About this Manual

The “Configuration” user manual contains the information you need to start operating the device. It takes you step by step from the first startup operation through to the basic settings for operation in your environment.

The “Installation” user manual contains a device description, safety instructions, a description of the display, and the other information that you need to install the device.

The “Graphical User Interface” reference manual contains detailed information on using the graphical user interface to operate the individual functions of the device.

The “Command Line Interface” reference manual contains detailed information on using the Command Line Interface to operate the individual functions of the device.

The Industrial HiVision Network Management software provides you with additional options for smooth configuration and monitoring:
- Auto-topology discovery
- Browser interface
- Client/server structure
- Event handling
- Event log
- Simultaneous configuration of multiple devices
- Graphical user interface with network layout
- SNMP/OPC gateway
### Key

The designations used in this manual have the following meanings:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>▶️</td>
<td>List</td>
</tr>
<tr>
<td>□</td>
<td>Work step</td>
</tr>
<tr>
<td>Link</td>
<td>Cross-reference with link</td>
</tr>
</tbody>
</table>

**Note:** A note emphasizes a significant fact or draws your attention to a dependency.

**Courier** Representation of a CLI command or field contents in the graphical user interface

- [ ] Execution in the Graphical User Interface
- [ ] Execution in the Command Line Interface
Notes on the Graphical User Interface

The Graphical User Interface of the device is divided as follows:

- Navigation area
- Dialog area
- Buttons

Navigation area

The Navigation area is located on the left side of the Graphical User Interface.

The Navigation area contains the following elements:

- Toolbar
- Filter
- Menu

You have the option of collapsing the entire Navigation area, for example when displaying the Graphical User Interface on small screens. To collapse or expand, you click the small arrow at the top of the navigation area.

Toolbar

The toolbar at the top of the navigation area contains several buttons.

- When you position the mouse pointer over a button, a tooltip displays further information.
- If the connection to the device is lost, then the toolbar is grayed out.

The device automatically refreshes the toolbar information every 5 seconds.

Clicking the button refreshes the toolbar manually.

When you position the mouse pointer over the button, a tooltip displays the following information:

- **User**
  - Name of the logged in user
- **Device name**
  - Name of the device

Clicking the button opens the **Device Security > User Management** dialog.

When you position the mouse pointer over the button, a tooltip displays the summary of the **Diagnostics > System > Configuration Check** dialog.

Clicking the button opens the **Diagnostics > System > Configuration Check** dialog.
Clicking the button logs out the current user and displays the login page.

Displays the remaining time in seconds until the device automatically logs out an inactive user.

Clicking the button opens the Device Security > Management Access > Web dialog. There you can specify the timeout.

When the configuration profile in the volatile memory (RAM) differs from the "Selected" configuration profile in the non-volatile memory (NVM), this button is visible. Otherwise, the button is hidden.

Clicking the button opens the Basic Settings > Load/Save dialog.

By right-clicking the button you can save the current settings in the non-volatile memory (NVM).

When you position the mouse pointer over the button, a tooltip displays the following information:

- **Device Status:** This section displays a compressed view of the Device status frame in the Basic Settings > System dialog. The section displays the alarm that is currently active and whose occurrence was recorded first.

- **Security Status:** This section displays a compressed view of the Security status frame in the Basic Settings > System dialog. The section displays the alarm that is currently active and whose occurrence was recorded first.

- **Boot Parameter:** If you permanently save changes to the settings and at least one boot parameter differs from the configuration profile used during the last restart, then this section displays a note.

The following settings cause the boot parameters to change:

- Basic Settings > External Memory dialog, Software auto update parameter
- Basic Settings > External Memory dialog, Config priority parameter
- Device Security > Management Access > Server dialog, SNMP tab, UDP port parameter
- Diagnostics > System > Selftest dialog, RAM test parameter
- Diagnostics > System > Selftest dialog, SysMon1 is available parameter
- Diagnostics > System > Selftest dialog, Load default config on error parameter

Clicking the button opens the Diagnostics > Status Configuration > Device Status dialog.

**Filter**

The filter enables you to reduce the number of menu items in the menu. When filtering, the menu displays only menu items matching the search string entered in the filter field.
Menu

The menu displays the menu items.

You have the option of filtering the menu items. See section “Filter”.

To display the corresponding dialog in the dialog area, you click the desired menu item. If the selected menu item is a node containing sub-items, then the node expands or collapses while clicking. The dialog area keeps the previously displayed dialog.

You have the option of expanding or collapsing every node in the menu at the same time. When you right-click anywhere in the menu, a context menu displays the following entries:

- **Expand**
  - Expands every node in the menu at the same time. The menu displays the menu items for every level.
- **Collapse**
  - Collapses every node in the menu at the same time. The menu displays the top level menu items.

Dialog area

The Dialog area is located on the right side of the Graphical User Interface. When you click a menu item in the Navigation area, the Dialog area displays the corresponding dialog.

Updating the display

If a dialog remains opened for a longer time, then the values in the device have possibly changed in the meantime.

☐ To update the display in the dialog, click the button. Unsaved information in the dialog is lost.

Saving the settings

☐ To transfer the changed settings to the volatile memory (RAM) of the device, click the button.
☐ To keep the changed settings, even after restarting the device, proceed as follows:
  ☐ Open the Basic Settings > Load/Save dialog.
  ☐ In the table, highlight the desired configuration profile.
  ☐ When in the Selected column the checkbox is unmarked, click the button and then the Select item.
  ☐ Click the button and then the Save item.

Note: Unintentional changes to the settings can terminate the connection between your PC and the device. To keep the device accessible, enable the Undo configuration modifications function in the Basic Settings > Load/Save dialog, before changing any settings. Using the function, the device continuously checks whether it can still be reached from the IP address of the user’s PC. If the connection is lost, then the device loads the configuration profile saved in the non-volatile memory (NVM) after the specified time. Afterwards, the device can be accessed again.
Working with tables

The dialogs display numerous settings in table form.

When you modify a table cell, the table cell displays a red mark in its top-left corner. The red mark indicates that your modifications are not yet transferred to the volatile memory (RAM) of the device.

You have the option of customizing the look of the tables to fit your needs. When you position the mouse pointer over a column header, the column header displays a drop-down list button. When you click this button, the drop-down list displays the following entries:

- **Sort ascending**
  Sorts the table entries in ascending order based on the entries of the selected column.
  You recognize sorted table entries by an arrow in the column header.

- **Sort descending**
  Sorts the table entries in descending order based on the entries of the selected column.
  You recognize sorted table entries by an arrow in the column header.

- **Columns**
  Displays or hides columns.
  You recognize hidden columns by an unmarked checkbox in the drop-down list.

- **Filters**
  The table only displays the entries whose content matches the specified filter criteria of the selected column.
  You recognize filtered table entries by an emphasized column header.

You have the option of selecting multiple table entries simultaneously and subsequently applying an action to them. This is useful when you are going to remove multiple table entries at the same time.

- **Select several consecutive table entries:**
  - Click the first desired table entry to highlight it.
  - Press and hold the <SHIFT> key.
  - Click the last desired table entry to highlight every desired table entry.

- **Select multiple individual table entries:**
  - Click the first desired table entry to highlight it.
  - Press and hold the <CTRL> key.
  - Click the next desired table entry to highlight it.
  - Repeat until every desired table entry is highlighted.

Buttons

Here you find the description of the standard buttons. The special dialog-specific buttons are described in the corresponding dialog help text.

- **Transfers the changes to the volatile memory (RAM) of the device and applies them to the device.**
  To save the changes in the non-volatile memory, proceed as follows:
  - Open the Basic Settings > Load/Save dialog.
  - In the table, highlight the desired configuration profile.
  - When in the Selected column the checkbox is unmarked, click the button and then the Select item.
  - Click the button to save your current changes.
Updates the fields with the values that are saved in the volatile memory (RAM) of the device.

Transfers the settings from the volatile memory (RAM) into the configuration profile designated as “Selected” in the non-volatile memory (NVM).

When in the Basic Settings > External Memory dialog the checkbox in the Backup config when saving column is marked, then the device generates a copy of the configuration profile in the external memory.

Displays a submenu with menu items corresponding to the respective dialog.

Opens the Wizard dialog.

Adds a new table entry.

Removes the highlighted table entry.

Opens the online help.
1 Basic Settings

The menu contains the following dialogs:
- System
- Network
- Software
- Load/Save
- External Memory
- Port
- Restart

1.1 System

In this dialog, you monitor individual operating statuses.

Device status

The fields in this frame display the device status and inform you about alarms that have occurred. When an alarm currently exists, the frame is highlighted.

You specify the parameters that the device monitors in the Diagnostics > Status Configuration > Device Status dialog.

Note: If you connect only one power supply unit for the supply voltage to a device with a redundant power supply unit, then the device reports an alarm. To help avoid this alarm, you deactivate the monitoring of the missing power supply units in the Diagnostics > Status Configuration > Device Status dialog.

Alarm counter

Displays the number of currently existing alarms.

When there is at least one currently existing alarm, the icon is visible.

When you position the mouse pointer over the icon, a tooltip displays the cause of the currently existing alarms and the time at which the device triggered the alarm.

If a monitored parameter differs from the desired status, then the device triggers an alarm. The Diagnostics > Status Configuration > Device Status dialog, Status tab displays an overview of the alarms.
**Security status**

The fields in this frame display the security status and inform you about alarms that have occurred. When an alarm currently exists, the frame is highlighted.

You specify the parameters that the device monitors in the Diagnostics > Status Configuration > Security Status dialog.

**Alarm counter**

Displays the number of currently existing alarms.

When there is at least one currently existing alarm, the icon is visible.

When you position the mouse pointer over the icon, a tooltip displays the cause of the currently existing alarms and the time at which the device triggered the alarm.

If a monitored parameter differs from the desired status, then the device triggers an alarm. The Diagnostics > Status Configuration > Security Status dialog, Status tab displays an overview of the alarms.

**Signal contact status**

The fields in this frame display the signal contact status and inform you about alarms that have occurred. When an alarm currently exists, the frame is highlighted.

You specify the parameters that the device monitors in the Diagnostics > Status Configuration > Signal Contact > Signal Contact 1/Signal Contact 2 dialog.

**Alarm counter**

Displays the number of currently existing alarms.

When there is at least one currently existing alarm, the icon is visible.

When you position the mouse pointer over the icon, a tooltip displays the cause of the currently existing alarms and the time at which the device triggered the alarm.

If a monitored parameter differs from the desired status, then the device triggers an alarm. The Diagnostics > Status Configuration > Signal Contact > Signal Contact 1/Signal Contact 2 dialog, Status tab displays an overview of the alarms.

**System data**

The fields in this frame display operating data and information on the location of the device.

**System name**

Specifies the name for which the device is known in the network.
Possible values:

- Alphanumeric ASCII character string with 0..255 characters

The following characters are allowed:
- 0..9
- a..z
- A..Z
- !#$%&'()*+,-./:;<=>?@\^[\]^_`{}~
- <device name>-<MAC address> (default setting)

When creating HTTPS X.509 certificates, the application generating the certificate uses the specified value as the domain name and common name.

The following functions use the specified value as a host name or FQDN (Fully Qualified Domain Name). For compatibility, it is recommended to use only small letters, since not every system compares the case in the FQDN. Verify that this name is unique in the whole network.

- DHCP client
- Syslog
- IEC61850-MMS
- PROFINET

**Note:** For compatibility in PROFINET environments, specify the PROFINET device name. In PROFINET the name is limited to a maximum of 240 characters. Do not begin the name with a number. Programs read the device name using SNMP and PROFINET DCP.

**Location**

Specifies the location of the device.

Possible values:

- Alphanumeric ASCII character string with 0..255 characters

**Contact person**

Specifies the contact person for this device.

Possible values:

- Alphanumeric ASCII character string with 0..255 characters

**Device type**

Displays the product name of the device.

**Power supply 1**

**Power supply 2**

Displays the status of the power supply unit on the relevant voltage supply connection.

Possible values:

- present
- defective
- not installed
- unknown
Basic Settings
[Basic Settings > System]

Uptime
Displays the time that has elapsed since this device was last restarted.

Possible values:
▶️ Time in the format $\text{day(s),...h...m...s}$

Temperature [$^\circ\text{C}$]
Displays the current temperature in the device in °C.

You activate the monitoring of the temperature thresholds in the Diagnostics > Status Configuration > Device Status dialog.

Upper temp. limit [$^\circ\text{C}$]
Specifies the upper temperature threshold in °C.

The “Installation” user manual contains detailed information about setting the temperature thresholds.

Possible values:
▶️ $-99..99$ (integer)
   If the temperature in the device exceeds this value, then the device generates an alarm.

Lower temp. limit [$^\circ\text{C}$]
Specifies the lower temperature threshold in °C.

The “Installation” user manual contains detailed information about setting the temperature thresholds.

Possible values:
▶️ $-99..99$ (integer)
   If the temperature in the device falls below this value, then the device generates an alarm.

**LED status**

This frame displays the states of the device status LEDs at the time of the last update. The “Installation” user manual contains detailed information about the device status LEDs.

<table>

</tbody>
</table>
Port status

This frame displays a simplified view of the ports of the device at the time of the last update. The icons represent the status of the individual ports. In some situations, the following icons interfere with one another. When you position the mouse pointer over the appropriate port icon, a tooltip displays a detailed information about the port state.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
1.2 Network

This dialog lets you specify the IP, VLAN and HiDiscovery settings required for the access to the device management through the network.

Management interface

This frame lets you specify the following settings:
- The source from which the device management receives its IP parameters
- VLAN in which the device management can be accessed

IP address assignment

Specifies the source from which the device management receives its IP parameters.

Possible values:
- **Local**
  The device uses the IP parameters from the internal memory. You specify the settings for this in the IP parameter frame.
- **BOOTP**
  The device receives its IP parameters from a BOOTP or DHCP server. The server evaluates the MAC address of the device, then assigns the IP parameters.
- **DHCP** (default setting)
  The device receives its IP parameters from a DHCP server. The server evaluates the MAC address, the DHCP name, or other parameters of the device, then assigns the IP parameters.
  When the server also provides the addresses of DNS servers, the device displays these addresses in the Advanced > DNS > Cache > Current dialog.

**Note:** If there is no response from the BOOTP or DHCP server, then the device sets the IP address to **0.0.0.0** and makes another attempt to obtain a valid IP address.

VLAN ID

Specifies the VLAN in which the device management is accessible through the network. The device management is accessible through ports that are members of this VLAN.

Possible values:
- **1..4042** (default setting: 1)
  The prerequisite is that the VLAN is already configured. See the Switching > VLAN > Configuration dialog.
  Assign a VLAN ID that is not assigned to any router interface.

When you click the **button after changing the value, the Information window opens. Select the port, over which you connect to the device in the future. After clicking the Ok button, the new device management VLAN settings are assigned to the port.
- After that the port is a member of the VLAN and transmits the data packets without a VLAN tag (untagged). See the Switching > VLAN > Configuration dialog.
- The device assigns the port VLAN ID of the device management VLAN to the port. See the Switching > VLAN > Port dialog.

After a short time the device is reachable over the new port in the new device management VLAN.
MAC address

Displays the MAC address of the device. The device management is accessible via the network using the MAC address.

MAC-Adresse Konflikterkennung

Enables/disables the MAC-Adresse Konflikterkennung function.

Possible values:

- marked
  - The MAC-Adresse Konflikterkennung function is enabled.
  - The device verifies that its MAC address is unique in the network.
- unmarked (default setting)
  - The MAC-Adresse Konflikterkennung function is disabled.

**BOOTP/DHCP**

Client ID

Displays the DHCP client ID that the device sends to the BOOTP or DHCP server. If the server is configured accordingly, then it reserves an IP address for this DHCP client ID. Therefore, the device receives the same IP from the server every time it requests it.

The DHCP client ID that the device sends is the device name specified in the System name field in the Basic Settings > System dialog.

**HiDiscovery protocol v1/v2**

This frame lets you specify settings for the access to the device using the HiDiscovery protocol.

On a PC, the HiDiscovery software displays the Hirschmann devices that can be accessed in the network on which the HiDiscovery function is enabled. You can access these devices even if they have invalid or no IP parameters assigned. The HiDiscovery software lets you assign or change the IP parameters in the device.

**Note:** With the HiDiscovery software you access the device only through ports that are members of the same VLAN as the device management. You specify which VLAN a certain port is assigned to in the Switching > VLAN > Configuration dialog.

Operation

Enables/disables the HiDiscovery function in the device.

Possible values:

- **On** (default setting)
  - HiDiscovery is enabled.
  - You can use the HiDiscovery software to access the device from your PC.
- **Off**
  - HiDiscovery is disabled.
Basic Settings
[Basic Settings > Network]

Access

Enable/disables the write access to the device using HiDiscovery.

Possible values:
- **readWrite** (default setting)
  The HiDiscovery software is given write access to the device. With this setting you can change the IP parameters in the device.
- **readOnly**
  The HiDiscovery software is given read-only access to the device. With this setting you can view the IP parameters in the device.

Recommendation: Change the setting to the value **readOnly** only after putting the device into operation.

Signal

Activates/deactivates the flashing of the port LEDs as does the function of the same name in the HiDiscovery software. The function lets you identify the device in the field.

Possible values:
- **marked**
  The flashing of the port LEDs is active. The port LEDs flash until you disable the function again.
- **unmarked** (default setting)
  The flashing of the port LEDs is inactive.

Relay status

Activates/deactivates the HiDiscovery relay function. This function lets the HiDiscovery software to find and display devices located in other subnets.

Possible values:
- **marked** (default setting)
  The HiDiscovery relay function is active. The device forwards the HiDiscovery request packets sent from the device management into directly connected subnets. The device also responds to requests with its IP parameters.
- **unmarked**
  The HiDiscovery relay function is inactive. The HiDiscovery software finds only the devices located in the same subnet as the device management.

**IP parameter**

This frame lets you assign the IP parameters manually. If you have selected the **Local** radio button in the Management interface frame, **IP address assignment** option list, then these fields can be edited.

**IP address**

Specifies the IP address under which the device management can be accessed through the network.

Possible values:
- Valid IPv4 address
Verify that the IP subnet of the device management is not overlapping with any subnet connected to another interface of the device:
• router interface
• loopback interface

Netmask

Specifies the netmask.
Possible values:
► Valid IPv4 netmask

Gateway address

Specifies the IP address of a router through which the device accesses other devices outside its own network.
Possible values:
► Valid IPv4 address

If the device does not use the specified gateway, check whether another default gateway is specified. The setting in the following dialog has precedence:
• Routing > Routing Table dialog, Next hop IP address column, if the value in the Network address column and in the Netmask column is 0.0.0.0

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
1.3 Software

This dialog lets you update the device software and display information about the device software. You also have the option to restore a backup of the device software saved in the device.

Note: Before updating the device software, follow the version-specific notes in the Readme text file.

Version

Stored version
Displays the version number and creation date of the device software stored in the flash memory. The device loads the device software during the next restart.

Running version
Displays the version number and creation date of the device software that the device loaded during the last restart and is currently running.

Backup version
Displays the version number and creation date of the device software saved as a backup in the flash memory. The device copied this device software into the backup memory during the last software update or after you clicked the Restore button.

Restore
Restores the device software saved as a backup. In the process, the device changes the Stored version and the Backup version of the device software.

Upon restart, the device loads the Stored version.

Bootcode
Displays the version number and creation date of the boot code.

Software update
Alternatively, when the image file is located in the external memory, the device lets you update the device software by right-clicking in the table.

URL
Specifies the path and the file name of the image file with which you update the device software.
The device gives you the following options for updating the device software:

- **Software update from the PC**
  When the file is located on your PC or on a network drive, drag and drop the file in the area. Alternatively click in the area to select the file.

- **Software update from an FTP server**
  When the file is located on an FTP server, specify the URL for the file in the following form:
  ftp://<user>:<password>@<IP address>:<port>/<file name>

- **Software update from a TFTP server**
  When the file is located on a TFTP server, specify the URL for the file in the following form:
  tftp://<IP address>/<path>/<file name>

- **Software update from an SCP or SFTP server**
  When the file is located on an SCP or SFTP server, specify the URL for the file in one of the following forms:
  - scp:// or sftp://<IP address>/<path>/<file name>
    When you click the **Start** button, the device displays the **Credentials** window. There you enter **User name** and **Password**, to log on to the server.
  - scp:// or sftp://<user>:<password>@<IP address>/<path>/<file name>

**Start**

Updates the device software.

The device installs the selected file in the flash memory, replacing the previously saved device software. Upon restart, the device loads the installed device software.

The device copies the existing software into the backup memory.

To remain logged in to the device during the software update, move the mouse pointer occasionally. Alternatively, specify a sufficiently high value in the **Device Security > Management Access > Web** dialog, field **Web interface session timeout [min]** before the software update.

### Table

**File location**

Displays the storage location of the device software.

Possible values:

- **ram**
  Volatile memory of the device

- **flash**
  Non-volatile memory (NVM) of the device

- **sd-card**
  External SD memory (ACA31)

**Index**

Displays the index of the device software.
For the device software in the flash memory, the index has the following meaning:

1. Upon restart, the device loads this device software.
2. The device copied this device software into the backup area during the last software update.

File name

Displays the device-internal file name of the device software.

Firmware

Displays the version number and creation date of the device software.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
1.4 Load/Save

This dialog lets you save the device settings permanently in a configuration profile.

The device can hold several configuration profiles. When you activate an alternative configuration profile, you change to other device settings. You have the option of exporting the configuration profiles to your PC or to a server. You also have the option of importing the configuration profiles from your PC or from a server to the device.

In the default setting, the device saves the configuration profiles unencrypted. If you enter a password in the Configuration encryption frame, then the device saves both the current and the future configuration profiles in an encrypted format.

Unintentional changes to the settings can terminate the connection between your PC and the device. To keep the device accessible, enable the Undo configuration modifications function before changing any settings. If the connection is lost, then the device loads the configuration profile saved in the non-volatile memory (NVM) after the specified time.

External memory

Selected external memory

Displays the type of the external memory.

Possible values:
- **sd**
  External SD memory (ACA31)

Status

Displays the operating state of the external memory.

Possible values:
- **notPresent**
  No external memory connected.
- **removed**
  Someone has removed the external memory from the device during operation.
- **ok**
  The external memory is connected and ready for operation.
- **outOfMemory**
  The memory space is occupied in the external memory.
- **genericErr**
  The device has detected an error.

Configuration encryption

Active

Displays whether the configuration encryption is active/inactive in the device.
### Possible values:

**marked**

- The configuration encryption is active.
  - If the configuration profile is encrypted and the password matches the password stored in the device, then the device loads a configuration profile from the non-volatile memory (NVM).

**unmarked**

- The configuration encryption is inactive.
  - If the configuration profile is unencrypted, then the device loads a configuration profile from the non-volatile memory (NVM) only.

If in the **Basic Settings > External Memory** dialog, the **Config priority** column has the value **first** and the configuration profile is unencrypted, then the **Security status** frame in the **Basic Settings > System** dialog displays an alarm.

In the **Diagnostics > Status Configuration > Security Status** dialog, **Global** tab, **Monitor** column you specify whether the device monitors the **Load unencrypted config from external memory** parameter.

### Set password

Opens the **Set password** window that helps you to enter the password needed for the configuration profile encryption. Encrypting the configuration profiles makes unauthorized access more difficult.

- When you are changing an existing password, enter the existing password in the **Old password** field. To display the password in plain text instead of ***** (asterisks), mark the **Display content** checkbox.
- In the **New password** field, enter the password. To display the password in plain text instead of ***** (asterisks), mark the **Display content** checkbox.
- Mark the **Save configuration afterwards** checkbox to use encryption also for the **Basic Settings** configuration profile in the non-volatile memory (NVM) and in the external memory.

**Note:** If a maximum of 1 configuration profile is stored in the non-volatile memory (NVM) of the device, then use this function only. Before creating additional configuration profiles, decide for or against permanently activated configuration encryption in the device. Save additional configuration profiles either unencrypted or encrypted with the same password.

If you are replacing a device with an encrypted configuration profile, for example due to a defect, then you proceed as follows:

- Restart the new device and assign the IP parameters.
- Open the **Basic Settings > Load/Save** dialog on the new device.
- Encrypt the configuration profile in the new device. See above. Enter the same password you used in the defective device.
- Install the external memory from the defective device in the new device.
- Restart the new device.

When you restart the device, the device loads the configuration profile with the settings of the defective device from the external memory. The device copies the settings into the volatile memory (RAM) and into the non-volatile memory (NVM).
Delete

Opens the **Delete** window which helps you to cancel the configuration encryption in the device.

- In the **Old password** field, enter the existing password.
  To display the password in plain text instead of ***** (asterisks), mark the **Display content** checkbox.

- Mark the **Save configuration afterwards** checkbox to remove the encryption also for the Selected configuration profile in the non-volatile memory (NVM) and in the external memory.

**Note:** If you keep additional encrypted configuration profiles in the memory, then the device helps prevent you from activating or designating these configuration profiles as "Selected".

Information

NVM in sync with running config

Displays whether the configuration profile in the volatile memory (RAM) and the "Selected" configuration profile in the non-volatile memory (NVM) are the same.

Possible values:

- **marked**
  The configuration profiles are the same.

- **unmarked**
  The configuration profiles differ.

External memory in sync with NVM

Displays whether the "Selected" configuration profile in the external memory and the "Selected" configuration profile in the non-volatile memory (NVM) are the same.

Possible values:

- **marked**
  The configuration profiles are the same.

- **unmarked**
  The configuration profiles differ.

Possible causes:
- No external memory is connected to the device.
- In the **Basic Settings > External Memory** dialog, the **Backup config when saving** function is disabled.

Backup config on a remote server when saving

Operation

Enables/disables the **Backup config on a remote server when saving** function.
Possible values:

- **Enabled**
  The *Backup config on a remote server when saving* function is enabled.
  When you save the configuration profile in the non-volatile memory (NVM), the device automatically backs up the configuration profile on the remote server specified in the **URL** field.

- **Disabled** (default setting)
  The *Backup config on a remote server when saving* function is disabled.

**URL**

Specifies path and file name of the backed up configuration profile on the remote server.

Possible values:

- Alphanumeric ASCII character string with 0..128 characters
  Example: `tftp://192.9.200.1/cfg/config.xml`

The device supports the following wildcards:

- **%d**
  System date in the format `YYYY-mm-dd`

- **%t**
  System time in the format `HH_MM_SS`

- **%i**
  IP address of the device

- **%m**
  MAC address of the device in the format `AA-BB-CC-DD-EE-FF`

- **%p**
  Product name of the device

**Set credentials**

Opens the *Credentials* window which helps you to enter the credentials needed to authenticate on the remote server.

- In the **User name** field, enter the user name.
  To display the user name in plain text instead of ***** (asterisks), mark the **Display content** checkbox.

  Possible values:
  - Alphanumeric ASCII character string with 1..32 characters

- In the **Password** field, enter the password.
  To display the password in plain text instead of ***** (asterisks), mark the **Display content** checkbox.

  Possible values:
  - Alphanumeric ASCII character string with 6..64 characters
    The following characters are allowed:
    - a..z
    - A..Z
    - 0..9
    - !#$%&'()+,-./:;<=>?@[\]^_`~
**Undo configuration modifications**

**Operation**

Enables/disables the *Undo configuration modifications* function. Using the function, the device continuously checks whether it can still be reached from the IP address of the user’s PC. If the connection is lost, after a specified time period the device loads the “Selected” configuration profile from the non-volatile memory (*NVM*). Afterwards, the device can be accessed again.

Possible values:

- **On**
  - The function is enabled.
  - You specify the time period between the interruption of the connection and the loading of the configuration profile in the field *Timeout [s] to recover after connection loss*.
  - When the non-volatile memory (*NVM*) contains multiple configuration profiles, the device loads the configuration profile designated as “Selected”.

- **Off** (default setting)
  - The function is disabled.
  - Disable the function again before you close the Graphical User Interface. You thus help prevent the device from restoring the configuration profile designated as “Selected”.

**Note:** Before you enable the function, save the settings in the configuration profile. Current changes, that are saved temporarily, are therefore maintained in the device.

**Timeout [s] to recover after connection loss**

Specifies the time in seconds after which the device loads the “Selected” configuration profile from the non-volatile memory (*NVM*) if the connection is lost.

Possible values:

- **30..600** (default setting: 600)

Specify a sufficiently large value. Take into account the time when you are viewing the dialogs of the Graphical User Interface without changing or updating them.

**Watchdog IP address**

Displays the IP address of the PC on which you have enabled the function.

Possible values:

- **IPv4 address** (default setting: 0.0.0.0)

**Table**

**Storage type**

Displays the storage location of the configuration profile.
Possible values:

- **RAM** (volatile memory of the device)
  In the volatile memory, the device stores the settings for the current operation.

- **NVM** (non-volatile memory of the device)
  When applying the function *Undo configuration modifications* or during a restart, the device loads the “Selected” configuration profile from the non-volatile memory.
  The non-volatile memory provides space for multiple configuration profiles, depending on the number of settings saved in the configuration profile. The device manages a maximum of 20 configuration profiles in the non-volatile memory.
  You can load a configuration profile into the volatile memory (**RAM**):
  □ In the table, highlight the configuration profile.
  □ Click the **button and then the **Activate** item.

- **ENVM** (external memory)
  In the external memory, the device saves a backup copy of the “Selected” configuration profile. The prerequisite is that in the *Basic Settings > External Memory* dialog you mark the **Backup config when saving** checkbox.

**Profile name**

Displays the name of the configuration profile.

Possible values:

- **running-config**
  Name of the configuration profile in the volatile memory (**RAM**).

- **config**
  Name of the factory setting configuration profile in the non-volatile memory (**NVM**).

- User-defined name
  The device lets you save a configuration profile with a user-specified name by highlighting an existing configuration profile in the table, clicking the **button and then the **Save As..** item.

To export the configuration profile as an XML file on your PC, click the link. Then you select the storage location and specify the file name.

To save the file on a remote server, click the **button and then the **Export...** item.

**Modification date (UTC)**

Displays the time (UTC) at which a user last saved the configuration profile.

**Selected**

Displays whether the configuration profile is designated as “Selected”.

Possible values:

- **marked**
  The configuration profile is designated as “Selected”.
  - When applying the function *Undo configuration modifications* or during a restart, the device loads the configuration profile into the volatile memory (**RAM**).
  - When you click the **button, the device saves the temporarily saved settings in this configuration profile.

- **unmarked**
  Another configuration profile is designated as “Selected”.

To designate another configuration profile as “Selected”, you highlight the desired configuration profile in the table, click the **button and then the **Activate** item.
Encrypted

Displays whether the configuration profile is encrypted.

Possible values:
- **marked**
  The configuration profile is encrypted.
- **unmarked**
  The configuration profile is unencrypted.

You activate/deactivate the encryption of the configuration profile in the **Configuration encryption** frame.

Encryption verified

Displays whether the password of the encrypted configuration profile matches the password stored in the device.

Possible values:
- **marked**
  The passwords match. The device is able to unencrypt the configuration profile.
- **unmarked**
  The passwords are different. The device is unable to unencrypt the configuration profile.

Software version

Displays the version number of the device software that the device ran while saving the configuration profile.

Fingerprint

Displays the checksum saved in the configuration profile.

When saving the settings, the device calculates the checksum and inserts it into the configuration profile.

Fingerprint verified

Displays whether the checksum saved in the configuration profile is valid.

The device calculates the checksum of the configuration profile marked as “Selected” and compares it with the checksum saved in this configuration profile.

Possible values:
- **marked**
  The calculated and the saved checksum match. The saved settings are consistent.
- **unmarked**
  For the configuration profile marked as “Selected” applies:
  The calculated and the saved checksum are different.
  The configuration profile contains modified settings.
  Possible causes:
  - The file is damaged.
  - The file system in the external memory is inconsistent.
  - A user has exported the configuration profile and changed the XML file outside the device.
  For the other configuration profiles the device has not calculated the checksum.
Basic Settings

The device verifies the checksum correctly only if the configuration profile has been saved before as follows:

- on an identical device
- with the same software version, which the device is running
- with a lower or the same level of the device software such as HiOS-2A or HiOS-3S on a device which runs HiOS-3S

**Note:** This function identifies changes to the settings in the configuration profile. The function does not provide protection against operating the device with modified settings.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Removes the configuration profile highlighted in the table from the non-volatile memory (NVM) or from the external memory.

If the configuration profile is designated as "Selected", then the device helps prevent you from removing the configuration profile.

**Save As..**

Copies the configuration profile highlighted in the table and saves it with a user-specified name in the non-volatile memory (NVM). The device designates the new configuration profile as “Selected”.

**Note:** Before creating additional configuration profiles, decide for or against permanently activated configuration encryption in the device. Save additional configuration profiles either unencrypted or encrypted with the same password.

If in the Basic Settings > External Memory dialog the checkbox in the Backup config when saving column is marked, then the device designates the configuration profile of the same name in the external memory as “Selected”.

**Activate**

Loads the settings of the configuration profile highlighted in the table to the volatile memory (RAM).

- The device terminates the connection to the Graphical User Interface.
- Reload the Graphical User Interface.
- Login again.
- The device immediately uses the settings of the configuration profile on the fly.

Enable the Undo configuration modifications function before you activate another configuration profile. If the connection is lost afterwards, then the device loads the last configuration profile designated as “Selected” from the non-volatile memory (NVM). The device can then be accessed again.
If the configuration encryption is inactive, then the device loads an unencrypted configuration profile. If the configuration encryption is active and the password matches the password stored in the device, then the device loads an encrypted configuration profile.

When you activate an older configuration profile, the device takes over the settings of the functions contained in this software version. The device sets the values of new functions to their default value.

Select

Designates the configuration profile highlighted in the table as “Selected”. In the Selected column, the checkbox is then marked.

When applying the function Undo configuration modifications or during a restart, the device loads the settings of this configuration profile to the volatile memory (RAM).

- If the configuration encryption in the device is disabled, then designate an unencrypted configuration profile only as “Selected”.
- If the configuration encryption in the device is enabled and the password of the configuration profile matches the password saved in the device, then designate an encrypted configuration profile only as “Selected”.

Otherwise, the device is unable to load and encrypt the settings in the configuration profile the next time it restarts. For this case you specify in the Diagnostics > System > Selftest dialog whether the device starts with the default settings or terminates the restart and stops.

Note: You only mark the configuration profiles saved in the non-volatile memory (NVM).

If in the Basic Settings > External Memory dialog the checkbox in the Backup config when saving column is marked, then the device designates the configuration profile of the same name in the external memory as “Selected”.

Import...

Opens the Import... window to import a configuration profile.

The prerequisite is that you have exported the configuration profile using the Export... button or using the link in the Profile name column.

- In the Select source drop-down list, select from where the device imports the configuration profile.
  - PC/URL
    - The device imports the configuration profile from the local PC or from a remote server.
  - External memory
    - The device imports the configuration profile from the external memory.

- When PC/URL is selected above, in the Import profile from PC/URL frame you specify the configuration profile file to be imported.
  - Import from the PC
    - When the file is located on your PC or on a network drive, drag and drop the file in the area. Alternatively click in the area to select the file.
  - Import from an FTP server
    - When the file is located on an FTP server, specify the URL for the file in the following form:
      ftp://<user>:<password>@<IP address>:<port>/<file name>
Basic Settings
[Basic Settings > Load/Save]

- Import from a TFTP server
  When the file is located on a TFTP server, specify the URL for the file in the following form:
  \texttt{tftp://<IP\ address>/<path>/<file\ name>}

- Import from an SCP or SFTP server
  When the file is located on an SCP or SFTP server, specify the URL for the file in one of the
  following forms:
  \texttt{scp://<IP\ address>/<path>/<file\ name>}
  \texttt{sftp://<IP\ address>/<path>/<file\ name>}

  When you click the \texttt{Start} button, the device displays the \texttt{Credentials} window. There you enter
  \texttt{User\ name} and \texttt{Password}, to log on to the server.
  \texttt{scp://<user>:<password>@<IP\ address>/<path>/<file\ name>}

- When \texttt{External\ memory} is selected above, in the \texttt{Import\ profile\ from\ external\ memory} frame you
  specify the configuration profile file to be imported.
  In the \texttt{Profile\ name} drop-down list, select the name of the configuration profile to be imported.

- In the \texttt{Destination} frame you specify where the device saves the imported configuration profile.
  In the \texttt{Profile\ name} field you specify the name under which the device saves the configuration
  profile.
  In the \texttt{Storage\ type} field you specify the storage location for the configuration profile. The
  prerequisite is that in the \texttt{Select\ source} drop-down list you have selected the value \texttt{PC/URL}.

  - \texttt{RAM}
    The device saves the configuration profile in the volatile memory (\texttt{RAM}) of the device. This
    replaces the \texttt{running-config}, the device uses the settings of the imported configuration
    profile immediately. The device terminates the connection to the Graphical User Interface.
    Reload the Graphical User Interface. Login again.

  - \texttt{NVM}
    The device saves the configuration profile in the non-volatile memory (\texttt{NVM}) of the device.

When you import a configuration profile, the device takes over the settings as follows:

- If the configuration profile was exported on the same device or on an identically equipped device
  of the same type, then:
  The device takes over the settings completely.

- If the configuration profile was exported on an other device, then:
  The device takes over the settings which it can interpret based on its hardware equipment and
  software level.
  The remaining settings the device takes over from its \texttt{running-config} configuration profile.

Regarding configuration profile encryption, also read the help text of the \texttt{Configuration\ encryption}
frame. The device imports a configuration profile under the following conditions:

- The configuration encryption of the device is inactive. The configuration profile is unencrypted.
- The configuration encryption of the device is active. The configuration profile is encrypted with
  the same password that the device currently uses.

\texttt{Export...}

Exports the configuration profile highlighted in the table and saves it as an XML file on a remote
server.

To save the file on your PC, click the link in the \texttt{Profile\ name} column to select the storage location
and specify the file name.
The device gives you the following options for exporting a configuration profile:

- **Export to an FTP server**
  To save the file on an FTP server, specify the URL for the file in the following form:
  \[ftp://<user>:<password>@<IP address>:<port>/<file name>\]

- **Export to a TFTP server**
  To save the file on a TFTP server, specify the URL for the file in the following form:
  \[tftp://<IP address>/<path>/<file name>\]

- **Export to an SCP or SFTP server**
  To save the file on an SCP or SFTP server, specify the URL for the file in one of the following forms:
  - \[scp://<IP address>/<path>/<file name>\]
  - \[sftp://<user>:<password>@<IP address>/<path>/<file name>\]

When you click the **Ok** button, the device displays the **Credentials** window. There you enter **User name** and **Password**, to log on to the server.

Load running-config as script

Imports a script file which modifies the current **running config** configuration profile.

The device gives you the following options to import a script file:

- **Import from the PC**
  When the file is located on your PC or on a network drive, drag and drop the file in the area. Alternatively click in the area to select the file.

- **Import from an FTP server**
  When the file is located on an FTP server, specify the URL for the file in the following form:
  \[ftp://<user>:<password>@<IP address>:<port>/<file name>\]

- **Import from a TFTP server**
  When the file is located on a TFTP server, specify the URL for the file in the following form:
  \[tftp://<IP address>/<path>/<file name>\]

- **Import from an SCP or SFTP server**
  When the file is located on an SCP or SFTP server, specify the URL for the file in one of the following forms:
  \[scp://<IP address>/<path>/<file name>\]

- **Save running-config as script**
  Saves the **running config** configuration profile as a script file on the local PC. This lets you backup your current device settings or to use them on various devices.

Back to factory...

Resets the settings in the device to the default values.

- The device deletes the saved configuration profiles from the volatile memory (**RAM**) and from the non-volatile memory (**NVM**).
- The device deletes the HTTPS certificate used by the web server in the device.
- The device deletes the RSA key (Host Key) used by the SSH server in the device.
- When an external memory is connected, the device deletes the configuration profiles saved in the external memory.
- After a brief period, the device reboots and loads the default values.

Back to default

Deletes the current operating (**running config**) settings from the volatile memory (**RAM**).
1.5 **External Memory**

This dialog lets you activate functions that the device automatically executes in combination with the external memory. The dialog also displays the operating state and identifying characteristics of the external memory.

**Table**

<table>
<thead>
<tr>
<th>Type</th>
<th>Displays the type of the external memory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>sd</td>
<td>External SD memory (ACA31)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Displays the operating state of the external memory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>notPresent</td>
<td>No external memory connected.</td>
</tr>
<tr>
<td>removed</td>
<td>Someone has removed the external memory from the device during operation.</td>
</tr>
<tr>
<td>ok</td>
<td>The external memory is connected and ready for operation.</td>
</tr>
<tr>
<td>outOfMemory</td>
<td>The memory space is occupied in the external memory.</td>
</tr>
<tr>
<td>genericErr</td>
<td>The device has detected an error.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Writable</th>
<th>Displays whether the device has write access to the external memory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>marked</td>
<td>The device has write access to the external memory.</td>
</tr>
<tr>
<td>unmarked</td>
<td>The device has read-only access to the external memory. Possibly the write protection is activated in the external memory.</td>
</tr>
</tbody>
</table>

**Software auto update**

Activates/deactivates the automatic device software update during the restart.
Possible values:

▲ marked (default setting)
- The automatic device software update during the restart is activated. The device updates the
  device software when the following files are located in the external memory:
  - the image file of the device software
  - a text file "startup.txt" with the content `autoUpdate=<image_file_name>.bin`

▲ unmarked
- The automatic device software update during the restart is deactivated.

SSH key auto upload

Activates/deactivates the loading of the RSA key from an external memory upon restart.

Possible values:

▲ marked (default setting)
- The loading of the RSA key is activated. During a restart, the device loads the RSA key from the external memory when the following files are located in the external memory:
  - SSH RSA key file
  - a text file "startup.txt" with the content `autoUpdateRSA=<filename_of_the_SSH_RSA_key>`
- The device displays messages on the system console of the serial interface.

▲ unmarked
- The loading of the RSA key is deactivated.

**Note:** When loading the RSA key from the external memory (`ENVM`), the device overwrites the existing keys in the non-volatile memory (`NVM`).

Config priority

Specifies the memory from which the device loads the configuration profile upon reboot.

Possible values:

▲ disable
- The device loads the configuration profile from the non-volatile memory (`NVM`).

▲ first
- The device loads the configuration profile from the external memory. When the device does not find a configuration profile in the external memory, it loads the configuration profile from the non-volatile memory (`NVM`).

**Note:** When loading the configuration profile from the external memory (`ENVM`), the device overwrites the settings of the Selected configuration profile in the non-volatile memory (`NVM`).

If the `Config priority` column has the value `first` and the configuration profile is unencrypted, then
the `Security status` frame in the `Basic Settings > System` dialog displays an alarm.

In the `Diagnostics > Status Configuration > Security Status` dialog, `Global` tab, `Monitor` column you specify whether the device monitors the `Load unencrypted config from external memory` parameter.

Backup config when saving

Activates/deactivates creating a copy of the configuration profile in the external memory.
Possible values:

► marked (default setting)
  Creating a copy is activated. When you click in the Basic Settings > Load/Save dialog the Save button, the device generates a copy of the configuration profile on the active external memory.

► unmarked
  Creating a copy is deactivated. The device does not generate a copy of the configuration profile.

Manufacturer ID

Displays the name of the memory manufacturer.

Revision

Displays the revision number specified by the memory manufacturer.

Version

Displays the version number specified by the memory manufacturer.

Name

Displays the product name specified by the memory manufacturer.

Serial number

Displays the serial number specified by the memory manufacturer.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
1.6 Port

[Basic Settings > Port]

This dialog lets you specify settings for the individual ports. The dialog also displays the operating mode, connection status, bit rate and duplex mode for every port.

The dialog contains the following tabs:
- [Configuration]
- [Statistics]
- [Utilization]

[Configuration]

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the port.</td>
</tr>
</tbody>
</table>

Possible values:
- Alphanumeric ASCII character string with 0..64 characters
  The following characters are allowed:
  - <space>
  - 0..9
  - a..z
  - A..Z
  - !#$%&'()*+,-./:;<=>?@[\]^_`{}~

<table>
<thead>
<tr>
<th>Port on</th>
<th>Activates/deactivates the port.</th>
</tr>
</thead>
</table>

Possible values:
- marked (default setting)
  The port is active.
- unmarked
  The port is inactive. The port does not send or receive any data.

<table>
<thead>
<tr>
<th>State</th>
<th>Displays whether the port is currently physically enabled or disabled.</th>
</tr>
</thead>
</table>
Possible values:

- **marked**
  - The port is physically enabled.

- **unmarked**
  - The port is physically disabled.
  - When the Port on function is active, the Auto-Disable function has disabled the port.
  - You specify the settings of the Auto-Disable function in the Diagnostics > Ports > Auto-Disable dialog.

Power state (port off)

Specifies, whether the port is physically switched on or off when you deactivate the port with the Port on function.

Possible values:

- **marked**
  - The port remains physically enabled. A connected device receives an active link.

- **unmarked** (default setting)
  - The port is physically disabled.

Auto power down

Specifies how the port behaves when no cable is connected.

Possible values:

- **no-power-save** (default setting)
  - The port remains activated.

- **auto-power-down**
  - The port changes to the energy-saving mode.

- **unsupported**
  - The port does not support this function and remains activated.

Automatic configuration

Activates/deactivates the automatic selection of the operating mode for the port.

Possible values:

- **marked** (default setting)
  - The automatic selection of the operating mode is active.
  - The port negotiates the operating mode independently using autonegotiation and detects the devices connected to the TP port automatically (Auto Cable Crossing). This setting has priority over the manual setting of the port.
  - Elapse several seconds until the port has set the operating mode.

- **unmarked**
  - The automatic selection of the operating mode is inactive.
  - The port operates with the values you specify in the Manual configuration column and in the Manual cable crossing (Auto. conf. off) column.

  Grayed-out display
  - No automatic selection of the operating mode.

Manual configuration

Specifies the operating mode of the ports when the Automatic configuration function is disabled.
Possible values:

- 10 Mbit/s HDX
  Half duplex connection
- 10 Mbit/s FDX
  Full duplex connection
- 100 Mbit/s HDX
  Half duplex connection
- 100 Mbit/s FDX
  Full duplex connection
- 1000 Mbit/s FDX
  Full duplex connection

**Note:** The operating modes of the port actually available depend on the device configuration.

**Link/Current settings**

Displays the operating mode which the port currently uses.

Possible values:

- –
  No cable connected, no link.
- 10 Mbit/s HDX
  Half duplex connection
- 10 Mbit/s FDX
  Full duplex connection
- 100 Mbit/s HDX
  Half duplex connection
- 100 Mbit/s FDX
  Full duplex connection
- 1000 Mbit/s FDX
  Full duplex connection

**Note:** The operating modes of the port actually available depend on the device configuration.

**Manual cable crossing (Auto. conf. off)**

Specifies the devices connected to a TP port.

The prerequisite is that the *Automatic configuration* function is disabled.

Possible values:

- mdi
  The device interchanges the send- and receive-line pairs on the port.
- mdix (default setting on TP ports)
  The device helps prevent the interchange of the send- and receive-line pairs on the port.
- auto-mdix
  The device detects the send and receive line pairs of the connected device and automatically adapts to them.
  Example: When you connect an end device with a crossed cable, the device automatically resets the port from mdix to mdi.
- unsupported (default setting on optical ports or TP-SFP ports)
  The port does not support this function.
Flow control

Activates/deactivates the flow control on the port.

Possible values:
- **marked** (default setting)
  The Flow control on the port is active.
  The sending and evaluating of pause packets (full-duplex operation) or collisions (half-duplex operation) is activated on the port.
  - To enable the flow control in the device, also activate the **Flow control** function in the **Switching > Global** dialog.
  - Activate the flow control also on the port of the device that is connected to this port.
  On an uplink port, activating the flow control can possibly cause undesired sending breaks in the higher-level network segment ("wandering backpressure").
- **unmarked**
  The Flow control on the port is inactive.

If you are using a redundancy function, then you deactivate the flow control on the participating ports. If the flow control and the redundancy function are active at the same time, it is possible that the redundancy function operates differently than intended.

Send trap (Link up/down)

Activates/deactivates the sending of SNMP traps when the device detects changes in the link up/down status for this port.

Possible values:
- **marked** (default setting)
  The sending of SNMP traps is active.
  When the device detects a link up/down status change, the device sends an SNMP trap.
- **unmarked**
  The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the **Diagnostics > Status Configuration > Alarms (Traps)** dialog and specify at least 1 trap destination.

MTU

Specifies the maximum allowed size of Ethernet packets on the port in bytes.

Possible values:
- **1518..12288** (default setting: **1518**)
  With the setting **1518**, the port transmits the Ethernet packets up to the following size:
  - 1518 bytes without VLAN tag
    (1514 bytes + 4 bytes CRC)
  - 1522 bytes with VLAN tag
    (1518 bytes + 4 bytes CRC)

This setting lets you increase the size of the Ethernet packets for specific applications. The following list contains possible applications:
- When you use the PRP redundancy protocol, it is possible that you require an **MTU** that is larger by 6 bytes. (depends on hardware)
- When you use the device in the transfer network with double VLAN tagging, it is possible that you require an **MTU** that is larger by 4 bytes.
On other interfaces, you specify the maximum permissible size of the Ethernet packets as follows:

- **Router interfaces**
  
  *Routing > Interfaces > Configuration* dialog, *MTU value* column

- **HSR interfaces** (depends on hardware)
  
  *Switching > L2-Redundancy > HSR > Configuration* dialog, *Configuration* frame, *MTU* field

- **PRP interfaces** (depends on hardware)
  
  *Switching > L2-Redundancy > PRP > Configuration* dialog, *Configuration* frame, *MTU* field

- **Link Aggregation interfaces**
  
  *Switching > L2-Redundancy > Link Aggregation* dialog, *MTU* column

**Signal**

Activates/deactivates the port LED flashing. This function lets you identify the port in the field.

Possible values:

- **marked**
  
  The flashing of the port LED is active.
  
  The port LED flashes until you disable the function again.

- **unmarked** (default setting)
  
  The flashing of the port LED is inactive.

**Link monitoring**

Activates/deactivates the *Link monitoring* function on the interface.

Use the *Link monitoring* function for end devices that do not support Far End Fault Indication (FEFI) on optical links.

Possible values:

- **marked**
  
  The *Link monitoring* function is active.
  
  If the device recognizes an established link, then the port LED illuminates. If the device recognizes that a link has been lost, then the port LED extinguishes.

- **unmarked** (default setting)
  
  The *Link monitoring* function is inactive.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

**Clear port statistics**

Resets the counter for the port statistics to 0.

**Statistics**

This tab displays the following overview per port:

- Number of data packets/bytes received in the device
  
  - *Received packets*
  
  - *Received octets*
Basic Settings

[Basic Settings > Port]

- Received unicast packets
- Received multicast packets
- Received broadcast packets

▶ Number of data packets/bytes sent from the device
  - Transmitted packets
  - Transmitted octets
  - Transmitted unicast packets
  - Transmitted multicast packets
  - Transmitted broadcast packets

▶ Number of errors detected by the device
  - Received fragments
  - Detected CRC errors
  - Detected collisions

▶ Number of data packets per size category received on the device
  - Packets 64 bytes
  - Packets 65 to 127 bytes
  - Packets 128 to 255 bytes
  - Packets 256 to 511 bytes
  - Packets 512 to 1023 bytes
  - Packets 1024 to 1518 bytes

▶ Number of data packets discarded by the device
  - Received discards
  - Transmitted discards

To sort the table by a specific criterion click the header of the corresponding row.

For example, to sort the table based on the number of received bytes in ascending order, click the header of the Received octets column once. To sort in descending order, click the header again.

To reset the counter for the port statistics in the table to 0, proceed as follows:
▶ In the Basic Settings > Port dialog, click the button and then the Clear port statistics item.
  or
▶ In the Basic Settings > Restart dialog, click the Clear port statistics button.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Clear port statistics**

Resets the counter for the port statistics to 0.

**[Utilization]**

This tab displays the utilization (network load) for the individual ports.

**Table**

Port

Displays the port number.
Utilization [%]
Displays the current utilization in percent in relation to the time interval specified in the Control interval [s] column.

The utilization is the relationship of the received data quantity to the maximum possible data quantity at the currently configured data rate.

Lower threshold [%]
Specifies a lower threshold for the utilization. If the utilization of the port falls below this value, then the Alarm column displays an alarm.

Possible values:
▶ 0.00..100.00  (default setting: 0.00)

The value 0 deactivates the lower threshold.

Upper threshold [%]
Specifies an upper threshold for the utilization. If the utilization of the port exceeds this value, then the Alarm column displays an alarm.

Possible values:
▶ 0.00..100.00  (default setting: 0.00)

The value 0 deactivates the upper threshold.

Control interval [s]
Specifies the interval in seconds.

Possible values:
▶ 1..3600  (default setting: 30)

Alarm
Displays the utilization alarm status.

Possible values:
▶ marked
  The utilization of the port is below the value specified in the Lower threshold [%] column or above the value specified in the Upper threshold [%] column. The device sends an SNMP trap.
▶ unmarked
  The utilization of the port is above the value specified in the Lower threshold [%] column and below the value specified in the Upper threshold [%] column. The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.
**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Clear port statistics

Resets the counter for the port statistics to 0.
1.7 Restart

This dialog lets you restart the device, reset port counters and address tables, and delete log files.

**Restart**

**Restart in**

Displays the remaining time until the device restarts.

To update the display of the remaining time, click the button.

**Cancel**

Aborts a delayed restart.

**Cold start...**

Opens the Restart dialog to initiate an immediate or delayed restart of the device.

If the configuration profile in the volatile memory (RAM) and the “Selected” configuration profile in the non-volatile memory (NVM) differ, then the device displays the Warning dialog.

- To permanently save the changes, click the Yes button in the Warning dialog.
- To discard the changes, click No in the Warning dialog.

- In the Restart in field you specify the delay time for the delayed restart.
  Possible values:
  - 00:00:00..596:31:23 (default setting: 00:00:00)

When the delay time elapsed, the device restarts and goes through the following phases:

- If you activate the function in the Diagnostics > System > Selftest dialog, then the device performs a RAM test.
- The device starts the device software that the Stored version field displays in the Basic Settings > Software dialog.
- The device loads the settings from the “Selected” configuration profile. See the Basic Settings > Load/Save dialog.

**Note:** During the restart, the device does not transfer any data. During this time, the device cannot be accessed by the Graphical User Interface or other management systems.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Reset MAC address table**

Removes the MAC addresses from the forwarding table that have in the Switching > Filter for MAC Addresses dialog the value learned in the Status column.
Basic Settings

[Basic Settings > Restart]

Reset ARP table

Removes the dynamically set up addresses from the ARP table.

See the Diagnostics > System > ARP dialog.

Clear port statistics

Resets the counter for the port statistics to 0.

See the Basic Settings > Port dialog, Statistics tab.

Reset IGMP snooping data

Removes the IGMP Snooping entries and resets the counter in the Information frame to 0.

See the Switching > IGMP Snooping > Global dialog.

Delete log file

Removes the logged events from the log file.

See the Diagnostics > Report > System Log dialog.

Delete persistent log file

Removes the log files from the external memory.

See the Diagnostics > Report > Persistent Logging dialog.

Clear email notification statistics

Resets the counters in the Information frame to 0.

See the Diagnostics > Email Notification > Global dialog.
2 Time

The menu contains the following dialogs:

- Basic Settings
- SNTP
- PTP

2.1 Basic Settings

The device is equipped with a buffered hardware clock. This clock maintains the correct time if the power supply fails or you disconnect the device from the power supply. After the device is started, the current time is available to you, for example for log entries.

The hardware clock bridges a power supply downtime of 3 hours. The prerequisite is that the power supply of the device has been connected continually for at least 5 minutes beforehand.

In this dialog, you specify time-related settings independently of the time synchronization protocol specified.

The dialog contains the following tabs:

- [Global]
- [Daylight saving time]

[Global]

In this tab, you specify the system time in the device and the time zone.

Configuration

System time (UTC)

Displays the current date and time with reference to Universal Time Coordinated (UTC).

Set time from PC

The device uses the time on the PC as the system time.

System time

Displays the current date and time with reference to the local time: \( \text{System time} = \text{System time (UTC)} + \text{Local offset [min]} + \text{Daylight saving time} \)

Time source

Displays the time source from which the device gets the time information.
The device automatically selects the available time source with the greatest accuracy.

Possible values:

- **local**
  System clock of the device.

- **sntp**
  The **SNTP** client is activated and the device is synchronized by an **SNTP** server.

- **ptp**
  PTP is activated and the clock of the device is synchronized with a **PTP** master clock.

**Local offset [min]**

Specifies the difference between the local time and **System time (UTC)** in minutes: **Local offset [min]** = **System time** − **System time (UTC)**

Possible values:

- **−780..840** (default setting: **60**)

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

[Daylight saving time]

In this tab, you activate the automatic daylight saving time function. You specify the beginning and the end of summertime using a pre-defined profile, or you specify these settings individually. During summertime, the device puts the local time forward by 1 hour.

**Operation**

**Daylight saving time**

Enables/disables the **Daylight saving time** mode.

Possible values:

- **On**
  The **Daylight saving time** mode is enabled.
  The device automatically changes between summertime and wintertime.

- **Off** (default setting)
  The **Daylight saving time** mode is disabled.

The times at which the device changes between summertime and wintertime are specified in the **Summertime begin** and **Summertime end** frames.

**Profile...**

Displays the **Profile...** dialog. There you select a pre-defined profile for the beginning and the end of summertime. This profile overwrites the settings in the **Summertime begin** and **Summertime end** frames.
**Summertime begin**

In the first 3 fields you specify the day for the beginning of summertime, and in the last field the time.

When the time in the *System time* field reaches the value entered here, the device switches to summertime.

**Week**

Specifies the week in the current month.

Possible values:
- `none` (default setting)
- `first`
- `second`
- `third`
- `fourth`
- `last`

**Day**

Specifies the day of the week.

Possible values:
- `none` (default setting)
- `Sunday`
- `Monday`
- `Tuesday`
- `Wednesday`
- `Thursday`
- `Friday`
- `Saturday`

**Month**

Specifies the month.

Possible values:
- `none` (default setting)
- `January`
- `February`
- `March`
- `April`
- `May`
- `June`
- `July`
- `August`
- `September`
- `October`
- `November`
- `December`
**System time**

Specifies the time.

Possible values:
- `<HH:MM>` (default setting: `00:00`)

**Summertime end**

In the first 3 fields you specify the day for the end of summertime, and in the last field the time.

When the time in the *System time* field reaches the value entered here, the device switches to wintertime.

**Week**

Specifies the week in the current month.

Possible values:
- `none` (default setting)
- `first`
- `second`
- `third`
- `fourth`
- `last`

**Day**

Specifies the day of the week.

Possible values:
- `none` (default setting)
- `Sunday`
- `Monday`
- `Tuesday`
- `Wednesday`
- `Thursday`
- `Friday`
- `Saturday`

**Month**

Specifies the month.

Possible values:
- `none` (default setting)
- `January`
- `February`
- `March`
- `April`
System time

Specifies the time.

Possible values:

- `<HH:MM>` (default setting: `00:00`)

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

2.2 SNTP

The Simple Network Time Protocol (SNTP) is a procedure described in the RFC 4330 for time synchronization in the network.

The device lets you synchronize the system time in the device as an SNTP client. As the SNTP server, the device makes the time information available to other devices.

The menu contains the following dialogs:

- SNTP Client
- SNTP Server
2.2.1 SNTP Client

In this dialog, you specify the settings with which the device operates as an SNTP client.

As an SNTP client the device obtains the time information from both SNTP servers and NTP servers and synchronizes the local clock with the time of the time server.

**Operation**

Enables/disables the SNTP Client function of the device.

Possible values:

- **On**
  - The SNTP Client function is enabled.
  - The device operates as an SNTP client.

- **Off** *(default setting)*
  - The SNTP Client function is disabled.

**Configuration**

**Mode**

Specifies whether the device actively requests the time information from an SNTP server known and configured in the network (Unicast mode) or passively waits for the time information from a random SNTP server (Broadcast mode).

Possible values:

- **unicast** *(default setting)*
  - The device takes the time information only from the configured SNTP server. The device sends Unicast requests to the SNTP server and evaluates its responses.

- **broadcast**
  - The device obtains the time information from one or more SNTP or NTP servers. The device evaluates the Broadcasts or Multicasts only from these servers.

**Request interval [s]**

Specifies the interval in seconds at which the device requests time information from the SNTP server.

Possible values:

- **5..3600** *(default setting: 30)*

**Broadcast recv timeout [s]**

Specifies the time in seconds a client in broadcast client mode waits before changing the value in the field from syncToRemoteServer to notSynchronized when the client receives no broadcast packets.
Possible values:

- **128..2048** (default setting: 320)

**Disable client after successful sync**

Activates/deactivates the disabling of the **SNTP** client after the device has successfully synchronized the time.

Possible values:

- **marked**
  - The disabling of the **SNTP** client is active.
  - The device deactivates the **SNTP** client after successful time synchronization.
- **unmarked** (default setting)
  - The disabling of the **SNTP** client is inactive.
  - The **SNTP** client remains active after successful time synchronization.

**State**

Displays the status of the **SNTP** client.

Possible values:

- **disabled**
  - The **SNTP** client is disabled.
- **notSynchronized**
  - The **SNTP** client is not synchronized with any **SNTP** or **NTP** server.
- **synchronizedToRemoteServer**
  - The **SNTP** client is synchronized with an **SNTP** or **NTP** server.

**Table**

In the table you specify the settings for up to 4 **SNTP** servers.

**Index**

Displays the index number to which the table entry relates.

Possible values:

- **1..4**

The device automatically assigns this number.

When you delete a table entry, this leaves a gap in the numbering. When you create a new table entry, the device fills the first gap.
After starting, the device sends requests to the SNTP server configured in the first table entry. When the server does not reply, the device sends its requests to the SNTP server configured in the next table entry.

If none of the configured SNTP servers responds in the meantime, then the SNTP client interrupts its synchronization. The device cyclically sends requests to each SNTP server until a server delivers a valid time. The device synchronizes itself with this SNTP server, even if the other servers can be reached again later.

Name

Specifies the name of the SNTP server.

Possible values:
- Alphanumeric ASCII character string with 1..32 characters

Address

Specifies the IP address of the SNTP server.

Possible values:
- Valid IPv4 address or Hostname (default setting: 0.0.0.0)

Destination UDP port

Specifies the UDP Port on which the SNTP server expects the time information.

Possible values:
- 1..65535 (default setting: 123)
  - Exception: Port 2222 is reserved for internal functions.

Status

Displays the connection status between the SNTP client and the SNTP server.

Possible values:
- success
  - The device has successfully synchronized the time with the SNTP server.
- badDateEncoded
  - The time information received contains protocol errors - synchronization failed.
- other
  - The value 0.0.0.0 is entered for the IP address of the SNTP server - synchronization failed.
  - The SNTP client is using a different SNTP server.
- requestTimedOut
  - The device has not received a reply from the SNTP server - synchronization failed.
- serverKissOfDeath
  - The SNTP server is overloaded. The device is requested to synchronize itself with another SNTP server. When no other SNTP server is available, the device checks at intervals longer than the setting in the Request interval [s] field, if the server is still overloaded.
serverUnsynchronized

The SNTP server is not synchronized with either a local or an external reference time source - synchronization failed.

versionNotSupported

The SNTP versions on the client and the server are incompatible with each other - synchronization failed.

**Active**

Activates/deactivates the connection to the SNTP server.

Possible values:

- **marked**
  
  The connection to the SNTP server is activated.
  The SNTP client has access to the SNTP server.

- **unmarked** (default setting)
  
  The connection to the SNTP server is deactivated.
  The SNTP client has no access to the SNTP server.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
2.2.2 SNTP Server

In this dialog, you specify the settings with which the device operates as an SNTP server.

The SNTP server provides the Universal Time Coordinated (UTC) without considering local time differences.

If the setting is appropriate, then the SNTP server operates in the broadcast mode. In broadcast mode, the SNTP server automatically sends broadcast messages or multicast messages according to the broadcast send interval.

Operation

Enables/disables the SNTP Server function of the device.

Possible values:

- **On**
  - The SNTP Server function is enabled.
  - The device operates as an SNTP server.
- **Off** (default setting)
  - The SNTP Server function is disabled.

Note the setting in the Disable server at local time source checkbox in the Configuration frame.

Configuration

UDP port

Specifies the number of the UDP port on which the SNTP server of the device receives requests from other clients.

Possible values:

- **1..65535** (default setting: 123)
  - Exception: Port 2222 is reserved for internal functions.

Broadcast admin mode

Activates/deactivates the Broadcast mode.

- **marked**
  - The SNTP server replies to requests from SNTP clients in Unicast mode and also sends SNTP packets in Broadcast mode as Broadcasts or Multicasts.
- **unmarked** (default setting)
  - The SNTP server replies to requests from SNTP clients in the Unicast mode.

Broadcast destination address

Specifies the IP address to which the SNTP server of the device sends the SNTP packets in Broadcast mode.
Possible values:
- Valid IPv4 address  (default setting: 0.0.0.0)

Broadcast and Multicast addresses are permitted.

Broadcast UDP port

Specifies the number of the UDP port on which the SNTP server sends the SNTP packets in Broadcast mode.

Possible values:
- 1..65535  (default setting: 123)
  Exception: Port 2222 is reserved for internal functions.

Broadcast VLAN ID

Specifies the ID of the VLAN in which the SNTP server of the device sends the SNTP packets in Broadcast mode.

Possible values:
- 0
  The SNTP server sends the SNTP packets in the same VLAN in which the access to the device management is possible. See the Basic Settings > Network dialog.
- 1..4042  (default setting: 1)

Broadcast send interval [s]

Specifies the time interval at which the SNTP server of the device sends SNTP broadcast packets.

Possible values:
- 64..1024  (default setting: 128)

Disable server at local time source

Activates/deactivates the disabling of the SNTP server when the device is synchronized to the local clock.

Possible values:
- marked
  The disabling of the SNTP server is active.
  If the device is synchronized to the local clock, then the device disables the SNTP server. The SNTP server continues to reply to requests from SNTP clients. In the SNTP packet, the SNTP server informs the clients that it is synchronized locally.
- unmarked  (default setting)
  The disabling of the SNTP server is inactive.
  If the device is synchronized to the local clock, then the SNTP server remains active.

State

Displays the state of the SNTP server.
Possible values:

- **disabled**
  The SNTP server is disabled.

- **notSynchronized**
  The SNTP server is not synchronized with either a local or an external reference time source.

- **syncToLocal**
  The SNTP server is synchronized with the hardware clock of the device.

- **syncToRefclock**
  The SNTP server is synchronized with an external reference time source, for example PTP.

- **syncToRemoteServer**
  The SNTP server is synchronized with an SNTP server that is higher than the device in a cascade.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

---

### 2.3 PTP

The menu contains the following dialogs:

- **PTP Global**
- **PTP Boundary Clock**
- **PTP Transparent Clock**
2.3.1 PTP Global

In this dialog, you specify basic settings for the PTP protocol.

The Precision Time Protocol (PTP) is a procedure described in the IEEE 1588-2008 standard that supplies the devices in the network with a precise time. The method synchronizes the clocks in the network with a precision of a few 100 ns. The protocol uses Multicast communication, so the load on the network due to the PTP synchronization messages is negligible.

PTP is significantly more accurate than SNTP. If the SNTP function and the PTP function are enabled in the device at the same time, then the PTP function has priority.

With the Best Master Clock Algorithm, the devices in the network determine which device has the most accurate time. The devices use the device with the most accurate time as the reference time source (Grandmaster). Subsequently the participating devices synchronize themselves with this reference time source.

If you want to transport PTP time accurately through your network, then use only devices with PTP hardware support on the transport paths.

The protocol differentiates between the following clocks:

- **Boundary Clock (BC)**
  This clock has any number of PTP ports and operates as both PTP master and PTP slave. In its respective network segment, the clock operates as an Ordinary Clock.
  - As PTP slave, the clock synchronizes itself with a PTP master that is higher than the device in the cascade.
  - As PTP master, the clock forwards the time information via the network to PTP slaves that are higher than the device in the cascade.

- **Transparent Clock (TC)**
  This clock has any number of PTP ports. In contrast to the Boundary Clock, this clock corrects the time information before forwarding it, without synchronizing itself.

**Operation IEEE1588/PTP**

Enables/disables the PTP function.

Possible values:

- **On**
  The PTP function is enabled.
  The device synchronizes its clock with PTP.
  If the SNTP function and the PTP function are enabled in the device at the same time, then the PTP function has priority.

- **Off** (default setting)
  The PTP function is disabled.
  The device transmits the PTP synchronization messages without any correction on every port.
Configuration IEEE1588/PTP

PTP mode

Specifies the PTP version and mode of the local clock.

Possible values:
- v2-transparent-clock (default setting)
- v2-boundary-clock

Sync lower bound [ns]

Specifies the lower threshold value in nanoseconds for the path difference between the local clock and the reference time source (Grandmaster). If the path difference falls below this value once, then the local clock is classed as synchronized.

Possible values:
- 0..999999999 (default setting: 30)

Sync upper bound [ns]

Specifies the upper threshold value in nanoseconds for the path difference between the local clock and the reference time source (Grandmaster). If the path difference exceeds this value once, then the local clock is classed as unsynchronized.

Possible values:
- 31..1000000000 (default setting: 5000)

PTP management

Activates/deactivates the PTP management defined in the PTP standard.

Possible values:
- marked
  PTP management is activated.
- unmarked (default setting)
  PTP management is deactivated.

Status

Is synchronized

Displays whether the local clock is synchronized with the reference time source (Grandmaster).

If the path difference between the local clock and the reference time source (Grandmaster) falls below the synchronization lower threshold one time, then the local clock is synchronized. This status is kept until the path difference exceeds the synchronization upper threshold one time.

You specify the synchronization thresholds in the Configuration IEEE1588/PTP frame.
Max. offset absolute [ns]

Displays the maximum path difference in nanoseconds that has occurred since the local clock was synchronized with the reference time source (Grandmaster).

PTP time

Displays the date and time for the PTP time scale when the local clock is synchronized with the reference time source (Grandmaster). Format: Month Day, Year hh:mm:ss AM/PM

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

2.3.2 PTP Boundary Clock

With this menu you can configure the Boundary Clock mode for the local clock.

The menu contains the following dialogs:
► PTP Boundary Clock Global
► PTP Boundary Clock Port
2.3.2.1 PTP Boundary Clock Global

In this dialog, you enter general, cross-port settings for the Boundary Clock mode for the local clock. The Boundary Clock (BC) operates according to PTP version 2 (IEEE 1588-2008).

The settings are effective when the local clock operates as the Boundary Clock (BC). For this, you select in the Time > PTP > Global dialog in the PTP mode field the value v2-boundary-clock.

Operation IEEE1588/PTPv2 BC

Priority 1

Specifies priority 1 for the device.

Possible values:

- 0..255 (default setting: 128)

The Best Master Clock Algorithm first evaluates priority 1 among the participating devices in order to determine the reference time source (Grandmaster).

The lower you set this value, the more probable it is that the device becomes the reference time source (Grandmaster). See the Grandmaster frame.

Priority 2

Specifies priority 2 for the device.

Possible values:

- 0..255 (default setting: 128)

When the previously evaluated criteria are the same for multiple devices, the Best Master Clock Algorithm evaluates priority 2 of the participating devices.

The lower you set this value, the more probable it is that the device becomes the reference time source (Grandmaster). See the Grandmaster frame.

Domain number

Assigns the device to a PTP domain.

Possible values:

- 0..255 (default setting: 0)

The device transmits time information from and to devices only in the same domain.

Status IEEE1588/PTPv2 BC

Two step

Displays that the clock is operating in Two-Step mode.
Steps removed

Displays the number of communication paths passed through between the local clock of the device and the reference time source (Grandmaster).

For a PTP slave, the value 1 means that the clock is connected with the reference time source (Grandmaster) directly through 1 communication path.

Offset to master [ns]

Displays the measured difference (offset) between the local clock and the reference time source (Grandmaster) in nanoseconds. The PTP slave calculates the difference from the time information received.

In Two-Step mode the time information consists of 2 PTP synchronization messages each, which the PTP master sends cyclically:

- The first synchronization message (sync message) contains an estimated value for the exact sending time of the message.
- The second synchronization message (follow-up message) contains the exact sending time of the first message.

The PTP slave uses the two PTP synchronization messages to calculate the difference (offset) from the master and corrects its clock by this difference. Here the PTP slave also considers the Delay to master [ns] value.

Delay to master [ns]

Displays the delay when transmitting the PTP synchronization messages from the PTP master to the PTP slave in nanoseconds.

The PTP slave sends a “Delay Request” packet to the PTP master and thus determines the exact sending time of the packet. When it receives the packet, the PTP master generates a time stamp and sends this in a “Delay Response” packet back to the PTP slave. The PTP slave uses the two packets to calculate the delay, and considers this starting from the next offset measurement.

The prerequisite is that the delay mechanism value of the slave ports is specified as e2e.

Grandmaster

This frame displays the criteria that the Best Master Clock Algorithm uses when evaluating the reference time source (Grandmaster).

The algorithm first evaluates priority 1 of the participating devices. The device with the lowest value for priority 1 is designated as the reference time source (Grandmaster). When the value is the same for multiple devices, the algorithm takes the next criterion, and when this is also the same, the algorithm takes the next criterion after this one. When every value is the same for multiple devices, the lowest value in the Clock identity field decides which device is designated as the reference time source (Grandmaster).

The device lets you influence which device in the network is designated as the reference time source (Grandmaster). To do this, modify the value in the Priority 1 field or the Priority 2 field in the Operation IEEE1588/PTPv2 BC frame.

Priority 1

Displays priority 1 for the device that is currently the reference time source (Grandmaster).
Clock class

Displays the class of the reference time source (Grandmaster). Parameter for the Best Master Clock Algorithm.

Clock accuracy

Displays the estimated accuracy of the reference time source (Grandmaster). Parameter for the Best Master Clock Algorithm.

Clock variance

Displays the variance of the reference time source (Grandmaster), also known as the Offset scaled log variance. Parameter for the Best Master Clock Algorithm.

Priority 2

Displays priority 2 for the device that is currently the reference time source (Grandmaster).

Local time properties

Time source

Specifies the time source from which the local clock gets its time information.

Possible values:

- atomicClock
- gps
- terrestrialRadio
- ptp
- ntp
- handSet
- other
- internalOscillator (default setting)

UTC offset [s]

Specifies the difference between the PTP time scale and the UTC.

See the PTP timescale checkbox.

Possible values:

- -32768..32767

Note: The default setting is the value valid on the creation date of the device software. You can find further information in the "Bulletin C" of the Earth Rotation and Reference Systems Service (IERS): http://www.iers.org/IERS/EN/Publications/Bulletins/bulletins.html

UTC offset valid

Specifies whether the value specified in the UTC offset [s] field is correct.
Possible values:
- marked
- unmarked (default setting)

**Time traceable**

Displays whether the device gets the time from a primary UTC reference, for example from an NTP server.

Possible values:
- marked
- unmarked

**Frequency traceable**

Displays whether the device gets the frequency from a primary UTC reference, for example from an NTP server.

Possible values:
- marked
- unmarked

**PTP timescale**

Displays whether the device uses the PTP time scale.

Possible values:
- marked
- unmarked

According to IEEE 1588, the PTP time scale is the TAI atomic time started on 01.01.1970. In contrast to UTC, TAI does not use leap seconds.

On 01.01.2017, the difference between TAI and UTC was +37 seconds.

**Identities**

The device displays the identities as byte sequences in hexadecimal notation.

The identification numbers (UUID) are made up as follows:
- The device identification number consists of the MAC address of the device, with the values ff and fe added between byte 3 and byte 4.
- The port UUID consists of the device identification number followed by a 16-bit port ID.

**Clock identity**

Displays the device’s own identification number (UUID).

**Parent port identity**

Displays the port identification number (UUID) of the directly superior master device.
Grandmaster identity

Displays the identification number (UUID) of the reference time source (Grandmaster) device.

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.
2.3.2.2 PTP Boundary Clock Port

In this dialog, you specify the Boundary Clock (BC) settings on each individual port.

The settings are effective when the local clock operates as the Boundary Clock (BC). For this, you select in the Time > PTP > Global dialog in the PTP mode field the value v2-boundary-clock.

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PTP enable</td>
<td>Activates/deactivates PTP synchronization message transmission on the port.</td>

<td>PTP uncalibrated mode</td>
</tr>
<tr>
<td>slave</td>
<td>PTP slave mode</td>
</tr>
<tr>
<td>Sync interval</td>
<td>Specifies the interval in seconds at which the port transmits PTP synchronization messages.</td>
</tr>
</tbody>
</table>
Possible values:

- 0.25
- 0.5
- 1  (default setting)
- 2

Delay mechanism

Specifies the mechanism with which the device measures the delay for transmitting the PTP synchronization messages.

Possible values:

- **disabled**
  The measurement of the delay for the PTP synchronization messages for the connected PTP devices is inactive.
- **e2e** (default setting)
  End-to-End: As the PTP slave, the port measures the delay for the PTP synchronization messages to the PTP master.
  The device displays the measured value in the Time > PTP > Boundary Clock > Global dialog.
- **p2p**
  Peer-to-Peer: The device measures the delay for the PTP synchronization messages for the connected PTP devices, provided that these devices support P2P.
  This mechanism saves the device from having to determine the delay again in the case of a reconfiguration.

P2P delay

Displays the measured Peer-to-Peer delay for the PTP synchronization messages.

The prerequisite is that you select the value `p2p` in the Delay mechanism column.

P2P delay interval [s]

Specifies the interval in seconds at which the port measures the Peer-to-Peer delay.

The prerequisite is that you have specified the value `p2p` on this port and on the port of the remote device.

Possible values:

- 1  (default setting)
- 2
- 4
- 8
- 16
- 32

Network protocol

Specifies which protocol the port uses to transmit the PTP synchronization messages.

Possible values:

- **IEEE 802.3** (default setting)
- **UDP/IPv4**
Announce interval [s]

Specifies the interval in seconds at which the port transmits messages for the PTP topology discovery.

Assign the same value to every device of a PTP domain.

Possible values:
- 1
- 2 (default setting)
- 4
- 8
- 16

Announce timeout

Specifies the number of announce intervals.

Example:

For the default setting (Announce interval [s] = 2 and Announce timeout = 3), the timeout is 3 ∙ 2 s = 6 s.

Possible values:
- 2..10 (default setting: 3)
  - Assign the same value to every device of a PTP domain.

E2E delay interval [s]

Displays the interval in seconds at which the port measures the End-to-End delay:

- When the port is operating as the PTP master, the device assigns to the port the value 8.
- When the port is operating as the PTP slave, the value is specified by the PTP master connected to the port.

V1 hardware compatibility

Specifies whether the port adjusts the length of the PTP synchronization messages when you have set in the Network protocol column the value udpIpv4.

It is possible that other devices in the network expect the PTP synchronization messages to be the same length as PTPv1 messages.

Possible values:
- auto (default setting)
  - The device automatically detects whether other devices in the network expect the PTP synchronization messages to be the same length as PTPv1 messages. If this is the case, then the device extends the length of the PTP synchronization messages before transmitting them.
- on
  - The device extends the length of the PTP synchronization messages before transmitting them.
- off
  - The device transmits PTP synchronization messages without changing the length.

Asymmetry

Corrects the measured delay value corrupted by asymmetrical transmission paths.
Possible values:

-2000000000..2000000000 (default setting: 0)

The value represents the delay symmetry in nanoseconds.

A measured delay value of x ns corresponds to an asymmetry of x⋅2 ns.

The value is positive if the delay from the PTP master to the PTP slave is longer than in the opposite direction.

**VLAN**

Specifies the VLAN ID with which the device marks the PTP synchronization messages on this port.

Possible values:

- none (default setting)
  - The device transmits PTP synchronization messages without a VLAN tag.
- 0..4042
  - You specify VLANs that you have already set up in the device from the list.

Verify that the port is a member of the VLAN.

See the Switching > VLAN > Configuration dialog.

**VLAN priority**

Specifies the priority with which the device transmits the PTP synchronization messages marked with a VLAN ID (Layer 2, IEEE 802.1D).

Possible values:

- 0..7 (default setting: 4)

If you specified in the VLAN column the value none, then the device ignores the VLAN priority.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

### 2.3.3 PTP Transparent Clock

With this menu you can configure the Transparent Clock mode for the local clock.

The menu contains the following dialogs:

- PTP Transparent Clock Global
- PTP Transparent Clock Port
2.3.3.1 PTP Transparent Clock Global

In this dialog, you enter general, cross-port settings for the Transparent Clock mode for the local clock. The Transparent Clock (TC) operates according to PTP version 2 (IEEE 1588-2008).

The settings are effective when the local clock operates as the Transparent Clock (TC). For this, you select in the Time > PTP > Global dialog in the PTP mode field the value v2-transparent-clock.

Operation IEEE1588/PTPv2 TC

Delay mechanism

Specifies the mechanism with which the device measures the delay for transmitting the PTP synchronization messages.

Possible values:
- **e2e** (default setting)
  As the PTP slave, the port measures the delay for the PTP synchronization messages to the PTP master.
  The device displays the measured value in the Time > PTP > Transparent Clock > Global dialog.
- **p2p**
  The device measures the delay for the PTP synchronization messages for every connected PTP device, provided that the device supports P2P.
  This mechanism saves the device from having to determine the delay again in the case of a reconfiguration.
  If you specify this value, then the value IEEE 802.3 is only available in the Network protocol field.
- **e2e-optimized**
  Like e2e, with the following special characteristics:
  - The device transmits the delay requests of the PTP slaves only to the PTP master, even though these requests are multicast messages. The device thus spares the other devices from unnecessary multicast requests.
  - If the master-slave topology changes, then the device relearns the port for the PTP master as soon as it receives a synchronization message from another PTP master.
  - If the device does not know a PTP master, then the device transmits delay requests to the ports.
- **disabled**
  The delay measuring is disabled on the port. The device discards messages for the delay measuring.

Primary domain

Assigns the device to a PTP domain.

Possible values:
- **0..255** (default setting: 0)

The device transmits time information from and to devices only in the same domain.

Network protocol

Specifies which protocol the port uses to transmit the PTP synchronization messages.
Time
[Time > PTP > Transparent Clock > Global]

Possible values:
- ieee8023 (default setting)
- udpIpv4

Multi domain mode

Activates/deactivates the PTP synchronization message correction in every PTP domain.

Possible values:
- marked
  The device corrects PTP synchronization messages in every PTP domain.
- unmarked (default setting)
  The device corrects PTP synchronization messages only in the primary PTP domain. See the Primary domain field.

VLAN ID

Specifies the VLAN ID with which the device marks the PTP synchronization messages on this port.

Possible values:
- none (default setting)
  The device transmits PTP synchronization messages without a VLAN tag.
- 0..4042
  You specify VLANs that you have already set up in the device from the list.

VLAN priority

Specifies the priority with which the device transmits the PTP synchronization messages marked with a VLAN ID (Layer 2, IEEE 802.1D).

Possible values:
- 0..7 (default setting: 4)

If you specified the value none in the VLAN ID field, then the device ignores the specified value.

Local synchronization

Syntonize

Activates/deactivates the frequency synchronization of the Transparent Clock with the PTP master.

Possible values:
- marked (default setting)
  The frequency synchronization is active.
  The device synchronizes the frequency.
- unmarked
  The frequency synchronization is inactive.
  The frequency remains constant.

Synchronize local clock

Activates/deactivates the synchronization of the local system time.
Possible values:

- **marked**
  - The synchronization is active.
  - The device synchronizes the local system time with the time received via PTP. The prerequisite is that the *Synchronize* checkbox is marked.

- **unmarked** (default setting)
  - The synchronization is inactive.
  - The local system time remains constant.

**Current master**

Displays the port identification number (UUID) of the directly superior master device on which the device synchronizes its frequency.

If the value contains only zeros, this is because:

- The *Synchronize* function is disabled.
- or
- The device cannot find a PTP master.

**Offset to master [ns]**

Displays the measured difference (offset) between the local clock and the PTP master in nanoseconds. The device calculates the difference from the time information received.

The prerequisite is that the *Synchronize local clock* function is enabled.

**Delay to master [ns]**

Displays the delay when transmitting the PTP synchronization messages from the PTP master to the PTP slave in nanoseconds.

Prerequisite:

- The *Synchronize local clock* function is enabled.
- In the *Delay mechanism* field, the value e2e is selected.

**Status IEEE1588/PTPv2 TC**

**Clock identity**

Displays the device's own identification number (UUID).

The device displays the identities as byte sequences in hexadecimal notation.

The device identification number consists of the MAC address of the device, with the values ff and fe added between byte 3 and byte 4.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
2.3.3.2 PTP Transparent Clock Port

In this dialog, you specify the Transparent Clock (TC) settings on each individual port.

The settings are effective when the local clock operates as the Transparent Clock (TC). For this, you select in the Time > PTP > Global dialog in the PTP mode field the value v2-transparent-clock.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PTP enable</td>
<td>Activates/deactivates the transmitting of PTP synchronization messages on the port.</td>
</tr>
<tr>
<td>P2P delay interval [s]</td>
<td>Specifies the interval in seconds at which the port measures the Peer-to-Peer delay.</td>
</tr>
<tr>
<td>P2P delay</td>
<td>Displays the measured Peer-to-Peer delay for the PTP synchronization messages.</td>
</tr>
<tr>
<td>Asymmetry</td>
<td>Corrects the measured delay value corrupted by asymmetrical transmission paths.</td>
</tr>
</tbody>
</table>

Possible values:

- **marked** (default setting)
  - The transmitting is active.
  - The port forwards and receives PTP synchronization messages.

- **unmarked**
  - The transmitting is inactive.
  - The port blocks PTP synchronization messages.

Possible values:

- 1 (default setting)
- 2
- 4
- 8
- 16
- 32
Possible values:

- $-2000000000 \ldots 2000000000$ (default setting: 0)

The value represents the delay symmetry in nanoseconds.

A measured delay value of $x$ ns corresponds to an asymmetry of $x \cdot 2$ ns.

The value is positive if the delay from the PTP master to the PTP slave is longer than in the opposite direction.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
3 Device Security

The menu contains the following dialogs:
- User Management
- Authentication List
- LDAP
- Management Access
- Pre-login Banner

3.1 User Management

If users log in with valid login data, then the device lets them have access to its device management.

In this dialog you manage the users of the local user management. You also specify the following settings here:
- Settings for the login
- Settings for saving the passwords
- Specify policy for valid passwords

The methods that the device uses for the authentication you specify in the Device Security > Authentication List dialog.

Configuration

This frame lets you specify settings for the login.

Login attempts

Number of login attempts possible.

Possible values:
- 0..5 (default setting: 0)

If the user makes one more unsuccessful login attempt, then the device locks access for the user.

The device lets only users with the administrator authorization remove the lock.

The value 0 deactivates the lock. The user has unlimited attempts to login.

Login attempts period

Displays the time period before the device resets the counter in the Login attempts field.

Possible values:
- 0..60 (default setting: 0)
Min. password length

The device accepts the password if it contains at least the number of characters specified here.

The device checks the password according to this setting, regardless of the setting for the Policy check checkbox.

Possible values:
▸ 1..64 (default setting: 6)

Password policy

This frame lets you specify the policy for valid passwords. The device checks every new password and password change according to this policy.

The settings effect the Password column. The prerequisite is that you mark the checkbox in the Policy check column.

Upper-case characters (min.)

The device accepts the password if it contains at least as many upper-case letters as specified here.

Possible values:
▸ 0..16 (default setting: 1)

The value 0 deactivates this setting.

Lower-case characters (min.)

The device accepts the password if it contains at least as many lower-case letters as specified here.

Possible values:
▸ 0..16 (default setting: 1)

The value 0 deactivates this setting.

Digits (min.)

The device accepts the password if it contains at least as many numbers as specified here.

Possible values:
▸ 0..16 (default setting: 1)

The value 0 deactivates this setting.

Special characters (min.)

The device accepts the password if it contains at least as many special characters as specified here.
Device Security

[Device Security > User Management]

Possible values:
▶ 0..16 (default setting: 1)

The value 0 deactivates this setting.

Table

Every user requires an active user account to gain access to the device management. The table lets you set up and manage user accounts.

To change settings, click the desired parameter in the table and modify the value.

User name

Displays the name of the user account.

To create a new user account, click the button.

Active

Activates/deactivates the user account.

Possible values:
▶ marked
   The user account is active. The device accepts the login of a user with this user name.
▶ unmarked (default setting)
   The user account is inactive. The device rejects the login of a user with this user name.

When one user account exists with the administrator access role, this user account is constantly active.

Password

Displays ***** (asterisks) instead of the password with which the user logs in. To change the password, click the relevant field.

Possible values:
▶ Alphanumeric ASCII character string with 6..64 characters
   The following characters are allowed:
   - a..z
   - A..Z
   - 0..9
   - !#$%&'()*+,-./:;<=>?@[\]^_`{}~

The minimum length of the password is specified in the Configuration frame. The device differentiates between upper and lower case.

If the checkbox in the Policy check column is marked, then the device checks the password according to the policy specified in the Password policy frame.

The device constantly checks the minimum length of the password, even if the checkbox in the Policy check column is unmarked.
Role

Specifies the user role that regulates the access of the user to the individual functions of the device.

Possible values:

- **unauthorized**
  The user is blocked, and the device rejects the user log on. Assign this value to temporarily lock the user account. If the device detects an error when another role is being assigned, then the device assigns this role to the user account.

- **guest** (default setting)
  The user is authorized to monitor the device.

- **auditor**
  The user is authorized to monitor the device and to save the log file in the Diagnostics > Report > Audit Trail dialog.

- **operator**
  The user is authorized to monitor the device and to change the settings – with the exception of security settings for device access.

- **administrator**
  The user is authorized to monitor the device and to change the settings.

The device assigns the Service Type transferred in the response of a RADIUS server as follows to a user role:

- Administrative-User: administrator
- Login-User: operator
- NAS-Prompt-User: guest

User locked

Unlocks the user account.

Possible values:

- **marked**
  The user account is locked. The user has no access to the device management. If the user makes too many unsuccessful log in attempts, then the device automatically locks the user.

- **unmarked** (grayed out) (default setting)
  The user account is unlocked. The user has access to the device management.

Policy check

Activates/deactivates the password check.

Possible values:

- **marked**
  The password check is activated. When you set up or change the password, the device checks the password according to the policy specified in the Password policy frame.

- **unmarked** (default setting)
  The password check is deactivated.

SNMP auth type

Specifies the authentication protocol that the device applies for user access via SNMPv3.
Possible values:

- **hmacmd5**  (default value)
  For this user account, the device uses protocol HMACMD5.

- **hmacsha**
  For this user account, the device uses protocol HMACSHA.

### SNMP encryption type

Specifies the encryption protocol that the device applies for user access via SNMPv3.

Possible values:

- **none**
  No encryption.

- **des**  (default value)
  DES encryption

- **aesCfb128**
  AES128 encryption

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

![Create](x)

Opens the **Create** window to add a new entry to the table.

- In the **User name** field, you specify the name of the user account.
  Possible values:
  - Alphanumeric ASCII character string with 1..32 characters
3.2 Authentication List

In this dialog you manage the authentication lists. In an authentication list you specify which method the device uses for the authentication. You also have the option to assign pre-defined applications to the authentication lists.

If users log in with valid login data, then the device lets them have access to its device management. The device authenticates the users using the following methods:

- User management of the device
- LDAP
- RADIUS

With the port-based access control according to IEEE 802.1X, if connected end devices log in with valid login data, then the device lets them have access to the network. The device authenticates the end devices using the following methods:

- RADIUS
- IAS (Integrated Authentication Server)

In the default setting the following authentication lists are available:

- defaultDot1x8021AuthList
- defaultLoginAuthList
- defaultV24AuthList

Table

**Note:** If the table does not contain a list, then the access to the device management is only possible using the Command Line Interface through the serial interface of the device. In this case, the device authenticates the user by using the local user management. See the Device Security > User Management dialog.

<table>
<thead>
<tr>
<th>Name</th>
<th>Displays the name of the list.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>To create a new list, click the button.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>Alphanumeric ASCII character string with 1..32 characters</td>
</tr>
</tbody>
</table>

Policy 1
Policy 2
Policy 3
Policy 4
Policy 5

Specifies the authentication policy that the device uses for access using the application specified in the Dedicated applications column.

The device gives you the option of a fall-back solution. For this, you specify another policy in each of the policy fields. If the authentication with the specified policy is unsuccessful, then the device can use the next policy, depending on the order of the values entered in each policy.
Possible values:

- **local** (default setting)
  The device authenticates the users by using the local user management. See the [Device Security > User Management](#) dialog.
  You cannot assign this value to the authentication list `defaultDot1x8021AuthList`.

- **radius**
  The device authenticates the users with a RADIUS server in the network. You specify the RADIUS server in the [Network Security > RADIUS > Authentication Server](#) dialog.

- **reject**
  The device accepts or rejects the authentication depending on which policy you try first. The following list contains authentication scenarios:
  - If the first policy in the authentication list is `local` and the device accepts the credentials of the user, then it logs the user in without attempting the other policies.
  - If the first policy in the authentication list is `local` and the device denies the credentials of the user, then it attempts to log the user in using the other policies in the order specified.
  - If the first policy in the authentication list is `radius` or `ldap` and the device rejects a login, then the login is immediately rejected without attempting to login the user using another policy.
    If there is no response from the RADIUS or LDAP server, then the device attempts to authenticate the user with the next policy.
  - If the first policy in the authentication list is `reject`, then the devices immediately rejects the user login without attempting another policy.
  - Verify that the authentication list `defaultV24AuthList` contains at least one policy different from `reject`.

- **ias**
  The device authenticates the end devices logging in via 802.1X with the integrated authentication server (IAS). The integrated authentication server manages the log in data in a separate database. See the [Network Security > 802.1X Port Authentication > Integrated Authentication Server](#) dialog.
  You can only assign this value to the authentication list `defaultDot1x8021AuthList`.

- **ldap**
  The device authenticates the users with authentication data and access role saved in a central location. You specify the Active Directory server that the device uses in the [Network Security > LDAP > Configuration](#) dialog.

**Dedicated applications**

Displays the dedicated applications. When users access the device with the relevant application, the device uses the specified policies for the authentication.

To allocate another application to the list or remove the allocation, click the button and then the **Allocate applications** item. The device lets you assign each application to exactly one list.

**Active**

Activates/deactivates the list.

Possible values:

- **marked**
  The list is activated. The device uses the policies in this list when users access the device with the relevant application.

- **unmarked** (default setting)
  The list is deactivated.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Allocate applications

Opens the Allocate applications window.
- The left field displays the applications that can be allocated to the highlighted list.
- The right field displays the applications that are allocated to the highlighted list.
- Buttons:
  - Moves every entry to the right field.
  - Moves the highlighted entries from the left field to the right field.
  - Moves the highlighted entries from the right field to the left field.
  - Moves every entry to the left field.

Note: When you move the entry WebInterface to the left field, the connection to the device is lost, after you click the Ok button.

3.3 LDAP

The Lightweight Directory Access Protocol (LDAP) lets you authenticate and authorize the users at a central point in the network. A widely used directory service accessible through LDAP is Active Directory®.

The device forwards the log in data of the user to the authentication server using the LDAP protocol. The authentication server decides whether the login data is valid and transfers the user’s authorizations to the device.

Upon successful log on, the device saves the log on data temporarily in the cache. This speeds up the logon process when users logon again. In this case, no complex LDAP search operation is necessary.

The menu contains the following dialogs:
- LDAP Configuration
- LDAP Role Mapping
3.3.1 LDAP Configuration

This dialog lets you specify up to 4 authentication servers. An authentication server authenticates and authorizes the users when the device forwards the login data to the server.

The device sends the log on data to the first authentication server. When no response comes from this server, the device contacts the next server in the table.

**Operation**

Enables/disables the [LDAP](https://www.example.com) client.

If in the Device Security > Authentication List dialog you specify the value `ldap` in 1 of the rows Policy 1 to Policy 5, then the device uses the LDAP client. Prior to this, specify in the Device Security > LDAP > Role Mapping dialog at least 1 Mapping for this role `administrator`. This provides you access to the device as administrator after logging on through LDAP.

Possible values:

- **On**
  - The LDAP client is enabled.

- **Off** (default setting)
  - The LDAP client is disabled.

**Configuration**

**Client cache timeout [min]**

Specifies for how many minutes after successfully logging on the logon data of a user remain valid. When a user logs on again within this time, no complex LDAP search operation is necessary. The logon process is much faster.

Possible values:

- **1..1440** (default setting: 10)

**Bind user**

Specifies the user ID in the form of the “Distinguished Name” (DN) with which the device logs on to the LDAP server.

If the LDAP server requires a user ID in the form of the “Distinguished Name” (DN) for the log on, then this information is necessary. In Active Directory environments, this information is unnecessary.

The device logs on to the LDAP server with the user ID to find the “Distinguished Name” (DN) for the users logging on. The device conducts the search according to the settings in the fields Base DN and User name attribute.
Possible values:
> Alphanumeric ASCII character string with 0..64 characters

Bind user password

Specifies the password which the device uses together with the user ID specified in the Bind user field when logging on to the LDAP server.

Possible values:
> Alphanumeric ASCII character string with 0..64 characters

Base DN

Specifies the starting point for the search in the directory tree in the form of the “Distinguished Name” (DN).

Possible values:
> Alphanumeric ASCII character string with 0..255 characters

User name attribute

Specifies the LDAP attribute which contains a biunique user name. Afterwards, the user uses the user name contained in this attribute to log on.

Often the LDAP attributes userPrincipalName, mail, sAMAccountName and uid contain a unique user name.

The device adds the character string specified in the Default domain field to the user name under the following condition:
- The user name contained in the attribute does not contain the @ character.
- In the Default domain field, a domain name is specified.

Possible values:
> Alphanumeric ASCII character string with 0..64 characters
  (default setting: userPrincipalName)

Default domain

Specifies the character string which the device adds to the user name of the users logging on if the user name does not contain the @ character.

Possible values:
> Alphanumeric ASCII character string with 0..64 characters

**CA certificate**

URL

Specifies the path and file name of the certificate.
The device accepts certificates with the following properties:
- X.509 format
- .PEM file name extension
- Base64-coded, enclosed by
  
  ----BEGIN CERTIFICATE-----
  
  and
  
  ----END CERTIFICATE-----

For security reasons, we recommend to constantly use a certificate which is signed by a certification authority.

The device gives you the following options for copying the certificate to the device:

- Import from the PC
  When the certificate is located on your PC or on a network drive, drag and drop the certificate in the area. Alternatively click in the area to select the certificate.

- Import from an FTP server
  When the certificate is on an FTP server, specify the URL for the file in the following form:
  
  ftp://<user>:<password>@<IP address>:<port>/<path>/<file name>

- Import from a TFTP server
  When the certificate is on a TFTP server, specify the URL for the file in the following form:
  
  tftp://<IP address>/<path>/<file name>

- Import from an SCP or SFTP server
  When the certificate is on an SCP or SFTP server, specify the URL for the file in the following form:
  
  – scp:// or sftp://<IP address>/<path>/<file name>
  
  When you click the Start button, the device displays the Credentials window. There you enter User name and Password, to log on to the server.
  
- scp:// or sftp://<user>:<password>@<IP address>/<path>/<file name>

Start

Copies the certificate specified in the URL field to the device.

Table

Index

Displays the index number to which the table entry relates.

Description

Specifies the description.

You have the option to describe here the authentication server or note additional information.

Possible values:

- Alphanumeric ASCII character string with 0..255 characters

Address

Specifies the IP address or the DNS name of the server.
Possible values:
► IPv4 address  (default setting: 0.0.0.0)
► DNS name in the format \textless domain\textgreater .\textless tld\textgreater  or \textless host\textgreater .\textless domain\textgreater .\textless tld\textgreater 
► _ldap._tcp.<domain>.<tld>

Using this DNS name, the device queries the LDAP server list (SRV Resource Record) from the DNS server.

If in the Connection security row a value other than none is specified and the certificate contains only DNS names of the server, then use a DNS name. Enable the Client function in the Advanced > DNS > Client > Global dialog.

Destination TCP port

Specifies the TCP Port on which the server expects the requests.

If you have specified the value \textless _ldap._tcp.domain.tld\textgreater  in the Address column, then the device ignores this value.

Possible values:
► 0..65535  (default setting: 389)

Exception: Port 2222 is reserved for internal functions.

Frequently used TCP-Ports:
• LDAP: 389
• LDAP over SSL: 636
• Active Directory Global Catalogue: 3268
• Active Directory Global Catalogue SSL: 3269

Connection security

Specifies the protocol which encrypts the communication between the device and the authentication server.

Possible values:
► none

No encryption. The device establishes an LDAP connection to the server and transmits the communication including the passwords in clear text.

► ssl

Encryption with SSL. The device establishes a TLS connection to the server and tunnels the LDAP communication over it.

► startTLS  (default setting)

Encryption with startTLS extension. The device establishes an LDAP connection to the server and encrypts the communication.

The prerequisite for encrypted communication is that the device uses the correct time. If the certificate contains only the DNS names, then you specify the DNS name of the server in the Address row. Enable the Client function in the Advanced > DNS > Client > Global dialog.

If the certificate contains the IP address of the server in the “Subject Alternative Name” field, then the device is able to verify the identity of the server without the DNS configuration.
Server status

Displays the connection status and the authentication with the authentication server.

Possible values:

- **ok**
  - The server is reachable.
  - If in the *Connection security* row a value other than *none* is specified, then the device has verified the certificate of the server.

- **unreachable**
  - Server is unreachable.

- **other**
  - The device has not established a connection to the server yet.

Active

Activates/deactivates the use of the server.

Possible values:

- **marked**
  - The device uses the server.

- **unmarked** (default setting)
  - The device does not use the server.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Flush cache

Removes the cached log on data of the successfully logged on users.
3.3.2 LDAP Role Mapping

This dialog lets you create up to 64 mappings to assign a role to users.

In the table, you specify whether the device assigns a role to the user based on an attribute with a specific value or based on the group membership.

- The device searches for the attribute and the attribute value within the user object.
- By evaluating the “Distinguished Name” (DN) contained in the member attributes, the device checks group the membership.

When a user logs on, the device searches for the following information on the LDAP server:

- In the related user project, the device searches for attributes specified in the mappings.
- In the group objects of the groups specified in the mappings, the device searches for the member attributes.

On this basis, the device checks any mapping.

- Does the user object contain the required attribute?
  - or
- Is the user member of the group?

If the device does not find a match, then the user does not get access to the device.

If the device finds more than 1 mapping that applies to a user, then the setting in the Matching policy field decides. The user either obtains the role with the more extensive authorizations or the 1st role in the table that applies.

Configuration

Matching policy

Specifies which role the device applies if more than 1 mapping applies to a user.

Possible values:

- highest (default setting)
  - The device applies the role with more extensive authorizations.
- first
  - The device applies the rule which has the lower value in the Index column to the user.

Table

Index

Displays the index number to which the table entry relates.

Role

Specifies the user role that regulates the access of the user to the individual functions of the device.
Possible values:

- **unauthorized**
  The user is blocked, and the device rejects the user log on. Assign this value to temporarily lock the user account. If an error occurs when another role is being assigned, then the device assigns this role to the user account.

- **guest** (default setting)
  The user is authorized to monitor the device.

- **auditor**
  The user is authorized to monitor the device and to save the log file in the Diagnostics > Report > Audit Trail dialog.

- **operator**
  The user is authorized to monitor the device and to change the settings – with the exception of security settings for device access.

- **administrator**
  The user is authorized to monitor the device and to change the settings.

**Type**

Specifies whether a group or an attribute with an attribute value is set in the **Parameter** column.

Possible values:

- **attribute** (default setting)
  The **Parameter** column contains an attribute with an attribute value.

- **group**
  The **Parameter** column contains the “Distinguished Name” (DN) of a group.

**Parameter**

Specifies a group or an attribute with an attribute value, depending on the setting in the **Type** column.

Possible values:

- Alphanumeric ASCII character string with 0..255 characters
  The device differentiates between upper and lower case.
  - If in the **Type** column the value **attribute** is specified, then you specify the attribute in the form of **Attribute_name=Attribute_value**.
    Example: l=Germany
  - If in the **Type** column the value **group** is specified, then you specify the “Distinguished Name” (DN) of a group.
    Example: CN=admin-users,OU=Groups,DC=example,DC=com

**Active**

Activates/deactivates the role mapping.

Possible values:

- **marked** (default setting)
  The role mapping is active.

- **unmarked**
  The role mapping is inactive.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

- In the Index field, you specify the index number.
  Possible values:
  - 1..64

3.4 Management Access

The menu contains the following dialogs:

- Server
- IP Access Restriction
- Web
- Command Line Interface
- SNMPv1/v2 Community
3.4.1 Server

This dialog lets you set up the server services which enable users or applications to access the management of the device.

The dialog contains the following tabs:
- [Information]
- [SNMP]
- [Telnet]
- [SSH]
- [HTTP]
- [HTTPS]

[Information]

This tab displays as an overview which server services are enabled.

Table

SNMPv1

Displays whether the server service is active or inactive, which authorizes access to the device using SNMP version 1. See the SNMP tab.

Possible values:
- marked
  Server service is active.
- unmarked
  Server service is inactive.

SNMPv2

Displays whether the server service is active or inactive, which authorizes access to the device using SNMP version 2. See the SNMP tab.

Possible values:
- marked
  Server service is active.
- unmarked
  Server service is inactive.

SNMPv3

Displays whether the server service is active or inactive, which authorizes access to the device using SNMP version 3. See the SNMP tab.
Possible values:

- marked
  - Server service is active.
- unmarked
  - Server service is inactive.

Telnet server

Displays whether the server service is active or inactive, which authorizes access to the device using Telnet. See the Telnet tab.

Possible values:

- marked
  - Server service is active.
- unmarked
  - Server service is inactive.

SSH server

Displays whether the server service is active or inactive, which authorizes access to the device using Secure Shell. See the SSH tab.

Possible values:

- marked
  - Server service is active.
- unmarked
  - Server service is inactive.

HTTP server

Displays whether the server service is active or inactive, which authorizes access to the device using the Graphical User Interface through HTTP. See the HTTP tab.

Possible values:

- marked
  - Server service is active.
- unmarked
  - Server service is inactive.

HTTPS server

Displays whether the server service is active or inactive, which authorizes access to the device using the Graphical User Interface through HTTPS. See the HTTPS tab.

Possible values:

- marked
  - Server service is active.
- unmarked
  - Server service is inactive.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[SNMP]

This tab lets you specify settings for the SNMP agent of the device and to enable/disable access to the device with different SNMP versions.

The SNMP agent enables access to the device management with SNMP-based applications.

Configuration

SNMPv1

Activates/deactivates the access to the device with SNMP version 1.

Possible values:

- marked (default setting)
  Access is activated.
- unmarked
  Access is deactivated.

You specify the community names in the Device Security > Management Access > SNMPv1/v2 Community dialog.

SNMPv2

Activates/deactivates the access to the device with SNMP version 2.

Possible values:

- marked (default setting)
  Access is activated.
- unmarked
  Access is deactivated.

You specify the community names in the Device Security > Management Access > SNMPv1/v2 Community dialog.

SNMPv3

Activates/deactivates the access to the device with SNMP version 3.

Possible values:

- marked (default setting)
  Access is activated.
- unmarked
  Access is deactivated.

Network management systems like Industrial HiVision use this protocol to communicate with the device.
UDP port

Specifies the number of the UDP port on which the SNMP agent receives requests from clients.

Possible values:
- `1..65535` (default setting: `161`)
  - Exception: Port `2222` is reserved for internal functions.

To enable the SNMP agent to use the new port after a change, you proceed as follows:
- Click the button.
- Select in the `Basic Settings > Load/Save` dialog the active configuration profile.
- Click the button to save the current changes.
- Restart the device.

SNMPover802

Activates/deactivates the access to the device through SNMP over IEEE-802.

Possible values:
- `marked` (access is activated)
- `unmarked` (default setting) (access is deactivated)

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Telnet]

This tab lets you enable/disable the Telnet server in the device and specify its settings.

The Telnet server enables access to the device management remotely through the Command Line Interface. Telnet connections are unencrypted.

Operation

Enables/disables the Telnet server.
Possible values:

- **On** (default setting)
  The Telnet server is enabled. The access to the device management is possible through the Command Line Interface using an unencrypted Telnet connection.

- **Off**
  The Telnet server is disabled.

**Note:** If the SSH server is disabled and you also disable Telnet, then the access to the Command Line Interface is only possible through the serial interface of the device.

### Configuration

**TCP port**

Specifies the number of the TCP port on which the device receives Telnet requests from clients.

Possible values:

- **1..65535** (default setting: 23)
  Exception: Port 2222 is reserved for internal functions.

The server restarts automatically after the port is changed. Existing connections remain in place.

**Connections**

Displays how many Telnet connections are currently established to the device.

**Connections (max.)**

Specifies the maximum number of Telnet connections to the device that can be set up simultaneously.

Possible values:

- **1..5** (default setting: 5)

**Session timeout [min]**

Specifies the timeout in minutes. After the device has been inactive for this time it ends the session for the user logged on.

A change in the value takes effect the next time a user logs on to the device.

Possible values:

- **0**
  Deactivates the function. The connection remains established in the case of inactivity.

- **1..160** (default setting: 5)

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
[SSH]

This tab lets you enable/disable the SSH server in the device and specify its settings required for SSH. The server works with SSH version 2.

The SSH server enables access to the device management remotely through the Command Line Interface. SSH connections are encrypted.

The SSH server identifies itself to the clients using its public RSA key. When first setting up the connection, the client program displays the user the fingerprint of this key. The fingerprint contains a Base64-coded character sequence that is easy to check. When you make this character sequence available to the users via a reliable channel, they have the option to compare both fingerprints. If the character sequences match, then the client is connected to the correct server.

The device lets you create the private and public keys (host keys) required for RSA directly in the device. Otherwise you have the option to copy your own keys to the device in PEM format.

As an alternative, the device lets you load the RSA key (host key) from an external memory upon restart. You activate this function in the Basic Settings > External Memory dialog, SSH key auto upload column.

**Operation**

Enables/disables the SSH server.

Possible values:

- **On** (default setting)
  - The SSH server is enabled.
  - The access to the device management is possible through the Command Line Interface using an encrypted SSH connection.
  - You can start the server only if there is an RSA signature in the device.
- **Off**
  - The SSH server is disabled.
  - When you disable the SSH server, the existing connections remain established. However, the device helps prevent new connections from being set up.

**Note:** If the Telnet server is disabled and you also disable SSH, then the access to the Command Line Interface is only possible through the serial interface of the device.

**Configuration**

**TCP port**

Specifies the number of the TCP port on which the device receives SSH requests from clients.

Possible values:

- **1..65535** (default setting: 22)
  - Exception: Port 2222 is reserved for internal functions.

The server restarts automatically after the port is changed. Existing connections remain in place.
Sessions

Displays how many SSH connections are currently established to the device.

Sessions (max.)

Specifies the maximum number of SSH connections to the device that can be set up simultaneously.

Possible values:
- **1..5** (default setting: 5)

Session timeout [min]

Specifies the timeout in minutes. After the user logged on has been inactive for this time, the device ends the connection.

A change in the value takes effect the next time a user logs on to the device.

Possible values:
- **0**
  - Deactivates the function. The connection remains established in the case of inactivity.
- **1..160** (default setting: 5)

Fingerprint

The fingerprint is an easy to verify string that uniquely identifies the host key of the SSH server.

After importing a new host key, the device continues to display the existing fingerprint until you restart the server.

RSA Fingerprint

Displays the fingerprint of the public host key of the SSH server.

Signature

RSA present

Displays whether an RSA host key is present in the device.

Possible values:
- **marked**
  - A key is present.
- **unmarked**
  - No key is present.

Create

Generates a host key in the device. The prerequisite is that the SSH server is disabled.
Length of the key created:

▸ 2048 bit (RSA)

To get the SSH server to use the generated host key, re-enable the SSH server.

Alternatively, you have the option to copy your own host key to the device in PEM format. See the Key import frame.

Delete

Removes the host key from the device. The prerequisite is that the SSH server is disabled.

Oper status

Displays whether the device currently generates a host key.

It is possible that another user triggered this action.

Possible values:

▸ rsa
  The device currently generates an RSA host key.
▸ none
  The device does not generate a host key.

Key import

URL

Specifies the path and file name of your own RSA host key.

The device accepts the RSA key if it has the following key length:

• 2048 bit (RSA)

The device gives you the following options for copying the key to the device:

▸ Import from the PC
  When the host key is located on your PC or on a network drive, drag and drop the file that contains the key in the area. Alternatively click in the area to select the file.

▸ Import from an FTP server
  When the key is on an FTP server, specify the URL for the file in the following form:
  ftp://<user>:<password>@<IP address>:<port>/<file name>

▸ Import from a TFTP server
  When the key is on a TFTP server, specify the URL for the file in the following form:
  tftp://<IP address>/<path>/<file name>

▸ Import from an SCP or SFTP server
  When the key is on an SCP or SFTP server, specify the URL for the file in the following form:
  – scp:// or sftp://<user>:<password>@<IP address>/<path>/<file name>
    When you click the Start button, the device displays the Credentials window. There you enter User name and Password, to log on to the server.
  – scp:// or sftp://<user>:<password>@<IP address>/<path>/<file name>
Start

Copies the key specified in the URL field to the device.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[HTTP]

This tab lets you enable/disable the HTTP protocol for the web server and specify the settings required for HTTP.

The web server provides the Graphical User Interface via an unencrypted HTTP connection. For security reasons, disable the HTTP protocol and use the HTTPS protocol instead.

The device supports up to 10 simultaneous connections using HTTP or HTTPS.

Note: If you change the settings in this tab and click the button, then the device ends the session and disconnects every opened connection. To continue working with the Graphical User Interface, login again.

Operation

Enables/disables the HTTP protocol for the web server.

Possible values:

- **On** (default setting)
  - The HTTP protocol is enabled.
  - The access to the device management is possible through an unencrypted HTTP connection. When the HTTPS protocol is also enabled, the device automatically redirects the request for a HTTP connection to an encrypted HTTPS connection.

- **Off**
  - The HTTP protocol is disabled.
  - When the HTTPS protocol is enabled, the access to the device management is possible through an encrypted HTTPS connection.

Note: If the HTTP and HTTPS protocols are disabled, then you can enable the HTTP protocol using the Command Line Interface command http server to get to the Graphical User Interface.

Configuration

TCP port

Specifies the number of the TCP port on which the web server receives HTTP requests from clients.
Possible values:

- $1..65535$ (default setting: 80)
  
  Exception: Port 222 is reserved for internal functions.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

[[HTTPS]]

This tab lets you enable/disable the HTTPS protocol for the web server and specify the settings required for HTTPS.

The web server provides the Graphical User Interface via an encrypted HTTP connection.

A digital certificate is required for the encryption of the HTTP connection. The device lets you create this certificate yourself or to load an existing certificate onto the device.

The device supports up to 10 simultaneous connections using HTTP or HTTPS.

**Note:** If you change the settings in this tab and click the button, then the device ends the session and disconnects every opened connection. To continue working with the Graphical User Interface, login again.

**Operation**

Operation

Enables/disables the HTTPS protocol for the web server.

Possible values:

- **On** (default setting)
  
  The HTTPS protocol is enabled.
  
  The access to the device management is possible through an encrypted HTTPS connection.
  
  When there is no digital certificate present, the device generates a digital certificate before it enables the HTTPS protocol.

- **Off**
  
  The HTTPS protocol is disabled.
  
  When the HTTP protocol is enabled, the access to the device management is possible through an unencrypted HTTP connection.

**Note:** If the HTTP and HTTPS protocols are disabled, then you can enable the HTTPS protocol using the Command Line Interface command `https server` to get to the Graphical User Interface.
Configuration

TCP port

Specifies the number of the TCP port on which the web server receives HTTPS requests from clients.

Possible values:

- 1..65535 (default setting: 443)
  - Exception: Port 2222 is reserved for internal functions.

Fingerprint

The fingerprint is an easily verified hexadecimal number sequence that uniquely identifies the digital certificate of the HTTPS server.

After importing a new digital certificate, the device displays the current fingerprint until you restart the server.

Fingerprint type

Specifies which fingerprint the Fingerprint field displays.

Possible values:

- sha1
  - The Fingerprint field displays the SHA1 fingerprint of the certificate.

- sha256
  - The Fingerprint field displays the SHA256 fingerprint of the certificate.

Fingerprint

Character sequence of the digital certificate used by the server.

When you change the settings in the Fingerprint type field, click afterwards the button and then the button to update the display.

Certificate

Note: If the device uses a certificate that is not signed by a certification authority, then the web browser displays a message while loading the Graphical User Interface. To continue, add an exception rule for the certificate in the web browser.

Present

Displays whether the digital certificate is present in the device.

Possible values:

- marked
  - The certificate is present.

- unmarked
  - The certificate has been removed.
Create

Generates a digital certificate in the device.

Until restarting the web server uses the previous certificate.

To get the web server to use the newly generated certificate, restart the web server. Restarting the web server is possible only through the Command Line Interface.

Alternatively, you have the option of copying your own certificate to the device. See the Certificate import frame.

Delete

Deletes the digital certificate.

Until restarting the web server uses the previous certificate.

Oper status

Displays whether the device currently generates or deletes a digital certificate.

It is possible that another user has triggered the action.

Possible values:
- none
  The device does currently not generate or delete a certificate.
- delete
  The device currently deletes a certificate.
- generate
  The device currently generates a certificate.

Certificate import

URL

Specifies the path and file name of the certificate.

The device accepts certificates with the following properties:
- X.509 format
- .PEM file name extension
- Base64-coded, enclosed by
  - -----BEGIN PRIVATE KEY-----
  and
  -----END PRIVATE KEY-----
  as well as
  - -----BEGIN CERTIFICATE-----
  and
  -----END CERTIFICATE-----
- RSA key with 2048 bit length
The device gives you the following options for copying the certificate to the device:

- **Import from the PC**
  When the certificate is located on your PC or on a network drive, drag and drop the certificate in the area. Alternatively click in the area to select the certificate.

- **Import from an FTP server**
  When the certificate is on a FTP server, specify the URL for the file in the following form:
  
  \[ftp://<user>:<password>@<IP address>:<port>/<path>/<file name>\]

- **Import from a TFTP server**
  When the certificate is on a TFTP server, specify the URL for the file in the following form:

  \[tftp://<IP address>/<path>/<file name>\]

- **Import from an SCP or SFTP server**
  When the certificate is on an SCP or SFTP server, specify the URL for the file in the following form:

  - \[scp:// or sftp://<IP address>/<path>/<file name>\]

  When you click the **Start** button, the device displays the **Credentials** window. There you enter **User name** and **Password**, to log on to the server.

  - \[scp:// or sftp://<user>:<password>@<IP address>/<path>/<file name>\]

**Start**

Copies the certificate specified in the **URL** field to the device.

**Buttons**

You find the description of the standard buttons in section “**Buttons**” on page 15.
3.4.2 IP Access Restriction

This dialog enables you to restrict the access to the device management to specific IP address ranges and selected IP-based applications.

- If the function is disabled, then the access to the device management is possible from any IP address and using every application.
- If the function is enabled, then the access is restricted. You have access to the device management only under the following conditions:
  - At least one table entry is activated.
  - You are accessing the device with a permitted application from a permitted IP address range.

**Operation**

*Note:* Before you enable the function, verify that at least one active entry in the table lets you access. Otherwise, if you change the settings, then the connection to the device terminates. The access to the device management is possible only using the Command Line Interface through the serial interface.

Operation

Enables/disables the *IP Access Restriction* function.

Possible values:

- **On**
  - The *IP Access Restriction* function is enabled.
  - The access to the device management is restricted.

- **Off** (default setting)
  - The *IP Access Restriction* function is disabled.

**Table**

You have the option of defining up to 16 table entries and activating them separately.

**Index**

Displays the index number to which the table entry relates.

When you delete a table entry, this leaves a gap in the numbering. When you create a new table entry, the device fills the first gap.

Possible values:

- **1..16**

**Address**

Specifies the IP address of the network from which you allow the access to the device management. You specify the network range in the *Netmask* column.
Possible values:

- Valid IPv4 address (default setting: 0.0.0.0)

Netmask

Specifies the range of the network specified in the Address column.

Possible values:

- Valid netmask (default setting: 0.0.0.0)

HTTP

Activates/deactivates the HTTP access.

Possible values:

- marked (default setting)
  Access is activated for the adjacent IP address range.
- unmarked
  Access is deactivated.

HTTPS

Activates/deactivates the HTTPS access.

Possible values:

- marked (default setting)
  Access is activated for the adjacent IP address range.
- unmarked
  Access is deactivated.

SNMP

Activates/deactivates the SNMP access.

Possible values:

- marked (default setting)
  Access is activated for the adjacent IP address range.
- unmarked
  Access is deactivated.

Telnet

Activates/deactivates the Telnet access.

Possible values:

- marked (default setting)
  Access is activated for the adjacent IP address range.
- unmarked
  Access is deactivated.

SSH

Activates/deactivates the SSH access.
Possible values:
- **marked** (default setting)
  Access is activated for the adjacent IP address range.
- **unmarked**
  Access is deactivated.

IEC61850-MMS

Activates/deactivates the access to the MMS server.

Possible values:
- **marked** (default setting)
  Access is activated for the adjacent IP address range.
- **unmarked**
  Access is deactivated.

Modbus TCP

Activates/deactivates the access to the *Modbus TCP* server.

Possible values:
- **marked** (default setting)
  Access is activated for the adjacent IP address range.
- **unmarked**
  Access is deactivated.

EtherNet/IP

Activates/deactivates the access to the *EtherNet/IP* server.

Possible values:
- **marked** (default setting)
  Access is activated for the adjacent IP address range.
- **unmarked**
  Access is deactivated.

PROFINET

Activates/deactivates the access to the *PROFINET* server.

Possible values:
- **marked** (default setting)
  Access is activated for the adjacent IP address range.
- **unmarked**
  Access is deactivated.

Active

Activates/deactivates the table entry.
Possible values:

- **marked** (default setting)
  Table entry is activated. The device restricts the access to the device management to the adjacent IP address range and the selected IP-based applications.

- **unmarked**
  Table entry is deactivated.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
3.4.3 Web

In this dialog, you specify settings for the Graphical User Interface.

Configuration

Web interface session timeout [min]

Specifies the timeout in minutes. After the device has been inactive for this time it ends the session for the user logged on.

Possible values:

- 0..160  (default setting: 5)

The value 0 deactivates the function, and the user remains logged on when inactive.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
3.4.4 Command Line Interface

The dialog contains the following tabs:

- [Global]
- [Login banner]

[Global]

This tab lets you change the prompt in the Command Line Interface and specify the automatic closing of sessions through the serial interface when they have been inactive.

The device has the following serial interfaces.

- V.24 interface

Configuration

Login prompt

Specifies the character string that the device displays in the Command Line Interface at the start of every command line.

Possible values:

- Alphanumeric ASCII character string with 0..128 characters (0x20..0x7E) including space characters

  Wildcards
  - %d date
  - %i IP address
  - %m MAC address
  - %p product name
  - %t time

Default setting: (RSP)

Changes to this setting are immediately effective in the active Command Line Interface session.

Serial interface timeout [min]

Specifies the time in minutes after which the device automatically closes the session of a logged on user in the Command Line Interface via the serial interface when it has been inactive.

Possible values:

- 0..160 (default setting: 5)
  The value 0 deactivates the function, and the user remains logged on when inactive.

A change in the value takes effect the next time a user logs on to the device.

For Telnet and SSH, you specify the timeout in the Device Security > Management Access > Server dialog.
Buttons
You find the description of the standard buttons in section “Buttons” on page 15.

[Login banner]
In this tab, you replace the start screen of the Command Line Interface with your own text.

In the default setting, the start screen displays information about the device, such as the software version and the device settings. With the function in this tab, you deactivate this information and replace it with an individually specified text.

To display your own text in the Command Line Interface and in the Graphical User Interface before the login, you use the Device Security > Pre-login Banner dialog.

Operation
Enables/disables the Login banner function.

Possible values:

- **On**
  - The Login banner function is enabled.
  - The device displays the text information specified in the Banner text field to the users that login to the device using the Command Line Interface.

- **Off** (default setting)
  - The Login banner function is disabled.
  - The start screen displays information about the device. The text information in the Banner text field is kept.

Banner text
Specifies the character string that the device displays in the Command Line Interface at the start of every session.

Possible values:

- Alphanumeric ASCII character string with 0..1024 characters (0x20..0x7E) including space characters
- `<Tab>`
- `<Line break>`

Remaining characters
Displays how many characters are still remaining in the Banner text field for the text information.
Possible values:

- 1024..0

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
3.4.5 **SNMPv1/v2 Community**

In this dialog, you specify the community name for SNMPv1/v2 applications.

Applications send requests via SNMPv1/v2 with a community name in the SNMP data packet header. Depending on the community name, the application gets read authorization or read and write authorization for the device.

You activate the access to the device via SNMPv1/v2 in the Device Security > Management Access > Server dialog.

**Table**

<table>
<thead>
<tr>
<th>Community</th>
<th>Displays the authorization for SNMPv1/v2 applications to the device:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write</td>
<td>For requests with the community name entered, the application receives read and write authorization for the device.</td>
</tr>
<tr>
<td>Read</td>
<td>For requests with the community name entered, the application receives read authorization for the device.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Specifies the community name for the adjacent authorization.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>Alphanumeric ASCII character string with 0..32 characters</td>
<td></td>
</tr>
<tr>
<td>private</td>
<td>(default setting for read and write authorizations)</td>
</tr>
<tr>
<td>public</td>
<td>(default setting for read authorization)</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
3.5 **Pre-login Banner**

This dialog lets you display a greeting or information text to users before they login to the device.

The users see this text in the login dialog of the Graphical User Interface and of the Command Line Interface. Users logging in with SSH see the text - regardless of the client used - before or during the login.

To display the text only in the Command Line Interface, use the settings in the **Device Security > Management Access > CLI** dialog.

**Operation**

**Operation**

Enables/disables the **Pre-login Banner** function.

Using the **Pre-login Banner** function, the device displays a greeting or information text in the login dialog of the Graphical User Interface and of the Command Line Interface.

Possible values:

- **On**
  - The **Pre-login Banner** function is enabled.
  - The device displays the text specified in the **Banner text** field in the login dialog.

- **Off** (default setting)
  - The **Pre-login Banner** function is disabled.
  - The device does not display a text in the login dialog. When you enter a text in the **Banner text** field, this text is saved in the device.

**Banner text**

**Banner text**

Specifies information text that the device displays in the Login dialog of the Graphical User Interface and of the Command Line Interface.

Possible values:

- Alphanumeric ASCII character string with 0..512 characters (0x20..0x7E) including space characters
- `<Tab>`
- `<Line break>`

**Remaining characters**

Displays how many characters are still remaining in the **Banner text** field.

Possible values:

- **512..0**
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
4 Network Security

The menu contains the following dialogs:
- Network Security Overview
- Port Security
- 802.1X Port Authentication
- RADIUS
- DoS
- DHCP Snooping
- Dynamic ARP Inspection
- ACL

4.1 Network Security Overview

This dialog displays the network security rules used in the device.

Parameter

Port/VLAN

Specifies whether the device displays VLAN- and/or port-based rules.

Possible values:
- **All** (default setting)
  The device displays the VLAN- and port-based rules specified by you.
- **Port: <Port Number>**
  The device displays port-based rules for a specific port. This selection is available, when you specified one or more rules for this port.
- **VLAN: <VLAN ID>**
  The device displays VLAN-based rules for a specific VLAN. This selection is available, when you specified one or more rules for this VLAN.

ACL

Displays the **ACL** rules in the overview.

You edit **ACL** rules in the **Network Security > ACL** dialog.

1:1 NAT

Displays the **1:1 NAT** rules in the overview.

You edit **1:1 NAT** rules in the **Routing > NAT > 1:1 NAT** dialog.

All

Marks the adjacent checkboxes. The device displays the related rules in the overview.
None

Unmarks the adjacent checkboxes. The device does not display any rules in the overview.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
4.2 Port Security

The device lets you transmit only data packets from desired senders on one port. When this function is enabled, the device checks the VLAN ID and MAC address of the sender before it transmits a data packet. The device discards data packets from other senders and logs this event. If the Auto-Disable function is activated, the device disables the port. This restriction makes MAC Spoofing attacks more difficult. The Auto-Disable function enables the relevant port again automatically when the parameters are no longer being exceeded.

In this dialog a Wizard window helps you to connect the ports with one or more desired sources. In the device these addresses are known as Static entries (/). To view the specified static addresses, highlight the relevant port and click the button.

To simplify the setup process, the device lets you record the desired senders automatically. The device “learns” the senders by evaluating the received data packets. In the device these addresses are known as Dynamic entries. When a user-defined upper limit has been reached (Dynamic limit), the device stops the “learning” on the relevant port and transmits only the data packets of the senders already recorded. When you adjust the upper limit to the number of expected senders, you thus make MAC Flooding attacks more difficult.

Note: With the automatic recording of the Dynamic entries, the device constantly discards the 1st data packet from unknown senders. Using this 1st data packet, the device checks whether the upper limit has been reached. The device records the sender until the upper limit is reached. Afterwards, the device transmits data packets that it receives on the relevant port from this sender.

Operation

Enables/disables the Port Security function.

Possible values:

- **On**
  - The Port Security function is enabled.
  - The device checks the VLAN ID and MAC address of the source before it transmits a data packet.
  - The device transmits a received data packet only if its source is desired on the relevant port.
  - Also activate the checking of the source on the relevant ports.

- **Off** (default setting)
  - The Port Security function is disabled.
  - The device transmits every received data packet without checking the source.

Configuration

Activates/deactivates the Auto-Disable function for Port Security.
Possible values:

- **marked**
  The Auto-Disable function for Port Security is active.
  Also mark the checkbox in the Auto-disable column for the relevant ports.

- **unmarked** (default setting)
  The Auto-Disable function for Port Security is inactive.

### Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Active</th>
<th>Activates/deactivates the checking of the source on the port.</th>
</tr>
</thead>
</table>

Possible values:

- **marked**
  The device checks every data packet received on the port and transmits it only if the source of the data packet is allowed. Also enable the function in the Operation frame.

- **unmarked** (default setting)
  The device transmits every data packet received on the port without checking the source.

**Note:** When you operate the device as an active subscriber within an MRP ring, we recommend that you unmark the checkbox.

### Auto-disable

Activates/deactivates the Auto-Disable function for the parameters that the Port Security function is monitoring on the port.

Possible values:

- **marked** (default setting)
  The Auto-Disable function is active on the port.
  The prerequisite is that you mark the checkbox Auto-disable in the Configuration frame.
  - If the port registers source MAC addresses that are not allowed or more source MAC addresses than specified in the Dynamic limit column, then the device disables the port. The “Link status” LED for the port flashes 3× per period.
  - The Diagnostics > Ports > Auto-Disable dialog displays which ports are currently disabled due to the parameters being exceeded.
  - The Auto-Disable function reactivates the port automatically. For this you go to the Diagnostics > Ports > Auto-Disable dialog and specify a waiting period for the relevant port in the Reset timer [s] column.

- **unmarked**
  The Auto-Disable function on the port is inactive.

### Send trap

Activates/deactivates the sending of SNMP traps when the device discards data packets from an undesired sender on the port.
Possible values:

- **marked**
  If the device discards data packets from a sender that is not allowed on the port, then the device sends an SNMP trap.

- **unmarked** (default setting)
  The sending of SNMP traps is deactivated.

The prerequisite for sending SNMP traps is that you enable the function in the **Diagnostics > Status Configuration > Alarms (Traps)** dialog and specify at least 1 trap destination.

**Trap interval [s]**

Specifies the delay time in seconds that the device waits after sending an SNMP trap before sending the next SNMP trap.

Possible values:

- **0..3600** (default setting: 0)
  The value 0 deactivates the delay time.

**Dynamic limit**

Specifies the upper limit for the number of automatically registered sources (**Dynamic entries**). When the upper limit is reached, the device stops “learning” on this port.

Adjust the value to the number of expected sources.

If the port registers more senders than specified here, then the port disables the **Auto-Disable** function. The prerequisite is that you mark the checkbox in the **Auto-disable** column and the **Auto-disable** checkbox in the **Configuration** frame.

Possible values:

- **0**
  Deactivates the automatic registering of sources on this port.

- **1..600** (default setting: 600)

**Static limit**

Specifies the upper limit for the number of sources connected to the port (**Static entries (/)**). The **Wizard** window helps you to connect the port with one or more desired sources.

Possible values:

- **0..64** (default setting: 64)
  The value 0 helps prevent you from connecting a source with the port.

**Dynamic entries**

Displays the number of senders that the device has automatically determined.

See the **Wizard** window, **Dynamic entries** field.
Static entries

Displays the number of senders that are linked with the port.

See the Wizard window, Static entries (/) field.

Last violating VLAN ID/MAC

Displays the VLAN ID and MAC address of an undesired sender whose data packets the device last discarded on this port.

Sent traps

Displays the number of discarded data packets on this port that caused the device to send an SNMP trap.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Port security (Wizard)]

The Wizard window helps you to connect the ports with one or more desired sources. After you specify the settings, click the Finish button.

Note: The device saves the sources connected with the port until you deactivate the checking of the source on the relevant port or in the Operation frame.

After closing the Wizard window, click the button to save your settings.

[Port security (Wizard) – Select port]

Port

Specifies the port that you assign to the sender in the next step.

[Port security (Wizard) – Addresses]

VLAN ID

Specifies the VLAN ID of the desired source.

Possible values:

- 1..4042

To transfer the VLAN ID and the MAC address to the Static entries (/) field, click the Add button.
MAC address

Specifies the MAC address of the desired source.

Possible values:

- Valid Unicast MAC address
  Specify the value with a colon separator, for example 00:11:22:33:44:55.

To transfer the VLAN ID and the MAC address to the Static entries (/) field, click the Add button.

Add

Transfers the values specified in the VLAN ID and MAC address fields to the Static entries (/) field.

Static entries (/)

Displays the VLAN ID and MAC address of desired senders connected to the port.

The device uses this field to display the number of senders connected to the port and the upper limit. You specify the upper limit for the number of entries in the table, Static limit field.

Note: You cannot assign a MAC address that you assign to this port to any other port.

Remove

Removes the entries highlighted in the Static entries (/) field.

Moves the entries highlighted in the Dynamic entries field to the Static entries (/) field.

Moves every entry from the Dynamic entries field to the Static entries (/) field.

When the Dynamic entries field contains more entries than are allowed in the Static entries (/) field, the device moves the foremost entries until the upper limit is reached.

Dynamic entries

Displays in ascending order the VLAN ID and MAC address of the senders automatically recorded on this port. The device transmits data packets from these senders when receiving the data packets on this port.

You specify the upper limit for the number of entries in the table, Dynamic limit field.

The and buttons allow you to transfer entries from this field into the Static entries (/) field. In this way, you connect the relevant senders with the port.
4.3 802.1X Port Authentication

With the port-based access control according to IEEE 802.1X, the device monitors the access to the network from connected end devices. The device (authenticator) lets an end device (supplicant) have access to the network if it logs in with valid login data. The authenticator and the end devices communicate via the EAPoL (Extensible Authentication Protocol over LANs) authentication protocol.

The device supports the following methods to authenticate end devices:

- **radius**
  A RADIUS server in the network authenticates the end devices.

- **ias**
  The Integrated Authentication Server (IAS) implemented in the device authenticates the end devices. Compared to RADIUS, the IAS provides only basic functions.

The menu contains the following dialogs:

- **802.1X Global**
- **802.1X Port Configuration**
- **802.1X Port Clients**
- **802.1X EAPoL Port Statistics**
- **802.1X Port Authentication History**
- **802.1X Integrated Authentication Server**
4.3.1 802.1X Global

This dialog lets you specify basic settings for the port-based access control.

Operation

Enables/disables the 802.1X Port Authentication function.

Possible values:

- **On**
  - The 802.1X Port Authentication function is enabled.
  - The device checks the access to the network from connected end devices.
  - The port-based access control is enabled.

- **off** (default setting)
  - The 802.1X Port Authentication function is disabled.
  - The port-based access control is disabled.

Configuration

VLAN assignment

Activates/deactivates the assigning of the relevant port to a VLAN. This function lets you provide selected services to the connected end device in this VLAN.

Possible values:

- **marked**
  - The assigning is active.
  - If the end device successfully authenticates itself, then the device assigns to the relevant port the VLAN ID transferred by the RADIUS authentication server.

- **unmarked** (default setting)
  - The assigning is inactive.
  - The relevant port is assigned to the VLAN specified in the Network Security > 802.1X Port Authentication > Port Configuration dialog, Assigned VLAN ID row.

Dynamic VLAN creation

Activates/deactivates the automatic creation of the VLAN assigned by the RADIUS authentication server if the VLAN does not exist.

Possible values:

- **marked**
  - The automatic VLAN creation is active.
  - The device creates the VLAN if it does not exist.

- **unmarked** (default setting)
  - The automatic VLAN creation is inactive.
  - If the assigned VLAN does not exist, then the port remains assigned to the original VLAN.
Monitor mode

Activates/deactivates the monitor mode.

Possible values:

- **marked**
  - The monitor mode is active.
  - The device monitors the authentication and helps with diagnosing detected errors. If an end device has not logged in successfully, then the device gives the end device access to the network.

- **unmarked** (default setting)
  - The monitor mode is inactive.

MAC authentication bypass format options

Group size

Specifies the size of the MAC address groups. The device splits the MAC address for authentication into groups. The size of the groups is specified in half bytes, each of which is represented as 1 character.

Possible values:

- **1**
  - The device splits the MAC address into 12 groups of 1 character.
  - Example: `A:A:B:B:C:C:D:D:E:E:F:F`

- **2**
  - The device splits the MAC address into 6 groups of 2 characters.

- **4**
  - The device splits the MAC address into 3 groups of 4 characters.
  - Example: `AABB:CCDD:EEFF`

- **12** (default setting)
  - The device formats the MAC address as 1 group of 12 characters.
  - Example: `AABBCCDDEEFF`

Group separator

Specifies the character which separates the groups.

Possible values:

- `-` 
  - dash

- `:` 
  - colon

- `. ` 
  - dot

Upper or lower case

Specifies whether the device formats the authentication data in lowercase or uppercase letters.
Password

Specifies the optional password for the clients which use the authentication bypass.

Possible values:
- lower-case
- upper-case

After entering the field displays ***** (asterisk) instead of the password.
- <empty>
  The device uses the username of the client also as the password.

Information

Monitor mode clients

Displays to how many end devices the device gave network access even though they did not login successfully.

The prerequisite is that you activate the Monitor mode function. See the Configuration frame.

Non monitor mode clients

Displays the number of end devices to which the device gave network access after successful login.

Policy 1

Displays the method that the device currently uses to authenticate the end devices using IEEE 802.1X.

You specify the method used in the Device Security > Authentication List dialog.
- To authenticate the end devices through a RADIUS server, you assign the radius policy to the 8021x list.
- To authenticate the end devices through the Integrated Authentication Server (IAS) you assign the ias policy to the 8021x list.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
4.3.2 802.1X Port Configuration

This dialog lets you specify the access settings for every port.

When multiple end devices are connected to a port, the device lets you authenticate these individually (multi-client authentication). In this case, the device lets logged in end devices have access to the network. In contrast, the device blocks access for unauthenticated end devices, or for end devices whose authentication has elapsed.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

Port initialization

Activates/deactivates the port initialization in order to activate the access control on the port or reset it to its initial state. Use this function only on ports in which the Port control column contains the value *auto* or *multiClient*.

Possible values:
- **marked**  
The port initialization is active.  
When the initialization is complete, the device changes the value to *unmarked* again.
- **unmarked** (default setting)  
The port initialization is inactive.  
The device keeps the current port status.

Port reauthentication

Activates/deactivates the one-time reauthentication request.

Use this function only on ports in which the Port control column contains the value *auto* or *multiClient*.

The device also lets you periodically request the end device to login again. See the Periodic reauthentication column.

Possible values:
- **marked**  
The one-time reauthentication request is active.  
The device requests the end device to login again. Afterwards, the device changes the value to *unmarked* again.
- **unmarked** (default setting)  
The one-time reauthentication request is inactive.  
The device keeps the end device logged in.

Authentication activity

Displays the current status of the Authenticator (*Authenticator PAE state*).
Possible values:
- initialize
- disconnected
- connecting
- authenticating
- authenticated
- aborting
- held
- forceAuth
- forceUnauth

Backend authentication state
Displays the current status of the connection to the authentication server (Backend Authentication state).

Possible values:
- request
- response
- success
- fail
- timeout
- idle
- initialize

Authentication state
Displays the current status of the authentication on the port (Controlled Port Status).

Possible values:
- authorized
  The end device is logged in successfully.
- unauthorized
  The end device is not logged in.

Users (max.)
Specifies the upper limit for the number of end devices that the device authenticates on this port at the same time. This upper limit applies only to ports in which the Port control column contains the value multiClient.

Possible values:
- 1..16 (default setting: 16)

Port control
Specifies how the device grants access to the network (Port control mode).
Possible values:

- forceUnauthorized
  The device blocks the access to the network. You use this setting if an end device is connected to the port that does not receive access to the network.

- auto
  The device grants access to the network if the end device logged in successfully. You use this setting if an end device is connected to the port that logs in at the authenticator.

**Note:** If other end devices are connected through the same port, then they get access to the network without additional authentication.

- forceAuthorized (default setting)
  When end devices do not support IEEE 802.1X, the device grants access to the network. You use this setting if an end device is connected to the port that receives access to the network without logging in.

- multiClient
  The device grants access to the network if the end device logs in successfully. If the end device does not send any EAPOL data packets, then the device grants or denies access to the network individually depending on the MAC address of the end device. See the MAC authorized bypass column. You use this setting if multiple end devices are connected to the port or if the MAC authorized bypass function is required.

**Quiet period [s]**

Specifies the time period in seconds in which the authenticator does not accept any more logins from the end device after an unsuccessful log in attempt (Quiet period [s]).

Possible values:

- 0..65535 (default setting: 60)

**Transmit period [s]**

Specifies the period in seconds after which the authenticator requests the end device to login again. After this waiting period, the device sends an EAP request/identity data packet to the end device.

Possible values:

- 1..65535 (default setting: 30)

**Supplicant timeout period [s]**

Specifies the period in seconds for which the authenticator waits for the login of the end device.

Possible values:

- 1..65535 (default setting: 30)

**Server timeout [s]**

Specifies the period in seconds for which the authenticator waits for the response from the authentication server (RADIUS or IAS).

Possible values:

- 1..65535 (default setting: 30)
Requests (max.)

Specifies how many times the authenticator requests the end device to login until the time specified in the Supplicant timeout period [s] column has elapsed. The device sends an EAP request/identity data packet to the end device as often as specified here.

Possible values:
- 0..10 (default setting: 2)

Assigned VLAN ID

Displays the ID of the VLAN that the authenticator assigned to the port. This value applies only on ports in which the Port control column contains the value auto.

Possible values:
- 0..4042 (default setting: 0)

You find the VLAN ID that the authenticator assigned to the ports in the Network Security > 802.1X Port Authentication > Port Clients dialog.

For the ports in which the Port control column contains the value multiClient, the device assigns the VLAN tag based on the MAC address of the end device when receiving data packets without a VLAN tag.

Assignment reason

Displays the cause for the assignment of the VLAN ID. This value applies only on ports in which the Port control column contains the value auto.

Possible values:
- notAssigned (default setting)
- radius
- guestVlan
- unauthenticatedVlan

You find the VLAN ID that the authenticator assigned to the ports for a supplicant in the Network Security > 802.1X Port Authentication > Port Clients dialog.

Reauthentication period [s]

Specifies the period in seconds after which the authenticator periodically requests the end device to login again.

Possible values:
- 1..65535 (default setting: 3600)

Periodic reauthentication

Activates/deactivates periodic reauthentication requests.
Possible values:

- **marked**
  The periodic reauthentication requests are active.
  The device periodically requests the end device to login again. You specify this time period in the **Reauthentication period [s]** column.
  If the authenticator assigned the ID of a Voice VLAN, Unauthenticated VLAN or Guest VLAN to the end device, then this setting becomes ineffective.

- **unmarked** (default setting)
  The periodic reauthentication requests are inactive.
  The device keeps the end device logged in.

**Guest VLAN ID**

Specifies the ID of the VLAN that the authenticator assigns to the port if the end device does not log in during the time period specified in the **Guest VLAN period** column. This value applies only on ports in which the **Port control** column contains the value **auto** or **multiClient**.

This function lets you grant end devices, without IEEE 802.1X support, access to selected services in the network.

Possible values:

- **0** (default setting)
  The authenticator does not assign a Guest VLAN to the port.
  When you enable the MAC-based authentication in the **MAC authorized bypass** column, the device automatically sets the value to 0.

- **1..4042**

  **Note:** The **MAC authorized bypass** function and the **Guest VLAN ID** function cannot be in use simultaneously.

**Guest VLAN period**

Specifies the period in seconds for which the authenticator waits for EAPOL data packets after the end device is connected. If this period elapses, then the authenticator grants the end device access to the network and assigns the port to the Guest VLAN specified in the **Guest VLAN ID** column.

Possible values:

- **1..300** (default setting: 90)

**Unauthenticated VLAN ID**

Specifies the ID of the VLAN that the authenticator assigns to the port if the end device does not login successfully. This value applies only on ports in which the **Port control** column contains the value **auto**.

This function lets you grant end devices without valid login data access to selected services in the network.

Possible values:

- **0..4042** (default setting: 0)

  The effect of the value 0 is that the authenticator does not assign a Unauthenticated VLAN to the port.

  **Note:** Assign to the port a VLAN set up statically in the device.
MAC authorized bypass

Activates/deactivates the MAC-based authentication.

This function lets you authenticate end devices without IEEE 802.1X support on the basis of their MAC address.

Possible values:

- **marked**
  The MAC-based authentication is active.
  The device sends the MAC address of the end device to the RADIUS authentication server. The device assigns the supplicant by its MAC address to the corresponding VLAN as if the authentication was performed through IEEE 802.1X directly.

- **unmarked** (default setting)
  The MAC-based authentication is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
4.3.3 **802.1X Port Clients**

This dialog displays information on the connected end devices.

**Table**

| Port | Displays the port number. |
| User name | Displays the user name with which the end device logged in. |
| MAC address | Displays the MAC address of the end device. |
| Filter ID | Displays the name of the filter list that the RADIUS authentication server assigned to the end device after successful authentication. |

The authentication server transfers the filter ID attributes in the Access Accept data packet.

| Assigned VLAN ID | Displays the VLAN ID that the authenticator assigned to the port after the successful authentication of the end device. |
| Assignment reason | Displays the reason for the assignment of the VLAN. |

Possible values:

- default
- radius
- unauthenticatedVlan
- guestVlan
- monitorVlan
- invalid

The field only displays a valid value as long as the client is authenticated.
Session timeout

Displays the remaining time in seconds until the log in of the end device expires. This value applies only if for the port in the Network Security > 802.1X Port Authentication > Port Configuration dialog, Port control column the value auto or multiClient is specified.

The authentication server assigns the timeout period to the device through RADIUS. The value 0 means that the authentication server has not assigned a timeout.

Termination action

Displays the action performed by the device when the login has elapsed.

Possible values:
- default
- reauthenticate

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
4.3.4 802.1X EAPOL Port Statistics

This dialog displays which EAPOL data packets the end device has sent and received for the authentication of the end devices.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received packets</td>
<td>Displays the total number of EAPOL data packets that the device received on the port.</td>
</tr>
<tr>
<td>Transmitted packets</td>
<td>Displays the total number of EAPOL data packets that the device sent on the port.</td>
</tr>
<tr>
<td>Start packets</td>
<td>Displays the number of EAPOL start data packets that the device received on the port.</td>
</tr>
<tr>
<td>Logoff packets</td>
<td>Displays the number of EAPOL logoff data packets that the device received on the port.</td>
</tr>
<tr>
<td>Response/ID packets</td>
<td>Displays the number of EAP response/identity data packets that the device received on the port.</td>
</tr>
<tr>
<td>Response packets</td>
<td>Displays the number of valid EAP response data packets that the device received on the port (without EAP response/identity data packets).</td>
</tr>
<tr>
<td>Request/ID packets</td>
<td>Displays the number of EAP request/identity data packets that the device received on the port.</td>
</tr>
<tr>
<td>Request packets</td>
<td>Displays the number of valid EAP request data packets that the device received on the port (without EAP request/identity data packets).</td>
</tr>
<tr>
<td>Invalid packets</td>
<td>Displays the number of EAPOL data packets with an unknown frame type that the device received on the port.</td>
</tr>
</tbody>
</table>
Received error packets

Displays the number of EAPOL data packets with an invalid packet body length field that the device received on the port.

Packet version

Displays the protocol version number of the EAPOL data packet that the device last received on the port.

Source of last received packet

Displays the sender MAC address of the EAPOL data packet that the device last received on the port.

The value \texttt{00:00:00:00:00:00} means that the port has not received any EAPOL data packets yet.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
4.3.5 **802.1X Port Authentication History**

The device registers the authentication process of the end devices that are connected to its ports. This dialog displays the information recorded during the authentication.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentification time stamp</td>
<td>Displays the time at which the authenticator authenticated the end device.</td>
</tr>
<tr>
<td>Result age</td>
<td>Displays since when this entry has been entered in the table.</td>
</tr>
<tr>
<td>MAC address</td>
<td>Displays the MAC address of the end device.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the ID of the VLAN that was assigned to the end device before the login.</td>
</tr>
</tbody>
</table>
| Authentication status | Displays the status of the authentication on the port. Possible values: 
  - **success**  
    The authentication was successful.  
  - **failure**  
    The authentication failed. |
| Access status | Displays whether the device grants the end device access to the network. Possible values: 
  - **granted**  
    The device grants the end device access to the network.  
  - **denied**  
    The device denies the end device access to the network. |
| Assigned VLAN ID | Displays the ID of the VLAN that the authenticator assigned to the port. |
Assignment type

Displays the type of the VLAN that the authenticator assigned to the port.

Possible values:
- default
- radius
- unauthenticatedVlan
- guestVlan
- monitorVlan
- notAssigned

Assignment reason

Displays the reason for the assignment of the VLAN ID and the VLAN type.

802.1X Port Authentication History

Port

Simplifies the table and displays only the entries relating to the port selected here. This makes it easier for you to record the table and sort it as you desire.

Possible values:
- all
  The table displays the entries for every port.
- <Port number>
  The table displays the entries that apply to the port selected here.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
4.3.6 802.1X Integrated Authentication Server

The Integrated Authentication Server (IAS) lets you authenticate end devices using IEEE 802.1X. Compared to RADIUS, the IAS has a very limited range of functions. The authentication is based only on the user name and the password.

In this dialog you manage the login data of the end devices. The device lets you set up to 100 sets of login data.

To authenticate the end devices through the Integrated Authentication Server you assign in the Device Security > Authentication List dialog the ias policy to the 8021x list.

Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User name</td>
<td>Displays the user name of the end device.</td>
</tr>
<tr>
<td>Password</td>
<td>Specifies the password with which the user authenticates. Possible values: Alphanumeric ASCII character string with 0..64 characters The device differentiates between upper and lower case.</td>
</tr>
<tr>
<td>Active</td>
<td>Activates/deactivates the login data. Possible values: marked The login data is active. An end device has the option of logging in through IEEE 802.1X using this login data. unmarked (default setting) The login data is inactive.</td>
</tr>
</tbody>
</table>

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
4.4 RADIUS

With its factory settings, the device authenticates users based on the local user management. However, as the size of a network increases, it becomes more difficult to keep the login data of the users consistent across the devices.

RADIUS (Remote Authentication Dial-In User Service) lets you authenticate and authorize the users at a central point in the network. A RADIUS server performs the following tasks here:

- **Authentication**: The authentication server authenticates the users when the RADIUS client at the access point forwards the login data of the users to the server.
- **Authorization**: The authentication server authorizes logged in users for selected services by assigning various parameters for the relevant end device to the RADIUS client at the access point.
- **Accounting**: The accounting server records the traffic data that has occurred during the port authentication according to IEEE 802.1X. This enables you to subsequently determine which services the users have used, and to what extent.

If you assign the `radius` policy to an application in the *Device Security > Authentication List* dialog, then the device operates in the role of the RADIUS client. The device forwards the users' login data to the primary authentication server. The authentication server decides whether the login data is valid and transfers the user’s authorizations to the device.

The device assigns the Service Type transferred in the response of a RADIUS server as follows to a user role existing in the device:

- **Administrative-User**: administrator
- **Login-User**: operator
- **NAS-Prompt-User**: guest

The device also lets you authenticate end devices with IEEE 802.1X through an authentication server. To do this, you assign the `radius` policy to the `8021x` list in the *Device Security > Authentication List* dialog.

The menu contains the following dialogs:

- RADIUS Global
- RADIUS Authentication Server
- RADIUS Accounting Server
- RADIUS Authentication Statistics
- RADIUS Accounting Statistics
4.4.1 RADIUS Global

This dialog lets you specify basic settings for RADIUS.

RADIUS configuration

Retransmits (max.)

Specifies how many times the device retransmits an unanswered request to the authentication server before the device sends the request to an alternative authentication server.

Possible values:
- 1..15 (default setting: 4)

Timeout [s]

Specifies how many seconds the device waits for a response after a request to an authentication server before it retransmits the request.

Possible values:
- 1..30 (default setting: 5)

Accounting

Activates/deactivates the accounting.

Possible values:
- marked (default setting)
  Accounting is active.
  The device sends the traffic data to an accounting server specified in the Network Security > RADIUS > Accounting Server dialog.
- unmarked
  Accounting is inactive.

NAS IP address (attribute 4)

Specifies the IP address that the device transfers to the authentication server as attribute 4. Specify the IP address of the device or another available address.

Possible values:
- Valid IPv4 address (default setting: 0.0.0.0)

In many cases, there is a firewall between the device and the authentication server. In the Network Address Translation (NAT) in the firewall changes the original IP address, and the authentication server receives the translated IP address of the device.

The device transfers the IP address in this field unchanged across the Network Address Translation (NAT).
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

4.4.2 RADIUS Authentication Server

This dialog lets you specify up to 8 authentication servers. An authentication server authenticates and authorizes the users when the device forwards the login data to the server.

The device sends the login data to the specified primary authentication server. When the server does not respond, the device contacts the specified authentication server that is highest in the table. When no response comes from this server either, the device contacts the next server in the table.

Table

Index
Displays the index number to which the table entry relates.

Name
Displays the name of the server.
To change the value, click the relevant field.

Possible values:
➤ Alphanumeric ASCII character string with 1..32 characters
(default setting: Default-RADIUS-Server)

Address
Specifies the IP address of the server.

Possible values:
➤ Valid IPv4 address

Destination UDP port
Specifies the number of the UDP port on which the server receives requests.

Possible values:
➤ 0..65535 (default setting: 1812)
Exception: Port 2222 is reserved for internal functions.

Secret
Displays ***** (asterisks) when you specify a password with which the device logs in to the server.
To change the password, click the relevant field.

Possible values:
➤ Alphanumeric ASCII character string with 1..64 characters

You get the password from the administrator of the authentication server.
Primary server

Specifies the authentication server as primary or secondary.

Possible values:

- marked
  The server is specified as the primary authentication server. The device sends the login data for authenticating the users to this authentication server.
  When you activate multiple servers, the device specifies the last server activated as the primary authentication server.

- unmarked (default setting)
  The server is the secondary authentication server. When the device does not receive a response from the primary authentication server, the device sends the login data to the secondary authentication server.

Active

Activates/deactivates the connection to the server.

The device uses the server, if you specify in the Device Security > Authentication List dialog the value radius in one of the rows Policy 1 to Policy 5.

Possible values:

- marked (default setting)
  The connection is active. The device sends the login data for authenticating the users to this server if the preconditions named above are fulfilled.

- unmarked
  The connection is inactive. The device does not send any login data to this server.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

- In the Index field, you specify the index number.
- In the Address field, you specify the IP address of the server.
4.4.3 RADIUS Accounting Server

This dialog lets you specify up to 8 accounting servers. An accounting server records the traffic data that has occurred during the port authentication according to IEEE 802.1X. The prerequisite is that you activate in the Network Security > RADIUS > Global menu the Accounting function.

The device sends the traffic data to the first accounting server that can be reached. When the accounting server does not respond, the device contacts the next server in the table.

</tbody>
</table>
Active

Activates/deactivates the connection to the server.

Possible values:
- marked (default setting)
  The connection is active. The device sends traffic data to this server if the preconditions named above are fulfilled.
- unmarked
  The connection is inactive. The device does not send any traffic data to this server.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.
- In the Index field, you specify the index number.
- In the Address field, you specify the IP address of the server.
4.4.4 RADIUS Authentication Statistics

This dialog displays information about the communication between the device and the authentication server. The table displays the information for each server in a separate row.

To delete the statistic, click in the Network Security > RADIUS > Global dialog the Clear RADIUS statistics? button.

Table

<table>
<thead>
<tr>

<td>Displays the number of malformed access response data packets that the device received from the server (including data packets with an invalid length).</td>
</tr>
</tbody>
</table>
Bad authenticators

Displays the number of access response data packets with an invalid authenticator that the device received from the server.

Pending requests

Displays the number of access request data packets that the device sent to the server to which it has not yet received a response from the server.

Timeouts

Displays how many times no response to the server was received before the specified waiting time elapsed.

Unknown types

Displays the number data packets with an unknown data type that the device received from the server on the authentication port.

Packets dropped

Displays the number of data packets that the device received from the server on the authentication port and then discarded them.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
4.4.5 **RADIUS Accounting Statistics**

This dialog displays information about the communication between the device and the accounting server. The table displays the information for each server in a separate row.

To delete the statistic, click in the *Network Security > RADIUS > Global* dialog the *Clear RADIUS statistics* button.

### Table

<tr>
<td>Malformed packets</td>
<td>Displays the number of malformed accounting response data packets that the device received from the server (including data packets with an invalid length).</td>
</tr>
<tr>
<td>Bad authenticators</td>
<td>Displays the number of accounting response data packets with an invalid authenticator that the device received from the server.</td>
</tr>
<tr>
<td>Pending requests</td>
<td>Displays the number of accounting request data packets that the device sent to the server to which it has not yet received a response from the server.</td>
</tr>
</tbody>
</table>
Timeouts
Displays how many times no response to the server was received before the specified waiting time elapsed.

Unknown types
Displays the number data packets with an unknown data type that the device received from the server on the accounting port.

Packets dropped
Displays the number of data packets that the device received from the server on the accounting port and then discarded them.

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.

4.5 DoS
Denial of Service (DoS) is a cyber-attack that aims to bring down specific services or devices. In this dialog you can set up several filters to help protect the device itself and other devices in the network from DoS attacks.

The menu contains the following dialogs:
► DoS Global
4.5.1 DoS Global

In this dialog, you specify the DoS settings for the TCP/UDP, IP and ICMP protocols.

**TCP/UDP**

A scanner uses port scans to prepare network attacks. The scanner uses different techniques to determine running devices and open ports. This frame lets you activate filters for specific scanning techniques.

The device supports the detection of the following scan types:
- Null scans
- Xmas scans
- SYN/FIN scans
- TCP Offset attacks
- TCP SYN attacks
- L4 Port attacks
- Minimal Header scans

**Null Scan filter**

Activates/deactivates the Null Scan filter.

The Null Scan filter detects incoming data packets with no TCP flags set and discards them.

Possible values:
- marked (default setting)
  - The filter is active.
- unmarked
  - The filter is inactive.

**Xmas filter**

Activates/deactivates the Xmas filter.

The Xmas filter detects incoming data packets with the TCP flags FIN, URG and PUSH set simultaneously and discards them.

Possible values:
- marked
  - The filter is active.
- unmarked (default setting)
  - The filter is inactive.

**SYN/FIN filter**

Activates/deactivates the SYN/FIN filter.

The SYN/FIN filter detects incoming data packets with the TCP flags SYN and FIN set simultaneously and discards them.
TCP Offset protection

Activates/deactivates the TCP Offset protection.

The TCP Offset protection detects incoming TCP data packets whose fragment offset field of the IP header is equal to 1 and discards them.

The TCP Offset protection accepts UDP and ICMP packets whose fragment offset field of the IP header is equal to 1.

Possible values:
- *marked* (default setting) The protection is active.
- *unmarked* (default setting) The protection is inactive.

TCP SYN protection

Activates/deactivates the TCP SYN protection.

The TCP SYN protection detects incoming data packets with the TCP flag SYN set and a L4 source port <1024 and discards them.

Possible values:
- *marked* (default setting) The protection is active.
- *unmarked* (default setting) The protection is inactive.

L4 Port protection

Activates/deactivates the L4 Port protection.

The L4 Port protection detects incoming TCP and UDP data packets whose source port number and destination port number are identical and discards them.

Possible values:
- *marked* (default setting) The protection is active.
- *unmarked* (default setting) The protection is inactive.

Min. Header Size filter

Activates/deactivates the Minimal Header filter.

The Minimal Header filter detects incoming data packets whose IP payload length in the IP header less the outer IP header size is smaller than the minimum TCP header size. If this is the first fragment that the device detects, then the device discards the data packet.
Possible values:

► marked
  The filter is active.
► unmarked (default setting)
  The filter is inactive.

Min. TCP header size

Displays the minimum size of a valid TCP header.

**IP**

This frame lets you activate or deactivate the Land Attack filter. With the land attack method, the attacking station sends data packets whose source and destination addresses are identical to those of the recipient. When you activate this filter, the device detects data packets with identical source and destination addresses and discards these data packets.

**Land Attack filter**

Activates/deactivates the Land Attack filter.

The Land Attack filter detects incoming IP data packets whose source and destination IP address are identical and discards them.

Possible values:

► marked
  The filter is active.
► unmarked (default setting)
  The filter is inactive.

**ICMP**

This dialog provides you with filter options for the following ICMP parameters:

► Fragmented data packets
► ICMP packets from a specific size upwards
► Broadcast pings

**Filter fragmented packets**

Activates/deactivates the filter for fragmented ICMP packets.

The filter detects fragmented ICMP packets and discards them.

Possible values:

► marked
  The filter is active.
► unmarked (default setting)
  The filter is inactive.
Filter by packet size

Activates/deactivates the filter for incoming ICMP packets.

The filter detects ICMP packets whose payload size exceeds the size specified in the **Allowed payload size [byte]** field and discards them.

Possible values:
- **marked**
  - The filter is active.
- **unmarked** (default setting)
  - The filter is inactive.

**Allowed payload size [byte]**

Specifies the maximum allowed payload size of ICMP packets in bytes.

Mark the **Filter by packet size** checkbox if you want the device to discard incoming data packets whose payload size exceeds the maximum allowed size for ICMP packets.

Possible values:
- **0..1472** (default setting: **512**)

Drop broadcast ping

Activates/deactivates the filter for Broadcast Pings. Broadcast Pings are a known evidence for Smurf Attacks.

Possible values:
- **marked**
  - The filter is active.
  - The device detects Broadcast Pings and drops them.
- **unmarked** (default setting)
  - The filter is inactive.

**Buttons**

You find the description of the standard buttons in section “**Buttons**” on page 15.

---

**4.6 DHCP Snooping**

DHCP Snooping is a function that supports the network security. DHCP Snooping monitors DHCP packets between the DHCP client and the DHCP server and acts like a firewall between the unsecured hosts and the secured DHCP servers.

In this dialog, you configure and monitor the following device properties:
- Validate DHCP packets from untrusted sources and filter out invalid packets.
- Limit DHCP data traffic from trusted and untrusted sources.
Set up and update the DHCP Snooping binding database. This database contains the MAC address, IP address, VLAN and port of DHCP clients at untrusted ports.

Validate follow-up requests from untrusted hosts on the basis of the DHCP Snooping binding database.

You can activate DHCP Snooping globally and for a specific VLAN. You specify the security status (trusted or untrusted) on individual ports. Verify that the DHCP service can be reached via trusted ports. For DHCP Snooping you typically configure the user/client ports as untrusted and the uplink ports as trusted.

The menu contains the following dialogs:

- DHCP Snooping Global
- DHCP Snooping Configuration
- DHCP Snooping Statistics
- DHCP Snooping Bindings
4.6.1 DHCP Snooping Global

This dialog lets you configure the global DHCP Snooping parameters for your device:
- Activate/deactivate DHCP Snooping globally.
- Activate/deactivate Auto-Disable globally.
- Enable/disable the checking of the source MAC address.
- Configure the name, storage location and storing interval for the binding database.

**Operation**

Enables/disables the DHCP Snooping function globally.

Possible values:
- **On**
- **Off** (default setting)

**Configuration**

Verify MAC

Activates/deactivates the source MAC address verification in the Ethernet packet.

Possible values:
- **marked**
  - The source MAC address verification is active.
  - The device compares the source MAC address with the MAC address of the client in the received DHCP packet.
- **unmarked** (default setting)
  - The source MAC address verification is inactive.

Auto-disable

Activates/deactivates the Auto-Disable function for DHCP Snooping.

Possible values:
- **marked**
  - The Auto-Disable function for DHCP Snooping is active.
  - Also mark the checkbox in the Auto-disable column on the Port tab in the Network Security > DHCP Snooping > Configuration dialog for the relevant ports.
- **unmarked** (default setting)
  - The Auto-Disable function for DHCP Snooping is inactive.
**Binding database**

**Remote file name**

Specifies the name of the file in which the device saves the DHCP Snooping binding database.

**Note:**

The device saves only dynamic bindings in the persistent binding database. The device saves static bindings in the configuration profile.

**Remote IP address**

Specifies the remote IP address under which the device saves the persistent DHCP Snooping binding database. With the value 0.0.0.0 the device saves the binding database locally.

Possible values:
- Valid IPv4 address
- 0.0.0.0 (default setting)
  The device saves the DHCP Snooping binding database locally.

**Store interval [s]**

Specifies the time delay in seconds after which the device saves the DHCP Snooping binding database when the device identifies a change in the database.

Possible values:
- 15..86400 (default setting: 300)

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
4.6.2 DHCP Snooping Configuration

This dialog lets you configure DHCP Snooping for individual ports and for individual VLANs.

The dialog contains the following tabs:

- [Port]
- [VLAN ID]

[Port]

In this tab, you configure the DHCP Snooping function for individual ports.

- Configure a port as trusted/untrusted.
- Activate/deactivate the logging of invalid packets for individual ports.
- Limit the number of DHCP packets.
- Deactivate a port automatically if the DHCP data traffic exceeds the specified limit.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

Trust

Activates/deactivates the security status (trusted, untrusted) of the port.

When this function is active, the port is configured as trusted. Typically, you have connected the trusted port to a DHCP server.

When this function is inactive, the port is configured as untrusted.

Possible values:

- **marked**
  The port is specified as trusted. DHCP Snooping forwards permissible client packets through trusted ports.

- **unmarked** (default setting)
  The port is configured as untrusted. On untrusted ports, the device compares the receiver port with the client port in the binding database.

Log

Activates/deactivates the logging of invalid packets that the device determines on this port.

Possible values:

- **marked**
  The logging of invalid packets is active.

- **unmarked** (default setting)
  The logging of invalid packets is inactive.
Rate limit

Specifies the maximum number of DHCP packets per burst interval for this port. If the number of incoming DHCP packets is currently exceeding the specified limit in a burst interval, then the device discards the additional incoming DHCP packets.

The value \(-1\) deactivates the limitation.

Possible values:
- \(-1\) (default setting)
  Deactivates the limitation of the number of DHCP packets per burst interval on this port.
- \(0..150\) packets per interval
  Limits the maximum number of DHCP packets per burst interval on this port.

You specify the burst interval in the \textit{Burst interval} column.

If you activate the auto-disable function, then the device also disables the port. You find the auto-disable function in the \textit{Auto-disable} column.

Burst interval

Specifies the length of the burst interval in seconds on this port. The burst interval is relevant for the rate limiting function.

You specify the maximum number of DHCP packets per burst interval in the \textit{Rate limit} column.

Possible values:
- \(1..15\) (default setting: 1)

Auto-disable

Activates/deactivates the \textit{Auto-Disable} function for the parameters that the \textit{DHCP Snooping} function is monitoring on the port.

Possible values:
- \textit{marked} (default setting)
  The \textit{Auto-Disable} function is active on the port.
  The prerequisite is that in the \textit{Network Security > DHCP Snooping > Global} dialog the \textit{Auto-disable} checkbox in the \textit{Configuration} frame is marked.
  - If the port receives more DHCP packets than specified in the \textit{Rate limit} field in the time specified in the \textit{Burst interval} column, then the device disables the port. The “Link status” LED for the port flashes 3× per period.
  - The \textit{Diagnostics > Ports > Auto-Disable} dialog displays which ports are currently disabled due to the parameters being exceeded.
  - The \textit{Auto-Disable} function reactivates the port automatically. For this you go to the \textit{Diagnostics > Ports > Auto-Disable} dialog and specify a waiting period for the relevant port in the \textit{Reset timer [s]} column.
- \textit{unmarked}
  The \textit{Auto-Disable} function on the port is inactive.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
[VLAN ID]

In this tab, you configure the *DHCP Snooping* function for individual VLANs.

**Table**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the VLAN ID to which the table entry relates.</td>
<td></td>
</tr>
</tbody>
</table>

**Active**

Activates/deactivates the *DHCP Snooping* function in this VLAN.

The *DHCP Snooping* function forwards valid DHCP client messages to the trusted ports in VLANs without the *Routing* function.

Possible values:

- **marked**
  - The *DHCP Snooping* function is active in this VLAN.
- **unmarked**  (default setting)
  - The *DHCP Snooping* function is inactive in this VLAN.
  - The device forwards DHCP packets according to the switching settings without monitoring the packets. The binding database remains unchanged.

**Note:** To enable DHCP Snooping for a port, enable the *DHCP Snooping* function globally in the *Network Security > DHCP Snooping > Global* dialog. Verify that you assigned the port to a VLAN in which DHCP Snooping is enabled.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
4.6.3 DHCP Snooping Statistics

With DHCP Snooping, the device logs detected errors and generates statistics. In this dialog, you monitor the DHCP Snooping statistics for each port.

The device logs the following:
- Errors detected when validating the MAC address of the DHCP client
- DHCP client messages with a detected incorrect port
- DHCP server messages to untrusted ports

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC verify failures</td>
<td>Displays the number of discrepancies between the MAC address of the DHCP client in the 'chaddr' field of the DHCP data packet and the source address in the Ethernet packet.</td>
</tr>
<tr>
<td>Invalid client messages</td>
<td>Displays the number of incoming DHCP client messages received on the port for which the device expects the client on another port according to the DHCP Snooping binding database.</td>
</tr>
<tr>
<td>Invalid server messages</td>
<td>Displays the number of DHCP server messages the device received on the untrusted port.</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

Reset

Resets the entire table.
4.6.4 DHCP Snooping Bindings

DHCP Snooping uses DHCP messages to set up and update the binding database.

- Static bindings
  The device lets you enter up to 1024 static DHCP Snooping bindings in the database.

- Dynamic bindings
  The dynamic binding database contains data for clients only on untrusted ports.

This menu lets you specify the settings for static and dynamic bindings.

- Set up new static bindings and set them to active/inactive.
- Display, activate/deactivate or delete static bindings that have been set up.

Table

<table>
<thead>
<tr>
<th>MAC address</th>
<th>Specifies the MAC address in the table entry that you bind to a IP address and VLAN ID.</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

| Remaining binding time | Displays the remaining time for the dynamic DHCP Snooping binding.                     |

| Active      | Activates/deactivates the specified static DHCP Snooping binding.                     |
Possible values:

- **marked**
  The static DHCP Snooping binding is active.

- **unmarked** (default setting)
  The static DHCP Snooping binding is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the **Create** window to add a new entry to the table.

In the **MAC address** field, you specify the MAC address which you bind to an IP address and a VLAN ID.

Removes the highlighted table entry.

The prerequisite is that the checkbox in the **Active** column is **unmarked**.

Also, the device removes the dynamic bindings of this port created with the **IP Source Guard** function.

**4.7 Dynamic ARP Inspection**

**Dynamic ARP Inspection** is a function that supports the network security. This function analyzes ARP packets, logs them, and discards invalid and hostile ARP packets.

The **Dynamic ARP Inspection** function helps prevent a range of man-in-the-middle attacks. With this kind of attack, a hostile station listens in on the data traffic from other subscribers by encroaching on the ARP cache of its unsuspecting neighbors. The hostile station sends ARP requests and ARP responses and enters the IP address of another subscriber for its own MAC address in the IP-to-MAC address relationship (binding).
Using the following measures, the Dynamic ARP Inspection function helps ensure that the device only forwards valid ARP requests and ARP responses.

- Listening in on ARP requests and ARP responses on untrusted ports.
- Verifying that the determined packets have a valid IP to MAC address relationship (binding) before the device updates the local ARP cache and before the device forwards the packets to the related destination address.
- Discarding invalid ARP packets.

The device lets you specify up to 100 active ARP ACLs (access lists). You can activate up to 20 rules for each ARP ACL.

The menu contains the following dialogs:

- Dynamic ARP Inspection Global
- Dynamic ARP Inspection Configuration
- Dynamic ARP Inspection ARP Rules
- Dynamic ARP Inspection Statistics
4.7.1 Dynamic ARP Inspection Global

Configuration

Verify source MAC

Activates/deactivates the source MAC address verification. The device executes the check in both ARP requests and ARP responses.

Possible values:

- **marked**
  - The source MAC address verification is active.
  - The device checks the source MAC address of the received ARP packets.
  - The device transmits ARP packets with a valid source MAC address to the related destination address and updates the local ARP cache.
  - The device discards ARP packets with an invalid source MAC address.

- **unmarked** (default setting)
  - The source MAC address verification is inactive.

Verify destination MAC

Activates/deactivates the destination MAC address verification. The device executes the check in ARP responses.

Possible values:

- **marked**
  - The destination MAC address verification is active.
  - The device checks the destination MAC address of the incoming ARP packets.
  - The device transmits ARP packets with a valid destination MAC address to the related destination address and updates the local ARP cache.
  - The device discards ARP packets with an invalid destination MAC address.

- **unmarked** (default setting)
  - The checking of the destination MAC address of the incoming ARP packets is inactive.

Verify IP address

Activates/deactivates the IP address verification.

In ARP requests, the device checks the source IP address. In ARP responses, the device checks the destination and source IP address.

The device designates the following IP addresses as invalid:

- 0.0.0.0
- Broadcast addresses 255.255.255.255
- Multicast addresses 224.0.0.0/4 (Class D)
- Class E addresses 240.0.0.0/4 (reserved for subsequent purposes)
- Loopback addresses in the range 127.0.0.0/8.
Possible values:

▶ marked
The IP address verification is active.
The device checks the IP address of the incoming ARP packets. The device transmits ARP packets with a valid IP address to the related destination address and updates the local ARP cache. The device discards ARP packets with an invalid IP address.

▶ unmarked (default setting)
The IP address verification is inactive.

Auto-disable
Activates/deactivates the Auto-Disable function for Dynamic ARP Inspection.

Possible values:

▶ marked
The Auto-Disable function for Dynamic ARP Inspection is active.
Also mark the checkbox in the Port column on the Auto-disable tab in the Network Security > Dynamic ARP Inspection > Configuration dialog for the relevant ports.

▶ unmarked (default setting)
The Auto-Disable function for Dynamic ARP Inspection is inactive.

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.
4.7.2 Dynamic ARP Inspection Configuration

The dialog contains the following tabs:
- [Port]
- [VLAN ID]

[Port]

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

Trust

Activates/deactivates the monitoring of ARP packets on untrusted ports.

Possible values:
- marked
  - Monitoring is active.
  - The device monitors ARP packets on untrusted ports.
  - The device immediately forwards ARP packets on trusted ports.
- unmarked (default setting)
  - Monitoring is inactive.

Rate limit

Specifies the maximum number of ARP packets per interval on this port. If the rate of incoming ARP packets is currently exceeding the specified limit in a burst interval, then the device discards the additional incoming ARP packets. You specify the burst interval in the Burst interval column.

Optionally, the device also deactivates the port if you activate the auto-disable function. You enable/disable the Auto-Disable function in the Auto-disable column.

Possible values:
- -1 (default setting)
  - Deactivates the limitation of the number of ARP packets per burst interval on this port.
- 0..300 packets per interval
  - Limits the maximum number of ARP packets per burst interval on this port.

Burst interval

Specifies the length of the burst interval in seconds on this port. The burst interval is relevant for the rate limiting function.

You specify the maximum number of ARP packets per burst interval in the Rate limit column.
Possible values:

- **1..15** (default setting: 1)

Auto-disable

Activates/deactivates the Auto-Disable function for the parameters that the Dynamic ARP Inspection function is monitoring on the port.

Possible values:

- **marked** (default setting)
  The Auto-Disable function is active on the port.
  The prerequisite is that in the Network Security > Dynamic ARP Inspection > Global dialog the Auto-disable checkbox in the Configuration frame is marked.
  - If the port receives more ARP packets than specified in the Rate limit field in the time specified in the Burst interval column, then the device disables the port. The “Link status” LED for the port flashes 3× per period.
  - The Diagnostics > Ports > Auto-Disable dialog displays which ports are currently disabled due to the parameters being exceeded.
  - The Auto-Disable function reactivates the port automatically. For this you go to the Diagnostics > Ports > Auto-Disable dialog and specify a waiting period for the relevant port in the Reset timer [s] column.

- **unmarked**
  The Auto-Disable function on the port is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**[VLAN ID]**

**Table**

**VLAN ID**

Displays the VLAN ID to which the table entry relates.

**Log**

Activates/deactivates the logging of invalid ARP packets that the device determines in this VLAN. If the device detects an error when checking the IP, source MAC or destination MAC address, or when checking the IP-to-MAC address relationship (binding), then the device identifies an ARP packet as invalid.

Possible values:

- **marked**
  The logging of invalid packets is active.
  The device registers invalid ARP packets.

- **unmarked** (default setting)
  The logging of invalid packets is inactive.
Binding check

Activates/deactivates the checking of incoming ARP packets that the device receives on untrusted ports and on VLANs for which the Dynamic ARP Inspection function is active. For these ARP packets the device checks the ARP ACL and the DHCP Snooping relationship (bindings).

Possible values:
- **marked** (default setting)
  The binding check of ARP packets is active.
- **unmarked**
  The binding check of ARP packets is inactive.

ACL strict

Activates/deactivates the strict checking of incoming ARP packets based on the ARP ACL rules specified.

Possible values:
- **marked**
  The strict checking is active.
  The device checks the incoming ARP packets based on the ARP ACL rule specified in the ARP ACL column.
- **unmarked** (default setting)
  The strict checking is inactive.
  The device checks the incoming ARP packets based on the ARP ACL rule specified in the ARP ACL column and subsequently on the entries in the DHCP Snooping database.

ARP ACL

Specifies the ARP ACL that the device uses.

Possible values:
- **<rule name>**

Active

Activates/deactivates the Dynamic ARP Inspection function in this VLAN.

Possible values:
- **marked**
  The Dynamic ARP Inspection function is active in this VLAN.
- **unmarked** (default setting)
  The Dynamic ARP Inspection function is inactive in this VLAN.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
4.7.3 Dynamic ARP Inspection ARP Rules

This dialog lets you specify rules for checking and filtering ARP packets.

**Table**

<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>Displays the name of the ARP rule.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Source IP address</strong></td>
<td>Specifies the source address of the IP data packets to which the device applies the rule.</td>
</tr>
</tbody>
</table>
| Possible values: | Valid IPv4 address  
The device applies the rule to IP data packets with the specified source address. |
| **Source MAC address** | Specifies the source address of the MAC data packets to which the device applies the rule. |
| Possible values: | Valid MAC address  
The device applies the rule to MAC data packets with the specified source address. |
| **Active** | Activates/deactivates the ARP rule. |
| Possible values: | marked (default setting)  
The rule is active.  
unmarked  
The rule is inactive. |

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

- In the Name field, you specify the name of the ARP rule.
- In the Source IP address field, you specify the source IP address of the ARP rule.
- In the Source MAC address field, you specify the source MAC address of the ARP rule.
4.7.4 Dynamic ARP Inspection Statistics

This window displays the number of discarded and forwarded ARP packets in an overview.

**Table**

**VLAN ID**
Displays the VLAN ID to which the table entry relates.

**Packets forwarded**
Displays the number of ARP packets that the device forwards after checking them using the Dynamic ARP Inspection function.

**Packets dropped**
Displays the number of ARP packets that the device discards after checking them using the Dynamic ARP Inspection function.

**DHCP drops**
Displays the number of ARP packets that the device discards after checking the DHCP Snooping relationship (binding).

**DHCP permits**
Displays the number of ARP packets that the device forwards after checking the DHCP Snooping relationship (binding).

**ACL drops**
Displays the number of ARP packets that the device discards after checking them using the ARP ACL rules.

**ACL permits**
Displays the number of ARP packets that the device forwards after checking them using the ARP ACL rules.

**Bad source MAC**
Displays the number of ARP packets that the device discards after the Dynamic ARP Inspection function detected an error in the source MAC address.

**Bad destination MAC**
Displays the number of ARP packets that the device discards after the Dynamic ARP Inspection function detected an error in the destination MAC address.
Invalid IP address

Displays the number of ARP packets that the device discards after the Dynamic ARP Inspection function detected an error in the IP address.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Resets the entire table.

4.8 ACL

In this menu, you specify the settings for the Access Control Lists (ACL). Access Control Lists contain rules which the device applies successively to the data stream on its ports or VLANs.

If a data packet complies with the criteria of one or more rules, then the device applies the action specified in the first rule that applies to the data stream. The device ignores the rules following. Possible actions include:

- **permit**: The device transmits the data packet to a port or to a VLAN.
  - When necessary, the device transmits a copy of the data packets to a further port.
- **deny**: The device drops the data packet.

In the default setting, the device forwards every data packet. Once you assign an Access Control List to an interface or VLAN, there is changing this behavior. The device enters at the end of an Access Control List an implicit Deny-All rule. Consequently, the device discards data packets that do not meet any of the rules. If you want a different behavior, then add a "permit" rule at the end of your Access Control Lists.

Proceed as follows to set up Access Control Lists and rules:
- Make a time profile if necessary. See the Network Security > ACL > Time Profile dialog. The device applies Access Control Lists with a time profile at specified times instead of permanently.
- Make a rule and specify the rule settings. See the Network Security > ACL > IPv4 Rule dialog, or the Network Security > ACL > MAC Rule dialog.
- Assign the Access Control List to the Ports and VLANs of the device. See the Network Security > ACL > Assignment dialog.

The menu contains the following dialogs:
- ACL IPv4 Rule
- ACL MAC Rule
- ACL Assignment
- ACL Time Profile
**4.8.1 ACL IPv4 Rule**

In this dialog, you specify the rules that the device applies to the IP data packets.

An Access Control List (group) contains one or more rules. The device applies the rules of an Access Control List successively, beginning with the rule with the lowest value in the Index column.

The device lets you filter according to the following criteria:
- Source or destination IP address of a data packet
- Type of the transmitting protocol
- Source or destination port of a data packet
- Classification according to DSCP
- Classification according to ToS

### Table

<table>
<thead>

| Source IP address | Specifies the source address of the IP data packets to which the device applies the rule. |
Possible values:

- **?.?.?.?** (default setting)
  The device applies the rule to IP data packets with any source address.

- **Valid IPv4 address**
  The device applies the rule to IP data packets with the specified source address.
  You use the ? character as a wild card.
  Example 192.??.32: The device applies the rule to IP data packets whose source address begins with 192. and ends with .32.

- **Valid IPv4 address/bit mask**
  The device applies the rule to IP data packets with the specified source address. The inverse bit mask lets you specify the address range with bit-level accuracy.
  Example 192.168.1.1/0.0.0.127: The device applies the rule to IP data packets with a source address in the range from 192.168.1.0 to ...127.

**Destination IP address**

Specifies the destination address of the IP data packets to which the device applies the rule.

Possible values:

- **?.?.?.?** (default setting)
  The device applies the rule to IP data packets with any destination address.

- **Valid IPv4 address**
  The device applies the rule to IP data packets with the specified destination address.
  You use the ? character as a wild card.
  Example 192.??.32: The device applies the rule to IP data packets whose source address begins with 192. and ends with .32.

- **Valid IPv4 address/bit mask**
  The device applies the rule to IP data packets with the specified destination address. The inverse bit mask lets you specify the address range with bit-level accuracy.
  Example 192.168.1.1/0.0.0.127: The device applies the rule to IP data packets with a destination address in the range from 192.168.1.0 to ...127.

**Protocol**

Specifies the protocol type of the IP data packets to which the device applies the rule.

Possible values:

- **any** (default setting)
  The device applies the rule to every IP data packet without considering the protocol type.

- **icmp**
- **igmp**
- **ip-in-ip**
- **tcp**
- **udp**
- **ip**

**Source TCP/UDP port**

Specifies the source port of the IP data packets to which the device applies the rule. The prerequisite is that you specify in the **Protocol** column the value **TCP** or **UDP**.
Possible values:
- **any** (default setting)
  The device applies the rule to every IP data packet without considering the source port.
- **1..65535**
  The device applies the rule only to IP data packets containing the specified source port.
  To specify a port range, you can use one of the following operators:
  - `<`
    Range below the specified port number
  - `>`
    Range above the specified port number
  - `!=`
    Entire port range except the specified port

**Destination TCP/UDP port**

Specifies the destination port of the IP data packets to which the device applies the rule. The prerequisite is that you specify in the *Protocol* column the value *TCP* or *UDP*.

Possible values:
- **any** (default setting)
  The device applies the rule to every IP data packet without considering the destination port.
- **1..65535**
  The device applies the rule only to IP data packets containing the specified destination port.
  To specify a port range, you can use one of the following operators:
  - `<`
    Range below the specified port number
  - `>`
    Range above the specified port number
  - `!=`
    Entire port range except the specified port

**DSCP**

Specifies the Differentiated Service Code Point (DSCP value) in the header of the IP data packets to which the device applies the rule.

Possible values:
- **-** (default setting)
  The device applies the rule to every IP data packet without considering the DSCP value.
- **0..63**
  The device applies the rule only to IP data packets containing the specified DSCP value.

**TOS priority**

Specifies the IP precedence (ToS value) in the header of the IP data packets to which the device applies the rule.

Possible values:
- **any** (default setting)
  The device applies the rule to every IP data packet without considering the ToS value.
- **0..7**
  The device applies the rule only to IP data packets containing the specified ToS value.
TOS mask

Specifies the bit mask for the ToS value in the header of the IP data packets to which the device applies the rule. The prerequisite is that you specify in the TOS priority column a ToS value.

Possible values:
- **any** (default setting)
  - The device applies the rule to IP data packets and considers the ToS value completely.
- **1..ff**
  - The device applies the rule to IP data packets and considers the bits of the ToS value specified in the bit mask.

ICMP type

Specifies the ICMP type in the TCP header of the IP data packets to which the device applies the rule.

Possible values:
- **-1** (default setting)
  - ICMP type matching is inactive.
- **0..255**
  - The device applies the rule to every IP data packet and considers the specified ICMP type.

ICMP code

Specifies the ICMP code in the TCP header of the IP data packets to which the device applies the rule. The prerequisite is that, in the ICMP type field, you specify an ICMP value.

Possible values:
- **-1** (default setting)
  - ICMP code matching is inactive.
- **0..255**
  - The device applies the rule to every IP data packet and considers the specified ICMP code.

IGMP type

Specifies the IGMP type in the TCP header of the IP data packets to which the device applies the rule.

Possible values:
- **0** (default setting)
  - IGMP type matching is inactive.
- **1..255**
  - The device applies the rule to every IP data packet and considers the specified IGMP type.

Established

Activates/deactivates applying the ACL rule to TCP data packets which have either the RST bit, or the ACK bit set in the TCP header.

Possible values:
- **marked**
  - The device applies the rule to every IP data packet in which the RST bit, or the ACK bit is set in the TCP header.
- **unmarked** (default setting)
  - Matching is inactive.
Packet fragmented

Activates/deactivates applying the ACL rule to fragmented packets.

Possible values:

- **marked**
  The device applies the ACL rule to fragmented packets.
- **unmarked** (default setting)
  Matching is inactive.

TCP flag

Specifies the TCP flag and mask value.

The device lets you enter multiple values, by separating the values with a comma.

Specify the flags as either `+` or `−`.

Possible values:

- **−** (default setting)
  TCP flag matching is inactive.
- **−**
  When you use this value in combination with the following flags, the device considers packets in which the flag is not set.
- **+**
  When you use this value in combination with the following flags, the device considers packets in which the flag is set.
- **fin**
  Indicates that the sending device has finished its transmission.
- **syn**
  Indicates that the Synchronize sequence numbers are significant. Only the first packet sent from each end device has this flag set.
- **rst**
  Indicates a reset on the link.
- **psh**
  Indicates the push function, in which a device asks to push the buffered data to the receiving application.
- **ack**
  Indicates that the Acknowledgment field is significant. Every packet, after the initial syn packet sent by the client, has this flag set.
- **urg**
  Indicates that the Urgent pointer field is significant.

Action

Specifies how the device handles received IP data packets when the device applies the rule.

Possible values:

- **permit** (default setting)
  The device transmits the IP data packets.
- **deny**
  The device drops the IP data packets.
Network Security

[Network Security > ACL > IPv4 Rule]

Redirection port

Specifies the port on which the device transmits the IP data packets. The prerequisite is that you specify in the Action column the value permit.

Possible values:

- (default setting)
  - The Redirection port function is disabled.

<Port number>
  - The device transmits the IP data packets on the specified port.

The device does not provide the option of mirroring IP data packets across VLAN boundaries or to router interfaces.

Mirror port

Specifies the port on which the device transmits a copy of the IP data packets. The prerequisite is that you specify in the Action column the value permit.

Possible values:

- (default setting)
  - The Mirror port function is disabled.

<Port number>
  - The device transmits a copy of the IP data packets on the specified port.

The device does not provide the option of mirroring IP data packets across VLAN boundaries or to router interfaces.

Assigned queue ID

Specifies the priority queue to which the device assigns the IP data packets.

Possible values:

0..7 (default setting: 0)

Log

Activates/deactivates the logging in the log file. See the Diagnostics > Report > System Log dialog.

Possible values:

marked
  - Logging is activated.
  - The prerequisite is that you assign the Access Control List in the Network Security > ACL > Assignment dialog to a VLAN or port.
  - The device registers in the log file, in an interval of 30 s, how many times it applied the deny rule to IP data packets.

unmarked (default setting)
  - Logging is deactivated.

The device lets you activate this function for up to 128 deny rules.

Time profile

Specifies whether the device applies the rule permanently or time-controlled.
Possible values:

- `<empty>` (default setting)
  - The device applies the rule permanently.
- `[Time Profile]`
  - The device applies the rule only at the times specified in the time profile. You edit the time profile in the `Network Security > ACL > Time Profile` dialog.

**Rate limit**

Specifies the limit for the data transfer rate for the port specified in the `Redirection port` column. The limit applies to the summary of the data sent and received.

This function limits the data stream on the port or in the VLAN:

Possible values:

- `0` (default setting)
  - No limitation of the data transfer rate.
- `1..4294967295`
  - If the data transfer rate on the port exceeds the value specified, then the device discards surplus IP data packets. The prerequisite is that you specify in the `Burst size` column a value > 0. You specify the measurement unit of the limit in the `Unit` column.

**Unit**

Specifies the measurement unit for the data transfer rate specified in the `Rate limit` column.

Possible values:

- `kbps` (default setting)
  - kByte per second
- `pps`
  - Data packet per second

**Burst size**

Specifies the limit in KByte for the data volume during temporary bursts.

Possible values:

- `0` (default setting)
  - No limitation of the data volume.
- `1..128`
  - If during temporary bursts on the port the data volume exceeds the value specified, then the device discards surplus MAC data packets. The prerequisite is that you specify in the `Rate limit` column a value > 0.

Recommendation:

- If the bandwidth is known:
  - \( \text{Burst size} = \text{bandwidth} \times \text{allowed duration of a burst} / 8. \)
- If the bandwidth is unknown:
  - \( \text{Burst size} = 10 \times \text{MTU} \) (Maximum Transmission Unit) of the port.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Oops the Create window to add a new entry to the table.

► In the Group name field, you specify the name of the Access Control List to which the rule belongs.

► In the Index field, you specify the number of the rule within the Access Control List. If the Access Control List contains multiple rules, then the device processes the rule with the lowest value first.
4.8.2 ACL MAC Rule

In this dialog, you specify the rules that the device applies to the MAC data packets.

An Access Control List (group) contains one or more rules. The device applies the rules of an Access Control List successively, beginning with the rule with the lowest value in the Index column.

The device lets you filter according to the following criteria:
- Source or destination MAC address of a data packet
- Type of the transmitting protocol
- Membership of a specific VLAN
- Service class of a data packet

Table

<table>
<thead>
<tr>
<th>Group name</th>
<th>Displays the name of the Access Control List. The Access Control List contains the rules.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Index</td>
<td>Displays the number of the rule within the Access Control List. If the Access Control List contains multiple rules, then the device processes the rule with the lowest value first.</td>
</tr>
</tbody>
</table>
| Match every packet | Specifies to which MAC data packets the device applies the rule. Possible values:  
  - marked (default setting)  
    The device applies the rule to every MAC data packet.  
    The device ignores the value in the fields Source MAC address, Destination MAC address, Ethertype, Ethertype custom value, VLAN ID, and COS.  
  - unmarked  
    The device applies the rule to MAC data packets depending on the value in the fields Source MAC address, Destination MAC address, Ethertype, Ethertype custom value, VLAN ID, and COS.  
| Source MAC address | Specifies the source address of the MAC data packets to which the device applies the rule. |
Network Security

[Network Security > ACL > MAC Rule]

Possible values:

- **??:??:??:??:??:?? (default setting)**
  The device applies the rule to MAC data packets with any source address.

- **Valid MAC address**
  The device applies the rule to MAC data packets with the specified source address.
  You use the ? character as a wild card.
  Example **00:11:??:??:??:??**: The device applies the rule to MAC data packets whose source address begins with **00:11**.

- **Valid MAC address/bit mask**
  The device applies the rule to MAC data packets with the specified source address. The bit mask lets you specify the address range with bit-level accuracy.
  Example **00:11:22:33:44:54/FF:FF:FF:FF:FF:FC**: The device applies the rule to MAC data packets with a source address in the range from **00:11:22:33:44:54** to **…:57**.

**Destination MAC address**

Specifies the destination address of the MAC data packets to which the device applies the rule.

Possible values:

- **??:??:??:??:??:?? (default setting)**
  The device applies the rule to MAC data packets with any destination address.

- **Valid MAC address**
  The device applies the rule to MAC data packets with the specified destination address.
  You use the ? character as a wild card.
  Example **00:11:??:??:??:??**: The device applies the rule to MAC data packets whose destination address begins with **00:11**.

- **Valid MAC address/bit mask**
  The device applies the rule to MAC data packets with the specified source address. The bit mask lets you specify the address range with bit-level accuracy.
  Example **00:11:22:33:44:54/FF:FF:FF:FF:FF:FC**: The device applies the rule to MAC data packets with a destination address in the range from **00:11:22:33:44:54** to **…:57**.

**Ethertype**

Specifies the Ethertype keyword of the MAC data packets to which the device applies the rule.

Possible values:

- **custom** (default setting)
  The device applies the value specified in the Ethertype custom value column.
- **appletalk**
- **arp**
- **ibmsna**
- **ipv4**
- **ipv6**
- **ipxold**
- **mplsmcast**
- **mplsucast**
- **netbios**
- **novell**
- **rarp**
- **pppoe**
**Ethertype custom value**

Specifies the Ethertype value of the MAC data packets to which the device applies the rule. The prerequisite is that in the *Ethertype* column the value *custom* is specified.

Possible values:
- **any** (default setting)
  The device applies the rule to every MAC data packet without considering the Ethertype value.
- **600..ffff**
  The device applies the rule only to MAC data packets containing the Ethertype value specified here.

**VLAN ID**

Specifies the VLAN ID of the MAC data packets to which the device applies the rule.

Possible values:
- **0** (default setting)
  The device applies the rule to every MAC data packet without considering the VLAN ID.
- **1..4042**

**COS**

Specifies the Class of Service (COS) value of the MAC data packets to which the device applies the rule.

Possible values:
- **0..7**
- **any** (default setting)
  The device applies the rule to every MAC data packet without considering the Class of Service value.

**Note:** For data packets without a VLAN tag, the device uses the port priority instead of the COS value.

**Action**

Specifies how the device handles received MAC data packets when the device applies the rule.

Possible values:
- **permit** (default setting)
  The device transmits the MAC data packets.
- **deny**
  The device discards the MAC data packets.

**Redirection port**

Specifies the port on which the device transmits the MAC data packets. The prerequisite is that in the *Action* column the value *permit* is specified.
Possible values:
▶ – (default setting)
  The \textit{Redirection port} function is disabled.
▶ \textless Port number\textgreater
  The device transmits the MAC data packets on the specified port.

The device does not provide the option of mirroring IP data packets across VLAN boundaries or to router interfaces.

\textbf{Mirror port}

Specifies the port on which the device transmits a copy of the MAC data packets. The prerequisite is that in the \textit{Action} column the value \textit{permit} is specified.

Possible values:
▶ – (default setting)
  The \textit{Mirror port} function is disabled.
▶ \textless Port number\textgreater
  The device transmits a copy of the MAC data packets on the specified port.

The device does not provide the option of mirroring IP data packets across VLAN boundaries or to router interfaces.

\textbf{Assigned queue ID}

Specifies the ID of the priority queue on which the device transmits the MAC data packets.

Possible values:
▶ 0..7 (default setting: 0)

\textbf{Log}

Activates/deactivates the logging in the log file. See the \textit{Diagnostics > Report > System Log} dialog.

Possible values:
▶ \textit{marked}
  Logging is activated.

  The prerequisite is that you assign the Access Control List in the \textit{Network Security > ACL > Assignment} dialog to a VLAN or port.

  The device registers in the log file, in an interval of 30 s, how many times it applied the deny rule to MAC data packets.
▶ \textit{unmarked} (default setting)
  Logging is deactivated.

The device lets you activate this function for up to 128 deny rules.

\textbf{Time profile}

Specifies whether the device applies the rule permanently or time-controlled.
Possible values:

- `<empty>` (default setting)
  The device applies the rule permanently.
- `[Time Profile]`
  The device applies the rule only at the times specified in the time profile. You edit the time profile in the `Network Security > ACL > Time Profile` dialog.

**Rate limit**

Specifies the limit for the data transfer rate for the port specified in the `Redirection port` column. The limit applies to the summary of the data sent and received.

This function limits the data stream on the port or in the VLAN:

Possible values:

- `0` (default setting)
  No limitation of the data transfer rate.
- `1..4294967295`
  If the data transfer rate on the port exceeds the value specified, then the device discards surplus MAC data packets. The prerequisite is that you specify in the `Burst size` column a value > 0. You specify the measurement unit of the limit in the `Unit` column.

**Unit**

Specifies the unit of measurement for the data transfer rate specified in the `Rate limit` column.

Possible values:

- `kbps` (default setting)
  kByte per second
- `pps`
  Data packet per second

**Burst size**

Specifies the limit in KByte for the data volume during temporary bursts.

Possible values:

- `0` (default setting)
  No limitation of the data volume.
- `1..128`
  If during temporary bursts on the port the data volume exceeds the value specified, then the device discards surplus MAC data packets. The prerequisite is that you specify in the `Rate limit` column a value > 0.

Recommendation:

- If the bandwidth is known:
  \[ \text{Burst size} = \text{bandwidth} \times \text{allowed duration of a burst} \div 8. \]
- If the bandwidth is unknown:
  \[ \text{Burst size} = 10 \times \text{MTU} \text{ (Maximum Transmission Unit) of the port}. \]
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

- In the Group name field, you specify the name of the Access Control List to which the rule belongs.
- In the Index field, you specify the number of the rule within the Access Control List. If the Access Control List contains multiple rules, then the device processes the rule with the lowest value first.
4.8.3 ACL Assignment

This dialog lets you assign one or more Access Control Lists to the ports and VLANs of the device. By assigning a priority you specify the processing sequence, provided you assign one or more Access Control Lists to a port or VLAN.

The device applies rules successively, namely in the sequence specified by the rule index. You specify the priority of a group in the Priority column. The lower the number, the higher the priority. In this process, the device applies the rules with a high priority before the rules with a low priority.

The assignment of Access Control Lists to ports and VLANs results in the following different types of ACL:
- Port-based IPv4-ACLs
- Port-based MAC ACLs
- VLAN-based IPv4 ACLs
- VLAN-based MAC ACLs

Note: Before you enable the function, verify that at least one active entry in the table lets you access. Otherwise, the connection to the device terminates if you change the settings. To access the device management is possible only using the CLI through the serial interface of the device.

Table

| Group name | Displays the name of the Access Control List. The Access Control List contains the rules. |
| Type | Displays whether the Access Control List contains MAC rules or IPv4 rules. Possible values: |
| mac | The Access Control List contains MAC rules. |
| ip | The Access Control List contains IPv4 rules. |
| Port | Displays the port to which the Access Control List is assigned. The field remains empty when the Access Control List is assigned to a VLAN. |
| VLAN ID | Displays the VLAN to which the Access Control List is assigned. The field remains empty when the Access Control List is assigned to a port. |
Direction
Displays that the device applies the Access Control List to received data packets.

Priority
Displays the priority of the Access Control List.
Using the priority, you specify the sequence in which the device applies the Access Control Lists to the data stream. The device applies the rules in ascending order starting with priority 1.
Possible values:
- 1..4294967295
If an Access Control List is assigned to a port and to a VLAN with the same priority, then the device applies the rules to the port first.

Active
Activates/deactivates the Access Control List on the port or in the VLAN.
Possible values:
- marked (default setting)
  The Access Control List is active.
- unmarked
  The Access Control List is inactive.

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create dialog to assign a rule to a port or a VLAN.
- In the Port/VLAN field, you specify the port or the VLAN ID.
- In the Priority field, you specify the source MAC address of the ARP rule.
- In the Direction field, you specify the data packets to which the device applies the rule.
- In the Group name filed, you specify which rule the device assigns to the port or VLAN.
4.8.4 ACL Time Profile

This dialog lets you edit time profiles. If you assign a time profile to a MAC or IPv4 rule, then the device applies the rule at the times specified in the time profile. If no time profile is assigned, the device applies the rule permanently.

The device lets you create up to 100 time profiles with up to 10 time periods.

The device applies the MAC and IPv4 rules during the time specified within the time period.
- If you specify the time periods using the **Absolute** option, then the device applies the rule one time.
- If you specify the time periods using the **Periodic** option, then the device applies the rule recurrently.

The implied Deny-All rule of the ACLs is constantly valid independently of the time control.

Table

**Note:** If you reconfigure a time period, then first specify the end time and then the start time. Otherwise, the dialog displays an error message.

<table>
<thead>
<tr>
<th>Profile name</th>
<th>Displays the name of the time profile. The time profile contains the time periods.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Index</td>
<td>Displays the number of the time period within the time profile. The device automatically assigns this number.</td>
</tr>
<tr>
<td>Absolute</td>
<td></td>
</tr>
<tr>
<td>Start date</td>
<td>Specifies the date at which the device starts to apply the one-time rule.</td>
</tr>
<tr>
<td>Possible values:</td>
<td><strong>YYYY-MM-DD</strong> or <strong>DD.MM.YY</strong> (depending on the language preferences of your web browser)</td>
</tr>
<tr>
<td>Start time</td>
<td>Specifies the time at which the device starts to apply the one-time rule.</td>
</tr>
<tr>
<td>Possible values:</td>
<td><strong>hh:mm</strong> Hour:Minute</td>
</tr>
<tr>
<td>End date</td>
<td>Specifies the date at which the device terminates the one-time rule.</td>
</tr>
</tbody>
</table>
Possible values:
- YYYY-MM-DD or DD.MM.YY
  (depending on the language preferences of your web browser)

End time
Specifies the time at which the device terminates the one-time rule.

Possible values:
- hh:mm
  Hour:Minute

Periodic
Starting days
Specifies the days of the week on which the device periodically starts to apply the rule.

Possible values:
- Sun
- Mon
- Tue
- Wed
- Thu
- Fri
- Sat

Start time
Specifies the time at which the device periodically starts to apply the rule.

Possible values:
- hh:mm
  Hour:Minute

Ending days
Specifies the days of the week on which the device periodically terminates the rule.

Possible values:
- Sun
- Mon
- Tue
- Wed
- Thu
- Fri
- Sat

End time
Specifies the time at which the device periodically terminates the rule.
Possible values:

- hh:mm
  Hour:Minute

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the *Create* dialog to create a new time period.

- In the **Profile name** field, you specify the name of the time profile to which the time period belongs.
- In the **Type** field, you specify the type of time period.
  - With the *Periodic* radio button, you specify a time period at which the device activates the recurring rule.
  - With the *Absolute* radio button, you specify a time period at which the device activates the rule one time. Within every time profile, exactly one such time period is allowed.
- In the **Start** frame, you specify the time at which the device starts to apply the rule.
- In the **End** frame, you specify the time at which the device terminates to apply the rule.
5 Switching

The menu contains the following dialogs:
- Switching Global
- Rate Limiter
- Filter for MAC Addresses
- IGMP Snooping
- MRP-IEEE
- GARP
- QoS/Priority
- VLAN
- L2-Redundancy

5.1 Switching Global

This dialog lets you specify the following settings:
- Change the Aging time of the address table
- Enable the flow control in the device
- Enable the VLAN Unaware Mode

If a large number of data packets are received in the priority queue of a port at the same time, then this can cause the port memory to overflow. This happens, for example, when the device receives data on a Gigabit port and forwards it to a port with a lower bandwidth. The device discards surplus data packets.

The flow control mechanism described in standard IEEE 802.3 helps ensure that no data packets are lost due to a port memory overflowing. Shortly before a port memory is completely full, the device signals to the connected devices that it is not accepting any more data packets from them.
- In full-duplex mode, the device sends a pause data packet.
- In half-duplex mode, the device simulates a collision.

Then the connected devices do not send any more data packets for as long as the signaling takes. On uplink ports, this can possibly cause undesired sending breaks in the higher-level network segment (“wandering backpressure”).

According to standard IEEE 802.1Q, the device forwards data packets with a VLAN tag in a VLAN ≥ 1. However, a small number of applications on connected end devices send or receive data packets with a VLAN ID=0. When the device receives one of these data packets, before forwarding it the device overwrites the original value in the data packet with the VLAN ID of the receiving port. If you activate the VLAN Unaware Mode, then this deactivates the VLAN settings in the device. The device then transparently forwards the data packets and evaluates the priority information contained only in the data packet.

Configuration

MAC address

Displays the MAC address of the device.
Aging time [s]

Specifies the aging time in seconds.

Possible values:

- 10..500000  (default setting: 30)

The device monitors the age of the learned unicast MAC addresses. The device deletes address entries that exceed a particular age (aging time) from its address table.

You find the address table in the Switching > Filter for MAC Addresses dialog.

In connection with the router redundancy, specify a time ≥ 30 s.

Flow control

Activates/deactivates the flow control in the device.

Possible values:

- marked
  The flow control is active in the device.
  Additionally activate the flow control on the required ports. See the Basic Settings > Port dialog, Configuration tab, checkbox in the Flow control column.
- unmarked  (default setting)
  The flow control is inactive in the device.

If you are using a redundancy function, then deactivate the flow control on the participating ports. If the flow control and the redundancy function are active at the same time, it is possible that the redundancy function operates differently than intended.

VLAN unaware mode

Activates/deactivates the VLAN unaware mode.

Possible values:

- marked
  The VLAN unaware mode is active.
  The device works in the VLAN Unaware bridging mode (802.1Q):
  - The device ignores the VLAN settings in the device and the VLAN tags in the data packets.
  - The device transmits the data packets based on their destination MAC address or destination IP address in VLAN 1.
  - The device ignores the VLAN settings specified in the Switching > VLAN > Configuration and Switching > VLAN > Port dialogs. Every port is assigned to VLAN 1.
  - The device evaluates the priority information contained in the data packet.

Note: You specify the VLAN ID 1 for every function in the device which uses VLAN settings. Among other things, this applies to static filters, MRP and IGMP Snooping.

- unmarked  (default setting)
  The VLAN unaware mode is inactive.
  The device works in the VLAN-aware bridging mode (802.1Q):
  - The device evaluates the VLAN tags in the data packets.
  - The device transmits the data packets based on their destination MAC address or destination IP address in the corresponding VLAN.
  - The device evaluates the priority information contained in the data packet.
**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.2 Rate Limiter

The device lets you limit the traffic on the ports in order to help provide stable operation even with a large traffic volume. If the traffic on a port exceeds the traffic value entered, then the device discards the excess traffic on this port.

The rate limiter function operates only on Layer 2, and is used to limit the effects of storms of data packets that flood the device (typically Broadcasts).

The rate limiter function ignores protocol information on higher levels, such as IP or TCP.

The dialog contains the following tabs:
- [Ingress]
- [Egress]

**Ingress**

In this tab, you enable the Rate Limiter function. The threshold value specifies the maximum amount of traffic the port receives. If the traffic on this port exceeds the threshold value, then the device discards the excess traffic on this port.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

**Threshold unit**

Specifies the unit for the threshold value:

Possible values:
- **percent** (default setting)
  - Specifies the threshold value as a percentage of the data rate of the port.
- **pps**
  - Specifies the threshold value in data packets per second.

**Broadcast mode**

Activates/deactivates the rate limiter function for received broadcast data packets.

Possible values:
- **marked**
- **unmarked** (default setting)

If the threshold value is exceeded, then the device discards the excess broadcast data packets on this port.
Broadcast threshold

Specifies the threshold value for received broadcasts on this port.

Possible values:

- `0..14880000` (default setting: 0)
  - The value 0 deactivates the rate limiter function on this port.
  - If you select the value `percent` in the Threshold unit column, then enter a percentage value from 0 to 100.
  - If you select the value `pps` in the Threshold unit column, then enter an absolute value for the data rate.

Multicast mode

Activates/deactivates the rate limiter function for received multicast data packets.

Possible values:

- `marked`
- `unmarked` (default setting)

If the threshold value is exceeded, then the device discards the excess multicast data packets on this port.

Multicast threshold

Specifies the threshold value for received multicasts on this port.

Possible values:

- `0..14880000` (default setting: 0)
  - The value 0 deactivates the rate limiter function on this port.
  - If you select the value `percent` in the Threshold unit column, then enter a percentage value from 0 to 100.
  - If you select the value `pps` in the Threshold unit column, then enter an absolute value for the data rate.

Unknown unicast mode

Activates/deactivates the rate limiter function for received unicast data packets with an unknown destination address.

Possible values:

- `marked`
- `unmarked` (default setting)

If the threshold value is exceeded, then the device discards the excess unicast data packets on this port.

Unicast threshold

Specifies the threshold value for received unicasts with an unknown destination address on this port.
Possible values:

- **0..14880000** (default setting: 0)
  - The value 0 deactivates the rate limiter function on this port.
  - If you select the value *percent* in the *Threshold unit*, then enter a percentage value from 0 to 100.
  - If you select the value *pps* in the *Threshold unit* column, then enter an absolute value for the data rate.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**[Egress]**

In this tab, you specify the egress transmission rate on the port.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth [%]</td>
<td>Specifies the egress transmission rate.</td>
</tr>
</tbody>
</table>

Possible values:

- **0** (default setting)
  - The bandwidth limitation is disabled.
- **1..100**
  - The bandwidth limitation is enabled.
  - This value specifies the percentage of overall link speed for the port in 1% increments.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
5.3 Filter for MAC Addresses

This dialog lets you display and edit address filters for the address table. Address filters specify the way the data packets are forwarded in the device based on the destination MAC address.

Each row in the table represents one filter. The device automatically sets up the filters. The device lets you set up additional filters manually.

The device transmits the data packets as follows:
- When the table contains an entry for the destination address of a data packet, the device transmits the data packet from the receiving port to the port specified in the table entry.
- When there is no table entry for the destination address, the device transmits the data packet from the receiving port to every other port.

Table

To delete the learned MAC addresses from the address table, click in the Basic Settings > Restart dialog the Reset MAC address table button.

Address

Displays the destination MAC address to which the table entry applies.

VLAN ID

Displays the ID of the VLAN to which the table entry applies.

The device learns the MAC addresses for every VLAN separately (independent VLAN learning).

Status

Displays how the device has set up the address filter.

Possible values:
- **learned**
  Address filter set up automatically by the device based on received data packets.
- **permanent**
  Address filter set up manually. The address filter stays set up permanently.
- **IGMP**
  Address filter automatically set up by IGMP Snooping.
- **mgmt**
  MAC address of the device. The address filter is protected against changes.
- **MRP~MMRP**
  Multicast address filter automatically set up by MMRP.
- **GMRP**
  Multicast address filter automatically set up by GMRP.

<Port number>

Displays how the corresponding port transmits data packets which it directs to the adjacent destination address.
Possible values:

- The port does not transmit any data packets to the destination address.
- **learned**
  The port transmits data packets to the destination address. The device created the filter automatically based on received data packets.
- **IGMP learned**
  The port transmits data packets to the destination address. The device created the filter automatically based on IGMP.
- **unicast static**
  The port transmits data packets to the destination address. A user created the filter.
- **multicast static**
  The port transmits data packets to the destination address. A user created the filter.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

Opens the *Create* window to add a new entry to the table.

- In the *Address* field, you specify the destination MAC address.
- In the *VLAN ID* field, you specify the ID of the VLAN.
- In the *Port* field, you specify the port.
  - Select one port if the destination MAC address is a unicast address.
  - Select one or more ports if the destination MAC address is a multicast address.
  - Select no port to create a discard filter. The device discards data packets with the destination MAC address specified in the table entry.

**Reset MAC address table**

Removes the MAC addresses from the forwarding table that have the value **learned** in the *Status* column.
5.4 IGMP Snooping

The Internet Group Management Protocol (IGMP) is a protocol for dynamically managing Multicast groups. The protocol describes the distribution of Multicast data packets between routers and end devices on Layer 3.

The device lets you use the IGMP Snooping function to also use the IGMP mechanisms on Layer 2:
- Without IGMP Snooping, the device transmits the Multicast data packets to every port.
- With the activated IGMP Snooping function, the device transmits the Multicast data packets only on ports to which Multicast receivers are connected. This reduces the network load. The device evaluates the IGMP data packets transmitted on Layer 3 and uses the information on Layer 2.

☐ Activate the IGMP Snooping function not until the following conditions are fulfilled:
  - There is a Multicast router in the network that creates IGMP queries (periodic queries).
  - The devices participating in IGMP Snooping forward the IGMP queries.

The device links the IGMP reports with the entries in its address table. When a multicast receiver joins a multicast group, the device creates a table entry for this port in the Switching > Filter for MAC Addresses dialog. When the multicast receiver leaves the multicast group, the device removes the table entry.

The menu contains the following dialogs:
- IGMP Snooping Global
- IGMP Snooping Configuration
- IGMP Snooping Enhancements
- IGMP Snooping Querier
- IGMP Snooping Multicasts
5.4.1 IGMP Snooping Global

This dialog lets you enable the IGMP Snooping protocol in the device and also configure it for each port and each VLAN.

**Operation**

Enables/disables the IGMP Snooping function in the device.

Possible values:

- **On**
  The IGMP Snooping function is enabled in the device according to RFC 4541 (Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches).

- **Off** (default setting)
  The IGMP Snooping function is disabled in the device.
  Received data packets with a Multicast destination address are transmitted to every port by the device.

**Information**

Multicast control packets processed

Displays the number of Multicast control data packets processed.

This statistic encompasses the following packet types:

- IGMP Reports
- IGMP Queries version V1
- IGMP Queries version V2
- IGMP Queries version V3
- IGMP Queries with an incorrect version
- PIM or DVMRP packets

The device uses the Multicast control data packets to create the address table for transmitting the Multicast data packets.

Possible values:

- `0..2^{31} - 1`

You use the `Reset IGMP snooping data` button in the Basic Settings > Restart dialog or the command `clear igmp-snooping` using the Command Line Interface to reset the IGMP Snooping entries, including the counter for the processed multicast control data packets.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset IGMP snooping counters

Removes the IGMP Snooping entries and resets the counter in the Information frame to 0.
5.4.2 IGMP Snooping Configuration

This dialog lets you enable the IGMP Snooping function in the device and also configure it for each port and each VLAN.

The dialog contains the following tabs:
- [VLAN ID]
- [Port]

[VLAN ID]

In this tab, you configure the IGMP Snooping function for every VLAN.

Table

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Displays the ID of the VLAN to which the table entry applies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates/deactivates the IGMP Snooping function for this VLAN.</td>
</tr>
<tr>
<td></td>
<td>The prerequisite is that the IGMP Snooping function is globally enabled.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>ʌ marked  IGMP Snooping is activated for this VLAN. The VLAN has joined the Multicast data stream.</td>
</tr>
<tr>
<td></td>
<td>ʌ unmarked (default setting)  IGMP Snooping is deactivated for this VLAN. The VLAN has left the Multicast data stream.</td>
</tr>
</tbody>
</table>

Group membership interval

Specifies the time in seconds for which a VLAN from a dynamic Multicast group remains entered in the address table when the device does not receive any more report data packets from the VLAN.

Specify a value larger than the value in the Max. response time column.

Possible values:
- 2..3600  (default setting: 260)

Max. response time

Specifies the time in seconds in which the members of a multicast group should respond to a query data packet. For their response, the members specify a random time within the response time. You thus help prevent the multicast group members from responding to the query at the same time.

Specify a value smaller than the value in the Group membership interval column.
Possible values:

- 1..25 (default setting: 10)

Fast leave admin mode

Activates/deactivates the Fast Leave function for this VLAN.

Possible values:

- marked
  - When the Fast Leave function is active and the device receives an IGMP Leave message from a multicast group, the device immediately removes the entry from its address table.
- unmarked (default setting)
  - When the Fast Leave function is inactive, the device first sends MAC-based queries to the members of the multicast group and removes an entry when a VLAN does not send any more report messages.

MRP expiration time

Multicast Router Present Expiration Time. Specifies the time in seconds for which the device waits for a query on this port that belongs to a VLAN. When the port does not receive a query data packet, the device removes the port from the list of ports with connected multicast routers.

You have the option of configuring this parameter only if the port belongs to an existing VLAN.

Possible values:

- 0
  - unlimited timeout - no expiration time
- 1..3600 (default setting: 260)

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.

[Port]

In this tab, you configure the IGMP Snooping function for every port.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates/deactivates the IGMP Snooping function for this port.</td>
</tr>
</tbody>
</table>

The prerequisite is that the IGMP Snooping function is globally enabled.
Switching
[Switching > IGMP Snooping > Configuration]

Possible values:
- **marked**
  - IGMP Snooping is active on this port. The device includes the port in the multicast data stream.
- **unmarked** (default setting)
  - IGMP Snooping is inactive on this port. The port left the multicast data stream.

Group membership interval

Specifies the time in seconds for which a port, from a dynamic multicast group, remains entered in the address table when the device does not receive any more report data packets from the port.

Possible values:
- **2..3600** (default setting: 260)

Specify the value larger than the value in the Max. response time column.

Max. response time

Specifies the time in seconds in which the members of a multicast group should respond to a query data packet. For their response, the members specify a random time within the response time. You thus help prevent the multicast group members from responding to the query at the same time.

Possible values:
- **1..25** (default setting: 10)

Specify a value lower than the value in the Group membership interval column.

MRP expiration time

Specifies the Multicast Router Present Expiration Time. The MRP expiration time is the time in seconds for which the device waits for a query packet on this port. When the port does not receive a query data packet, the device removes the port from the list of ports with connected multicast routers.

Possible values:
- **0**
  - unlimited timeout - no expiration time
- **1..3600** (default setting: 260)

Fast leave admin mode

Activates/deactivates the Fast Leave function for this port.

Possible values:
- **marked**
  - When the Fast Leave function is active and the device receives an IGMP Leave message from a multicast group, the device immediately removes the entry from its address table.
- **unmarked** (default setting)
  - When the Fast Leave function is inactive, the device first sends MAC-based queries to the members of the multicast group and removes an entry when a port does not send any more report messages.

Static query port

Activates/deactivates the Static query port mode.
Possible values:

- **marked**
  - The Static query port mode is active.
  - The port is a static query port in the VLANs that are set up.
  - If you use the Redundant Coupling Protocol function and the device operates as slave, then do not activate the Static query port mode for the ports on the secondary ring/network.

- **unmarked** (default setting)
  - The Static query port mode is inactive.
  - The port is not a static query port. The device transmits IGMP report messages to the port only if it receives IGMP queries.

**VLAN IDs**

Displays the ID of the VLANs to which the table entry applies.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.4.3 IGMP Snooping Enhancements

This dialog lets you select a port for a VLAN ID and to configure the port.

**Table**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Displays the ID of the VLAN to which the table entry applies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Port number&gt;</td>
<td>Displays for every VLAN set up in the device whether the relevant port is a query port. Additionally, the field displays whether the device transmits every Multicast stream in the VLAN to this port.</td>
</tr>
</tbody>
</table>

Possible values:

- The port is not a query port in this VLAN.
- L = Learned
  The device detected the port as a query port because the port received IGMP queries in this VLAN. The port is not a statically configured query port.
- A = Automatic
  The device detected the port as a query port. The prerequisite is that you configure the port as Learn by LLDP.
- S = Static (manual setting)
  A user specified the port as a static query port. The device transmits IGMP reports only to ports on which it previously received IGMP queries – and to statically configured query ports.
  To assign this value, proceed as follows:
  - Open the Wizard window.
  - On the Configuration page, mark the Static checkbox.
- P = Learn by LLDP (manual setting)
  A user specified the port as Learn by LLDP.
  With the Link Layer Discovery Protocol (LLDP), the device detects Hirschmann devices connected directly to the port. The device denotes the detected query ports with A.
  To assign this value, proceed as follows:
  - Open the Wizard window.
  - On the Configuration page, mark the Learn by LLDP checkbox.
- F = Forward All (manual setting)
  A user specified the port so that the device transmits every received Multicast stream in the VLAN to this port. Use this setting for diagnostics purposes, for example.
  To assign this value, proceed as follows:
  - Open the Wizard window.
  - On the Configuration page, mark the Forward all checkbox.
Display categories

Enhances the clarity of the display. The table emphasizes the cells which contain the specified value. This helps to analyze and sort the table according to your needs.

- **Learned (L)**
  The table displays cells which contain the value L and possibly further values. Cells which contain other values than L only, the table displays with the “-” symbol.

- **Static (S)**
  The table displays cells which contain the value S and possibly further values. Cells which contain other values than S only, the table displays with the “-” symbol.

- **Automatic (A)**
  The table displays cells which contain the value A and possibly further values. Cells which contain other values than A only, the table displays with the “-” symbol.

- **Learned by LLDP (P)**
  The table displays cells which contain the value P and possibly further values. Cells which contain other values than P only, the table displays with the “-” symbol.

- **Forward all (F)**
  The table displays cells which contain the value F and possibly further values. Cells which contain other values than F only, the table displays with the “-” symbol.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the **Wizard** window that helps you to select and configure the ports.

**[Selection VLAN/Port (Wizard)]**

On the **Selection VLAN/Port** page you assign a VLAN ID to port.

On the **Configuration** page you specify the settings for the port.

After closing the **Wizard** window, click the **✓** button to save your settings.

**[Selection VLAN/Port (Wizard) – Selection VLAN/Port]**

**VLAN ID**

Select the ID of the VLAN.

Possible values:

- **1..4042**

**Port**

Select the port.
Possible values:

- <Port number>

[Selection VLAN/Port (Wizard) – Configuration]

VLAN ID

Displays the ID of the selected VLAN.

Port

Displays the number of the selected port.

Static

Specifies the port as a static query port in the VLANs that are set up. The device transmits IGMP report messages to the ports at which it receives IGMP queries. This lets you also transmit IGMP report messages to other selected ports (enable) or connected Hirschmann devices (Automatic).

Learn by LLDP

Specifies the port as Learn by LLDP. Lets the device detect directly connected Hirschmann devices using LLDP and learn the related ports as a query port.

Forward all

Specifies the port as Forward all. With the Forward all setting, the device transmits at this port every data packet with a Multicast address in the destination address field.
5.4.4 IGMP Snooping Querier

The device lets you send a Multicast stream only to those ports to which a Multicast receiver is connected.

To determine which ports Multicast receivers are connected to, the device sends query data packets to the ports at a definable interval. When a Multicast receiver is connected, it joins the Multicast stream by responding to the device with a report data packet.

This dialog lets you configure the Snooping Querier settings globally and for the VLANs that are set up.

**Operation**

operation

Enables/disables the IGMP Querier function globally in the device.

Possible values:

- **On**
- **Off** (default setting)

**Configuration**

In this frame you specify the IGMP Snooping Querier settings for the general query data packets.

**Protocol version**

Specifies the IGMP version of the general query data packets.

Possible values:

- **1**
  - IGMP v1
- **2** (default setting)
  - IGMP v2
- **3**
  - IGMP v3

**Query interval [s]**

Specifies the time in seconds after which the device generates general query data packets itself when it has received query data packets from the Multicast router.

Possible values:

- **1..1800** (default setting: 60)
Switching

Expiry interval [s]

Specifies the time in seconds after which an active querier switches from the passive state back to the active state if it has not received any query packets for longer than specified here.

Possible values:
- \( 60..300 \) (default setting: 125)

Table

In the table you specify the Snooping Querier settings for the VLANs that are set up.

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Displays the ID of the VLAN to which the table entry applies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates/deactivates the IGMP Snooping Querier function for this VLAN.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>- marked  The IGMP Snooping Querier function is active for this VLAN.</td>
</tr>
<tr>
<td></td>
<td>- unmarked (default setting)  The IGMP Snooping Querier function is inactive for this VLAN.</td>
</tr>
</tbody>
</table>

Current state

Displays whether the Snooping Querier is active for this VLAN.

Possible values:
- marked  The Snooping Querier is active for this VLAN.
- unmarked  The Snooping Querier is inactive for this VLAN.

Address

Specifies the IP address that the device adds as the source address in generated general query data packets. You use the address of the multicast router.

Possible values:
- Valid IPv4 address  (default setting: 0.0.0.0)

Protocol version

Displays the IGMP protocol version of the general query data packets.
Possible values:

- 1
  - IGMP v1
- 2
  - IGMP v2
- 3
  - IGMP v3

Max. response time

Displays the time in seconds in which the members of a Multicast group should respond to a query data packet. For their response, the members specify a random time within the response time. This helps prevent every Multicast group member to respond to the query at the same time.

Last querier address

Displays the IP address of the Multicast router from which the last received IGMP query was sent out.

Last querier version

Displays the IGMP version that the Multicast router used when sending out the last IGMP query received in this VLAN.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
5.4.5 IGMP Snooping Multicasts

The device lets you specify how it transmits data packets with unknown Multicast addresses: Either the device discards these data packets, floods them to every port, or transmits them only to the ports that previously received query packets.

The device also lets you transmit the data packets with known Multicast addresses to the query ports.

Configuration

Unknown multicasts

Specifies how the device transmits the data packets with unknown Multicast addresses.

Possible values:

- **Discard**
  - The device discards data packets with an unknown MAC/IP Multicast address.

- **Send to all ports** *(default setting)*
  - The device forwards data packets with an unknown MAC/IP Multicast address to the registered ports.

- **Send to query ports**
  - The device forwards data packets with an unknown MAC/IP Multicast address to the query ports.

Table

In the table you specify the settings for known Multicasts for the VLANs that are set up.

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Displays the ID of the VLAN to which the table entry applies.</th>
</tr>
</thead>
</table>

Known multicasts

Specifies how the device transmits the data packets with known Multicast addresses.

Possible values:

- **send to query and registered ports**
  - The device forwards data packets with an unknown MAC/IP Multicast address to the query ports and to the registered ports.

- **send to registered ports** *(default setting)*
  - The device forwards data packets with an unknown MAC/IP Multicast address to registered ports.
5.5 MRP-IEEE

The IEEE 802.1ak amendment to the IEEE 802.1Q standard introduced the Multiple Registration Protocol (MRP) to replace the Generic Attribute Registration Protocol (GARP). The IEEE also modified and replaced the GARP applications, GARP Multicast Registration Protocol (GMRP) and GARP VLAN Registration Protocol (GVRP). The Multiple MAC Registration Protocol (MMRP) and the Multiple VLAN Registration Protocol (MVRP) replace these protocols.

MRP-IEEE helps confine traffic to the required areas of the LAN. To confine traffic, the MRP-IEEE applications distribute attribute values to participating MRP-IEEE devices across a LAN registering and de-registering multicast group membership and VLAN identifiers.

Registering group participants lets you reserve resources for specific traffic transversing a LAN. Defining resource requirements regulates the level of traffic, allowing the devices to determine the required resources and provides for dynamic maintenance of the allocated resources.

The menu contains the following dialogs:
- MRP-IEEE Configuration
- MRP-IEEE Multiple MAC Registration Protocol
- MRP-IEEE Multiple VLAN Registration Protocol
5.5.1 MRP-IEEE Configuration

This dialog lets you set the various MRP timers. By maintaining a relationship between the various timer values, the protocol operates efficiently and with less likelihood of unnecessary attribute withdraws and re-registration. The default timer values effectively maintain these relationships.

When you reconfigure the timers, maintain the following relationships:
- To allow for re-registration after a Leave or LeaveAll event, even if there is a lost message, specify the LeaveTime to: \[ \geq (2 \times \text{JoinTime}) + 60 \].
- To minimize the volume of rejoining traffic generated following a LeaveAll event, specify the value for the LeaveAll timer larger than the LeaveTime value.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join time [1/100s]</td>
<td>Specifies the Join timer which controls the interval between transmit opportunities applied to the Applicant state machine.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>10..100 (default setting: 20)</td>
</tr>
<tr>
<td>Leave time [1/100s]</td>
<td>Specifies the Leave timer which controls the period that the Registrar state machine waits in the leave (LV) state before transiting to the empty (MT) state.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>20..600 (default setting: 60)</td>
</tr>
<tr>
<td>Leave all time [1/100s]</td>
<td>Specifies the LeaveAll timer which controls the frequency with which the LeaveAll state machine generates LeaveAll PDUs.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>200..6000 (default setting: 1000)</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.5.2 MRP-IEEE Multiple MAC Registration Protocol

The Multiple MAC Registration Protocol (MMRP) lets end devices and MAC switches register and de-register group membership and individual MAC address information with switches located in the same LAN. The switches within the LAN disseminate the information through switches that support extended filtering services. Using the MAC address information, MMRP lets you confine multicast traffic to the required areas of a Layer 2 network.

For an example of how MMRP works, consider a security camera mounted on a mast overlooking a building. The camera sends multicast packets onto a LAN. You have 2 end devices installed for surveillance in separate locations. You register the MAC addresses of the camera and the 2 end devices in the same multicast group. You then specify the MMRP settings on the ports to send the multicast group packets to the 2 end devices.

The dialog contains the following tabs:

- [Configuration]
- [Service requirement]
- [Statistics]

[Configuration]

In this tab, you select active MMRP port participants and set the device to transmit periodic events. The dialog also lets you enable VLAN registered MAC address broadcasting.

A periodic state machine exists for each port and transmits periodic events regularly to the applicant state machines associated with active ports. Periodic events contain information indicating the status of the devices associated with the active port.

Operation

 Enables/disables the global MMRP function in the device. The device participates in MMRP message exchanges.

Possible values:

- **On**: The device is a normal participant in MMRP message exchanges.
- **Off** *(default setting)*: The device ignores MMRP messages.

Configuration

 Enables/disables the global periodic state machine in the device.
Switching

Possible values:

- On
  With MMRP Operation enabled globally, the device transmits MMRP messages in one-second intervals, on MMRP participating ports.

- Off (default setting)
  Disables the periodic state machine in the device.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

Active

Activates/deactivates the port MMRP participation.

Possible values:

- marked (default setting)
  With MMRP enabled globally and on this port, the device sends and receives MMRP messages on this port.

- unmarked
  Disables the port MMRP participation.

Restricted group registration

Activates/deactivates the restriction of dynamic MAC address registration using MMRP on the port.

Possible values:

- marked
  If enabled and a static filter entry for the MAC address exists on the VLAN concerned, then the device registers the MAC address attributes dynamically.

- unmarked (default setting)
  Activates/deactivates the restriction of dynamic MAC address registration using MMRP on the port.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Service requirement]

This tab contains forwarding parameters for each active VLAN, specifying the ports on which multicast forwarding applies. The device lets you statically setup VLAN ports as Forward all or Forbidden. You set the Forbidden MMRP service requirement statically only through the Graphical User Interface or Command Line Interface.

A port is setup only as ForwardAll or Forbidden.
Table

### VLAN ID

Displays the ID of the VLAN.

### <Port number>

Specifies the service requirement handling for the port.

#### Possible values:

- **FA**
  - Specifies the ForwardAll traffic setting on the port. The device forwards traffic destined to MMRP registered multicast MAC addresses on the VLAN. The device forwards traffic to ports which MMRP has dynamically setup or ports which the administrator has statically setup as ForwardAll ports.

- **F**
  - Specifies the Forbidden traffic setting on the port. The device blocks dynamic MMRP ForwardAll service requirements. With ForwardAll requests blocked on this port in this VLAN, the device blocks traffic destined to MMRP registered multicast MAC addresses on this port. Furthermore, the device blocks MMRP service request for changing this value on this port.

- **-** (default setting)
  - Disables the forwarding functions on this port.

- **Learned**
  - Displays values setup by MMRP service requests.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Statistics]

Devices on a LAN exchange Multiple MAC Registration Protocol Data Units (MMRPDU) to maintain statuses of devices on an active MMRP port. This tab lets you monitor the MMRP traffic statistics for each port.

Information

**Transmitted MMRP PDU**

Displays the number of MMRPDUs transmitted in the device.

**Received MMRP PDU**

Displays the number of MMRPDUs received in the device.

**Received bad header PDU**

Displays the number of MMRPDUs received with a bad header in the device.
Switching

Switching > MRP-IEEE > MMRP

225

RM GUI RSP
Release 8.1 12/2019

Received bad format PDU
Displays the number of MMRPDUs with a bad data field that were not transmitted in the device.

Transmission failed
Displays the number of MMRPDUs not transmitted in the device.

Table

Port
Displays the port number.

Transmitted MMRP PDU
Displays the number of MMRPDUs transmitted on the port.

Received MMRP PDU
Displays the number of MMRPDUs received on the port.

Received bad header PDU
Displays the number of MMRPDUs with a bad header that were received on the port.

Received bad format PDU
Displays the number of MMRPDUs with a bad data field that were not transmitted on the port.

Transmission failed
Displays the number of MMRPDUs not transmitted on the port.

Last received MAC address
Displays the last MAC address from which the port received MMRPPDUs.

Buttons
You find the description of the standard buttons in section "Buttons" on page 15.

Reset
Resets the port statistics counters and the values in the Last received MAC address column.
5.5.3 **MRP-IEEE Multiple VLAN Registration Protocol**

The Multiple VLAN Registration Protocol (MVRP) provides a mechanism that lets you distribute VLAN information and configure VLANs dynamically. For example, when you configure a VLAN on an active MVRP port, the device distributes the VLAN information to other MVRP enabled devices. Using the information received, an MVRP enabled device dynamically creates the VLAN trunks on other MVRP enabled devices as needed.

The dialog contains the following tabs:
- [Configuration]
- [Statistics]

**[Configuration]**

In this tab, you select active MVRP port participants and set the device to transmit periodic events.

A periodic state machine exists for each port and transmits periodic events regularly to the applicant state machines associated with active ports. Periodic events contain information indicating the status of the VLANs associated with the active port. Using the periodic events, MVRP enabled switches dynamically maintain the VLANs.

**Operation**

Enables/disables the global Applicant Administrative Control which specifies whether the Applicant state machine participates in MMRP message exchanges.

Possible values:
- **On**
  Normal Participant. The Applicant state machine participates in MMRP message exchanges.
- **Off** (default setting)
  Non-Participant. The Applicant state machine ignores MMRP messages.

**Configuration**

Enables/disables the periodic state machine in the device.
Possible values:

- **On**
  The periodic state machine is enabled.
  With MVRP Operation enabled globally, the device transmits MVRP periodic events in 1 second intervals, on MVRP participating ports.

- **Off** (default setting)
  The periodic state machine is disabled.
  Disables the periodic state machine in the device.

**Table**

**Port**

Displays the port number.

**Active**

Activates/deactivates the port MVRP participation.

Possible values:

- **marked** (default setting)
  With MVRP enabled globally and on this port, the device distributes VLAN membership information to MVRP-aware devices connected to this port.

- **unmarked**
  Disables the port MVRP participation.

**Restricted VLAN registration**

Activates/deactivates the Restricted VLAN registration function on this port.

Possible values:

- **marked**
  If enabled and a static VLAN registration entry exists, then the device lets you create a dynamic VLAN for this entry.

- **unmarked** (default setting)
  Disables the Restricted VLAN registration function on this port.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
[Statistics]

Devices on a LAN exchange Multiple VLAN Registration Protocol Data Units (MVRPDU) to maintain statuses of VLANs on active ports. This tab lets you monitor the MVRP traffic.

Information

Transmitted MVRP PDU
Displays the number of MVRPDUs transmitted in the device.

Received MVRP PDU
Displays the number of MVRPDUs received in the device.

Received bad header PDU
Displays the number of MVRPDUs received with a bad header in the device.

Received bad format PDU
Displays the number of MVRPDUs with a bad data field that the device blocked.

Transmission failed
Displays the number of failures while adding a message into the MVRP queue.

Message queue failures
Displays the number of MVRPDUs that the device blocked.

Table

Port
Displays the port number.

Transmitted MVRP PDU
Displays the number of MVRPDUs transmitted on the port.

Received MVRP PDU
Displays the number of MVRPDUs received on the port.

Received bad header PDU
Displays the number of MVRPDUs with a bad header that the device received on the port.

Received bad format PDU
Displays the number of MVRPDUs with a bad data field that the device blocked on the port.
Transmission failed

Displays the number of MVRPDUs that the device blocked on the port.

Registrations failed

Displays the number of failed registration attempts on the port.

Last received MAC address

Displays the last MAC address from which the port received MMRPDUs.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Resets the port statistics counters and the values in the *Last received MAC address* column.

### 5.6 GARP

The Generic Attribute Registration Protocol (GARP) is defined by the IEEE to provide a generic framework so switches can register and deregister attribute values, such as VLAN identifiers and multicast group membership.

When an attribute for a participant is registered or deregistered according to GARP, the participant is modified according to specific rules. The participants are a set of reachable end stations and network devices. The defined set of participants at any given time, along with their attributes, is the reachability tree for the subset of the network topology. The device forwards the data frames only to the registered end stations. The station registration helps prevent attempts to send data to the end stations that are unreachable.

*Note:* Before you enable the GMRP function, verify that the MMRP function is disabled.

The menu contains the following dialogs:

- GMRP
- GVRP
5.6.1 GMRP

The GARP Multicast Registration Protocol (GMRP) is a Generic Attribute Registration Protocol (GARP) that provides a mechanism allowing network devices and end stations to dynamically register group membership. The devices register group membership information with the devices attached to the same LAN segment. GARP also lets the devices distribute the information across the network devices that support extended filtering services.

GMRP and GARP are industry-standard protocols defined by the IEEE 802.1P.

**Operation**

Enables/disables the global GMRP function in the device. The device participates in GMRP message exchanges.

Possible values:
- **On**
  GMRP is enabled.
- **Off** (default setting)
  The device ignores GMRP messages.

**Multicasts**

Enables/disables the unknown multicast data to be either flooded or discarded.

Possible values:
- **discard**
  The device discards unknown multicast data.
- **flood** (default setting)
  The device forwards unknown multicast data to every port.

**Table**

**Port**

Displays the port number.

**GMRP active**

Activates/deactivates the port GMRP participation.

The prerequisite is that the GMRP function is globally enabled.
Possible values:

- **marked** (default setting)
  The port **GMRP** participation is active.

- **unmarked**
  The port **GMRP** participation is inactive.

**Service requirement**

Specifies the ports on which multicast forwarding applies.

Possible values:

- **Forward all unregistered groups** (default setting)
  The device forwards data destined to **GMRP**-registered multicast MAC addresses on the VLAN. The device forwards data to the unregistered groups.

- **Forward all groups**
  The device forwards data destined to every group, registered or unregistered.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
The GARP VLAN Registration Protocol (GVRP) or Generic VLAN Registration Protocol is a protocol that facilitates control of Virtual Local Area Networks (VLANs) within a larger network. GVRP is a Layer 2 network protocol, used to automatically configure devices in a VLAN network.

GVRP is a GARP application that provides IEEE 802.1Q-compliant VLAN pruning, and creating dynamic VLAN on 802.1Q trunk ports. With GVRP, the device exchanges VLAN configuration information with other GVRP devices. Thus, the device reduces the unnecessary broadcast and unknown unicast traffic. Exchanging VLAN configuration information also lets you dynamically create and manage VLANs connected through the 802.1Q trunk ports.

**Operation**

Enables/disables the **GVRP** function globally in the device. The device participates in **GVRP** message exchanges. If the function is disabled, then the device ignores **GVRP** messages.

Possible values:
- **On**
  - The **GVRP** function is enabled.
- **Off** (default setting)
  - The **GVRP** function is disabled.

**Table**

<table>
<thead>
<tr>
<th>Port</th>

<td>- The port <strong>GVRP</strong> participation is inactive.</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
Communication networks transmit a number of applications at the same time that have different requirements as regards availability, bandwidth and latency periods.

QoS (Quality of Service) is a procedure defined in IEEE 802.1D. It is used to distribute resources in the network. You therefore have the possibility of providing minimum bandwidth for necessary applications. The prerequisite is that the end devices and the devices in the network support prioritized data transmission. Data packets with high priority are given preference when transmitted by devices in the network. You transfer data packets with lower priority when there are no data packets with a higher priority to be transmitted.

The device provides the following setting options:
- You specify how the device evaluates QoS/prioritization information for inbound data packets.
- For outbound packets, you specify which QoS/prioritization information the device writes in the data packet (for example priority for management packets, port priority).

**Note:** If you use the functions in this menu, then disable the flow control. The flow control is inactive if in the Switching > Global dialog, Configuration frame the Flow control checkbox is unmarked.

The menu contains the following dialogs:
- QoS/Priority Global
- QoS/Priority Port Configuration
- 802.1D/p Mapping
- IP DSCP Mapping
- Queue Management
- DiffServ
5.7.1 QoS/Priority Global

The device lets you maintain access to the device management, even in situations with heavy utilization. In this dialog you specify the required QoS/priority settings.

Configuration

VLAN priority for management packets

Specifies the VLAN priority for sending management data packets. Depending on the VLAN priority, the device assigns the data packet to a specific traffic class and thus to a specific priority queue of the port.

Possible values:

- 0..7 (default setting: 0)

In the Switching > QoS/Priority > 802.1D/p Mapping dialog, you assign a traffic class to every VLAN priority.

IP DSCP value for management packets

Specifies the IP DSCP value for sending management data packets. Depending on the IP DSCP value, the device assigns the data packet to a specific traffic class and thus to a specific priority queue of the port.

Possible values:

- 0 (be/cs0)...63 (default setting: 0 (be/cs0))

Some values in the list also have a DSCP keyword, for example 0 (be/cs0), 10 (af11) and 46 (ef). These values are compatible with the IP precedence model.

In the Switching > QoS/Priority > IP DSCP Mapping dialog you assign a traffic class to every IP DSCP value.

Queues per port

Displays the number of priority queues per port.

The device has 8 priority queues per port. You assign every priority queue to a specific traffic class (traffic class according to IEEE 802.1D).

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
5.7.2 QoS/Priority Port Configuration

In this dialog, you specify for every port how the device processes received data packets based on their QoS/priority information.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port priority</td>
<td>Specifies what VLAN priority information the device writes into a data packet if the data packet contains no priority information. After this, the device transmits the data packet depending on the value specified in the Trust mode column.</td>
</tr>
</tbody>
</table>

Possible values:
- 0..7 (default setting: 0)

<table>
<thead>
<tr>
<th>Trust mode</th>
<th>Specifies how the device handles a received data packet if the data packet contains QoS/priority information.</th>
</tr>
</thead>
<tbody>
<tr>
<td>untrusted</td>
<td>The device transmits the data packet according to the priority specified in the Port priority column. The device ignores the priority information contained in the data packet. In the Switching &gt; QoS/Priority &gt; 802.1D/p Mapping dialog, you assign a traffic class to every VLAN priority.</td>
</tr>
<tr>
<td>trustDot1p (default setting)</td>
<td>The device transmits the data packet according to the priority information in the VLAN tag. In the Switching &gt; QoS/Priority &gt; 802.1D/p Mapping dialog, you assign a traffic class to every VLAN priority.</td>
</tr>
<tr>
<td>trustIpDscp</td>
<td>If the data packet is an IP packet, then: The device transmits the data packet according to the IP DSCP value contained in the data packet. In the Switching &gt; QoS/Priority &gt; IP DSCP Mapping dialog, you assign a traffic class to every IP DSCP value. If the data packet is not an IP packet, then: The device transmits the data packet according to the priority specified in the Port priority column. In the Switching &gt; QoS/Priority &gt; 802.1D/p Mapping dialog, you assign a traffic class to every VLAN priority.</td>
</tr>
</tbody>
</table>

Untrusted traffic class

Displays the traffic class assigned to the VLAN priority information specified in the Port priority column. In the Switching > QoS/Priority > 802.1D/p Mapping dialog, you assign a traffic class to every VLAN priority.
Possible values:

- 0..7

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.7.3 **802.1D/p Mapping**

The device transmits data packets with a VLAN tag according to the contained QoS/priority information with a higher or lower priority.

In this dialog, you assign a traffic class to every VLAN priority. You assign the traffic classes to the priority queues of the ports.

**Table**

<table>
<thead>
<tr>
<th>VLAN priority</th>
<th>Traffic class</th>
<th>Content description according to IEEE 802.1D</th>
</tr>
</thead>
</table>
| 0             | 2             | **Best Effort**  
Normal data without prioritizing |
| 1             | 0             | **Background**  
Non-time-sensitive data and background services |
| 2             | 1             | **Standard**  
Normal data |
| 3             | 3             | **Excellent Effort**  
Crucial data |
| 4             | 4             | **Controlled Load**  
Time-sensitive data with a high priority |

---

**Note:** Among other things, redundancy mechanisms use the highest traffic class. Therefore, select another traffic class for application data.
<table>

5.7.5 Queue Management

This dialog lets you enable and disable the \textit{Strict priority} function for the traffic classes. When you disable the \textit{Strict priority} function, the device processes the priority queues of the ports with "Weighted Fair Queuing".

You also have the option of assigning a minimum bandwidth to every traffic class which the device uses to process the priority queues with "Weighted Fair Queuing".

\begin{table}
\hline
\textbf{Traffic class} & Displays the traffic class. \\
\textbf{Strict priority} & Activates/deactivates the processing of the port priority queue with \textit{Strict priority} for this traffic class. \\
\textbf{Possible values:} & \\
\hline
\textbf{marked} (default setting) & The processing of the port priority queue with \textit{Strict priority} is active. \\
& The port forwards only data packets that are in the priority queue with the highest priority. \\
& When this priority queue is empty, the port forwards data packets that are in the priority queue with the next lower priority. \\
& The port forwards data packets with a lower traffic class after the priority queues with a higher priority are empty. In unfavorable situations, the port does not send these data packets. \\
& When you select this setting for a traffic class, the device also enables the function for traffic classes with a higher priority. \\
& Use this setting for applications such as VoIP or video that require the least possible delay. \\
\textbf{unmarked} & The processing of the port priority queue with \textit{Strict priority} is inactive. The device uses "Weighted Fair Queuing"/"Weighted Round Robin" (WRR) to process the port priority queue. \\
& The device assigns a minimum bandwidth to each traffic class. \\
& Even under a high network load the port transmits data packets with a low traffic class. \\
& When you select this setting for a traffic class, the device also disables the function for traffic classes with a lower priority. \\
\textbf{Min. bandwidth [\%]} & Specifies the minimum bandwidth for this traffic class when the device is processing the priority queues of the ports with "Weighted Fair Queuing". \\
\textbf{Possible values:} & \\
\hline
\textbf{0..100} (default setting: 0 = the device does not reserve any bandwidth for this traffic class) & The value specified in percent refers to the available bandwidth on the port. When you disable the \textit{Strict priority} function for every traffic class, the maximum bandwidth is available on the port for the "Weighted Fair Queuing". \\
& The maximum total of the assigned bandwidths is 100\%. \\
\end{table}
Max. bandwidth [%]

Specifies the shaping rate at which a Traffic Class transmits packets (Queue Shaping).

Possible values:
- 0 (default setting)
  The device does not reserve any bandwidth for this traffic class.
- 1..100
  The device reserves the specified bandwidth for this traffic class. The specified value in percent
  refers to the maximum available bandwidth on this port.

For example, using queue shaping lets you limit the rate of a strict-high priority queue. Limiting a
strict-high priority queue lets the device also process low-priority queues. To use queue shaping,
you set the maximum bandwidth for a particular queue.

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.

5.7.6 DiffServ

Differentiated Services (DiffServ) filter data packets in order to prioritize or limit the data stream.
- In a class, you specify the filter criteria.
- In a policy, you link the class with actions.

The device applies the actions of the policy to those data packets that meet the filter criteria of the
assigned class.

To configure DiffServ, perform the following steps:
- Create a class with the filter criteria.
- Create a policy.
- Assign a class with the filter criteria to the policy.
- Specify the actions of the policy.
- Assign the policy to a port.
- Activate the DiffServ function.

The device lets you use the following per class and per instance configurations:
- 13 rules per class
- 28 instances per policy
- 3 attributes per instance

The menu contains the following dialogs:
- DiffServ Overview
- DiffServ Global
- DiffServ Class
- DiffServ Policy
- DiffServ Assignment
5.7.6.1 DiffServ Overview

This dialog displays the configured DiffServ settings.

**Port**

Simplifies the table and displays the entries relating to a specific port. Displaying the table in this fashion makes it easier for you to sort the table as you desire.

Possible values:
- **All** (default setting)
  The table displays the entries for every port.
- `<Port number>`
  The table displays the entries that apply to the selected port.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.7.6.2 DiffServ Global

In this dialog, you enable the DiffServ function.

**Operation**

Enables/disables the DiffServ function.

Possible values:

- **On**
  
  The DiffServ function is enabled. The device processes traffic according to the DiffServ rules.

- **Off** (default setting)
  
  The DiffServ function is disabled.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.7.6.3 DiffServ Class

In this dialog, you specify the data packets to which the device executes the actions specified in the Policy dialog. This assignment is called a class.

Only one class can be assigned to a policy. This means each class can contain multiple filter criteria.

Table

Class name

Specifies the name of the DiffServ class. The device lets you change the class name directly in the table.

Possible values:
- Alphanumeric ASCII character string with 1..31 characters

Criteria

Displays the specified criteria for this rule.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

Create

Class name

Specifies the name of the DiffServ class.

Possible values:
- Alphanumeric ASCII character string with 1..31 characters

Type

Specifies the type of Class Rule for matching; this determines the individual match conditions for the present class rule.

Depending on which value you select, the following visible parameters change.

To match every packet regardless of content, select the value every.
Possible values:

- **cos** (default setting)
- **dstip**
- **dstl4port**
- **dstmac**
- **every**
- **ipdscp**
- **ipprecedence**
- **iptos**
- **protocol**
- **refclass**
- **srcip**
- **src14port**
- **srcl4port**
- **srclac**
- **cos2**
- **ETYPE**
- **vlanid**
- **vlanid2**

**Type = cos**

**COS**

Specifies the class of service as the match value for the class.

Possible values:

- **0..7** (default setting: 0)

**Type = dstip**

**Destination IP address**

Specifies the destination IP address as the match value for the class.

Possible values:

- Valid IP address

**Destination IP address mask**

Specifies the mask for the destination IP address.

Possible values:

- Valid netmask

**Type = dstl4port**

**Destination port**

Specifies the destination Layer 4 port as the match value for the class.

Possible values:

- Valid TCP or UDP port number
Type = **dstmac**

Destination MAC address

Specifies the destination MAC address as the match value for the class.

Possible values:

- Valid MAC address

Destination MAC address mask

Specifies the mask for the destination MAC address.

Possible values:

- Valid netmask

Type = **ipdscp**

DSCP

Specifies the IP DiffServ Code Point (DSCP) as the match value for the class.

Possible values:

- 0..63  (default setting: 0 (be/cs0))

Type = **ipp precedence**

TOS priority

Specifies the IP Precedence as the match value for the class. The precedence bits are the high-order 3 bits of the Service Type octet in the IPv4 header.

Possible values:

- 0..7  (default setting: 0)

Type = **iptos**

TOS mask

Specifies the IP TOS bits and mask as the match value for the class. The TOS bits are the 8 bits of the Service Type octet in the IPv4 header.

Possible values:

- 0x00..0xFF

Type = **protocol**

Protocol number

Specifies the internet protocol number as the match value for the class.
Possible values:

- **0..255**
  Some common values are listed here:
  - **1**
    - ICMP
  - **2**
    - IGMP
  - **4**
    - IPv4
  - **6**
    - TCP
  - **17**
    - UDP
  - **255**
    - A rule with this value matches every protocol in the list.

The IANA defined the “Assigned Internet Protocol Numbers” that you enter here.

To find a list of the assigned numbers use the following link: www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml.

**Type = refclass**

Ref class

Specifies the parent class as a corresponding reference class. This reference class uses the set of match rules specified in a parent class as the match value.

Possible values:

- **<Name of the DiffServ Class>**

Conditions:

- If the reference class refers only to the parent class, then the parent class to which the user binds this rule and the reference class produce the same results.
- Any attempt to delete the parent class while still referenced to by another class fails.
- If the reference class uses the parent class as the match value, then any subsequent change to the parent class rules changes the reference class rules only.
- You add subsequent rules to the parent class compatible with the rules existing in the reference class.

**Type = srcip**

Source IP address

Specifies the source IP address as the match value for the class.

Possible values:

- **Valid IP address**

Source IP address mask

Specifies the mask for the source IP address.

Possible values:

- **Valid netmask**
Type = srcl4port

Source port

Specifies the source Layer 4 port as the match value for the class.

Possible values:
- Valid TCP or UDP port number

Type = srcmac

Source MAC address

Specifies the source MAC address as the match value for the class.

Possible values:
- Valid MAC address and mask

Source MAC address mask

Specifies the mask for the source MAC address.

Possible values:
- Valid netmask

Type = cos2

COS 2

Specifies a secondary class of service as the match value for the class.

Possible values:
- 0..7 (default setting: 0)

Type = etype

Etype

Specifies the Ethertype as the match value for the class.

Possible values:
- custom (default setting)
  You specify the Ethertype in the Etype value field.
- appletalk
- arp
- ibmsna
- ipv4
- ipv6
- ipx
- mplsmcast
- mplsucast
- netbios
- novell
Etype value
Specifies the user-defined Ethertype value.

The prerequisite is that in the Etype field you specify the value custom.

Possible values:
- 0x0600..0xFFFF

Type = vlanid

VLAN ID
Specifies the VLAN ID as the match value for the class.

Possible values:
- 1..4042

Type = vlanid2

VLAN2 ID
Specifies the secondary VLAN ID as the match value for the class.

Possible values:
- 1..4042
5.7.6.4 DiffServ Policy

In this dialog, you specify which actions the device performs on data packets which fulfill the filter criteria specified in the Class dialog. This assignment is called a policy.

Only one policy can be assigned to a port. Each policy can contain multiple actions.

Table

Policy name
Displays the name of the policy.
To change the value, click the relevant field.
Possible values:
- Alphanumeric ASCII character string with 1..31 characters

Direction
Displays that the device applies the policy to received data packets.

Class name
Displays the name of the class that is assigned to the policy.
The filter criteria are specified in the class.

Attribute
Displays the action that the device performs on the data packets.
- To change an existing action, select the affected row, click the button and then the Modify attribute item.
- To add additional actions to a policy, click the button.

Buttons
You find the description of the standard buttons in section "Buttons" on page 15.

Opens the Create window to add a new entry to the table.

Modify attribute
Specifies the action that the device performs on the data packets.
Create

In this dialog you create a new policy or add further actions to an existing policy.

Policy name

Specifies the name of the policy.

☐ To create a new policy, add a new name.
☐ To add more actions to an existing policy, select a name in the list.

Possible values:

▲ Alphanumeric ASCII character string with 1..31 characters

Direction

Displays that the device applies the policy to received data packets.

Class name

Assigns the class to the policy.

The filter criteria are specified in the class.

Type

Specifies the policy type.

Depending on which value you select, the following visible parameters change.

Possible values:

▲ markCosVal (default setting)
▲ markIpDscpVal
▲ markIpPrecedenceVal
▲ policeSimple
▲ policeTworate
▲ assignQueue
▲ drop
▲ redirect
▲ mirror
▲ markCosAsSecCos
Type = `markCosVal`

Overwrites the priority field in the VLAN tag of the Ethernet packets:
- in the VLAN tag, the device overwrites the priority value in the COS parameter.
- With QinQ-tagged data packets, the device writes the value to the outer tag (C tag).
- With data packets without VLAN tags, the device adds a priority tag.

Can be combined with `Type = redirect` and `mirror`.

COS

Specifies the priority value that the device writes to the priority field of the VLAN tag of the Ethernet packets.

Possible values:
- `0..7`

Type = `markIpDscpVal`

Overwrites the DS field of the IP packets.

The device writes the value specified in the DSCP parameter to the DS field. Subsequent devices in the network to which the device forwards the IP packets, prioritize the IP packets according to this setting. For making the device prioritize the IP packets, also enter the IP packets with `Type = assignQueue` into the desired queue.

Can be combined with `Type = assignQueue, redirect` and `mirror`.

DSCP

Specifies the value that the device writes to the DS field of the IP packets.

Possible values:
- `0..63`

Type = `markIpPrecedenceVal`

Overwrites the TOS field of the IP packets.

The device writes the value specified in the TOS priority parameter to the TOS field.

Can be combined with `Type = assignQueue, redirect` and `mirror`.

TOS priority

Specifies the value that the device writes to the TOS field of the IP packets.

Possible values:
- `0..7`
Switching
[Switching > QoS/Priority > DiffServ > Policy]

Type = policeSimple

Limits the classified data stream to the values specified in the Simple C rate and Simple C burst fields:
- If the transfer rate and burst size of the data stream are below the specified values, then the device applies the action specified in the Conform action field.
- If the transfer rate and burst size of the data stream are above the specified values, then the device applies the action specified in the Non conform action field.

Can be combined with Type = assignQueue, redirect and mirror.

Simple C rate

Specifies the committed rate in kbit/s.

Upper limit

Possible values:
> 1..4294967295

Simple C burst

Specifies the committed burst size in kBytes.

Possible values:
> 0..128

Conform action, Non conform action

In the Conform action field, you specify the action that the device applies to the compliant data stream. Compliant means that the data stream is under the limits specified in the parameters Simple C rate and Simple C burst.

In the Non conform action field, you specify the action that the device applies to the non-compliant data stream. Non-compliant means that the data stream is over the limits specified in the parameters Simple C rate and Simple C burst.

Possible values:
> drop
  Discards the data packets.
> markDscp
  Overwrites the DS field of the IP packets.
  The device writes the value specified in the adjacent field [0..63] to the DS field.
> markPrec
  Overwrites the TOS field of the IP packets.
  The device writes the value specified in the adjacent field [0..7] to the TOS field.
> send
  Sends the data packets.
> markCos
  Overwrites the priority field in the VLAN tag of the Ethernet packets:
  - in the VLAN tag, the device overwrites the priority value in the COS parameter.
  - With QinQ-tagged Ethernet packets, the device writes the value to the outer tag (C tag).
  - With Ethernet packets without VLAN tags, the device adds a priority tag.
markCos2
With QinQ-tagged Ethernet packets, overwrites the priority field in the inner tag (S tag) with the value specified in the adjacent field [0..7].

markCosAsSecCos
Overwrites the priority field in the outer tag (C tag) with the priority value of the inner tag (S tag).

Color conform class
Specifies the class of the received data stream that the devices designates as conform (green).

Possible values:

- **blind**
The device operates in the color-blind mode. The devices designates the complete data stream received as conform (green).

- **<Name of the DiffServ Class>**
The devices designates only this class of the received data stream as conform (green). Those classes are selectable for which in the Switching > QoS/Priority > DiffServ > Class dialog, Criteria column a rule of the type cos, ipdscp, ipprec, cos2 is specified.

Verify that the filter criteria of the class selected in the Class name drop-down list above and of the class selected in this drop-down list, is neither identical nor exclude each other. Exclusion criteria are:

- The filter criteria have the same rule type, for example cos and cos. Use classes with a different rule type, for example cos and ipdscp.
- One of the classes references with the rule type refclass another class that conflicts with the used classes.

Type = policeTworate
Limits the classified data stream to the values specified in the Two rate C rate, Two rate C burst, Two rate P rate, and Two rate P burst fields.

- If the transfer rate and burst size are below Two rate C rate and Two rate C burst, then the device applies the Conform action action to the data stream.
- If the transfer rate and burst size are between Two rate C rate and Two rate P rate as well as Two rate C burst and Two rate P burst, then the device applies the Exceed action action to the data stream.
- If the transfer rate and burst size are above Two rate P rate and Two rate P burst, then the device applies the Non conform action action to the data stream.

Can be combined with Type = assignQueue, redirect and mirror.

Two rate C rate
Specifies the committed rate in kbit/s.

Possible values:

- 1..4294967295

Two rate C burst
Specifies the committed burst size in kBytes.

Possible values:

- 0..128
Two rate P rate

Specifies the peak rate (max. allowable transfer rate of the data stream) in kbit/s.

Possible values:
- 1..4294967295

Two rate P burst

Specifies the peak burst size (max. allowable burst size) in kBytes.

Possible values:
- 1..128

Conform action
Conform value
Exceed action
Exceed value
Non conform action
Non conform value

In the **Conform action** field, you specify the action that the device applies to the compliant data stream. Compliant means that transfer rate and burst size are below **Two rate C rate** and **Two rate C burst**.

In the **Exceed action** field, you specify the action that the device applies to the data stream. The prerequisite is that the transfer rate and burst size are between **Two rate C rate** and **Two rate P rate** as well as **Two rate C burst** and **Two rate P burst**.

In the **Non conform action** field, you specify the action that the device applies to the non-compliant data stream. Non-compliant means that the transfer rate and burst size are above **Two rate P rate** and **Two rate P burst**.

Possible values:
- **drop**
  Discards the data packets.
- **markDscp**
  Overwrites the DS field of the IP packets.
  The device writes the value specified in the adjacent field [0..63] to the DS field.
- **markPrec**
  Overwrites the TOS field of the IP packets.
  The device writes the value specified in the adjacent field [0..7] to the TOS field.
- **send**
  Sends the data packets.
- **markCos**
  Overwrites the priority field in the VLAN tag of the Ethernet packets:
  - in the VLAN tag, the device overwrites the priority value in the **COS** parameter.
  - With QinQ-tagged Ethernet packets, the device writes the value to the outer tag (C tag).
  - With Ethernet packets without VLAN tags, the device adds a priority tag.
Switching
[Switching > QoS/Priority > DiffServ > Policy]

- **markCos2**
  With QinQ-tagged Ethernet packets, overwrites the priority field in the inner tag (S tag) with the value specified in the adjacent field [0..7].

- **markCosAsSecCos**
  Overwrites the priority field in the outer tag (C tag) with the priority value of the inner tag (S tag).

**Color conform class**

Specifies the class of the received data stream that the devices designates as conform (green).

Possible values:
- **0 - blind**
  The device operates in the color blind mode. The devices designates the complete data stream received as conform (green).
- **<Name of the DiffServ Class>**
  The devices designates only this class of the received data stream as conform (green).

Those classes are selectable for which in the **Switching > QoS/Priority > DiffServ > Class** dialog, **Criteria** column a rule of the type cos, ipdscp, ipprec, cos2 is specified.

Verify that the filter criteria of the class selected in the **Class name** drop-down list above and of the class selected in this drop-down list, is neither identical nor exclude each other. Exclusion criteria are:
- The filter criteria have the same rule type, for example cos and cos. Use classes with a different rule type, for example cos and ipdscp.
- One of the classes references with the rule type refclass another class that conflicts with the used classes.

**Type** = **assignQueue**

Changes the priority queue into which the device adds the data packets.

The device enqueues the data packets into the priority queue with the ID specified in the **Queue ID** parameter.

Can be combined with **Type** = drop, markCosVal and markCosAsSecCos.

**Queue ID**

Specifies the ID of the priority queue into which the device adds the data packets. See the **Traffic class** field and the **Switching > QoS/Priority > 802.1D/p Mapping** dialog.

Possible values:
- **0..7**

**Type** = **drop**

Discards the data packets.

Can be combined with **Type** = mirror if mirror is set up first.
Type = redirect

The device forwards the received data stream to the port specified in the *Redirection interface* field.

Can be combined with *Type* = *markCosVal, markIpDscpVal, markIpPrecedenceVal, policeSimple, policeTworate, assignQueue* and *markCosAsSecCos*.

Redirection interface

Specifies the destination port.

Possible values:

- **<Port number>**
  - Number of the destination port. The device forwards the data packets to this port.

*Note:* The destination port needs sufficient bandwidth to absorb the data stream. If the copied data stream exceeds the bandwidth of the destination port, then the device discards surplus data packets on the destination port.

Type = mirror

The device copies the received data stream and also transfers it to the port specified in the *Mirror interface* field.

Can be combined with *Type* = *markCosVal, markIpDscpVal, markIpPrecedenceVal, policeSimple, policeTworate, assignQueue* and *markCosAsSecCos*.

Mirror interface

Specifies the destination port.

Possible values:

- **<Port number>**
  - Number of the destination port. The device copies the data packets to this port.

*Note:* The destination port needs sufficient bandwidth to absorb the data stream. If the copied data stream exceeds the bandwidth of the destination port, then the device discards surplus data packets on the destination port.

Type = markCosAsSecCos

Overrides the priority field in the outer VLAN tag of the Ethernet packets with the priority value of the inner VLAN tag.

Can be combined with *Type* = *assignQueue, redirect* and *mirror*. 
5.7.6.5 **DiffServ Assignment**

In this dialog you assign the policy to a port.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction</td>
<td>Displays the interface direction to which you assigned the policy.</td>
</tr>
<tr>
<td>Policy name</td>
<td>Displays the name of the policy assigned to the interface.</td>
</tr>
<tr>
<td>Status</td>
<td>Displays the port status.</td>
</tr>
</tbody>
</table>

**Active**

Activates/deactivates the DiffServ parameters associated with this row.

Possible values:
- **marked**
  The device forwards traffic according to the specified DiffServ settings.
- **unmarked**
  The device forwards traffic without regarding the specified DiffServ settings.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

Opens the **Create** window to add a new entry to the table.

**Create**

| Port                  | Specifies the port to which the table entry relates. |
Switching

[Switching > VLAN]

Possible values:

- Available ports

Direction

Specifies the direction in which the device applies the policy.

Possible values:

- **In** (default setting)
- **Out**

Policy

Specifies the policy assigned to the port.

Possible values:

- Available policies

5.8 VLAN

[Switching > VLAN]

With VLAN (Virtual Local Area Network) you distribute the data traffic in the physical network to logical subnetworks. This provides you with the following advantages:

- **High flexibility**
  - With VLAN you distribute the data traffic to logical networks in the existing infrastructure. Without VLAN, it would be necessary to have additional devices and complicated cabling.
  - With VLAN you specify network segments independently of the location of the individual end devices.
- **Improved throughput**
  - In VLANs data packets can be transferred by priority. When the priority is high, the device transfers the data of a VLAN preferentially, for example for time-sensitive applications such as VoIP phone calls.
  - When the data packets and Broadcasts are distributed in small network segments instead of in the entire network, the network load is considerably reduced.
- **Increased security**
  - The distribution of the data traffic among individual logical networks makes unwanted accessing more difficult and strengthens the system against attacks such as MAC Flooding or MAC Spoofing.

The device supports packet-based “tagged” VLANs according to the IEEE 802.1Q standard. The VLAN tagging in the data packet indicates the VLAN to which the data packet belongs.

The device transmits the tagged data packets of a VLAN only on ports that are assigned to the same VLAN. This reduces the network load.

The device learns the MAC addresses for every VLAN separately (independent VLAN learning).

The device prioritizes the received data stream in the following sequence:

- Voice VLAN
- MAC-based VLAN
- IP subnet-based VLAN
Switching

[Switching > VLAN]

- Protocol-based VLAN
- Port-based VLAN

The menu contains the following dialogs:
- VLAN Global
- VLAN Configuration
- VLAN Port
- VLAN Voice
- MAC Based VLAN
- Subnet Based VLAN
- Protocol Based VLAN
5.8.1 VLAN Global

This dialog lets you view general VLAN parameters for the device.

Configuration

Max. VLAN ID

Highest ID assignable to a VLAN.

See the Switching > VLAN > Configuration dialog.

VLANs (max.)

Displays the maximum number of VLANs possible.

See the Switching > VLAN > Configuration dialog.

VLANs

Number of VLANs currently configured in the device.

See the Switching > VLAN > Configuration dialog.

The VLAN ID 1 is constantly present in the device.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Clear...

Resets the VLAN settings of the device to the default setting.

Note that you lose your connection to the device if you have changed the VLAN ID for the device management in the Basic Settings > Network dialog.
5.8.2 VLAN Configuration

In this dialog, you manage the VLANs. To set up a VLAN, create a further row in the table. There you specify for each port if it transmits data packets of the respective VLAN and if the data packets contain a VLAN tag.

You distinguish between the following VLANs:
- The user sets up static VLANs.
- The device sets up dynamic VLANs automatically and removes them if the prerequisites cease to apply.

For the following functions the device creates dynamic VLANs:
- **MRP**: If you assign to the ring ports a non-existing VLAN, then the device creates this VLAN.
- **MVRP**: The device creates a VLAN based on the messages of neighboring devices.
- **Routing**: The device creates a VLAN for every router interface.

**Note**: The settings are effective only if the VLAN Unaware Mode is disabled. See the Switching > Global dialog.

**Table**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>ID of the VLAN.</th>
</tr>
</thead>
</table>

The device supports up to 256 VLANs simultaneously set up.

Possible values:
- 1..4042

<table>
<thead>
<tr>
<th>Status</th>
<th>Displays how the VLAN is set up.</th>
</tr>
</thead>
</table>

Possible values:
- **other**
  - VLAN set up using the 802.1X Port Authentication function. See the Network Security > 802.1X Port Authentication dialog.
- **permanent**
  - VLAN set up by the user.
  - VLAN set up using the MRP function. See the Switching > L2-Redundancy > MRP dialog.
  - If you save the changes in the non-volatile memory, then the VLANs with this setting remain set up after a restart.
- **dynamicMvrp**
  - VLAN set up using the MVRP function. See the Switching > MRP-IEEE > MVRP dialog.
  - VLANs with this setting are write-protected. The device removes a VLAN from the table as soon as the last port leaves the VLAN.
Creation time

Displays the time of VLAN creation.

The field displays the time stamp for the operating time (system uptime).

Name

Specifies the name of the VLAN.

Possible values:
- Alphanumeric ASCII character string with 1..32 characters

<Port number>

Specifies if the respective port transmits data packets of the VLAN and if the data packets contain a VLAN tag.

Possible values:
- - (default setting)
  - The port is not a member of the VLAN and does not transmit data packets of the VLAN.
- T = Tagged
  - The port is a member of the VLAN and transmits the data packets with a VLAN tag. You use this setting for uplink ports, for example.
- LT = Tagged Learned
  - The port is a member of the VLAN and transmits the data packets with a VLAN tag. The device created the entry automatically based on the GVRP or MVRP function.
- F = Forbidden
  - The port is not a member of the VLAN and does not transmit data packets of this VLAN. Additionally, the device helps prevent the port from becoming a VLAN member through the MVRP function.
- U = Untagged (default setting for VLAN 1)
  - The port is a member of the VLAN and transmits the data packets without a VLAN tag. Use this setting if the connected device does not evaluate any VLAN tags, for example on end ports.
- LU = Untagged Learned
  - The port is a member of the VLAN and transmits the data packets without a VLAN tag. The device created the entry automatically based on the GVRP or MVRP function.

Note: Verify that the port on which the network management station is connected is a member of the VLAN in which the device transmits the management data. In the default setting, the device transmits the management data on VLAN 1. Otherwise, the connection to the device terminates when you transfer the changes to the device. The access to the device management is possible only using the Command Line Interface through the serial interface.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

In the VLAN ID field, you specify the ID of the VLAN.
5.8.3 VLAN Port

In this dialog you specify how the device handles received data packets that have no VLAN tag, or whose VLAN tag differs from the VLAN ID of the port.

This dialog lets you assign a VLAN to the ports and thus specify the port VLAN ID.

Additionally, you also specify for each port how the device transmits data packets if the VLAN Unaware mode is disabled and one of the following situations occurs:

- The port receives data packets without a VLAN tagging.
- The port receives data packets with VLAN priority information (VLAN ID 0, priority tagged).
- The VLAN tagging of the data packet differs from the VLAN ID of the port.

**Note:** The settings are effective only if the VLAN Unaware Mode is disabled. See the Switching > Global dialog.

### Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port-VLAN ID</td>
<td>Specifies the ID of the VLAN which the devices assigns to data packets without a VLAN tag. The prerequisite is that you specify in the Acceptable packet types column the value admitAll.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>ID of a VLAN you set up (default setting: 1)</td>
</tr>
<tr>
<td>If you use the MRP function and you did not assign a VLAN to the ring ports, then you specify the value 1 here for the ring ports. Otherwise, the device assigns the value to the ring ports automatically.</td>
<td></td>
</tr>
<tr>
<td>Acceptable packet types</td>
<td>Specifies whether the port transmits or discards received data packets without a VLAN tag.</td>
</tr>
</tbody>
</table>
| Possible values: | admitAll (default setting)  
The port accepts data packets both with and without a VLAN tag. |
| | admitOnlyVlanTagged  
The port accepts only data packets tagged with a VLAN ID ≥ 1. |
| Ingress filtering | Activates/deactivates the ingress filtering. |
Possible values:

- **marked**
  The ingress filtering is active. The device compares the VLAN ID in the data packet with the VLANs of which the device is a member. See the [Switching > VLAN > Configuration](#) dialog. If the VLAN ID in the data packet matches one of these VLANs, then the port transmits the data packet. Otherwise, the device discards the data packet.

- **unmarked** (default setting)
  The ingress filtering is inactive. The device transmits received data packets without comparing the VLAN ID. Thus the port also transmits data packets with a VLAN ID of which the port is not a member.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
5.8.4 **VLAN Voice**

Use the Voice VLAN feature to separate voice and data traffic on a port, by VLAN and/or priority. A primary benefit of Voice VLAN is safeguarding the quality of voice traffic when data traffic on the port is high.

The device detects VoIP phones using the Link Layer Discovery Protocol - Media Endpoint Discovery (LLDP-MED). The device then adds the appropriate port to the member set of the configured Voice VLAN. The member set is either tagged or untagged. Tagging depends on the Voice VLAN interface mode (VLAN ID, Dot1p, None, Untagged).

Another benefit of the Voice VLAN feature is that the VoIP phone obtains VLAN ID or priority information via LLDP-MED from the device. As a result, the VoIP phone sends voice data tagged as priority, or untagged. This depends on the configured Voice VLAN Interface mode. You activate Voice VLAN on the port which is connecting to the VoIP phone.

**Operation**

Enables/disables the VLAN Voice function of the device globally.

Possible values:
- **On**
- **Off** (default setting)

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voice VLAN mode</td>
<td>Specifies whether the port transmits or discards received data packets without a voice VLAN tagging or with voice VLAN priority information.</td>
</tr>
</tbody>
</table>

Possible values:
- **disabled** (default setting)
  - Deactivates the VLAN Voice function for this table entry.
- **none**
  - Lets the IP telephone use its own configuration for sending untagged voice traffic.
- **vlan/dot1p-priority**
  - The port filters data packets of the voice VLAN using the vlan and dot1p priority tags.
- **untagged**
  - The port filters data packets without a voice VLAN tag.
Switching
[Switching > VLAN > Voice]

- **vlan**
  The port filters data packets of the voice VLAN using the vlan tag.

- **dot1p-priority**
  The port filters data packets of the voice VLAN using the dot1p priority tags. If you select this value, then additionally specify a proper value in the **Priority** column.

### Data priority mode

Specifies the trust mode for the data traffic on the particular port.

The device uses this mode for data traffic on the voice VLAN, when it detects a VoIP telephone and a PC and when these devices use the same cable for transmitting and receiving data.

Possible values:
- **trust** (default setting)
  If voice traffic is present on the interface, then the data traffic uses the normal priority with this setting.
- **untrust**
  If voice traffic is present and the **Voice VLAN mode** is set to **dot1p-priority**, then the data has the priority **0**. If the interface only transmits data, then the data has the normal priority.

### Status

Displays the status of the Voice VLAN on the port.

Possible values:
- **marked**
  The Voice VLAN is enabled.
- **unmarked**
  The Voice VLAN is disabled.

### VLAN ID

Specifies the ID of the VLAN to which the table entry applies.

To forward traffic to this VLAN ID using this filter, select in the **Voice VLAN mode** column the value **vlan**.

Possible values:
- **0..4042**

### Priority

Specifies the Voice VLAN Priority of the port. The prerequisite is that you specify in the **Voice VLAN mode** column the value **dot1p-priority**.

Possible values:
- **0..7**
- **none**
  Deactivates the Voice VLAN Priority of the port.

### Bypass authentication

Activates the Voice VLAN Authentication mode.
If you deactivate the function and set the value in the Voice VLAN mode column to `dot1p-priority`, then voice devices require an authentication.

Possible values:

- **marked** (default setting)
  - If you activated the function in the Dialog `Network Security > 802.1X Port Authentication > Global` dialog, then set the Port control parameter for this port to the `multiClient` value before activating this function. The parameter Port control you find in the `Network Security > 802.1X Port Authentication > Global` dialog.

- **unmarked**

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
5.8.5 MAC Based VLAN

In a MAC-based VLAN, the device forwards traffic based on the source MAC address associated with a VLAN. User-defined filters determine whether a packet belongs to a particular VLAN.

MAC-based VLANs specify the filtering criteria only for untagged or priority-tagged packets. Assign a port to a MAC-based VLAN for a specific source MAC address. The device then forwards untagged packets received with the configured MAC address to the MAC-based VLAN ID. Other untagged packets are subject to normal VLAN classification rules.

**Table**

<table>
<thead>
<tr>
<th>MAC address</th>
<th>Displays the MAC address to which the table entry relates.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The device supports up to 256 simultaneous MAC-based VLAN assignments.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>▶ Valid MAC address</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Displays the ID of the VLAN to which the table entry applies.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>▶ 1..4042 (set up VLAN IDs)</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

▶ In the MAC address field, you specify the MAC address.
▶ In the VLAN ID field, you specify the ID of the VLAN.
5.8.6 Subnet Based VLAN

In IP subnet-based VLANs, the device forwards traffic based on the source IP address and subnet mask associated with the VLAN. User-defined filters determine whether a packet belongs to a particular VLAN.

IP subnet-based VLANs specify the filtering criteria only for untagged packets or priority tagged packets. Assign a port to an IP subnet-based VLAN for a specific source address. The device then forwards untagged packets received with the configured address to the IP subnet-based VLAN ID.

To configure an IP subnet based VLAN, specify an IP address, a subnet mask, and the corresponding VLAN identifier. When multiple entries apply, the device uses the entry with the longest prefix first.

<table>
<thead>
<tr>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
</tr>
<tr>
<td>Netmask</td>
</tr>
<tr>
<td>VLAN ID</td>
</tr>
</tbody>
</table>

The device supports up to 128 VLANs set up simultaneously to subnetwork based VLANs.

Possible values:
- Valid IP address
- Valid IP netmask
- 1..4042
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

- In the IP address field, you specify the IP address.
- In the Netmask field, you specify the netmask.
- In the VLAN ID field, you specify the ID of the VLAN.
5.8.7 Protocol Based VLAN

In a protocol-based VLAN, specified ports bridge traffic based on the L3 protocol (EtherType) associated with the VLAN. User-defined packet filters determine whether a packet belongs to a particular VLAN.

Protocol-based VLANs specify the filtering criteria only for untagged packets. Assign a port to a protocol-based VLAN for a specific protocol. The device then forwards untagged packets received with the configured protocol to the protocol-based VLAN ID. The device assigns other untagged packets with the port VLAN ID.

**Table**

<table>
<thead>
<tr>
<th>Group ID</th>
<th>Displays the group identifier of the protocol-based VLAN entry.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The device supports up to 128 protocol-based VLAN associations simultaneously.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>1..128</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Specifies the group name of the protocol-based VLAN entry.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible values:</td>
<td>Alphanumeric ASCII character string with 1..16 characters</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Specifies the ID of the VLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible values:</td>
<td>1..4042</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Port</th>
<th>Specifies the ports that are assigned to the group.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible values:</td>
<td>&lt;Port number&gt;</td>
</tr>
<tr>
<td>Select the ports in the drop-down list.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Ethertype</th>
<th>Specifies the Ethertype value assigned to the VLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Ethertype is a two-octet field in an Ethernet packet to indicate which protocol the payload contains.</td>
<td></td>
</tr>
</tbody>
</table>
Possible values:

- **0x0600..0xFFFF**
  Ethertype as a hexadecimal number sequence
  When you enter a decimal value, the device converts the value into a hexadecimal number sequence when you click the *Add* button.

- **ip**
  Ethertype keyword for IPv4 (equivalent to 0x0800)

- **arp**
  Ethertype keyword for ARP (equivalent to 0x0806)

- **ipx**
  Ethertype keyword for IPX (equivalent to 0x8137)

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

### 5.9 L2-Redundancy

The menu contains the following dialogs:

- MRP
- HIPER Ring
- DLR (depends on hardware)
- PRP (depends on hardware)
- HSR (depends on hardware)
- Spanning Tree
- Link Aggregation
- Link Backup
- FuseNet
The Media Redundancy Protocol (MRP) is a protocol that lets you set up high-availability, ring-shaped network structures. An MRP ring with Hirschmann devices is made up of up to 100 devices that support the MRP protocol according to IEC 62439.

If a section fails, then the ring structure of an MRP ring changes back into a line structure. The maximum recovery time can be configured.

The Ring Manager function of the device closes the ends of a backbone in a line structure to a redundant ring.

Note: Spanning Tree and Ring Redundancy have an effect on each other. Deactivate the Spanning Tree protocol for the ports connected to the MRP ring. See the Switching > L2-Redundancy > Spanning Tree > Port dialog.

When you work with oversized Ethernet packets (the value in the MTU column for the port is > 1518, see the Basic Settings > Port dialog), the switching time of the MRP ring reconfiguration depends on the following parameters:

- Bandwidth of the ring line
- Size of the Ethernet packets
- Number of devices in the ring

Set the recovery time sufficiently large to help avoid delays in the MRP packages due to latencies in the devices. You can find the formula for calculating the switching time in IEC 62439-2, section 9.5.

**Operation**

Enables/disables the MRP function.

After you configured the parameters for the MRP ring, enable the function here.

Possible values:

- **On**
  - The MRP function is enabled.
  - After you configured the devices in the MRP ring, the redundancy is active.

- **Off** (default setting)
  - The MRP function is disabled.

**Ring port 1/Ring port 2**

Specifies the number of the port that is operating as a ring port.
Possible values:

- `<Port number>`
  Number of the ring port

**Note:** If the device uses the software supporting Fast MRP, then you cannot select a Link Aggregation port as a ring port.

**Operation**

Displays the operating status of the ring port.

Possible values:

- **forwarding**
  The port is enabled, connection exists.
- **blocked**
  The port is blocked, connection exists.
- **disabled**
  The port is disabled.
- **not-connected**
  No connection exists.

**Fixed backup**

Activates/deactivates the backup port function for the **Ring port 2**.

**Note:** The switch over to the primary port can exceed the maximum ring recovery time.

Possible values:

- **marked**
  The **Ring port 2** backup function is active. When the ring is closed, the ring manager reverts back to the primary ring port.
- **unmarked** (default setting)
  The **Ring port 2** backup function is inactive. When the ring is closed, the ring manager continues to send data on the secondary ring port.

**Configuration**

**Ring manager**

Enables/disables the **Ring manager** function.

If there is one device at each end of the line, then you activate this function.

Possible values:

- **On**
  The **Ring manager** function is enabled. The device operates as a ring manager.
- **Off** (default setting)
  The **Ring manager** function is disabled. The device operates as a ring client.
Advanced mode

Activates/deactivates the advanced mode for fast recovery times.

Possible values:
- **marked** (default setting)
  - Advanced mode active.
  - MRP-capable Hirschmann devices support this mode.
- **unmarked**
  - Advanced mode inactive.
  - Select this setting if another device in the ring does not support this mode.

Ring recovery

Specifies the maximum recovery time in milliseconds for reconfiguration of the ring. This setting is effective if the device operates as a ring manager.

Possible values:
- **500ms**
- **200ms** (default setting)
- **30ms** (depends on hardware)
- **10ms** (depends on hardware)

Shorter switching times make greater demands on the response time of every individual device in the ring. Use values lower than 500ms if the other devices in the ring also support this shorter recovery time.

**Note:** The switching times 30ms and 10ms are available for devices with an FPGA (hardware for extended functions). The product code indicates whether your device supports Fast MRP. In order to use the functions, load the device software supporting Fast MRP.

Set the switching time to **10ms** only if you use up to 20 devices in the ring that support this switching time. If you use more than 20 of these devices, then set the switching time to at least **30ms**.

When you are working with oversized Ethernet packets, the number of devices in the ring is limited. Note that the switching time depends on several parameters. See the description above.

VLAN ID

Specifies the ID of the VLAN which you assign to the ring ports.

Possible values:
- **0** (default setting)
  - No VLAN assigned.
  - Assign in the **Switching > VLAN > Configuration** dialog to the ring ports for VLAN 1 the value **0**.
- **1..4042**
  - VLAN assigned.
  - If you assign to the ring ports a non-existing VLAN, then the device creates this VLAN. In the **Switching > VLAN > Configuration** dialog, the device creates an entry in the table for the VLAN and assigns the value **1** to the ring ports.
**Information**

Displays messages for the redundancy configuration and the possible causes of errors.

When the device operates as a ring client or a ring manager, the following messages are possible:

- **Redundancy available**
  The redundancy is set up. When a component of the ring is down, the redundant line takes over its function.

- **Configuration error: Error on ringport link.**
  Error in the cabling of the ring ports.

When the device operates as a ring manager, the following messages are possible:

- **Configuration error: Packets from another ring manager received.**
  Another device exists in the ring that operates as the ring manager.
  Enable the Ring manager function only on one device in the ring.

- **Configuration error: Ring link is connected to wrong port.**
  A line in the ring is connected with a different port instead of with a ring port. The device only receives test data packets on 1 ring port.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Delete ring configuration**

Disables the redundancy function and resets the settings in the dialog to the default setting.
5.9.2 HIPER Ring

The concept of HIPER ring redundancy enables the construction of high-availability, ring-shaped networks. This device provides a HIPER ring client. This function lets you extend an existing HIPER ring or to replace a device already participating as a client in a HIPER ring.

A HIPER ring contains a Ring Manager (RM) which controls the ring. The RM sends watchdog packets into the ring on both the primary and secondary ports. When the RM receives the watchdog packets on both ports, the primary port remains in the forwarding state and the secondary port remains in the discarding state.

The device operates only in the ring client mode. This means that the device is able to recognize and forward the watchdog packets on the ring ports and can also forward the change in link status to the RM for example, LinkDown and LinkUp packets.

The device only supports Fast Ethernet and Gigabit Ethernet ports as ring ports. Furthermore, the device only supports HIPER ring in VLAN 1.

Note: Spanning Tree and Ring Redundancy have an effect on each other. Deactivate the Spanning Tree protocol for the ports connected to the HIPER ring. See the Switching > L2-Redundancy > Spanning Tree > Port dialog.

Note: Configure the devices of the HIPER ring individually. Before you connect the redundant link, complete the configuration of every device of the HIPER ring. You thus help avoid loops during the configuration phase.

Operation

Enables/disables the HIPER Ring client.

Possible values:

- **On**
  The HIPER Ring client is enabled.
- **Off** (default setting)
  The HIPER Ring client is disabled.

Ring port 1/Ring port 2

Specifies the port number of the primary/secondary ring port.

Possible values:

- **-** (default setting)
  No primary/secondary ring port selected.
- `<Port number>`
  Number of the ring port
State

Displays the state of the primary/secondary ring port.

Possible values:
- **not-available**
  - The HIPER Ring client is disabled.
  - or
  - No primary or secondary ring port selected.
- **active**
  - The ring port is enabled and logically up.
- **inactive**
  - The ring port is logically down.

As soon as the link goes down on a ring port, the device sends a LinkDown packet to the Ring Manager on the other ring port.

Information

Mode

Displays that the device is able to operate in the ring client mode.

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.

5.9.3 DLR

The Device Level Ring (DLR) protocol provides high network availability in a ring topology. The primary intent for the DLR protocol is implementation in EtherNet/IP end-devices that have 2 Ethernet ports and embedded Layer 2 switch technology. The DLR protocol provides network fault detection and reconfiguration to support demanding control applications.

The DLR network uses a ring supervisor to monitor the network. The ring supervisor controls data on the ring by sending data only on the primary ring port until a break in the ring occurs. When a break in the ring occurs, the ring supervisor unblocks the secondary port allowing the data to reach the ring participants located on the other side of the break.

To maintain control of the network, the active ring supervisor sends Beacon packets through both ports. The device lets you specify the interval between consecutive Beacon packets. The Beacon packets help detect breaks in the ring, send Ring State messages to the participants, and also contain the following information:
- the precedence of the active ring supervisor
- the MAC address of the active ring supervisor
- the Beacon timeout
- the DLR VLAN ID
In the supervisor mode, the device also sends Announce packets, once every second, through the unblocked port only. The Announce packets also contain Ring State messages.

In the non-supervisor mode, the device functions as a Beacon-based participant. Upon receiving a Ring Fault State message from the active ring supervisor, the Beacon-based participant flushes its unicast MAC address table, and conducts a Neighbor Check. The Neighbor Check helps isolate a break between adjacent participants.

DLR uses a VLAN to distribute information contained in the Beacon Packet, to other ring participants as priority tagged. The default setting for the DLR VLAN ID is 0. VLAN ID is only set in this dialog. You use VLAN ID 0 in conjunction with the VLAN unaware mode.

Verify that the functions which directly affect the DLR function have the following settings:

<table>
<thead>
<tr>
<th>Network Type</th>
<th>Operation</th>
<th>VLAN unaware mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>EtherNet/IP</td>
<td>On</td>
<td></td>
</tr>
<tr>
<td>Spanning Tree</td>
<td>Off</td>
<td></td>
</tr>
<tr>
<td>VLAN</td>
<td>marked</td>
<td></td>
</tr>
<tr>
<td>IGMP Snooping</td>
<td>On</td>
<td></td>
</tr>
</tbody>
</table>

Note: DLR is available for devices with an FPGA (hardware for extended functions). The product code indicates whether your device supports DLR. In order to use the functions, load the device software supporting DLR.

The menu contains the following dialogs:
- DLR Configuration (depends on hardware)
- DLR Statistics (depends on hardware)
5.9.3.1 DLR Configuration

In this dialog, you specify the role of the device in the ring. When you specify the device as a ring supervisor, the device sends Beacon packets containing its precedence for active ring supervisor candidacy. As active ring supervisor, the device monitors the ring for breaks, and sends configuration information to the ring participants.

**Operation**

Operation

Enables/disables the DLR function globally.

Possible values:
- **On** (default setting)
  The DLR function is enabled.
- **Off**
  The DLR function is disabled.

**Table**

Ring index

Displays the index number to which the table entry relates.

Name

Specifies the name of the DLR ring.

Possible values:
- Alphanumeric ASCII character string with 0..255 characters

Ring port 1

Specifies the first of 2 ring ports used to connect the device to the DLR ring.

Possible values:
- `<Port number>` (default setting: 1/1)
  Select the port from the drop-down list.

Ring port 1 status

Displays the status of ring port 1.
Possible values:

- **disabled**
  The port is disabled. To enable the port, open the *Basic Settings > Port* dialog, *Configuration* tab. In the *Port on* column, mark the appropriate checkbox.

- **blocked**
  The port is the secondary port, sending and receiving only Beacon packets.

- **forwarding**
  The port is the primary port, sending and receiving data, Beacon packets, and Announce packets.

- **notConnected**
  The port is physically unconnected.

### Ring port 2

Specifies the second of 2 ring ports used to connect the device to the DLR ring.

Possible values:

- `<Port number>` (default setting: 1/2)
  Select the port from the drop-down list.

### Ring port 2 status

Displays the status of ring port 2.

Possible values:

- **disabled**
  The port is disabled. To enable the port, open the *Basic Settings > Port* dialog, *Configuration* tab. In the *Port on* column, mark the appropriate checkbox.

- **blocked**
  The port is the secondary port, sending and receiving only Beacon packets.

- **forwarding**
  The port is the primary port, sending and receiving data, Beacon packets, and Announce packets.

- **notConnected**
  The port is physically unconnected.

### Supervisor active

Activates/deactivates the supervisor function.

Possible values:

- **marked** (default setting)
  The device is configured as a ring supervisor. The device monitors the ring for breaks. If a break in the ring occurs, then the device unblocks and forwards data on the secondary port.

- **unmarked**
  The device is a Beacon-based ring participant.

### Status

Displays the status of the device in the DLR ring.
Possible values:

- **backup**
  Another device in the same ring is the active supervisor.

- **supervisor**
  This device is the active supervisor.

- **node**
  The device functions as a Beacon-based ring participant.

- **nonDlr**
  The device has detected that the network topology is something other than a ring using the DLR protocol.

- **unsupported**
  The configuration in the row is invalid.

**Supervisor precedence**

Specifies the precedence value of the device for the ring supervisor selection. The device sends the value to other ring devices in the Beacon packets. When another ring supervisor is present on the same ring, the device with the higher value is selected active ring supervisor. When both values are the same, the device with the higher MAC address becomes active supervisor.

Possible values:

- **0..255** (default setting: 0)
  A numerically higher value indicates a higher precedence.

**Beacon interval [µs]**

Specifies the interval, in microseconds, at which the supervisor sends Beacon packets. The ring supervisor transmits a Beacon packet through both of its Ethernet ports once per Beacon interval. When the ring is intact, the device receives the Beacon packet on the opposite ports, and leaves the blocked port in the blocking mode.

Possible values:

- **400..100000** (default setting: 400)
  Lower interval times increase the recovery time. When the ring contains only DLR participants, use the following formula to calculate:
  \[ \text{Minimum value} = 13 \times \text{Number of ring participants} \]

**Beacon timeout [µs]**

Specifies the amount of time, in microseconds, the device listens for Beacon packets. After the device times out the reception of a Beacon packet, it takes the appropriate action depending on its role as an active supervisor or ring participant.

Possible values:

- **1600..500000** (default setting: 1960)
  Set this value to at least 4 times the value specified in the *Beacon interval [µs]* column. When the ring contains only DLR participants, use the following formula to calculate:
  \[ \text{Maximum value} = (\text{Number of ring participants} \times (1 - 0.1) \times 25) + (\text{Number of ring participants} \times 0.1 \times 137) \]

**VLAN ID**

Specifies the VLAN ID used to send the DLR protocol messages to the other devices on the ring.

The active supervisor informs the ring participants which VLAN ID to use in the Beacon packets. Create and configure the VLAN in the *Switching > VLAN > Configuration* dialog.
The prerequisite for setting the VLAN ID to 0 is that you activate the VLAN unaware mode. In the Switching > Global dialog, mark the VLAN unaware mode checkbox.

Possible values:

- 0..4042 (default setting: 0)

**Active**

Activates/deactivates the DLR configuration.

Possible values:

- marked: The DLR configuration is active.
- unmarked (default setting): The DLR configuration is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Service action**

Opens the Service action dialog to specify the DLR services that the device uses to help locate and clear detected faults.

Possible values:

- verifyFaultLocation (default setting)
  The supervisor verifies the fault location by retransmitting the Locate_Fault packet to ring participants.
- clearRapidFaults
  Clears the Rapid Fault condition where the ring supervisor detected a cycle of rapid ring faults.
- restartSignOn
  Restarts the Sign On process and refreshes the participants list.
5.9.3.2 **DLR Statistics**

This dialog displays the status of the ring, the type of topology, number of participants, and other information to help you to analyze the network.

This dialog also displays a list of participating ring participants. The active ring supervisor gathers the information contained in the participants list using the `Sign_On` packet. If the participants list is too large, then the DLR Object returns, `Reply Data Too Large` (code 0x11).

The dialog contains the following tabs:
- **Status**
- **Participants**

### Status

#### Table

**Ring index**

Displays the index number to which the table entry relates.

**Capability**

Displays the capabilities of the device.

Possible values:
- `announce`
  The device is an announce-based ring participant.
- `beacon`
  The device is capable of sending Beacon packets.
- `supervisor`
  The device is capable of being a supervisor.
- `gateway`
  The device is capable of being a gateway.
- `flushTable`
  The device is capable of flushing the unicast MAC address table.

**Status**

Displays the status of the device in the DLR ring.

Possible values:
- `backup`
  Another device in the same ring is the active supervisor.
- `supervisor`
  This device is the active supervisor.
- `node`
  The device functions as a Beacon-based ring participant.
The device has detected that the network topology is something other than a ring using the DLR protocol.

- **unsupported**
  The row parameters are invalid.

### Network topology

Displays the current network topology mode.

#### Possible values:

- **linear**
  The network is linear.

- **ring**
  The network is a DLR ring.

### Network status

Displays the current network status.

#### Possible values:

- **normal**
  After the device receives Beacon packets on both ports, the supervisor transitions to the NORMAL_STATE, flushes the unicast MAC address table, and reconfigures a port to blocking. The device sends Beacon packets with the Ring State set to RING_NORMAL_STATE. The ring supervisor also sends an Announce packet out of the forwarding port, with the Ring State set to RING_NORMAL_STATE.

- **ringFault**
  The reasons for which the device displays the value are as follows:
  - Upon boot up, an enabled ring supervisor starts in the FAULT_STATE with both ports forwarding packets.
  - The device received a Beacon packet from another supervisor with a higher precedence.
  - Upon receipt of a Beacon packet with the Ring State set to RING_FAULT_STATE. When the device is in the FAULT_STATE, the ring supervisor continues to send Beacon packets, in order to detect ring restoration.

- **loop**
  The device has detected a loop in the network.

- **partial**
  The device detected a partial network fault where the Beacon packets are lost only in 1 direction. If the active ring supervisor detects a partial fault, then it blocks traffic on 1 port and sets a status value in the DLR Object. The condition requires user intervention.

- **rapidFault**
  The device detected a rapid fault, 5 faults in a 30 second period. Rapid faults can lead to an unstable network. If the active ring supervisor detects a rapid fault, then it blocks traffic on 1 port and sets a status value in the DLR Object. The condition requires user intervention. To reset the device open the Switching > L2-Redundancy > DLR > Configuration dialog and set the value clearRapidFaults in the Service column.

### Last status change

Displays the time, in seconds, since the network status last changed.

### Participants

Displays the number of devices in the ring protocol participants list.
Supervisor IP address

Displays the IPv4 address assigned to the active supervisor.

Supervisor MAC address

Displays the MAC address of the active ring supervisor.

Supervisor precedence

Displays the precedence value of the active ring supervisor.

Faults

Displays the number of times that the device has detected a ring fault, since starting as either the active or the backup supervisor.

Port 1 IP address

Displays the IPv4 address assigned to port 1.

Port 1 MAC address

Displays the MAC address of last active ring participant on port 1.

Port 2 IP address

Displays the IPv4 address assigned to port 2.

Port 2 MAC address

Displays the MAC address of last active ring participant on port 2.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Participants]

Only the active ring supervisor displays the ring participants.

Table

Index

Displays the index number to which the table entry relates.

Address

Displays the IP address of the participating ring participant.
5.9.4 PRP

The Parallel Redundancy Protocol (PRP) is defined in the international standard IEC 62439-3. PRP uses 2 independent LANs with any ring, star, bus and mesh topologies, providing a high availability of network connections.

To connect the device to the PRP network, use either 100 Mbit/s FDX or 1000 Mbit/s FDX on both of the specially marked ports, Port A and Port B.

The maximum allowed size of Ethernet packets on these ports is restricted to 1534 bytes. See the MTU column in the Basic Settings > Port dialog.

The main advantage of PRP is that the destination node receives packets from the source as long as 1 LAN is available. The absence of the second LAN due to repairs or maintenance has no impact on the packet transmission.

The network device which connects the end devices to the network implements the PRP protocol. The Ethernet switches in both LANs are standard switches that are oblivious to PRP. A Double Attached Node implementing PRP (DANP) is a network device with PRP functionality and has 1 connection into each independent LAN. A Single Attached Node (SAN) is a standard Ethernet device with a single LAN interface directly connected to one of the redundant LANs. For this reason, a SAN is unable to use the redundant LAN.

A Redundancy Box (RedBox) is a network device which implements the PRP functionality for standard ethernet devices. A standard ethernet device when connected to a PRP network via a RedBox is a virtual DANP (VDAN).

Note: PRP is available for devices with an FPGA (hardware for extended functions). The product code indicates whether your device supports PRP. In order to use the functions, load the device software supporting PRP.

Note: If the inter-frame gap is shorter than the latency between the 2 LANs, then a frame-ordering mismatch can occur. Frame-ordering mismatch is a phenomenon of the PRP protocol. The only solution to help avoid a frame-ordering mismatch is to verify that the inter-frame gap is greater than the latency between the LANs.

The menu contains the following dialogs:
- PRP Configuration (depends on hardware)
- PRP DAN/VDAN Table (depends on hardware)
- PRP Proxy Node Table (depends on hardware)
- PRP Statistics (depends on hardware)
5.9.4.1 PRP Configuration

In this dialog, you enable/disable the PRP function, and configure PRP supervision packet reception and transmission.

The MRP and Spanning Tree functions cannot operate on the same ports as the PRP function. Disable the MRP function or choose different ports. Deactivate the Spanning Tree function on the PRP ports.

Note: When PRP is active, it uses the interfaces 1/1 and 1/2. As seen in the Switching > VLAN, Switching > Rate Limiter and Switching > Filter for MAC Addresses dialogs, the PRP function replaces the interfaces 1/1 and 1/2 with the interface prp/1. Configure the VLAN membership, the rate limiting, and the MAC filtering for the interface prp/1.

**Operation**

Enables/disables the PRP function.

Possible values:
- **On**
  - The PRP function is enabled globally.
  - When this function is active, the device processes the data stream according to the set up.
- **Off** (default setting)
  - The PRP function is disabled globally.
  - To help avoid network loops, disable the PRP function on Port A or Port B before disabling the PRP function globally.

Note: When you use SFPs for PRP ports and the device only supports 100 Mbit/s, verify that the SFPs support 100 Mbit/s.

**Port A / Port B**

Physical port

Displays the number of the physical port which the device uses as the PRP Port A or Port B.

Port A admin state

Enables/disables the PRP function on the port.

Possible values:
- **On** (default setting)
  - The PRP function on the port is enabled.
- **Off**
  - The PRP function on the port is disabled.
**Supervision packet receiver**

Evaluate supervision packets

Activates/deactivates the analysis of the supervision packets.

Possible values:

- **marked** (default setting)
  - The analysis of the supervision packets is activated.
  - The device receives Supervision Packets and analyzes them.
- **unmarked**
  - The analysis of the supervision packets is deactivated.
  - The device receives supervision packets without analyzing them.

**Supervision packet sender**

Active

Enables/disables the transmission of supervision packets.

Possible values:

- **On** (default setting)
  - The transmission of supervision packets is enabled. The RedBox transmits its own supervision packets.
- **Off**
  - The transmission of supervision packets is disabled.

Send VDAN packets

Activates/deactivates the transmission of VDAN supervision packets.

The prerequisite is that you activate the *Supervision packet sender* first.

Possible values:

- **marked** (default setting)
  - The transmission of VDAN supervision packets is active.
  - The RedBox transmits both its own supervision packets and the supervision packets for the VDANs listed in the *PRP Proxy Node Table*.
- **unmarked**
  - The transmission of VDAN supervision packets is inactive.

**Configuration**

MTU

Specifies the maximum allowed size of Ethernet packets on the interface in bytes.
Possible values:

- **1518...1530** (default setting: **1518**)
  
  With the setting **1518**, the port transmits the Ethernet packets up to the following size:
  
  - 1518 bytes without VLAN tag
    
    (1514 bytes + 4 bytes CRC)
  
  - 1522 bytes with VLAN tag
    
    (1518 bytes + 4 bytes CRC)

  This setting lets you increase the size of the Ethernet packets for specific applications.

**Speed**

Specifies the speed of the PRP interface. The prerequisite is that both PRP member ports operate with the specified speed.

Possible values:

- **100Mbps** (default setting)
- **1Gbps**

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.9.4.2 PRP DAN/VDAN Table

This dialog lets you analyze the LANs. This is helpful for example, when the Last seen A counter of one port continually increases while the Last seen B counter remains the same (and the other way round). This condition indicates an interruption of LAN connection.

DAN/VDAN means Double Attached Node / Virtual Double Attached Node.

Table

Index
Displays the index number to which the table entry relates.

MAC address
Displays the MAC address of the node.

Last seen A
Displays the time between received first packets for this node on LAN A. When the counter threshold reaches 497 days, it restarts from 0.

Last seen B
Displays the time between received first packets for this node on LAN B. When the counter threshold reaches 497 days, it restarts from 0.

Remote node type
Displays the type of node.

Possible values:
- redbox
  Management
- vdan
  Client

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.

Reset
Resets the entire table.
5.9.4.3 PRP Proxy Node Table

This dialog informs you of the connected devices for which this device provides PRP redundancy.

Note: The Redbox supports up to 128 hosts. If this number is exceeded with Redbox, then the device drops the packets.

Table

Index
Displays the index number to which the table entry relates.
Possible values:

MAC address
Displays the MAC address of the connected devices for which this device implements PRP redundancy.

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.

Reset
Resets the entire table.
5.9.4.4 PRP Statistics

This dialog lists receive events for various MIB Managed Objects. Each entry represents link degradation for the MIB Managed Objects listed in the description column. The table lists how many times the event occurred for each path through the device. The Port A entries for example, specify the path between the transceiver, through the Link Redundancy Entity (LRE) to the UDP and TCP layers.

### Table

<table>
<thead>
<tr>
<th>Description</th>
<th>Port A</th>
<th>Port B</th>
<th>Interlink</th>
<th>CPU port</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the MIB Managed Objects description to which the Port A, Port B, and Interlink entries refer.</td>
<td>Displays the number of MIB Managed Objects events on Port A. The device examines the traffic as it passes from receive transceiver A to the LRE.</td>
<td>Displays the number of MIB Managed Objects events on Port B. The device examines the traffic as it passes from receive transceiver B to the LRE.</td>
<td>Displays the number of MIB Managed Objects events on the interlink. The counters are active for the MIB Managed Objects that pertain to the interlink. The other counters remain empty. A sample is made of the traffic as it passes from the LRE to the switch.</td>
<td>Displays the number of MIB Managed Objects events on the CPU Port. There is one MIB Managed Object that pertains to the CPU Port. The other counters remain empty. A sample is made of the traffic as it passes from receive transceiver to the CPU.</td>
</tr>
</tbody>
</table>

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Resets the entire table.
An HSR-based ring offers zero recovery time (HSR = High-availability Seamless Redundancy). HSR is suited for applications that demand high availability and short reaction times. For example, protection applications for electrical station automation and controllers for synchronized drives which require constant connection.

HSR Redundancy Boxes (RedBox) use 2 Ethernet ports operating in parallel to connect to a ring. An HSR RedBox operating in this configuration is a Doubly Attached Node implementing the HSR protocol (DANH). A standard ethernet device connected to the HSR ring through an HSR RedBox is a Virtual DANH (VDANH).

The transmitting HSR node or HSR RedBox sends twin packets, 1 in each direction, on the ring. For identification, the HSR node injects the twin packets with an HSR tag. The HSR tag consists of a port identifier, the length of the payload and a sequence number. In a normal operating ring, the destination HSR node or RedBox receives both packets within a certain time skew. An HSR node forwards the first packet to arrive to the upper layers and discards the second packet when it arrives. A RedBox on the other hand forwards the first packet to the VDANHs and discards the second packet when it arrives.

The device performs a specific role in the network. Configure a device as an HSR RedBox connecting standard ethernet devices to an HSR ring. Configure a device as an HSR node connecting a PRP LAN to an HSR ring.

A single HSR ring accommodates up to 7 PRP LANs. Configure the device to identify and tag the traffic addressed for the connected PRP LAN.

The number of HSR nodes in the ring should not exceed 50. If the HSR interface speed is 1Gbps, then the number should not exceed 300.

It is useful to limit the traffic injected into the HSR ring. If there are any third party devices with a higher latency in the ring, then you reduce the number of ring participants. Verify that the sum of bandwidths applied to the HSR nodes is less than 84 %.

**Note:** HSR is available for devices with an FPGA (hardware for extended functions). The product code indicates whether your device supports HSR. In order to use the functions, load the device software supporting HSR.

The menu contains the following dialogs:
- HSR Configuration (depends on hardware)
- HSR DAN/VDAN Table (depends on hardware)
- HSR Proxy Node Table (depends on hardware)
- HSR Statistics (depends on hardware)
5.9.5.1 **HSR Configuration**

In this dialog, you enable the HSR function, configure HSR supervision packets, and specify the function that the device executes in the HSR ring.

The MRP and Spanning Tree functions cannot operate on the same ports as the HSR function. Disable the MRP function or choose different ports. Deactivate the Spanning Tree function on the HSR ports.

**Note:** When HSR is active, it uses the interfaces 1/1 and 1/2. As seen in the Switching > Rate Limiter and Switching > Filter for MAC Addresses dialogs, the HSR function replaces the interfaces 1/1 and 1/2 with the interface hsr/1. Set up the VLAN membership and the rate limiting for the interface hsr/1.

**Operation**

Enables/disables the HSR function globally.

Possible values:
- **On**
  - When this function is active, the device processes the data stream according to the set up.
- **Off** (default setting)

**Note:** When you use SFPs for HSR ports and the device only supports 100 Mbit/s, verify that the SFPs support 100 Mbit/s.

**Port A / Port B**

Displays the number of the physical port which the device uses as the HSR Port A or Port B.

**Port A admin state**

Enables/disables the HSR function on the port.

Possible values:
- **On** (default setting)
  - The HSR function on the port is enabled.
- **Off**
  - The HSR function on the port is disabled.
**Supervision packet receiver**

Evaluate supervision packets

Activates/deactivates the supervision packet analysis.

Possible values:

- **marked** (default setting)
  - Supervision packet analysis is active.
  - The device receives supervision data packets and analyzes them.

- **unmarked**
  - Supervision packet analysis is inactive.
  - The device receives supervision data packets without analyzing them.

**Supervision packet sender**

Active

Enables/disables the transmission of supervision packets.

Possible values:

- **On** (default setting)
  - The transmission of supervision packets is enabled. The RedBox transmits its own supervision packets.

- **Off**
  - The transmission of supervision packets is disabled.

Send VDAN packets

Activates/deactivates the transmission of VDAN supervision packets.

The prerequisite is that you enable the transmission of supervision packets. See the **Active** field.

Possible values:

- **marked**
  - The transmission of VDAN supervision packets is active.
  - The RedBox transmits both its own supervision packets and the supervision packets for the VDANs listed in the **HSR Proxy Node Table**.

- **unmarked** (default setting)
  - The transmission of VDAN supervision packets is inactive.

**Configuration**  
**MTU**

Specifies the maximum allowed size of Ethernet packets on the interface in bytes.
Possible values:
  - 1518..1530 (default setting: 1518)

With the setting 1518, the port transmits the Ethernet packets up to the following size:
  - 1518 bytes without VLAN tag
    (1514 bytes + 4 bytes CRC)
  - 1522 bytes with VLAN tag
    (1518 bytes + 4 bytes CRC)

This setting lets you increase the size of the Ethernet packets for specific applications.

**Note:** If you increase the value, then it can be necessary to increase the MTU size of other ports by the same amount. See the MTU column in the Basic Settings > Port dialog, Configuration tab.

**Speed**

Specifies the speed of the HSR interface. The prerequisite is that both HSR member ports operate with the specified speed.

Possible values:
  - 100Mbps (default setting)
  - 1Gbps

**HSR parameter**

**HSR mode**

Specifies the forwarding capacity of the device for unicast traffic.

Possible values:
  - modeh (default setting)
    If the host functions as a proxy for a destination device, then it removes unicast traffic from the ring and forwards it to the destination address.
  - modeu
    If the host operates as a proxy for a destination device, then it forwards unicast traffic around the ring and forwards it to the destination address. If the packets return to the source node, then it discards the unicast traffic.

**Switching node type**

Specifies the function that the device executes in the HSR ring.

Possible values:
  - hsrredboxsan (default setting)
    You use this setting if you connect SANs to the device within a HSR ring.
  - hsrredboxprpa
    You use this setting to connect the corresponding device with PRP LAN A. Furthermore, set the Redbox identity parameter for the corresponding network connection.
  - hsrredboxprpb
    You use this setting to connect the corresponding device with PRP LAN B. Furthermore, set the Redbox identity parameter for the corresponding network connection.
**Redbox identity**

Specifies the tags for the PRP LAN traffic.

The parameter identifies and tags the data traffic for the PRP LAN that you connect to this device. The device identifies the traffic for up to 7 PRP LANs that you connect to the HSR ring.

The prerequisite is that you set the **Switching node type** parameter to `hsrredboxprpa` or to `hsrredboxprpb`.

Possible values:

- **id1a** (default setting)
  - Use this value to handle the HSR data traffic for LAN A in PRP network 1.
- **id1b**
  - Use this value to handle the HSR data traffic for LAN B in PRP network 1.
- **id2a**
  - Use this value to handle the HSR data traffic for LAN A in PRP network 2.
- **id2b**
  - Use this value to handle the HSR data traffic for LAN B in PRP network 2.
- **id7a**
  - Use this value to handle the HSR data traffic for LAN A in PRP network 7.
- **id7b**
  - Use this value to handle the HSR data traffic for LAN B in PRP network 7.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.9.5.2 **HSR DAN/VDAN Table**

This dialog lets you analyze the LANs. This is helpful for example, when the *Last seen A* counter of one port continually increases while the *Last seen B* counter remains the same (and the other way round). This condition indicates an interruption of LAN connection.

DAN/VDAN means Double Attached Node / Virtual Double Attached Node.

**Table**

<table>
<thead>
<tr>
<th>Index</th>
<th>Displays the index number to which the table entry relates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC address</td>
<td>Displays the MAC address of the node.</td>
</tr>
<tr>
<td>Last seen A</td>
<td>Displays the time between received first packets for this node on LAN A. When the counter threshold reaches 497 days, it restarts from 0.</td>
</tr>
<tr>
<td>Last seen B</td>
<td>Displays the time between received first packets for this node on LAN B. When the counter threshold reaches 497 days, it restarts from 0.</td>
</tr>
<tr>
<td>Remote node type</td>
<td>Displays the type of node.</td>
</tr>
</tbody>
</table>

Possible values:
- *redboxh* Management
- *vdanh* Client

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Resets the entire table.
5.9.5.3  **HSR Proxy Node Table**

This dialog informs you of the connected devices for which this device provides HSR redundancy.

**Table**

**Index**

Displays the index number to which the table entry relates.

Possible values:

> 1..128

**MAC address**

Displays the MAC addresses of the connected devices for which this device implements HSR redundancy.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

**Reset**

Resets the entire table.
5.9.5.4 HSR Statistics

This dialog lists receive events for various MIB Managed Objects. Each entry represents link degradation for the MIB Managed Objects listed in the description column. The table lists how many times the event occurred for each path through the device. The Port A entries for example, specify the path between the transceiver, through the Link Redundancy Entity (LRE) to the UDP and TCP layers.

### Table

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the MIB Managed Objects description to which the Port A, Port B, and Interlink entries refer.</td>
</tr>
</tbody>
</table>

| Port A | Displays the number of MIB Managed Objects events on Port A. The device examines the traffic as it passes from receive transceiver A to the LRE. |

| Port B | Displays the number of MIB Managed Objects events on Port B. The device examines the traffic as it passes from receive transceiver B to the LRE. |

| Interlink | Displays the number of MIB Managed Objects events on the interlink. The counters are active for the MIB Managed Objects that pertain to the interlink. The other counters remain empty. A sample is made of the traffic as it passes from the LRE to the switch. |

| CPU port | Displays the number of MIB Managed Objects events on the CPU Port. There is one MIB Managed Object that pertains to the CPU Port. The other counters remain empty. A sample is made of the traffic as it passes from receive transceiver to the CPU. |

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

**Reset**

Resets the entire table.
5.9.6 **Spanning Tree**

The Spanning Tree Protocol (STP) is a protocol that deactivates redundant paths of a network in order to help avoid loops. If a network component becomes inoperable on the path, then the device calculates the new topology andreactivates these paths.

The Rapid Spanning Tree Protocol (RSTP) enables fast switching to a newly calculated topology without interrupting existing connections. RSTP gets average reconfiguration times of less than a second. When you use RSTP in a ring with 10 to 20 devices, you can get reconfiguration times in the order of milliseconds.

The device supports the Multiple Spanning Tree Protocol (MSTP) standardized in IEEE 802.1, which is a further development of the Spanning Tree Protocol (STP).

**Note:** When you connect the device to the network through twisted pair SFPs instead of through usual twisted pair ports, the reconfiguration of the network takes slightly longer.

The menu contains the following dialogs:

- Spanning Tree Global
- Spanning Tree MSTP
- Spanning Tree Port
5.9.6.1 Spanning Tree Global

In this dialog, you enable/disable the Spanning Tree function and specify the bridge settings.

**Operation**

Enables/disables the Spanning Tree function in the device.

Possible values:
- **On** (default setting)
- **Off**
  
  The device behaves transparently. The device floods received Spanning Tree data packets like multicast data packets to the ports.

**Variant**

Specifies the protocol used for the Spanning Tree function:

Possible values:
- **rstp** (default setting)
  
  The protocol RSTP is active.
  
  With RSTP (IEEE 802.1Q-2005), the Spanning Tree function operates for the underlying physical layer.
- **mstp**
  
  The protocol MSTP is active.
  
  To help avoid longer recovery times, specify the maximum value 40 in the **Tx holds** field.

**Traps**

Activates/deactivates the sending of SNMP traps for the following events:
- Another bridge takes over the root bridge role.
- The topology changes. A port changes its **Port state** from forwarding into discarding or from discarding into forwarding.

Possible values:
- **marked**
  
  The sending of SNMP traps is active.
- **unmarked** (default setting)
  
  The sending of SNMP traps is inactive.
Ring only mode

Activates/deactivates the Ring only mode function, in which the device does not verify the age of the BPDUs.

Possible values:

- **marked**
  - The Ring only mode function is active. Use this setting for applications for RSTP rings with diameters greater than 40.

- **unmarked** (default setting)
  - The Ring only mode function is inactive.

First port

Specifies the port number of the first interface.

Possible values:

- `<Port number>` (default setting: -)

Second port

Specifies the port number of the second interface.

Possible values:

- `<Port number>` (default setting: -)

Bridge configuration

Bridge ID

Displays the bridge ID of the device.

The device with the lowest bridge ID numerical value takes over the role of the root bridge in the network.

Possible values:

- `<Bridge priority> / <MAC address>
  - Value in the Priority field / MAC address of the device

Priority

Specifies the bridge priority of the device.

Possible values:

- `0..61440` in steps of 4096  (default setting: 32768)

To make this device the root bridge, assign the lowest numeric priority value in the network to the device.
Hello time [s]
Specifies the time in seconds between the sending of two configuration messages (Hello data packets).
Possible values:
▲ 1..2  (default setting: 2)
If the device takes over the role of the root bridge, then the other devices in the network use the value specified here.
Otherwise, the device uses the value specified by the root bridge. See the Root information frame.
Due to the interaction with the Tx holds parameter, we recommend that you do not change the default setting.

Forward delay [s]
Specifies the delay time for the status change in seconds.
Possible values:
▲ 4..30  (default setting: 15)
If the device takes over the role of the root bridge, then the other devices in the network use the value specified here.
Otherwise, the device uses the value specified by the root bridge. See the Root information frame.
In the RSTP protocol, the bridges negotiate a status change without a specified delay.
The Spanning Tree protocol uses the parameter to delay the status change between the statuses disabled, discarding, learning, forwarding.
The parameters Forward delay [s] and Max age have the following relationship:
Forward delay [s] ≥ (Max age/2) + 1
If you enter values in the fields that contradict this relationship, then the device replaces these values with the last valid values or with the default value.

Max age
Specifies the maximum permitted branch length for example, the number of devices to the root bridge.
Possible values:
▲ 6..40  (default setting: 20)
If the device takes over the role of the root bridge, then the other devices in the network use the value specified here.
Otherwise, the device uses the value specified by the root bridge. See the Root information frame.
The Spanning Tree protocol uses the parameter to specify the validity of STP-BPDUs in seconds.

Tx holds
Limits the maximum transmission rate for sending BPDUs.
Possible values:

- **1..40** (default setting: 10)
  
  To help avoid longer recovery times when using the MSTP protocol, set the maximum value to 40.

When the device sends a BPDU, the device increments a counter on this port.

If the counter reaches the value specified here, then the port stops sending BPDUs. On the one hand, this reduces the load generated by RSTP, and on the other when the device does not receive BPDUs, a communication interruption can be caused.

The device decrements the counter by 1 every second. In the following second, the device sends a maximum of 1 new BPDU.

**BPDU guard**

Activates/deactivates the BPDU Guard function in the device.

With this function, the device helps protect your network from incorrect configurations, attacks with STP-BPDUs, and unwanted topology changes.

Possible values:

- **marked**
  - The **BPDU guard** is active.
  - The device applies the function to manually specified edge ports. For these ports, in the **Switching > L2-Redundancy > Spanning Tree > Port** dialog, **CIST** tab the checkbox in the **Admin edge port** column is marked.
  - If an edge port receives an STP-BPDU, then the device disables the port. For this port, in the **Basic Settings > Port** dialog, **Configuration** tab the checkbox in the **Port on** column is unmarked.

- **unmarked** (default setting)
  - The **BPDU guard** is inactive.

To reset the status of the port to the value **forwarding**, you proceed as follows:

- [ ] If the port is still receiving BPDUs, then:
  - In the **Switching > L2-Redundancy > Spanning Tree > Port** dialog, **CIST** tab unmark the checkbox in the **Admin edge port** column.
  - or
  - In the **Switching > L2-Redundancy > Spanning Tree > Global** dialog, unmark the **BPDU guard** checkbox.

- [ ] To re-enable the port again you use the **Auto-Disable** function. Alternatively, proceed as follows:
  - Open the **Basic Settings > Port** dialog, **Configuration** tab.
  - Mark the checkbox in the **Port on** column.

**BPDU filter (all admin edge ports)**

Activates/deactivates the STP-BPDU filter on every manually specified edge port. For these ports, in the **Switching > L2-Redundancy > Spanning Tree > Port** dialog, **CIST** tab the checkbox in the **Admin edge port** column is marked.
Possible values:
• marked
  The BPDU filter is active on every edge port. The function does not use these ports in Spanning Tree operations.
  – The device does not send STP-BPDUs on these ports.
  – The device drops any STP-BPDUs received on these ports.
• unmarked (default setting)
  The global BPDU filter is inactive. You have the option to explicitly activate the BPDU filter for single ports. See the Port BPDU filter column in the Switching > L2-Redundancy > Spanning Tree > Port dialog.

Auto-disable

Activates/deactivates the Auto-Disable function for the parameters that BPDU guard is monitoring on the port.

Possible values:
• marked
  The Auto-Disable function for the BPDU guard is active.
  – When the port receives an STP-BPDU, the device disables an edge port. The “Link status” LED for the port flashes 3× per period.
  – The Diagnostics > Ports > Auto-Disable dialog displays which ports are currently disabled due to the parameters being exceeded.
  – The Auto-Disable functionreactivates the port automatically. For this you go to the Diagnostics > Ports > Auto-Disable dialog and specify a waiting period for the relevant port in the Reset timer [s] column.
• unmarked (default setting)
  The Auto-Disable function for the BPDU guard is inactive.

Root information

Bridge ID

Displays the bridge ID of the current root bridge.

Possible values:
• <Bridge priority> / <MAC address>

Priority

Displays the bridge priority of the current root bridge.

Possible values:
• 0..61440 in steps of 4096

Hello time [s]

Displays the time in seconds that the root bridge specifies between the sending of two configuration messages (Hello data packets).
Possible values:

- 1..2

The device uses this specified value. See the Bridge configuration frame.

Forward delay [s]

Specifies the delay time in seconds set up by the root bridge for status changes.

Possible values:

- 4..30

The device uses this specified value. See the Bridge configuration frame.

In the RSTP protocol, the bridges negotiate a status change without a specified delay.

The Spanning Tree protocol uses the parameter to delay the status change between the statuses disabled, discarding, learning, forwarding.

Max age

Specifies the maximum permitted branch length that the root bridge sets up for example, the number of devices to the root bridge.

Possible values:

- 6..40 (default setting: 20)

The Spanning Tree protocol uses the parameter to specify the validity of STP-BPDUs in seconds.

**Topology information**

Bridge is root

Displays if the device currently has the role of the root bridge.

Possible values:

- marked
  - The device currently has the role of the root bridge.

- unmarked
  - Another device currently has the role of the root bridge.

Root port

Displays the number of the port from which the current path leads to the root bridge.

If the device takes over the role of the root bridge, then the field displays the value 0.

Root path cost

Specifies the path cost for the path that leads from the root port of the device to the root bridge of the layer 2 network.
Possible values:

- 0..200000000
  
  If the value 0 is specified, then the device takes over the role of the root bridge.

**Topology changes**

Displays how many times the device has put a port into the forwarding status using the Spanning Tree function since the Spanning Tree instance was started.

**Time since topology change**

Displays the time since the last topology change.

Possible values:

- <days, hours:minutes:seconds>

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
### 5.9.6.2 Spanning Tree MSTP

In this dialog you manage the settings of the global and local MST instances.

In contrast to the local MST instances, the global MST instance is configured permanently in the device. The global MST instance contains the VLANs that are not explicitly allocated to a local MST instance.

The device supports up to 16 local MST instances. To create a local MST instance, click the button.

While STP has a single Spanning Tree spanning the network, MSTP lets you set up one Spanning Tree per VLAN or group of VLANs. Thus it is possible to specify several smaller Spanning Trees covering one network.

How to help avoid longer convergence times:

- Only use devices in the network that support RSTP or MSTP.
- Adjust the following parameters to the topology and number of bridges:
  - Maximum allowed number of devices to the root bridge, *Max age* field
  - Maximum allowed number of bridges within the MST region in a branch to the root bridge, *Global CIST parameter frame, Hops (max.)* field

For bridges in an MST region, specify identical values for the following parameters:

- *Name* of the MST region
- *Revision level* of the MST region
- Allocation of the VLANs to the MST instances
  - Include ports connecting the bridges of an MST region as tagged members in the VLANs set up on the bridges. You thus help avoid potential connection breaks within the MST region when the topology is changed.
  - Include ports connecting an MST region with other MST regions or with the CST region (boundary ports) as tagged members in the VLANs set up in both regions. You thus help avoid potential connection breaks when topology changes affecting the boundary ports are made.

#### MST region identifier

**Name**

Specifies the name of the MST region to which the device belongs.

Possible values:

- Alphanumeric ASCII character string with 1..32 characters

**Revision level**

Specifies the version number of the MST region to which the device belongs.

Possible values:

- $0..65535$ (default setting: $1$)
Checksum

Displays the MD5 checksum of the MST configuration.

**Global CIST parameter**

Hops (max.)

Specifies the maximum number of bridges within the MST region in a branch to the root bridge.

Possible values:

- \(6..40\) (default setting: 20)

Attached VLANs

Displays the IDs of the VLANs that are assigned only to the global MST instance and to no other local MST instance.

Possible values:

- ID of the statically configured VLANs (default setting: 1)

Bridge ID

Displays the bridge ID of the device.

Possible values:

- \(<\text{Bridge priority}> / <\text{MAC address}>\)
  The value is made up as follows:
  - Value in the *Priority* field. See the *Switching > L2-Redundancy > Spanning Tree > Global* dialog, *Bridge configuration* frame.
  - MAC address of the device.

Root ID

Displays the bridge ID of the current CIST root bridge of the whole Layer 2 network.

Possible values:

- \(<\text{Bridge priority}> / <\text{MAC address}>\)

The device with the numerically lowest bridge ID takes over the role of the CIST root bridge in the network. The following devices are able to take over the role of the root bridge:

- Bridges not belonging to any MST region
- Bridges belonging to the global instance of an MST region

In the whole Layer 2 network, the bridges use the time settings of the CIST root bridge, for example *Hello time [s]*.

Regional root ID

Displays the Bridge ID of the current root bridge that belongs to the global instance of the MST region to which this device belongs.
Possible values:

- `<Bridge priority> / <MAC address>`

The values in the `Regional root ID` and `Root ID` fields are identical when the regional root bridge has the lowest bridge ID in the whole Layer 2 network.

### Root port

Displays the port of the device from which the path leads to the current CIST root bridge of the whole Layer 2 network.

Possible values:

- **no Port**
  - The device currently has the role of the root bridge.
- `<Port number>`
  - The path to the current CIST root bridge of the whole Layer 2 network leads over this port.

### Root path cost

Displays the path cost for the path that leads from the regional root bridge of the MST region to the current CIST root bridge of the whole Layer 2 network.

Possible values:

- **0..200000000**
  - If the value 0 is specified, then the regional root bridge simultaneously has the role of the CIST root bridge.
  - For the devices within an MST region, the `Root path cost` values are identical.

If you do not use MSTP, then the `Root path cost` values are identical to the root path costs of Spanning Tree or Rapid Spanning Tree. In this case, every device considers itself as an own region.

### Internal root path cost

Displays the internal path cost for the path that leads from the root port of the device to the current regional root bridge of the MST region.

Possible values:

- **0..200000000**
  - If the value 0 is specified, then the local bridge simultaneously has the role of the current regional root bridge.

### Table

#### MSTI

Displays the instance number of the local MST instance.

#### Attached VLANs

Displays the IDs of the VLANs that are allocated to this local MST instance.
Priority

Specifies the bridge priority of the local MST instance.

Possible values:
- \(0..61440\) in steps of 4096 (default setting: 32768)

Assign the lowest numeric priority in this local MST instance to the device to make this device the root bridge.

Bridge ID

Displays the bridge ID.

The device with the numerically lowest bridge ID takes over the role of the MSTI (regional) root bridge in the instance.

Possible values:
- \(<\text{Bridge priority} + \text{Number of the instance}> / <\text{MAC address}>\)
  - Sum of the value in the fields Priority and MSTI / MAC address of the device

Time since topology change

Displays the time that has elapsed since the last topology change within this instance.

Topology changes

Displays how many times the device has put a port into the forwarding status using the Spanning Tree function since the Spanning Tree instance was started.

Topology change

Displays whether the device has detected a topology change within the instance.

Possible values:
- \(true\)
  - The device has detected a topology change.
- \(false\)
  - The device has not detected a topology change.

Root ID

Displays the bridge ID of the current root bridge in this instance.

Possible values:
- \(<\text{Bridge ID}> / <\text{MAC address}>\)

Root path cost

Displays the path cost for the path that leads from the root port of the device to the root bridge of the instance.

Possible values:
- \(0..200000000\)
  - If the value 0 is specified, then the bridge is simultaneously the root bridge of the instance.
Root port

Displays the port of the device from which the current path leads to the root bridge of the instance.

Possible values:
- **no Port**
  The device currently has the role of the root bridge.
- **<Port number>**
  The path to the current root bridge of the instance leads over this port.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Adds a new table entry.

The device supports up to local 16 instances.

**Configure VLANs**

Opens the Configure VLANs dialog to allocate VLANs to the local MST instance which is highlighted in the table.
5.9.6.3 Spanning Tree Port

In this dialog, you activate the Spanning Tree function on the ports, specify edge ports, and specify the settings for various protection functions.

The dialog contains the following tabs:
- [CIST]
- [Guards]
- [MSTI <MSTI>]

[CIST]

In this tab, you have the option to activate the Spanning Tree function on the ports individually, specify the settings for edge ports, and view the current values. The abbreviation CIST stands for Common and Internal Spanning Tree.

**Note:** Deactivate the Spanning Tree function on the ports that are participating in other Layer 2 redundancy protocols. Otherwise, it is possible that the redundancy protocols operate differently than intended. This can cause loops.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>STP active</th>
<th>Activates/deactivates the Spanning Tree function on the port.</th>
</tr>
</thead>
</table>

**Possible values:**
- **marked** (default setting)
- **unmarked**

If the Spanning Tree function is enabled in the device and disabled on the port, then the port does not send STP-BPDUs and drops any STP-BPDUs received.

<table>
<thead>
<tr>
<th>Port state</th>
<th>Displays the transmission status of the port.</th>
</tr>
</thead>
</table>

**Possible values:**
- **discarding**
  The port is blocked and forwards only STP-BPDUs.
- **learning**
  The port is blocked, but it learns the MAC addresses of received data packets.
- **forwarding**
  The port forwards data packets.
Switching
[Switching > L2-Redundancy > Spanning Tree > Port]

- **disabled**
  The port is inactive. See the Basic Settings > Port dialog, Configuration tab.

- **manualFwd**
  The Spanning Tree function is disabled on the port. The port forwards STP-BPDUs.

- **notParticipate**
  The port is not participating in STP.

Port role

Displays the current role of the port in CIST.

Possible values:

- **root**
  Port with the cheapest path to the root bridge.

- **alternate**
  Port with the alternative path to the root bridge (currently blocking).

- **designated**
  Port for the side of the tree averted from the root bridge (currently blocking).

- **backup**
  Port receives STP-BPDUs from its own device.

- **master**
  Port with the cheapest path to the CIST. The port is the CIST root port of the CIST Regional Root. The port is unique in an MST region.

- **disabled**
  The port is inactive. See the Basic Settings > Port dialog, Configuration tab.

Port path cost

Specifies the path costs of the port.

Possible values:

- **0..200000000** (default setting: 0)

  When the value is 0, the device automatically calculates the path costs depending on the data rate of the port.

Port priority

Specifies the priority of the port.

Possible values:

- **16..240** in steps of 16 (default setting: 128)

  This value represents the first 4 bits of the port ID.

Received bridge ID

Displays the bridge ID of the device from which this port last received an STP-BPDU.
Switching
[Switching > L2-Redundancy > Spanning Tree > Port]

Possible values:
- For ports with the designated role, the device displays the information for the STP-BPDU last received by the port. This helps to diagnose the possible STP problems in the network.
- For the alternate, backup, master, and root port roles, in the stationary condition (static topology) this information is identical to the information of the designated port role.
- If a port has no connection or if it did not receive any STP-BDPUs yet, then the device displays the values that the port can send with the designated role.

Received port ID

Displays the port ID of the device from which this port last received an STP-BPDU.

Possible values:
- For ports with the designated role, the device displays the information for the STP-BPDU last received by the port. This helps to diagnose the possible STP problems in the network.
- For the alternate, backup, master, and root port roles, in the stationary condition (static topology) this information is identical to the information of the designated port role.
- If a port has no connection or if it did not receive any STP-BDPUs yet, then the device displays the values that the port can send with the designated role.

Received path cost

Displays the path cost that the higher-level bridge has from its root port to the root bridge.

Possible values:
- For ports with the designated role, the device displays the information for the STP-BPDU last received by the port. This helps to diagnose the possible STP problems in the network.
- For the alternate, backup, master, and root port roles, in the stationary condition (static topology) this information is identical to the information of the designated port role.
- If a port has no connection or if it did not receive any STP-BDPUs yet, then the device displays the values that the port can send with the designated role.

Received path cost

Displays the path cost that the higher-level bridge has from its root port in the local MST instance to the root bridge.

Admin edge port

Activates/deactivates the Admin edge port mode. If the port is connected to an end device, then use the Admin edge port mode. This setting lets the edge port change faster to the forwarding state after linkup and thus a faster accessibility of the end device.
Switching
[Switching > L2-Redundancy > Spanning Tree > Port]

Possible values:
- **marked**
  - The Admin edge port mode is active.
  - The port is connected to an end device.
  - After the connection is set up, the port changes to the forwarding status without changing to the learning status beforehand.
  - If the port receives an STP-BPDU and the BPDU Guard function is active, then the device deactivates the port. See the Switching > L2-Redundancy > Spanning Tree > Global dialog.
- **unmarked** (default setting)
  - The Admin edge port mode is inactive.
  - The port is connected to another STP bridge.
  - After the connection is set up, the port changes to the learning status before changing to the forwarding status, if applicable.

**Auto edge port**

Activates/deactivates the automatic detection of whether you connect an end device to the port. The prerequisite is that the checkbox in the Admin edge port column is unmarked.

Possible values:
- **marked** (default setting)
  - The automatic detection is active.
  - After the installation of the connection and after $1.5 \times \text{Hello time [s]}$, the device sets the port to the forwarding status (default setting $1.5 \times 2$ s) if the port did not receive any STP-BPDUs during this time.
- **unmarked**
  - The automatic detection is inactive.
  - After the installation of the connection, and after **Max age** the device sets the port to the forwarding status.
  - (default setting: 20 s)

**Oper edge port**

Displays whether an end device or an STP bridge is connected to the port.

Possible values:
- **marked**
  - An end device is connected to the port. The port does not receive any STP-BPDUs.
- **unmarked**
  - An STP bridge is connected to the port. The port receives STP-BPDUs.

**Oper PointToPoint**

Displays whether the port is connected to an STP device via a direct full-duplex link.

Possible values:
- **true**
  - The port is connected directly to an STP device via a full-duplex link. The direct, decentralized communication between 2 bridges enables short reconfiguration times.
- **false**
  - The port is connected in another way, for example via a half-duplex link or via a hub.

**Port BPDU filter**

Activates/deactivates the filtering of STP-BPDUs on the port explicitly.
The prerequisite is that the port is a manually specified edge port. For these ports, the checkbox in the *Admin edge port* column is marked.

Possible values:

- **marked**
  - The BPDU filter is active on the port.
  - The function excludes the port from *Spanning Tree* operations.
  - The device does not send STP-BPDUs on the port.
  - The device drops any STP-BPDUs received on the port.

- **unmarked** (default setting)
  - The BPDU filter is inactive on the port.
  - You have the option to globally activate the BPDU filter for every edge port. See the *Switching > L2-Redundancy > Spanning Tree > Global* dialog, *Bridge configuration* frame.

If the *BPDU filter (all admin edge ports)* checkbox is marked, then the BPDU filter is still active on the port.

### BPDU filter status

Displays whether or not the BPDU filter is active on the port.

Possible values:

- **marked**
  - The BPDU filter is active on the port as a result of the following settings:
    - The checkbox in the *Port BPDU filter* column is marked.
    - The checkbox in the *BPDU filter (all admin edge ports)* column is marked. See the *Switching > L2-Redundancy > Spanning Tree > Global* dialog, *Bridge configuration* frame.

- **unmarked**
  - The BPDU filter is inactive on the port.

### BPDU flood

Activates/deactivates the *BPDU flood* mode on the port even if the *Spanning Tree* function is inactive on the port. The prerequisite is that the *BPDU flood* mode is also active for these ports.

Possible values:

- **marked**
  - The *BPDU flood* mode is active.
  - The device floods STP-BPDUs received on the port to the ports for which the *Spanning Tree* function is inactive.

- **unmarked** (default setting)
  - The *BPDU flood* mode is inactive.

### Buttons

You find the description of the standard buttons in section "Buttons" on page 15.
Switching
[Switching > L2-Redundancy > Spanning Tree > Port]  

[Guards]

This tab lets you specify the settings for various protection functions on the ports.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Root guard</td>
<td>Activates/deactivates the monitoring of STP-BPDUs on the port. The prerequisite is that the Loop guard function is inactive.</td>
</tr>
</tbody>
</table>

With this setting the device helps you protect your network from incorrect configurations or attacks with STP-BPDUs that try to change the topology. This setting is relevant only for ports with the STP role designated.

Possible values:

- **marked**
  - The monitoring of STP-BPDUs is active.
    - If the port receives an STP-BPDU with better path information to the root bridge, then the device discards the STP-BPDU and sets the status of the port to the value discarding instead of root.
    - If there are no STP-BPDUs with better path information to the root bridge, then the device resets the status of the port after 2 × Hello time [s].
- **unmarked** (default setting)
  - The monitoring of STP-BPDUs is inactive.

TCN guard

Activates/deactivates the monitoring of "Topology Change Notifications" on the port. With this setting the device helps you protect your network from attacks with STP-BPDUs that try to change the topology.

Possible values:

- **marked**
  - The monitoring of "Topology Change Notifications" is enabled.
    - The port ignores the Topology Change flag in received STP-BPDUs.
    - If the received BPDU contains other information that causes a topology change, then the device processes the BPDU even if the TCN guard is enabled.
      Example: The device receives better path information for the root bridge.
- **unmarked** (default setting)
  - The monitoring of "Topology Change Notifications" is disabled.
  - If the device receives STP-BPDUs with a Topology Change flag, then the device deletes the address table of the port and forwards the Topology Change Notifications.

Loop guard

Activates/deactivates the monitoring of loops on the port. The prerequisite is that the Root guard function is inactive.

With this setting the device helps prevent loops if the port does not receive any more STP-BPDUs. Use this setting only for ports with the STP role alternate, backup or root.
Possible values:

► **marked**
  The monitoring of loops is active. This helps prevent loops for example, if you disable the Spanning Tree function on the remote device or if the connection is interrupted only in the receiving direction.
  - If the port does not receive any STP-BPDUs for a while, then the device sets the status of the port to the value *discarding* and the value in the *Loop state* column to *true*.
  - If the port receives STP-BPDUs again, then the device sets the status of the port to a value according to *Port role* and the value in the *Loop state* column to *false*.

► **unmarked** (default setting)
  The monitoring of loops is inactive.
  If the port does not receive any STP-BPDUs for a while, then the device sets the status of the port to the value *forwarding*.

**Loop state**

Displays whether the loop state of the port is inconsistent.

Possible values:

► **true**
  The loop state of the port is inconsistent:
  - The port is not receiving any STP-BPDUs and the *Loop guard* function is enabled.
  - The device sets the state of the port to the value *discarding*. The device thus helps prevent any potential loops.

► **false**
  The loop state of the port is consistent. The port receives STP-BPDUs.

**Trans. into loop**

Displays how many times the device has set the value in the *Loop state* column from *false* to *true*.

**Trans. out of loop**

Displays how many times the device has set the value in the *Loop state* column from *true* to *false*.

**BPDU guard effect**

Displays whether the port received an STP-BPDU as an edge port.

**Prerequisite:**
- The port is a manually specified edge port. In the *Port* dialog, the checkbox for this port in the *Admin edge port* column is *marked*.
- In the *Switching > L2-Redundancy > Spanning Tree > Global* dialog, the BPDU Guard function is active.

Possible values:

► **marked**
  The port is an edge port and received an STP-BPDU.
  The device deactivates the port. For this port, in the *Basic Settings > Port* dialog, *Configuration* tab the checkbox in the *Port on* column is *unmarked*.

► **unmarked**
  The port is an edge port and has not received any STP-BPDUs, or the port is not an edge port.
To reset the status of the port to the value \textit{forwarding}, you proceed as follows:

- If the port is still receiving BPDUs, then:
  - In the CIST tab, unmark the checkbox in the \textit{Admin edge port} column.
  - Or
  - In the Switching > L2-Redundancy > Spanning Tree > Global dialog, unmark the \textit{BPDU guard} checkbox.

- To activate the port, proceed as follows:
  - Open the Basic Settings > Port dialog, Configuration tab.
  - Mark the checkbox in the Port on column.

\textbf{Buttons}

You find the description of the standard buttons in section “Buttons” on page 15.

\textbf{[MSTI <MSTI>]}\)

This tab lets you specify the settings on the ports for path costs and priority in the local MST instance, and to view current values.

\textbf{Table}

\begin{tabular}{|c|}
\hline
Port & Displays the port number. \\
\hline
Port state & Displays the transmission status of the port. \\
\hline
Possible values: & \\
\hline
\begin{itemize}
\item \textit{discarding} & The port is blocked and forwards only STP-BPDUs. \\
\item \textit{learning} & The port is blocked, but it learns the MAC addresses of received data packets. \\
\item \textit{forwarding} & The port forwards data packets. \\
\item \textit{disabled} & The port is inactive. See the Basic Settings > Port dialog, Configuration tab. \\
\item \textit{manualFwd} & The Spanning Tree function is disabled on the port. The port forwards STP-BPDUs. \\
\item \textit{notParticipate} & The port is not participating in STP. \\
\end{itemize} \\
\hline
Port role & Specifies the current role of the port in the local instance. \\
\hline
\end{tabular}
Possible values:

- **root**
  Port with the cheapest path to the root bridge.

- **alternate**
  Port with the alternative path to the root bridge (currently interrupted).

- **designated**
  Port for the side of the tree averted from the root bridge.

- **backup**
  Port which receives STP-BPDUs from its own device.

- **master**
  Port with the cheapest path to the CIST. The port is the CIST root port of the CIST Regional Root. The port is unique in an MST region.

- **disabled**
  The port is inactive. See the Basic Settings > Port dialog, Configuration tab.

**Port path cost**

Specifies the path costs of the port in the local instance.

Possible values:

- **0..200000000** (default setting: 0)
  When the value is 0, the device automatically calculates the path costs depending on the data rate of the port.

**Port priority**

Specifies the priority of the port in the local instance.

Possible values:

- **16..240** in steps of 16 (default setting: 128)

**Received bridge ID**

Displays the bridge ID of the device from which this port last received an STP-BPDU in the local instance.

**Received port ID**

Displays the port ID of the device from which this port last received an STP-BPDU.

Possible values:

- For ports with the **designated** role, the device displays the information for the STP-BPDU last received by the port. This helps to diagnose the possible STP problems in the network.

- For the **alternate**, **backup**, **master**, and **root** port roles, in the stationary condition (static topology) this information is identical to the information of the **designated** port role.

- If a port has no connection or if it did not receive any STP-BDPUs yet, then the device displays the values that the port can send with the **designated** role.

**Received path cost**

Displays the path cost that the higher-level bridge has from its root port to the root bridge.
Possible values:

- For ports with the designated role, the device displays the information for the STP-BPDU last received by the port. This helps to diagnose the possible STP problems in the network.
- For the alternate, backup, master, and root port roles, in the stationary condition (static topology) this information is identical to the information of the designated port role.
- If a port has no connection or if it did not receive any STP-BPDUs yet, then the device displays the values that the port can send with the designated role.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

### 5.9.7 Link Aggregation

The Link Aggregation function lets you aggregate multiple parallel links. The prerequisite is that the links have the same speed and are full duplex. The advantages compared to conventional connections using a single line are higher availability and a higher transmission bandwidth.

The criteria for distributing the load to the parallel links are based on the Hashing option function.

The Link Aggregation Control Protocol (LACP) makes it possible to monitor the packet-based continuous link status on the physical ports. LACP also helps ensure that the link partners meet the aggregation prerequisites.

If the remote side does not support the Link Aggregation Control Protocol (LACP), then you can use the Static link aggregation function. In this case, the device aggregates the links based on the link, link speed and duplex setting.

**Configuration**

**Hashing option**

Specifies which information the device uses to distribute the packets to the physical ports of the LAG interface. The device transmits packets containing the same distribution-relevant information over the same physical port to keep the packet order.

This setting overwrites the value specified in the Hashing option column for the port.

Possible values:

- **sourceMacVlan**
  - The device uses the fields Source MAC address, VLAN ID, EtherType of the packet, and the physical ingress port.

- **destMacVlan**
  - The device uses the fields Destination MAC address, VLAN ID, EtherType of the packet, and the physical ingress port.
Switching

Switching > L2-Redundancy > Link Aggregation

- **sourceDestMacVlan** *(default setting)*
  - The device uses the fields *Source MAC address, Destination MAC address, VLAN ID, EtherType* of the packet, and the physical ingress port.

- **sourceIPsourcePort**
  - The device uses the fields *Source IP address and Source TCP/UDP port* of the packet.

- **destIPdestPort**
  - The device uses the fields *Destination IP address and Destination TCP/UDP port* of the packet.

- **sourceDestIPPort**
  - The device uses the fields *Source IP address, Destination IP address, Source TCP/UDP port and Destination TCP/UDP port* of the packet.

**Table**

<table>
<thead>

</tbody>
</table>
Switching
[Switching > L2-Redundancy > Link Aggregation]

Active

Activates/deactivates the LAG interface.

Possible values:
- **marked** (default setting)
  The LAG interface is active. Consider that the following protocols do not work properly on the physical ports when you activate the LAG interface:
  - PTP
- **unmarked**
  The LAG interface is inactive.

STP active

Activates/deactivates the Spanning Tree protocol on this LAG interface. The prerequisite is that you enable the Spanning Tree function globally in the Switching > L2-Redundancy > Spanning Tree > Global dialog.

You can also activate/deactivate the Spanning Tree protocol on the LAG interfaces in the Switching > L2-Redundancy > Spanning Tree > Port dialog.

Possible values:
- **marked** (default setting)
  The Spanning Tree protocol is active on this LAG interface.
- **unmarked**
  The Spanning Tree protocol is inactive on this LAG interface.

Static link aggregation

Activates/deactivates the Static link aggregation function on the LAG interface. The device aggregates the assigned physical ports to the LAG interface, even if the remote site does not support LACP.

Possible values:
- **marked**
  The Static link aggregation function is active on this LAG interface. The device aggregates an assigned physical port to the LAG interface as soon as the physical port gets a link. The device does not send LACPDUs and discards received LACPDUs.
- **unmarked** (default setting)
  The Static link aggregation function is inactive on this LAG interface. If the connection was successfully negotiated using LACP, then the device aggregates an assigned physical port to the LAG interface.

Hashing option

Specifies which information the device uses to distribute the packets to the individual physical ports of the LAG interface. This setting has priority over the value selected from the Configuration frame, Hashing option drop-down list.

For further information on the values, see the description of the Hashing option drop-down list the Configuration frame.

MTU

Specifies the maximum allowed size of Ethernet packets on the LAG interface in bytes. Any present VLAN tag is not taken into account.
This setting lets you increase the size of the Ethernet packets for specific applications.

Possible values:

- **1518..12288** (default setting: 1518)
  
  With the value 1518, the LAG interface transmits the Ethernet packets up to the following size:
  
  - 1518 bytes without VLAN tag
    
    (1514 bytes + 4 bytes CRC)
  
  - 1522 bytes with VLAN tag
    
    (1518 bytes + 4 bytes CRC)

Active ports (min.)

Specifies the minimum number of physical ports to be active for the LAG interface to stay active. If the number of active physical ports is lower than the specified value, then the device deactivates the LAG interface.

If a redundancy function like **Spanning Tree** or **MRP** over LAG is active in the device, then you use this function to force the device to switch automatically to the redundant line.

Possible values:

- **1** (default setting)
- **2**
- Depending on the hardware:
  - 4
  - 8
  - 32

Type

Displays whether the LAG interface is based on the **Static link aggregation** function or on LACP.

Possible values:

- **static**
  
  The LAG interface is based on the **Static link aggregation** function.
- **dynamic**
  
  The LAG interface is based on LACP.

Send trap (Link up/down)

Activates/deactivates the sending of SNMP traps when the device detects changes in the link up/down status for this interface.

Possible values:

- **marked** (default setting)
  
  The sending of SNMP traps is active.
  
  If the device detects a link up/down status change, then the device sends an SNMP trap.
- **unmarked**
  
  The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the **Diagnostics > Status Configuration > Alarms (Traps)** dialog and specify at least 1 trap destination.

LACP admin key

Specifies the LAG interface key. The device uses this key to identify the ports that can be aggregated to the LAG interface.
Possible values:

- **0..65535**
  
  You specify the corresponding value for the physical ports in the *LACP port actor admin key* column.

**Port**

Displays the physical ports number assigned to the LAG interface.

**Aggregation port status**

Displays whether the LAG interface aggregates the physical port.

Possible values:

- **active**
  
  The LAG interface aggregates the physical port.

- **inactive**
  
  The LAG interface does not aggregate the physical port.

**LACP active**

Activates/deactivates LACP on the physical port.

Possible values:

- **marked** (default setting)
  
  LACP is active on the physical port.

- **unmarked**
  
  LACP is inactive on the physical port.

**LACP port actor admin key**

Specifies the physical port key. The device uses this key to identify the ports that can be aggregated to the LAG interface.

Possible values:

- **0**
  
  The device ignores the key on this physical port when deciding to aggregate the port into the LAG interface.

- **1..65535**
  
  If this value matches the value of the LAG interface specified in the *LACP admin key* column, then the device only aggregates this physical port to the LAG interface.

**LACP actor admin state**

Specifies the actor state values that the LAG interface transmits in the LACPDU. This lets you control the LACPDU parameters.

The device lets you mix the values. In the drop-down list, select one or more values.
Possible values:

- **ACT** *(LACP_Activity state)*
  When selected, the link transmits the LACPDUs cyclically, otherwise when requested.

- **STO** *(LACP_Timeout state)*
  When selected, the link transmits the LACPDUs cyclically using the short timeout, otherwise using the long timeout.

- **AGG** *(Aggregation state)*
  When selected, the device interprets the link as a candidate for aggregation, otherwise as an individual link.

For further information on the values, see the standard IEEE 802.1AX-2014.

**LACP actor oper state**

Displays the actor state values that the LAG interface transmits in the LACPDUs.

Possible values:

- **ACT** *(LACP_Activity state)*
  When visible, the link transmits the LACPDUs cyclically, otherwise when requested.

- **STO** *(LACP_Timeout state)*
  When visible, the link transmits the LACPDUs cyclically using the short timeout, otherwise using the long timeout.

- **AGG** *(Aggregation state)*
  When visible, the device interprets the link as a candidate for aggregation, otherwise as an individual link.

- **SYN** *(Synchronization state)*
  When visible, the device interprets the link as **IN_SYNC**, otherwise as **OUT_OF_SYNC**.

- **COL** *(Collecting state)*
  When visible, collection of incoming frames is enabled on this link, otherwise disabled.

- **DST** *(Distributing state)*
  When visible, distribution of outgoing frames is enabled on this link, otherwise disabled.

- **DFT** *(Defaulted state)*
  When visible, the link uses defaulted operational information, administratively specified for the Partner. Otherwise the link uses the operational information received from a LACPDU.

- **EXP** *(Expired state)*
  When visible, the link receiver is in the **EXPIRED** state.

**LACP partner oper SysID**

Displays the MAC address of the remote device connected to this physical port.

The LAG interface has received this information in a LACPDU from the partner.
LACP partner oper port

Displays the port number of the remote device connected to this physical port.

The LAG interface has received this information in a LACPDU from the partner.

LACP partner oper port state

Displays the partner state values that the LAG interface receives in the LACPDUs.

Possible values:

- **ACT**
- **STO**
- **AGG**
- **SYN**
- **COL**
- **DST**
- **DFT**
- **EXP**

For further information on the values, see the description of the *LACP actor oper state* column and the standard IEEE 802.1AX-2014.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the *Create* window to add a new LAG interface entry to the table or to assign a physical port to a LAG interface.

- In the *Trunk port* drop-down list, you select the LAG interface number.
- In the *Port* drop-down list, you select the number of a physical port to assign to the LAG interface.

After you create a LAG interface, the device adds the LAG interface to the table in the *Basic Settings > Port* dialog, *Statistics* tab.
5.9.8 Link Backup

With Link Backup, you configure pairs of redundant links. Each pair has a primary port and a backup port. The primary port forwards traffic until the device detects an error. If the device detects an error on the primary port, then the Link Backup function transfers traffic over to the backup port.

The dialog also lets you set a fail back option. If you enable the fail back function and the primary port returns to normal operation, then the device first blocks traffic on the backup port and then forwards traffic on the primary port. This process helps protect the device from causing loops in the network.

**Operation**

Enables/disables the Link Backup function globally in the device.

Possible values:
- **On**: Enables the Link Backup function.
- **Off** (default setting): Disables the Link Backup function.

**Table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary port</td>
<td>Displays the primary port of the interface pair. When you enable the Link Backup function, this port is responsible for forwarding traffic. Possible values: Physical ports</td>
</tr>
<tr>
<td>Backup port</td>
<td>Displays the backup port on which the device forwards traffic if the device detects an error on the primary port. Possible values: Physical ports except for the port you set as the primary port.</td>
</tr>
<tr>
<td>Description</td>
<td>Specifies the Link Backup pair. Enter a name to identify the Backup pair. Possible values: Alphanumeric ASCII character string with 0..255 characters</td>
</tr>
</tbody>
</table>
Primary port status

Displays the status of the primary port for this Link Backup pair.

Possible values:

- **forwarding**
  The link is up, no shutdown, and forwarding traffic.

- **blocking**
  The link is up, no shutdown, and blocking traffic.

- **down**
  The port is either link down, cable unplugged, or disabled in software, shutdown.

- **unknown**
  The Link Backup feature is globally disabled, or the port pair is inactive. Therefore, the device ignores the port pair settings.

Backup port status

Displays the status of the Backup port for this Link Backup pair.

Possible values:

- **forwarding**
  The link is up, no shutdown, and forwarding traffic.

- **blocking**
  The link is up, no shutdown, and blocking traffic.

- **down**
  The port is either link down, cable unplugged, or disabled in the software, shutdown.

- **unknown**
  The Link Backup feature is globally disabled, or the port pair is inactive. Therefore, the device ignores the port pair settings.

Fail back

Activates/deactivates the automatic fail back.

Possible values:

- **marked** (default setting)
  The automatic fail back is active.
  After the delay timer expires, the backup port changes to **blocking** and the primary port changes to **forwarding**.

- **unmarked**
  The automatic fail back is inactive.
  The backup port continues forwarding traffic even after the primary port re-establishes a link or you manually change the admin status of the primary port from **shutdown** to **no shutdown**.

Fail back delay [s]

Specifies the delay time in seconds that the device waits after the primary port re-establishes a link. Furthermore, this timer also applies when you manually set the admin status of the primary port from **shutdown** to **no shutdown**. After the delay timer expires, the backup port changes to **blocking** and the primary port changes to **forwarding**.
Switching

[Switching > L2-Redundancy > FuseNet]

Active

Activates/deactivates the Link Backup pair configuration.

Possible values:

- **marked**
  - The Link Backup pair is active. The device senses the link and administration status and forwards traffic according to the pair configuration.
- **unmarked** (default setting)
  - The Link Backup pair is inactive. The ports forward traffic according to standard switching.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Create

Primary port

Specifies the primary port of the backup interface pair. During normal operation this port is responsible for forwarding the traffic.

Possible values:

- Physical ports

Backup port

Specifies the backup port to which the device transfers the traffic if the device detects an error on the primary port.

Possible values:

- Physical ports except for the port you set as the primary port.

5.9.9 **FuseNet**

[Switching > L2-Redundancy > FuseNet]

The **FuseNet** protocols let you couple rings that are operating with one of the following redundancy protocols:

- **MRP**
- **Fast MRP** (depends on hardware)
Note: If you use the *Ring/Network Coupling* protocol to couple networks, then verify that the networks only contain Hirschmann devices.

Use the following table to select the *FuseNet* coupling protocol to be used in your network:

<table>
<thead>
<tr>
<th>Main Ring</th>
<th>Connected Network</th>
<th>MRP</th>
<th>RSTP</th>
<th>HIPER Ring</th>
<th>Fast MRP 2)</th>
<th>DLR 2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MRP</td>
<td>Sub Ring¹)</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td></td>
</tr>
<tr>
<td>Fast MRP ²)</td>
<td>Sub Ring¹)</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td></td>
</tr>
<tr>
<td>HIPER Ring</td>
<td>Sub Ring³)</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td></td>
</tr>
<tr>
<td>DLR ²)</td>
<td>Sub Ring</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>–</td>
<td>–</td>
<td></td>
</tr>
</tbody>
</table>

Explanation:

- no suitable coupling protocol

1) with *MRP* configured on different VLANs

2) depending on the device configuration

The menu contains the following dialogs:

- Sub Ring
- Ring/Network Coupling
- Redundant Coupling Protocol
5.9.9.1 **Sub Ring**

This dialog lets you set up the device as a subring manager.

The Sub Ring function enables you to easily couple network segments to existing redundancy rings. The subring manager (SRM) couples a subring to an existing ring (base ring).

In the subring you can use any devices that support MRP as ring participants. These devices do not require a subring manager function.

When setting up subrings, remember the following rules:

- The device supports **Link Aggregation** in the subring
- No spanning tree on subring ports
- **Same MRP domain** on devices within a subring
- Different VLANs for base ring and subring

Specify the VLAN settings as follows:

- **VLAN X** for base ring
  - on the ring ports of the base ring participants
  - on the base ring ports of the subring manager

- **VLAN Y** for subring
  - on the ring ports of the subring participants
  - on the subring ports of the subring manager

**Note**: To help avoid loops, only close the redundant line when the settings are specified in every device participating in the ring.

**Operation**

Enables/disables the Sub Ring function.

Possible values:

- **On**
  - The Sub Ring function is enabled.

- **Off** (default setting)
  - The Sub Ring function is disabled.

**Information**

Table entries (max.)

Displays the maximum number of subrings supported by the device.
### Table

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sub ring ID</td>
<td>Displays the unique identifier of this subring.</td>
</tr>
<tr>
<td>Possible values</td>
<td>1..8</td>
</tr>
<tr>
<td>Name</td>
<td>Specifies the optional name of the subring.</td>
</tr>
<tr>
<td>Possible values</td>
<td>Alphanumeric ASCII character string with 0..255 characters</td>
</tr>
<tr>
<td>Active</td>
<td>Activates/deactivates the subring.</td>
</tr>
<tr>
<td>Possible values</td>
<td>marked (The subring is active.)</td>
</tr>
<tr>
<td></td>
<td>unmarked (default setting) (The subring is inactive.)</td>
</tr>
<tr>
<td>Configuration status</td>
<td>Displays the operational state of the subring configuration.</td>
</tr>
<tr>
<td>Possible values</td>
<td>noError (The device detects an acceptable subring configuration.)</td>
</tr>
<tr>
<td></td>
<td>ringPortLinkError (The ring port has no link. The subring line is not connected to one of the ring ports of the device.)</td>
</tr>
<tr>
<td></td>
<td>multipleSRM (The subring manager receives packets from more than one subring manager in the subring.)</td>
</tr>
<tr>
<td></td>
<td>noPartnerManager (The subring manager receives its own frames.)</td>
</tr>
<tr>
<td></td>
<td>concurrentVLAN (The MRP protocol in the base ring uses the VLAN of the subring manager domain.)</td>
</tr>
<tr>
<td></td>
<td>concurrentPort (One more redundancy protocol uses the ring port of the subring manager domain.)</td>
</tr>
<tr>
<td></td>
<td>concurrentRedundancy (The subring manager domain is inactive because of one more active redundancy protocol.)</td>
</tr>
</tbody>
</table>
trunkMember
The ring port of the subring manager domain is member of a Link Aggregation connection.

sharedVLAN
The subring manager domain is inactive because shared VLAN is active and the main ring also uses the MRP protocol.

Redundancy available
Displays the operational state of the ring redundancy in the subring.

Possible values:
- redGuaranteed
  Redundancy reserve is available.
- redNotGuaranteed
  Loss of redundancy reserve.

Port
Specifies the port that connects the device to the subring.

Possible values:
- <Port number>

SRM mode
Specifies the mode of the subring manager.

A subring has 2 managers simultaneously that couple the subring to the base ring. As long as the subring is physically closed, 1 manager blocks its subring port.

Possible values:
- manager (default setting)
  The subring port forwards data packets.
  When this value is set on both devices that couple the subring to the base ring, the device with the higher MAC address functions as the redundantManager.
- redundantManager
  The subring port is blocked while the subring is physically closed. If the subring is interrupted, then the subring port transmits the data packets.
  When this value is set on both devices that couple the subring to the base ring, the device with the higher MAC address functions as the redundantManager.
- singleManager
  Use this value when the subring is coupled to the base ring via one single device. The prerequisite is that there are 2 instances of the subring in the table. Assign this value to both instances. The subring port of the instance with the higher port number is blocked while the subring is physically closed.

SRM status
Displays the current mode of the subring manager.
Possible values:

- **manager**
  
The subring port forwards data packets.

- **redundantManager**
  
The subring port is blocked while the subring is physically closed. If the subring is interrupted, then the subring port transmits the data packets.

- **singleManager**
  
The subring is coupled to the base ring via one single device. The subring port of the instance with the higher port number is blocked while the subring is physically closed.

- **disabled**
  
The subring is inactive.

### Port status

Displays the connection status of the subring port.

Possible values:

- **forwarding**
  
The port is passing frames according to the forwarding behavior of IEEE 802.1D.

- **disabled**
  
The port is dropping every frame.

- **blocked**
  
The port is dropping every frame with the exception of the following cases:
  - The port passes frames used by the selected ring protocol specified to pass blocked ports.
  - The port passes frames from other protocols specified to pass blocked ports.

- **not-connected**
  
The port link is down.

### VLAN

Specifies the VLAN to which this subring is assigned. If no VLAN exists under the VLAN ID entered, then the device automatically creates it.

Possible values:

- **Available configured VLANs (default setting: 0)**
  
  If you do not want to use a separate VLAN for this subring, then you leave the entry as 0.

### Partner MAC

Displays the MAC address of the subring manager at the other end of the subring.

### MRP domain

Specifies the MRP domain of the subring manager. Assign the same MRP domain name to every member of a subring. If you only use Hirschmann devices, then you use the default value for the MRP domain; otherwise adjust this value if necessary. With multiple subrings, the function lets you use the same MRP domain name for the subrings.

Possible values:

- **Permitted MRP domain names (default setting: 255.255.255.255)**

### Protocol

Specifies the protocol.
Possible values:

- iec-62439-mrp

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
5.9.9.2 Ring/Network Coupling

You use the *Ring/Network Coupling* function to redundantly couple an existing HIPER ring, MRP ring, or Fast HIPER ring to another network or another ring. Verify that the coupling partners are Hirschmann devices.

**Note:** With two-switch coupling, verify that you have configured a HIPER ring, MRP ring, or Fast HIPER ring before configuring the *Ring/Network Coupling* function.

In the *Ring/Network Coupling* dialog, you can perform the following tasks:
- display an overview of the existing *Ring/Network Coupling*
- configure a *Ring/Network Coupling*
- create a new *Ring/Network Coupling*
- delete *Ring/Network Coupling*
- enable/disable *Ring/Network Coupling*

When configuring the coupling ports, specify the following settings in the *Basic Settings > Port* dialog:

<table>
<thead>
<tr>
<th>Port type</th>
<th>Bit rate</th>
<th>Automatic configuration</th>
<th>Port on</th>
<th>Manual configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>TX</td>
<td>100 Mbit/s</td>
<td>unmarked</td>
<td>marked</td>
<td>100 Mbit/s FDX</td>
</tr>
<tr>
<td>TX</td>
<td>1 Gbit/s</td>
<td>–</td>
<td>marked</td>
<td>–</td>
</tr>
<tr>
<td>Optical</td>
<td>100 Mbit/s</td>
<td>unmarked</td>
<td>marked</td>
<td>100 Mbit/s FDX</td>
</tr>
<tr>
<td>Optical</td>
<td>1 Gbit/s</td>
<td>–</td>
<td>marked</td>
<td>–</td>
</tr>
</tbody>
</table>

**Note:** The operating modes of the port actually available depend on the device configuration.

If you configured VLANs, then note the VLAN configuration of the coupling and partner coupling ports. In the *Ring/Network Coupling* configuration, select the following values for the coupling and partner coupling ports:
- **VLAN ID 1** and **Ingress filtering** disabled in the port table
- **VLAN membership**: 1 in the **VLAN Configuration** table

Independently of the VLAN settings, the device sends the ring coupling frames with **VLAN ID 1** and priority 7. Verify that the device sends VLAN 1 frames tagged in the local ring and in the connected network. Tagging the VLAN frames maintains the priority of the ring coupling frames.

The *Ring/Network Coupling* function operates with test packets. The devices send their test packets VLAN-tagged, including the VLAN ID 1 and the highest VLAN priority 7. If the forwarding port is an untagged member in VLAN 1, then the device also sends test packets.

**Operation**

Enables/disables the *Ring/Network Coupling* function.
Possible values:

- **On**
  - The *Ring/Network Coupling* function is enabled.

- **Off** (default setting)
  - The *Ring/Network Coupling* function is disabled.

### Mode

**Type**

Specifies the method used to couple the networks together.

Possible values:

- **one-switch coupling**
  - Lets you specify the port settings in the *Coupling port* and *Partner coupling port* frames.

- **two-switch coupling, master**
  - Lets you specify the port settings in the *Coupling port* frame.

- **two-switch coupling, slave**
  - Lets you specify the port settings in the *Coupling port* frame.

- **two-switch coupling with control line, master**
  - Lets you specify the port settings in the *Coupling port* and *Control port* frames.

- **two-switch coupling with control line, slave**
  - Lets you specify the port settings in the *Coupling port* and *Control port* frames.

### Coupling port

**Port**

Specifies the port to which you connect the redundant link.

Possible values:

- `-`
  - No port selected.

- `<Port number>`

If you also have configured ring ports, then specify the coupling and ring ports on different ports.

To help prevent continuous loops, the device disables the coupling port in the following cases:

- disabling the function
- changing the configuration while the connections are operating on the ports

When the device has disabled the coupling port, the *Port on* checkbox is unmarked in the *Basic Settings > Port* dialog, *Configuration* tab.

**State**

Displays the status of the selected port.
Possible values:
- **active**
  - The port is active.
- **standby**
  - The port is in stand-by mode.
- **not-connected**
  - The port is not connected.
- **not-applicable**
  - The port is incompatible with the configured control mode.

**Partner coupling port**

**Port**

Specifies the port on which you connect the partner port.

Possible values:
- `-`
  - No port selected.
- `<Port number>`

If you also have configured ring ports, then specify the coupling and ring ports on different ports.

**State**

Displays the status of the selected port.

Possible values:
- **active**
  - The port is active.
- **standby**
  - The port is in stand-by mode.
- **not-connected**
  - The port is not connected.
- **not-applicable**
  - The port is incompatible with the configured control mode.

**IP address**

Displays the IP address of the partner, when the devices are connected.

The prerequisite is that you select a two-switch coupling method and enable the partner in the network.

**Control port**

**Port**

Displays the port on which you connect the control line.
Possible values:

- No port selected.
- <Port number>

State

Displays the status of the selected port.

Possible values:

- active
  The port is active.
- standby
  The port is in stand-by mode.
- not-connected
  The port is not connected.
- not-applicable
  The port is incompatible with the configured control mode.

Configuration

Redundancy mode

Enables/disables the device to respond to a failure in the remote ring or network.

Possible values:

- redundant ring/network coupling
  Either the main line or the redundant line is active. Both lines are not active simultaneously. If the device detects that the link is down between the devices in the connected network, then the standby device keeps the redundant port in the standby mode.
- extended redundancy
  The main line and the redundant line are active simultaneously. If the device detects a problem in the connection between the devices in the connected network, then the standby device forwards data on the redundant port. With the setting you can maintain continuity in the remote network.

Note: During the reconfiguration period, package duplications can occur. Therefore, if your application is able to detect package duplications, then you can select this setting.

Coupling mode

The settings in this frame allow you to couple a specific type of network.
Possible values:

- **ring coupling**
  The device couples redundant rings. The device lets you couple rings that use the following redundancy protocols:
  - HIPER ring
  - Fast HIPER ring
  - MRP ring

- **network coupling**
  The device couples network segments. The function lets you couple mesh and bus networks together.

**Information**

Redundancy available

Displays whether or not the redundancy is available.

When a component of the ring is down, the redundant line takes over its function.

Possible values:

- **redGuaranteed**
  The redundancy is available.

- **redNotGuaranteed**
  The redundancy is unavailable.

Configuration failure

You have configured the function incorrectly, or there is no ring port connection.

Possible values:

- **noError**

- **slaveCouplingLinkError**
  The coupling line is not connected to the coupling port of the slave device. Instead, the coupling line is connected to another port of the slave device.

- **slaveControlLinkError**
  The control port of the slave device has no data link.

- **masterControlLinkError**
  The control line is not connected to the control port of the master device. Instead, the control line is connected to another port of the master device.

- **twoSlaves**
  The control line connects two slave devices.

- **localPartnerLinkError**
  The partner coupling line is not connected to the partner coupling port of the slave device. Instead, the partner coupling line is connected to another port of the slave device in one-switch coupling mode.

- **localInvalidCouplingPort**
  In one-switch coupling mode, the coupling line is not connected on the same device as the partner line. Instead, the coupling line is connected to another device.

- **couplingPortNotAvailable**
  The coupling port is not available because the module to which the port refers is not available or the port does not exist on this module.
controlPortNotAvailable

The control port is not available because the module to which the port refers is not available or the port does not exist on this module.

partnerPortNotAvailable

The partner coupling port is not available because the module to which the port refers is not available or the port does not exist on this module.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

**Reset**

Disables the redundancy function and resets the parameters in the dialog to the default setting.
5.9.9.3 **Redundant Coupling Protocol**

A ring topology provides short transition times with a minimal use of resources. However, to couple these rings redundantly to a higher-level network is more of a challenge.

When you want to use a standard protocol such as MRP for the ring redundancy and RSTP to couple the rings together, the **Redundant Coupling Protocol** helps provide options for you.

Do not use the following redundancy procedures and settings together on the ports of the **RCP** primary and secondary ring:
- **Sub Ring**
- **Ring/Network Coupling**

**Operation**

Enables/disables the **RCP** function.

Possible values:
- **On**
  - The **RCP** function is enabled.
- **Off** (default setting)
  - The **RCP** function is disabled.

**Primary ring/network / Secondary ring/network**

If the device operates as slave (value in the **Role** field is **slave**), then do not activate the **Static query port** mode for the ports on the secondary ring/network.

**Inner port**

Specifies the inner port number in the primary ring. The port is directly connected to the partner bridge.

Possible values:
- **-** (default setting)
  - No port selected.
- **<Port number>**

**Outer port**

Specifies the outer port number in the primary ring.

Possible values:
- **-** (default setting)
  - No port selected.
- **<Port number>**
Coupler configuration

Role

Specifies the role of the local device.

Possible values:

- master
  The device operates as master.
- slave
  The device operates as slave.
- auto (default setting)
  The device automatically selects its role as master or slave.

Current role

Displays the current role of the local device. The value can be different from the configured role:

- If you configured both partner bridges as auto, then the partner bridge that is currently coupling the instances takes the master role. The other partner bridge takes the slave role.
- If both partner bridges are configured as master or both as slave, then the partner bridge with the smaller Basis MAC address takes the master role. The other partner bridge takes the slave role.
- If the protocol is started and the partner bridge cannot be found for a bridge in the configured role master, slave or auto, then the bridge sets its own role to listening.
- If the device detects a configuration problem for example, the inner ring ports are connected crosswise, then the device sets its role to error.

Timeout [ms]

Specifies the maximum time, in milliseconds, during which the slave device waits for test packets from the master device on the outer ports before the slave device takes over the coupling. This only applies in the state in which both inner ports of the slave device have lost the connection to the master device.

Configure the timeout longer than the longest assumable interruption time for the redundancy protocol of the faster instance. Otherwise, loops can occur.

Possible values:

- 5..60000 (default setting: 250)

Partner MAC address

Displays the basic MAC address of the partner device.

Partner IP address

Displays the IP address of the partner device.

Coupling state

Displays the coupling state of the local device.
Possible values:

- **forwarding**
  The coupling state of the port is forwarding.
- **blocking**
  The coupling state of the port is blocking.

**Redundancy state**

Displays whether or not the redundancy is available.

For a master-slave configuration, both bridges display this information.

Possible values:

- **redAvailable**
  The redundancy is available.
- **redNotAvailable**
  The redundancy is unavailable.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
6 Routing

The menu contains the following dialogs:
- Routing Global
- Routing Interfaces
- ARP
- Router Discovery
- RIP
- Open Shortest Path First
- Routing Table
- Tracking
- L3 Relay
- Loopback Interface
- Multicast Routing
- L3-Redundancy
- NAT

6.1 Routing Global

The Routing menu lets you specify the Routing functions settings for transmitting data on Layer 3 of the ISO/OSI layer model.

For security reasons, the following functions are permanently disabled in the device:
- ICMP Redirects
  ICMP redirect data packets are able to modify the routing table. The device generally ignores received ICMP redirect data packets. The settings in the Routing > Interfaces > Configuration dialog, column ICMP redirects, have an effect only on the sending of ICMP redirect data packets.

In accordance with RFC 2644, the device does not exchange any broadcast data packets from external networks in a local network. This behavior supports you in protecting the devices in the local network against overloading, for example due to so-called smurf attacks.

This dialog lets you enable the routing function in the device and to specify further settings.

Operation

Enables/disables the Routing function in the device.

Possible values:
- On
  The Routing function is enabled.
  Also activate the routing function on the router interfaces. See the Routing > Interfaces > Configuration dialog.
- Off (default setting)
  The Routing function is disabled.
Routing profile

In the Routing profile frame, you have the option of selecting a routing profile containing specific router settings.

Next routing profile

Specifies the routing profile that the device loads and applies upon the next restart.

A routing profile contains association settings for the internal resources (unicast routes, multicast routes, next-hop table / ARP table). By selecting a preset routing profile you have the option of operating the router with settings especially adapted to your intended use.

Possible values:
- default
  - Sets the preset value for the device.
- ipv4RoutingDefault (default setting)
- ipv4RoutingUnicast

When you position the mouse pointer over one of the values, a bubble help displays the association settings used in the routing profile.

Current routing profile

Displays the routing profile that the device loaded during the last restart and is currently applied.

ICMP filter

In the ICMP filter frame, you have the option of limiting the transmission of ICMP messages on the set up router interfaces. A limitation is meaningful for several reasons:
- A large number of “ICMP Error” messages influences the router performance and reduces the available network bandwidth.
- Malicious senders use “ICMP Redirect” messages to perform man-in-the-middle attacks or to divert data packets through “black hole” for the purpose of supervision or denial-of-service (DoS).
- “ICMP Echo Reply” messages are ping responses which can be misused to discover vulnerable devices and routers in the network.

Send echo reply

Activates/deactivates the responding to pings on the router interfaces.

Possible values:
- marked (default setting)
  - Responding to pings is active. The device reacts to received “IPv4 Echo Requests” and responds with an “ICMP Echo Reply” message.
- unmarked
  - Responding to pings is inactive.

Send redirects

Activates/deactivates the sending of “ICMP Redirect” messages on the router interfaces.
Possible values:

- marked (default setting)
  The sending of "ICMP Redirect" messages is active.
  In the Routing > Interfaces > Configuration dialog, you have the option of individually activating the sending on every router interface. See the ICMP redirects function.

- unmarked
  The sending of "ICMP Redirect" messages is inactive.
  This setting helps prevent the multiplication of data packets, if both hardware and software functions of the device forward a copy of the same data packet.

**Rate limit interval [ms]**

Specifies the time window in milliseconds in which the device sends the number of “ICMP error message” type data packets specified in the Rate limit burst size field.

Possible values:

- \(0..2147483647\) (default setting: 1000)

**Rate limit burst size**

Specifies the number of “ICMP Error” messages that the device sends in the time window specified in the Rate limit interval [ms] field.

The limitation contains every “ICMP Error” message on the router interfaces that are set up.

Possible values:

- \(1..200\) (default setting: 100)

The device lets you specify the limitation for a time window of any size desired. In the default setting, the device sends 100 data packets per 1000 ms. You obtain the same result but with a finer granularity using the following settings:

- \[Rate\ limit\ interval\ [ms]]=100
  \[Rate\ limit\ burst\ size]=10
  or

- \[Rate\ limit\ interval\ [ms]]=10
  \[Rate\ limit\ burst\ size]=1

**Configuration**

**File transfer source interface**

Specifies the interface whose IP address the device uses as source IP address for the following file transfers:

- FTP
- SCP
- SFTP
- TFTP

Possible values:

- none (default setting)
- \(<\text{Port number}\>)
Source routing

Activates/deactivates the Source routing function.

The Source routing function lets the sender of a data packet determine its route through the network. This can lead to an unavoidable security issue. If a sniffer inserts its IP address into the data packets, then he can redirect the data packets to his host.

Possible values:

- **marked**  
  The Source routing function is active.  
  The device forwards packets which contain Source routing information. If the device is the receiver specified in a packet, the device accepts the packet.

- **unmarked** (default setting)  
  The Source routing function is inactive.  
  The device neither forwards nor accepts packets which contain Source routing information.

Information

Default TTL

Displays the fixed TTL value 64 which the device adds to IP packets that the device management sends.

TTL (Time To Live, also known as “Hop Count”) identifies the maximum number of steps an IP packet is allowed to perform on the way from the sender to the receiver. Every router on the transmission path reduces the value in the IP packet by 1. If a router receives a data packet with the TTL value 1, then the router discards the IP packet. The router reports to the source that it has discarded the IP packet.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

6.2 Routing Interfaces

This menu lets you specify the settings for the router interfaces.

The menu contains the following dialogs:

- Routing Interfaces Configuration
6.2.1 Routing Interfaces Configuration

This dialog lets you specify the settings for the router interfaces.

To set up a port-based router interface, edit the table entries. To set up a VLAN-based router interface, use the **Wizard** window.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the number of the port or VLAN belonging to the router interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the port. Possible values:</td>
</tr>
<tr>
<td></td>
<td>➤ Alphanumeric ASCII character string with 0..64 characters</td>
</tr>
<tr>
<td></td>
<td>The following characters are allowed:</td>
</tr>
<tr>
<td></td>
<td>➤ <code>&lt;space&gt;</code></td>
</tr>
<tr>
<td></td>
<td>➤ 0..9</td>
</tr>
<tr>
<td></td>
<td>➤ a..z</td>
</tr>
<tr>
<td></td>
<td>➤ A..Z</td>
</tr>
<tr>
<td></td>
<td>➤ !#$%&amp;'()+,.-/:;&lt;=&gt;?@[]^_`{}~</td>
</tr>
<tr>
<td>Port on</td>
<td>Activates/deactivates the port. Possible values:</td>
</tr>
<tr>
<td></td>
<td>➤ marked (default setting)</td>
</tr>
<tr>
<td></td>
<td>The port is active.</td>
</tr>
<tr>
<td></td>
<td>➤ unmarked</td>
</tr>
<tr>
<td></td>
<td>The port is inactive. The port does not send or receive any data.</td>
</tr>
<tr>
<td>Port status</td>
<td>Displays the operating state of the port. Possible values:</td>
</tr>
<tr>
<td></td>
<td>➤ marked</td>
</tr>
<tr>
<td></td>
<td>The port is enabled.</td>
</tr>
<tr>
<td></td>
<td>➤ unmarked</td>
</tr>
<tr>
<td></td>
<td>The port is disabled.</td>
</tr>
<tr>
<td>IP address</td>
<td>Specifies the IP address for the router interface.</td>
</tr>
</tbody>
</table>
Routing

[Routing > Interfaces > Configuration]

Possible values:

- Valid IPv4 address (default setting: 0.0.0.0)

Verify that the IP subnet of the router interface is not overlapping with any subnet connected to another interface of the device:

- management port
- router interface
- loopback interface

Netmask

Specifies the netmask for the router interface.

Possible values:

- Valid IPv4 netmask (default setting: 0.0.0.0)

Routing

Activates/deactivates the *Routing* function on the router interface.

Possible values:

- **marked**
  The *Routing* function is active.
  - With port-based routing, the device transforms the port into a router interface.
    Enabling the *Routing* function removes the port from the VLANs in which it was previously a member. Disabling the *Routing* function does NOT reestablish the assignment; the port is not a member of any VLAN.
  - With VLAN-based routing, the device forwards the data packets in the related VLAN.
- **unmarked** (default setting)
  The *Routing* function is inactive.
  With VLAN-based routing, the device is still reachable through the router interface if the IP address and netmask have been configured for the router interface.

Proxy ARP

Activates/deactivates the *Proxy ARP* function on the router interface. This feature lets you connect devices from other networks as if these devices could be reached in the same network.

Possible values:

- **marked**
  The *Proxy ARP* function is active.
  The device responds to ARP requests from end devices that are located in other networks.
- **unmarked** (default setting)
  The *Proxy ARP* function is inactive.

Netdirected broadcasts

Activates/deactivates the forwarding of netdirected broadcasts to the connected subnet on the router interface.
Routing

Routing > Interfaces > Configuration

Possible values:

- **marked**
  Forwarding is active. The router interface forwards netdirected broadcasts to the connected subnet. If the subnet has a direct connection to the Internet, then this setting increases the vulnerability to Denial of Service (DoS) attacks.

- **unmarked** (default setting)
  Forwarding is inactive.

### MTU value

Specifies the maximum allowed size of IP packets on the router interface in bytes.

Possible values:

- **0**
  Restores the default value (1500).

- **68..12266** (default setting: 1500)
  The prerequisite is that on the ports belonging to the router interface you specify the maximum allowed size of Ethernet packets at least 18 bytes larger than specified here. See the Basic Settings > Port dialog, MTU column.

### ICMP unreachables

Activates/deactivates the sending of “ICMP Destination Unreachable” messages on the router interface.

Possible values:

- **marked** (default setting)
  The router interface sends “ICMP Destination Unreachable” messages.

- **unmarked**
  The router interface does not send “ICMP Destination Unreachable” messages.

### ICMP redirects

Activates/deactivates the sending of “ICMP Redirect” messages on the router interface.

Possible values:

- **marked** (default setting)
  The router interface sends “ICMP Redirect” messages.
  The prerequisite is that you activate the Send redirects function in the device. See the Routing > Global dialog.

- **unmarked**
  The router interface does not send “ICMP Redirect” messages.
**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the *Create* window to add a new entry to the table.

In the *VLAN ID* field, you specify the ID of the VLAN.

---

**[Configure VLAN router interface (Wizard)]**

This *Wizard* window lets you set up a VLAN-based router interface.

- To set up a router interface from a VLAN already set up, highlight a VLAN in the table.
- To set up a router interface from a new VLAN, specify at the bottom of the *VLAN ID* field the ID of the new VLAN.

After closing the *Wizard* window, click the ✅ button to save your settings.

---

**[Configure VLAN router interface (Wizard) – Create or select VLAN]**

**Table**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Displays the ID of the VLANs set up in the device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Displays the name of the VLANs set up in the device.</td>
</tr>
</tbody>
</table>

**Area under the table**

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Specifies the ID of a VLAN that the <em>Wizard</em> window specifies for you.</th>
</tr>
</thead>
</table>

Possible values:

- 1..4042
### Configure VLAN router interface (Wizard) – Setup VLAN

#### Area above the table

**VLAN ID**

Displays the ID of the VLAN that you have marked or specified on the Create or select VLAN page.

**Name**

Specifies the name of the VLAN.

Possible values:
- Alphanumeric ASCII character string with 1..32 characters (0x20..0x7E) including space characters

This setting overwrites the setting specified for the port in the Switching > VLAN > Configuration dialog.

#### Table

**Port**

Displays the port number.

**Member**

Activates/deactivates the VLAN membership of the port.

As a VLAN member the port belongs to router interface to be set up. This setting overwrites the setting for the port specified in the Switching > VLAN > Configuration dialog.

Possible values:
- **marked**
  - The port is a member of the VLAN.
- **unmarked**
  - The port is not a member of the VLAN.

**Untagged**

Activates/deactivates the transmission of data packets with a VLAN tag on the port. This setting overwrites the setting for the port specified in the Switching > VLAN > Configuration dialog.

Possible values:
- **marked**
  - The port transmits the data packets without a VLAN tag.
  - Use this setting if the connected device does not evaluate any VLAN tags, for example on end ports.
- **unmarked**
  - The port transmits the data packets with a VLAN tag.
**Routing**

**[Routing > ARP]**

**Port-VLAN ID**

Specifies the ID of the VLAN which the devices assigns to data packets without a VLAN tag. This setting overwrites the setting for the port specified in the *Switching > VLAN > Port* dialog, column *Port-VLAN ID*.

Possible values:
- ID of a VLAN you set up (default setting: 1)

**[Configure VLAN router interface (Wizard) – Setup virtual router port]**

When you assign ports to the router interface that already transmit data packets in other VLANs, the device displays a message upon closing the *Wizard* window:
- If you click the *Yes* button, then the related ports transmit the data packets from now on only in the router VLAN.
  - In the *Switching > VLAN > Configuration* dialog, the related ports in the row of the router VLAN have the value U or T, in the rows of other VLANs the value –.
- If you click the *No* button, then the related ports transmit the data packets in the router VLAN and in other VLANs. This setting possibly causes undesired behavior.

**Primary address**

**Address**

Specifies the primary IP address for the router interface.

Possible values:
- Valid IPv4 address (default setting: 0.0.0.0)

**Netmask**

Specifies the primary netmask for the router interface.

Possible values:
- Valid IPv4 netmask (default setting: 0.0.0.0)

**6.3 ARP**

**[Routing > ARP]**

The Address Resolution Protocol (ARP) learns the MAC address that belongs to an IP address.

The menu contains the following dialogs:
- ARP Global
- ARP Current
- ARP Static
6.3.1 ARP Global

This dialog lets you set the ARP parameters and view statistical values.

**Configuration**

**Aging time [s]**

Specifies the time in seconds, after which the device removes an entry from the ARP table.

When there is data exchange with the associated device within this time period, the time measuring begins from the start again.

Possible values:

- 15..21600 (default setting: 1200)

**Response timeout [s]**

Specifies the time in seconds, that the device waits for a response before the query is seen as a failure.

Possible values:

- 1..10 (default setting: 1)

**Retries**

Specifies how many times the device repeats a failed query before it discards the query to this address.

Possible values:

- 0..10 (default setting: 4)

**Dynamic renew**

Activates/deactivates the query to a device if the aging time is exceeded.

Possible values:

- marked
  - The query is activated.
  - The device sends a new query to a device when its entry has exceeded the aging time. When the query remains unanswered, the device removes the entry from the ARP table.
- unmarked (default setting)
  - The query is deactivated.

**Selective learning**

Activates or deactivates the learning of the IP/MAC address assignment of the sender.
Possible values:

- **marked** (default setting)
  Learning is activated.
  The device learns the IP/MAC address assignment of transmitting equipment only if the ARP query was addressed to the address of the device itself.

- **unmarked**
  Learning is deactivated.
  The device learns the IP/MAC address assignment of transmitting devices by evaluating the received ARP queries.
  This does away with time-consuming ARP queries before the device forwards data packets to unknown devices.
  On the other hand, the device is vulnerable to “ARP cache poisoning” and also learns unnecessary ARP entries, such as from devices that communicate only in the local network.

**Information**

Current entries total
Displays the number of entries that the ARP table currently contains.

Entries (max.)
Displays how many entries the ARP table can contain at a maximum.

Total entry peaks
Displays how many entries the ARP table has already contained at a maximum.

When you reset the ARP table, the counter is reset to the value 0. See the **Reset ARP table** button in the **Routing > ARP > Current** dialog.

Current static entries
Displays the number of statically configured entries the ARP table currently contains. See the **Routing > ARP > Static** dialog.

Static entries (max.)
Displays the number of statically configured entries the ARP table can contain at a maximum.

**Buttons**

You find the description of the standard buttons in section “**Buttons**” on page 15.
6.3.2 ARP Current

This dialog lets you view the ARP table and delete the dynamically configured entries.

**Table**

- **Port**
  Displays the router interface on which the device has learned the IP/MAC address assignment.

- **IP address**
  Displays the IP address of the device that responded to an ARP query on this router interface.

- **MAC address**
  Displays the MAC address of the device that responded to an ARP query on this router interface.

- **Last updated**
  Displays the time in seconds since the current settings of the entry were registered in the ARP table.

- **Type**
  Displays the way in which the ARP entry was set up.
  Possible values:
  - *dynamic*
    Dynamically configured entry.
    When no traffic with the associated device takes place by the end of the aging time, the device removes this entry from the ARP table.
    You specify the aging time in the Routing > ARP > Global dialog, field Aging time [s].
  - *static*
    Statically configured entry.
    When you remove the dynamically configured addresses from the ARP table using the Reset ARP table button, the entry remains.
  - *local*
    Identifies the IP/MAC address assignment of the router interface.
  - *invalid*
    Invalid entry.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Reset ARP table

Removes the dynamically set up addresses from the ARP table.
6.3.3 **ARP Static**

This dialog lets you add to the ARP table IP/MAC address assignments that you have specified yourself.

**Table**

- **IP address**
  Displays the IP address that the device assigns to the adjacent MAC address.

- **MAC address**
  Displays the MAC address that the device assigns to the adjacent IP address.

- **Port**
  Displays the router interface to which the device applies the IP/MAC address assignment.

  Possible values:
  - `<Router interface>`
    The device applies the IP/MAC address assignment to this router interface.
  - `no port`
    The IP/MAC address assignment is currently not assigned to a router interface.

- **Active**
  Displays whether the IP/MAC address assignment is active or inactive.

  Possible values:
  - `marked`
    The IP/MAC address assignment is active. The ARP table of the device contains the IP/MAC address assignment as a static entry.
  - `unmarked` (default setting)
    The IP/MAC address assignment is inactive.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

Opens the Create window to add a new entry to the table.

In the **IP address** field, you specify the IP address that the device assigns to the adjacent MAC address.
The Wizard window lets you add to the ARP table IP/MAC address assignments that you have specified yourself. The prerequisite is that at least one router interface is set up.

In the fields under the table, specify the IP address and the associated MAC address. To insert the IP/MAC address assignment into the table on the top, click the Add button. After closing the Wizard window, specify in the Port column the router interface. Then enable in the Active column the IP/MAC address assignment.

After closing the Wizard window, click the button to save your settings.

### Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>Specifies the IP address.</td>
<td>Valid IPv4 address</td>
</tr>
<tr>
<td>MAC address</td>
<td>Specifies the MAC address.</td>
<td>Valid MAC address</td>
</tr>
</tbody>
</table>

### 6.4 Router Discovery

The ICMP Router Discovery Protocol (IRDP), described in RFC 1256, lets end devices determine the addresses of the routers available in a subnet.

The router sends advertisements to identify itself as a router to the end devices.

End devices that support IRDP update their routing table after receiving an advertisement. If a standard gateway was previously entered, then the address learned with the advertisement has a lower priority in the routing table.
# Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the router interface to which the setting applies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advertise mode</td>
<td>Activates/deactivates the router discovery function on the router interface. Possible values:</td>
</tr>
<tr>
<td></td>
<td>▶ marked (default setting)  The router discovery function is active. The device sends advertisements on the router interface.</td>
</tr>
<tr>
<td></td>
<td>▶ unmarked (default setting)  The router discovery function is inactive.</td>
</tr>
<tr>
<td>Advertise address</td>
<td>Specifies the destination to which the device sends advertisements. Possible values:</td>
</tr>
<tr>
<td></td>
<td>▶ Broadcast  The device sends advertisements to the broadcast address 255.255.255.255.</td>
</tr>
<tr>
<td></td>
<td>▶ Multicast (default setting)  The device sends advertisements to the multicast address 224.0.0.1.</td>
</tr>
<tr>
<td>Min. advertisement interval [s]</td>
<td>Specifies the minimum period in seconds after which the device sends another advertisement. Possible values:</td>
</tr>
<tr>
<td></td>
<td>▶ 3..1800 (default setting: 450)</td>
</tr>
<tr>
<td>Max. advertisement interval [s]</td>
<td>Specifies the maximum period in seconds after which the device sends another advertisement. The prerequisite is that the value is greater than or equal to the value specified in the Min. advertisement interval [s] column. Possible values:</td>
</tr>
<tr>
<td></td>
<td>▶ 4..1800 (default setting: 600)</td>
</tr>
<tr>
<td>Advertisement lifetime [s]</td>
<td>Specifies the validity period for the advertisements in seconds. The prerequisite is that the value is greater than or equal to the value specified in the Max. advertisement interval [s] column. Possible values:</td>
</tr>
<tr>
<td></td>
<td>▶ 4..9000 (default setting: 1800)</td>
</tr>
<tr>
<td>Preference level</td>
<td>Specifies the key figure that an end device uses to decide which gateway to the destination network to use when multiple routers in the subnet identify themselves through IRDP.</td>
</tr>
</tbody>
</table>
Possible values:

- **0..2147483647** (default setting: 0)
  
The higher the specified value, the greater the probability that an end device will use the device as a gateway.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
6.5 RIP

The Routing Information Protocol (RIP) as specified in RFC 2453 is a routing protocol based on the distance vector algorithm using a hop count as the metric to determine the path from source to destination. You use RIP for the dynamic creation of the routing table.

RIP uses 2 types of packets to communicate with its neighbor, request packets and response packets. When you first start RIP, the router transmits a request packet out of the RIP enabled interfaces. Routers on which RIP is active transmit response packets back to the request originator. The response packets contain the routing table of each router. The routes transmitted in the response packets include the network address and metric.

RIP uses routing by rumor to update the routing tables. Routing by rumor means that the router only exchanges routing information with its neighbors.

The dialog contains the following tabs:

- [Configuration]
- [Route redistribution]
- [Statistics]

[Configuration]

In this tab, you enter both general settings and settings for each port for the routing information protocol.

**Operation**

Enables/disables the RIP function on this router.

Possible values:

- **On**
  - The RIP function is enabled.
- **Off** (default setting)
  - The RIP function is disabled.

**Configuration**

Auto-summary mode

Activates/deactivates the auto summary mode.
Possible values:

- **marked** (default setting)
  The device combines or summarizes, routes advertised by a RIP router whenever possible into aggregates. Summarizing the routes reduces the amount of routing information in the routing table.

- **unmarked**
  The function is inactive.

Host routes accept mode

Activates/deactivates the host routes accept mode. When you activate the function, RIP lets you specify the host routes.

Possible values:

- **marked** (default setting)
  The device enters (learns) the host routes with a 32-bit netmask advertised to this RIP router into its routing table.

- **unmarked**
  The function is inactive.

Advertise default route

Activates/deactivates the propagation of the default routes learned from other protocols.

Possible values:

- **marked**
  The device advertises the default routes learned from other protocols to its neighbors.

- **unmarked** (default setting)
  The function is inactive.

Split horizon

Activates/deactivates the split horizon mode. You use the split horizon mode to help avoid the count-to-infinity issue.

Possible values:

- **none**
  Disables split horizon.

- **simple** (default setting)
  Simple split horizon omits the entries known by a neighbor when sending the routing table to this neighbor.

- **poisonReverse**
  The Poison Reverse split horizon sends the routing table to a neighbor with the entries known by this neighbor, but denotes these entries with the infinity metric.

Default metric

Specifies the default metric of redistributed routes.

Possible values:

- **0** (default setting)
  No default metric. RIP propagates the route with metric 1.

- **1..15**
Update interval [s]

Specifies the time interval at which the router transfers the entire content of the routing table to the RIP neighbors.

The router sets other RIP timers accordingly:
- **Timeout**
  6 x update interval
- **Garbage Collection**
  10 x update interval

Possible values:
- **0..1000** (default setting: 30)
  Values below 10 seconds cause an increased network load in larger networks.

Preference

Specifies the "administrative distance" of the route.

The device uses this value instead of the metric, when the metric of the routes is incomparable.

Possible values:
- **1..254** (default setting: 120)
  In routing decisions, the device gives preference to the route with the smallest value.
- **255**
  In routing decisions, the device ignores the route.

Table

Port

Displays the router interface number.

Active

Activates/deactivates RIP on this router interface.

Send version

Specifies the RIP version that the router uses on this router interface to send RIP information.

Possible values:
- **doNotSend**
  RIP does not send any routing information.
- **ripVersion1**
  RIP sends information with version 1 as a broadcast.
- **rip1Compatible**
  RIP sends information with version 2 as a broadcast.
- **ripVersion2** (default setting)
  RIP sends information with version 2 as a multicast.
Receive version

Specifies the RIP version that the device accepts on the receiver side.

Possible values:
- **rip1**
  - RIP accepts RIP V1 packets.
- **rip2**
  - RIP accepts RIP V2 packets.
- **rip1OrRip2**  (default setting)
  - RIP accepts RIP V1 and V2 packets.
- **doNotReceive**
  - The device rejects RIP information.

Authentication

Specifies the type of authentication used on this interface.

Possible values:
- **noAuthentication**  (default setting)
  - The routers exchange RIP information without authentication.
- **simplePassword**
  - The routers exchange RIP information with plain text password authentication.
- **MD5**
  - The routers exchange RIP information with password authentication, whereby the devices transfer the password with md5 encryption.

Key

Specifies the password for authentication. For communication purposes, the port on the other end requires the same authentication settings.

The prerequisite is that, in the Authentication column, you specify the value simplePassword or MD5.

Possible values:
- **0..16** (octets in a string)
  - If you supply a string shorter than 16 octets, then RIP left-justifies and pads the string, on the right with nulls (0x00), to 16 octets.

Key identifier

Specifies the password identification number for authentication. For communication purposes, the port at the other end requires the same key ID.

The prerequisite for changing the value is that, in the Authentication column, you specify the value MD5.

Possible values:
- **0..255**

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
[Route redistribution]

Route distribution describes how RIP propagates routes that RIP transferred from other protocols to other RIP routers.

Table

Source

Displays the source from which RIP takes over routing information:

Possible values:
- **connected**
  The route points to networks of local router interfaces where RIP is not enabled.
- **static**
  The route is in the static routing table.
- **ospf**
  The route is from OSPF.

Active

Activates/deactivates route-redistribution for a particular source protocol.

Possible values:
- **marked**
  The router redistributes routes received with this protocol.
- **unmarked** (default setting)
  The device blocks redistribution.

Metric

Specifies the metric that RIP assigns to the routes from the source.

Possible values:
- **0** (default setting)
  RIP uses the value specified in the Default metric field.
- **1..15**

Match internal

Enables/disables the router to process internal OSPF routes.

Possible values:
- **Enabled** (default setting)
  RIP adopts OSPF Intra and OSPF Inter routes.
- **Disabled**
  RIP rejects OSPF Intra and OSPF Inter routes.

Match external 1

Enables/disables the router to process external OSPF routes of metric type 1.
Possible values:

- **Enabled**
  RIP adopts OSPF Ext T1 routes.
- **Disabled** (default setting)
  RIP rejects OSPF Ext T1 routes.

**Match external 2**

Enables/disables the router to process external OSPF routes of metric type 2.

Possible values:

- **Enabled**
  RIP adopts OSPF Ext T2 routes.
- **Disabled** (default setting)
  RIP rejects OSPF Ext T2 Inter routes.

**Match NSSAExternal 1**

Enables/disables the router to process external OSPF routes of metric type 1.

Possible values:

- **Enabled**
  RIP adopts OSPF Intra and OSPF Inter routes.
- **Disabled** (default setting)
  RIP rejects OSPF Intra and OSPF Inter routes.

**Match NSSAExternal 2**

Enables/disables the router to process external OSPF routes of metric type 2.

Possible values:

- **Enabled**
  RIP adopts NSSA (Not so Stubby Area) routes.
- **Disabled** (default setting)
  RIP rejects NSSA (Not so Stubby Area) routes.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
[Statistics]

The RIP statistics tab displays counters that count events relevant to routing.

Information

Global route changes
Displays the number of route changes to the IP Route Database by RIP in the routing table.

Global queries
Displays the number of responses sent to queries from other systems.

Table

Port
Displays the port number.

Receive bad packets
Displays the number of received routing data packets that the router rejected for various reasons, such as different protocol version, or unknown command type.

Receive bad routes
Displays the number of routing information messages received, which the router ignored because the input format was invalid.

Sent updates
Displays the number of routing tables sent with changed routing entries.

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.

6.6 Open Shortest Path First

Open Shortest Path First (OSPF) version 2, is a routing protocol described in RFC 2328, which is applicable to networks with many routers.
In contrast to the hop count based distance-vector routing protocols such as RIP, OSPF provides a link state algorithm. OSPF bases its link state algorithm on link cost meaning that the criteria for the routing decisions are the path costs instead of hop counts. The path cost is calculated as \( \frac{100 \text{ Mbit/s}}{\text{bandwidth in Mbit/s}} \). OSPF also supports Variable Length Subnet Masking (VLSM) or Classless Inter-Domain Routing (CIDR) networks.

OSPF convergence of the entire network is slow. However, after implementation the protocol is quick in reacting to topology changes. The convergence time for OSPF is 5 to 15 seconds, depending on the size of the network.

OSPF supports networks grouped to "Areas" and thus reduces the administrative effort when maintaining the overall network (OSPF domain). The routers participating in the network know and only manage their own "Area" by flooding Link State Advertisements (LSAs) into the area. Using the LSAs each router builds its own topology database.

- The Area Border Routers (ABR) flood LSAs in an "Area" informing the local networks about destinations in other areas within the OSPF domain. The Designated Routers (DR) transmit LSAs informing about destinations in other areas.
- With Hello packets, neighboring routers periodically identify themselves and signal their availability. If a router misses the Hello packets of another router, then after the expiration of the dead-interval timer, the router considers this router as unreachable.

The device lets you use the md5 algorithm for data transmission. If you use the md5 mode, then specify the same values in the devices in the same area. Specify the area relevant values connected to the ABRs and ASBRs.

OSPF divides routers into the following roles:
- Designated Router (DR)
- Backup Designated Router (BDR)
- Area Border Router (ABR)
- Autonomous System Boundary Router (ASBR)

The menu contains the following dialogs:
- OSPF Global
- OSPF Areas
- OSPF Stub Areas
- OSPF Not So Stubby Areas
- OSPF Interfaces
- OSPF Virtual Links
- OSPF Ranges
- OSPF Diagnostics
6.6.1 OSPF Global

This dialog lets you specify the basic OSPF settings.

The menu contains the following dialogs:
- [General]
- [Configuration]
- [Redistribution]

[General]

This tab lets you enable OSPF in the device and to specify network parameters.

**Operation**

Enables/disables the OSPF function in the device.

Possible values:
- **On**
  - The OSPF function is enabled.
- **Off** (default setting)
  - The OSPF function is disabled.

**Configuration**

**Router ID**

Specifies the unique identifier for the router in the Autonomous System (AS). It influences the election of the Designated Router (DR) and the Backup Designated Router (BDR). Ideally, you use the IP address of a router interface in the device.

Possible values:
- `<IP address of an interface>` (default setting: 0.0.0.0)

**External LSDB limit**

Specifies the maximum number of entries, non-default AS-external-LSAs, that the device saves in the link state database. When this limit is reached, the router enters the overflow state.

Possible values:
- `-1` (default setting)
  - The router continues to save entries until the memory is full.
- `0..2147483647`
  - The device saves up to the specified number of entries.
  - Specify the same value in the routers on the OSPF backbone and in any regular OSPF area.
External LSAs

Displays the current number of entries, non-default AS-external-LSAs, that the device currently holds in the link state database.

Autocost reference bandwidth

Specifies a reference for router interface bandwidth calculations, in Mbps. You use this value for metric calculations.

Possible values:
- 1..4294967 \((\text{default setting: } 100)\)

Paths (max.)

Displays the maximum number of ECMP routes that OSPF adds to the routing table when multiple routes exist for a subnet with same path costs, but different next hops.

Default metric

Specifies the default metric value for OSPF.

Possible values:
- 0 \((\text{default setting})\)
  - OSPF automatically assigns a cost of 20 for routes learned from external sources (static or directly connected).
- 1..16777214

Send trap

Activates/deactivates the sending of SNMP traps when the device detects a OSPF parameter change.

Possible values:
- marked
  - The sending of SNMP traps is active.
  - If the device detects changes in the OSPF parameters, then the device sends an SNMP trap.
- unmarked \((\text{default setting})\)
  - The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.

**Shortest path first**

Delay time [s]

Specifies the delay time, in seconds, between when the router receives a topology change and when it starts an SPF calculation.

Possible values:
- 0..65535 \((\text{default setting: } 5)\)
  - The value 0 means that the router immediately begins the SPF calculation after receiving the topology change.
Hold time [s]

Specifies the minimum time, in seconds, between consecutive SPF calculations.

Possible values:
- 0..65535  (default setting: 10)
  The value 0 means that after the router completes an SPF calculation it immediately begins the next consecutive SPF calculation.

Exit overflow interval [s]

Specifies the number of seconds, after entering the overflow state, that a router attempts to leave the overflow state. When the router leaves the overflow state, the router transmits new non-default AS-external-LSAs.

Possible values:
- 0..2147483647  (default setting: 0)
  The value 0 means that the router remains in the Overflow-State until restarted.

Information

ASBR status

Displays whether the device operates as an Autonomous System Boundary Router (ASBR).

Possible values:
- marked
  The router is an ASBR.
- unmarked
  The router functions in a role other than the role of an ASBR.

ABR status

Displays whether the device operates as an Area Border Router (ABR).

Possible values:
- marked
  The router is an ABR.
- unmarked
  The router functions in a role other than the role of an ABR.

External LSA checksum

Displays the link state checksums of the external LSAs contained in the link state database. This value helps to determine when changes occur in a link state database of the router, and to compare the link state database to other routers.

New LSA originated

Displays the number of new link state advertisements originated on this router. The router increments this number each time it originates a new Link State Advertisement (LSA).
LSAs received

Displays the number of LSAs received that the router determined to be new instances. This number also excludes newer instances of self-originated LSAs.

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.

(Configuration)

This dialog lets you specify the following settings:
- the manner in which the device calculates the path costs
- how OSPF handles default routes
- the type of route OSPF uses for the path-cost calculation

RFC 1583 compatibility

The Network Working Group is continually developing the OSPF function improving and adding parameters. This router provides parameters in accordance with RFC 2328. With parameters in this dialog, you make the router compatible with routers developed under RFC 1583. Activating the compatibility function lets you install this device in a network containing routers developed under RFC 1583.

RFC 1583 compatibility

Enables/disabled the device to be compatible with routers developed under RFC 1583.

In order to minimize the chance of routing loops, set this function to the same value on the OSPF enabled routers in an OSPF domain.

Possible values:
- On (default setting)
  Enable the function when routers are present in the domain without software containing the external path preference functionality described in RFC 2328.
- Off
  Disable the function when every router present in the domain has software containing the external path preference functionality described in RFC 2328.

Preferences

The preferences in this dialog are metrics values which the device uses as a tie breaker between identical routes with different distance types. For example, when a route is inside the local area (intra-area) and the other is outside the local area (inter-area or external). If the metric values are the same for intra, inter and external, then the order of preference is intra, inter then external.

OSPF considers routes specified with a preference value of 255 as unreachable.
Preference (intra)

Specifies the "administrative distance" between routers within the same area (intra-area OSPF routes).

Possible values:
- **1..255** (default setting: 110)

Preference (inter)

Specifies the "administrative distance" between routers in different areas (inter-area OSPF routes).

Possible values:
- **1..255** (default setting: 110)

Preference (external)

Specifies the "administrative distance" between routers external to the areas (external OSPF routes).

Possible values:
- **1..255** (default setting: 110)

Default route

Advertise

Activates/deactivates OSPF advertisements of default routes learned from other protocols.

For example, area border routers of stub areas advertise a default route into the stub area through summary link advertisements. When you configure the router as an AS boundary router, it advertises the default route in AS external link advertisements.

Possible values:
- **marked**  
  The router advertises default routes.
- **unmarked**  (default setting)  
  The router suppresses advertisements of default routes.

Advertise always

Displays whether the router constantly advertises 0.0.0.0/0 as the default route.

When routers forward an IP packet, the router constantly forwards the packet to the best matching destination address. A default route with a destination address of 0.0.0.0 and a mask of 0.0.0.0 is a match for every IP destination address. Matching every IP destination address lets an AS boundary router operate as a gateway for destinations outside of the AS.

Possible values:
- **marked**  
  The router constantly advertises 0.0.0.0/0 as the default route.
- **unmarked**  (default setting)  
  The device uses the settings specified in the Advertise parameter.
Metric

Specifies the metric of the default route, which OSPF advertises when learned from other protocols.

Possible values:

- **0**: The device uses the value specified in the Default metric field.
- **1..16777214**

Metric type

Displays the metric type of the default route which OSPF advertises when learned from another protocol.

Possible values:

- **externalType1**: Includes both the external path cost from the ABR to the ASBR that originated the route plus the internal path cost to the ABR that advertised the route in the local area.
- **externalType2**: (default setting) Includes only the external path cost.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

[Redistribution]

A router with a disabled OSPF function on a routed interface does not propagate the network of this interface on its other interfaces. Thus, the network cannot be reached. To propagate such networks, enable the Redistribution for "connected" networks.

Redistribution is helpful in cases where multiple network administrators manage different departments, or in multi-vendor networks with multiple protocols. OSPF redistribution lets you convert route information such as cost and distance to a destination from other protocols into OSPF.

To help prevent routes from double redistribution and thus preventing a possible loop, use the Tag function. This function marks the routes redistributed from other protocols into OSPF. Then on the other routers in the network, create an ACL active to deny the tagged number. To specify exactly which routes the device distributes in OSPF, create ACL permit rules.

The number of routes that the device learns through OSPF is limited to the size of the routing table.

**Table**

Source

Displays the source protocol, from which OSPF redistributes routes. This object also acts as the identifier for the table entry.
Activating a row lets the device redistribute routes from the specific source protocol into OSPF.

Possible values:
- connected
  The router is directly connected to the route.
- static
  A network administrator has specified the route in the router.
- rip
  The router has learned the route using the RIP protocol.

Active

Activates/deactivates route redistribution from the source protocol into OSPF.

Possible values:
- marked
  Redistribution of routes learned from the source protocol is active.
- unmarked (default setting)
  OSPF route redistribution is inactive.

Metric

Specifies the metric value for routes redistributed from this protocol.

Possible values:
- 0 (default setting)
  The device uses the value specified in the Default metric field.
- 1..16777214

Metric type

Specifies the route metric type which OSPF redistributes from other source protocols.

Possible values:
- externalType1
  This metric type includes both the external path cost from the ABR to the ASBR that originated the route plus the internal path cost to the ABR that advertised the route in the local area.
- externalType2 (default setting)
  This metric type is only that of the external path cost.

Tag

Specifies a tag for routes redistributed into OSPF.

When you set a route tag, OSPF assigns the value to every redistributed route from this source protocol. This function is useful when 2 or more border routers connect an autonomous system to an external network. To help prevent double redistribution, specify the same value in every border router when redistributing the same protocol.

Possible values:
- 0..4294967295 (default setting: 0)

Subnets

Activates/deactivates subnet route redistribution into OSPF.
OSPF only redistributes classful routes into the OSPF domain. In order to redistribute subnet routes into OSPF activate the subnet parameter.

Possible values:
- **marked** (default setting)
  The router redistributes classful and subnet routes into OSPF.
- **unmarked**
  The router redistributes only classful routes into OSPF.

**ACL group name**

Specifies the name of the Access Control List created to filter routes received from the specified source protocol.

To help prevent double redistribution and eventual loops, create an access list denying redistribution of routes originating in another protocol. Specify the access list ID, then activate the function in the **ACL active** column. When filtering redistributed routes, the device uses the source address.

Possible values:
- **-** (default setting)
  No Access Control List assigned.
- **<Group name> (IPv4)**
  You specify the Access Control Lists in the [Network Security > ACL > IPv4 Rule](#) dialog.

**ACL active**

Activates/deactivates Access Control List filtering for this source protocol.

Possible values:
- **marked**
  The router filters redistribution of routes according to the specified Access Control List.
- **unmarked** (default setting)
  The router ignores Access Control List filtering for this source protocol.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
6.6.2 OSPF Areas

OSPF supports networks divided into "Areas" and thus reduces the administrative effort when maintaining the network. The routers participating in the network know and only manage their own "Area" by flooding Link State Advertisements (LSAs) into the area. Using the LSAs each router builds its own topology database.

The device lets you specify up to a total of 15 OSPF Areas.

Table

<table>
<thead>
<tr>
<th>Area ID</th>
<th>Displays the area ID.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area type</td>
<td>Specifies the import policy of AS external LSAs for the area which determines the Area Type. OSPF import policies apply to external routes only. An external route is a route that is outside the OSPF autonomous system. Possible values:</td>
</tr>
<tr>
<td>area (default setting)</td>
<td>The router imports type 5 AS external LSAs into the area.</td>
</tr>
<tr>
<td>stub area</td>
<td>The router ignores type 5 AS external LSAs.</td>
</tr>
<tr>
<td>nssa</td>
<td>The router translates type 7AS external LSAs into type 5 NSSA summary LSAs and imports them into the area.</td>
</tr>
<tr>
<td>SPF runs</td>
<td>Displays the number of times that the router calculated the intra-area routing table using the link state database of this area. The router uses Dijkstra's algorithm for route calculation.</td>
</tr>
<tr>
<td>Area border router</td>
<td>Displays the total number of ABRs reachable within this area. The number of reachable routers is initially 0. OSPF calculates the number in each SPF Pass.</td>
</tr>
<tr>
<td>AS boundary router</td>
<td>Displays the total number of ASBRs reachable within this area. The number of reachable ASBRs is initially 0. OSPF calculates the number in each SPF Pass.</td>
</tr>
<tr>
<td>Area LSAs</td>
<td>Displays the total number of link state advertisements in the link state database of this area, excluding AS External LSAs.</td>
</tr>
</tbody>
</table>
Area LSA checksum

Displays the total number of LS checksums contained in the LS database of this area. This sum excludes type 5 external LSAs. You use the sum to determine if there has been a change in an LS database of a router, and to compare the LS database to other routers.

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.

Opens the Create window to add a new entry to the table.

- In the Area ID field you specify the area ID for the new table entry.
  Possible values:
  - Octet value displayed like an IPv4 address
6.6.3 **OSPF Stub Areas**

OSPF lets you specify certain areas as stub areas. The Area Border Router (ABR) of a stub area enters the information learned from AS external LSAs in its database without flooding the AS external LSAs across the stub area. The ABR instead sends a summary LSA into the stub area advertising a default route. The default route advertised in the summary LSA pertains only to the particular stub area. When forwarding data to AS external destinations, the routers in a stub area use the default ABR only. Sending a summary LSA containing the default route instead of AS external LSAs reduces the link state database size, and therefore the memory requirements for an internal router of a stub area.

The device gives you the following options for creating a Stub Area:

- Converting an Area to a Stub Area
  - In the *Routing > OSPF > Areas* dialog, change the value in the *Area type* column to *Stub Area*.

- Creating a new Stub Area
  - In the *Routing > OSPF > Areas* dialog, create an entry in the table.
  - Change the value in the *Area type* column to *stub area*.

**Table**

<table>
<thead>
<tr>
<th>Area ID</th>
<th>Displays the area ID for the stub area.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default cost</td>
<td>Specifies the external metric value for the metric type.</td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>0..16777215</td>
<td>The router sets the default value to equal the lower cost within the area for the metric type.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Specifies the type of metric used for the default route advertised into the area.</td>
</tr>
<tr>
<td>The border router of a stub area advertises a default route as a network summary LSA.</td>
<td></td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>OSPF metric (default setting)</td>
<td>The ABR advertises the metric as OSPF internal, which is the cost of an intra-area route to the ABR.</td>
</tr>
<tr>
<td>External type 1</td>
<td>The ABR advertises the metric as External type 1, which is the cost of the OSPF internal metric plus external metric to the ASBR.</td>
</tr>
<tr>
<td>External type 2</td>
<td>The ABR advertises the metric as External type 2, which is the cost of the external metric to the ASBR. You use this value for NSSAs.</td>
</tr>
<tr>
<td>Totally stub</td>
<td>Activates/deactivates the import of summary LSAs into stub areas.</td>
</tr>
</tbody>
</table>
Possible values:

- **marked** (default setting)
  The router does not import area summaries. The stub area relies entirely on the default route. This makes the default route a Totally Stub Area.

- **unmarked**
  The router both summarizes and propagates summary LSAs into the stub area.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
### 6.6.4 OSPF Not So Stubby Areas

NSSAs are similar to the OSPF stub area. However, NSSAs have the additional capability of importing limited AS external routes. The ABR sends external routes out of the NSSA by converting type 7 AS external LSAs into type 5 AS external LSAs. The ASBR in an NSSA originates type 7 LSAs. The only difference between the type 5 and type 7 LSAs is that the router sets the "N" bit for NSSAs. Both NSSA neighbors have the "N" bit set. This forms the OSPF neighbor adjacency.

Beside the internal data traffic, NSSAs act like transit areas by transport data coming from external sources to other areas within the OSPF domain.

The device gives you the following options for creating an NSSA:
- Converting an Area to an NSSA
  - In the Routing > OSPF > Areas dialog, change the value in the Area type column to nssa.
- Creating a new NSSA
  - In the Routing > OSPF > Areas dialog, create an entry in the table.
  - Change the value in the Area type column to nssa.

<table>
<thead>
<tr>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area ID</td>
</tr>
<tr>
<td>Redistribute</td>
</tr>
</tbody>
</table>

#### Redistribute

Possible values:
- **marked** (default setting)
  - The NSSA ASBRs suppress external route redistribution into the NSSA. Furthermore, the ASBR stops to create type 7 external LSAs for external routes.
- **unmarked**
  - The NSSA ASBRs redistribute external routes into the NSSA.

#### Originate default info

Activates/deactivates the creation of type 7 default LSAs.

The prerequisite for the creation of type 7 default LSAs is that the router is an NSSA ABR or ASBR.

Possible values:
- **marked**
  - The router creates type 7 default LSAs and sends them into the NSSA.
  - **unmarked** (default setting)
  - The router suppresses type 7 default LSAs.

#### Default metric

Specifies the metric value advertised in the type 7 default LSA.
Possible values:
- **1..16777214** (default setting: **10**)

**Default metric type**

Specifies the metric type advertised in the type 7 default LSA.

Possible values:
- **ospfMetric**
  - The router advertises the metric as OSPF internal, which is the cost of an intra-area route to the ABR.
- **comparable**
  - The router advertises the metric as external type 1, which is the cost of the OSPF internal metric plus external metric to the ASBR.
- **nonComparable**
  - The router advertises the metric as external type 2, which is the cost of the external metric to the ASBR.

**Translator role**

Specifies the ability of an NSSA border router to perform translation of type-7 LSAs into type-5 LSAs.

NSSA Area Border Routers receive type-5 LSAs containing information about external routes. The NSSA border routers block the type-5 LSAs from entering into the NSSA. However, using type-7 LSAs the border routers inform each other about external routes. The ABRs then translate the type-7 LSAs to type-5 external LSAs and flood the information to the rest of the OSPF network.

Possible values:
- **always**
  - The router translates type-7 LSAs to type-5 LSAs.
  - When the router receives a type-5 LSAs from another router with a router ID higher then its own, it flushes its type-5 LSAs.
- **candidate** (default setting)
  - The router translates type-7 LSAs to type-5 LSAs.
  - To help prevent routing loops, OSPF performs a translator election. When multiple candidates exist, OSPF elects the router with the higher router ID as the translator.

**Translator status**

Displays if and how the router is translating type-7 LSAs into type-5 LSAs.

Possible values:
- **enabled**
  - The Translator role of the router is set to always.
- **elected**
  - As a candidate, the NSSA Border router is translating type-7 LSAs into type-5.
- **disabled**
  - Another NSSA border router is translating type-7 LSAs into type-5 LSAs.

**Translator stability interval [s]**

Specifies the number of seconds after the router loses a translation election that it continues to translate type-7 LSAs into type-5 LSAs.
Routing

[Routing > OSPF > NSSA]

Possible values:

- 0..65535  (default setting: 40)

Translator events

Displays the number of translator status changes that have occurred since the last boot-up.

Discontinuities in the value of this counter occur while OSPF is disabled and can occur during re-initialization of the management system.

Totally NSSA

Activates/deactivates importation of summary routes into the NSSA as type 3 summary LSAs.

Possible values:

- marked  (default setting)
  The router suppresses summary route importation making the area a Totally NSSA.
- unmarked
  The router imports summary routes into the NSSA as type 3 summary LSAs.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
6.6.5 OSPF Interfaces

This dialog lets you specify, activate, and display OSPF parameters on the router interfaces.

The device uses the OSPF routing protocol to exchange reachability information between the routers. The device uses routing information learned from peers to determine the next hop towards the destination. To route traffic correctly, the router authenticates OSPF protocol exchanges to help prevent malicious or incorrect routing information from getting introduced into the routing table.

OSPF supports multiple types of authentication. You configure the type of authentication in use on a per interface basis. The cryptographic authentication option `md5`, helps protect your network against passive attacks and helps provide significant protection against active attacks. When using the cryptographic authentication option, each router appends a "message digest" to its transmitted OSPF packets. Receivers then use the shared secret key and received digest to verify that each received OSPF packet is authentic.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the interface to which the table entry applies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>Displays the IP address of this OSPF interface.</td>
</tr>
<tr>
<td>Active</td>
<td>Activates/deactivates the OSPF administrative status of the interface. Possible values:</td>
</tr>
<tr>
<td></td>
<td><code>marked</code> The router advertises the values specified on the interface, and the interface as an OSPF internal route.</td>
</tr>
<tr>
<td></td>
<td><code>unmarked</code> (default setting) The interface is external to OSPF.</td>
</tr>
<tr>
<td>Area ID</td>
<td>Specifies the area ID of the domain to which the interface connects. Possible values:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;Area ID&gt;</code> You specify the area IDs in the Routing &gt; OSPF &gt; Areas dialog.</td>
</tr>
<tr>
<td>Priority</td>
<td>Specifies the priority of this interface. In multi-access networks, the router uses the value in the Designated Router election algorithm. When a tie occurs, the routers use their router ID as a tie breaker. The highest router ID wins.</td>
</tr>
</tbody>
</table>
Routing

[Routing > OSPF > Interfaces]

Possible values:

- **0**
  The router is unable to become the Designated Router on this particular network.
- **1..255** (default setting: 1)

Transmit delay [s]

Specifies the estimated number of seconds it takes to transmit a link state update packet over this interface.

This setting is useful for low speed links. The timer increases the age of the LS updates to compensate for estimated delays on the interface. Increasing the packet age too much results in a reply that is younger than the original packet.

Possible values:

- **0..3600** (default setting: 1)

Retrans interval [s]

Specifies the number of seconds between link state advertisement retransmissions for adjacencies belonging to this interface.

You also use this value when retransmitting database description and link state request packets.

Possible values:

- **0..3600** (default setting: 5)

Hello interval [s]

Specifies the number of seconds between Hello packet transmissions on the interface.

Set this value the same for the routers attached to a common network. Verify that every router in an area has the same value.

Possible values:

- **1..65535** (default setting: 10)

Dead interval [s]

Specifies the number of seconds between received Hello packets before a router declares the neighbor router down.

Specify the value to a multiple of the Hello interval [s]. Specify the same value for the router interfaces within the same area.

Possible values:

- **1..65535** (default setting: 40)

  Specify a lower value to get a faster detection of a neighbor in a down state.

**Note:** Lower values are prone to interoperability issues.

Status

Displays the OSPF interface state.
Routing

Routing > OSPF > Interfaces

Possible values:

- **down** (default setting)
  The interface is in the initial state and is blocking traffic.

- **loopback**
  The interface is a loopback interface of the device. Although packets are not sent out on the loopback interface, the router LSAs continue to advertise the interface address.

- **waiting**
  Applies only to interfaces connected to broadcast and Non-broadcast Multi-access (NBMA) network types. While in this state, the router attempts to identify the state of the network DR and BDR by sending and receiving Hello packets. The wait timer causes the interface to exit the waiting state and select a DR. The period of this timer is the same as the value in the Dead interval [s] field.

- **pointToPoint**
  Applies only to interfaces connected to point-to-point, point-to-multipoint, and virtual link network types. While in this state the interface sends Hello packets every Hello interval [s] and establishes an adjacency with its neighbor.

- **designatedRouter**
  The router is the DR for the multi-access network and establishes adjacencies with the other network routers.

- **backupDesignatedRouter**
  The router is the BDR for the multi-access network and establishes adjacencies with the other network routers.

- **otherDesignatedRouter**
  The router is only a network participant. The router establishes adjacencies only with the DR and BDR and tracks its network neighbors.

**Designated router**

Displays the IP address of the Designated Router.

Possible values:

- Valid IPv4 address (default setting: 0.0.0.0)

**Backup designated router**

Displays the IP address of the Backup Designated Router.

Possible values:

- Valid IPv4 address (default setting: 0.0.0.0)

**Events**

Displays the number of times this OSPF interface changed its state, or the router detected an error.

**Network type**

Specifies the OSPF network type of the autonomous system.

Possible values:

- **broadcast**
  Use this value for broadcast networks, such as Ethernet and IEEE 802.5. OSPF performs a DR and BDR election with which the non-designated routers form an adjacency.

- **nbma**
  Use this value for non-broadcast multi-access networks such as X.25 and similar technologies. OSPF performs a DR and BDR election to limit the number of adjacencies formed.
Routing

[Routing > OSPF > Interfaces]

- **pointToPoint**
  Use this value for networks that link only 2 interfaces.

- **pointToMultipoint**
  Use this value when you collect several point-to-point links into a non-broadcast network. Every router in the network transmits Hello packets to other routers in the network, but without having a DR and BDR election.

### Auth type

Specifies the authentication type for an interface.

If you specify `simple` or `MD5`, then this router requires other routers to pass an authentication process before this router accepts the other routers as neighbors.

If you use authentication to help protect your network, then use the same type and key for every router in your autonomous system.

Possible values:

- **none** (default setting)
  Network authentication is inactive.

- **simple**
  The router uses clear text authentication. In this case, routers transmit the passwords as clear text.

- **MD5**
  The router uses the message-digest algorithm MD5 authentication. This type of authentication helps make your network more secure.

### Auth key

Specifies the authentication key.

After entering the field displays ***** (asterisk) instead of the authentication key.

Possible values:

- Alphanumeric ASCII character string
  - with 8 characters if in the Auth type drop-down list the value `simple` is selected
  - with 16 characters if in the Auth type drop-down list the value `MD5` is selected

If you specify a shorter authentication key, then the device fills in the remaining characters with 0.

### Auth key ID

Specifies the MD5 authentication key ID value.

The cryptographic authentication option MD5, helps protect your network against passive attacks and helps provide significant protection against active attacks.

The prerequisite for changing the value is that, in the Auth type column, you specify the value MD5.

Possible values:

- **0..255** (default setting: 0)

### Cost

Specifies the internal metric.
OSPF uses link cost as the metric. OSPF also uses the cost of a link to calculate the SPF routes. OSPF prefers the route with the smaller value.

The formula to calculate cost is reference bandwidth divided by interface bandwidth. Reference bandwidth is specified in the Autocost reference bandwidth field and is set to 100 Mbit/s by default. See the Routing > OSPF > Global dialog, General tab.

Example:

The interface bandwidth is 10 Mbit/s.

The metric is 100 Mbit/s divided by 10 Mbit/s = 10.

Possible values:
- auto (default setting)
  OSPF calculates the metric and automatically adjusts the value when the interface bandwidth changes.
- 1..65535
  OSPF uses the value specified here as metric.

Calculated cost

Displays the metric value which OSPF currently uses for this interface.

MTU ignore

Activates/deactivates the IP maximum transmission unit (MTU) mismatch detection on this OSPF interface.

Possible values:
- marked
  Disables the IP MTU check and makes adjacencies possible when the MTU value differs on the interfaces.
- unmarked (default setting)
  The router checks if neighbors are using the same MTU value on the interfaces.

Fast Hello mode

Activates/deactivates the Fast Hello mode on the port. For a ring that contains 8 devices, the function makes it possible for the recovery time to be less than 1.5 seconds for a detected link or router failure.

The prerequisite is that you specify a value of 1 second for the following parameters:
- Dead interval [s] column
- Delay time [s] column in the Routing > OSPF > Global dialog, Shortest path first frame

Possible values:
- marked
  The device sends the Hello packets every 250 ms, and ignores the value specified in the Hello interval [s] column.
- unmarked (default setting)
  The device sends the Hello packets according to the value specified in the Hello interval [s] column.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
6.6.6 **OSPF Virtual Links**

OSPF requires that you link every area to the backbone area. The physical location of routers often prohibits a direct link to the backbone. Virtual links allow you to connect physically separated areas to the backbone through a transit area. You specify both routers on the endpoints of a virtual link as ABRs on a point-to-point link.

To enter a virtual link in the table, click the button.

**Table**

<table>
<thead>
<tr>
<th>Area ID</th>
<th>Displays the area ID for the transit area that the virtual link traverses.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor ID</td>
<td>Displays the router ID of the virtual neighbor. The router learns this value from Hello packets received from the virtual neighbor. The value is a static value for virtual adjacencies.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Transmit delay [s]</th>
<th>Specifies the estimated number of seconds it takes to transmit an LS update packet over this interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>This setting is useful for low speed links. The timer increases the age of the LS updates to compensate for estimated delays on the interface. Increasing the packet age too much results in a reply that is younger than the original packet.</td>
<td></td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>- 0..3600 (default setting: 1)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Retrans interval [s]</th>
<th>Specifies the number of seconds between the LS advertisement retransmissions for adjacencies belonging to this interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>You also use this value when retransmitting Database Description (DD) and LS Request packets.</td>
<td></td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>- 0..3600 (default setting: 5)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Dead interval [s]</th>
<th>Specifies the number of seconds between received Hello packets before a router declares the neighbor router down.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify the value to a multiple of the <strong>Hello interval [s]</strong>. Specify the same value for the router interfaces within the same area.</td>
<td></td>
</tr>
</tbody>
</table>
Possible values:

- **1..65535** (default setting: 40)
  
  Specify a lower value to get a faster detection of a neighbor in a down state.

**Note:** Lower values are prone to interoperability issues.

**Hello interval [s]**

Specifies the number of seconds between Hello packet transmissions on the interface.

Set this value the same for the routers attached to a common network.

Possible values:

- **1..65535** (default setting: 10)

**Status**

Displays the OSPF virtual interface state.

Possible values:

- **down** (default setting)
  
  The interface is in the initial state and is blocking traffic.

- **pointToPoint**
  
  Applies only to interfaces connected to point-to-point, point-to-multipoint, and virtual link network types. While in this state the interface sends Hello packets every Hello interval [s] and establishes an adjacency with its neighbor.

**Events**

Displays the number of times this interface changed its state due to a received event.

**Auth type**

Specifies the authentication type for a virtual link.

If you specify **simple** or **MD5**, then this router requires other routers to pass an authentication process before this router accepts the other routers as neighbors.

If you use authentication to help protect your network, then use the same type and key for every router in your autonomous system.

Possible values:

- **none** (default setting)
  
  Network authentication is inactive.

- **simple**
  
  The router uses clear text authentication. In this case, routers transmit the passwords as clear text.

- **MD5**
  
  The router uses the message-digest algorithm MD5 authentication. This type of authentication helps make your network more secure.

**Auth key**

Specifies the authentication key.

After entering the field displays ***** (asterisk) instead of the authentication key.
Possible values:

- Alphanumeric ASCII character string
  - with 8 characters if in the Auth type drop-down list the value simple is selected
  - with 16 characters if in the Auth type drop-down list the value MD5 is selected

If you specify a shorter authentication key, then the device fills in the remaining characters with 0.

**Auth key ID**

Specifies the MD5 authentication key ID value.

The cryptographic authentication option md5, helps protect your network against passive attacks and helps provide significant protection against active attacks.

The prerequisite for specifying this value is that you specify in the Auth type column the value MD5.

Possible values:

- 0..255 (default setting: 0)

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

- In the Area ID drop-down list you select the area ID for the new table entry.
- In the Neighbor ID field you specify the router ID of the virtual neighbor.
6.6.7 **OSPF Ranges**

In large areas, OSPF messages flooded across the network reduce available bandwidth and increase the size of the routing table. A large routing table increases the amount of CPU processing that the router requires to enter the information into the routing table. A large routing table also reduces available memory. To decrease the number of OSPF messages flooded across the network, OSPF lets you create several smaller subnets within a large area.

In order to summarize routing information into and out of a subnet, the Area Border Router (ABR) specifies the subnet as a single address range. The ABR advertises each address range as a single route to the external area. The IP address that the ABR advertises for the subnet is an address and mask pair. Unadvertised ranges allow you to hide the existence of subnets from other areas.

The router specifies cost of the advertised route as the greater cost in the set component subnets.

To enter an address range into the table, click the button.

**Table**

<table>
<thead>
<tr>
<th>Area ID</th>
<th>Displays the area ID of the address range.</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSDB type</td>
<td>Displays the route information aggregated by the address range.</td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>summaryLink</td>
<td>The area range aggregates type 5 route information.</td>
</tr>
<tr>
<td>nssaExternalLink</td>
<td>The area range aggregates type 7 route information.</td>
</tr>
<tr>
<td>Network</td>
<td>Displays the IP address of the subnet of the range.</td>
</tr>
<tr>
<td>Netmask</td>
<td>Displays the netmask of the subnet of the range.</td>
</tr>
<tr>
<td>Effect</td>
<td>Specifies the external advertisement of the subnet ranges.</td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>advertiseMatching (default setting)</td>
<td>The router advertises the range in other areas.</td>
</tr>
<tr>
<td>doNotAdvertiseMatching</td>
<td>The router withholds range advertisement to other external areas.</td>
</tr>
</tbody>
</table>
**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the *Create* window to add a new entry to the table.

- In the *Area ID* drop-down list you select the area ID of the address range.
- In the *LSDB type* drop-down list you select the route information aggregated by the address range.
  Possible values:
  - *summaryLink*  
    The area range aggregates type 5 route information.
  - *nssaExternalLink*  
    The area range aggregates type 7 route information.
- In the *Network* field you specify the IP address for the area subnet.
- In the *Netmask* field you specify the netmask for the area subnet.
6.6.8 OSPF Diagnostics

To function properly, OSPF relies on 2 basic processes.
- forming adjacencies
- after forming adjacencies, the neighboring routers exchange information and update their routing table

The statistics displayed in the tabs help you to analyze the OSPF processes.

The dialog contains the following tabs:
- [Statistics]
- [Link state database]
- [Neighbors]
- [Virtual neighbors]
- [External link state database]
- [Route]

[Statistics]

In order to accomplish the 2 basic processes, OSPF routers send and receive various messages containing information to form adjacencies, and update routing tables. The counters in the tab indicate the amount of message traffic transmitted and received on the OSPF interfaces.
- Link State Acknowledgments (LSAcks) provide a response to a Link State Update (LS update) request as part of the link state exchange process.
- The Hello messages allow a router to discover other OSPF routers in the area and to establish adjacencies between the neighboring devices. After establishing adjacencies, the routers advertise their credentials for establishing a role as either a Designated Router (DR), a Backup Designated Router (BDR), or only as a participant in the OSPF network. The routers then use the Hello messages to exchange information about the OSPF configuration in the Autonomous System (AS).
- Database Description (DD) messages contain descriptions of the AS or area topology. The messages also propagate the contents of the link state database for the AS or area from a router to other routers in the area.
- Link State Requests (LS Request) messages provide a means of requesting updated information about a portion of the Link State Database (LSDB). The message specifies the link or links for which the requesting router requires current information.
- LS Update messages contain updated information about the state of certain links on the LSDB. The router sends the updates as a response to an LS Request message. The router also broadcast or multicast messages periodically. The router uses the message contents to update the information in the LSDBs of routers that receive them.
- LSAs contain the local routing information for the OSPF area. The router transmits the LSAs to other routers in an OSPF area and only on interfaces connecting the router to the specific OSPF area.
- Type 1 LSAs are router LSAs. Each router in an area originates a router-LSA. A single router LSA describes the state and cost of every link in the area. The router floods type 1 LSAs only across its own area.
- Type 2 LSAs are network LSAs. The DR creates a network LSA from information received in the type 1 LSAs. The DR originates in its own area a network LSA for each broadcast and NBMA network it is connected to. The LSA describes every router attached to the network, including the DR itself. The router floods type 2 LSAs only across its own area.
Type 3 LSAs are network summary LSAs. An Area Border Router (ABR) creates a single network summary LSA from information contained in the type 1 and type 2 LSAs received from the DRs. The ABR transmits network summary LSAs describing inter-area destinations. The router floods type 3 LSAs across every area connected to it. Except this is the area for which it generated the Type 3 LSA.

Type 4 LSAs are Autonomous System Boundary Router (ASBR) summary LSAs. An ABR creates a single ASBR summary LSA from information contained in the type 1 and type 2 LSAs received from the DRs. The ABR transmits type 4 LSAs to areas different than the area it resides in, to describe the ASBRs from which the ABR received type 5 LSAs. The router floods type 4 LSAs across every area connected to it. Except this is the area for which it generated the Type 4 LSA.

Type 5 LSAs are AS external LSAs. The AS boundary routers create the AS external LSAs describing destinations external to the AS. The type 5 LSAs contain information redistributed into OSPF from other routing processes. The router floods type 5 LSAs to every area except stub and NSSA areas.

**Global**

- **LSA retransmitted**: Displays the total number of LSAs retransmitted since resetting the counters. When the router transmits the same LSA to multiple neighbors, the router increments the count for each neighbor.

- **Hello packets received**: Displays the total number of OSPFv2 Hello packets received since resetting the counters.

- **Hello packets transmitted**: Displays the total number of OSPFv2 Hello packets transmitted since resetting the counters.

- **DB description packets received**: Displays the total number of OSPFv2 Database Description packets received since resetting the counters.

- **DB description packets transmitted**: Displays the total number of OSPFv2 Database Description packets transmitted since resetting the counters.

- **LS request packets received**: Displays the total number of OSPFv2 Link State Request packets received since resetting the counters.

- **LS request packets transmitted**: Displays the total number of OSPFv2 Link State Request packets transmitted since resetting the counters.

- **LS update packets received**: Displays the total number of OSPFv2 LS Update packets received since resetting the counters.
LS update packets transmitted

Displays the total number of OSPFv2 LS Update packets transmitted since resetting the counters.

LS ack update packets received

Displays the total number of OSPFv2 LS Acknowledgement packets received since resetting the counters.

LS ack update packets transmitted

Displays the total number of OSPFv2 LS Acknowledgement packets transmitted since resetting the counters.

Max. rate of LSU received in any 5sec

Displays the maximum rate of OSPFv2 LS Update packets received over any 5-second interval since resetting the counters. The field displays the rate in packets per second. For example, the number of packets received during the 5-second interval, divided by 5.

Max. rate of LSU transmitted in any 5sec

Displays the maximum rate of OSPFv2 LS Update packets transmitted over any 5-second interval since resetting the counters. The field displays the rate in packets per second. For example, the number of packets transmitted during the 5-second interval, divided by 5.

Type-1 (Router) LSAs received

Displays the number of type 1 router LSAs received since resetting the counters.

Type-2 (Network) LSAs received

Displays the number of type 2 network LSAs received since resetting the counters.

Type-3 (Summary) LSAs received

Displays the number of type 3 network summary LSAs received since resetting the counters.

Type-4 (ASBR) LSAs received

Displays the number of type 4 ASBR summary LSAs received since resetting the counters.

Type-5 (External) LSAs received

Displays the number of type 5 external LSAs received since resetting the counters.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
A router maintains a separate link state database for every area to which it belongs.

The router adds LSAs to the database in the following cases:
- When the router receives an LSA, for example during the flooding process.
- When the router originates the LSA.

When a router deletes an LSA from the database, it also removes the LSA from the link state retransmission lists of the other routers in the network. A router deletes an LSA from its database in the following cases:
- A newer instance overwrites the LSA during the flooding process.
- The router originates a newer instance of a self-originated LSA.
- The LSA ages out and the router flushes the LSA from the routing domain.

**Table**

<table>
<thead>
<tr>
<th>Area ID</th>
<th>Displays the area ID from which router received the LSA.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Displays the type of the LSAs received. Each LSA type has a separate advertisement format.</td>
</tr>
</tbody>
</table>

**Possible values:**
- **routerLink**
  - The router received the information from another router in the same area. Routers announce their existence and list the links to other routers within the same area using a type 1 LSA. The link state ID is the originating router ID.
- **networkLink**
  - The router received the information from a DR on a broadcast segment using a type 2 LSA. The DR compiles the information received in type 1 LSAs and lists the routers linked together by the segment. The link state ID is the IP interface address of the DR.
- **summaryLink**
  - The router received the information from an ABR using a type 3 LSA describing routes to networks. ABRs compile information learned from type 1 and type 2 LSAs received from the attached areas before sending the routing information to the other areas. The link state ID is the destination network number which is the results of the summarization process.
- **asSummaryLink**
  - The router received the information from an ABR using a type 4 LSA describing routes to ASBRs. ABRs compile information learned from type 1 and type 2 LSAs received from the attached areas before sending the routing information to the other areas. The link state ID is the destination network number.
- **asExternalLink**
  - The router received the information from an ASBR using a type 5 LSA describing routes to another AS. The link state ID is the router id of the ASBR.
- **nssaExternalLink**
  - The router received the information from a router in a NSSA using a type 7 LSA.
LSID

Displays the Link State ID (LSID) value received in the LSA.

The LSID is a field located in the LSA header. The field contains either a router ID or an IP address according to the LSA type.

Possible values:
▶ <Router ID>
▶ Valid IPv4 address

Router ID

Displays the router ID uniquely identifying the originating router.

Sequence

Displays the value of the sequence field in an LSA.

The router examines the contents or the LS checksum field whenever the LS sequence number field indicates that 2 instances of an LSA are the same. When there is a difference, the router considers the instance with the larger LS checksum to be most recent.

Age

Displays the age of the link state advertisement in seconds.

When the router creates the LSA, the router sets the LS age to the value 0. As the routers transmit the LSA across the network they increment the value by the value specified in the Transmit delay [s] column.

If a router receives 2 LSAs for the same segment having identical LS sequence numbers and LS checksums, then the router examines the age of the LSAs.
• The router immediately discards LSA with MaxAge.
• Otherwise, the router discards the LSA with the smaller age.

Checksum

Displays the contents of the checksum.

The field is a checksum of the complete contents of the LSA, except for the age field. The age field of the advertisement increases as the routers transmit the message across the network. Excluding the age field lets routers transmit the message without needing to update the checksum field.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
The Hello Protocol is responsible for neighbor acquisition, maintenance, and for 2-way communication between neighbors.

During the acquisition process, the routers on a segment compare their configurations for compatibility. If the routers are compatible, then the routers form adjacencies. The routers discover their master or slave status using information provided in the Hello packets.

After the routers discover their roles, they exchange routing information to synchronize their routing databases. When the routers finish updating their databases, the neighbors are fully adjacent and the LSA lists the adjacency.

### Table

<table>
<thead>
<tr>
<th>Neighbor ID</th>
<th>Displays the router ID of the neighboring router. The router learns this value from Hello packets received from the neighbor. The value is a static value for virtual adjacencies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>Displays the IP address of the neighboring router interface attached to the port. When sending unicast protocol packets on this adjacency, the router uses the value as the destination IP address. When the neighboring router is the DR, the router is also used in router LSAs as the link ID for the attached network. The router learns the neighbor IP address when it receives Hello packets from the neighbor. For virtual links, the router learns the neighbor IP address while building the routing table.</td>
</tr>
<tr>
<td>Interface</td>
<td>Displays the interface to which the entries in this row refer.</td>
</tr>
<tr>
<td>Status</td>
<td>Displays the state of the relationship with the neighbor listed in this instance. An event invokes each state change, such as a received Hello packet. This event produces different effects, depending on the current state of the neighbor. Also, depending on the state of neighbor change, the routers initiate a DR election. Possible values:</td>
</tr>
</tbody>
</table>
|             | - **down** *(default setting)*  
  The initial state of a neighbor conversation or a router terminated the conversation due to expiration of the *Dead interval [s]* timer.  
  - **attempt**  
  The state is only valid for neighbors attached to NBMA networks. The information from the neighbor remains unresolved. The router actively attempts to contact the neighbor by sending the neighbor Hello packets in the interval specified in *Hello interval [s]*.
Routing

[Routing > OSPF > Diagnostics]

- **init**
  The router has recently seen a Hello packet from the neighbor. However, the router has only established uni-directional communication with the neighbor. For example, the router ID of this router is missing from the Hello packet of the neighbor. When sending Hello packets, the associated interface lists neighbors in this state or higher.

- **twoWay**
  Communication between the 2 routers is bidirectional. The router verifies the operation by examining the contents of the Hello packet. The routers elect a DR and BDR from the set of neighbors while in or after the 2-way state.

- **exchangeStart**
  The first step in creating an adjacency between the 2 neighboring routers. The goal of this step is to decide which router is the master and to decide upon the initial Sequence number.

- **exchange**
  The router is announcing its entire link state database by sending Database Description (DD) packets to the neighbor. The router explicitly acknowledges each DD packet. Each packet has a sequence number. The adjacencies only allow 1 DD packet to be outstanding at any time. In this state, the router sends LS Request packets asking for up-to-date database information. The adjacencies are fully capable of transmitting and receiving OSPF routing protocol packets.

- **loading**
  The router sends LS Request packets to the neighbor inquiring about the outstanding database updates sent in the exchange state.

- **full**
  The neighboring routers are fully adjacent. The adjacencies now appear in router LSAs and network LSAs.

**Dead time**

Displays the amount of time remaining before the router declares the neighbor status as down. The timer initiates the count down after the router receives a Hello packet.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**[Virtual neighbors]**

OSPF requires a continuous connection of the Autonomous System backbone area. OSPF also requires that every area has a connection to the backbone area. The physical location of routers often prohibits an area from directly connecting to the backbone area. Virtual links allow you to connect physically separated areas to the backbone area.

The ABRs of the backbone area and the physically separated area form a point-to-point link through a transit area. When the ABRs establish an adjacency, the backbone router LSAs include the link and OSPF packets flow over the virtual link. Furthermore, the routing database of each endpoint router includes the link state information of the other endpoint router.

**Note:** The OSPF lets you specify virtual links through every type of area except for stub areas.
Table

Area ID
Displays the transit area ID of the virtual link.

Router ID
Displays the router ID of the other virtual endpoint ABR.

After virtual adjacencies form, the virtual link carries OSPF packets such as Hello packets and LS update packets containing database information. The prerequisite is that the LSAs of the neighbor router contain the router ID of the local router.

IP address
Displays the IP address of the virtual neighbor.
The router uses the IP address to send OSPF packets across the transit network to the virtual neighbor.

Options
Displays the information contained in the options field of the LSA. This value indicates the capabilities of virtual neighbor.

The options field used in the Hello packets allow routers to identify their optional capabilities, and to communicate the capabilities to other routers. This mechanism lets you mix routers of different capabilities within a routing domain.

The router supports 4 options by setting the following bits in the options field either high or low depending on the capabilities of the router. The field displays the value by adding the following option bits together. You read the fields from least significant bit to most significant bit.

- The routers advertise the ability to process TOS 0 in AS external routes when it sets the E-bit high. The E-bit is the second bit in the options field and represents the value $2^1$ or 2.
- The routers advertise the ability to process multicast routes when it sets the MC-bit high. The MC-bit is the third bit in the options field and represents the value $2^2$ or 4.
- The routers advertise the ability to process AS external routes in an NSSA summary with type 7 LSAs when it sets the N/P-bit high. The N/P-bit is the fourth bit in the options field and represents the value $2^3$ or 8.
- The routers advertise the ability to process demand circuits when it sets the DC-bit high. The DC-bit is the sixth bit in the options field and represents the value $2^5$ or 32.

In a special case, the router sets the E-bit low.
- The routers advertise the ability to process TOS metrics other than TOS 0 when it sets the E-bit low. The E-bit is the second bit in the options field and when set low, the bit represents the value 0.

Possible values:

- $2, 6, 10, 14, 34, 38, 42, 46$
The values indicate that the virtual neighbor supports Type of Service metric (TOS) 0 in AS external LSAs.
- $0, 4, 8, 12, 32, 36, 40, 44$
The values indicate that the virtual neighbor supports TOS metrics other than TOS 0.
Routing

Routing > OSPF > Diagnostics

- 4,6,12,14,36,38,44,46
  The values indicate that the virtual neighbor supports multicast routing.

- 8,10,12,14,40,42,44,46
  The values indicate that the virtual neighbor supports type 7 LSAs.

- 32,34,36,38,40,42,44,46
  The values indicate that the virtual neighbor supports demand circuits.

Status

Displays the state of the relationship with the neighbor listed in this instance.

An event invokes each state change, such as a received Hello packet. This event produces different effects, depending on the current state of the neighbor. Also, depending on the state of neighbor change, the routers initiate a DR election.

Possible values:

- **down** (default setting)
  The initial state of a neighbor conversation or a router terminated the conversation due to expiration of the **Dead interval [s]** timer.

- **attempt**
  The state is only valid for neighbors attached to NBMA networks. Information from the neighbor remains unresolved. The router actively attempts to contact the neighbor by sending the neighbor Hello packets in the interval specified in **Hello interval [s]**.

- **init**
  The router has recently seen a Hello packet from the neighbor. However, the router has only established uni-directional communication with the neighbor. For example, the router ID of this router is missing from the Hello packet of the neighbor. When sending Hello packets, the associated interface lists neighbors in this state or higher.

- **twoWay**
  Communication between the 2 routers is bidirectional. The router verifies the operation by examining the contents of the Hello packet. The routers elect a DR and BDR from the set of neighbors while in or after the 2-way state.

- **exchangeStart**
  The first step in creating an adjacency between the 2 neighboring routers. The goal of this step is to decide which router is the master and to decide upon the initial **Sequence** number.

- **exchange**
  The router is announcing its entire link state database by sending Database Description (DD) packets to the neighbor. The router explicitly acknowledges each DD packet. Each packet has a sequence number. The adjacencies only allow 1 DD packet to be outstanding at any time. In this state, the router sends LS Request packets asking for up-to-date database information. The adjacencies are fully capable of transmitting and receiving OSPF routing protocol packets.

- **loading**
  The router sends LS Request packets to the neighbor inquiring about the outstanding database updates sent in the exchange state.

- **full**
  The neighboring routers are fully adjacent. The adjacencies now appear in router LSAs and network LSAs.

Events

Displays the number of times this interface changed its state due to a received event such as HelloReceived or 2-way.
Length of retransmission queue

Displays the length of the retransmission list.

In order to flood LSAs out of an interface to the neighbor, the router places the LSAs on the link state retransmission list of the adjacency. To validate LSA flooding, the router retransmits the LSAs until the neighbor acknowledges the LSA reception. You configure the length of time between retransmissions in the Routing > OSPF > Interfaces dialog in the Retrans interval [s] column.

Suppressed Hellos

Displays whether the router is suppressing Hello packets to the neighbor.

Suppressing Hello packet transmission to the neighbor lets demand circuits close, on point-to-point links, during periods of inactivity. In NBMA networks, the periodic transmission of LSAs causes the circuit to remain open.

Possible values:

- **marked**
  - The router suppresses Hello packets.
- **unmarked**
  - The router transmits Hello packets.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

**[External link state database]**

The table displays the contents of the external link state database, with an entry for each unique link state ID. External links allow the area to connect to destinations outside of the autonomous system. Routers pass information about the external links throughout the network as link state updates.

**Table**

**Type**

Displays the type of the link state advertisement. When the router detects an external link state advertisement, the router enters the information in the table.

Possible values:

- **asExternalLink**

**LSID**

Displays the Link State ID is an LS type-specific field containing either a router ID or an IP address. The value identifies the routing domain described in the advertisement.
Router ID

Displays the router ID uniquely identifying the originating router.

Sequence

Displays the value of the sequence field in an LSA.

The router examines the contents or the LS checksum field whenever the LS sequence number field indicates that 2 instances of an LSA are the same. When there is a difference, the router considers the instance with the larger LS checksum to be most recent.

Age

Displays the age of the link state advertisement in seconds.

When the router creates the LSA, the router sets the LS age to the value 0. As the routers transmit the LSA across the network they increment the value by the value specified in the Transmit delay [s] column.

If a router receives 2 LSAs for the same segment having identical LS sequence numbers and LS checksums, then the router examines the age of the LSAs.

- The router immediately discards LSA with MaxAge.
- Otherwise, the router discards the LSA with the smaller age.

Checksum

Displays the contents of the checksum.

The field is a checksum of the complete contents of the LSA, except for the age field. The age field of the advertisement increases as the routers transmit the message across the network. Excluding the age field lets routers transmit the message without needing to update the checksum field.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Route]

The dialog displays the OSPF route information learned from the Link State Advertisements (LSA).

Table

IP address

Displays the IP address of the network or subnet for the route.

Netmask

Displays the netmask for the network or subnet.
6.7 Routing Table

This dialog displays the routing table with the routes configured in the device. Using the routing table, the device learns the router interface through which it transfers IP packets that are addressed to recipients in a different network.

Preference

Specifies the preference number that the device assigns by default to the newly configured, static routes.
Possible values:

- **1..255** (default setting: 1)
  Routes with a value of 255 will be ignored by the device in the routing decision.

**Table**

*Port*

Displays the router interface through which the device is currently transmitting IP packets addressed to the destination network.

Possible values:

- **<Router interface>**
  The device uses this router interface to transfer IP packets addressed to the destination network.
- **no port**
  The static route is currently not assigned to a router interface.

*Network address*

Displays the address of the destination network.

*Netmask*

Displays the netmask.

*Next hop IP address*

Displays the IP address of the next router on the path to the destination network.

*Type*

Displays the type of the route.

Possible values:

- **local**
  The router interface is directly connected to the destination network.
- **remote**
  The router interface is connected to the destination network through a router (*Next hop IP address*).
- **reject**
  The device discards IP packets addressed to the destination network and informs the sender.
- **other**
  The route is inactive. See the *Active* checkbox.

*Protocol*

Displays the origin of this route.
Possible values:

- **local**
  The device created this route when setting up the router interface. See the Routing > Interfaces > Configuration dialog.

- **netmgmt**
  A user created this static route with the button.

- **ospf**
  The OSPF function created this route. See the Routing > OSPF dialog.

- **rip**
  The RIP function created this route. See the Routing > RIP dialog.

### Preference

Specifies the "administrative distance" of the route.

The device uses this value instead of the metric, when the metric of the routes is incomparable.

Possible values:

- **0**
  Reserved for routes that the device creates when setting up the router interfaces. These routes have the value *local* in the Protocol column.

- **1..254**
  In routing decisions, the device gives preference to the route with the smallest value.

- **255**
  In routing decisions, the device ignores the route.

The "administrative distance" can be set for static routes created using the button.

### Metric

Displays the metric of the route.

The device transmits the data packets using the route with the smallest value.

### Last update [s]

Displays the time in seconds, since the current settings of the route were entered in the routing table.

### Track name

Specifies the tracking object with which the device links the route.

The device automatically activates or deactivates static routes – depending on the link status of an interface or the reachability of a remote router or end device.

You set up tracking objects in the Routing > Tracking > Configuration dialog.

Possible values:

- Name of the tracking object, made up of *Type* and *Track ID*.

- **-**
  No tracking object selected.

This function is used only for static routes. (Column *Protocol* = *netmgmt*)
Active

Displays whether the route is active or inactive.

Possible values:

- **marked**
  The route is active; the device uses the route.

- **unmarked**
  The route is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create dialog to create a static route.

- In the **Network address** field, you specify the address of the destination network.
  Possible values:
  - Valid IPv4 address
  If you specify a default route (0.0.0.0), then you specify a default gateway in the Next hop IP address field. This setting takes precedence over the setting in the following dialog:
  - **Basic Settings > Network** dialog, Gateway address field

- In the **Netmask** field, you specify the netmask that identifies the network prefix in the address of the destination network.
  Possible values:
  - Valid IPv4 netmask

- In the **Next hop IP address** field, you specify the IP address of the next router on the path to the destination network.
  Possible values:
  - Valid IPv4 address
    To make a reject type route, specify the value 0.0.0.0 in this field. With this route, the device discards IP packets addressed to the destination network and informs the sender.

- In the **Preference** field, you specify the preference number that the device uses to decide which of several existing routes to the destination network it will use.
  Possible values:
  - 1...255
    In routing decisions, the device gives preference to the route with the smallest value. The default setting is the value specified in the Configuration frame, field Preference.

- In the **Track name** field, you specify the tracking object with which the device links the route.
  Possible values:
  - No tracking object selected.
  - Name of the tracking object, made up of Type and Track ID.
The tracking function lets you monitor what are known as tracking objects. Examples of monitored tracking objects are the link status of an interface or the reachability of a remote router or end device.

The device forwards status changes of the tracking objects to the registered applications, for example to the routing table or to a VRRP instance. The applications then react to the status changes:
- In the routing table, the device activates/deactivates the route linked to the tracking object.
- The VRRP instance linked to the tracking object reduces the priority of the virtual router so that a backup router takes over the role of the master.

If you set up the tracking objects in the Tracking Configuration dialog, then you can link applications with the tracking objects:
- You link static routes with a tracking object in the Routing > Routing Table dialog, Track name column.
- You link virtual routers with a tracking object in the Routing > L3-Redundancy > VRRP > Tracking dialog. Click the button to open the Create window and select the tracking object in the Track name drop-down list.

The menu contains the following dialogs:
- Tracking Configuration
- Tracking Applications
### 6.8.1 Tracking Configuration

In this dialog, you set up the tracking objects.

#### Table

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The device monitors the link status of its physical ports or of its link aggregation, LRE or VLAN router interface.</td>
</tr>
<tr>
<td>Ping</td>
<td>The device monitors the route to a remote router or end device by means of periodic ping requests.</td>
</tr>
<tr>
<td>Logical</td>
<td>The device monitors tracking objects logically linked to each other and thus enables complex monitoring tasks.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Track ID</th>
<th>Specifies the identification number of the tracking object. Possible values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1..256</td>
<td>This range is available to every type (interface, ping and logical).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Track name</th>
<th>Displays the name of the tracking object made up of Type and Track ID.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Active</th>
<th>Activates/deactivates the monitoring of the tracking object. Possible values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Marked</td>
<td>Monitoring is active. The device monitors the tracking object.</td>
</tr>
<tr>
<td>Unmarked</td>
<td>Monitoring is inactive.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Specifies the description. Here you describe what the device uses the tracking object for. Possible values:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Alphanumeric ASCII character string with 0..255 characters</td>
</tr>
</tbody>
</table>
Status

Displays the monitoring result of the tracking object.

Possible values:

- **up**
  - The monitoring result is positive:
    - The link status is active.
    - The remote router or end device is reachable.
    - The result of the logical link is TRUE.

- **down**
  - The monitoring result is negative:
    - The link status is inactive.
    - The remote router or end device is not reachable.
    - The result of the logical link is FALSE.

- **notReady**
  - The monitoring of the tracking object is inactive. You activate the monitoring in the **Active** column.

Changes

Displays the number of status changes since the tracking object has been activated.

Last changed

Displays the time of the last status change.

Send trap

Activates/deactivates the sending of an SNMP trap when someone activates or deactivates the tracking object.

Possible values:

- **marked**
  - If someone activates or deactivates the tracking object in the **Active** column, then the device sends an SNMP trap.

- **unmarked** (default setting)
  - The device does not send an SNMP trap.

Port

Specifies the interface to be monitored for tracking objects of the **interface** type.

Possible values:

- **<Interface number>**
  - Number of the physical ports or of the link aggregation, LRE or VLAN router interface.

- **no Port**
  - No tracking object of the **interface** type.
Routing

[Routing > Tracking > Configuration]

Link up delay [s]

Specifies the period in seconds after which the device evaluates the monitoring result as positive. If the link has been active on the interface for longer than the period specified here, then the Status column displays the value up.

Possible values:
- 0..255
- -
  No tracking object of the logical type.

Link down delay [s]

Specifies the period in seconds after which the device evaluates the monitoring result as negative. If the link has been inactive on the interface for longer than the period specified here, then the Status column displays the value down.

Possible values:
- 0..255
- -
  No tracking object of the interface type.

If the link to every aggregated port is interrupted, then Link aggregation, LRE and VLAN router interfaces have a negative monitoring result.

If the link to every physical port and link-aggregation interface which is a member of the VLAN is interrupted, then a VLAN router interface has a negative monitoring result.

Ping port

Specifies the router interface for tracking objects of the ping type through which the device sends the ping request packets.

Possible values:
- <Interface number>
  Number of the router interface.
- noName
  No router interface assigned.
- -
  No tracking object of the ping type.

IP address

Specifies the IP address of the remote router or end device to be monitored.

Possible values:
- Valid IPv4 address
- -
  No tracking object of the ping type.

Ping interval [ms]

Specifies the interval in milliseconds at which the device periodically sends ping request packets.
Possible values:

- **100...20000** (default setting: **1000**)
  If you specify a value <1000, then you can set up a maximum of 16 tracking objects of the *ping* type.
- **–**
  No tracking object of the *ping* type.

### Ping replies to lose

Specifies the number of missed responses from the device after which the device evaluates the monitoring result as negative. If the device does not receive a response to its sent ping request packets for the number of times specified here in a row, then the *Status* column displays the value *down*.

Possible values:

- **1..10** (default setting: **3**)
- **–**
  No tracking object of the *ping* type.

### Ping replies to receive

Specifies the number of received responses from the device after which the device evaluates the monitoring result as positive. If the device receives a response to its sent ping request packets for the number of times specified here in a row, then the *Status* column displays the value *up*.

Possible values:

- **1..10** (default setting: **2**)
- **–**
  No tracking object of the *ping* type.

### Ping timeout [ms]

Specifies the period in milliseconds for which the device waits for a response. If the device does not receive a response within this period, then the device evaluates this as a missed response. See the *Ping replies to lose* column.

Possible values:

- **10..10000** (default setting: **100**)
  If a large number of ping tracking objects is set up in the device, then specify a sufficiently large value. If more than 100 instances are present, then specify at least 200 ms.
- **–**
  No tracking object of the *ping* type.

### Ping TTL

Specifies the TTL value in the IP header with which the device sends the ping request packets.

TTL (Time To Live, also known as “Hop Count”) identifies the maximum number of steps an IP packet is allowed to perform on the way from the sender to the receiver.

Possible values:

- **–**
  No tracking object of the *ping* type.
- **1..255** (default setting: **128**)

---

RM GUI RSP
Release 8.1 12/2019
Routing

[Routing > Tracking > Configuration]

Best route
Displays the number of the router interface through which the best route leads to the monitoring router or end device.

Possible values:
- <Port number>
  Number of the router interface.
- no Port
  No route exists.
- –
  No tracking object of the ping type.

Logical operand A
Specifies the first operand of the logical link for tracking objects of the logical type.

Possible values:
- Tracking objects set up
- –
  No tracking object of the logical type.

Logical operand B
Specifies the second operand of the logical link for tracking objects of the logical type.

Possible values:
- Tracking objects set up
- –
  No tracking object of the logical type.

Operator
Links the tracking objects specified in the Logical operand A and Logical operand B fields.

Possible values:
- and
  Logical AND link
- or
  Logical OR link
- –
  No tracking object of the logical type.
**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the *Create* window to add a new entry to the table.

- In the *Type* field, you specify the type of the tracking object. Possible values:
  - *interface* The device monitors the link status of its physical ports or of its link aggregation, LRE or VLAN router interface.
  - *ping* The device monitors the route to a remote router or end device by means of periodic ping requests.
  - *logical* The device monitors tracking objects logically linked to each other and thus enables complex monitoring tasks.

- In the *Track ID* field, you specify the identification number of the tracking object. Possible values:
  - 1..2147483647
6.8.2 Tracking Applications

In this dialog, you see which applications are linked with the tracking objects.

The following applications can be linked with tracking objects:
- You link static routes with a tracking object in the Routing > Routing Table dialog, Track name column.
- You link virtual routers with a tracking object in the Routing > L3-Redundancy > VRRP > Tracking dialog. Click the button to open the Create window and select the tracking object in the Track name drop-down list.

<table>
<thead>
<tr>
<th>Table</th>

</tr>
<tr>
<td>Track name</td>
</tr>
</tbody>
</table>

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
Clients in a subnet send BOOTP/DHCP broadcasts messages to DHCP servers requesting configuration information such as IP addresses. Routers provide a border for broadcast domains so that BOOTP/DHCP requests remain in the local subnet. The Layer 3 Relay (L3 Relay) function acts as a proxy for clients that require information from a BOOTP/DHCP server in another network.

When you configure this device to retrieve IP addresses from a DHCP server located in another subnet, the L3 Relay function lets you forward requests across multiple hops to a server located in another network.

Using IP helper addresses and UDP helper ports the L3 Relay forwards DHCP packets between the clients and servers. The IP helper address is the DHCP server IP address. Clients use the UDP helper port to request a type of information such as DNS information on UDP port 53, or DHCP information on UDP port 67.

The L3 Relay function provides you the follow advantages over the standard BOOTP/DHCP function:

- **redundancy**, when you specify multiple servers to process client requests.
- **load balancing**, when you specify multiple interfaces to relay broadcast packets from the client to the servers.
- **central management**, useful in large networks. The administrator saves the device configurations on a centrally located server which responds to client requests in multiple subnets.
- **diversity**, this function lets you specify up to 512 entries.

**Operation**

Enables/disables the L3 Relay function.

Possible values:

- **On**
  
  The L3 Relay function is globally enabled.

- **Off** (default setting)
  
  The L3 Relay function is globally disabled.

**Configuration**

Activates/deactivates the BOOTP/DHCP Circuit ID Option Mode.

The device sends circuit ID suboption information, identifying the local agent, to the DHCP server. The DHCP server uses the suboption information to send responses back to the proper agent.
Possible values:

- **marked**
  The device adds the circuit ID of the DHCP relay agent to the suboptions for client requests.
- **unmarked** *(default setting)*
  The device removes the DHCP relay agent circuit ID suboptions from client requests.

**BOOTP/DHCP wait time (min.)**

Specifies the minimum amount of time that the device delays forwarding the BOOTP/DHCP request.

The end devices send broadcast request on the local network. This setting lets a local server respond to the client request before the router forwards the client request through the interfaces.

Possible values:

- **0..100** *(default setting: 0)*
  If a local server is absent from the network, then set the value to 0.

**BOOTP/DHCP hops (max.)**

Specifies the maximum number of cascaded devices allowed to forward the BOOTP/DHCP request.

If the hop count exceeds the maximum number of hops specified in this field, then the device drops BOOTP requests.

Possible values:

- **0..16** *(default setting: 4)*

**Information**

**DHCP client messages received**

Displays the number of DHCP requests received from the clients.

**DHCP client messages relayed**

Displays the number of DHCP requests forwarded to the servers specified in the table.

**DHCP server messages received**

Displays the number of DHCP offers received from the servers specified in the table.

**DHCP server messages relayed**

Displays the number of DHCP offers forwarded to the clients from the servers specified in the table.

**UDP messages received**

Displays the number of UDP requests received from the clients.
UDP messages relayed

Displays the number of UDP requests forwarded to the servers specified in the table.

Packets with expired TTL

Displays the number of UDP packets received with an expired TTL value.

Discarded packets

Displays the number of UDP packets that device discarded, because the packet matched an active table entry.

Table

Port

Displays the interface to which the table entry applies.

UDP port

Displays the UDP port for client messages received on this interface for this table entry. The device forwards client DHCP messages matching the UDP port criteria to the IP helper address specified in this table entry.

IP address

Displays the IP helper address associated with this table entry.

Hits

Displays the current number of packets that the interface forwards for the specified UDP port in this table entry.

Active

Activates/deactivates the table entry.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset statistics

Resets the table statistics.

Create

Port

Specifies the interface to which the entry applies.
Interface configurations take priority over global configurations. If the destination UDP port for a packet matches any entry on an ingress interface, then the device handles the packet according to the interface configuration. If none of the interface entries match the packet, then the device handles the packet according to the global configuration.

Possible values:
- **All** (default setting)
  - Relay entries with this port value specify a global configuration.
- `<available interfaces>`
  - Used to specify interface configurations.

**UDP port**

Specifies the helper UDP port criteria for packets received on this interface for this entry. When active, the device forwards packets received with this destination UDP port value to the IP address specified in this entry.

Possible values:
- **default** (default setting)
  - Equal to UDP port 0.
  - An entry with a UDP port specified as 0 enables the dhcp, time, nameserver, tacacs, dns, tftp, netbios-ns, and netbios-dgm entries.
- **dhcp**
  - Equal to UDP port 67.
  - The device forwards DHCP requests for IP address assignment and networking parameters.
- **domain**
  - Equal to UDP port 53.
  - The device forwards DNS requests for host name to IP address conversion.
- **isakmp**
  - Equal to UDP port 500.
  - The device forwards Internet Security Association and Key Management Protocol requests. The requests specifies procedures and packet formats which establish, negotiate, modify and delete Security Associations.
- **mobile-ip**
  - Equal to UDP port 434.
  - The device forwards Home Agent Registration requests. Use this value when you install the device in a network other than the home network.
- **nameserver**
  - Equal to UDP port 42.
  - The device forwards Windows Internet Name Service requests. You use the port to copy the NetBIOS name table from 1 Windows server to another.
- **netbios-dgm**
  - Equal to UDP port 138.
  - The device forwards NetBIOS Datagram Service requests. The datagram service provides the ability to send a message to a unique name or to a group name.
- **netbios-ns**
  - Equal to UDP port 137.
  - The device forwards NetBIOS Name Service requests for name registration and resolution.
- **ntp**
  - Equal to UDP port 123.
  - The device forwards Network Time Protocol requests. Use this value for peer-to-peer synchronization where both peers consider the other to be a time source.
- **pim-auto-rp**
  Equal to UDP port 496.
  The device forwards Protocol Independent Multicast-Automatic-Rendezvous Point requests.
  The Rendezvous Point (RP) serves as the root of the shared multicast delivery tree and is responsible for gathering multicast data from different sources, then forwarding the data to the clients.

- **rip**
  Equal to UDP port 520.
  The device forwards RIP requests and RIP response messages.

- **tacacs**
  Equal to UDP port 49.
  The device forwards TACACS Login Host Protocol requests for remote authentication and related services for networked access control through a centralized server.

- **tftp**
  Equal to UDP port 69.
  The device forwards Trivial File Transfer Protocol requests and responses.

- **time**
  Equal to UDP port 37.
  The device forwards Time Protocol requests. The device forwards client requests to a server that supports the time protocol. The server then responds with a message containing an integer representing the number of seconds since 00:00 1 January, 1900 GMT, and closes the data link.

- **0..65535**
  When you know the UDP port number, the device lets you specify the port number directly.

**IP address**

Specifies the IP helper address for packets received on this interface.

Possible values:

- **Valid IP address**
  An address of **0.0.0.0** identifies the entry as a discard entry. The device drops packets that match a discard entry. You specify discard entries only on the interfaces.
6.10 **Loopback Interface**

A loopback interface is a virtual network interface without reference to a physical port. Loopback interfaces are constantly available while the device is in operation.

The device lets you create router interfaces on the basis of loopback interfaces. Using such a router interface, the device is constantly available, even during periods of inactivity of individual router interfaces.

Up to 2 loopback interfaces can be set up in the device.

**Table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

</tr>
</tbody>
</table>
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create dialog to create a loopback interface.

▶ In the Index field, you specify the number that uniquely identifies the loopback interface.

Possible values:

- 1..2
6.11 Multicast Routing

The menu contains the following dialogs:
- Multicast Routing Global
- Multicast Routing Boundary Configuration
- Multicast Routing Static
- IGMP
6.11.1 Multicast Routing Global

IP multicast routing is the distribution of IP data packets to multiple participants simultaneously under one IP address.

The menu lets you specify and display global settings and static counters of the Multicast Routing function. Here you also display and specify parameters for the IGMP, IGMP Proxy, DVMRP and PIM-SM/PIM-DM protocols.

The dialog contains the following tabs:
- [Configuration]
- [Statistics]

[Configuration]

This tab lets you enable IP multicast routing and specify and display global parameters for the function.

Operation

Operation

Enables/disables the Multicast Routing function.

Possible values:
- On
  The Multicast Routing function is enabled.
- Off (default setting)
  The Multicast Routing function is disabled.

Configuration

DSCP

Specifies the DSCP value that the device writes in routed multicast data packets.

The DSCP value (Differentiated Services Code Point) corresponds to bits 0 to 5 of the TOS field of a IP data packet. The TOS field (Type of Service) is used to prioritize data packets.

Possible values:
- 0..64 (default setting: 48)
  The value 64 means that the device leaves the DSCP value of received data packets unchanged.
Information

Multicast routing entries

Displays the maximum number of entries in the IP multicast routing table.

IGMP proxy active

Displays whether the IGMP proxy function (Internet Group Management Protocol) is active.

Possible values:

- marked
  - IGMP proxy is active.
- unmarked
  - IGMP proxy is inactive.

Table

Port

Displays the number of the router interface to which the table entry relates.

TTL

Specifies the TTL value (Time to Live) for this router interface. The device discards IP multicast data packets whose TTL value is below the specified value.

The TTL value is an 8-bit field in the IP data packet. With each hop (the next router on the path to the destination network) the multicast router reduces the TTL value by 1.

Possible values:

- 0
  - The device forwards every multicast data packet received on this router interface.
- 1..255 (default setting: 1)

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
This tab lets you display the statistic counters of the multicast routing function.

### Table

- **Multicast group address**
  - Displays the IP address of the multicast group to which the table entry relates.
  - Possible values:
    - Valid IPv4 address

- **Multicast source address**
  - Displays the IP address of the multicast source to which the table entry relates. The device identifies the multicast source in combination with the related netmask.
  - Possible values:
    - Valid IPv4 address

- **Upstream neighbor**
  - Displays the IP address of the upstream neighbor from which the device receives IP data packets sent to this multicast address.
  - The upstream neighbor for the device is the next participating neighbor in the upstream direction (in the direction of the source of the multicast stream).
  - For example, the device uses the RPF algorithm (Reverse Path Forwarding) to calculate the multicast route and to determine the upstream neighbor.
  - Possible values:
    - Valid IPv4 address
      - The value 0.0.0.0 means that the upstream neighbor is unknown.

- **Port**
  - Displays the port number.

- **Outgoing interfaces**
  - Displays a list of the outgoing interfaces.

- **Uptime**
  - Displays the time that has elapsed since the multicast router last modified the table entry for the port.
Timeout

Displays the time remaining until the multicast router deletes the entry for the participant from the group table when the participant is inactive.

The value 0 means that there is no time limit for the entry.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
6.11.2 Multicast Routing Boundary Configuration

The multicast boundary function lets you reject selectively IP multicast streams.

This dialog lets you specify and display the parameters for restricting the IP multicast streams on specific ports. This restriction includes incoming as well as outgoing data packets.

Table

<table>
<thead>
<tr>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the port number.</td>
</tr>
</tbody>
</table>

On this port the device discards multicast data packets whose address is in the range specified in the fields **IP address** and **Netmask**.

You specify the value in the Create dialog.

<table>
<thead>
<tr>
<th>IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the IP address of the multicast group to which this restriction applies.</td>
</tr>
</tbody>
</table>

The **IP address** of the multicast group combined with the associated **Netmask** specify the range for the multicast restriction. The device discards multicast data packets from this range.

You specify the value in the Create dialog.

Possible values:

| 239.0.0.0..239.255.255.255 |

<table>
<thead>
<tr>
<th>Netmask</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the netmask of the multicast group to which this restriction applies.</td>
</tr>
</tbody>
</table>

The **IP address** of the multicast group combined with the associated **Netmask** specify the range for the multicast restriction. The device discards multicast data packets from this range.

You specify the value in the Create dialog.

<table>
<thead>
<tr>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the status for processing this table entry.</td>
</tr>
</tbody>
</table>

This value determines the procedure the router uses to create new table entries or delete certain entries from the table.
Possible values:

- **active**
  The table entry for the multicast routing restriction is active on this port. The table entry exists and is available for the router to use.

- **notInService** (default setting)
  The table entry for the multicast routing restriction is inactive on this port. The table entry exists, but is unavailable for the router to use.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens a *Create* window to add a new entry to the table.

- In the *Port* field, you specify the port to which the device applies the multicast restriction.
- In the *IP address* field, you specify the IP address for the multicast source.
- In the *Netmask* field, you specify the netmask for the multicast source.
6.11.3 Multicast Routing Static

The Multicast static routing function lets you specify the route of the multicast data traffic in the network. The device uses the Reverse Path Forwarding (RPF) algorithm to define the path of the multicast data traffic through the multicast routers. The RPF algorithm uses the static entries to calculate the path of the multicast data traffic.

This dialog lets you specify and display the parameters for the static multicast routing function:
- IP address and netmask of the multicast data source
- RPF address (upstream neighbor of the device)
- Priority of the static multicast routing entry

**Table**

<table>
<thead>
<tr>
<th>IP address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the IP address of the multicast data source.</td>
</tr>
<tr>
<td>You specify the value in the Create dialog.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Netmask</th>
</tr>
</thead>
<tbody>

</thead>
<tbody>
<tr>
<td>Activates/deactivates the static multicast routing entry.</td>
</tr>
</tbody>
</table>
The prerequisite for activating the static multicast routing entry is that you specified valid values in the fields **RPF address** and **Preference**.

Possible values:

- **active**
  - The table entry for the static multicast routing is active on this router interface.
  - The table entry exists and is available for the router to use.

- **notInService** (default setting)
  - The table entry for the static multicast routing is inactive on this port.
  - The table entry exists, but is unavailable for the router to use.

If the table entry is unavailable for the router due to missing information or to interruption, then the router displays this value:

- **notReady**
  - The device detected unfulfilled conditions on the port or device level.

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Opens a **Create** window to add a new entry to the table.

- In the **IP address** field, you specify the IP address for the multicast data source.
- In the **Netmask** field, you specify the netmask for the multicast data source.

### 6.11.4 IGMP

The Internet Group Management Protocol (IGMP) enables IPv4 multicasting (group communication), that means the distribution of data packets to multiple participants simultaneously using one IP address. IGMP enables multicast groups to be managed dynamically. The management is carried out by local routers. The participants of a multicast group are connected directly to the local routers.

The menu contains the following dialogs:

- **IGMP Configuration**
- **IGMP Proxy Configuration**
- **IGMP Proxy Database**
The Internet Group Management Protocol (IGMP) lets you manage IP multicast groups dynamically. The participants (hosts) of a multicast use IGMP for logging on and off the multicast router (querier).

The device supports the versions IGMPv1, IGMPv2, and IGMPv3. The IGMPv1 and IGMPv2 versions are backward compatible.

- **IGMPv1**
  - Lets participants join a multicast group. In case of inactivity, the multicast router removes the participant from the multicast group after expiration of the timeout.
- **IGMPv2**
  - In addition to IGMPv1, IGMPv2 provides the participant with the opportunity to log off from the multicast group (Leave message).
- **IGMPv3**
  - In addition to IGMPv1 and IGMPv2, IGMPv3 provides the participant with the opportunity to specify the source from which it wishes to receive the multicast stream:
    - Receive only data packets from certain source addresses
    - Discard data packets from certain source addresses

The multicast routers send queries (periodic requests) to the participants.

- **IGMPv1 and IGMPv2**
  - The participants respond to these queries for one multicast group in each case. The router enters the address of the multicast group into the database.
- **IGMPv3**
  - Participants respond to these queries for one or more multicast groups. The router enters into the database the addresses of the multicast groups as well as the desired source addresses for a multicast stream.

IGMP routing uses the following message types to manage multicast groups:

- **Membership Query**
  - Queries of the router regarding membership in a group (general queries, queries to groups, queries to groups and to specific source addresses)
- **Membership Report**
  - The participant's responses regarding membership in a group
- **Leave Group**
  - Messages from the participant when logging off from a group

**Operation**

The dialog contains the following tabs:

- [Port]
- [Cache information]
- [Interface membership]

Enables/disables the **IGMP** function in the device.
Possible values:

- **On**: The IGMP function is enabled.
- **Off**: (default setting) The IGMP function is disabled.

**[Port]**

This tab lets you set and monitor the parameters for IGMP routing.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the router interface number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure at least one multicast router interface before viewing or configuring parameters for an IGMP-enabled router interface. Otherwise, the device displays a detected error.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Querier</th>
<th>Displays the IP address of the multicast router (IGMP querier) in the IP subnet to which the selected router interface belongs.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible values:</td>
<td><strong>Valid IPv4 address</strong> (default setting: <strong>0.0.0.0</strong>)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Query interval</th>
<th>Specifies the time interval in seconds that the device uses to send IGMP host queries (queries to the IGMP-enabled participants) from this router interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>The IGMP-capable network devices in the network respond to the queries with report messages.</td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td><strong>1..3600</strong> (default setting: <strong>125</strong>)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Activates/deactivates the IGMP routing function.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible values:</td>
<td><strong>active</strong>: The IGMP routing function is active on this router interface.</td>
</tr>
<tr>
<td></td>
<td><strong>notInService</strong>: (default setting) The IGMP routing function is inactive on this router interface.</td>
</tr>
</tbody>
</table>

| Version | Specifies the IGMP version used for this router interface. |
Activate IGMP routing on this router interface before you configure the entry in the Version column.

Possible values:
- **1** Specifies version IGMPv1 for this router interface.
- **2** Specifies version IGMPv2 for this router interface.
- **3** (default setting) Specifies version IGMPv3 for this router interface.

**Max. response time**

Specifies the maximum query response time in tenths of a second for this router interface for IGMPv2 and IGMPv3.

If the router interface responds to the query of the multicast router within this time, then the router interface remains a member of the multicast group.

Possible values:
- **0..255** (default setting: **100**)

**Robustness**

Specifies the value for the IGMP robustness for this router interface.

The robustness lets you adjust the router interface to the expected packet loss in the subnet.

The IGMP routing function behaves in a robust manner in regard to the following number of packet losses in the subnet: **Robustness** minus 1.

Possible values:
- **1..255** (default setting: **2**)
  - Use high values for the robustness if you expect a large number of packet losses in a subnet.

**Last member query interval**

Specifies the IGMP Last member query interval in tenths of a second, for IGMPv2, IGMPv3.

To log off from a multicast group, the participant sends a message to the multicast router (a Leave Group Message). Then the multicast router sends a query to the participant.

The value of the parameter specifies the maximum allowable response time to this query for the participant. In addition, this value specifies the time interval between the group-specific queries of the multicast router.

Possible values:
- **0..255** (default setting: **10**)

**Last member queries**

Displays the number of queries that the multicast router sends if it receives a report for logging off from a multicast group (Leave Group Report).

Possible values:
- **1..20** (default setting: **2**)
Routing

[Routing > Multicast Routing > IGMP > Configuration]

Startup queries

Displays the number of startup queries (queries in the start-up phase) which the multicast router sends.

The intervals between the queries are specified in the Startup query interval column.

Possible values:
- 1..20 (default setting: 2)

Startup query interval

Displays the time in seconds between successive startup queries (queries in the startup phase) of the multicast router.

The number of periodic queries are specified by Startup queries.

Possible values:
- 1..300 (default setting: 31)

Querier uptime

Displays the time that has elapsed since the multicast router last modified the table entry for the port.

Querier expiry time

Displays the remaining time until the multicast router deletes the entry for the port from the multicast group table.

If the device itself is the querier (multicast router), then the Querier expiry time parameter has the value of 0.

Wrong version queries

Displays how many times participants attempted to access the port with an IGMP protocol version detected to be incorrect.

The prerequisite is that the IGMP routing function is active for this port.

You specify the same IGMP version for every router within the network. If the device receives queries with other IGMP versions, then the device reports a detected configuration error.

Joins

Displays how many IGMP membership reports for a multicast group this router interface has received. The value of the parameter is related to the frequency with which a multicast router adds entries for this router interface to the cache table. The parameter indicates IGMP activity on this router interface.

The prerequisite is that the IGMP function is enabled for this router interface.

Groups

Displays how many multicast groups the cache table currently contains for the multicast router for this router interface.
**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**[Cache information]**

This tab lets you monitor the parameters from the cache table of the IGMP multicast router.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the router interface number. The prerequisite is that the IGMP routing function is active for this router interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Displays the IP address of the multicast group to which the table entry relates. The prerequisite is that the IGMP routing function is active on this router interface and that the router interface receives IGMP membership reports. Possible values: Valid IPv4 address</td>
</tr>
<tr>
<td>Last reporter</td>
<td>Displays the source IP address from which the device last received an IGMP membership report (report for membership of a multicast group) for this router interface. Possible values: Valid IPv4 address</td>
</tr>
<tr>
<td>Uptime</td>
<td>Displays the time in [hh:mm:ss] that has elapsed since the multicast router created the table entry for this participant.</td>
</tr>
<tr>
<td>Expiry time</td>
<td>Displays the value of the cache timer (time limiter) in [hh:mm:ss]. After this time has elapsed, the multicast router deletes the entry from the cache table. When the device receives an IGMP membership report for this multicast group on this router interface, the device resets the value of this timer.</td>
</tr>
</tbody>
</table>
V1 host timer
Displays the value of the host present timer (time limiter) in [hh:mm:ss] for IGMPv1 participants. This is the time remaining until the local multicast router assumes that none of the participants in the IP subnet connected through this port are active any more. When the multicast router receives IGMP membership reports again (reports on the membership of multicast groups), it resets the value of this timer.

As long as the value is greater than null, the multicast router ignores IGMPv2 and IGMPv3 Leave Group messages that it receives on this router interface.

V2 host timer
Displays the value of the host present timer (time limiter) in [hh:mm:ss] for IGMPv2 participants. This is the time remaining until the local multicast router assumes that none of the stations in the IP subnet connected through this port are active any more. When the multicast router receives IGMP membership reports again (reports on the membership of multicast groups), it resets the value of this timer.

As long as the value is greater than null, the multicast router ignores IGMPv3 Leave Group messages that it receives on this router interface.

Source filter mode
Displays the filter mode provided in the IGMPv3 report for source IP addresses for the multicast group.

Possible values:
- **include**
  The participant receives the multicast stream only from specific source IP addresses.
- **exclude**
  The participant receives the multicast stream without specific source IP addresses.
- **NA** (default setting)
  The filter mode for source IP addresses is inactive. The field remains empty.

**Buttons**
You find the description of the standard buttons in section "Buttons" on page 15.
[Interface membership]

The table in this tab displays detailed information on the source addresses included in an IGMP multicast group. This information is provided in the IGMPv3 membership reports.

**Table**

**Port**

Displays the port number.

The prerequisite is that the **IGMP** function is active for this port.

**Address**

Displays the IP address of the multicast group for which the router has received an IGMPv3 membership report on this router interface.

The prerequisite is that the **IGMP** function is active on this port and that the port receives IGMP membership reports.

Possible values:
- Valid IPv4 address

**Host address**

Displays the source IP addresses of this multicast group.

Possible values:
- Valid IPv4 address

**Expire**

Displays the value of the time limiter in [hh:mm:ss] for this multicast group. This is the time remaining until the multicast router deletes the multicast group entry. When the multicast router receives IGMP membership reports for this source specific multicast again, it resets the value of this timer.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
6.11.4.2 IGMP Proxy Configuration

This dialog lets you configure and monitor the parameters for the IGMP proxy router interface.

The multicast router learns information about membership of multicast groups through the IGMP router interface (downstream interface). In this direction, the device operates as a querier. On the IGMP proxy router interface (upstream interface) the device operates as a host and sends IGMP membership reports for the registered multicast groups from the downstream router interfaces.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the number of the upstream router interface on which the IGMP proxy function is active. The prerequisite is that this router interface is not an IGMP downstream router interface.</th>
</tr>
</thead>
</table>
| Querier | Displays the IP address of the multicast router (IGMP querier) in the IP subnet to which the upstream interface belongs. Possible values:  

  - Valid IPv4 address (default setting: 0.0.0.0) |
| V1 querier timer | Displays the remaining time in seconds until the device assumes that no IGMPv1 querier is active on the upstream router interfaces. |
| V2 querier timer | Displays the remaining time in seconds until the device assumes that no IGMPv2 querier is active on the upstream router interfaces. |
| Version | Specifies the IGMP version used for this router interface.  

Disable IGMP globally before you configure the entry in the Version column. Possible values:  

  - 1 Specifies version IGMPv1 for this upstream router interface.  
  - 2 Specifies version IGMPv2 for this upstream router interface.  
  - 3 (default setting) Specifies version IGMPv3 for this upstream router interface. |
| Robustness | Specifies the value for the IGMP robustness for this upstream router interface. |
The robustness lets you adjust the port to the expected packet loss in the subnet.

The IGMP routing function behaves in a robust manner in regard to the following number of packet losses in the subnet: *Robustness* minus 1.

The host repeats the transfer of the status report *Robustness* minus 1 times.

Possible values:

- 1..255  (default setting: 2)
  
  Use high values if you expect a large number of packet losses in a subnet.

**Unsolicited report interval**

Specifies the interval in seconds in which the device sends unsolicited reports to the multicast router on the upstream interface.

Possible values:

- 1..260  (default setting: 1)

**Groups**

Displays the number of multicast groups for which the upstream router interface sends IGMP membership reports.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the *Create* window to add a new entry to the table.

In the *Port* field, you specify the number of the port on which the IGMP proxy function is active.
6.11.4.3 IGMP Proxy Database

This dialog lets you monitor the parameters for membership of multicast groups and the source list.

When registering or de-registering Multicast members on downstream interfaces, the IGMP Proxy device updates the database entries and sends IGMP Membership reports and Leave Group messages. The proxy interface sends this information in the upstream direction. Upon request, the device sends IGMP Membership reports to the upstream interfaces.

The dialog contains the following tabs:
- [Groups]
- [Source list]

[Groups]

Table

Port
Displays the port number to which the table entry relates.

IP multicast group address
Displays the IP address of the registered multicast group.

Possible values:
- Valid IPv4 multicast address

Creation time
Displays the time in seconds that has elapsed since the multicast router created the table entry.

Last reporter
Displays the source IP address of the IGMP proxy router interface from which the device last sent an IGMP membership report in the upstream direction.

Possible values:
- Valid IPv4 multicast address

Filter mode
Displays the filter mode for source IP addresses for the multicast groups.
Possible values:

- **include**
  The participant gets the multicast stream only from specific source IP addresses.

- **exclude**
  The participant discards the multicast stream from specific source IP addresses.

- **None** (default setting)
  The filter mode for source IP addresses is inactive. The field remains empty.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**[Source list]**

**Table**

**Port**

Displays the router interface number to which the table entry relates.

**IP address**

Displays the IP address of the multicast group.

Possible values:

- Valid IPv4 multicast address

**Host address**

Displays the source IP addresses of this multicast group.

Possible values:

- Valid IPv4 address

**Expiry time**

Displays the value of the time limiter for this multicast group entry. This is the time remaining until the device deletes the entry for this multicast group when the participants of the IGMP router interface are inactive.

When the parameter has the value null, the device deletes the entry.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
6.12 **L3-Redundancy**

The menu contains the following dialogs:

- VRRP

6.12.1 **VRRP**

The Virtual Router Redundancy Protocol (VRRP) is a procedure that lets the system react to the failure of a router.

You use VRRP in networks with end devices that support 1 entry for the default gateway. If the default gateway fails, then VRRP helps ensure that the end devices find a redundant gateway.

Hirschmann has further developed VRRP into the Hirschmann Virtual Router Redundancy Protocol (HiVRRP). With the appropriate configuration, this protocol provides switching times of less than 400 ms.

**Note:** You find detailed information on VRRP in the "Configuration" user manual.

The menu contains the following dialogs:

- VRRP Configuration
- VRRP Domains
- VRRP Statistics
- VRRP Tracking
6.12.1.1 VRRP Configuration

This dialog lets you specify the following settings:

- up to 8 virtual routers per router interface
- 1 address per virtual router
- up to 16 virtual routers per physical router with HiVRRP

**Operation**

Enables/disables the **VRRP** redundancy in the device.

Possible values:

- **On**
  - The **VRRP** function is enabled.
- **Off** (default setting)
  - The **VRRP** function is disabled.

**Information + Configuration**

**Version**

Specifies the VRRP version.

**Send trap (VRRP master)**

Activates/deactivates the sending of SNMP traps when the device is the VRRP master.

Possible values:

- **marked**
  - The sending of SNMP traps is active.
  - If the device is the VRRP master, then the device sends an SNMP trap.
- **unmarked** (default setting)
  - The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the **Diagnostics > Status Configuration > Alarms (Traps)** dialog and specify at least 1 trap destination.

**Send trap (VRRP authentication failure)**

Activates/deactivates the sending of SNMP traps when the device receives a VRRP packet including authentication information.

**Note:** The device supports only VRRP packets without authentication information. In order for the device to operate in conjunction with other devices that support VRRP authentication, verify that on those devices the VRRP authentication is not applied.
Possible values:

- **marked**
  The sending of SNMP traps is active. If the device receives a VRRP packet including authentication information, then the device sends an SNMP trap.

- **unmarked** (default setting)
  The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.

### Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number to which the table entry relates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRID</td>
<td>Displays the Virtual Router IDentifier.</td>
</tr>
<tr>
<td>Active</td>
<td>Activates/deactivates the VRRP instance specified in this row. Possible values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>marked</strong> The <strong>VRRP</strong> instance is active.</td>
</tr>
<tr>
<td></td>
<td>- <strong>unmarked</strong> (default setting) The <strong>VRRP</strong> instance is inactive.</td>
</tr>
<tr>
<td>Oper status</td>
<td>Specifies the row status. The operational state of the related virtual router controls the row status of a currently active row in the table. Possible values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>active</strong> The instance is available for use.</td>
</tr>
<tr>
<td></td>
<td>- <strong>notInService</strong> The instance exists in the device, but necessary information is missing and it is unavailable for use.</td>
</tr>
<tr>
<td></td>
<td>- <strong>notReady</strong> The instance exists in the device, but necessary information is missing and it is unavailable for use.</td>
</tr>
<tr>
<td>State</td>
<td>Displays the VRRP state.</td>
</tr>
</tbody>
</table>
Possible values:

- **initialize**
  VRRP is in the initialization phase, the function is inactive, or the master router is still unnamed.

- **backup**
  The router sees the possibility of becoming the master router.

- **master**
  The router is the master router.

**Base priority**

Specifies the priority of the virtual router. The value differs from **Priority** if tracked objects are down or the virtual router is the IP address owner.

Possible values:

- **1..254** (default setting: **100**)

When you configure multiple VRRP routers in a single instance, distribute the priority values uniformly on the routers. For example, assign the priority value of **50** to the primary router, the value of **100** to the next router. Repeat the steps with the value **150**, and so on.

**Priority**

Specifies the VRRP priority value.

The router with the higher priority value takes over the master router role. If the virtual router IP address is the same as an IP address of a router interface, then the router is the “owner” of the IP address. If an IP address owner exists, then VRRP assigns the IP address owner the VRRP priority 255 and declares the router as the master router.

Possible values:

- **1..255** (default setting: **100**)

When you plan to remove a master router from the network, lower the priority number to force an election, thus reducing the black hole period.

**Virtual IP address**

Displays the virtual IP address in the subnet of the primary IP address on the interface. If no match is found, then the device returns an unspecified virtual address. If no virtual address is configured, then **0.0.0.0** is returned.

Possible values:

- Valid IPv4 address

**VRRP advert interval [ms]**

Specifies the interval for sending out messages (advertisements) as the master router.

Possible values:

- **1000..255000** (default setting: **1000**)
  Interval for VRRP

- **100..900** (default setting: **100**)
  Interval for HiVRRP
VRRP advert address

Specifies the IP address to which the virtual router sends advertisements.

Possible values:
- Valid IPv4 address (default setting: 224.0.0.18)

Link-down notify address

Specifies the IP address to which the local router sends notifications when changes on the link occur. Sending the notifications informs the back up router that a link on the master router is down reducing failover times.

If the virtual router consists of only 2 routers, routers A and B for example, then specify the IP address of the interface on the backup router that is linked to the opposite virtual router interface. For example, when specifying the link down notification address for interface 1/2 on router A, specify the IP address of interface 1/1 on router B.

If the virtual router consists of more than 2 routers, then specify the IP address of the interface with the second highest priority that is linked to the other virtual router interface. For example, when specifying the link down notification address for interface 1/2 on router A, specify the IP address of interface 1/1 on router C.

Possible values:
- Valid IP address (default setting: 0.0.0.0)
  The value 0.0.0.0 suppresses notifications.

Preempt mode

Activates/deactivates the preempt mode. This setting specifies whether this router, as a backup router, takes over the master router role when the master router has a lower VRRP priority.

Possible values:
- marked (default setting)
  When you enable the preempt mode, this router takes the master router role from a router with a lower VRRP priority without waiting for an election.
- unmarked
  When you disable the Preempt mode, this router assumes the role of a backup router and listens for master router advertisements. After the master down interval expires, without receiving advertisements from the master router, this router participates in the master router election process.

Preempt delay [s]

Specifies the pre-empt delay time in seconds.
With the pre-empt mode activated and in collaboration with VRRP tracking, a reassignment of the master router role is possible. However, dynamic routing procedures take a certain amount of time to react to route changes and to refill routing tables. To help avoid the loss of packets during this time, the device lets you specify a pre-empt delay. The delay lets the dynamic routing procedure fill the routing tables before reassignment of the master router role.

Possible values:
- \(0..65535\) (default setting: 0)

**Domain ID**

Specifies the virtual domain in which the router participates.

VRRP domains bundle a set of VRRP instances together. The supervisor router sends advertisement packets. The members follow the supervisor. If the loss of a single instance within a domain is likely, then configure the device to send advertisements to the member.

Possible values:
- 0 (default setting)
  - No domain specified.
- 1..8

**Domain role**

Specifies the role of this router in the virtual domain.

Possible values:
- none (default setting: 0)
  - The router is currently not a domain member.
- member
  - The router copies the behavior of the supervisor.
- supervisor
  - The router determines the behavior of the domain.

**VRRP master candidate**

Specifies the primary virtual router IP address.

When the interface has several specified IP addresses, the parameter lets the user select an IP address as the *Master IP address*.

Possible values:
- Valid IPv4 address (default setting: 0.0.0.0)
  - The default setting 0.0.0.0 indicates that the router is using the lower IP address as the *Master IP address*.

**Master IP address**

Displays the current master router interface IP address.

Possible values:
- Valid IPv4 address (default setting: 0.0.0.0)
Ping answer

Activates/deactivates the ping answer function on the virtual router. You use the VRRP ping for connectivity analyses.

The prerequisite for allowing the device to answer ping requests from the interfaces is that you activate the function globally. In the Routing > Global dialog, ICMP filter frame, mark the Send echo reply checkbox.

Possible values:
- **marked** (default setting)
  - The device answers ICMP ping requests.
- **unmarked**
  - The device ignores ICMP ping requests.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.
- In the Port field, you specify the router interface.
- In the VRID field, you specify the Virtual Route Identifier (VRID).

**Setting up the VRRP router instance**

The device lets you set up to 8 virtual routers per router interface.

Before you set up a VRRP instance, verify that network routing functions properly and set the IP addresses on the router interfaces used for the VRRP instances.

Perform the following steps:
- In the Routing > L3-Redundancy > VRRP > Configuration dialog, open the Wizard window.
- In the Wizard window, open the Create or select entry page.
  - Select a router interface from the Port drop-down list.
  - Specify the Virtual Router IDentifier in the VRID column.
- In the Wizard window, open the Edit entry page.
  - In the Configuration frame, specify the values for the following parameters:
    - Priority
    - Preempt mode
    - Advertisement interval [s]
    - Ping answer
    - Select the VRRP master candidate IP address from the drop-down list.
- Open the HiVRRP tab.
  - The HiVRRP tab helps you to set up the following parameters:
    - failover times of less than 3 s,
    - the routers to use Unicasts to communicate with each other
    - to set up domains or
    - to send link-down notifications
In the **Configuration** frame, specify the values for the following parameters:

- **VRRP advert address** (IP address of the partner HiVRRP router)
- **VRRP advert interval [ms]**
- **Link-down notify address** (IP address of the second router to which the device sends link-down notifications)
  
  You use this function when the virtual router consists of 2 VRRP routers.

- **Domain ID**
- **Domain role**

To transfer the settings to the VRRP router interface table, click the **Finish** button.

In the **Routing > L3-Redundancy > VRRP > Configuration** dialog, select the **On** radio button in the **Operation** frame. Then click the ✅ button.

---

**Editing an existing VRRP router instance**

- In the **Routing > L3-Redundancy > VRRP > Configuration** dialog, highlight a row in the table and click the ✏️ button to edit it.

- As an alternative, double-click a field in the table and edit the entry directly. Or right-click a field and select a value.

---

**Deleting a VRRP router instance**

- In the **Routing > L3-Redundancy > VRRP > Configuration** dialog, highlight a row and click the 🗑️ button.

---

**[VRRP configuration (Wizard)]**

The **Wizard** window helps you to create a VRRP router instance.

**Prerequisites:**

- Network routing is functioning correctly.
- On the interfaces used in the VRRP instance the IP addresses are specified.

After closing the **Wizard** window, click the ✅ button to save your settings.

---

**[VRRP configuration (Wizard) – Create or select entry]**

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the router interface number to which the table entry relates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRID</td>
<td>Displays the Virtual Router IDentifier.</td>
</tr>
</tbody>
</table>
IP address
Displays the primary IP address of the router interface.
You specify this address in the Routing > Interfaces > Configuration dialog.

Netmask
Displays the netmask of primary IP address.
You specify this subnet mask in the Routing > Interfaces > Configuration dialog.

Area under the table

Port
Specifies the router interface number to which the table entry relates.

Possible values:

- <Available router interfaces>

VRID
Specifies the Virtual Router IDentifier.
A virtual router uses 00-00-5E-00-01-XX as its MAC address. The value specified here replaces the last octet (XX) in the MAC address. Assign a unique value to every physical router within a virtual router instance. The device changes the effective priority value to 255 for a physical router with the same IP address as the virtual router.

Possible values:

- 1..255

[VRRP configuration (Wizard) – Edit entry – VRRP]

Operation
Enables/disables the VRRP redundancy in the device.

Possible values:

- **On**
  The VRRP function is enabled.
- **Off** (default setting)
  The VRRP function is disabled.
Information

Port
Displays the router interface number to which the table entry relates.

VRID
Displays the Virtual Router IDentifier.

Configuration

Base priority
Specifies the priority of the virtual router. The value differs from Priority if tracked objects are down or the virtual router is the IP address owner.

Possible values:
- \(1..254\) (default setting: 100)

When you configure multiple VRRP routers in a single instance, distribute the priority values uniformly on the routers. For example, assign the priority value of 50 to the primary router, the value of 100 to the next router. Repeat the steps with the value 150, and so on.

Priority
Specifies the VRRP priority value.

The router with the higher priority value takes over the master router role. If the virtual router IP address is the same as an IP address of a router interface, then the router is the “owner” of the IP address. If an IP address owner exists, then the VRRP function assigns the IP address owner the priority value 255 and declares the router as the master router.

Possible values:
- \(1..255\) (default setting: 100)

Disabling or removing an VRRP router, which is in the master role, forces the instance to send an advertisement with priority value 0. This lets the other backup routers know that the master is not participating. Sending a priority value 0 forces a new election.

Preempt mode
Activates/deactivates the preempt mode. This setting specifies whether this router, as a backup router, takes over the master router role when the master router has a lower VRRP priority.

Possible values:
- marked (default setting)
  When you enable the Preempt mode, this router takes the master router role from a router with a lower VRRP priority without waiting for an election.
- unmarked
  When you disable the Preempt mode, this router assumes the role of a backup router and listens for master router advertisements. After the master down interval expires, without receiving advertisements from the master router, this router participates in the master router election process.
Advertisement interval [s]

Specifies the interval between master router advertisements in seconds.

Possible values:

- 1..255 (default setting: 1)

Note: The longer the advertisement interval, the longer the time for which backup routers wait for a message from the master router before starting a new election process (master down interval). Also, specify the same value on every participant in a given virtual router instance.

Ping answer

Activates/deactivates the ping answer function in the device. You use the VRRP ping for connectivity analyses.

The prerequisite for allowing the device to answer ping requests from the interfaces is that you activate the Send echo reply function globally. In the Routing > Global dialog, ICMP filter frame, mark the Send echo reply checkbox.

Possible values:

- marked (default setting)
  - The Ping answer function in the device is active.
  - The device answers ICMP ping requests.
- unmarked
  - The Ping answer function in the device is inactive.
  - The device ignores ICMP ping requests.

VRRP master candidate

Primary virtual router IP address.

Physical routers within a virtual router instance use the VRRP IP address to communicate with themselves. If the virtual router IP address is the same as an IP address of a router interface, then the router is the “owner” of the IP address and the master router.

Possible values:

- Valid IP address (default setting: 0.0.0.0)

[VRRP configuration (Wizard) – Edit entry – HiVRRP]

Information

Port

Specifies the router interface number to which the table entry relates.

Possible values:

- <Available router interfaces>
VRID

Specifies the Virtual Router IDentifier.

A virtual router uses `00-00-5E-00-01-XX` as its MAC address. The value specified here replaces the last octet (`XX`) in the MAC address. Assign a unique value to every physical router within a virtual router instance. The device changes the effective priority value to `255` for a physical router with the same IP address as the virtual router.

Possible values:

- `1..255`

**Configuration**

VRRP advert address

Specifies the IP address to which the virtual router sends advertisements.

Possible values:

- Valid IPv4 address (default setting: `224.0.0.18`)

VRRP advert interval [ms]

Specifies the interval for sending out messages (advertisements) as the master router.

The devices lets you specify up to 16 instances with advertisement intervals between 100 ms and 1000 ms.

Possible values:

- `100..255000` (default setting: `1000`)

Link-down notify address

Specifies the management IP address to which the virtual router sends notifications when changes occur within the virtual router.

Possible values:

- Valid IP address (default setting: `0.0.0.0`)

Domain ID

Specifies the virtual domain in which the router participates.

VRRP domains bundle a set of VRRP instances together. The supervisor router sends advertisement packets. The members follow the supervisor. If the loss of a single instance within a domain is likely, then configure the device to send advertisements to the members.

Possible values:

- `0..8` (default setting: `0`)
  
  The value `0` means „no domain“.

Domain role

Specifies the role of this router in the virtual domain.
Possible values:
- **none**  (default setting: 0)
  The router is currently not a domain member.
- **member**
  The router copies the behavior of the supervisor.
- **supervisor**
  The router determines the behavior of the domain.

[**VRRP configuration (Wizard) – Tracking**]

**Current track entries**

**Type**
Displays the type of the tracking object.

Possible values:
- **interface**
  The device monitors the link status of its physical ports or of its link aggregation, LRE or VLAN router interface.
- **ping**
  The device monitors the route to a remote router or end device by means of periodic ping requests.
- **logical**
  The device monitors tracking objects logically linked to each other and thus enables complex monitoring tasks.

**Track ID**
Displays the identification number of the tracking object.

**Track name**
Displays the name of the tracking object made up of **Type** and **Track ID**.

**Assigned track entries**

**Track name**
Displays the name of the tracking object to which the virtual router is linked.

If the result for a tracking object is negative, then the **VRRP** instance reduces the priority of the virtual router. The tracking object is negative for example, if the monitored interface is inactive or the monitored router cannot be reached.
Possible values:

- Name of the tracking object, made up of Type and Track ID.
- Logical trackers, which combine multiple trackers
- No tracking object selected.

You set up tracking objects in the Routing > Tracking > Configuration dialog.

Decrement

Specifies the value by which the VRRP instance reduces the priority of the virtual router when the monitoring result is negative.

Possible values:

- 1..253 (default setting: 20)

Note: If in the Routing > L3-Redundancy > VRRP > Configuration dialog the value in the Priority column is 255, then the virtual router is the owner of the IP address. In this case the priority of the virtual router remains unchanged.

[VRRP configuration (Wizard) – Virtual IP addresses]

The device lets you specify up to 8 virtual routers per router interface

Each virtual router supports 1 address.

Information

IP address

Displays the primary IP address of the router interface.

Multinetting

Additional IP address

Displays the secondary IP addresses of the router interface.

The device lets you specify 1 primary and 1 secondary multinetting addresses per router interface.

Additional netmask

Displays the subnet mask of the secondary IP addresses.
Virtual IP addresses

IP address

Displays the assigned IP address of the master router within a virtual router.

Virtual IP addresses

Specifies the virtual IP address to be assigned.

To insert the IP address in the IP address table, click the Add button.
6.12.1.2 VRRP Domains

HiVRRP provides various mechanisms to decrease the failover time or reduce the number of multicasts. In an HiVRRP domain, you combine multiple HiVRRP instances of a router into 1 administrative unit. You nominate 1 HiVRRP instance as the supervisor of the HiVRRP domain. This supervisor regulates the behavior of the HiVRRP instances in its domain.

The router supports up to 8 domains.

If you divide domain instances (members) among different physical router interfaces, then by default, the router monitors supervisor advertisements for interruptions. The checkbox *Redundancy check per member* is unmarked.

You also have the option of monitoring the other data links within the domain for interruptions. If the supervisor is unresponsive, then the other members of the domain start sending HiVRRP messages.

In the *Redundancy check per member* column, you enable the function for a selected domain. With this function, you allow every member of the domain to send HiVRRP messages when detecting data link interruptions.

**Note:** If there is a low probability of a data link interruption, then select a long HiVRRP message interval to minimize the network load.

**Table**

<table>
<thead>
<tr>
<th>Domain ID</th>
<th>Displays the virtual domain in which the router participates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRRP domains bundle a set of VRRP instances together. The supervisor router sends advertisement packets. The members follow the supervisor. If the loss of a single instance within a domain is likely, then configure the device to send advertisements to the members.</td>

<tr>
<td>noSupervisor (default setting)</td>
<td>The supervisor function is undefined.</td>
</tr>
</tbody>
</table>

| Supervisor port | Displays the supervisor router interface for a VRRP instance. |
Possible values:
- Available ports

**Supervisor VRID**

Displays the VRID of the supervisor.

**Supervisor status**

Displays the status of the supervisor.

Possible values:
- **initialize**
  VRRP is in the initialization phase. No master has been named yet.
- **backup**
  The router sees the possibility of becoming master.
- **master**
  The router is master.
- **unknown**
  no supervisor.

**Current priority**

Displays the current VRRP priority of the domain supervisor.

Possible values:
- 1..255

**Redundancy check per member**

Activates the function for the selected domain.

Possible values:
- **marked**
  The device sends advertisement packets even when a virtual router is in the member role.
- **unmarked** (default setting)
  The supervisor of the domain only sends advertisement packets.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
6.12.1.3 VRRP Statistics

This dialog displays the number of counters that count events relevant to the VRRP function.

Information

Checksum errors
Displays the number of VRRP messages received with the wrong checksum.

Version errors
Displays the number of VRRP messages received with an unknown or unsupported version number.

VRID errors
Displays the number of VRRP messages received with an invalid Virtual Router IDentifier for this virtual router.

Table

Port
Displays the router interface number to which the table entry relates.

VRID
Displays the Virtual Router IDentifier.

Become master
Displays the number of times that the device has taken the master role. This entry helps you to analyze the network. When this number is low, your network is relatively stable.

Advertise received
Displays the number of VRRP advertisements received.

Advertise interval errors
Displays the number of VRRP advertisements received by the router outside the advertisement interval. The value lets you determine if the routers have the same advertise interval specified across the virtual router instance.

Authentication failures
Displays the number of VRRP advertisements received with authentication errors.
Routing

[Routing > L3-Redundancy > VRRP > Statistics]

IP TTL errors
Displays the number of VRRP advertisements received with an IP TTL not equal to 255.

Priority zero packets received
Displays the number of VRRP advertisements received with priority 0.

Priority zero packets sent
Displays the number of VRRP advertisements that the device sent with priority 0.

Invalid type packets received
Displays the number of VRRP advertisements received with an invalid type.

Address list errors
Displays the number of VRRP advertisements received for which the address list does not match the address list configured locally for the virtual router.

Invalid authentication type
Displays the number of VRRP advertisements received with an invalid authentication type.

Authentication type mismatch
Displays the number of VRRP advertisements received with an incorrect authentication type.

Packet length errors
Displays the number of VRRP advertisements received with an incorrect packet length.

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.
6.12.1.4 VRRP Tracking

VRRP tracking lets you follow the operation of specific object and react to a change in the object status. The function is periodically notified about the tracked object and displays the changes in the table. The table displays the object statuses as either up, down or notReady.

To enter a track object in the table, click the button.

Table

Port
Displays the router interface number of the virtual router.

VRID
Displays the virtual router ID for this virtual router.

Track name
Displays the name of the tracking object to which the virtual router is linked.

If the result for a tracking object is negative, then the VRRP instance reduces the priority of the virtual router. The tracking object is negative for example, if the monitored interface is inactive or the monitored router cannot be reached.

Possible values:
- Name of the tracking object, made up of Type and Track ID.
- Logical trackers, which combine multiple trackers
- – No tracking object selected.

You set up tracking objects in the Routing > Tracking > Configuration dialog.

Decrement
Specifies the value by which the VRRP instance reduces the priority of the virtual router when the monitoring result is negative.

Possible values:
- 1..253 (default setting: 20)

Note: If in the Routing > L3-Redundancy > VRRP > Configuration dialog the value in the Priority column is 255, then the virtual router is the owner of the IP address. In this case the priority of the virtual router remains unchanged.

Status
Displays the monitoring result of the tracking object.
Routing

[Routing > NAT]

Possible values:

- **notReady**
  The tracking object is not operating.

- **up**
  The monitoring result is positive:
  - The link status is active.
  - The remote router or end device is reachable.

- **down**
  The monitoring result is negative:
  - The link status is inactive.
  - The remote router or end device is not reachable.

- A combination of the **up** and **down** trackers.

**Active**

Displays whether the monitoring of the tracking object is active or inactive.

Possible values:

- **active**
  The monitoring of the tracking object is active.

- **notReady**
  The monitoring of the tracking object is inactive. You activate the monitoring in the **Routing > Tracking > Configuration** dialog, **Active** column.

**Buttons**

You find the description of the standard buttons in section “**Buttons**” on page 15.

- Opens the **Create** window to add a new entry to the table.
  - In the **Port VRID** drop-down list, you select the interface and router ID of a virtual router that has been set up.
  - In the **Track name** drop-down list, you select the tracking object with which the device links the virtual router.

**6.13 NAT**

[Routing > NAT]

The menu contains the following dialogs:

- **1:1 NAT**
The **1:1 NAT** function lets you establish communication links within a local network to devices that are located in other networks. The **NAT** router virtually “shifts” the devices into the public network. To do this, the **NAT** router replaces the virtual with the actual IP address in the data packet while sending it. A typical application is connecting some identically structured production cells with the same IP address to a server farm.

To use the **NAT** function, set up a router interface for each network and turn on the routing function in the device.

The **1:1 NAT** function has the following restrictions:

- Only supports IPv4 unicast.
- Only supports full-duplex mode.
- Only supported on ports operating with **100 Mbit/s**.

**Note:** If you enable the **VRRP** function and use the same **VRID** value on multiple VLAN router interfaces, then the **1:1 NAT** function is ineffective on these VLAN router interfaces.

**Note:** The **NAT** function is available for devices with an FPGA (hardware for extended functions). The product code indicates whether your device supports the **NAT** function. In order to use the functions, load the device software supporting **NAT**.

The menu contains the following dialogs:

- **1:1 NAT Rule**
6.13.1.1 1:1 NAT Rule

In this dialog, you generate, edit and activate the 1:1 NAT rules. The dialog also lets you specify a filter for FTP, ICMP error messages and a public interface.

Configuration

Application-level gateway

Specifies the type of filter used in the application-level gateway for the 1:1 NAT rules. The device supports translation for the control and data protocols of the application-layer.

Possible values:

- none
  - The device does not translates IP addresses.
- ftp
  - The device translates IP addresses present in the FTP header of the FTP control packets (TCP port 21).
- icmp
  - The device translates IP addresses present in the ICMP header.
- ftp/icmp (default setting)
  - The device translates IP addresses present in the FTP header of the FTP control packets and IP addresses present in the ICMP header.

Public interface

Specifies the public interface.

The device applies the 1:1 NAT rules to packets which are addressed to the public interface or which are sent using the public interface.

Information

1:1 NAT rules (max.)

Displays how many rules can be configured in the device for the 1:1 NAT function.

1:1 NAT rules

Displays the number of current 1:1 NAT rules specified in the device.

Table

Index

Displays the index number to which the table entry relates.
Routing

[Routing > NAT > 1:1 NAT > Rule]

Possible values:

- 1..255

Rule name

Displays the name of the 1:1 NAT rule. To change the name, click the relevant field.

Possible values:

- Alphanumeric ASCII character string with 0..32 characters

Destination address

Specifies the destination address of the data packets to which the device applies the 1:1 NAT rule. The device sends data packets with this destination address to the destination address specified in the New destination address column.

Possible values:

- Valid IPv4 address
  - The device applies the 1:1 NAT rule only to data packets containing the destination address specified here.
- Valid IPv4 address and netmask in CIDR notation
  - The device applies the 1:1 NAT rule only to data packets containing a destination address in the subnet specified here.

New destination address

Specifies the actual IP address of the destination device. The device sends data packets to the destination address specified here.

Possible values:

- Valid IPv4 address
  - The device replaces the destination address in the data packet with this new destination address.
- Valid IPv4 address and netmask in CIDR notation
  - The device replaces the destination address in the data packet with a destination address in the subnet specified here.

Active

Activates/deactivates the 1:1 NAT rule.

Possible values:

- marked
  - The rule is active.
- unmarked (default setting)
  - The rule is inactive.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
7 Diagnostics

The menu contains the following dialogs:
- Status Configuration
- System
- Email Notification
- Syslog
- Ports
- LLDP
- SFlow
- Report

7.1 Status Configuration

The menu contains the following dialogs:
- Device Status
- Security Status
- Signal Contact
- MAC Notification
- Alarms (Traps)
7.1.1 Device Status

The device status provides an overview of the overall condition of the device. Many process visualization systems record the device status for a device in order to present its condition in graphic form.

The device displays its current status as **error** or **ok** in the Device status frame. The device determines this status from the individual monitoring results.

The device displays detected faults in the Status tab and also in the Basic Settings > System dialog, Device Status frame.

The dialog contains the following tabs:
- [Global]
- [Port]
- [Status]

[Global]

Device status

Displays the current status of the device. The device determines the status from the individual monitored parameters.

Possible values:
- **error**  
  The device displays this value to indicate a detected error in one of the monitored parameters.
- **ok**

Traps

Activates/deactivates the sending of SNMP traps when the device detects changes in the monitored functions.

Possible values:
- **marked**  
  The sending of SNMP traps is active.  
  If the device detects a change in the monitored functions, then the device sends an SNMP trap.
- **unmarked** (default setting)  
  The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.
Diagnostics
[Diagnoses > Status Configuration > Device Status]

Table

Temperature
Activates/deactivates the monitoring of the temperature in the device.

Possible values:
- marked (default setting)
  Monitoring is active.
  If the temperature exceeds or falls below the specified limit, then in the Device status frame, the value changes to error.
- unmarked
  Monitoring is inactive.

You specify the temperature thresholds in the Basic Settings > System dialog, Upper temp. limit [°C] field and Lower temp. limit [°C] field.

Ring redundancy
Activates/deactivates the monitoring of the ring redundancy.

Possible values:
- marked
  Monitoring is active.
  In the Device status frame, the value changes to error in the following situations:
  - The redundancy function becomes active (loss of redundancy reserve).
  - The device is a normal ring participant and detects an error in its settings.
- unmarked (default setting)
  Monitoring is inactive.

Connection errors
Activates/deactivates the monitoring of the link status of the port/interface.

Possible values:
- marked
  Monitoring is active.
  If the link interrupts on a monitored port/interface, then in the Device status frame, the value changes to error.
  In the Port tab, you have the option of selecting the ports/interfaces to be monitored individually.
- unmarked (default setting)
  Monitoring is inactive.

External memory removal
Activates/deactivates the monitoring of the active external memory.

Possible values:
- marked
  Monitoring is active.
  If you remove the active external memory from the device, then in the Device status frame, the value changes to error.
- unmarked (default setting)
  Monitoring is inactive.
External memory not in sync

Activates/deactivates the monitoring of the configuration profile in the device and in the external memory.

Possible values:

- **marked**
  Monitoring is active.
  In the *Device status* frame, the value changes to *error* in the following situations:
  - The configuration profile only exists in the device.
  - The configuration profile in the device differs from the configuration profile in the external memory.

- **unmarked** (default setting)
  Monitoring is inactive.

Power supply

Activates/deactivates the monitoring of the power supply unit.

Possible values:

- **marked** (default setting)
  Monitoring is active.
  If the device has a detected power supply fault, then in the *Device status* frame, the value changes to *error*.

- **unmarked**
  Monitoring is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

[Port]

**Table**

Port

Displays the port number.

Propagate connection error

Activates/deactivates the monitoring of the link on the port/interface.
Possible values:
- **marked**
  Monitoring is active.
  If the link on the selected port/interface is interrupted, then in the Device status frame, the value changes to **error**.
- **unmarked** (default setting)
  Monitoring is inactive.

This setting takes effect when you mark the Connection errors checkbox in the Global tab.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**[Status]**

**Table**

- **Timestamp**
  Displays the date and time of the event in the format, Month Day, Year hh:mm:ss AM/PM.

- **Cause**
  Displays the event which caused the SNMP trap.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
7.1.2 Security Status

This dialog gives you an overview of the status of the safety-relevant settings in the device.

The device displays its current status as error or ok in the Security status frame. The device determines this status from the individual monitoring results.

The device displays detected faults in the Status tab and also in the Basic Settings > System dialog, Security status frame.

The dialog contains the following tabs:
- [Global]
- [Port]
- [Status]

[Global]

Security status

Displays the current status of the security-relevant settings in the device. The device determines the status from the individual monitored parameters.

Possible values:
- error
  The device displays this value to indicate a detected error in one of the monitored parameters.
- ok

Traps

Send trap

Activates/deactivates the sending of SNMP traps when the device detects changes in the monitored functions.

Possible values:
- marked
  The sending of SNMP traps is active.
  If the device detects a change in the monitored functions, then the device sends an SNMP trap.
- unmarked (default setting)
  The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.
## Table

**Password default settings unchanged**

Activates/deactivates the monitoring of the password for the locally set up user accounts *user* and *admin*.

Possible values:

- **marked** (default setting)
  Monitoring is active.
  If the password is set to the default setting for the *user* or *admin* user accounts, then in the *Security status* frame, the value changes to *error*.

- **unmarked**
  Monitoring is inactive.

You set the password in the *Device Security > User Management* dialog.

**Min. password length < 8**

Activates/deactivates the monitoring of the *Min. password length* policy.

Possible values:

- **marked** (default setting)
  Monitoring is active.
  If the value for the *Min. password length* policy is less than 8, then in the *Security status* frame, the value changes to *error*.

- **unmarked**
  Monitoring is inactive.

You specify the *Min. password length* policy in the *Device Security > User Management* dialog in the *Configuration* frame.

**Password policy settings deactivated**

Activates/deactivates the monitoring of the Password policies settings.

Possible values:

- **marked** (default setting)
  Monitoring is active.
  If the value for at least one of the following policies is less than 1, then in the *Security status* frame, the value changes to *error*.
  - *Upper-case characters (min.)*
  - *Lower-case characters (min.)*
  - *Digits (min.)*
  - *Special characters (min.)*

- **unmarked**
  Monitoring is inactive.

You specify the policy settings in the *Device Security > User Management* dialog in the *Password policy* frame.

**User account password policy check deactivated**

Activates/deactivates the monitoring of the *Policy check* function.
Possible values:

► **marked**
  Monitoring is active.
  If the Policy check function is inactive for at least 1 user account, then in the Security status frame, the value changes to error.

► **unmarked** (default setting)
  Monitoring is inactive.

You activate the Policy check function in the Device Security > User Management dialog.

**Telnet server active**

Activates/deactivates the monitoring of the Telnet server.

Possible values:

► **marked** (default setting)
  Monitoring is active.
  If you enable the Telnet server, then in the Security status frame, the value changes to error.

► **unmarked**
  Monitoring is inactive.

You enable/disable the Telnet server in the Device Security > Management Access > Server dialog, Telnet tab.

**HTTP server active**

Activates/deactivates the monitoring of the HTTP server.

Possible values:

► **marked** (default setting)
  Monitoring is active.
  If you enable the HTTP server, then in the Security status frame, the value changes to error.

► **unmarked**
  Monitoring is inactive.

You enable/disable the HTTP server in the Device Security > Management Access > Server dialog, HTTP tab.

**SNMP unencrypted**

Activates/deactivates the monitoring of the SNMP server.
Possible values:

- **marked** (default setting)
  - Monitoring is active.
  - If at least one of the following conditions applies, then in the `Security status` frame, the value changes to `error`:
    - The `SNMPv1` function is enabled.
    - The `SNMPv2` function is enabled.
    - The encryption for `SNMPv3` is disabled.
  - You enable the encryption in the `Device Security > User Management` dialog, in the `SNMP encryption type` column.

- **unmarked**
  - Monitoring is inactive.

You specify the settings for the SNMP agent in the `Device Security > Management Access > Server` dialog, `SNMP` tab.

**Access to system monitor with serial interface possible**

Activates/deactivates the monitoring of the system monitor.

When the system monitor is activated, the user has the possibility to change to the system monitor via a serial connection.

Possible values:

- **marked**
  - Monitoring is active.
  - If you activate the system monitor, then in the `Security status` frame, the value changes to `error`.

- **unmarked** (default setting)
  - Monitoring is inactive.

You activate/deactivate the system monitor in the `Diagnostics > System > Selftest` dialog.

**Saving the configuration profile on the external memory possible**

Activates/deactivates the monitoring of the configuration profile in the external memory.

Possible values:

- **marked**
  - Monitoring is active.
  - If you activate the saving of the configuration profile in the external memory, then in the `Security status` frame, the value changes to `error`.

- **unmarked** (default setting)
  - Monitoring is inactive.

You activate/deactivate the saving of the configuration profile in the external memory in the `Basic Settings > External Memory` dialog.

**Load unencrypted config from external memory**

Activates/deactivates the monitoring of loading unencrypted configuration profiles from the external memory.
Possible values:

- **marked** (default setting)
  Monitoring is active.
  If the settings allow the device to load an unencrypted configuration profile from the external memory, then in the Security status frame, the value changes to **error**.
  If the following preconditions are fulfilled, then the Security status frame in the Basic Settings > System dialog, displays an alarm.
  - The configuration profile stored in the external memory is unencrypted.
  - The **Config priority** column in the Basic Settings > External Memory dialog has the value **first**.

- **unmarked**
  Monitoring is inactive.

**Link interrupted on enabled device ports**

Activates/deactivates the monitoring of the link on the active ports.

Possible values:

- **marked**
  Monitoring is active.
  If the link interrupts on an active port, then in the Security status frame, the value changes to **error**. In the Port tab, you have the option of selecting the ports to be monitored individually.

- **unmarked** (default setting)
  Monitoring is inactive.

**Access with HiDiscovery possible**

Activates/deactivates the monitoring of the HiDiscovery function.

Possible values:

- **marked** (default setting)
  Monitoring is active.
  If you enable the HiDiscovery function, then in the Security status frame, the value changes to **error**.

- **unmarked**
  Monitoring is inactive.

You enable/disable the HiDiscovery function in the Basic Settings > Network dialog.

**IEC61850-MMS active**

Activates/deactivates the monitoring of the IEC61850-MMS function.

Possible values:

- **marked** (default setting)
  Monitoring is active.
  If you enable the IEC61850-MMS function, then in the Security status frame, the value changes to **error**.

- **unmarked**
  Monitoring is inactive.

You enable/disable the IEC61850-MMS function in the Industrial Protocols > IEC61850-MMS dialog, Operation frame.
Diagnostics
[Diagnostics > Status Configuration > Security Status]

Modbus TCP active
Activates/deactivates the monitoring of the Modbus TCP function.

Possible values:
- marked (default setting)
  Monitoring is active.
  If you enable the Modbus TCP function, then in the Security status frame, the value changes to error.
- unmarked
  Monitoring is inactive.

You enable/disable the Modbus TCP function in the Advanced > Industrial Protocols > Modbus TCP dialog, Operation frame.

EtherNet/IP active
Activates/deactivates the monitoring of the EtherNet/IP function.

Possible values:
- marked (default setting)
  Monitoring is active.
  If you enable the EtherNet/IP function, then in the Security status frame, the value changes to error.
- unmarked
  Monitoring is inactive.

You enable/disable the EtherNet/IP function in the Advanced > Industrial Protocols > EtherNet/IP dialog, Operation frame.

PROFINET active
Activates/deactivates the monitoring of the PROFINET function.

Possible values:
- marked (default setting)
  Monitoring is active.
  If you enable the PROFINET function, then in the Security status frame, the value changes to error.
- unmarked
  Monitoring is inactive.

You enable/disable the PROFINET function in the Advanced > Industrial Protocols > PROFINET dialog, Operation frame.

Self-signed HTTPS certificate present
Activates/deactivates the monitoring of the HTTPS certificate.

Possible values:
- marked (default setting)
  Monitoring is active.
  If the HTTPS server uses a self-created digital certificate, then in the Security status frame, the value changes to error.
- unmarked
  Monitoring is inactive.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Port]

Table

Port

Displays the port number.

Link interrupted on enabled device ports

Activates/deactivates the monitoring of the link on the active ports.

Possible values:

- **marked**
  Monitoring is active.
  If the port is enabled (Basic Settings > Port dialog, Configuration tab, Port on checkbox is marked) and the link is down on the port, then in the Security status frame, the value changes to error.

- **unmarked** (default setting)
  Monitoring is inactive.

This setting takes effect when you mark the Link interrupted on enabled device ports checkbox in the Diagnostics > Status Configuration > Security Status dialog, Global tab.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Status]

Table

Timestamp

Displays the date and time of the event in the format, Month Day, Year hh:mm:ss AM/PM.

Cause

Displays the event which caused the SNMP trap.
**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

### 7.1.3 Signal Contact

The signal contact is a potential-free relay contact. The device thus lets you perform remote diagnosis. The device uses the relay contact to signal the occurrence of events by opening the relay contact and interrupting the closed circuit.

**Note:** The device can contain several signal contacts. Each contact contains the same monitoring functions. Several contacts allow you to group various functions together providing flexibility in system monitoring.

The menu contains the following dialogs:
- Signal Contact 1 / Signal Contact 2
7.1.3.1 Signal Contact 1 / Signal Contact 2

In this dialog you specify the trigger conditions for the signal contact.

The signal contact gives you the following options:
- Monitoring the correct operation of the device.
- Signaling the device status of the device.
- Signaling the security status of the device.
- Controlling external devices by manually setting the signal contacts.

The device displays detected faults in the Status tab and also in the Basic Settings > System dialog, Signal contact status frame.

The dialog contains the following tabs:
- [Global]
- [Port]
- [Status]

[Global]

Configuration

Mode

Specifies which events the signal contact indicates.

Possible values:
- Manual setting (default setting for Signal Contact 2, if present)
  You use this setting to manually open or close the signal contact, for example to turn on or off
  a remote device. See the Contact option list.
- Monitoring correct operation (default setting)
  Using this setting the signal contact indicates the status of the parameters specified in the table
  below.
- Device status
  Using this setting the signal contact indicates the status of the parameters monitored in the
  Diagnostics > Status Configuration > Device Status dialog. In addition, you can read the status in the
  Signal contact status frame.
- Security status
  Using this setting the signal contact indicates the status of the parameters monitored in the
  Diagnostics > Status Configuration > Security Status dialog. In addition, you can read the status in
  the Signal contact status frame.
- Device/Security status
  Using this setting the signal contact indicates the status of the parameters monitored in the
  Diagnostics > Status Configuration > Device Status and the Diagnostics > Status Configuration >
  Security Status dialog. In addition, you can read the status in the Signal contact status frame.

Contact

Toggles the signal contact manually. The prerequisite is that you select in the Mode drop-down list
the value Manual setting.
Possible values:

- **open**
  The signal contact is opened.
- **close**
  The signal contact is closed.

### Signal contact status

**Signal contact status**

Displays the current status of the signal contact.

Possible values:

- **Opened (error)**
  The signal contact is opened. The circuit is interrupted.
- **Closed (ok)**
  The signal contact is closed. The circuit is closed.

### Trap configuration

**Send trap**

Activates/deactivates the sending of SNMP traps when the device detects changes in the monitored functions.

Possible values:

- **marked**
  The sending of SNMP traps is active.
  If the device detects a change in the monitored functions, then the device sends an SNMP trap.
- **unmarked** (default setting)
  The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the **Diagnostics > Status Configuration > Alarms (Traps)** dialog and specify at least 1 trap destination.

### Monitoring correct operation

In the table you specify the parameters that the device monitors. The device signals the occurrence of an event by opening the signal contact.

**Temperature**

Activates/deactivates the monitoring of the temperature in the device.
Possible values:

- **marked** (default setting)
  Monitoring is active.
  If the temperature exceeds / falls below the threshold values, then the signal contact opens.

- **unmarked**
  Monitoring is inactive.

You specify the temperature thresholds in the *Basic Settings > System* dialog, *Upper temp. limit [°C]* field and *Lower temp. limit [°C]* field.

### Ring redundancy
Activates/deactivates the monitoring of the ring redundancy.

Possible values:

- **marked**
  Monitoring is active.
  The signal contact opens in the following situations:
  - The redundancy function becomes active (loss of redundancy reserve).
  - The device is a normal ring participant and detects an error in its settings.

- **unmarked** (default setting)
  Monitoring is inactive.

### Connection errors
Activates/deactivates the monitoring of the link status of the port/interface.

Possible values:

- **marked**
  Monitoring is active.
  If the link interrupts on a monitored port/interface, then the signal contact opens.
  In the *Port* tab, you have the option of selecting the ports/interfaces to be monitored individually.

- **unmarked** (default setting)
  Monitoring is inactive.

### External memory removed
Activates/deactivates the monitoring of the active external memory.

Possible values:

- **marked**
  Monitoring is active.
  If you remove the active external memory from the device, then the signal contact opens.

- **unmarked** (default setting)
  Monitoring is inactive.

### External memory not in sync with NVM
Activates/deactivates the monitoring of the configuration profile in the device and in the external memory.
Possible values:

- **marked**
  Monitoring is active.
  The signal contact opens in the following situations:
  - The configuration profile only exists in the device.
  - The configuration profile in the device differs from the configuration profile in the external memory.

- **unmarked** (default setting)
  Monitoring is inactive.

### Power supply

Activates/deactivates the monitoring of the power supply unit.

Possible values:

- **marked** (default setting)
  Monitoring is active.
  If the device has a detected power supply fault, then the signal contact opens.

- **unmarked**
  Monitoring is inactive.

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

### [Port]

#### [Table]

Port

Displays the port number.

#### Propagate connection error

Activates/deactivates the monitoring of the link on the port/interface.

Possible values:

- **marked**
  Monitoring is active.
  If the link interrupts on the selected port/interface, then the signal contact opens.

- **unmarked** (default setting)
  Monitoring is inactive.

This setting takes effect when you mark the Connection errors checkbox in the Global tab.
### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

### Table

#### Timestamp

Displays the date and time of the event in the format, Month Day, Year hh:mm:ss AM/PM.

#### Cause

Displays the event which caused the SNMP trap.

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

### 7.1.4 MAC Notification

The device lets you track changes in the network using the MAC address of the devices in the network. The device saves the combination of port and MAC address in its MAC address table. If the device (un)learns the MAC address of a (dis)connected device, then the device sends an SNMP trap.

This function is intended for ports to which you connect end devices and thus the MAC address changes infrequently.

### Operation

Enables/disables the MAC Notification function in the device.

Possible values:

- **On**
  
  The MAC Notification function is enabled.

- **Off** (default setting)
  
  The MAC Notification function is disabled.
**Configuration**

**Interval [s]**

Specifies the send interval in seconds. If the device (un)learns the MAC address of a (dis)connected device, then the device sends an SNMP trap after this time.

Possible values:

- 0..2147483647 (default setting: 30)

Before sending an SNMP trap, the device registers up to 20 MAC addresses. If the device detects a high number of changes, then the device sends the SNMP trap before the send interval expires.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates/deactivates the MAC Notification function on the port.</td>
</tr>
</tbody>
</table>

Possible values:

- **marked**
  The MAC Notification function is active on the port.
  - The device sends an SNMP trap in case of one of the following events:
    - The device learns the MAC address of a newly connected device.
    - The device unlearns the MAC address of a disconnected device.

- **unmarked** (default setting)
  The MAC Notification function is inactive on the port.

The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.

**Last MAC address**

Displays the MAC address of the device last connected on or disconnected from the port.

The device detects the MAC addresses of devices which are connected as follows:

- directly connected to the port
- connected to the port through other devices in the network

**Last MAC status**

Displays the status of the Last MAC address value on this port.
Possible values:

- **added**
  The device detected that another device was connected at the port.

- **removed**
  The device detected that the connected device was removed from the port.

- **other**
  The device did not detect a status.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
7.1.5 Alarms (Traps)

The device lets you send an SNMP trap as a reaction to specific events. In this dialog, you specify the trap destinations to which the device sends the SNMP traps.

The events for which the device triggers an SNMP trap, you specify, for example, in the following dialogs:
- in the Diagnostics > Status Configuration > Device Status dialog
- in the Diagnostics > Status Configuration > Security Status dialog
- in the Diagnostics > Status Configuration > MAC Notification dialog

When loopback interfaces are set up, the device uses the IP address of the 1st loopback interface as the source of the SNMP traps. Otherwise, the device uses the address of the device management.

**Operation**

Enables/disables the sending of SNMP traps to the trap destinations.

Possible values:
- **On** (default setting)
  The sending of SNMP traps is enabled.
- **Off**
  The sending of SNMP traps is disabled.

**Table**

Name

Specifies the name of the trap destination.

Possible values:
- Alphanumeric ASCII character string with 1..32 characters

Address

Specifies the IP address and the port number of the trap destination.

Possible values:
- `<Valid IPv4 address>:<port number>`

Active

Activates/deactivates the sending of SNMP traps to this trap destination.
Possible values:

- **marked** (default setting)
  The sending of SNMP traps to this trap destination is active.

- **unmarked**
  The sending of SNMP traps to this trap destination is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Opens the Create window to add a new entry to the table.

- In the **Name** field you specify a name for the trap destination.
- In the **Address** field you specify the IP address and the port number of the trap destination. If you choose not to enter a port number, then the device automatically adds the port number 162.
7.2 **System**

The menu contains the following dialogs:
- System Information
- Hardware State
- Configuration Check
- IP Address Conflict Detection
- ARP
- Selftest
7.2.1 System Information

This dialog displays the current operating condition of individual components in the device. The displayed values are a snapshot; they represent the operating condition at the time the dialog was loaded to the page.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Save system information

Opens the HTML page in a new web browser window or tab. You can save the HTML page on your PC using the appropriate web browser command.
7.2.2 **Hardware State**

This dialog provides information about the distribution and state of the flash memory of the device.

**Information**

**Uptime**

Displays the total operating time of the device since it was delivered.

Possible values:

- ..d ..h ..m ..s
  - Day(s) Hour(s) Minute(s) Second(s)

**Table**

**Flash region**

Displays the name of the respective memory area.

**Description**

Displays a description of what the device uses the memory area for.

**Flash sectors**

Displays how many sectors are assigned to the memory area.

**Sector erase operations**

Displays how many times the device has overwritten the sectors of the memory area.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
### 7.2.3 Configuration Check

The device lets you compare the settings in the device with the settings in its neighboring devices. For this purpose, the device uses the information that it received from its neighboring devices through topology recognition (LLDP).

The dialog lists the deviations detected, which affect the performance of the communication between the device and the recognized neighboring devices.

You update the content of the table by clicking the button. When the table remains empty, the configuration check was successful and the settings in the device are compatible with the settings in the detected neighboring devices.

If you have set up more than 39 VLANs in the device, then the dialog constantly displays a warning. The reason is the limited number of possible VLAN data sets in LLDP packets with a maximum length. The device compares the first 39 VLANs automatically. If you have set up 40 or more VLANs in the device, then check the congruence of the further VLANs manually, if necessary.

**Note:** A neighboring device without LLDP support, which forwards LLDP packets, can be the cause of equivocal messages in the dialog. This occurs if the neighboring device is a hub or a switch without management, which ignores the IEEE 802.1D-2004 standard. In this case, the dialog displays the devices recognized and connected to the neighboring device as connected to the device itself, even though they are connected to the neighboring device.

**Summary**

You also find this information when you position the mouse pointer over the button in the Toolbar in the top part of the Navigation area.

**Error**

Displays the number of errors that the device detected during the configuration check.

**Warning**

Displays the number of warnings that the device detected during the configuration check.

**Information**

Displays the amount of information that the device detected during the configuration check.

**Table**

When you highlight a row in the table, the device displays additional information in the area beneath it.

**ID**

Displays the rule ID of the deviations having occurred. The dialog combines several deviations with the same rule ID under one rule ID.
Level

Displays the level of deviation between the settings in this device and the settings in the detected neighboring devices.

The device differentiates between the following access statuses:

- **INFORMATION**
  - The performance of the communication between the two devices is not impaired.

- **WARNING**
  - The performance of the communication between the two devices is possibly impaired.

- **ERROR**
  - The communication between the two devices is impaired.

Message

Displays the information, warnings and errors having occurred more precisely.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
7.2.4  IP Address Conflict Detection

Using the *IP Address Conflict Detection* function the device verifies that its IP address is unique in the network. For this purpose, the device analyzes received ARP packets.

In this dialog you specify the procedure with which the device detects address conflicts and specify the required settings for this.

The device displays detected address conflicts in the table in the *Management* tab.

When the device detects an address conflicts on its router interfaces, the device displays the most recent address conflict in the *Routing* tab.

When the device detects an address conflict, the status LED of the device flashes red 4 times.

The dialog contains the following tabs:
- [Management]
- [Routing]

[Management]

**Operation**

Enables/disables the *IP Address Conflict Detection* function.

Possible values:
- **On** (default setting)
  - The *IP Address Conflict Detection* function is enabled.
  - The device verifies that its IP address is unique in the network.
- **Off**
  - The *IP Address Conflict Detection* function is disabled.

**Configuration**

**Detection mode**

Specifies the procedure with which the device detects address conflicts.
Possible values:

- **active and passive** *(default setting)*
The device uses active and passive address conflict detection.

- **active**
  Active address conflict detection. The device actively helps avoid communicating with an IP address that already exists in the network. The address conflict detection begins as soon as you connect the device to the network or change its IP parameters.
  - The device sends 4 ARP probe data packets at the interval specified in the **Detection delay [ms]** field. If the device receives a response to these data packets, then there is an address conflict.
  - If the device does not detect an address conflict, then it sends 2 gratuitous ARP data packets as an announcement. The device also sends these data packets when the address conflict detection is disabled.
  - If the IP address already exists in the network, then the device changes back to the previously used IP parameters (if possible).
    - If the device receives its IP parameters from a DHCP server, then it sends a DHCPDECLINE message back to the DHCP server.
    - After the period specified in the **Release delay [s]** field, the device checks if the address conflict still exists. When the device detects 10 address conflicts one after the other, the device extends the waiting time to 60 s for the next check.
  - When the device resolves the address conflict, the device management returns to the network again.

- **passive**
  Passive address conflict detection. The device analyzes the data traffic in the network. If another device in the network is using the same IP address, then the device initially “defends” its IP address. The device stops sending if the other device keeps sending with the same IP address.
  - As a “defence” the device sends gratuitous ARP data packets. The device repeats this procedure for the number of times specified in the **Address protections** field.
  - If the other device continues sending with the same IP address, then after the period specified in the **Release delay [s]** field, the device periodically checks if the address conflict still exists.
  - When the device resolves the address conflict, the device management returns to the network again.

**Send periodic ARP probes**
Activates/deactivates the periodic address conflict detection.

Possible values:

- **marked** *(default setting)*
The periodic address conflict detection is active.
  - The device periodically sends an ARP probe data packet every 90 to 150 seconds and waits for the time specified in the **Detection delay [ms]** field for a response.
  - If the device detects an address conflict, then the device applies the passive detection mode function. If the **Send trap** function is active, then the device sends an SNMP trap.

- **unmarked**
The periodic address conflict detection is inactive.

**Detection delay [ms]**
Specifies the period in milliseconds for which the device waits for a response after sending a ARP data packets.

Possible values:

- **20..500** *(default setting: 200)*
Release delay [s]

Specifies the period in seconds after which the device checks again whether the address conflict still exists.

Possible values:

- 3..3600 (default setting: 15)

Address protections

Specifies how many times the device sends gratuitous ARP data packets in the passive detection mode to “defend” its IP address.

Possible values:

- 0..100 (default setting: 3)

Protection interval [ms]

Specifies the period in milliseconds after which the device sends gratuitous ARP data packets again in the passive detection mode to “defend” its IP address.

Possible values:

- 20..5000 (default setting: 200)

Send trap

Activates/deactivates the sending of SNMP traps when the device detects address conflicts.

Possible values:

- marked
  The sending of SNMP traps is active.
  If the device detects an address conflict, then the device sends an SNMP trap.
- unmarked (default setting)
  The sending of SNMP traps is inactive.

The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.

Information

Conflict detected

Displays whether an address conflict currently exists.

Possible values:

- marked
  The device detects an address conflict.
- unmarked
  The device does not detect an address conflict.
Diagnostics
[Diagnostics > System > IP Address Conflict Detection]

Table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timestamp</td>
<td>Displays the time at which the device detected an address conflict.</td>
</tr>
<tr>
<td>Port</td>
<td>Displays the number of the port on which the device detected the address conflict.</td>
</tr>
<tr>
<td>IP address</td>
<td>Displays the IP address that is causing the address conflict.</td>
</tr>
<tr>
<td>MAC address</td>
<td>Displays the MAC address of the device with which the address conflict exists.</td>
</tr>
</tbody>
</table>

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

[Routing]

Configuration

Send trap

Activates/deactivates the sending of SNMP traps if address conflicts are detected.

Possible values:

- marked
  - If the device detects an address conflict, then the device sends an SNMP trap.
- unmarked (default setting)
  - The sending of SNMP traps is deactivated.

The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.

Information

The device continues to display the information in this frame, even if the last address conflict that the device has detected is no longer present. To reset the values, click the button and then the Reset routing statistics item.

IP address conflict detected

Displays whether the device has detected an address conflict.
Possible values:

- **marked**
  The device has detected an address conflict.

- **unmarked**
  The device has not detected an address conflict.

**IP address**
Displays the IP address that has caused the address conflict.

**MAC address**
Displays the MAC address of the device that has caused the address conflict.

**Time since last conflict**
Displays the time that has elapsed since the device has detected the address conflict.

**Buttons**
You find the description of the standard buttons in section “Buttons” on page 15.

**Reset routing statistics**
Resets the values in the *Information* frame.

**Run routing conflict detection**
Starts the detection on its router interfaces.

The device sends a broadcast on the router interfaces. The device then analyzes the received ARP packets.
7.2.5 ARP

This dialog displays the MAC and IP addresses of the neighboring devices connected to the device management.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>Displays the IP address of a device that responded to an ARP query to this device.</td>
</tr>
<tr>
<td>MAC address</td>
<td>Displays the MAC address of a device that responded to an ARP query to this device.</td>
</tr>
<tr>
<td>Last updated</td>
<td>Displays the time in seconds since the current settings of the entry were registered in the ARP table.</td>
</tr>
<tr>
<td>Type</td>
<td>Displays the type of the ARP entry.</td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>static</td>
<td>Static ARP entry. When the ARP table is deleted, the device keeps the ARP entry.</td>
</tr>
<tr>
<td>dynamic</td>
<td>Dynamic ARP entry. When the Aging time [s] has been exceeded and the device does not receive any data from this device during this time, the device deletes the ARP entry.</td>
</tr>
<tr>
<td>local</td>
<td>IP and MAC address of the device management.</td>
</tr>
</tbody>
</table>

Active

Displays that the ARP table contains the IP/MAC address assignment as an active entry.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset ARP table

Removes the dynamically set up addresses from the ARP table.
7.2.6 Selftest

This dialog lets you do the following:

- Activate/deactivate the RAM test when the device is being started.
- Enable/disable the option of entering the system monitor upon the system start.
- Specify how the device behaves in the case of an error.

Configuration

If the device does not detect any readable configuration profile when restarting, then the following settings block your access to the device permanently:

- **SysMon1 is available** checkbox is unmarked.
- **Load default config on error** checkbox is unmarked.

This is the case, for example, if the password of the configuration profile that you are loading differs from the password set in the device. To have the device unlocked again, contact your sales partner.

RAM test

Activates/deactivates the RAM memory check during the restart.

Possible values:

- **marked** (default setting)
  The RAM memory check is activated. During the restart, the device checks the RAM memory.
- **unmarked**
  The RAM memory check is deactivated. This shortens the start time for the device.

SysMon1 is available

Activates/deactivates the access to the system monitor during the restart.

Possible values:

- **marked** (default setting)
  The device lets you open the system monitor during the restart.
- **unmarked**
  The device starts without the option of opening to the system monitor.

Among other things, the system monitor lets you update the device software and to delete saved configuration profiles.

Load default config on error

Activates/deactivates the loading of the default settings if the device does not detect any readable configuration profile when restarting.
Possible values:

▶ **marked** (default setting)
  The device loads the default settings.

▶ **unmarked**
  The device interrupts the restart and stops. The access to the device management is possible only using the Command Line Interface through the serial interface.
  To regain the access to the device through the network, open the system monitor and reset the settings. Upon restart, the device loads the default settings.

**Table**

In this table you specify how the device behaves in the case of an error.

**Cause**

Error causes to which the device reacts.

Possible values:

▶ **task**
  The device detects errors in the applications executed, for example if a task terminates or is not available.

▶ **resource**
  The device detects errors in the resources available, for example if the memory is becoming scarce.

▶ **software**
  The device detects software errors, for example error in the consistency check.

▶ **hardware**
  The device detects hardware errors, for example in the chip set.

**Action**

Specifies how the device behaves if the adjacent event occurs.

Possible values:

▶ **reboot** (default setting)
  The device triggers a restart.

▶ **logOnly**
  The device registers the detected error in the log file. See the **Diagnostics > Report > System Log** dialog.

▶ **sendTrap**
  The device sends an SNMP trap.
  The prerequisite for sending SNMP traps is that you enable the function in the **Diagnostics > Status Configuration > Alarms (Traps)** dialog and specify at least 1 trap destination.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
The device lets you inform multiple recipients by email about events that have occurred.

The device sends the emails immediately or periodically depending on the event severity. Usually you specify events with a high severity to be sent immediately.

You can specify multiple recipients to which the device sends the emails either immediately or periodically.

The menu contains the following dialogs:
- Email Notification Global
- Email Notification Recipients
- Email Notification Mail Server
7.3.1 Email Notification Global

In this dialog, you specify the sender settings. Also, you specify for which event severities the device sends the emails immediately and for which periodically.

**Operation**

Enables/disables the sending of emails:

Possible values:
- **On**
  - The sending of emails is enabled.
- **Off** (default setting)
  - The sending of emails is disabled.

**Certificate**

The device can send messages to a server over unsecured networks. To help deny a “man in the middle” attack, request that the Certificate Authority creates a certificate for the server. Configure the server to use the certificate. Transfer the certificate onto the device.

If you specify the settings for the mail servers, then use the IP address or DNS name provided as Common Name or Subject Alternative Name in the certificate. Otherwise the certificate validation will fail.

**URL**

Specifies the path and file name of the certificate.

The device accepts certificates with the following properties:
- X.509 format
- .PEM file name extension
- Base64-coded, enclosed by
  
  -----BEGIN CERTIFICATE-----
  and
  -----END CERTIFICATE-----

For security reason, we recommend to constantly use a certificate which is signed by a certification authority.

The device gives you the following options for copying the certificate to the device:
- **Import from the PC**
  - When the certificate is located on your PC or on a network drive, drag and drop the certificate in the area. Alternatively click in the area to select the certificate.
- **Import from an FTP server**
  - When the certificate is on a FTP server, specify the URL for the file in the following form:

  ftp://<user>:<password>@<IP address>:<port>/<path>/<file name>
**Diagnostics**

[Diagnoses > Email Notification > Global]

- **Import from a TFTP server**
  When the certificate is on a TFTP server, specify the URL for the file in the following form:
  \[tftp://<IP address>/<path>/<file name>\]

- **Import from an SCP or SFTP server**
  When the certificate is on an SCP or SFTP server, you specify the URL for the file in the following form:
  - \[scp://<IP address>/<path>/<file name>\]
    When you click the **Start** button, the device displays the **Credentials** window. There you enter **User name** and **Password**, to log on to the server.
  - \[sftp://<user>:<password>@<IP address>/<path>/<file name>\]

**Start**

Copies the certificate specified in the **URL** field to the device.

**Sender**

**Address**

Specifies the email address of the device.

The device sends the emails using this email address as the sender.

Possible values:
- Alphanumeric ASCII character string with 0..255 characters
  (default setting: **switch@hirschmann.com**)

**Notification immediate**

Here you specify the settings for emails which the device sends immediately.

**Severity**

Specifies the minimum severity of events for which the device immediately sends an email. If an event of this severity occurs, or of a more urgent severity, then the device sends an email to the recipients.

Possible values:
- **emergency**
- **alert** (default setting)
- **critical**
- **error**
- **warning**
- **notice**
- **informational**
- **debug**

**Subject**

Specifies the subject of the email.
Possible values:
- Alphanumeric ASCII character string with 0..255 characters

**Notification periodic**

Here you specify the settings for emails which the device sends periodically.

**Severity**

Specifies the minimum severity of events for which the device periodically sends an email. If an event of this severity occurs, or of a more urgent severity, then the device registers the event in the buffer. The device sends the buffer content periodically or when the buffer overflows.

If an event of a less urgent severity occurs, then the device does not register the event in the buffer.

Possible values:
- emergency
- alert
- critical
- error
- warning  (default setting)
- notice
- informational
- debug

**Subject**

Specifies the subject of the email.

Possible values:
- Alphanumeric ASCII character string with 0..255 characters

**Sending interval [min]**

Specifies the send interval in minutes.

If the device has registered at least 1 event, then the device sends an email with the log file after the time expires.

Possible values:
- 30..1440  (default setting: 30)

**Send**

Sends an email immediately with the buffer content and clears the buffer.
Information

Sent messages
Displays how many times the device has successfully sent an email to the mail server.

Undeliverable messages
Displays how many times the device has unsuccessfully tried to send an email to the mail server.

Time of the last messages sent
Displays the date and time at which the device has last sent an email to the mail server.

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.

Clear email notification statistics
Resets the counters in the Information frame to 0.

Meaning of the event severities

<table>
<thead>
<tr>
<th>Severity</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>emergency</td>
<td>Device not ready for operation</td>
</tr>
<tr>
<td>alert</td>
<td>Immediate user intervention required</td>
</tr>
<tr>
<td>critical</td>
<td>Critical status</td>
</tr>
<tr>
<td>error</td>
<td>Error status</td>
</tr>
<tr>
<td>warning</td>
<td>Warning</td>
</tr>
<tr>
<td>notice</td>
<td>Significant, normal status</td>
</tr>
<tr>
<td>informational</td>
<td>Informal message</td>
</tr>
<tr>
<td>debug</td>
<td>Debug message</td>
</tr>
</tbody>
</table>
7.3.2 Email Notification Recipients

In this dialog, you specify the recipients to which the device sends the emails. The device lets you specify up to 10 recipients.

Table

<table>
<thead>
<tr>
<th>Index</th>
<th>Displays the index number to which the table entry relates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification type</td>
<td>Specifies whether the device sends the emails to this recipient immediately or periodically. Possible values:</td>
</tr>
<tr>
<td>immediate</td>
<td>The device sends the emails to this recipient immediately.</td>
</tr>
<tr>
<td>periodic</td>
<td>The device sends the emails to this recipient periodically.</td>
</tr>
<tr>
<td>Address</td>
<td>Specifies the email address of the recipient. Possible values:</td>
</tr>
<tr>
<td>Valid email address with up to 255 characters</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>Activates/deactivates the informing of the recipient. Possible values:</td>
</tr>
<tr>
<td>marked (default setting)</td>
<td>The informing of the recipient is active.</td>
</tr>
<tr>
<td>unmarked</td>
<td>The informing of the recipient is inactive.</td>
</tr>
</tbody>
</table>

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
7.3.3 Email Notification Mail Server

In this dialog, you specify the settings for the mail servers. The device supports encrypted and unencrypted connections to the mail server.

**Table**

<table>
<thead>
<tr>
<th>Index</th>
<th>Displays the index number to which the table entry relates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Specifies the name of the server.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>Alphanumeric ASCII character string with 0..255 characters</td>
</tr>
<tr>
<td>IP address</td>
<td>Specifies the IP address or the DNS name of the server.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>Valid IPv4 address  (default setting: 0.0.0.0)</td>
</tr>
<tr>
<td>Encryption</td>
<td>Specifies the protocol which encrypts the connection between the device and the mail server.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>none  (default setting)</td>
</tr>
<tr>
<td></td>
<td>The device establishes an unencrypted connection to the server.</td>
</tr>
<tr>
<td></td>
<td>tlsv1</td>
</tr>
<tr>
<td></td>
<td>The device establishes an encrypted connection to the server using the startTLS extension.</td>
</tr>
</tbody>
</table>

Exception: Port 2222 is reserved for internal functions.

Frequently used TCP-Ports:
- **SMTP**  25
- **Message Submission**  587
User name

Specifies the user name of the account which the device uses to authenticate on the mail server.

Possible values:
- Alphanumeric ASCII character string with 0..255 characters

Password

Specifies the password of the account which the device uses to authenticate on the mail server.

Possible values:
- Alphanumeric ASCII character string with 0..255 characters

Timeout [s]

Specifies the time in seconds after which the device sends an email again. The prerequisite is that the device has failed to send the complete email due to a connection error.

Possible values:
- 1..15 (default setting: 3)

Active

Activates/deactivates the use of the mail server.

Possible values:
- *marked*  
  The mail server is active.  
  The device sends emails to this mail server.  
- *unmarked* (default setting)  
  The mail server is inactive.  
  The device does not send emails to this mail server.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

Connection test

Opens the *Connection test* dialog to send a test email.

If the mail server settings are correct, then the selected recipients receive a test email.

- In the *Recipient* field, you specify to which recipients the device sends the test email:
  - immediate  
    The device sends the test email to the recipients to which the device sends emails immediately.  
  - periodic  
    The device sends the test email to the recipients to which the device sends emails periodically.

- In the *Message text* field, you specify the text of the test email.
7.4 Syslog

The device lets you report selected events, independent of the severity of the event, to different syslog servers. In this dialog, you specify the settings for this function and manage up to 8 syslog servers.

**Operation**

Enables/disables the sending of events to the syslog servers.

Possible values:
- **On** (The sending of events is enabled. The device sends the events specified in the table to the specified syslog servers.)
- **off** (default setting) (The sending of events is disabled.)

**Certificate**

The device can send messages to a server over unsecured networks. To help deny a “man in the middle” attack, request that the Certificate Authority creates a certificate for the server. Configure the server to use the certificate. Transfer the certificate onto the device.

If you specify the parameters on the server, then verify that you specify the IP address and DNS name provided in the certificate as the Common Name or Subject Alternative Name. Otherwise the certificate validation will fail.

**Note:** In order for the changes to take effect after loading a new certificate, restart the Syslog function.

**URL**

Specifies the path and file name of the certificate.

The device accepts certificates with the following properties:
- X.509 format
- .PEM file name extension
- Base64-coded, enclosed by
  ```
  -----BEGIN CERTIFICATE-----
  and
  -----END CERTIFICATE-----
  ```

For security reason, we recommend to constantly use a certificate which is signed by a certification authority.
The device gives you the following options for copying the certificate to the device:

- **Import from the PC**
  When the certificate is located on your PC or on a network drive, drag and drop the certificate in the area. Alternatively click in the area to select the certificate.

- **Import from an FTP server**
  When the certificate is on an FTP server, specify the URL for the file in the following form:
  ftp://<user>:<password>@<IP address>:<port>/<path>/<file name>

- **Import from a TFTP server**
  When the certificate is on a TFTP server, specify the URL for the file in the following form:
  tftp://<IP address>/<path>/<file name>

- **Import from an SCP or SFTP server**
  When the certificate is on an SCP or SFTP server, you specify the URL for the file in the following form:
  - scp:// or sftp://<IP address>/<path>/<file name>
    When you click the **Start** button, the device displays the **Credentials** window. There you enter **User name** and **Password**, to log on to the server.
  - scp:// or sftp://<user>:<password>@<IP address>/<path>/<file name>

**Start**
Copies the certificate specified in the **URL** field to the device.

**Table**

**Index**
Displays the index number to which the table entry relates.

When you delete a table entry, this leaves a gap in the numbering. When you create a new table entry, the device fills the first gap.

Possible values:
- **1..8**

**IP address**
Specifies the IP address of the syslog server.

Possible values:
- **Valid IPv4 address** (default setting: **0.0.0.0**)

**Destination UDP port**
Specifies the TCP or UDP port on which the syslog server expects the log entries.

Possible values:
- **1..65535** (default setting: **514**)

**Transport type**
Specifies the transport type the device uses to send the events to the syslog server.
Possible values:

- **udp**  (default setting)
  The device sends the events over the UDP port specified in the Destination UDP port column.

- **tls**
  The device sends the events over TLS on the TCP port specified in the Destination UDP port column.

### Min. severity

Specifies the minimum severity of the events. The device sends a log entry for events with this severity and with more urgent severities to the syslog server.

Possible values:

- **emergency**
- **alert**
- **critical**
- **error**
- **warning**  (default setting)
- **notice**
- **informational**
- **debug**

### Type

Specifies the type of the log entry transmitted by the device.

Possible values:

- **systemlog**  (default setting)
- **audittrail**

### Active

Activates/deactivates the transmission of events to the syslog server:

- **marked**
  The device sends events to the syslog server.

- **unmarked**  (default setting)
  The transmission of events to the syslog server is deactivated.

### Buttons

You find the description of the standard buttons in section "Buttons" on page 15.
7.5 Ports

The menu contains the following dialogs:

- SFP
- TP cable diagnosis
- Port Monitor
- Auto-Disable
- Port Mirroring
7.5.1 SFP

This dialog lets you look at the SFP transceivers currently connected to the device and their properties.

Table

The table displays valid values if the device is equipped with SFP transceivers.

| Port | Displays the port number. |
| Module type | Type of the SFP transceiver, for example M-SFP-SX/LC. |
| Serial number | Displays the serial number of the SFP transceiver. |
| Connector type | Displays the connector type. |
| Supported | Displays whether the device supports the SFP transceiver. |
| Temperature [°C] | Operating temperature of the SFP transceiver in °Celsius. |
| Tx power [mW] | Transmission power of the SFP transceiver in mW. |
| Rx power [mW] | Receiving power of the SFP transceiver in mW. |
| Tx power [dBm] | Transmission power of the SFP transceiver in dBm. |
| Rx power [dBm] | Receiving power of the SFP transceiver in dBm. |
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
7.5.2 TP cable diagnosis

This feature tests the cable attached to an interface for short or open circuit. The table displays the cable status and estimated length. The device also displays the individual cable pairs connected to the port. When the device detects a short circuit or an open circuit in the cable, it also displays the estimated distance to the problem.

Note: This test interrupts traffic on the port.

Information

Port

Displays the port number.

Status

Status of the Virtual Cable Tester.

Possible values:

► active
  Cable testing is in progress.
  To start the test, click the button and then the Start cable diagnosis... item. This action opens the Select port dialog.

► success
  The device displays this entry after performing a successful test.

► failure
  The device displays this entry after an interruption in the test.

► uninitialized
  The device displays this entry while in standby.

Table

Cable pair

Displays the cable pair to which this entry relates. The device uses the first PHY index supported to display the values.

Result

Displays the results of the cable test.

Possible values:

► normal
  The cable is functioning properly.

► open
  There is a break in the cable causing an interruption.
Diagnostics
[Diagnostics > Ports > TP cable diagnosis]

- **short**
  Wires in the cable are touching together causing a short circuit.

- **unknown**
  The device displays this value for untested cable pairs.

The device displays different values than expected in the following cases:
- If no cable is connected to the port, then the device displays the value **unknown** instead of **open**.
- If the port is deactivated, then the device displays the value **short**.

**Min. length**
Displays the minimum estimated length of the cable in meters.
If the cable length is unknown or in the **Information** frame the **Status** field displays the value **active**, **failure** or **uninitialized**, then the device displays the value **0**.

**Max. length**
Displays the maximum estimated length of the cable in meters.
If the cable length is unknown or in the **Information** frame the **Status** field displays the value **active**, **failure** or **uninitialized**, then the device displays the value **0**.

**Distance [m]**
Displays the estimated distance in meters from the end of the cable to the failure location.
If the cable length is unknown or in the **Information** frame the **Status** field displays the value **active**, **failure** or **uninitialized**, then the device displays the value **0**.

**Buttons**
You find the description of the standard buttons in section “Buttons” on page 15.

Start cable diagnosis...
Opens the **Select port** dialog.
In the **Port** drop-down list you select the port to be tested. Use for copper-based ports only.
To initiate the cable test on the selected port, click the **Ok** button.
7.5.3 **Port Monitor**

[Diagnostics > Ports > Port Monitor]

The *Port Monitor* function monitors the adherence to the specified parameters on the ports. If the *Port Monitor* function detects that the parameters are being exceeded, then the device performs an action.

To apply the *Port Monitor* function, proceed as follows:

- **Global** tab
  - □ Enable the *Operation* function in the *Port Monitor* frame.
  - □ Activate for each port those parameters that you want the *Port Monitor* function to monitor.

- **Link flap, CRC/Fragments and Overload detection** tab
  - □ Specify the threshold values for the parameters for each port.

- **Link speed/Duplex mode detection** tab
  - □ Activate the allowed combinations of speed and duplex mode for each port.

- **Global** tab
  - □ Specify for each port an action that the device carries out if the *Port Monitor* function detects that the parameters have been exceeded.

- **Auto-disable** tab
  - □ Mark the *Auto-disable* checkbox for the monitored parameters if you have specified the *auto-disable* action at least once.

The dialog contains the following tabs:
- [Global]
- [Auto-disable]
- [Link flap]
- [CRC/Fragments]
- [Overload detection]
- [Link speed/Duplex mode detection]

[Global]

In this tab, you enable the *Port Monitor* function and specify the parameters that the *Port Monitor* function is monitoring. Also specify the action that the device carries out if the *Port Monitor* function detects that the parameters have been exceeded.

**Operation**

Enables/disables the *Port Monitor* function globally.

Possible values:

- **On**
  - The *Port Monitor* function is enabled.
- **Off** (default setting)
  - The *Port Monitor* function is disabled.
### Table

<table>
<thead>

<td></td>
</tr>
<tr>
<td>➣ marked</td>
<td>Monitoring is active.</td>
</tr>
<tr>
<td>➢ The Port Monitor function monitors duplex mismatches on the port.</td>
<td></td>
</tr>
<tr>
<td>➢ If the device detects a duplex mismatch, then the device executes the action specified in the Action column.</td>
<td></td>
</tr>
<tr>
<td>➣ unmarked</td>
<td>(default setting)</td>
</tr>
<tr>
<td>Monitoring is inactive.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Overload detection on</th>
<th>Activates/deactivates the overload detection on the port.</th>
</tr>
</thead>
</table>
Possible values:

- **marked**
  - Monitoring is active.
  - The Port Monitor function monitors the data load on the port.
  - If the device detects a data overload on the port, then the device executes the action specified in the Action column.
  - On the Overload detection tab, specify the parameters to be monitored.

- **unmarked** (default setting)
  - Monitoring is inactive.

Link speed/Duplex mode detection on

Activates/deactivates the monitoring of the link speed and duplex mode on the port.

Possible values:

- **marked**
  - Monitoring is active.
  - The Port Monitor function monitors the link speed and duplex mode on the port.
  - If the device detects an unpermitted combination of link speed and duplex mode, then the device executes the action specified in the Action column.
  - On the Link speed/Duplex mode detection tab, specify the parameters to be monitored.

- **unmarked** (default setting)
  - Monitoring is inactive.

Active condition

Displays the monitored parameter that led to the action on the port.

Possible values:

- **-**
  - No monitored parameter.
  - The device does not carry out any action.

- **Link flap**
  - Too many link changes in the observed period.

- **CRC/Fragments**
  - Too many CRC/fragment errors in the observed period.

- **Duplex mismatch**
  - Duplex mismatch detected.

- **Overload detection**
  - Overload detected in the observed period.

- **Link speed/Duplex mode detection**
  - Impermissible combination of speed and duplex mode detected.

Action

Specifies the action that the device carries out if the Port Monitor function detects that the parameters have been exceeded.
Possible values:

▲ disable port
The device disables the port and sends an SNMP trap.
The “Link status” LED for the port flashes 3× per period.
− To re-enable the port, highlight the port and click the □ button and then the Reset item.
− If the parameters are no longer being exceeded, then the Auto-Disable function enables the relevant port again after the specified waiting period. The prerequisite is that on the Auto-disable tab the checkbox for the monitored parameter is marked.

▲ send trap
The device sends an SNMP trap.
The prerequisite for sending SNMP traps is that you enable the function in the Diagnostics > Status Configuration > Alarms (Traps) dialog and specify at least 1 trap destination.

▲ auto-disable (default setting)
The device disables the port and sends an SNMP trap.
The “Link status” LED for the port flashes 3× per period.
The prerequisite is that on the Auto-disable tab the checkbox for the monitored parameter is marked.
− The Diagnostics > Ports > Auto-Disable dialog displays which ports are currently disabled due to the parameters being exceeded.
− The Auto-Disable function reactivates the port automatically. For this you go to the Diagnostics > Ports > Auto-Disable dialog and specify a waiting period for the relevant port in the Reset timer [s] column.

Port status
Displays the operating state of the port.

Possible values:

▲ up
The port is enabled.

▲ down
The port is disabled.

▲ notPresent
Physical port unavailable.

Buttons
You find the description of the standard buttons in section “Buttons” on page 15.

Reset
Enables the port highlighted in the table again and resets its counter to 0. This affects the counters in the following dialogs:

▲ Diagnostics > Ports > Port Monitor dialog
− Link flap tab
− CRC/Fragments tab
− Overload detection tab
▲ Diagnostics > Ports > Auto-Disable dialog
In this tab, you activate the Auto-Disable function for the parameters monitored by the Port Monitor function.

**Table**

<table>
<thead>
<tr>
<th>Reason</th>
<th>Displays the parameters monitored by the Port Monitor function.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Mark the adjacent checkbox so that the Port Monitor function carries out the auto-disable action if it detects that the monitored parameters have been exceeded.</td>
</tr>
</tbody>
</table>

**Auto-disable**

Activates/deactivates the Auto-Disable function for the adjacent parameters.

Possible values:

- marked
  - The Auto-Disable function for the adjacent parameters is active.
  - If the adjacent parameters are exceeded and the value auto-disable is specified in the Action column, then the device carries out the Auto-Disable function.

- unmarked (default setting)
  - The Auto-Disable function for the adjacent parameters is inactive.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Reset**

Enables the port highlighted in the table again and resets its counter to 0. This affects the counters in the following dialogs:

- Diagnostics > Ports > Port Monitor dialog
  - Link flap tab
  - CRC/Fragments tab
  - Overload detection tab

- Diagnostics > Ports > Auto-Disable dialog

**[Link flap]**

In this tab, you specify individually for every port the following settings:

- The number of link changes.
- The period during which the Port Monitor function monitors a parameter to detect discrepancies.
You also see how many link changes the Port Monitor function has detected up to now.

The Port Monitor function monitors those ports for which the checkbox in the Link flap on column is marked on the Global tab.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sampling interval [s]</td>
<td>Specifies in seconds, the period during which the Port Monitor function monitors a parameter to detect discrepancies.</td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>1..180 (default setting: 10)</td>
<td></td>
</tr>
<tr>
<td>Link flaps</td>
<td>Specifies the number of link changes.</td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>1..100 (default setting: 5)</td>
<td></td>
</tr>
<tr>
<td>Last sampling interval</td>
<td>Displays the number of errors that the device has detected during the period that has elapsed.</td>
</tr>
<tr>
<td>Total</td>
<td>Displays the total number of errors that the device has detected since the port was enabled.</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Reset**

Enables the port highlighted in the table again and resets its counter to 0. This affects the counters in the following dialogs:

- Diagnostics > Ports > Port Monitor dialog
  - Link flap tab
  - CRC/Fragments tab
  - Overload detection tab

- Diagnostics > Ports > Auto-Disable dialog
In this tab, you specify individually for every port the following settings:

- The fragment error rate.
- The period during which the Port Monitor function monitors a parameter to detect discrepancies.

You also see the fragment error rate that the device has detected up to now.

The Port Monitor function monitors those ports for which the checkbox in the CRC/Fragments column is marked on the Global tab.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sampling interval [s]</td>
<td>Specifies in seconds, the period during which the Port Monitor function monitors a parameter to detect discrepancies.</td>
</tr>
<tr>
<td>Possible values:</td>
<td>▶ 5..180 (default setting: 10)</td>
</tr>
<tr>
<td>CRC/Fragments count [ppm]</td>
<td>Specifies the fragment error rate (in parts per million).</td>
</tr>
<tr>
<td>If the Port Monitor function detects this fragment error rate in the monitored period, then the device performs the specified action.</td>
<td></td>
</tr>
<tr>
<td>Possible values:</td>
<td>▶ 1..1000000 (default setting: 1000)</td>
</tr>
<tr>
<td>Last active interval [ppm]</td>
<td>Displays the fragment error rate that the device has detected during the period that has elapsed.</td>
</tr>
<tr>
<td>Total [ppm]</td>
<td>Displays the fragment error rate that the device has detected since the port was enabled.</td>
</tr>
</tbody>
</table>
**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Reset**

Enables the port highlighted in the table again and resets its counter to 0. This affects the counters in the following dialogs:

- Diagnostics > Ports > Port Monitor dialog
  - Link flap tab
  - CRC/Fragments tab
  - Overload detection tab
- Diagnostics > Ports > Auto-Disable dialog

**[Overload detection]**

In this tab, you specify individually for every port the following settings:

- The load threshold values.
- The period during which the Port Monitor function monitors a parameter to detect discrepancies.

You also see the number of data packets that the device has detected up to now.

The Port Monitor function monitors those ports for which the checkbox in the Overload detection on column is marked on the Global tab.

The Port Monitor function does not monitor any ports that are members of a link aggregation group or PRP/HSR subscribers.

**Table**

**Port**

Displays the port number.

**Traffic type**

Specifies the type of data packets that the device considers when monitoring the load on the port.

Possible values:

- **all**
  - The Port Monitor function monitors Broadcast, Multicast and Unicast packets.
- **bc** (default setting)
  - The Port Monitor function monitors only Broadcast packets.
- **bc-mc**
  - The Port Monitor function monitors only Broadcast and Multicast packets.

**Threshold type**

Specifies the unit for the data rate.
Possible values:

- pps (default setting)  
  packets per second
- kbps  
  kbit per second

The prerequisite is that the value in the Traffic type column = all.

**Lower threshold**

Specifies the lower threshold value for the data rate.

The Auto-Disable function enables the port again only when the load on the port is lower than the value specified here.

Possible values:

- 0..10000000 (default setting: 0)

**Upper threshold**

Specifies the upper threshold value for the data rate.

If the Port Monitor function detects this load in the monitored period, then the device performs the specified action.

Possible values:

- 0..10000000 (default setting: 0)

**Interval [s]**

Specifies in seconds, the period that the Port Monitor function observes a parameter to detect that a parameter is being exceeded.

Possible values:

- 1..20 (default setting: 1)

**Packets**

Displays the number of Broadcast, Multicast and Unicast packets that the device has detected during the period that has elapsed.

**Broadcast packets**

Displays the number of Broadcast packets that the device has detected during the period that has elapsed.

**Multicast packets**

Displays the number of Multicast packets that the device has detected during the period that has elapsed.

**Kbit/s**

Displays the data rate in Kbits per second that the device has detected during the period that has elapsed.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Enables the port highlighted in the table again and resets its counter to 0. This affects the counters in the following dialogs:

- Diagnostics > Ports > Port Monitor dialog
  - Link flap tab
  - CRC/Fragments tab
  - Overload detection tab
- Diagnostics > Ports > Auto-Disable dialog

[Link speed/Duplex mode detection]

In this tab, you activate the allowed combinations of speed and duplex mode for each port.

The Port Monitor function monitors those ports for which the checkbox in the Link speed/Duplex mode detection on column is marked on the Global tab.

The Port Monitor function monitors only enabled physical ports.

Table

Port

Displays the port number.

10 Mbit/s HDX

Activates/deactivates the port monitor to accept a half-duplex and 10 Mbit/s data rate combination on the port.

Possible values:

- marked
  The port monitor takes into consideration the speed and duplex combination.
- unmarked
  If the port monitor detects the speed and duplex combination on the port, then the device executes the action specified in the Global tab.

10 Mbit/s FDX

Activates/deactivates the port monitor to accept a full-duplex and 10 Mbit/s data rate combination on the port.
Possible values:

- **marked**
  - The port monitor takes into consideration the speed and duplex combination.

- **unmarked**
  - If the port monitor detects the speed and duplex combination on the port, then the device executes the action specified in the *Global* tab.

### 100 Mbit/s HDX

Activates/deactivates the port monitor to accept a half-duplex and 100 Mbit/s data rate combination on the port.

Possible values:

- **marked**
  - The port monitor takes into consideration the speed and duplex combination.

- **unmarked**
  - If the port monitor detects the speed and duplex combination on the port, then the device executes the action specified in the *Global* tab.

### 100 Mbit/s FDX

Activates/deactivates the port monitor to accept a full-duplex and 100 Mbit/s data rate combination on the port.

Possible values:

- **marked**
  - The port monitor takes into consideration the speed and duplex combination.

- **unmarked**
  - If the port monitor detects the speed and duplex combination on the port, then the device executes the action specified in the *Global* tab.

### 1,000 Mbit/s FDX

Activates/deactivates the port monitor to accept a full-duplex and 1 Gbit/s data rate combination on the port.

Possible values:

- **marked**
  - The port monitor takes into consideration the speed and duplex combination.

- **unmarked**
  - If the port monitor detects the speed and duplex combination on the port, then the device executes the action specified in the *Global* tab.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Enables the port highlighted in the table again and resets its counter to 0. This affects the counters in the following dialogs:

- Diagnostics > Ports > Port Monitor dialog
  - Link flap tab
  - CRC/Fragments tab
  - Overload detection tab
- Diagnostics > Ports > Auto-Disable dialog
7.5.4 Auto-Disable

The **Auto-Disable** function lets you disable monitored ports automatically and enable them again as you desire.

For example, the **Port Monitor** function and selected functions in the **Network Security** menu use the **Auto-Disable** function to disable ports if monitored parameters are exceeded.

If the parameters are no longer being exceeded, then the **Auto-Disable** function enables the relevant port again after the specified waiting period.

The dialog contains the following tabs:

- [Port]
- [Status]

### [Port]

This tab displays which ports are currently disabled due to the parameters being exceeded. If the parameters are no longer being exceeded and you specify a waiting period in the **Reset timer [s]** column, then the **Auto-Disable** function automatically enables the relevant port again.

### Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset timer [s]</td>
<td>Specifies the waiting period in seconds, after which the <strong>Auto-Disable</strong> function enables the port again. Possible values:</td>
</tr>
<tr>
<td>Error time</td>
<td>Displays when the device disabled the port due to the parameters being exceeded.</td>
</tr>
<tr>
<td>Remaining time [s]</td>
<td>Displays the remaining time in seconds, until the <strong>Auto-Disable</strong> function enables the port again.</td>
</tr>
<tr>
<td>Component</td>
<td>Displays the software component in the device that disabled the port.</td>
</tr>
</tbody>
</table>
Diagnostics

[Diagnostics > Ports > Auto-Disable]

Possible values:

- **PORT_MON**
  - *Port Monitor*
  - See the Diagnostics > Ports > Port Monitor dialog.

- **PORT_ML**
  - *Port Security*
  - See the Network Security > Port Security dialog.

- **DHCP_SNP**
  - *DHCP Snooping*
  - See the Network Security > DHCP Snooping dialog.

- **DOT1S**
  - *BPDU guard*
  - See the Switching > L2-Redundancy > Spanning Tree > Global dialog.

- **DAI**
  - *Dynamic ARP Inspection*
  - See the Network Security > Dynamic ARP Inspection dialog.

**Reason**

Displays the monitored parameter that led to the port being disabled.

Possible values:

- **none**
  - No monitored parameter.
  - The port is enabled.

- **link-flap**
  - Too many link changes. See the Diagnostics > Ports > Port Monitor dialog, Link flap tab.

- **crc-error**
  - Too many CRC/fragment errors. See the Diagnostics > Ports > Port Monitor dialog, CRC/Fragments tab.

- **duplex-mismatch**
  - Duplex mismatch detected. See the Diagnostics > Ports > Port Monitor dialog, Global tab.

- **dhcp-snooping**
  - Too many DHCP packages from untrusted sources. See the Network Security > DHCP Snooping > Configuration dialog, Port tab.

- **arp-rate**
  - Too many ARP packages from untrusted sources. See the Network Security > Dynamic ARP Inspection > Configuration dialog, Port tab.

- **bpdu-rate**
  - STP-BPDUs received. See the Switching > L2-Redundancy > Spanning Tree > Global dialog.

- **mac-based-port-security**
  - Too many data packets from undesired senders. See the Network Security > Port Security dialog.

- **overload-detection**
  - Overload. See the Diagnostics > Ports > Port Monitor dialog, Overload detection tab.

- **speed-duplex**
  - Impermissible combination of speed and duplex mode detected. See the Diagnostics > Ports > Port Monitor dialog, Link speed/Duplex mode detection tab.

**Active**

Displays whether the port is currently disabled due to the parameters being exceeded.
Possible values:

- **marked**
  The port is currently disabled.
- **unmarked**
  The port is enabled.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**[Status]**

This tab displays the monitored parameters for which the *Auto-Disable* function is activated.

**Table**

**Reason**

Displays the parameters that the device monitors.

Mark the adjacent checkbox so that the *Auto-Disable* function disables and, when applicable, enables the port again if the monitored parameters are exceeded.

**Category**

Displays which function the adjacent parameter belongs to.

Possible values:

- **port-monitor**
  The parameter belongs to the *Port Monitor* function. See the Diagnostics > Port > Port Monitor dialog.
- **network-security**
  The parameter belongs to the functions in the *Network Security* menu.
- **l2-redundancy**
  The parameter belongs to the *L2-Redundancy* functions. See the Switching > L2-Redundancy dialog.

**Auto-disable**

Displays whether the *Auto-Disable* function is activated/deactivated for the adjacent parameter.

Possible values:

- **marked**
  The *Auto-Disable* function for the adjacent parameters is active.
  The *Auto-Disable* function disables and, when applicable, enables the relevant port again if the monitored parameters are exceeded.
- **unmarked** (default setting)
  The *Auto-Disable* function for the adjacent parameters is inactive.
Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Enables the port highlighted in the table again and resets its counter to 0. This affects the counters in the following dialogs:

- **Diagnostics > Ports > Port Monitor** dialog
  - Link flap tab
  - CRC/Fragments tab
  - Overload detection tab
- **Diagnostics > Ports > Auto-Disable** dialog
7.5.5 **Port Mirroring**

The *Port Mirroring* function lets you copy received and sent data packets from selected ports to a destination port. You can watch and process the data stream using an analyzer or an RMON probe, connected to the destination port. The data packets remain unmodified on the source port.

**Note:** To enable the access to the device management using the destination port, mark the checkbox *Allow management* in the *Destination port* frame before you enable the *Port Mirroring* function.

### Operation

**Operation**

Enables/disables the *Port Mirroring* function.

Possible values:

- **On**
  - The *Port Mirroring* function is enabled.
  - The device copies the data packets from the selected source ports to the destination port.

- **Off** (default setting)
  - The *Port Mirroring* function is disabled.

### Destination port

**Primary port**

Specifies the destination port.

Suitable ports are those ports that are not used for the following purposes:

- Source port
- L2 redundancy protocols
- Port-based router interface

Possible values:

- **no Port** (default setting)
  - No destination port selected.

- **<Port number>**
  - Number of the destination port. The device copies the data packets from the source ports to this port.

On the destination port, the device adds a VLAN tag to the data packets that the source port transmits. The destination port transmits unmodified the data packets that the source port receives.

**Note:** The destination port needs sufficient bandwidth to absorb the data stream. If the copied data stream exceeds the bandwidth of the destination port, then the device discards surplus data packets on the destination port.
Allow management

Activates/deactivates the access to the device management using the destination port.

Possible values:
- **marked**
  - The access to the device management using the destination port is active.
  - The device lets users have access to the device management using the destination port without interrupting the active Port Mirroring session.
  - The device duplicates multicasts, broadcasts and unknown unicasts on the destination port.
  - The VLAN settings on the destination port remain unchanged. The prerequisite for access to the device management using the destination port is that the destination port is not a member of the VLAN of the device management.
- **unmarked** (default setting)
  - The access to the device management using the destination port is inactive.
  - The device prohibits the access to the device management using the destination port.

**VLAN mirroring**

The VLAN mirroring function lets you copy ingress data packets in a specific VLAN to the selected destination port. The device forwards the data stream out of the specified destination port.

**Note:** The VLAN mirroring function is only available on the primary port.

**Source VLAN ID**

Specifies the VLAN from which the device mirrors data to the destination port.

Possible values:
- **0** (default setting)
  - Disables the VLAN mirroring function.
- **2..4042**
  - The device lets you specify a VLAN only if no source port is specified.

**RSPAN**

The RSPAN (Remote Switched Port Analyzer) function extends the mirroring function by allowing the device to forward the monitored data across multiple devices, on a specific VLAN, to a single destination.

**Note:** If you use the device on the path between the source and destination device, then specify in the VLAN ID field the VLAN needed to use the RSPAN function. For this, the Port Mirroring function is not required and remains disabled.

**Note:** The RSPAN function is only available on the primary port.

**Source VLAN ID**

Specifies the source VLAN from which the device mirrors data to the destination VLAN.
Possible values:

1. **0** (default setting: 0)
   - The source VLAN is inactive.
2. **2-4042**
   - Mirrored ports cannot be members of the RSPAN VLAN.

**VLAN ID**

Specifies the VLAN that the device uses to tag and forward mirrored data.

Possible values:

1. **0** (default setting: 0)
   - The RSPAN VLAN is inactive.
2. **2-4042**
   - The device uses the value to tag and forward mirrored data.

**Destination VLAN ID**

Specifies the VLAN that the device uses to forward the network traffic to the destination device.

Possible values:

1. **0** (default setting: 0)
   - The destination VLAN is inactive.
2. **2-4042**
   - The device uses this value to tag data and to forward the network traffic to the destination device.

**Table**

<table>
<thead>
<tr>
<th>Source port</th>
<th>Specifies the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>1. <code>&lt;Port number&gt;</code></td>
<td></td>
</tr>
</tbody>
</table>

**Enabled**

Activates/deactivates the copying of the data packets from this source port to the destination port.
Possible values:

- **marked**
  The copying of the data packets is active.
  The port is specified as a source port.

- **unmarked** (default setting)
  The copying of the data packets is inactive.

- (Grayed-out display)
  It is not possible to copy the data packets for this port.

Possible causes:
- The port is already specified as a destination port.
- The port is a logical port, not a physical port.

**Note:** The device lets you activate every physical port as source port except for the destination port.

**Type**

Specifies which data packets the device copies to the destination port.

Possible values:

- **none** (default setting)
  No data packets.

- **tx**
  Data packets that the source port transmits.

- **rx**
  Data packets that the source port receives.

- **txrx**
  Data packets that the source port transmits and receives.

**Note:** With the txrx setting the device copies transmitted and received data packets. The destination ports needs at least a bandwidth that corresponds to the sum of the send and receive channel of the source ports. For example, for similar ports the destination port is at 100 % capacity when the send and receive channel of a source port are at 50 % capacity respectively.

On the destination port, the device adds a VLAN tag to the data packets that the source port transmits. The destination port transmits unmodified the data packets that the source port receives.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

**Reset config**

Resets the settings in the dialog to the default settings and transfers the changes to the volatile memory of the device (RAM).
The device lets you gather information about neighboring devices. For this, the device uses the Link Layer Discovery Protocol (LLDP). This information enables a network management station to map the structure of your network.

This menu lets you configure the topology discovery and to display the information received in table form.

The menu contains the following dialogs:
- LLDP Configuration
- LLDP Topology Discovery
7.6.1 LLDP Configuration

This dialog lets you configure the topology discovery for every port.

**Operation**

Enables/disables the LLDP function.

Possible values:
- **On** (default setting)
  - The LLDP function is enabled.
  - The topology discovery using LLDP is active in the device.
- **Off**
  - The LLDP function is disabled.

**Configuration**

Transmit interval [s]

Specifies the interval in seconds at which the device transmits LLDP data packets.

Possible values:
- **5..32768** (default setting: 30)

Transmit interval multiplier

Specifies the factor for determining the time-to-live value for the LLDP data packets.

Possible values:
- **2..10** (default setting: 4)

The time-to-live value coded in the LLDP header results from multiplying this value with the value in the Transmit interval [s] field.

Reinit delay [s]

Specifies the delay in seconds for the reinitialization of a port.

Possible values:
- **1..10** (default setting: 2)

If in the Operation column the value **Off** is specified, then the device tries to reinitialize the port after the time specified here has elapsed.
Transmit delay [s]

Specifies the delay in seconds for transmitting successive LLDP data packets after configuration changes in the device occur.

Possible values:
- **1..8192** (default setting: 2)

The recommended value is between a minimum of 1 and a maximum of a quarter of the value in the Transmit interval [s] field.

Notification interval [s]

Specifies the interval in seconds for transmitting LLDP notifications.

Possible values:
- **5..3600** (default setting: 5)

After transmitting a notification trap, the device waits for a minimum of the time specified here before transmitting the next notification trap.

Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Operation</th>
<th>Notification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Displays the port number.</td>
<td>Activates/deactivates the LLDP notifications on the port.</td>
</tr>
</tbody>
</table>

Operation

Specifies whether the port transmits and receives LLDP data packets.

Possible values:
- **transmit**
  The port transmits LLDP data packets but does not save any information about neighboring devices.
- **receive**
  The port receives LLDP data packets but does not transmit any information to neighboring devices.
- **receive and transmit** (default setting)
  The port transmits LLDP data packets and saves information about neighboring devices.
- **disabled**
  The port does not transmit LLDP data packets and does not save information about neighboring devices.

Notification

Activates/deactivates the LLDP notifications on the port.

Possible values:
- **marked**
  LLDP notifications are active on the port.
- **unmarked** (default setting)
  LLDP notifications are inactive on the port.
Transmit port description

Actives/deactivates the transmitting of a TLV (Type Length Value) with the port description.

Possible values:

- **marked** (default setting)
  - The transmitting of the TLV is active.
  - The device transmits the TLV with the port description.

- **unmarked**
  - The transmitting of the TLV is inactive.
  - The device does not transmit a TLV with the port description.

Transmit system name

Actives/deactivates the transmitting of a TLV (Type Length Value) with the device name.

Possible values:

- **marked** (default setting)
  - The transmitting of the TLV is active.
  - The device transmits the TLV with the device name.

- **unmarked**
  - The transmitting of the TLV is inactive.
  - The device does not transmit a TLV with the device name.

Transmit system description

Actives/deactivates the transmitting of the TLV (Type Length Value) with the system description.

Possible values:

- **marked** (default setting)
  - The transmitting of the TLV is active.
  - The device transmits the TLV with the system description.

- **unmarked**
  - The transmitting of the TLV is inactive.
  - The device does not transmit a TLV with the system description.

Transmit system capabilities

Actives/deactivates the transmitting of the TLV (Type Length Value) with the system capabilities.

Possible values:

- **marked** (default setting)
  - The transmitting of the TLV is active.
  - The device transmits the TLV with the system capabilities.

- **unmarked**
  - The transmitting of the TLV is inactive.
  - The device does not transmit a TLV with the system capabilities.

Neighbors (max.)

Limits the number of neighboring devices to be recorded for this port.

Possible values:

- **1..50** (default setting: 10)
FDB mode

Specifies which function the device uses to record neighboring devices on this port.

Possible values:

- **lldpOnly**
  The device uses only LLDP data packets to record neighboring devices on this port.

- **macOnly**
  The device uses learned MAC addresses to record neighboring devices on this port. The device uses the MAC address only if there is no other entry in the address table (FDB, Forwarding Database) for this port.

- **both**
  The device uses LLDP data packets and learned MAC addresses to record neighboring devices on this port.

- **autoDetect** (default setting)
  If the device receives LLDP data packets at this port, then the device operates the same as with the lldpOnly setting. Otherwise, the device operates the same as with the macOnly setting.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
Devices in networks send notifications in the form of packets which are also known as "LLDPDU" (LLDP data units). The data that is sent and received via LLDPDU are useful for many reasons. Thus the device detects which devices in the network are neighbors and via which ports they are connected.

The dialog lets you display the network and to detect the connected devices along with their specific features.

The dialog contains the following tabs:

- [LLDP]
- [LLDP-MED]

This tab displays the collected LLDP information for the neighboring devices. This information enables a network management station to map the structure of your network.

When devices both with and without an active topology discovery function are connected to a port, the topology table hides the devices without active topology discovery.

When only devices without active topology discovery are connected to a port, the table contains one line for this port to represent every device. This line contains the number of connected devices.

The Forwarding Database (FDB) address table contains MAC addresses of devices that the topology table hides for the sake of clarity.

When you use 1 port to connect several devices, for example via a hub, the table contains 1 line for each connected device.

### Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

| Neighbor identifier | Displays the chassis ID of the neighboring device. This can be the basis MAC address of the neighboring device, for example. |

| FDB | Displays whether or not the connected device has active LLDP support. |
Possible values:

- **marked**
  - The connected device does not have active LLDP support.
  - The device uses information from its address table (FDB, Forwarding Database)

- **unmarked** (default setting)
  - The connected device has active LLDP support.

**Neighbor IP address**

Displays the IP address with which the access to the neighboring device management is possible.

**Neighbor port description**

Displays a description for the port of the neighboring device.

**Neighbor system name**

Displays the device name of the neighboring device.

**Neighbor system description**

Displays a description for the neighboring device.

**Port ID**

Displays the ID of the port through which the neighboring device is connected to the device.

**Autonegotiation supported**

Displays whether the port of the neighboring device supports autonegotiation.

**Autonegotiation**

Displays whether autonegotiation is enabled on the port of the neighboring device.

**PoE supported**

Displays whether the port of the neighboring device supports Power over Ethernet (PoE).

**PoE enabled**

Displays whether Power over Ethernet (PoE) is enabled on the port of the neighboring device.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices and network devices. It specifically provides support for VoIP applications. In this support rule, it provides an additional set of common advertisement, Type Length Value (TLV), messages. The device uses the TLVs for capabilities discovery such as network policy, Power over Ethernet, inventory management and location information.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device class</td>
<td>Displays the device class of the remotely connected device.</td>
</tr>
<tr>
<td></td>
<td>A value of <code>notDefined</code> indicates that the device has capabilities not covered by any of the <strong>LLDP-MED</strong> classes.</td>
</tr>
<tr>
<td></td>
<td>A value of <code>endpointClass1..3</code> indicates that the device has &quot;endpoint class 1..3&quot; capabilities.</td>
</tr>
<tr>
<td></td>
<td>A value of <code>networkConnectivity</code> indicates that the device has network connectivity device capabilities.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the extension of the VLAN Identifier for the remote system connected to this port, as defined in IEEE 802.3.</td>
</tr>
<tr>
<td></td>
<td>The device uses a value from 1 through 4092 to specify a valid Port VLAN ID.</td>
</tr>
<tr>
<td></td>
<td>The device displays the value 0 for priority tagged packets. This means that only the 802.1D priority is significant and the device uses the default VLAN ID of the ingress port.</td>
</tr>
<tr>
<td>Priority</td>
<td>Displays the value of the 802.1D priority which is associated with the remote system connected to the port.</td>
</tr>
<tr>
<td>DSCP</td>
<td>Displays the value of the Differentiated Service Code Point (DSCP) which is associated with the remote system connected to the port.</td>
</tr>
<tr>
<td>Unknown bit status</td>
<td>Displays the unknown bit status of incoming traffic.</td>
</tr>
<tr>
<td></td>
<td>A value of <code>true</code> indicates that the network policy for the specified application type is currently unknown. In this case, the VLAN ID ignores the Layer 2 priority and value of the <strong>DSCP</strong> field.</td>
</tr>
<tr>
<td></td>
<td>A value of <code>false</code> indicates a specified network policy.</td>
</tr>
</tbody>
</table>
Tagged bit status

Displays the tagged bit status.

- A value of true indicates that the application uses a tagged VLAN.
- A value of false indicates that for the specific application the device uses untagged VLAN operation. In this case, the device ignores both the VLAN ID and the Layer 2 priority fields. The DSCP value, however, is relevant.

Hardware revision

Displays the vendor-specific hardware revision string as advertised by the remote endpoint.

Firmware revision

Displays the vendor-specific firmware revision string as advertised by the remote endpoint.

Software revision

Displays the vendor-specific software revision string as advertised by the remote endpoint.

Serial number

Displays the vendor-specific serial number as advertised by the remote endpoint.

Manufacturer name

Displays the vendor-specific manufacturer name as advertised by the remote endpoint.

Model name

Displays the vendor-specific model name as advertised by the remote endpoint.

Asset ID

Displays the vendor-specific asset tracking identifier as advertised by the remote endpoint.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

7.7 SFlow

sFlow is a standard protocol for monitoring networks. The device contains the sFlow feature which gives you visibility into network activity, allowing for effective management and control of network resources.
The sFlow monitoring system consists of an sFlow agent and a central sFlow collector. The agent uses the following forms of sampling:

- statistical packet-based sampling of packet flows
- time-based sampling of counters

The device combines both types of samples into datagrams. sFlow uses the datagrams to forward the sampled traffic statistics to an sFlow collector for analysis.

In order to perform packet flow sampling, you configure an instance with a sampling rate. You then configure the instance with a polling interval for counter sampling.

The menu contains the following dialogs:

- SFlow Configuration
- SFlow Receiver
7.7.1 **SFlow Configuration**

This dialog displays device parameters and lets you set up sFlow instances.

The dialog contains the following tabs:
- [Global]
- [Sampler]
- [Poller]

**[Global]**

**Information**

**Version**
Displays the MIB version, the organization responsible for agent implementation, and the device software revision.

**IP address**
Displays the IP address associated with the agent providing SNMP connectivity.

**Buttons**
You find the description of the standard buttons in section “Buttons” on page 15.

**[Sampler]**

**Table**

**Port**
Displays the physical source of data for the sampler.

**Receiver**
Displays the receiver index associated with the sampler.

**Sampling rate**
Specifies the static sampling rate for the sampling of the packets from this source.
Possible values:
- 0 (default setting)
  Deactivates the sampling.
- 256..65535
  When the ports receive data, the device increments to the set value and then samples the data.

Max. header size [byte]

Specifies the maximum header size in bytes copied from a sampled packet.

Possible values:
- 20..256 (default setting: 128)

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

**[Poller]**

**Table**

Port

Displays the physical source of data for the poller counter.

Receiver

Displays the receiver index associated with the query counter.

Possible values:
- 0..8 (default setting: 0)

Interval [s]

Specifies the maximum number of seconds between successive samples of the counters which are associated with this data source.

Possible values:
- 0..86400 (default setting: 0)

A sampling interval with the value 0 deactivates the sampling of the counters.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.
7.7.2 SFlow Receiver

In order to help avoid a condition where 2 persons or organizations attempt to assume control of the same sampler, the person or organization sets both the Name and Timeout [s] parameters in the same SNMP set request.

When releasing a sampler, the controlling person or organization deletes the value in the Name column. The controlling person or organization also restores the other parameters in this row to their default settings.

Table

Index
Displays the index number to which the table entry relates.

Name
Specifies the name of the person or company which uses the entry. An empty field indicates that the entry is currently unused. Edit this field before making changes to other sampler parameters.

Possible values:
- Alphanumeric ASCII character string with 0..127 characters

Timeout [s]
Displays the time, in seconds, remaining before the sampler is released and stops sampling.

Datagram size [byte]
Specifies the maximum number of data bytes that are sent in one sample datagram.

Possible values:
- 200..3996 (default setting: 1400)

IP address
Specifies the IP address of the sFlow collector.

Possible values:
- Valid IPv4 address (default setting: 0.0.0.0)

Destination UDP port
Specifies the number of the UDP port for sFlow datagrams.

Possible values:
- 1..65535 (default setting: 6343)
  Exception: Port 2222 is reserved for internal functions.
Datagram version

Displays the version of sFlow datagrams requested.

Buttons

You find the description of the standard buttons in section "Buttons" on page 15.

7.8 Report

The menu contains the following dialogs:
- Report Global
- Persistent Logging
- System Log
- Audit Trail
7.8.1 Report Global

The device lets you log specific events using the following outputs:

- on the console
- on one or more syslog servers
- on a connection to the Command Line Interface set up using SSH
- on a connection to the Command Line Interface set up using Telnet

In this dialog, you specify the required settings. By assigning the severity you specify which events the device registers.

The dialog lets you save a ZIP archive with system information on your PC.

Console logging

Operation

Enables/disables the Console logging function.

Possible values:

- **On**
  - The Console logging function is enabled.
  - The device logs the events on the console.
- **Off** (default setting)
  - The Console logging function is disabled.

Severity

Specifies the minimum severity for the events. The device logs events with this severity and with more urgent severities.

The device outputs the messages on the serial interface.

Possible values:

- emergency
- alert
- critical
- error
- warning (default setting)
- notice
- informational
- debug
Buffered logging

The device buffers logged events in 2 separate storage areas so that the log entries for urgent events are kept.

This dialog lets you specify the minimum severity for events that the device buffers in the storage area with a higher priority.

Severity

Specifies the minimum severity for the events. The device buffers log entries for events with this severity and with more urgent severities in the storage area with a higher priority.

Possible values:
- emergency
- alert
- critical
- error
- warning (default setting)
- notice
- informational
- debug

SNMP logging

When you enable the logging of SNMP requests, the device sends these as events with the preset severity notice to the list of syslog servers. The preset minimum severity for a syslog server entry is critical.

To send SNMP requests to a syslog server, you have a number of options to change the default settings. Select the ones that meet your requirements best.

- Set the severity for which the device creates SNMP requests as events to warning or error and change the minimum severity for a syslog entry for one or more syslog servers to the same value.
  - You also have the option of creating a separate syslog server entry for this.
- When you set the severity for SNMP requests to critical or higher, the device then sends SNMP requests as events with the severity critical or higher to the syslog servers.
- When you set the minimum severity for one or more syslog server entries to notice or lower, then it is possible that the device sends many events to the syslog servers.

Log SNMP get request

Enables/disables the logging of SNMP Get requests.

Possible values:
- On
  - The logging is enabled.
  - The device registers SNMP Get requests as events in the syslog.
  - In the Severity get request drop-down list, you select the severity for this event.
- Off (default setting)
  - The logging is disabled.
Log SNMP set request

Enables/disables the logging of SNMP Set requests.

Possible values:

- **On**
  The logging is enabled. The device registers SNMP Set requests as events in the syslog. In the Severity set request drop-down list, you select the severity for this event.

- **Off** (default setting)
  The logging is disabled.

Severity get request

Specifies the severity of the event that the device registers for SNMP Get requests.

Possible values:

- emergency
- alert
- critical
- error
- warning
- notice (default setting)
- informational
- debug

Severity set request

Specifies the severity of the event that the device registers for SNMP Set requests.

Possible values:

- emergency
- alert
- critical
- error
- warning
- notice (default setting)
- informational
- debug

**CLI logging**

Operation

Enables/disables the CLI logging function.
Possible values:

- **On**
  
  The **CLI logging** function is enabled. The device logs every command received using the Command Line Interface.

- **Off** (default setting)
  
  The **CLI logging** function is disabled.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Download support information

Generates a ZIP archive which the web browser lets you download from the device.

The ZIP archive contains system information about the device. You will find an explanation of the files contained in the ZIP archive in the following section.

**Support Information: Files contained in ZIP archive**

<table>
<thead>
<tr>
<th>File name</th>
<th>Format</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>audittrail.html</td>
<td>HTML</td>
<td>Contains the chronological recording of the system events and saved user changes in the Audit Trail.</td>
</tr>
<tr>

</table>
7.8.2 Persistent Logging

The device lets you save log entries permanently in a file in the external memory. Therefore, even after the device is restarted you have access to the log entries.

In this dialog, you limit the size of the log file and specify the minimum severity for the events to be saved. When the log file reaches the specified size, the device archives this file and saves the following log entries in a newly created file.

In the table the device displays you the log files held in the external memory. As soon as the specified maximum number of files has been attained, the device deletes the oldest file and renames the remaining files. This helps ensure that there is enough memory space in the external memory.

Note: Verify that an external memory is connected. To verify if an external memory is connected, see the Status column in the Basic Settings > External Memory dialog. We recommend to monitor the external memory connection using the Device Status function, see the External memory removal parameter in the Diagnostics > Status Configuration > Device Status dialog.

Operation

Operation

Enables/disables the Persistent Logging function.

Only activate this function if the external memory is available in the device.

Possible values:

- **On** (default setting)
  - The Persistent Logging function is enabled.
  - The device saves the log entries in a file in the external memory.

- **Off**
  - The Persistent Logging function is disabled.

Configuration

Max. file size [kbyte]

Specifies the maximum size of the log file in KBytes. When the log file reaches the specified size, the device archives this file and saves the following log entries in a newly created file.

Possible values:

- **0..4096** (default setting: 1024)
  - The value 0 deactivates saving of log entries in the log file.

Files (max.)

Specifies the number of log files that the device keeps in the external memory.
As soon as the specified maximum number of files has been attained, the device deletes the oldest file and renames the remaining files.

Possible values:
- 0..25 (default setting: 4)

The value 0 deactivates saving of log entries in the log file.

Severity

Specifies the minimum severity of the events. The device saves the log entry for events with this severity and with more urgent severities in the log file in the external memory.

Possible values:
- emergency
- alert
- critical
- error
- warning (default setting)
- notice
- informational
- debug

Log file target

Specifies the external memory device for logging.

Possible values:
- sd
  - External SD memory (ACA31)

Table

Index

Displays the index number to which the table entry relates.

Possible values:
- 1..25

The device automatically assigns this number.

File name

Displays the file name of the log file in the external memory.

Possible values:
- messages
- messages.X
File size [byte]

Displays the size of the log file in the external memory in bytes.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

Delete persistent log file

Removes the log files from the external memory.
7.8.3 **System Log**

The device logs device-internal events in a log file (System Log).

This dialog displays the log file (System Log). The dialog lets you save the log file in HTML format on your PC.

In order to search the log file for search terms, use the search function of your web browser.

The log file is kept until a restart is performed in the device. After the restart the device creates the file again.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Save log file**

Opens the HTML page in a new web browser window or tab. You can save the HTML page on your PC using the appropriate web browser command.

**Delete log file**

Removes the logged events from the log file.
7.8.4 **Audit Trail**

This dialog displays the log file (Audit Trail). The dialog lets you save the log file as an HTML file on your PC.

In order to search the log file for search terms, use the search function of your web browser.

The device logs system events and writing user actions in the device. This lets you keep track of WHO changes WHAT in the device and WHEN. The prerequisite is that the user role auditor or administrator is assigned to your user account.

The device logs the following user actions, among others:
- A user logging on via Command Line Interface (local or remote)
- A user logging off manually
- Automatic logging off of a user in the Command Line Interface after a specified period of inactivity
- Device restart
- Locking of a user account due to too many unsuccessful logon attempts
- Locking of the access to the device management due to unsuccessful logon attempts
- Commands executed in the Command Line Interface, apart from show commands
- Changes to configuration variables
- Changes to the system time
- File transfer operations, including firmware updates
- Configuration changes via HiDiscovery
- Firmware updates and automatic configuration of the device via the external memory
- Opening and closing of SNMP via an HTTPS tunnel

The device does not log passwords. The logged entries are write-protected and remain saved in the device after a restart.

**Note:** During the restart, access to the system monitor is possible using the default settings of the device. If an attacker gains physical access to the device, then he is able to reset the device settings to its default values using the system monitor. After this, the device and log file are accessible using the standard password. Take appropriate measures to restrict physical access to the device. Otherwise, deactivate access to the system monitor. See the Diagnostics > System > Selftest dialog, SysMon1 is available checkbox.

**Buttons**

You find the description of the standard buttons in section "Buttons" on page 15.

Save audit trail file

Opens the HTML page in a new web browser window or tab. You can save the HTML page on your PC using the appropriate web browser command.
8 Advanced

The menu contains the following dialogs:
- DHCP L2 Relay
- DHCP Server
- DNS
- Industrial Protocols
- Command Line Interface

8.1 DHCP L2 Relay

A network administrator uses the DHCP L2 Relay Agent to add DHCP client information. L3 Relay Agents and DHCP servers need the DHCP client information to assign an IP address and a configuration to the clients.

When active, the relay adds Option 82 information configured in this dialog to the packets before it relays DHCP requests from the clients to the server. The Option 82 fields provide unique information about the client and relay. This unique identifier consists of a Circuit ID for the client and a Remote ID for the relay.

In addition to the type, length, and multicast fields, the Circuit ID includes the VLAN ID, unit number, slot number, and port number for the connected client.

The Remote ID consists of a type and length field and either a MAC address, IP address, client identifier, or a user-defined device description. A client identifier is the user-defined system name for the device.

The menu contains the following dialogs:
- DHCP L2 Relay Configuration
- DHCP L2 Relay Statistics
8.1.1 DHCP L2 Relay Configuration

This dialog lets you activate the relay function on an interface and VLAN. When you activate this function on a port, the device either relays the Option 82 information or drops the information on untrusted ports. Furthermore, the device lets you specify the remote identifier.

The dialog contains the following tabs:
- [Interface]
- [VLAN ID]

### Operation

Enables/disables the DHCP L2 Relay function of the device globally.

Possible values:
- **On**
  - Enables the DHCP Layer 2 Relay function of the device.
- **Off** (default setting)
  - Disables the DHCP Layer 2 Relay function of the device.

### [Interface]

#### Table

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Active</th>
<th>Activates/deactivates the DHCP L2 Relay function on the port.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The prerequisite is that you enable the function globally.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>- <strong>marked</strong></td>
</tr>
<tr>
<td></td>
<td>The DHCP L2 Relay function is active.</td>
</tr>
<tr>
<td></td>
<td>- <strong>unmarked</strong> (default setting)</td>
</tr>
<tr>
<td></td>
<td>The DHCP L2 Relay function is inactive.</td>
</tr>
</tbody>
</table>

| Trusted port | Activates/deactivates the secure DHCP L2 Relay mode for the corresponding port. |
Possible values:

- **marked**
  The device accepts DHCP packets with Option 82 information.
- **unmarked** (default setting)
  The device discards DHCP packets received on non-secure ports that contain Option 82 information.

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

### [VLAN ID]

#### Table

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>VLAN to which the table entry relates.</th>
</tr>
</thead>
</table>
| Active  | Activates/deactivates the DHCP Layer 2 Relay function on the VLAN. The prerequisite is that you enable the function globally. Possible values:
  - **marked**
    The DHCP Layer 2 Relay function is active.
  - **unmarked** (default setting)
    The DHCP Layer 2 Relay function is inactive. |
| Circuit ID | Activates or deactivates the addition of the Circuit ID to the Option 82 information. Possible values:
  - **marked** (default setting)
    Enables Circuit ID and Remote ID to be sent together.
  - **unmarked**
    The device sends only the Remote ID. |
| Remote ID type | Specifies the components of the Remote ID for this VLAN. |
Possible values:

- **ip**
  Specifies the IP address of the device as Remote ID.
- **mac** (default setting)
  Specifies the MAC address of the device as Remote ID.
- **client-id**
  Specifies the system name of the device as Remote ID.
- **other**
  When you use this value, enter in the **Remote ID** column user-defined information.

**Remote ID**

Displays the Remote ID for the VLAN.

When you specify the value **other** in the **Remote ID type** column, specify the identifier.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
8.1.2 DHCP L2 Relay Statistics

The device monitors the traffic on the ports and displays the results in tabular form. This table is divided into various categories to aid you in traffic analysis.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untrusted server messages with Option 82</td>
<td>Displays the number of DHCP server messages received with Option 82 information on the untrusted interface.</td>
</tr>
<tr>
<td>Untrusted client messages with Option 82</td>
<td>Displays the number of DHCP client messages received with Option 82 information on the untrusted interface.</td>
</tr>
<tr>
<td>Trusted server messages without Option 82</td>
<td>Displays the number of DHCP server messages received without Option 82 information on the trusted interface.</td>
</tr>
<tr>
<td>Trusted client messages without Option 82</td>
<td>Displays the number of DHCP client messages received without Option 82 information on the trusted interface.</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Reset

Resets the entire table.
8.2 DHCP Server

With the DHCP server, you manage a database of available IP addresses and configuration information. When the device receives a request from a client, the DHCP server validates the DHCP client network, and then leases an IP address. When activated, the DHCP server also allocates configuration information appropriate for that client. The configuration information specifies, for example, which IP address, DNS server and the default route a client uses.

The DHCP server assigns an IP address to a client for a user-defined interval. The DHCP client is responsible for renewing the IP address before the interval expires. When the DHCP client is unable to renew the address, the address returns to the pool for reassignment.

The menu contains the following dialogs:

- DHCP Server Global
- DHCP Server Pool
- DHCP Server Lease Table
8.2.1 DHCP Server Global

Activate the function either globally or per port according to your requirements.

Operation

Operation Enables/disables the DHCP server function of the device globally.

Possible values:

- **On**
- **Off** (default setting)

Table

Port

Displays the port number.

DHCP server active

Activates/deactivates the DHCP server function on this port.

The prerequisite is that you enable the function globally.

Possible values:

- **marked** (default setting)
  - The DHCP server function is active.
- **unmarked**
  - The DHCP server function is inactive.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
8.2.2 DHCP Server Pool

Assign an IP address to an end device or switch connected to a port or included in a VLAN.

The DHCP server provides IP address pools from which it allocates IP addresses to clients. A pool consists of a list of entries. Specify an entry as static to a specific IP address, or as dynamic to an IP address range. The device accommodates up to 128 pools.

With static allocation, the DHCP server assigns an IP address to a specific client. The DHCP server identifies the client using a unique hardware ID. A static address entry contains 1 IP address. You apply this IP address to every port or to a specific port of the device. For static allocation, enter an IP address for allocation in the IP address field, and leave the Last IP address column empty. Enter a hardware ID with which the DHCP server uniquely identifies the client. This ID is either a MAC address, a Client ID, a Remote ID, or a Circuit ID. When a client contacts the device with a known hardware ID, the DHCP server allocates the static IP address.

In dynamic allocation, when a DHCP client makes contact on a port, the DHCP server assigns an available IP address from a pool for this port. For dynamic allocation, create a pool for the ports by assigning an IP address range. Specify the first and last IP addresses for the IP address range. Leave the MAC address, Client ID, Remote ID and Circuit ID fields empty. You have the option of creating multiple pool entries. This lets you create an IP address range that contains gaps.

This dialog displays the different information that is required for the assignment of an IP address for a port or a VLAN. Use the button to add an entry. The device adds a writable and readable entry.

Table

<table>
<thead>
<tr>
<th>Index</th>
<th>Displays the index number to which the table entry relates.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates/deactivates the DHCP server function on this port.</td>
</tr>
<tr>
<td>Possible values:</td>
<td></td>
</tr>
<tr>
<td>marked</td>
<td>The DHCP server function is active.</td>
</tr>
<tr>
<td>unmarked</td>
<td>(default setting)</td>
</tr>
<tr>
<td>The DHCP server function is inactive.</td>
<td></td>
</tr>
</tbody>
</table>

IP address

Specifies the IP address for static IP address assignment. When using dynamic IP address assignment, this value specifies the start of the IP address range.

Possible values:

- Valid IPv4 address
Last IP address

When using dynamic IP address assignment, this value specifies the end of the IP address range.

Possible values:
- Valid IPv4 address

Port

Displays the port number.

VLAN ID

Displays the VLAN to which the table entry relates.

A value of $1$ corresponds to the default device management VLAN.

Possible values:
- $1..4042$

MAC address

Specifies the MAC address of the device leasing the IP address.

Possible values:
- Valid Unicast MAC address
  - Specify the value with a colon separator, for example $00:11:22:33:44:55$.
- $-$
  - For the IP address assignment, the server ignores this variable.

DHCP relay

Specifies the IP address of the DHCP relay through which the clients transmit their requests to the DHCP server. When the DHCP server receives the client's request through another DHCP relay, it ignores this request.

Possible values:
- Valid IPv4 address
  - IP address of the DHCP relay.
- $-$
  - Between the client and the DHCP server there is no DHCP relay.

Client ID

Specifies the identification of the client device leasing the IP address.

Possible values:
- $1..80$ bytes (format $XX \ XX \ .. \ XX$)
- $-$
  - For the IP address assignment, the server ignores this variable.

Remote ID

Specifies the identification of the remote device leasing the IP address.
Possible values:
- 1..80 bytes (format XX XX .. XX)
- –
  For the IP address assignment, the server ignores this variable.

**Circuit ID**

Specifies the Circuit ID of the device leasing the IP address.

Possible values:
- 1..80 bytes (format XX XX .. XX)
- –
  For the IP address assignment, the server ignores this variable.

**Hirschmann device**

Activates/deactivates Hirschmann multicasts.

If the device in this IP address range serves only Hirschmann devices, then activate this function.

Possible values:
- marked
  In this IP address range, the device serves only Hirschmann devices. Hirschmann multicasts are activated.
- unmarked (default setting)
  In this IP address range, the device serves the devices of different manufacturers. Hirschmann multicasts are deactivated.

**Configuration URL**

Specifies the protocol to be used as well as the name and path of the configuration file.

Possible values:
- Alphanumeric ASCII character string with 0..70 characters
  Example: tftp://192.9.200.1/cfg/config.xml

When you leave this field blank, the device leaves this option field blank in the DHCP message.

**Lease time [s]**

Specifies the lease time in seconds.

Possible values:
- 1..4294967294 (default setting: 86400)
- 4294967295
  Use this value for assignments unlimited in time and for assignments via BOOTP.

**Default gateway**

Specifies the IP address of the default gateway.

A value of 0.0.0.0 disables the attachment of the option field in the DHCP message.

Possible values:
- Valid IPv4 address
Netmask

Specifies the mask of the network to which the client belongs.

A value of 0.0.0.0 disables the attachment of the option field in the DHCP message.

Possible values:
▶ Valid IPv4 netmask

WINS server

Specifies the IP address of the Windows Internet Name Server which converts NetBIOS names.

A value of 0.0.0.0 disables the attachment of the option field in the DHCP message.

Possible values:
▶ Valid IPv4 address

DNS server

Specifies the IP address of the DNS server.

A value of 0.0.0.0 disables the attachment of the option field in the DHCP message.

Possible values:
▶ Valid IPv4 address

Hostname

Specifies the hostname.

When you leave this field blank, the device leaves this option field blank in the DHCP message.

Possible values:
▶ Alphanumeric ASCII character string with 0..64 characters

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
### 8.2.3 DHCP Server Lease Table

This dialog displays the status of IP address leasing on a per port basis.

**Table**

<table>
<thead>
<tr>
<th>Port</th>
<th>Displays the port number to which the address is currently being leased.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>Displays the leased IP address to which the entry refers.</td>
</tr>
<tr>
<td>Status</td>
<td>Displays the lease phase.</td>
</tr>
</tbody>
</table>

According to the standard for DHCP operations, there are 4 phases to leasing an IP address: Discovery, Offer, Request, and Acknowledgement.

**Possible values:**

- **bootp**
  - A DHCP client is attempting to discover a DHCP server for IP address allocation.
- **offering**
  - The DHCP server is validating that the IP address is suitable for the client.
- **requesting**
  - A DHCP client is acquiring the offered IP address.
- **bound**
  - The DHCP server is leasing the IP address to a client.
- **renewing**
  - The DHCP client is requesting an extension to the lease.
- **rebinding**
  - The DHCP server is assigning the IP address to the client after a successful renewal.
- **declined**
  - The DHCP server denied the request for the IP address.
- **released**
  - The IP address is available for other clients.

| Remaining lifetime | Displays the time remaining on the leased IP address. |
|                   |                                                           |
| Leased MAC address | Displays the MAC address of the device leasing the IP address. |
|                   |                                                           |
| Gateway           | Displays the Gateway IP address of the device leasing the IP address. |
Client ID

Displays the client identifier of the device leasing the IP address.

Remote ID

Displays the remote identifier of the device leasing the IP address.

Circuit ID

Displays the Circuit ID of the device leasing the IP address.

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.

8.3 DNS

The menu contains the following dialogs:

- DNS Client

8.3.1 DNS Client

DNS (Domain Name System) is a service in the network that translates host names into IP addresses. This name resolution lets you contact other devices using their host names instead of their IP addresses.

The Client function enables the device to send requests for resolving hostnames in IP addresses to a DNS server.

The menu contains the following dialogs:

- DNS Client Global
- DNS Client Current
- DNS Client Static
- DNS Client Static Hosts
8.3.1.1 DNS Client Global

In this dialog, you enable the Client function and the Cache function.

**Operation**

Enables/disables the Client function.

Possible values:

- **On**
  - The Client function is enabled.
  - The device sends requests for resolving hostnames in IP addresses to a DNS server.

- **Off** (default setting)
  - The Client function is disabled.

**Cache**

Enables/disables the Cache function.

Possible values:

- **On** (default setting)
  - The Cache function is enabled.
  - The device temporarily saves up to 128 DNS server responses (hostname and corresponding IP address) in the cache. When the cache contains a matching entry, the host name of a new request the device resolves itself. This makes sending a new query to the DNS server unnecessary.

- **Off**
  - The Cache function is disabled.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Flush cache**

Removes every entry from the DNS cache.
8.3.1.2 DNS Client Current

This dialog displays to which DNS servers the device sends requests for resolving hostnames in IP addresses.

**Table**

<table>
<thead>
<tr>
<th>Index</th>
<th>Displays the sequential number of the DNS server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Displays the IP address of the DNS server. The device forwards requests for resolving hostnames in IP addresses to the DNS server with this IP address.</td>
</tr>
</tbody>
</table>

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
8.3.1.3 DNS Client Static

In this dialog, you specify the DNS servers to which the device forwards requests for resolving host names in IP addresses. The device lets you specify up to 4 IP addresses yourself or to transfer the IP addresses from a DHCP server.

Configuration

Configuration source

Specifies the source from which the device obtains the IP address of DNS servers to which the device addresses requests.

Possible values:

- **user**
  - The device uses the IP addresses specified in the table.

- **mgmt-dhcp** (default setting)
  - The device uses the IP addresses which the DHCP server delivers to the device.

Domain name

Specifies the domain name according to RFC1034 which the device adds to hostnames without a domain suffix.

Possible values:

- Alphanumeric ASCII character string with 0..255 characters

Request timeout [s]

Specifies the time interval in seconds for sending again a request to the server.

Possible values:

- 0
  - Deactivates the function. The device does not send a request to the server again.

- 1..3600 (default setting: 3)

Request retransmits

Specifies, how many times the device retransmits a request.

The prerequisite is that, in the Request timeout [s] field, you specify a value >0.

Possible values:

- 0..100 (default setting: 2)
### Table

**Index**

Displays the sequential number of the DNS server.

The device lets you specify up to 4 DNS servers.

**Address**

Specifies the IP address of the DNS server.

Possible values:

- Valid IPv4 address (default setting: 0.0.0.0)

**Active**

Activates/deactivates the table entry.

The device sends requests to the DNS server configured in the first active table entry. When the device does not receive a response from this server, it sends requests to the DNS server configured in the next active table entry.

Possible values:

- marked
  - The DNS client sends requests to this DNS server.
  - Prerequisites:
    - Enable the DNS-client function in the Advanced > DNS > Global dialog.
    - Select in the Configuration frame, Configuration source drop-down-list the value user.
- unmarked (default setting)
  - The device does not send requests to this DNS server.

### Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
8.3.1.4 DNS Client Static Hosts

This dialog lets you specify up to 64 hostnames which you link with one IP address each. Upon a request for resolving hostnames in IP addresses, the device searches this table for a corresponding entry. When the device does not find a corresponding entry, it forwards the request.

Table

<table>
<thead>
<tr>

Buttons

You find the description of the standard buttons in section “Buttons” on page 15.
8.4 Industrial Protocols

The menu contains the following dialogs:

- IEC61850-MMS
- Modbus TCP
- EtherNet/IP
- PROFINET
The IEC61850-MMS is a standardized industrial communication protocol from the International Electrotechnical Commission (IEC). For example, automatic switching equipment uses this protocol when communicating with power station equipment.

The packet orientated protocol defines a uniform communication language based on the transport protocol, TCP/IP. The protocol uses a Manufacturing Message Specification (MMS) server for client server communications. The protocol includes functions for SCADA, Intelligent Electronic Device (IED) and the network control systems.

Note: IEC61850/MMS does not provide any authentication mechanisms. If the write access for IEC61850 is activated, then every client that can access the device using TCP/IP is capable of changing the settings of the device. This in turn can result in an incorrect configuration of the device and to failures in the network.

Activate the write access only if you have taken additional measures (for example Firewall, VPN, etc.) to reduce possible unauthorized access.

This dialog lets you specify the following MMS server settings:
- Activates/deactivates the MMS server.
- Activates/deactivates the write access to the MMS server.
- The MMS server TCP Port.
- The maximum number of MMS server sessions.

**Operation**

Enables/disables the IEC61850-MMS server.

Possible values:
- **On**
  - The IEC61850-MMS server is enabled.
- **Off** (default setting)
  - The IEC61850-MMS server is disabled.
  - The IEC61850 MIBs stay accessible.

**Configuration**

Activates/deactivates the write access to the MMS server.
Advanced
[Advanced > Industrial Protocols > IEC61850-MMS]

Possible values:

► **marked**
  The write access to the MMS server is activated. This setting lets you change the device settings using the IEC 61850 MMS protocol.

► **unmarked (default setting)**
  The write access to the MMS server is deactivated. The MMS server is accessible as read-only.

**Technical key**

Specifies the IED name.

The IED name is eligible independently of the system name.

Possible values:

► Alphanumeric ASCII character string with 0..32 characters
  The following characters are allowed:
  - _
  - 0..9
  - a..z
  - A..Z (default setting: KEY)

To get the MMS server to use the IED name, click the button and restart the MMS server. The connection to connected clients is then interrupted.

**TCP port**

Specifies TCP port for MMS server access.

Possible values:

► **1..65535 (default setting: 102)**
  Exception: Port 2222 is reserved for internal functions.

**Note:** The server restarts automatically after you change the port. In the process, the device terminates open connections to the server.

**Sessions (max.)**

Specifies the maximum number of MMS server connections.

Possible values:

► **1..15 (default setting: 5)**

**Information**

**Status**

Displays the current **IEC61850-MMS** server status.

Possible values:

► **unavailable**
► **starting**
► **running**
Active sessions

Displays the number of active MMS server connections.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

Download

Copies the ICD file to your PC.
**8.4.2 Modbus TCP**

*Modbus TCP* is a protocol used for Supervisory Control and Data Acquisition (SCADA) system integration. *Modbus TCP* is a vendor-neutral protocol used to monitor and control industrial automation equipment such as Programmable Logic Controllers (PLC), sensors and meters.

This dialog lets you specify the parameters of the protocol. To monitor and control the parameters of the device, you need Human-Machine Interface (HMI) software and the memory mapping table. Refer to the tables located in the Industrial Protocol user manual for the supported objects and memory mapping.

The dialog lets you enable the function, activate the write access, control which TCP port the Human-Machine Interface (HMI) polls for data. You can also specify the number of sessions allowed to be open at the same time.

**Note:** Activating the *Modbus TCP* write-access can cause an unavoidable security risk, because the protocol does not authenticate user access.

To help minimize the unavoidable security risks, specify the IP address range located in the *Device Security > Management Access* dialog. Enter only the IP addresses assigned to your devices before enabling the function. Furthermore, the default setting for monitoring function activation in the *Diagnostics > Status Configuration > Security Status* dialog, *Global* tab, is active.

**Operation**

Enables/disables the *Modbus TCP* server in the device.

Possible values:

- **On**
  - The *Modbus TCP* server is enabled.
- **Off** (default setting)
  - The *Modbus TCP* server is disabled.

**Configuration**

Activates/deactivates the write access to the *Modbus TCP* parameters.

**Note:** Activating the *Modbus TCP* write-access can cause an unavoidable security risk, because the protocol does not authenticate user access.
Possible values:

- **marked** (default setting)
  The Modbus TCP server read/write access is active. This lets you change the device configuration using the Modbus TCP protocol.

- **unmarked**
  The Modbus TCP server read-only access is active.

**TCP port**

Specifies the TCP port number that the Modbus TCP server uses for communication.

Possible values:

- `<TCP Port number>` (default setting: 502)
  Specifying 0 is not allowed.

**Sessions (max.)**

Specifies the maximum number of concurrent sessions that the Modbus TCP server maintains.

Possible values:

- `1..5` (default setting: 5)

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.
8.4.3 PROFINET

This dialog lets you configure the PROFINET protocol on this device used in conjunction with PROFINET Controllers and PROFINET devices. The device bases the PROFINET function on the Siemens V2.2 PROFINET stack for common Ethernet controllers. The PROFINET protocol implemented in the device conforms to Class B for real time responses according to IEC 61158.

Functions that directly affect the PROFINET function require the following default values to be changed. If you have obtained the device as a specially available PROFINET variant, then these values are already predefined:

**PROFINET**

**Advanced > Industrial Protocols > PROFINET** dialog
- **Operation** frame
  - **Operation** = **On**
- **Configuration** frame
  - **Name of station** field = <empty>

**Network**

**Basic Settings > Network** dialog
- **Management interface** frame
  - **IP address assignment** radio button = **Local**
- **HiDiscovery protocol v1/v2** frame
  - **Access** drop-down list = **readOnly**
- **IP parameter** frame
  - **IP address** field = **0.0.0.0**
  - **Netmask** field = **0.0.0.0**
  - **Gateway address** field = **0.0.0.0**

**VLAN**

**Switching > Global** dialog
- **Configuration** frame
  - **VLAN unaware mode** checkbox = **marked**

**LLDP**

**Diagnostics > LLDP > Configuration** dialog
- **Configuration** frame
  - **Transmit interval [s]** field = **5**
  - **Transmit delay [s]** field = **1**

**Operation**

**Operation**

Enables/disables the PROFINET function in the device.
Possible values:

- **On**: The PROFINET function is enabled.
- **Off** (default setting): The PROFINET function is disabled.

**Configuration**

**Name of station**

Specifies the name of the device.

Possible values:

- Alphanumeric ASCII character string with 0..240 characters
  - The device prohibits you from using a number as the first character.

**Information**

**Active application relations**

Displays how many application relations are active.

**Table**

**Port**

Displays the port number.

**DCP mode**

Specifies the data stream direction on the port to monitor for DCP packets.

The Programmable Logic Controller (PLC) detects PROFINET devices using the Discovery and Configuration Protocol (DCP).
The DCP identify request packets are multicast, the responses from the agents are unicast. Regardless of the settings, the device forwards the received DCP packets to other ports whose setting is either \textit{egress} or \textit{both}.

Possible values:
\begin{itemize}
  \item \texttt{none} \textit{The agent does not respond to packets received on this port. The port does not forward packets received on other ports.}
  \item \texttt{ingress} \textit{The agent responds to packets received on this port. The port does not forward packets received on other ports.}
  \item \texttt{egress} \textit{The agent does not respond to packets received on this port. The port forwards packets received on other ports.}
  \item \texttt{both} (default setting) \textit{The agent responds to packets received on this port. The port forwards packets received on other ports.}
\end{itemize}

\textbf{Buttons}

You find the description of the standard buttons in section “\textit{Buttons}” on page 15.

\textbf{Download GSDML file}

Copies the GSDML file onto your PC.
8.4.4 EtherNet/IP

This dialog lets you activate the EtherNet/IP protocol, to change the SET/GET capability and to download the EDS file from the device.

**Operation**

Enables/disables the EtherNet/IP function in the device.

Possible values:
- **On**
  The EtherNet/IP function is enabled.
- **Off** (default setting)
  The EtherNet/IP function is disabled. The device continues to read the EtherNet/IP data.

**Configuration**

Write access

Activates/deactivates the read/write capability of the EtherNet/IP protocol.

Possible values:
- **marked**
  The EtherNet/IP protocol accepts set/get requests.
- **unmarked** (default setting)
  The EtherNet/IP protocol accepts only get requests.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Download EDS file**

Copies the following information in a zip file onto your PC:
- Electronic Data Sheet (EDS) with device related information
- device icon
This dialog lets you access the device using the Command Line Interface.

The prerequisites are:
- In the device, enable the SSH server in the Device Security > Management Access > Server dialog, tab SSH.
- On your workstation, install a SSH-capable client application which registers a handler for URLs starting with ssh:// in your operating system.

**Buttons**

You find the description of the standard buttons in section “Buttons” on page 15.

**Open SSH connection**

Opens the SSH-capable client application.

When you click the button, the web application passes the URL of the device starting with ssh:// and the user name of the currently logged on user.

If the web browser finds a SSH-capable client application, then the SSH-capable client establishes a connection to the device using the SSH protocol.

B Further support

Technical questions

For technical questions, please contact any Hirschmann dealer in your area or Hirschmann directly.

You find the addresses of our partners on the Internet at www.hirschmann.com.

A list of local telephone numbers and email addresses for technical support directly from Hirschmann is available at hirschmann-support.belden.com.

This site also includes a free of charge knowledge base and a software download section.

Technical Documents

The current manuals and operating instructions for Hirschmann products are available at doc.hirschmann.com.

Hirschmann Competence Center

The Hirschmann Competence Center is ahead of its competitors on three counts with its complete range of innovative services:

- Consulting incorporates comprehensive technical advice, from system evaluation through network planning to project planning.
- Training offers you an introduction to the basics, product briefing and user training with certification.
  
  You find the training courses on technology and products currently available at www.hicomcenter.com.
- Support ranges from the first installation through the standby service to maintenance concepts.

With the Hirschmann Competence Center, you decided against making any compromises. Our client-customized package leaves you free to choose the service components you want to use.
What is your opinion of this manual? We are constantly striving to provide as comprehensive a description of our product as possible, as well as important information to assist you in the operation of this product. Your comments and suggestions help us to further improve the quality of our documentation.

Your assessment of this manual:

4 Managing configuration profiles

4.1 Detecting changed settings .................................................. 74
4.2 Saving the settings ............................................................... 74
4.2.1 Saving the configuration profile in the device ...................... 75
4.2.2 Saving the configuration profile in the external memory ....... 77
4.2.3 Backup the configuration profile on a remote server ........... 77
4.2.4 Exporting a configuration profile ....................................... 78
4.3 Loading settings ................................................................. 80
4.3.1 Activating a configuration profile ...................................... 80
4.3.2 Loading the configuration profile from the external memory ... 80
4.3.3 Importing a configuration profile ....................................... 80
4.4 Reset the device to the factory defaults ................................ 85
4.4.1 Using the Graphical User Interface or Command Line Interface... 85
4.4.2 Using the System Monitor .................................................. 85

5 Loading software updates ....................................................... 87
5.1 Software update from the PC ................................................ 87
5.2 Software update from a server ............................................. 88
5.3 Software update from the external memory ......................... 89
5.3.1 Manually—initiated by the administrator ............................ 89
5.3.2 Automatically—initiated by the device ............................... 89
5.4 Loading a previous software version ................................... 91

6 Configuring the ports .............................................................. 92
6.1 Enabling/disabling the port .................................................. 92
6.2 Selecting the operating mode ................................................ 93
6.3 Link monitoring ................................................................. 94
6.3.1 Example ................................................................. 94

7 Assistance in the protection from unauthorized access .................. 95
7.1 Changing the SNMPv1/v2 community ................................... 95
7.2 Disabling SNMPv1/v2 ......................................................... 96
7.3 Disabling HTTP ............................................................... 97
7.4 Disabling Telnet ............................................................... 98
7.5 Disabling the HiDiscovery access ....................................... 99
7.6 Activating the IP access restriction ..................................... 100
7.7 Adjusting the session timeouts ............................................ 103
8 Controlling the data traffic

8.1 Helping protect against unauthorized access ......................................................... 105
8.2 ACL ....................................................................................................................... 107
8.2.1 Creating and editing IPv4 rules ........................................................................... 108
8.2.2 Creating and configuring an IP ACL using the Command Line Interface ........... 109
8.2.3 Creating and editing MAC rules ........................................................................... 110
8.2.4 Creating and configuring a MAC ACL using the Command Line Interface ...... 110
8.2.5 Assigning ACLs to a port or VLAN ................................................................. 111
8.3 MAC authentication bypass ................................................................................... 112

9 Synchronizing the system time in the network

9.1 Basic settings ......................................................................................................... 113
9.1.1 Setting the time .................................................................................................. 114
9.1.2 Automatic daylight saving time changeover ...................................................... 115
9.2 SNTP ..................................................................................................................... 116
9.2.1 Preparation ........................................................................................................ 117
9.2.2 Defining settings of the SNTP client ................................................................. 118
9.2.3 Specifying SNTP server settings ....................................................................... 119
9.3 PTP ....................................................................................................................... 120
9.3.1 Types of clocks .................................................................................................. 120
9.3.2 Best Master Clock algorithm .......................................................................... 121
9.3.3 Delay measurement ......................................................................................... 121
9.3.4 PTP domains .................................................................................................... 122
9.3.5 Using PTP ......................................................................................................... 122

10 Network load control

10.1 Direct packet distribution ...................................................................................... 123
10.1.1 Learning MAC addresses ................................................................................. 123
10.1.2 Aging of learned MAC addresses ..................................................................... 123
10.1.3 Static address entries ....................................................................................... 124
10.2 Multicasts ............................................................................................................. 126
10.2.1 Example of a Multicast application .................................................................. 126
10.2.2 IGMP snooping ............................................................................................... 126
10.3 Rate limiter ........................................................................................................... 131
10.4 QoS/Priority ......................................................................................................... 132
10.4.1 Description of prioritization ............................................................................ 132
10.4.2 Handling of received priority information ........................................................ 133
10.4.3 VLAN tagging ................................................................................................. 133
10.4.4 IP ToS (Type of Service) ................................................................................ 134
10.4.5 Handling of traffic classes ............................................................................... 135
10.4.6 Queue management ........................................................................................ 136
10.4.7 Management prioritization ............................................................................ 139
10.4.8 Setting prioritization ....................................................................................... 139
10.5 Flow control ........................................................................................................ 144
10.5.1 Halfduplex or fullduplex link .......................................................................... 144
10.5.2 Setting up the Flow Control ........................................................................... 145

11 VLANs .................................................................................................................... 146
11.1 Examples of VLANs ............................................................................................. 147
11.1.1 Example 1 ........................................................................................................ 147
11.1.2 Example 2 ....................................................................................................... 150

## Safety instructions

### WARNING

**UNCONTROLLED MACHINE ACTIONS**

To avoid uncontrolled machine actions caused by data loss, configure all the data transmission devices individually.

Before you start any machine which is controlled via data transmission, be sure to complete the configuration of all data transmission devices.

Failure to follow these instructions can result in death, serious injury, or equipment damage.
The “Configuration” user manual contains the information you need to start operating the device. It takes you step by step from the first startup operation through to the basic settings for operation in your environment.

The “Installation” user manual contains a device description, safety instructions, a description of the display, and the other information that you need to install the device.

The “Graphical User Interface” reference manual contains detailed information on using the graphical user interface to operate the individual functions of the device.

The “Command Line Interface” reference manual contains detailed information on using the Command Line Interface to operate the individual functions of the device.

The Industrial HiVision Network Management software provides you with additional options for smooth configuration and monitoring:

- Auto-topology discovery
- Browser interface
- Client/server structure
- Event handling
- Event log
- Simultaneous configuration of multiple devices
- Graphical user interface with network layout
- SNMP/OPC gateway
The designations used in this manual have the following meanings:

<table>
<thead>
<tr>
<th>Designation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>List</td>
<td>Work step</td>
</tr>
<tr>
<td>Link</td>
<td>Cross-reference with link</td>
</tr>
<tr>

<td>A note emphasizes a significant fact or draws your attention to a dependency.</td>
</tr>
<tr>
<td>Courier</td>
<td>Representation of a CLI command or field contents in the graphical user interface</td>
</tr>
</tbody>
</table>

- Execution in the Graphical User Interface
- Execution in the Command Line Interface
Introduction

The device has been developed for use in a harsh industrial environment. Accordingly, the installation process has been kept simple. Thanks to the selected default settings, you only have to enter a few settings before starting to operate the device.
# 1 User interfaces

The device lets you specify the settings of the device using the following user interfaces.

<table>
<thead>
<tr>
<th>User interface</th>
<th>Can be reached through …</th>
<th>Prerequisite</th>
</tr>
</thead>
<tbody>
<tr>
<td>Graphical User Interface</td>
<td>Ethernet (In-Band)</td>

<td>Serial interface (Out-of-Band)</td>
<td></td>
</tr>
<tr>
<td>System monitor</td>
<td>Serial interface (Out-of-Band)</td>
<td>Terminal emulation software</td>
</tr>
</tbody>
</table>

## 1.1 Graphical User Interface

### System requirements

To open the Graphical User Interface, you need the desktop version of a web browser with HTML5 support.

**Note:** Third-party software such as web browsers validate certificates based on criteria such as their expiration date and current cryptographic parameter recommendations. Old certificates can cause errors for example, when they expire or cryptographic recommendations change. To solve validation conflicts with third-party software, transfer your own up-to-date certificate onto the device or regenerate the certificate with the latest firmware.

### Starting the Graphical User Interface

The prerequisite for starting the Graphical User Interface is that the IP parameters are configured in the device. See "Specifying the IP parameters" on page 42.

1. Start your web browser.
2. Type the IP address of the device in the address field of the web browser.
   
   Use the following form: **https://xxx.xxx.xxx.xxx**

   The web browser sets up the connection to the device and displays the Login page.
3. When you want to change the language of the Graphical User Interface, click the appropriate link in the top right corner of the Login page.
4. Enter the user name.
5. Enter the password.
6. Click the **Login** button.

   The web browser displays the Graphical User Interface.
1.2 **Command Line Interface**

The Command Line Interface enables you to use the functions of the device through a local or remote connection.

The Command Line Interface provides IT specialists with a familiar environment for configuring IT devices. As an experienced user or administrator, you have knowledge about the basics and about using Hirschmann devices.

1.2.1 **Preparing the data connection**

Information for assembling and starting up your device can be found in the "Installation" user manual.

- Connect the device with the network. The prerequisite for a successful data connection is the correct setting of the network parameters.

You can access the user interface of the Command Line Interface for example, with the freeware program **PuTTY**.

This program is provided on the product CD.

- Install the **PuTTY** program on your computer.

1.2.2 **Access to the Command Line Interface using Telnet**

**Telnet connection using Windows**

Telnet is only installed as standard in Windows versions before Windows Vista.

Proceed as follows:

- Start the **Command Prompt** program on your computer.
- Enter the command `telnet <IP_address>`.

![Command Prompt: Setting up the Telnet connection to the device](image)
**Telnet connection using PuTTY**

Proceed as follows:

- Start the PuTTY program on your computer.

![PuTTY input screen](image)

- In the **Host Name (or IP address)** field you enter the IP address of your device. The IP address consists of 4 decimal numbers with values from 0 to 255. The 4 decimal numbers are separated by points.
- To select the connection type, select the **Telnet** radio button in the **Connection type** range.
- Click the **Open** button to set up the data connection to your device. The Command Line Interface appears on the screen with a window for entering the user name. The device enables up to 5 users to have access to the Command Line Interface at the same time.

**Note:** This device is a security-relevant product. Change the password during the first startup procedure.

- Enter the user name. The default user name is *admin*.
- Press the <Enter> key.
- Enter the password. The default password is *private*.
- Press the <Enter> key.

RSP20 Release 8.1

(Build date 2019-02-05 19:17)

System Name   :  RSP-ECE555015560
Management IP :  192.168.1.5
Subnet Mask   :  255.255.255.0
Base MAC      :  EC:E5:55:01:02:03
System Time   :  2019-01-01 17:39:01

NOTE: Enter '?' for Command Help. Command help displays all options that are valid for the particular mode.
For the syntax of a particular command form, please consult the documentation.

RSP>

Figure 3: Start screen of the Command Line Interface
1.2.3 **Access to the Command Line Interface using SSH (Secure Shell)**

In the following example we use the *PuTTY* program. Another option to access your device using SSH is the OpenSSH Suite.

Proceed as follows:

- Start the *PuTTY* program on your computer.

![PuTTY Configuration](image)

*Figure 4: PuTTY input screen*

- In the *Host Name (or IP address)* field you enter the IP address of your device. The IP address consists of 4 decimal numbers with values from 0 to 255. The 4 decimal numbers are separated by points.

- To specify the connection type, select the *SSH* radio button in the *Connection type* range. After selecting and setting the required parameters, the device enables you to set up the data connection using SSH.
Click the **Open** button to set up the data connection to your device. Depending on the device and the time at which SSH was configured, setting up the connection takes up to a minute.

When you first login to your device, towards the end of the connection setup, the PuTTY program displays a security alert message and lets you check the fingerprint of the key.

![Security alert prompt for the fingerprint](image)

Check the fingerprint.
This helps protect yourself from unwelcome guests.

When the fingerprint matches the fingerprint of the device key, click the **Yes** button.

The device lets you display the finger prints of the device keys with the command `show ssh` or in the **Device Security > Management Access > Server** dialog, **SSH** tab.

The Command Line Interface appears on the screen with a window for entering the user name. The device enables up to 5 users to have access to the Command Line Interface at the same time.

Enter the user name.
The default user name is `admin`.

Press the `<Enter>` key.

Enter the password.
The default password is `private`.

Press the `<Enter>` key.

**Note:** This device is a security-relevant product. Change the password during the first startup procedure.
user interfaces
1.2 Command Line Interface

Figure 6: Start screen of the Command Line Interface

1.2.4 Access to the Command Line Interface using the serial interface

The serial interface is used to locally connect an external network management station (VT100 terminal or PC with terminal emulation). The interface lets you set up a data connection to the Command Line Interface and to the system monitor.

<table>
<thead>
<tr>
<th>VT 100 terminal settings</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>9600 bit/s</td>
</tr>
<tr>
<td>Data</td>
<td>8 bit</td>
</tr>
<tr>
<td>Stopbit</td>
<td>1 bit</td>
</tr>
<tr>
<td>Handshake</td>
<td>off</td>
</tr>
<tr>
<td>Parity</td>
<td>none</td>
</tr>
</tbody>
</table>
Proceed as follows:

- Connect the device to a terminal using the serial interface. Alternatively connect the device to a COM port of your PC using terminal emulation based on VT100 and press any key.
- Alternatively you set up the serial data connection to the device with the serial interface using the PuTTY program. Press the <Enter> key.

![PuTTY Configuration](image)

*Figure 7: Serial data connection with the serial interface using the PuTTY program*

- Press any key on your terminal keyboard a number of times until the login screen indicates the CLI mode.
- Enter the user name.
  - The default user name is `admin`.
- Press the <Enter> key.
- Enter the password.
  - The default password is `private`.
- Press the <Enter> key.

**Note:** This device is a security-relevant product. Change the password during the first startup procedure.
1.2 Command Line Interface

1.2.5 User rights

The device functions available to you as a user depend on your access role. When you are logged on to the user interface with a specific access role, the functions of the access role are available to you.

The commands available to you as a user, also depend on the Command Line Interface mode in which you are currently working. See “Mode-based command hierarchy” on page 24.
Access roles

The user interface offers the following access roles:

![Access roles diagram]

Table 2: Access roles and scope of user authorizations

<table>
<thead>
<tr>
<th>Access role</th>
<th>User authorizations</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Users logged on with the access role <strong>User</strong> are authorized to monitor the device.</td>
</tr>
<tr>
<td>Auditor</td>
<td>Users logged on with the access role <strong>Auditor</strong> are authorized to monitor the device and to save the log file in the <em>Diagnostics &gt; Report &gt; Audit Trail</em> dialog.</td>
</tr>
<tr>
<td>Operator</td>
<td>Users logged on with the access role <strong>Operator</strong> are authorized to monitor the device and to change the settings – with the exception of security settings for device access.</td>
</tr>
<tr>
<td>Administrator</td>
<td>Users logged on with the access role <strong>Administrator</strong> are authorized to monitor the device.</td>
</tr>
<tr>
<td>Unauthorized</td>
<td>Unauthorized users are blocked, and the device rejects the user login. Assign this value to temporarily lock the user account. If a detected error occurs during an access role change, then the device assigns this access role to the user account.</td>
</tr>
</tbody>
</table>

1.2.6 Mode-based command hierarchy

In the Command Line Interface, the commands are grouped in the related modes, according to the type of the command. Every command mode supports specific Hirschmann software commands.

The commands available to you as a user depend on your privilege level (administrator, operator, guest, auditor). They also depend on the mode in which you are currently working. When you switch to a specific mode, the commands of the mode are available to you.

The User Exec mode commands are an exception. The Command Line Interface enables you to execute these commands in the Privileged Exec mode, too.
The following figure displays the modes of the Command Line Interface.

![Structure of the Command Line Interface](image)

The Command Line Interface supports, depending on the user level, the following modes:

- **User Exec mode**
  When you login to the Command Line Interface, you enter the User Exec mode. The User Exec mode contains a limited range of commands.
  Command prompt: (RSP) >

- **Privileged Exec mode**
  To access the entire range of commands, you enter the Privileged Exec mode. If you login as a privileged user, then you are able to enter the Privileged Exec mode. In the Privileged Exec mode, you are able to execute the User Exec mode commands, too.
  Command prompt: (RSP) #

- **VLAN mode**
  The VLAN mode contains VLAN-related commands.
  Command prompt: (RSP) (VLAN)#
User interfaces

1.2 Command Line Interface

- **Global Config mode**
  The Global Config mode lets you perform modifications to the current configuration. This mode groups general setup commands.
  Command prompt: (RSP) (config)#

- **Interface Range mode**
  The commands in the Interface Range mode affect a specific port, a selected group of multiple ports or all port of the device. The commands modify a value or switch a function on/off on one or more specific ports.
  - All physical ports in the device
    Command prompt: (RSP) ((interface) all)#
    Example: When you switch from the Global Config mode to the Interface Range mode, the command prompt changes as follows:
    - (RSP) (config)#interface all
    - (RSP) ((Interface)all)#
  - A single port on one interface
    Command prompt: (RSP) (interface <slot/port>)#
    Example: When you switch from the Global Config mode to the Interface Range mode, the command prompt changes as follows:
    - (RSP) (config)#interface 2/1
    - (RSP) (interface 2/1)#
  - A range of ports on one interface
    Command prompt: (RSP) (interface <interface range>)#
    Example: When you switch from the Global Config mode to the Interface Range mode, the command prompt changes as follows:
    - (RSP) (config)#interface 1/2-1/4
    - (RSP) ((Interface)1/2-1/4)#
  - A list of single ports
    Command prompt: (RSP) (interface <interface list>)#
    Example: When you switch from the Global Config mode to the Interface Range mode, the command prompt changes as follows:
    - (RSP) (config)#interface 1/2,1/4,1/5
    - (RSP) ((Interface)1/2,1/4,1/5)#
  - A list of port ranges and single ports
    Command prompt: (RSP) (interface <complex range>)#
    Example: When you switch from the Global Config mode to the Interface Range mode, the command prompt changes as follows:
    - (RSP) (config)#interface 1/2-1/4,1/6-1/9
    - (RSP) ((Interface)1/2-1/4,1/6-1/9)

The following table displays the command modes, the command prompts (input request characters) visible in the corresponding mode, and the option with which you quit this mode.

**Table 3: Command modes**

<table>
<thead>
<tr>
<th>Command mode</th>
<th>Access method</th>
<th>Quit or start next mode</th>
</tr>
</thead>
</table>
| User Exec mode         | First access level. Perform basic tasks and list system information. | To quit you enter **logout**: (RSP) >logout  
Are you sure (Y/N) ?y |
| Privileged Exec mode   | From the User Exec mode, you enter the command enable: (RSP) >enable (RSP) # | To quit the Privileged Exec mode and return to the User Exec mode, you enter exit: (RSP) #exit (RSP) > |
Table 3: Command modes

<table>
<thead>
<tr>
<th>Command mode</th>
<th>Access method</th>
<th>Quit or start next mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN mode</td>
<td>From the Privileged Exec mode, you enter the command <strong>vlan database</strong>: (RSP) #vlan database (RSP) (Vlan)#</td>
<td>To end the VLAN mode and return to the Privileged Exec mode, you enter <strong>exit</strong> or press Ctrl Z. (RSP) (Vlan)#exit (RSP) #</td>
</tr>
<tr>
<td>Global Config mode</td>
<td>From the Privileged Exec mode, you enter the command <strong>configure</strong>: (RSP) #configure (RSP) (config)#</td>
<td>To quit the Global Config mode and return to the Privileged Exec mode, you enter <strong>exit</strong>: (RSP) (config)#exit (RSP) #</td>
</tr>
<tr>
<td></td>
<td>From the User Exec mode, you enter the command <strong>enable</strong>, and then in Privileged Exec mode, enter the command <strong>configure</strong>: (RSP) &gt;enable (RSP) #configure (RSP) (config)#</td>
<td>To then quit the Privileged Exec mode and return to the User Exec mode, you enter <strong>exit</strong> again: (RSP) #exit (RSP) &gt;</td>
</tr>
<tr>
<td>Interface Range mode</td>
<td>From the Global Config mode you enter the command <strong>interface</strong> {all</td>
<td>&lt;slot/port&gt;</td>
</tr>
</tbody>
</table>

When you enter a question mark (?) after the prompt, the Command Line Interface displays a list of the available commands and a short description of the commands.

```
{RSP}> cli
Set the CLI preferences.
{RSP}> enable
Turn on privileged commands.
{RSP}> help
Display help for various special keys.
{RSP}> history
Show a list of previously run commands.
{RSP}> logout
Exit this session.
{RSP}> ping
Send ICMP echo packets to a specified IP address.
{RSP}> show
Display device options and settings.
{RSP}> telnet
Establish a telnet connection to a remote host.
```

(Figure 10: Commands in the User Exec mode)

1.2.7 Executing the commands

Syntax analysis

When you login to the Command Line Interface, you enter the User Exec mode. The Command Line Interface displays the prompt *(RSP)* on the screen.
When you enter a command and press the <Enter> key, the Command Line Interface starts the syntax analysis. The Command Line Interface searches the command tree for the desired command.

When the command is outside the Command Line Interface command range, a message informs you of the detected error.

Example:

The user wants to execute the `show system info` command, but enters `info` without `s` and presses the <Enter> key.

The Command Line Interface then displays a message:

```
(RSP)>show system info
Error: Invalid command 'info'
```

**Command tree**

The commands in the Command Line Interface are organized in a tree structure. The commands, and where applicable the related parameters, branch down until the command is completely defined and therefore executable. The Command Line Interface checks the input. When you entered the command and the parameters correctly and completely, you execute the command with the <Enter> key.

After you entered the command and the required parameters, the other parameters entered are treated as optional parameters. When one of the parameters is unknown, the Command Line Interface displays a syntax message.

The command tree branches for the required parameters until the required parameters have reached the last branch in the structure.

With optional parameters, the command tree branches until the required parameters and the optional parameters have reached the last branch in the structure.

**1.2.8 Structure of a command**

This section describes the syntax, conventions and terminology, and uses examples to represent them.

**Format of commands**

Most of the commands include parameters.

When the command parameter is missing, the Command Line Interface informs you about the detection of an incorrect command syntax.

This manual displays the commands and parameters in the *Courier* font.
Parameters

The sequence of the parameters is relevant for the correct syntax of a command.

Parameters are required values, optional values, selections, or a combination of these things. The representation indicates the type of the parameter.

Table 4: Parameter and command syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;command&gt;</code></td>
<td>Commands in pointed brackets (&lt;&gt; are obligatory.</td>
</tr>
<tr>
<td><code>[command]</code></td>
<td>Commands in square brackets ([]) are optional.</td>
</tr>
<tr>
<td><code>&lt;parameter&gt;</code></td>
<td>Parameters in pointed brackets (&lt;&gt;) are obligatory.</td>
</tr>
<tr>
<td><code>[parameter]</code></td>
<td>Parameters in square brackets ([]) are optional.</td>
</tr>
<tr>
<td>...</td>
<td>An ellipsis (3 points in sequence without spaces) after an element indicates that you can repeat the element.</td>
</tr>
<tr>
<td>`[Choice1</td>
<td>Choice2]`</td>
</tr>
<tr>
<td>[list]</td>
<td>Curved brackets ({}) indicate that a parameter is to be selected from a list of options.</td>
</tr>
<tr>
<td>`[Choice1</td>
<td>Choice2]`</td>
</tr>
<tr>
<td>`{Choice1</td>
<td>Choice2}`</td>
</tr>
<tr>
<td>`{param1 {Choice1</td>
<td>Choice2]`</td>
</tr>
<tr>
<td><code>&lt;a.b.c.d&gt;</code></td>
<td>Small letters are wild cards. You enter parameters with the notation a.b.c.d with decimal points (for example IP addresses)</td>
</tr>
<tr>
<td><code>&lt;cr&gt;</code></td>
<td>You press the &lt;Enter&gt; key to create a line break (carriage return).</td>
</tr>
</tbody>
</table>

The following list displays the possible parameter values within the Command Line Interface:

Table 5: Parameter values in the Command Line Interface

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>This parameter represents a valid IPv4 address. The address consists of 4 decimal numbers with values from 0 to 255. The 4 decimal numbers are separated by a decimal point. The IP address 0.0.0.0 is a valid entry.</td>
</tr>
<tr>
<td>MAC address</td>
<td>This parameter represents a valid MAC address. The address consists of 6 hexadecimal numbers with values from 00 to FF. The numbers are separated by a colon, for example, 00:F6:29:B2:81:40.</td>
</tr>
<tr>
<td>string</td>
<td>User-defined text with a length in the specified range, for example a maximum of 32 characters.</td>
</tr>
<tr>
<td>character string</td>
<td>Use double quotation marks to indicate a character string, for example “System name with space character”.</td>
</tr>
<tr>
<td>number</td>
<td>Whole integer in the specified range, for example 0..999999.</td>
</tr>
<tr>
<td>date</td>
<td>Date in format YYYY-MM-DD.</td>
</tr>
<tr>
<td>time</td>
<td>Time in format HH:MM:SS.</td>
</tr>
</tbody>
</table>
Network addresses

Network addresses are a requirement for establishing a data connection to a remote workstation, a server, or another network. You distinguish between IP addresses and MAC addresses.

The IP address is an address allocated by the network administrator. The IP address is unique in one network area.

The MAC addresses are assigned by the hardware manufacturer. MAC addresses are unique worldwide.

The following table displays the representation and the range of the address types:

<table>
<thead>
<tr>
<th>Address Type</th>
<th>Format</th>
<th>Range</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>nnn.nnn.nnn.nnn</td>
<td>nnn: 0 to 255 (decimal)</td>
<td>192.168.11.110</td>
</tr>
<tr>
<td>MAC Address</td>
<td>mm:mm:mm:mm:mm</td>
<td>mm: 00 to ff (hexadecimal number pairs)</td>
<td>A7:C9:89:DD:A9:B3</td>
</tr>
</tbody>
</table>

Strings

A string is indicated by quotation marks. For example, "System name with space character". Space characters are not valid user-defined strings. You enter a space character in a parameter between quotation marks.

Example:
*(RSP)#cli prompt Device name
Error: Invalid command 'name'*

*(RSP)#cli prompt 'Device name'*

*(Device name)#*

1.2.9 Examples of commands

Example 1: clear arp-table-switch

Command for clearing the ARP table of the management agent (cache).

clear arp-table-switch is the command name. The command is executable without any other parameters by pressing the <Enter> key.

Example 2: radius server timeout

Command to configure the RADIUS server timeout value.

(RSP) {config)#radius server timeout
<1..30> Timeout in seconds (default: 5).
radius server timeout is the command name.

The parameter is required. The value range is 1..30.

**Example 3: radius server auth modify <1..8>**

Command to set the parameters for RADIUS authentication server 1.

```
(RSP) (config)#radius server auth modify 1

[name] RADIUS authentication server name.
[msgauth] Enable or disable the message authenticator attribute for this server.
[primary] Configure the primary RADIUS server.
[status] Enable or disable a RADIUS authentication server entry.
[secret] Configure the shared secret for the RADIUS authentication server.
[encrypted] Configure the encrypted shared secret.
```

radius server auth modify is the command name.

The parameter <1..8> (RADIUS server index) is required. The value range is 1..8 (integer).

The parameters [name], [port], [msgauth], [primary], [status], [secret] and [encrypted] are optional.

**1.2.10 Input prompt**

**Command mode**

With the input prompt, the Command Line Interface displays which of the three modes you are in:

- (RSP) > User Exec mode
- (RSP) # Privileged Exec mode
- (RSP) (config)# Global Config mode
- (RSP) (Vlan)# VLAN Database mode
- (RSP) ((Interface)all)# Interface Range mode / All ports of the device
- (RSP) ((Interface)2/1)# Interface Range mode / A single port on one interface
- (RSP) ((Interface)1/2-1/4)# Interface Range mode / A range of ports on one interface
- (RSP) ((Interface)1/2,1/4,1/5)# Interface Range mode / A list of single ports
- (RSP) ((Interface)1/1-1/2,1/4-1/6)# Interface Range mode / A list of port ranges and single ports
Asterisk, pound sign and exclamation point

- **Asterisk**
  An asterisk * in the first or second position of the input prompt displays you that the settings in the volatile memory and the settings in the non-volatile memory are different. In your configuration, the device has detected modifications which have not been saved.

- **Pound sign**
  A pound sign # at the beginning of the input prompt displays you that the boot parameters and the parameters during the boot phase are different.

- **Exclamation point**
  An exclamation point ! at the beginning of the input prompt displays: the password for the user or admin user account corresponds with the default setting.

Wildcards

The device lets you change the command line prompt.

The Command Line Interface supports the following wildcards:

<table>
<thead>
<tr>
<th>Wildcard</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%d</td>
<td>System date</td>
</tr>
<tr>
<td>%t</td>
<td>System time</td>
</tr>
<tr>
<td>%i</td>
<td>IP address of the device</td>
</tr>
<tr>
<td>%m</td>
<td>MAC address of the device</td>
</tr>
<tr>
<td>%p</td>
<td>Product name of the device</td>
</tr>
</tbody>
</table>

!(RSP)>enable

!(RSP)#cli prompt %i

!192.168.1.5#cli prompt (RSP)%d

!* (RSP)2019-01-27#cli prompt (RSP)%d%t

!* (RSP)2019-01-2715:45:41#cli prompt %m

!* AA:BB:CC:DD:EE:FF#
1.2.11 **Key combinations**

The following key combinations make it easier for you to work with the Command Line Interface:

<table>
<thead>
<tr>
<th>Key combination</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTRL + H, Backspace</td>
<td>Delete previous character</td>
</tr>
<tr>
<td>CTRL + A</td>
<td>Go to beginning of line</td>
</tr>
<tr>
<td>CTRL + E</td>
<td>Go to end of line</td>
</tr>
<tr>
<td>CTRL + F</td>
<td>Go forward one character</td>
</tr>
<tr>
<td>CTRL + B</td>
<td>Go backward one character</td>
</tr>
<tr>
<td>CTRL + D</td>
<td>Delete current character</td>
</tr>
<tr>
<td>CTRL + U, X</td>
<td>Delete to beginning of line</td>
</tr>
<tr>
<td>CTRL + K</td>
<td>Delete to end of line</td>
</tr>
<tr>
<td>CTRL + W</td>
<td>Delete previous word</td>
</tr>
<tr>
<td>CTRL + P</td>
<td>Go to previous line in history buffer</td>
</tr>
<tr>
<td>CTRL + R</td>
<td>Rewrite or paste the line</td>
</tr>
<tr>
<td>CTRL + N</td>
<td>Go to next line in history buffer</td>
</tr>
<tr>
<td>CTRL + Z</td>
<td>Return to root command prompt</td>
</tr>
<tr>
<td>CTRL + G</td>
<td>Aborts running tcpdump session</td>
</tr>
<tr>
<td>Tab, &lt;SPACE&gt;</td>
<td>Command line completion</td>
</tr>
<tr>
<td>Exit</td>
<td>Go to next lower command prompt</td>
</tr>
<tr>
<td>?</td>
<td>List choices</td>
</tr>
</tbody>
</table>

The Help command displays the possible key combinations in Command Line Interface on the screen:
1.2 Command Line Interface

Data entry elements

Command completion

To simplify typing commands, the Command Line Interface lets you use command completion (Tab Completion). Thus you are able to abbreviate key words.

- Type in the beginning of a keyword. When the characters entered identify a keyword, the Command Line Interface completes the keyword after you press the tab key or the space key. When there is more than one option for completion, enter the letter or the letters necessary for uniquely identifying the keyword. Press the tab key or the space key again. After that, the system completes the command or parameter.
- When you make a non-unique entry and press <Tab> or <Space> twice, the Command Line Interface provides you with a list of options.
- On a non-unique entry and pressing <Tab> or <Space>, the Command Line Interface completes the command up to the end of the uniqueness. When several commands exist and you press <Tab> or <Space> again, the Command Line Interface provides you with a list of options.

Example:

(RSP) (Config)#lo
(RSP) (Config)#log
logging logout

When you enter lo and <Tab> or <Space>, the Command Line Interface completes the command up to the end of the uniqueness to log.

When you press <Tab> or <Space> again, the Command Line Interface provides you with a list of options (logging logout).
**Possible commands/parameters**

You can obtain a list of the commands or the possible parameters by entering `help` or `?`, for example by entering `(RSP) >show ?`

When you enter the command displayed, you get a list of the parameters available for the command `show`.

When you enter the command without space character in front of the question mark, the device displays the help text for the command itself:

```
!*#(RSP) (Config)#show?

show          Display device options and settings.
```

### 1.2.13 Use cases

**Saving the Configuration**

To help ensure that your password settings and your other configuration changes are kept after the device is reset or after an interruption of the voltage supply, you save the configuration. To save your current configuration, you proceed as follows:

- Enter `enable` to switch to the Privileged Exec mode.
- Enter the following command:
  ```
  save [profile]
  ```
- Execute the command by pressing the `<Enter>` key.
Syntax of the „radius server auth add“ command

Use this command to add a RADIUS authentication server.

- **Mode:** Global Config mode
- **Privilege Level:** Administrator
- **Format:** `radius server auth add <1..8> ip <a.b.c.d> [name <string>] [port <1..65535>]`
  - `<name>`: RADIUS authentication server name.
  - `<port>`: RADIUS authentication server port (default: 1813).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;1..8&gt;</code></td>
<td>RADIUS server index.</td>
<td>1..8</td>
</tr>
<tr>
<td><code>&lt;a.b.c.d&gt;</code></td>
<td>RADIUS accounting server IP address.</td>
<td>IP address</td>
</tr>
<tr>
<td><code>&lt;string&gt;</code></td>
<td>Enter a user-defined text, max. 32 characters.</td>
<td></td>
</tr>
<tr>
<td><code>&lt;1..65535&gt;</code></td>
<td>Enter port number between 1 and 65535.</td>
<td>1..65535</td>
</tr>
</tbody>
</table>

**Mode and Privilege Level:**

- The prerequisite for executing the command: You are in the Global Config mode. See “Mode-based command hierarchy” on page 24.
- The prerequisite for executing the command: You have the Administrator access role.

**Syntax of commands and parameters:** See “Structure of a command” on page 28.

**Examples for executable commands:**

- `radius server auth add 1 ip 192.168.30.40`
- `radius server auth add 2 ip 192.168.40.50 name radiusserver2`
- `radius server auth add 3 ip 192.168.50.60 port 1813`
- `radius server auth add 4 ip 192.168.60.70 name radiusserver4 port 1814`
1.2.14 Service Shell

The Service Shell is for service purposes only.

The Service Shell lets users have access to internal functions of the device. When you need assistance with your device, the service personnel use the Service Shell to monitor internal conditions for example, the switch or CPU registers.

Do not execute internal functions without service technician instructions. Executing internal functions such as deleting the content of the non-volatile memory (NVM) possibly leads to inoperability of your device.

Start the Service Shell

The prerequisite is that you are in User Exec mode: (RSP) >

Perform the following steps:

- Enter `enable` and press the <Enter> key.
  
  To reduce the effort when typing:
  - Enter `e` and press the <Tab> key.

- Enter `serviceshell start` and press the <Enter> key.
  
  To reduce the effort when typing:
  - Enter `ser` and press the <Tab> key.
  - Enter `s` and press the <Tab> key.

```
!RSP >enable

!*RSP #serviceshell start
WARNING! The service shell offers advanced diagnostics and functions.
Proceed only when instructed by a service technician.

You can return to the previous mode using the 'exit' command.

BusyBox v1.31.0 (2019-09-05 12:17:22 UTC) built-in shell (ash)
Enter 'help' for a list of built-in commands.

!/mnt/fastpath #
```

Working with the Service Shell

When the Service Shell is active, the timeout of the Command Line Interface is inactive. To help prevent configuration inconsistencies, end the Service Shell before any other user starts transferring a new configuration to the device.
Display the Service Shell commands

The prerequisite is that you already started the Service Shell.

Perform the following steps:
- Enter `help` and press the <Enter> key.

```
/mnt/fastpath # help
Built-in commands:
------------------
   . : [ ]( alias bg break cd chdir command continue echo eval exec
   exit export false fg getopts hash help history jobs kill let
   local pwd read readonly return set shift source test times trap
   true type ulimit umask unalias unset wait
/mnt/fastpath #
```

End the Service Shell

Perform the following steps:
- Enter `exit` and press the <Enter> key.

Deactivate the Service Shell permanently in the device

When you deactivate the Service Shell, you are still able to configure the device, but you limit the service personnel to system diagnostics. The service technician has no possibility to access internal functions of your device.

The deactivation is irreversible, the Service Shell remains permanently deactivated. In order to reactivate the Service Shell, the device requires disassembly by the manufacturer.

The prerequisites are:
- The Service Shell is not started.
- You are in User Exec mode: (RSP) >

Perform the following steps:
- Enter `enable` and press the <Enter> key.
  To reduce the effort when typing:
  - Enter `e` and press the <Tab> key.
Enter `serviceshell deactivate` and press the <Enter> key.
To reduce the effort when typing:
- Enter `ser` and press the <Tab> key.
- Enter `de` and press the <Tab> key.
This step is irreversible!
Press the <Y> key.

!RSP >enable

!*RSP #serviceshell deactivate
Notice: If you continue, then the Service Shell is permanently deactivated.
This step is irreversible!
For details, refer to the Configuration Manual.
Are you sure (Y/N) ?
1.3 System monitor

The System Monitor lets you set basic operating parameters before starting the operating system.

1.3.1 Functional scope

In the System Monitor, you carry out the following tasks, for example:
- Managing the operating system and verifying the software image
- Updating the operating system
- Starting the operating system
- Deleting configuration profiles, resetting the device to the factory defaults
- Checking boot code information

1.3.2 Starting the System Monitor

Prerequisite:
- Terminal cable for connecting the device to your PC (available as an optional accessory).
- PC with VT100 terminal emulation (such as the PuTTY program) or serial terminal

Perform the following steps:
- Use the terminal cable to connect the serial interface of the device with the COM port of the PC.
- Start the VT100 terminal emulation on the PC.
- Specify the following transmission parameters:

<table>
<thead>
<tr>
<th>VT 100 terminal settings</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed</td>
<td>9600 bit/s</td>
</tr>
<tr>
<td>Data</td>
<td>8 bit</td>
</tr>
<tr>
<td>Stopbit</td>
<td>1 bit</td>
</tr>
<tr>
<td>Handshake</td>
<td>off</td>
</tr>
<tr>
<td>Parity</td>
<td>none</td>
</tr>
</tbody>
</table>

- Set up a connection to the device.
- Turn on the device. When the device is already on, reboot it.
  The screen displays the following message after rebooting:
  Press <1> to enter System Monitor 1.
- Press the <1> key within 3 seconds.
  The device starts the System Monitor. The screen displays the following view:
User interfaces
1.3 System monitor

System Monitor 1
(Selected OS: ...-8.1 (2019-02-05 19:17))

1  Manage operating system
2  Update operating system
3  Start selected operating system
4  Manage configurations
5  Show boot code information
q  End (reset and reboot)

sysMon1>

*Figure 12: System Monitor 1 screen display*

- Select a menu item by entering the number.
- To leave a submenu and return to the main menu of System Monitor 1, press the <ESC> key.
2 Specifying the IP parameters

When you install the device for the first time, enter the IP parameters.

The device provides the following options for entering the IP parameters during the first installation:

- Entry using the Command Line Interface.
  When you preconfigure your device outside its operating environment, or restore the network access ("In-Band") to the device, choose this "Out-of-Band" method.
- Entry using the HiDiscovery protocol.
  When you have a previously installed network device or you have another Ethernet connection between your PC and the device, you choose this "In-Band" method.
- Configuration using the external memory.
  When you are replacing a device with a device of the same type and have already saved the configuration in the external memory, you choose this method.
- Using BOOTP.
  To configure the installed device using BOOTP, you choose this "In-Band" method. You need a BOOTP server for this method. The BOOTP server assigns the configuration data to the device using its MAC address. The DHCP mode is the default mode for the configuration data reference.
- Configuration using DHCP.
  To configure the installed device using DHCP, you choose this "In-Band" method. You need a DHCP server for this method. The DHCP server assigns the configuration data to the device using its MAC address or its system name.
- Configuration using the Graphical User Interface.
  When the device already has an IP address and is reachable using the network, the Graphical User Interface provides you with another option for configuring the IP parameters.

2.1 IP parameter basics

2.1.1 IP address (version 4)

The IP addresses consist of 4 bytes. Write these 4 bytes in decimal notation, separated by a decimal point.

RFC 1340 written in 1992, defines 5 IP Address classes.

Table 9: IP address classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Network address</th>
<th>Host address</th>
<th>Address range</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>1 Byte</td>
<td>3 Bytes</td>
<td>0.0.0.0 to 127.255.255.255</td>
</tr>
<tr>
<td>B</td>
<td>2 Bytes</td>
<td>2 Bytes</td>
<td>128.0.0.0 to 191.255.255.255</td>
</tr>
<tr>
<td>C</td>
<td>3 Bytes</td>
<td>1 Byte</td>
<td>192.0.0.0 to 223.255.255.255</td>
</tr>
<tr>
<td>D</td>
<td></td>
<td></td>
<td>224.0.0.0 to 239.255.255.255</td>
</tr>
<tr>
<td>E</td>
<td></td>
<td></td>
<td>240.0.0.0 to 255.255.255.255</td>
</tr>
</tbody>
</table>
The first byte of an IP address is the network address. The worldwide leading regulatory board for assigning network addresses is the IANA ("Internet Assigned Numbers Authority"). When you require an IP address block, contact your Internet Service Provider (ISP). Your ISP contacts their local higher-level organization to reserve an IP address block:

- APNIC (Asia Pacific Network Information Center)
- ARIN (American Registry for Internet Numbers)
- LACNIC (Regional Latin-American and Caribbean IP Address Registry)
- RIPE NCC (Réseaux IP Européens)

When the first bit of an IP address is a zero, it belong to class A for example, the first octet is less than 128.

When the first bit of an IP address is a one and the second bit is a zero, it belongs to class B for example, the first octet is between 128 and 191.

When the first 2 bits of an IP address are a one, it belongs to class C for example, the first octet is higher than 191.

Assigning the host address (host ID) is the responsibility of the network operator. The network operator alone is responsible for the uniqueness of the assigned IP addresses.

### 2.1.2 Netmask

Routers and Gateways subdivide large networks into subnetworks. The netmask assigns the IP addresses of the individual devices to a particular subnetwork.

You perform subnetwork division using the netmask in much the same way as the division of the network addresses (net id) into classes A to C.

Set the bits of the host address (host id) that represent the mask to one. Set the remaining host address bits to zero (see the following examples).

Example of a subnet mask:

**Decimal notation**

255.255.192.0

**Binary notation**

```
11111111.11111111.11000000.00000000
```

Subnetwork mask bits
Class B
Example of applying the subnet mask to IP addresses for subnetwork assignment:

Decimal notation
129.218.65.17

128 < 129 191 \> Class B

Binary notation
10000001.11011010.01000001.00010001

Subnetwork 1
Network address

Decimal notation
129.218.129.17

128 < 129 191 \> Class B

Binary notation
10000001.11011010.10000001.00010001

Subnetwork 2
Network address

**Example of how the netmask is used**

In a large network it is possible that Gateways and routers separate the management agent from its network management station. How does addressing work in such a case?

Romeo knows Juliet's IP address and also knows that the router "Lorenzo" knows the way to Juliet. Romeo therefore puts his message in an envelope and writes Juliet's IP address as the destination address; for the source address he writes his own IP address on the envelope.

Romeo then places this envelope in a second one with Lorenzo's MAC address as the destination and his own MAC address as the source. This process is comparable to going from Layer 3 to Layer 2 of the ISO/OSI base reference model.

Finally, Romeo puts the entire data packet into the mailbox which is comparable to going from Layer 2 to Layer 1, that means to sending the data packet over the Ethernet.
Lorenzo receives the letter, removes the outer envelope and recognizes from the inner envelope that the letter is meant for Juliet. He places the inner envelope in a new outer envelope and searches his address list (the ARP table) for Juliet's MAC address; he writes her MAC address on the outer envelope as the destination address and his own MAC address as the source address. He then places the entire data packet in the mail box.

Juliet receives the letter and removes the outer envelope. She finds the inner envelope with Romeo's IP address. Opening the inner envelope and reading its contents corresponds to transferring the message to the higher protocol layers of the ISO/OSI layer model.

Juliet would now like to send a reply to Romeo. She places her reply in an envelope with Romeo's IP address as destination and her own IP address as source. But where is she to send the answer? For she did not receive Romeo's MAC address. It was lost, because Lorenzo replaced the outer envelope.

In the MIB, Juliet finds Lorenzo listed under the variable \texttt{hm.NetGatewayIPAddr} as a means of communicating with Romeo. She therefore puts the envelope with the IP addresses in a further envelope with Lorenzo's MAC destination address.

The letter now travels back to Romeo via Lorenzo, the same way the first letter traveled from Romeo to Juliet.

### 2.1.3 Classless Inter-Domain Routing

Class C with a maximum of 254 addresses was too small, and class B with a maximum of 65534 addresses was too large for most users. Resulting in an ineffective usage of the available class B addresses.

Class D contains reserved Multicast addresses. Class E is for experimental purposes. A non-participating Gateway ignores experimental datagrams with these destination addresses.

Since 1993, RFC 1519 has been using Classless Inter-Domain Routing (CIDR) to provide a solution. CIDR overcomes these class boundaries and supports classless address ranges.

With CIDR, you enter the number of bits that designate the IP address range. You represent the IP address range in binary form and count the mask bits that designate the netmask. The mask bits equal the number of bits used for the subnet in a given IP address range.

**Example:**

<table>
<thead>
<tr>
<th>IP address, decimal</th>
<th>Network mask, decimal</th>
<th>IP address, binary</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.112.1</td>
<td>255.255.255.128</td>
<td>11000000 10101000 01110000 00000001</td>
</tr>
<tr>
<td>192.168.112.127</td>
<td></td>
<td>11000000 10101000 01110000 01111111</td>
</tr>
</tbody>
</table>

CIDR notation: 192.168.112.0/25

The term “supernetting” refers to combing a number of class C address ranges. Supernetting enables you to subdivide class B address ranges to a fine degree.
2.2 Specifying the IP parameters using the Command Line Interface

There are several methods you enter the system configuration, either using BOOTP/DHCP, the HiDiscovery protocol, the external memory. You have the option of performing the configuration over the serial interface using the Command Line Interface.

The device lets you specify the IP parameters using the HiDiscovery protocol or using the Command Line Interface over the serial interface.

Figure 15: Flow chart for entering IP addresses
Note: If a terminal or PC with terminal emulation is unavailable in the vicinity of the installation location, you can configure the device at your own workstation, then take it to its final installation location.

- Set up a connection to the device.
  The start screen appears.

- Deactivate DHCP.
- Enter the IP parameters.
  - Local IP address
    In the default setting, the local IP address is 0.0.0.0.
  - Netmask
    When you divided your network into subnetworks, and these are identified with a netmask, enter the netmask here. In the default setting, the local netmask is 0.0.0.0.
  - IP address of the Gateway.
    This entry is only required, in cases where the device and the network management station or TFTP server are located in different subnetworks (see on page 44 “Example of how the netmask is used”).
    Specify the IP address of the Gateway between the subnetwork with the device and the path to the network management station.
    In the default setting, the IP address is 0.0.0.0.
- Save the configuration specified using `copy config running-config nvm`.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Change to the Privileged EXEC mode.</td>
</tr>
<tr>
<td><code>network protocol none</code></td>
<td>Deactivating DHCP.</td>
</tr>
<tr>
<td><code>network parms 10.0.1.23 255.255.255.0</code></td>
<td>Assign the device the IP address 10.0.1.23 and the netmask 255.255.255.0. You have the option of also assigning a Gateway address.</td>
</tr>
<tr>
<td><code>copy config running-config nvm</code></td>
<td>Save the current settings in the non-volatile memory (nvm) in the “selected” configuration profile.</td>
</tr>
</tbody>
</table>

After entering the IP parameters, you easily configure the device using the Graphical User Interface.
2.3 Specifying the IP parameters using HiDiscovery

The HiDiscovery protocol enables you to assign IP parameters to the device using the Ethernet.

You easily configure other parameters using the Graphical User Interface.

- To install the HiDiscovery software on your PC. The software is on the product DVD supplied with the device.
- Start the HiDiscovery program.

To install it, you start the installation program on the DVD.

When HiDiscovery is started, HiDiscovery automatically searches the network for those devices which support the HiDiscovery protocol.

HiDiscovery uses the first network interface found for the PC. When your computer has several network cards, you can select the one you desire in the HiDiscovery toolbar.

HiDiscovery displays a line for every device that responds to a HiDiscovery protocol inquiry.

HiDiscovery enables you to identify the devices displayed.

- Select a device line.
- To set the LEDs to flashing for the selected device, click the **Signal** button on the toolbar. To stop the flashing, click the **Signal** button again.
- By double-clicking a line, you open a window in which you specify the device name and the IP parameter.
Specifying the IP parameters

2.3 Specifying the IP parameters using HiDiscovery

Note: Disable the HiDiscovery function in the device, after you have assigned the IP parameters to the device.

Note: Save the settings so that you will still have the entries after a restart.

2.3.1 Relay

When you connect the management station to a switching subnetwork, the HiDiscovery requests collect information from the devices located in that subnetwork. The HiDiscovery Relay lets you discover and set IP parameters on devices in other subnetworks.

The HiDiscovery function and the HiDiscovery Relay are independent from each other. You can enable the HiDiscovery Relay without enabling the HiDiscovery function. When you activate the relay with the function disabled, the device forwards the requests to other subnetworks, but does not respond to requests.

The HiDiscovery Relay is active in the default setting.

Note: When you activate the HiDiscovery Relay, the device forwards requests received on the router interfaces only to other router interfaces. A loopback interface is an internal virtual router interface. If you connect the management station to a loopback interface, then the device does not forward the request to the other connected subnetworks. The device does not forward responses received on a router interface to the subnetwork of the management station.

2.3.2 Example configuration

To poll devices in the 192.168.47.0 subnetwork use the following steps on both Rt A and Rt B. With the relay activated on router Rt A, the device forwards the requests packets into the 192.168.47.0 subnetwork. With the relay activated on router Rt B, the device returns the responses from the 192.168.47.0 subnetwork back to the management station.

When the HiDiscovery Relay is inactive on either router, the management station only displays the devices located in the 192.168.45.0 subnetwork.

![Diagram of management station connected to a switch.](image-url)
The prerequisite for these steps is that you already configured the device as a router and installed it in a network.

- Open the Basic Settings > Network dialog.
- In the HiDiscovery protocol v1/v2 frame, mark the Relay status checkbox.

```
enable
network hidiscovery relay

Change to the Privileged EXEC mode.
Activating the HiDiscovery relay.
```
2.4 Specifying the IP parameters using the Graphical User Interface

Perform the following steps:

- Open the Basic Settings > Network dialog.
  In this dialog you first specify the source from which the device gets its IP parameters after starting. You also define the VLAN in which the device management can be accessed, configure the HiDiscovery access and allocate manual IP parameters.

- In the Management interface frame you first specify where the device gets its IP parameters from:
  - In the BOOTP mode, the configuration is using a BOOTP or DHCP server on the basis of the MAC address of the device.
  - In the DHCP mode, the configuration is using a DHCP server on the basis of the MAC address or the name of the device.
  - In the Local mode, the device uses the network parameters from the internal device memory.
  
  **Note:** When you change the allocation mode of the IP address, the device activates the new mode immediately after you click the button.

- In the VLAN ID column you specify the VLAN in which the device management can be accessed over the network.

- Note here that you can only access the device management using ports that are members of the relevant VLAN.

  The MAC address field displays the MAC address of the device with which you access the device over the network.

- In the HiDiscovery protocol v1/v2 frame you specify the settings for accessing the device using the HiDiscovery software.

- The HiDiscovery protocol lets you allocate an IP address to the device on the basis of its MAC address. Activate the HiDiscovery protocol if you want to allocate an IP address to the device from your PC with the HiDiscovery software.

- If required, you enter the IP address, the netmask and the Gateway in the IP parameter frame.

- To save the changes temporarily, click the button.
2.5 Specifying the IP parameters using BOOTP

With the **BOOTP** function activated the device sends a boot request message to the BOOTP server. The boot request message contains the Client ID configured in the *Basic Settings > Network* dialog. The BOOTP server enters the Client ID into a database and assigns an IP address. The server answers with a boot reply message. The boot reply message contains the assigned IP address.
2.6 Specifying the IP parameters using DHCP

The DHCP (Dynamic Host Configuration Protocol) is a further development of BOOTP, which it has replaced. The DHCP additionally lets the configuration of a DHCP client using a name instead of using the MAC address.

For the DHCP, this name is known as the “Client Identifier” in accordance with RFC 2131.

The device uses the name entered under sysName in the system group of the MIB II as the Client Identifier. You can change the system name using the graphic user interface (see dialog Basic Settings > System), the Command Line Interface or SNMP.

The device sends its system name to the DHCP server. The DHCP server then uses the system name to allocate an IP address as an alternative to the MAC address.

In addition to the IP address, the DHCP server sends
- the netmask
- the default Gateway (if available)
- the TFTP URL of the configuration file (if available).

The device applies the configuration data to the appropriate parameters. When the DHCP Server assigns the IP address, the device permanently saves the configuration data in non-volatile memory.

Table 10: DHCP options which the device requests

<table>
<thead>
<tr>
<th>Options</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Subnet Mask</td>
</tr>
<tr>
<td>2</td>
<td>Time Offset</td>
</tr>
<tr>
<td>3</td>
<td>Router</td>
</tr>
<tr>
<td>4</td>

</tr>
<tr>
<td>12</td>
<td>Host Name</td>
</tr>
<tr>
<td>42</td>
<td>NTP server</td>
</tr>
<tr>
<td>61</td>
<td>Client Identifier</td>
</tr>
<tr>
<td>66</td>
<td>TFTP Server Name</td>
</tr>
<tr>
<td>67</td>
<td>Bootfile Name</td>
</tr>
</tbody>
</table>

The advantage of using DHCP instead of BOOTP is that the DHCP server can restrict the validity of the configuration parameters (“Lease”) to a specific time period (known as dynamic address allocation). Before this period (“Lease Duration”) elapses, the DHCP client can attempt to renew this lease. Alternatively, the client can negotiate a new lease. The DHCP server then allocates a random free address.

To help avoid this, DHCP servers provide the explicit configuration option of assigning a specific client the same IP address based on a unique hardware ID (known as static address allocation).

In the default setting, DHCP is activated. As long as DHCP is activated, the device attempts to obtain an IP address. When the device cannot find a DHCP server after restarting, it will not have an IP address. The Basic Settings > Network dialog lets you activate or deactivate DHCP.

**Note:** When using Industrial HiVision network management, verify that DHCP allocates the original IP address to every device.
The appendix contains an example configuration of the BOOTP/DHCP-server.

Example of a DHCP-configuration file:

```conf
# /etc/dhcpd.conf for DHCP Daemon
#
subnet 10.1.112.0 netmask 255.255.240.0 {
  option subnet-mask 255.255.240.0;
  option routers 10.1.112.96;
}
#
# Host berta requests IP configuration
# with her MAC address
#
host berta {
  hardware ethernet 00:80:63:08:65:42;
  fixed-address 10.1.112.82;
}
#
# Host hugo requests IP configuration
# with his client identifier.
#
host hugo {
  option dhcp-client-identifier "hugo";
  option dhcp-client-identifier 00:68:75:67:6f;
  fixed-address 10.1.112.83;
  server-name "10.1.112.11";
  filename "/agent/config.dat";
}
```

Lines beginning with the `#` character, contain comments.

The lines preceding the individually listed devices refer to settings that apply to the following device.

The fixed-address line assigns a permanent IP address to the device.

For further information, please refer to the DHCP server manual.

2.7 Management address conflict detection

You assign an IP address to the device using several different methods. This function helps the device detect IP address conflicts on a network after boot up and the device also checks periodically during operation. This function is described in RFC 5227.

When enabled, the device sends an SNMP trap informing you that it detected an IP address conflict.

The following list contains the default settings for this function:
- **Operation**: On
- **Detection mode**: active and passive
- **Send periodic ARP probes**: marked
- **Detection delay [ms]**: 200
- **Release delay [s]**: 15
- **Address protections**: 3
- **Protection interval [ms]**: 200
- **Send trap**: marked

2.7.1 Active and passive detection

Actively checking the network helps prevent the device from connecting to the network with a duplicate IP address. After connecting the device to a network or after configuring the IP address, the device immediately checks whether its IP address exists within the network. To check the network for address conflicts, the device sends 4 ARP probes with the detection delay of 200 ms into the network. When the IP address exists, the device attempts to return to the previous configuration, and make another check after the configured release delay time.

When you disable active detection, the device sends 2 gratuitous ARP announcements in 2 s intervals. Using the ARP announcements with passive detection enabled, the device polls the network to determine whether there is an address conflict. After resolving an address conflict or after expired release delay time, the device reconnects to the network. Following 10 detected conflicts, when the configured release delay interval is less than 60 s, the device sets the release delay interval to 60 s.

After the device performs active detection or you disable the active detection function, with passive detection enabled the device listens on the network for other devices using the same IP address. When the device detects a duplicate IP address, it initially defends its address by employing the ACD mechanism in the passive detection mode and sends out gratuitous ARPs. The number of protections that the device sends and the protection interval are configurable. To resolve conflicts, if the remote device remains connected to the network, then the network interface of the local device disconnects from the network.

When a DHCP server assigns an IP address to the device and an address conflict occurs, the device returns a DHCP decline message.

The device uses the ARP probe method. This has the following advantages:
- ARP caches on other devices remain unchanged
- the method is robust through multiple ARP probe transmissions
3 Access to the device

3.1 First login (Password change)

To help prevent undesired access to the device, it is imperative that you change the default password during initial setup.

Perform the following steps:

☐ Open the Graphical User Interface, the Command Line Interface, or HiView the first time you log on to the device.
☐ Log on to the device with the default password.
    The device prompts you to type in a new password.
☐ Type in your new password.
    To help increase security, choose a password that contains at least 8 characters which includes upper-case characters, lower-case characters, numerical digits, and special characters.
☐ When you log on to the device with the Command Line Interface, then the device prompts you to confirm your new password.
☐ Log on to the device again with your new password.

Note: If you lost your password, then use the System Monitor to reset the password.

For further information see: hirschmann-support.belden.com.
3.2 Authentication lists

When a user accesses the device using a specific connection, the device verifies the credentials of the user in an authentication list which contains the policies that the device applies for authentication.

The prerequisite for a user's access to the device management is that at least one policy is assigned to the authentication list of the application through which access is performed.

3.2.1 Applications

The device provides an application for each type of connection through which someone accesses the device:

- Access to the Command Line Interface using a serial connection: Console(V.24)
- Access to the Command Line Interface using SSH: SSH
- Access to the Command Line Interface using Telnet: Telnet
- Access to the Graphical User Interface: WebInterface

The device also provides an application to control the access to the network from connected end devices using port-based access control: 8021x

3.2.2 Policies

When a user logs in with valid login data, the device lets the user have access to its device management. The device authenticates the users using the following policies:

- User management of the device
- LDAP
- RADIUS

When the end device logs in with valid login data, the device lets the connected end devices have access to the network with the port-based access control according to IEEE 802.1X. The device authenticates the end devices using the following policies:

- RADIUS
- IAS (Integrated Authentication Server)

The device gives you the option of a fall-back solution. For this, you specify more than one policy in the authentication list. When authentication is unsuccessful using the current policy, the device applies the next specified policy.
3.2.3 **Managing authentication lists**

You manage the authentication lists in the Graphical User Interface or in the Command Line Interface.

Perform the following steps:

- Open the *Device Security > Authentication List* dialog. The dialog displays the authentication lists that are set up.
  
  ```
  show authlists
  ```
  
  Displays the authentication lists that are set up.

- Deactivate the authentication list for those applications by means of which no access to the device is performed, for example 8021x.

  ```
  authlists disable defaultDot1x8021AuthList
  ```
  
  Deactivates the authentication list defaultDot1x8021AuthList.

- In the *Active* column of the authentication list defaultDot1x8021AuthList, unmark the checkbox.

- To save the changes temporarily, click the ✓ button.
3.2.4 Adjust the settings

Example:

Set up a separate authentication list for the application WebInterface which is by default included in the authentication list defaultLoginAuthList. The device forwards authentication requests to a RADIUS server in the network. As a fall-back solution, the device authenticates users using the local user management.

Perform the following steps:

- Create an authentication list loginGUI.
- Open the Device Security > Authentication List dialog.
- Click the button. The dialog displays the Create window.
- Enter a meaningful name in the Name field. In this example, enter the name loginGUI.
- Click the Ok button. The device adds a new table entry.
- Change to the Privileged EXEC mode.
- Change to the Configuration mode.
- authlists add loginGUI Creates the authentication list loginGUI.
- In the Policy 1 column, select the value radius.
- In the Policy 2 column, select the value local.
- In the Policy 3 to Policy 5 columns, select the value reject to help prevent further fall-back.
- In the Active column, mark the checkbox.
- To save the changes temporarily, click the button.
- Assign an application to the authentication list loginGUI.
- In the Device Security > Authentication List dialog, highlight the authentication list loginGUI.
- Click the button and then the Allocate applications item. The dialog displays the Allocate applications window.
- In the left column, highlight the application WebInterface.
Access to the device

3.2 Authentication lists

☐ Click the **button.
The right column now displays the application **WebInterface**.

☐ Click the **Ok** button.
The dialog displays the updated settings:
- The **Dedicated applications** column of authentication list **loginGUI** displays the application **WebInterface**.
- The **Dedicated applications** column of authentication list **defaultLoginAuthList** does not display the application **WebInterface** anymore.

☐ To save the changes temporarily, click the **button.

```
show applists
applists set-authlist WebInterface loginGUI
```

Displays the applications and the allocated lists.
Assigns the **loginGUI** application to the authentication list **WebInterface**.
3.3 User management

When a user logs in with valid login data, the device lets the user have access to its device management. The device authenticates the users either using the local user management or with a RADIUS server in the network. To get the device to use the user management, assign the local policy to an authentication list, see the Device Security > Authentication List dialog.

In the local user management, you manage the user accounts. One user account is usually allocated to each user.

3.3.1 Access roles

The device lets you use a role-based authorization model to specifically control the access to the device management. Users to whom a specific authorization profile is allocated are allowed to use commands and functions from the same authorization profile or a lower one.

The device uses the authorization profiles on every application with which the device management can be accessed.
Every user account is linked to an access role that regulates the access to the individual functions of the device. Depending on the planned activity for the respective user, you assign a pre-defined access role to the user. The device differentiates between the following access roles.

**Table 11: Access roles for user accounts**

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Authorized for the following activities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>The user is authorized to monitor and administer the device.</td>
<td>All activities with read/write access, including the following activities reserved for an administrator: Add, modify or delete user accounts, Activate, deactivate or unlock user accounts, Change every password, Configure password management, Set or change system time, Load files to the device, for example device configurations, certificates or software images, Reset settings and security-related settings to the state on delivery, Configure RADIUS server and authentication lists, Apply scripts using the Command Line Interface, Enable/disable CLI logging and SNMP logging, External memory activation and deactivation, System monitor activation and deactivation, Enable/disable the services for the access to the device management (for example SNMP), Configure access restrictions to the Graphical User Interface or the Command Line Interface based on the IP addresses.</td>
</tr>
<tr>
<td>Operator</td>
<td>The user is authorized to monitor and configure the device - with the exception of security-related settings.</td>
<td>All activities with read/write access, with the exception of the above-named activities, which are reserved for an administrator:</td>
</tr>
<tr>
<td>Auditor</td>
<td>The user is authorized to monitor the device and to save the log file in the Diagnostics &gt; Report &gt; Audit Trail dialog.</td>
<td>Monitoring activities with read access.</td>
</tr>
<tr>
<td>Guest</td>
<td>The user is authorized to monitor the device - with the exception of security-related settings.</td>
<td>Monitoring activities with read access.</td>
</tr>
<tr>
<td>Unauthorized</td>
<td>No access to the device possible.</td>
<td>No activities allowed.</td>
</tr>
</tbody>
</table>
3.3.2 Managing user accounts

You manage the user accounts in the Graphical User Interface or in the Command Line Interface.

Perform the following steps:

- Open the Device Security > User Management dialog. The dialog displays the user accounts that are set up.

3.3.3 Default setting

In the state on delivery, the user accounts admin and user are set up in the device.

Table 12: Default settings for the factory setting user accounts

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>User name</td>
<td>admin</td>
</tr>
<tr>
<td>Password</td>
<td>private</td>
</tr>
<tr>
<td>Role</td>
<td>administrator</td>
</tr>
<tr>
<td>User locked</td>
<td>unmarked</td>
</tr>
<tr>
<td>Policy check</td>
<td>unmarked</td>
</tr>
<tr>
<td>SNMP auth type</td>
<td>hmacmd5</td>
</tr>
<tr>
<td>SNMP encryption type</td>
<td>des</td>
</tr>
</tbody>
</table>

Change the password for the admin user account before making the device available in the network.
### 3.3.4 Changing default passwords

To help prevent undesired access, change the password of the default user accounts.

Perform the following steps:

- Change the passwords for the admin and user user accounts.
- Open the **Device Security > User Management** dialog. The dialog displays the user accounts that are set up.
  - To obtain a higher level of complexity for the password, mark the checkbox in the Policy check column. Before saving it, the device checks the password according to the policy specified in the Password policy frame.
  - **Note:** The password check can lead to a message in the Security status frame in the Basic Settings > System dialog. You specify the settings that cause this message in the Basic Settings > System dialog.
- Click the row of the relevant user account in the Password field. Enter a password of at least 6 characters. Up to 64 alphanumeric characters are allowed.
  - The device differentiates between upper and lower case.
  - The minimum length of the password is specified in the Configuration frame. The device constantly checks the minimum length of the password.
- To save the changes temporarily, click the **✓** button.

```plaintext
enable  
configure  
users password-policy-check <user>  
enable

Note: Change to the Privileged EXEC mode. Change to the Configuration mode.
Activates the checking of the password for the <user> user account based on the specified policy. In this way, you obtain a higher level of complexity for the password.

Note: When you display the security status, the password check can lead to a message (show security-status all). You specify the settings that cause this message with the command security-status monitor pwd-policy-inactive.

users password <user> SECRET  
save

Note: Specifies the password <user> for the SECRET user account. Enter at least 6 characters.
Save the settings in the non-volatile memory (nvm) in the “selected” configuration profile.
3.3.5 Setting up a new user account

Allocate a separate user account to each user that accesses the device management. In this way you can specifically control the authorizations for the access.

In the following example, we will set up the user account for a USER user with the role operator. Users with the operator role are authorized to monitor and configure the device - with the exception of security-related settings.

Perform the following steps:
- Create a new user account.

- Open the Device Security > User Management dialog.
- Click the button.
  The dialog displays the Create window.
- Enter the name in the User name field.
  In this example, we give the user account the name USER.
- Click the Ok button.
- To obtain a higher level of complexity for the password, mark the checkbox in the Policy check column.
  Before saving it, the device checks the password according to the policy specified in the Password policy frame.
- In the Password field, enter a password of at least 6 characters.
  Up to 64 alphanumeric characters are allowed.
  - The device differentiates between upper and lower case.
  - The minimum length of the password is specified in the Configuration frame. The device constantly checks the minimum length of the password.
- In the Role column, select the user role.
  In this example, we select the value operator.
- To activate the user account, mark the checkbox in the Active column.
- To save the changes temporarily, click the button.
  The dialog displays the user accounts that are set up.

Note: When you are setting up a new user account in the Command Line Interface, remember to
allocate the password.

### 3.3.6 Deactivating the user account

After a user account is deactivated, the device denies the related user access to the device management. In contrast to completely deleting it, deactivating a user account lets you keep the settings and reuse them in the future.

Perform the following steps:
- To keep the user account settings and reuse them in the future, you temporarily deactivate the user account.
- Open the *Device Security > User Management* dialog. The dialog displays the user accounts that are set up.
- In the row for the relevant user account, unmark the checkbox in the *Active* column.
- To save the changes temporarily, click the ✔ button.

- To permanently deactivate the user account settings, you delete the user account.
- Highlight the row for the relevant user account.
- Click the ✗ button.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Change to the Privileged EXEC mode.</td>
</tr>
<tr>
<td>configure</td>
<td>Change to the Configuration mode.</td>

<td>Save the settings in the non-volatile memory (<em>nvm</em>) in the “selected” configuration profile.</td>
</tr>
</tbody>
</table>
3.3.7 Adjusting policies for passwords

The device lets you check whether the passwords for the user accounts adhere to the specified policy. When the passwords adhere to the policy, you obtain a higher level of complexity for the passwords.

The user management of the device lets you activate or deactivate the check separately in each user account. When you mark the checkbox and the new password fulfills the requirements of the policy, the device accepts the password change.

In the default settings, practical values for the policy are set up in the device. You have the option of adjusting the policy to meet your requirements.

Perform the following steps:
- Adjust the policy for passwords to meet your requirements.
- Open the Device Security > User Management dialog.
- In the Configuration frame you specify the number user login attempts before the device locks out the user. You also specify the minimum number of characters that defines a password.
- Specify the values to meet your requirements.
  - You specify the number of times that a user attempts to log on to the device in the Login attempts field. The field lets you define this value in the range 0..5.
  - In the above example, the value 0 deactivates the function.
  - The Min. password length field lets you enter values in the range 1..64.
- The dialog displays the policy set up in the Password policy frame.
- Adjust the values to meet your requirements.
  - Values in the range 1 through 16 are allowed.
  - The value 0 deactivates the relevant policy.
- To apply the entries specified in the Configuration and Password policy frames, mark the checkbox in the Policy check column for a particular user.
- To save the changes temporarily, click the button.

```
enable
configure
passwords min-length 6
passwords min-lowercase-chars 1
passwords min-numeric-chars 1
passwords min-special-chars 1
passwords min-uppercase-chars 1
show passwords
save
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Specifies the policy for the minimum length of the password.
Specifies the policy for the minimum number of lower-case letters in the password.
Specifies the policy for the minimum number of digits in the password.
Specifies the policy for the minimum number of special characters in the password.
Specifies the policy for the minimum number of upper-case letters in the password.
Displays the policies that are set up.
Save the settings in the non-volatile memory (nvm) in the “selected” configuration profile.
3.4 LDAP

Server administrators manage Active Directories which contain user login credentials for applications used in the office environment. The Active Directory is hierarchical in nature, containing user names, passwords, and the authorized read/write permission levels for each user.

This device uses the Lightweight Directory Access Protocol (LDAP) to retrieve user login information and permission levels from a Active Directory. This provides a “single sign on” for network devices. Retrieving the credentials from an Active Directory lets the user login to the device with the same credentials used in the office environment.

An LDAP session starts with the device contacting the Directory System Agent (DSA) to search the Active Directory of an LDAP server. If the server finds multiple entries in the Active Directory for a user, then the server sends the higher permission level found. The DSA listens for information requests and sends responses on TCP port 389 for LDAP, or on TCP port 636 for LDAP over SSL (LDAPS). Clients and servers encode LDAPS requests and responses using the Basic Encoding Rules (BER). The device opens a new connection for every request and closes the connection after receiving a response from the server.

The device lets you upload a CA certificate to validate the server for Secure Socket Level (SSL) and Transport Layer Security (TLS) sessions. Whereby, the certificate is optional for TLS sessions.

The device is able to cache credentials for up to 1024 users in memory. If the active directory servers are unreachable, then the users are still able to login using their office credentials.

3.4.1 Coordination with the server administrator

Configuring the LDAP function requires that the network administrator request the following information from the server administrator:

- The server name or IP address
- The location of the Active Directory on the server
- The type of connection used
- The TCP listening port
- When required, the location of the CA certificate
- The name of the attribute containing the user login name
- The names of the attribute containing the user permission levels

The server administrator can assign permission levels individually using an attribute such as description, or to a group using the memberOf attribute. In the Device Security > LDAP > Role Mapping dialog you specify which attributes receive the various permission levels.

You also have the option to retrieve the name of the attributes containing the user login name and permission levels using a LDAP browser such as JXplorer or Softerra.
3.4.2 Example configuration

The device is able to establish an encrypted link to a local server using only the server name or to a server on a different network using an IP address. The server administrator uses attributes to identify credentials of a user and assign individual and group permission levels.

Using information received from the server administrator, specify which attributes in the Active Directory contain the user credentials and permission level. The device then compares the user credentials with the permission levels specified in the device and lets the user login at the assigned permission level.

![Figure 19: LDAP Example Configuration](image)

For this example, the server administrator sent the following information:

<table>
<thead>
<tr>
<th>Information</th>
<th>Primary Server</th>
<th>Backup Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>The server name or IP address</td>
<td>local.server</td>
<td>10.16.1.2</td>
</tr>
<tr>
<td>The location of the Active Directory on the server</td>
<td>Country/City/User</td>
<td>Country/Company/User</td>
</tr>
<tr>
<td>The type of connection used</td>
<td>TLS (with certificate)</td>
<td>SSL</td>
</tr>
<tr>
<td>The server administrator sent the CA certificate in an email.</td>
<td>CA certificate for primary server saved locally</td>
<td>CA certificate for backup server saved locally</td>
</tr>
<tr>
<td>The TCP listening port</td>
<td>389 (tls)</td>
<td>636 (ssl)</td>
</tr>
<tr>
<td>Name of the attribute containing the user name</td>
<td>userPrincipalName</td>
<td>userPrincipalName</td>
</tr>
<tr>
<td>The names of the attribute containing the user permission levels</td>
<td>OPERATOR</td>
<td>OPERATOR</td>
</tr>
<tr>
<td></td>
<td>ADMINISTRATOR</td>
<td>ADMINISTRATOR</td>
</tr>
</tbody>
</table>
Open the **Device Security > Authentication List** dialog.

To configure the device to retrieve the user credentials, during log in using the Graphical User Interface, from the Active Directory first, specify for the `defaultLoginAuthList` list the value `ldap` in the `Policy 1` column.

Open the **Device Security > LDAP > Configuration** dialog.

The device lets you specify the length of time that it saves the login credentials in the cache. To cache user credentials for a day, in the `Configuration` frame, `Client cache timeout [min]` field, enter the value `1440`.

The `Bind user` entry is optional. When specified, users enter only their user name to log on to the device. The service user can be anyone with credentials listed in the Active Directory under the attribute specified in the `User name attribute` column. In the `Bind user` column, enter the user name and the domain.

The `Base DN` is a combination of the domain component (dc) and the organizational unit (ou). The `Base DN` lets the device locate a server in a domain (dc) and find the Active Directory (ou). Specify the location of the Active Directory. In the `Base DN` column, specify the value `ou=Users,ou=City,ou=Country,dc=server,dc=local`.

In the `User name attribute` column, enter the value `userPrincipalName` to specify the attribute under which the server administrator lists the users.

The device uses a CA certificate to verify the server.

When the certificate is located on your PC or on a network drive, drag and drop the certificate in the area. Alternatively click in the area to select the certificate.

To transfer the CA certificate onto the device, click the `Start` button.

To add a table entry, click the button.

To specify a description, enter the value `Primary AD Server` in the `Description` column.

To specify the server name and domain of the primary server, in the `Address` column, enter the value `local.server`.

The primary server uses the TCP port `389` for communication which is the `Destination TCP port` default value.

The primary server uses TLS for encrypting communication and a CA certificate for server validation. In the `Connection security` column, specify the value `startTLS`.

To activate the entry, mark the checkbox in the `Active` column.

Using the information received from the server administrator for the Backup server, add, configure and activate another row.

Open the **Device Security > LDAP > Role Mapping** dialog.

To add a table entry, click the button.

When a user logs on to the device, with LDAP configured and enabled, the device searches the Active Directory for the credentials of the user. If the device finds the user name and the password is correct, then the device searches for the value specified in the `Type` column. If the device finds the attribute and the text in the `Parameter` column matches the text in the Active Directory, then the device lets the user login with the assigned permission level. When the value `attribute` is specified in the `Type` column, specify the value in the `Parameter` column in the following form: `attributeName=attributeValue`.

In the `Role` column, enter the value `operator` to specify the user role.

To activate the entry, mark the checkbox in the `Active` column.
The following table describes how to configure the LDAP function in the device using the Command Line Interface. The table displays the commands for Index 1. To configure Index 2, use the same commands and substitute the appropriate information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Change to the Privileged EXEC mode.</td>
</tr>
<tr>
<td>configure</td>
<td>Change to the Configuration mode.</td>
</tr>
<tr>
<td>ldap cache-timeout 1440</td>
<td>Specify the device to flush the non-volatile memory after a day.</td>
</tr>
<tr>
<td>ldap client server add 1 local.server port 389</td>
<td>Add a connection to the remote authentication client server with the host name eu.local and the UDP port 389.</td>
</tr>
<tr>
<td>ldap client server modify 1 security startTLS</td>
<td>Specify the type of security used for the connection.</td>
</tr>
<tr>
<td>ldap client server modify 1 description Primary_AD_Server</td>
<td>Specify the configuration name of the entry.</td>
</tr>
<tr>
<td>ldap basedn ou=Users,ou=City,ou=Country,dc=server,dc=local</td>
<td>Specify the Base Domain Name used to find the Active Directory on the server.</td>
</tr>
<tr>
<td>ldap search-attr userPrincipalName</td>
<td>Specify the attribute to search for in the Active Directory which contains the credential of the users.</td>
</tr>
<tr>
<td>ldap bind-user <a href="mailto:user@company.com">user@company.com</a></td>
<td>Specify the name and domain of the service user.</td>
</tr>
<tr>
<td>ldap bind-passwd Ur-123456</td>
<td>Specify the password of the service user.</td>
</tr>
<tr>
<td>ldap client server enable 1</td>
<td>Enable the remote authentication client server connection.</td>
</tr>
<tr>
<td>ldap mapping add 1 access-role operator mapping-type attribute mapping-parameter OPERATOR</td>
<td>Add a remote authentication role mapping entry for the Operator role. Map the operator role to the attribute containing the word OPERATOR.</td>
</tr>
<tr>
<td>ldap mapping enable 1</td>
<td>Enable the remote authentication role mapping entry.</td>
</tr>
<tr>
<td>ldap operation</td>
<td>Enable the remote authentication function.</td>
</tr>
</tbody>
</table>
3.5 SNMP access

The SNMP protocol lets you work with a network management system to monitor the device over the network and change its settings.

3.5.1 SNMPv1/v2 access

Using SNMPv1 or SNMPv2 the network management system and the device communicate unencrypted. Every SNMP packet contains the community name in plain text and the IP address of the sender.

The community names public for read accesses and private for write accesses are preset in the device. If SNMPv1/v2 is enabled, then the device lets anyone who knows the community name have access to the device.

Make the following basic provisions to make undesired access to the device more difficult:

- Change the default community names in the device.
  - Treat the community names with discretion.
  - Anyone who knows the community name for write access, has the ability to change the settings of the device.
- Specify a different community name for read/write access than for read access.
- Use SNMPv1 or SNMPv2 only in environments protected from eavesdropping. The protocols do not use encryption.
- We recommend using SNMPv3 and disabling the access using SNMPv1 and SNMPv2 in the device.
3.5.2 **SNMPv3 access**

Using SNMPv3 the network management system and the device communicate encrypted. The network management system authenticates itself with the device using the credentials of a user. The prerequisite for the SNMPv3 access is that in the network management system uses the same settings that are defined in the device.

The device lets you specify the *SNMP auth type* and *SNMP encryption type* parameters individually in each user account.

When you set up a new user account in the device, the parameters are preset so that the network management system Industrial HiVision reaches the device immediately.

The user accounts set up in the device use the same passwords in the Graphical User Interface, in the Command Line Interface, and for SNMPv3.

To adapt the SNMPv3 parameters of the user account settings to the settings in your network management system, perform the following steps:

1. Open the **Device Security > User Management** dialog. The dialog displays the user accounts that are set up.
2. Click the row of the relevant user account in the *SNMP auth type* field. Select the desired setting.
3. Click the row of the relevant user account in the *SNMP encryption type* field. Select the desired setting.
4. To save the changes temporarily, click the **save** button.

```plaintext
enable
configure
users snmpv3 authentication <user> md5 | sha1
users snmpv3 encryption <user> des | aescfb128 | none
show users
save
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Assigning the HMAC-MD5 or HMACSHA protocol for authentication requests to the `<user>` user account.
Assigns the DES or AES-128 algorithm to the `<user>` user account.
With this algorithm, the device encrypts authentication requests. The value `none` removes the encryption.
Display the user accounts that have been configured.
Save the settings in the non-volatile memory (`nvm`) in the “selected” configuration profile.
4 Managing configuration profiles

If you change the settings of the device during operation, then the device stores the changes in its memory (RAM). After a reboot the settings are lost.

In order to keep the changes after a reboot, the device lets you save additional settings in a configuration profile in the non-volatile memory (NVM). In order to make it possible to quickly switch to other settings, the non-volatile memory offers storage space for multiple configuration profiles.

If an external memory is connected, then the device saves a copy of the configuration profile in the external memory automatically. This function can be deactivated.

4.1 Detecting changed settings

The device stores changes made to settings during operation in its volatile memory (RAM). The configuration profile in the non-volatile memory (NVM) remains unchanged until you save it. Until then, the configuration profiles in memory and non-volatile memory are different.

This device helps you recognize changed settings. When the configuration profile in the memory (RAM) is different from the "selected" configuration profile in the non-volatile memory (NVM), you can recognize the difference based on the following criteria:

The status bar at the top of the menu displays the blinking icon. When the configuration profiles match, the icon is hidden.

In the Basic Settings > Load/Save dialog, the checkbox in the Information frame is unmarked. When the configuration profiles match, the checkbox is marked.

When the copy in the external memory is different from the configuration profile in the non-volatile memory, you see the difference based on the following criteria:

In the Basic Settings > Load/Save dialog, the checkbox in the Information frame is unmarked. If the configuration profiles match, the checkbox is marked.
4.2  Saving the settings

4.2.1  Saving the configuration profile in the device

If you change the settings of the device during operation, then the device stores the changes in its memory (RAM). In order to keep the changes after a reboot, save the configuration profile in the non-volatile memory (NVM).

Saving a configuration profile

The device stores the settings in the "selected" configuration profile in the non-volatile memory (NVM).

Perform the following steps:

- Open the Basic Settings > Load/Save dialog.
- Verify that the required configuration profile is "Selected". You can recognize the "selected" configuration profile because the checkbox in the Selected column is marked.
- Click the button.

<table>
<thead>
<tr>
<th>show config profiles nvm</th>
<th>Displays the configuration profiles contained in the non-volatile memory (nvm).</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Change to the Privileged EXEC mode.</td>
</tr>
<tr>
<td>save</td>
<td>Save the settings in the non-volatile memory (nvm) in the &quot;selected&quot; profile.</td>
</tr>
</tbody>
</table>
Copying settings to a configuration profile

The device lets you store the settings saved in the memory (RAM) in a configuration profile other than the "selected" configuration profile. In this way you create a new configuration profile in the non-volatile memory (NVM) or overwrite an existing one.

Perform the following steps:

- Open the Basic Settings > Load/Save dialog.
- Click the button and then the Save As.. item.
  The dialog displays the Save As.. window.
- In the Name field, change the name of the configuration profile. If you keep the proposed name, the device will overwrite an existing configuration profile of the same name.
- Click the Ok button.
  The new configuration profile is designated as “Selected”.

```plaintext
show config profiles nvm
enable
copy config running-config nvm profile <string>
```

Displays the configuration profiles contained in the non-volatile memory (nvm).
Change to the Privileged EXEC mode.
Save the current settings in the configuration profile named <string> in the non-volatile memory (nvm). If present, the device overwrites a configuration profile of the same name. The new configuration profile is designated as “Selected”.

Selecting a configuration profile

When the non-volatile memory (NVM) contains multiple configuration profiles, you have the option to select any configuration profile there. The device stores the settings in the “selected” configuration profile. Upon reboot, the device loads the settings of the “selected” configuration profile into the memory (RAM).

Perform the following steps:

- Open the Basic Settings > Load/Save dialog.
  The table displays the configuration profiles present in the device. You can recognize the "selected" configuration profile because the checkbox in the Selected column is marked.
- In the table, select the entry of the required configuration profile stored in the non-volatile memory (NVM).
- Click the button and then the Select item.
  In the Selected column, the checkbox of the configuration profile is now marked.

```plaintext
enable
show config profiles nvm
```

Change to the Privileged EXEC mode.
Displays the configuration profiles contained in the non-volatile memory (nvm).
4.2.2 Saving the configuration profile in the external memory

When an external memory is connected and you save a configuration profile, the device automatically saves a copy in the Selected external memory. In the default setting, the function is enabled. You can disable this function.

Perform the following steps:

- Open the Basic Settings > External Memory dialog.
- Mark the checkbox in the Backup config when saving column in order to enable the device to automatically save a copy in the external memory during the saving process.
- To deactivate the function, unmark the checkbox in the Backup config when saving column.
- To save the changes temporarily, click the button.

4.2.3 Backup the configuration profile on a remote server

The device lets you automatically backup the configuration profile to a remote server. The prerequisite is that you activate the function before you save the configuration profile.

After you save the configuration profile in the non-volatile memory (nvm), the device sends a copy to the specified URL.
Perform the following steps:

- Open the Basic Settings > Load/Save dialog.
  The following steps you perform in the Backup config on a remote server when saving frame.
- In the URL field, specify the server as well as the path and file name of the backed up configuration profile.
- Click the Set credentials button.
  The dialog displays the Credentials window.
- Enter the credentials needed to authenticate on the remote server.
- In the Operation option list, enable the function.
- To save the changes temporarily, click the button.

If the transfer to the remote server is unsuccessful, then the device logs this event in the log file (System Log).

### 4.2.4 Exporting a configuration profile

The device lets you save a configuration profile to a server as an XML file. If you use the Graphical User Interface, then you have the option to save the XML file directly to your PC.

**Prerequisites:**
- To save the file on a server, you need a configured server on the network.
- To save the file to an SCP or SFTP server, you also need the username and password for accessing this server.

Perform the following steps:

- Open the Basic Settings > Load/Save dialog.
- In the table, select the entry of the required configuration profile.

To export the configuration profile to your PC, perform the following steps:

- Click the link in the Profile name column.
Managing configuration profiles

4.2 Saving the settings

To export the configuration profile to a remote server, perform the following steps:

- Select the storage location and specify the file name.
- Click the Ok button.

The configuration profile is now saved as an XML file in the specified location.

To export the configuration profile to a remote server, perform the following steps:

- Click the button and then the Export... item. The dialog displays the Export... window.
- In the URL field, specify the file URL on the remote server:
  - To save the file on an FTP server, specify the URL for the file in the following form:
    \texttt{ftp://<user>::<password>@<IP address>::<port>/<file name>}
  - To save the file on a TFTP server, specify the URL for the file in the following form:
    \texttt{tftp://<IP address>/<path>/<file name>}
  - To save the file on an SCP or SFTP server, specify the URL for the file in one of the following forms:
    \texttt{scp://<user>::<password>@<IP address>/<path>/<file name>}
    \texttt{sftp://<user>::<password>@<IP address>/<path>/<file name>}

When you click the Ok button, the device displays the Credentials window. There you enter User name and Password to log on to the server.

- Click the Ok button.

The configuration profile is now saved as an XML file in the specified location.

show config profiles nvm

Displays the configuration profiles contained in the non-volatile memory (nvm).

enable

Change to the Privileged EXEC mode.

copy config running-config remote tftp://<IP_address>/ <path>/<file_name>

copy config nv config3 remote tftp://<IP_address>/ <path>/<file_name>

copy config nv profile config3 remote tftp://<IP_address>::<port>/ <path>/<file_name>

Save the current settings on a TFTP server.

Save the selected configuration profile in the non-volatile memory (nvm) on a SFTP server.

Save the configuration profile \texttt{config3} in the non-volatile memory (nvm) on a TFTP server.

Save the configuration profile \texttt{config3} in the non-volatile memory (nvm) on an FTP server.
4.3 Loading settings

If you save multiple configuration profiles in the memory, then you have the option to load a different configuration profile.

4.3.1 Activating a configuration profile

The non-volatile memory of the device can contain multiple configuration profiles. If you activate a configuration profile stored in the non-volatile memory (NVM), then you immediately change the settings in the device. The device does not require a reboot.

Perform the following steps:

1. Open the Basic Settings > Load/Save dialog.
2. In the table, select the entry of the required configuration profile.
3. Click the button and then the Activate item.
   The device copies the settings to the memory (RAM) and disconnects from the Graphical User Interface. The device immediately uses the settings of the configuration profile.
4. Reload the Graphical User Interface.
5. Log in again.

In the Selected column, the checkbox of the configuration profile that was activated before is marked.

```show config profiles nvm```

Displays the configuration profiles contained in the non-volatile memory (NVM).

```enable```

Change to the Privileged EXEC mode.

```copy config nvm profile config3 running-config```

Activate the settings of the configuration profile config3 in the non-volatile memory (NVM). The device copies the settings into the volatile memory and disconnects the connection to the Command Line Interface. The device immediately uses the settings of the configuration profile config3.
4.3.2 Loading the configuration profile from the external memory

If an external memory is connected, then the device loads a configuration profile from the external memory upon restart automatically. The device lets you save these settings in a configuration profile in non-volatile memory.

When the external memory contains the configuration profile of an identical device, you have the possibility to transfer the settings from one device to another.

Perform the following steps:

- Verify that the device loads a configuration profile from the external memory upon restart.
- In the default setting, the function is enabled. If the function is disabled, enable it again as follows:

  - Open the Basic Settings > External Memory dialog.
  - In the Config priority column, select the value first.
  - To save the changes temporarily, click the □ button.

- Using the Command Line Interface, the device lets you copy the settings from the external memory directly into the non-volatile memory (NVM).

  - enable
  - configure
  - config envm load-priority sd first

- The device can also automatically load a configuration profile from a script file during the boot process.

  - Prerequisites:
    - Verify that the external memory is connected before you start the device.
    - The root directory of the external memory contains a text file startup.txt with the content script=<file_name>. The placeholder <file_name> represents the script file that the device executes during the boot process.
    - The root directory of the external memory contains the script file. You have the option to save...
the script with a user-specified name. Save the file with the file extension `.cli`.

Note: Verify that the script saved in the external memory is not empty. If the script is empty, then the device loads the next configuration profile as per the configuration priority settings.

After applying the script, the device automatically saves the configuration profile from the script file as an XML file in the external memory. When you type the appropriate command into the script file, you have the option to disable this function:

```
no config envm config-save sd
```

The device does not create a copy in the external SD memory.

When the script file contains an incorrect command, the device does not apply this command during the boot process. The device logs the event in the log file (System Log).
### 4.3.3 Importing a configuration profile

The device lets you import from a server a configuration profile saved as an XML file. If you use the Graphical User Interface, then you can import the XML file directly from your PC.

**Prerequisites:**
- To save the file on a server, you need a configured server on the network.
- To save the file to an SCP or SFTP server, you also need the username and password for accessing this server.

Perform the following steps:

1. Open the **Basic Settings > Load/Save** dialog.
2. Click the ** ensuing button and then the **Import**... item. The dialog displays the **Import**... window.
3. In the **Select source** drop-down list, select the location from where the device imports the configuration profile.
   - **PC/URL**
     - The device imports the configuration profile from the local PC or from a remote server.
   - **External memory**
     - The device imports the configuration profile from the external memory.

To import the configuration profile from the local PC or from a remote server, perform the following steps:

1. **Import the configuration profile:**
   - When the file is located on an FTP server, specify the URL for the file in the following form:
     
     \[
     \text{ftp://<user>:<password>@<IP address>:<port>/<file name>}
     \]

   - When the file is located on a TFTP server, specify the URL for the file in the following form:
     
     \[
     \text{tftp://<IP address>/<path>/<file name>}
     \]

   - When the file is located on an SCP or SFTP server, specify the URL for the file in one of the following forms:
     
     \[
     \text{scp:// or sftp://<IP address>/<path>/<file name>}
     \]
     
     When you click the **Start** button, the device displays the **Credentials** window. There you enter **User name** and **Password** to log on to the server.

     \[
     \text{scp:// or sftp://<user>:<password>@<IP address>/<path>/<file name>}
     \]

   - In the **Destination** frame, specify where the device saves the imported configuration profile:
     - In the **Profile name** field, specify the name under which the device saves the configuration profile.
     - In the **Storage type** field, specify the storage location for the configuration profile.

   - Click the **Ok** button.

   The device copies the configuration profile into the specified memory.

   If you specified the value **ram** in the **Destination** frame, then the device disconnects the Graphical User Interface and uses the settings immediately.
To import the configuration profile from the external memory, perform the following steps:

- In the Import profile from external memory frame, Profile name drop-down list, select the name of the configuration profile to be imported. The prerequisite is that the external memory contains an exported configuration profile.
- In the Destination frame, specify where the device saves the imported configuration profile:
  - In the Profile name field, specify the name under which the device saves the configuration profile.
- Click the Ok button.

The device copies the configuration profile into the non-volatile memory (NVM) of the device.

If you specified the value ram in the Destination frame, then the device disconnects the Graphical User Interface and uses the settings immediately.

```plaintext
enable

copy config remote ftp://<IP_address>:<port>/<path>/<file_name>
running-config

copy config remote tftp://<IP_address>/ <path>/<file_name>
running-config

copy config remote sftp://<user name>:<password>@<IP_address>/
<path>/<file_name> running-config

copy config remote ftp://<IP_address>:<port>/<path>/<file_name>
nvm profile config3

copy config remote tftp://<IP_address>/ <path>/<file_name>
nvm profile config3
```

Change to the Privileged EXEC mode.

Import and activate the settings of a configuration profile saved on an FTP server. The device copies the settings into the volatile memory and disconnects the connection to the Command Line Interface. The device immediately uses the settings of the imported configuration profile.

Import and activate the settings of a configuration profile saved on a TFTP server. The device copies the settings into the volatile memory and disconnects the connection to the Command Line Interface. The device immediately uses the settings of the imported configuration profile.

Import and activate the settings of a configuration profile saved on a SFTP server. The device copies the settings into the volatile memory and disconnects the connection to the Command Line Interface. The device immediately uses the settings of the imported configuration profile.

Import the settings of a configuration profile saved on an FTP server and save the settings in the configuration profile config3 in the non-volatile memory (NVM).

Import the settings of a configuration profile saved on a TFTP server and save the settings in the configuration profile config3 in the non-volatile memory (NVM).
4.4 Reset the device to the factory defaults

If you reset the settings in the device to the delivery state, then the device deletes the configuration profiles in the volatile memory and in the non-volatile memory.

If an external memory is connected, then the device also deletes the configuration profiles saved in the external memory.

The device then reboots and loads the factory settings.

4.4.1 Using the Graphical User Interface or Command Line Interface

Perform the following steps:

- Open the Basic Settings > Load/Save dialog.
- Click the button, then Back to factory.... The dialog displays a message.
- Click the Ok button.

The device deletes the configuration profiles in the memory (RAM) and in the non-volatile memory (NVM).

If an external memory is connected, then the device also deletes the configuration profiles saved in the external memory.

After a brief period, the device restarts and loads the delivery settings.

4.4.2 Using the System Monitor

Prerequisite:

Your PC is connected with the serial connection of the device using a terminal cable.

Perform the following steps:

- Restart the device.
- To change to the System Monitor, press the <1> key within 3 seconds when prompted during reboot.
  The device loads the System Monitor.
- To change from the main menu to the Manage configurations menu, press the <4> key.
- To execute the Clear configs and boot params command, press the <1> key.
To load the factory settings, press the <Enter> key. The device deletes the configuration profiles in the memory (RAM) and in the non-volatile memory (NVM). If an external memory is connected, then the device also deletes the configuration profiles saved in the external memory.

To change to the main menu, press the <q> key.

To reboot the device with factory settings, press the <q> key.
5 Loading software updates

Hirschmann is continually working on improving and developing their software. Check regularly whether there is an updated version of the software that provides you with additional benefits. You find information and software downloads on the Hirschmann product pages on the Internet at www.hirschmann.com.

The device gives you the following options for updating the device software:

- Software update from the PC
- Software update from a server
- Software update from the external memory
- Loading a previous software version

Note: The device settings are kept after updating the device software.

You see the version of the installed device software on the Login page of the Graphical User Interface. When you are already logged in, perform the following steps to display the version of the installed software.

```plaintext
- Open the Basic Settings > Software dialog.
  The field Running version displays the version number and creation date of the device software that the device loaded during the last restart and is currently running.

- Change to the Privileged EXEC mode.
  show system info
  Displays the system information such as the version number and creation date of the device software that the device loaded during the last restart and is currently running.
```

5.1 Software update from the PC

The prerequisite is that the image file of the device software is saved on a data carrier which is accessible from your PC.

Perform the following steps:

```plaintext
- Navigate to the folder where the image file of the device software is saved.
- Open the Basic Settings > Software dialog.
- Drag and drop the image file in the area. Alternatively click in the area to select the file.
- To start the update procedure, click the Start button.
  As soon as the update procedure is completed successfully, the device displays an information that the software is successfully updated.
  Upon restart, the device loads the installed device software.
```
5.2 Software update from a server

To update the software using SFTP or SCP you need a server on which the image file of the device software is saved.

To update the software using TFTP, SFTP or SCP you need a server on which the image file of the device software is saved.

Perform the following steps:

- Open the Basic Settings > Software dialog.
- In the Software update frame, URL field, enter the URL for the image file in the following form:
  - When the image file is saved on an FTP server:
    - ftp://<IP_address>:<port>/<path>/<image_file_name>.bin
  - When the image file is saved on a TFTP server:
    - tftp://<IP_address>/<path>/<image_file_name>.bin
  - When the image file is saved on a SCP or SFTP server:
    - scp:// or sftp://<IP_address>/<path>/<image_file_name>.bin
    - scp:// or sftp://<username>:<password>@<IP_address>/<path>/<image_file_name>.bin

  When you enter the URL without the user name and password, the device displays the Credentials window. There you enter credentials needed to log on to the server.

- To start the update procedure, click the Start button.
  The device copies the currently running device software into the backup memory.
  As soon as the update procedure is completed successfully, the device displays an information that the software is successfully updated.
  Upon restart, the device loads the installed device software.

enable

Copy the firmware remote tftp://10.0.1.159/product.bin system

Change to the Privileged EXEC mode.

Transfer the product.bin file from the TFTP server with the IP address 10.0.1.159 to the device.
5.3 Software update from the external memory

5.3.1 Manually—initiated by the administrator

The device lets you update the device software with a few mouse clicks. The prerequisite is that the image file of the device software is located in the external memory.

Perform the following steps:

- Open the Basic Settings > Software dialog.
- In the table, mark the row which displays the name of the desired image file in the external memory.
- Right-click to display the context menu.
- To start the update procedure, click in the context menu the Update item.

The device copies the currently running device software into the backup memory. As soon as the update procedure is completed successfully, the device displays an information that the software is successfully updated. Upon restart, the device loads the installed device software.

5.3.2 Automatically—initiated by the device

When the following files are located in the external memory during a restart, the device updates the device software automatically:

- the image file of the device software
- a text file startup.txt with the content autoUpdate=<Image_file_name>.bin

The prerequisite is that in the Basic Settings > External Memory dialog, you mark the checkbox in the Software auto update column. This is the default setting in the device.

Perform the following steps:

- Copy the image file of the new device software into the main directory of the external memory. Use only an image file suitable for the device.
- Create a text file startup.txt in the main directory of the external memory.
- Open the startup.txt file in the text editor and add the following line:

  autoUpdate=<Image_file_name>.bin

- Install the external memory in the device.
- Restart the device.

During the booting process, the device checks automatically the following criteria:

- Is an external memory connected?
- Is a startup.txt file in the main directory of the external memory?
- Does the image file exist which is specified in the startup.txt file?
- Is the software version of the image file more recent than the software currently running in the device?

When the criteria are fulfilled, the device starts the update procedure. The device copies the currently running device software into the backup memory. As soon as the update procedure is completed successfully, the device reboots automatically and loads the new software version.
Check the result of the update procedure. The log file in the Diagnostics > Report > System Log dialog contains one of the following messages:

- S.watson AUTOMATIC_SWUPDATE_SUCCESS
  Software update completed successfully
- S.watson AUTOMATIC_SWUPDATE_ABORTED
  Software update aborted
- S.watson AUTOMATIC_SWUPDATE_ABORTED WRONG_FILE
  Software update aborted due to wrong image file
- S.watson AUTOMATIC_SWUPDATE_ABORTED SAVING_FILE
  Software update aborted because the device did not save the image file.
5.4 Loading a previous software version

The device lets you replace the device software with a previous version. The basic settings in the device are kept after replacing the device software.

Note: Only the settings for functions which are available in the newer device software version are lost.
6 Configuring the ports

The following port configuration functions are available.

- Enabling/disabling the port
- Selecting the operating mode
- Link monitoring function

6.1 Enabling/disabling the port

In the default setting, every port is enabled. For a higher level of access security, disable unconnected ports.

Perform the following steps:

- Open the Basic Settings > Port dialog, Configuration tab.
- To enable a port, mark the checkbox in the Port on column.
- To disable a port, unmark the checkbox in the Port on column.
- To save the changes temporarily, click the ✓ button.

```
enable
configure
interface 1/1
no shutdown
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 1/1.
Enable the interface.
6.2 Selecting the operating mode

In the default setting, the ports are set to Automatic configuration operating mode.

Note: The active automatic configuration has priority over the manual configuration.

Perform the following steps:

- Open the Basic Settings > Port dialog, Configuration tab.
- If the device connected to this port requires a fixed setting, then perform the following steps:
  - Deactivate the function. Unmark the checkbox in the Automatic configuration column.
  - In the Manual configuration column, enter the desired operating mode (transmission rate, duplex mode).
- To save the changes temporarily, click the button.

```
enable
configure
interface 1/1
no auto-negotiate
speed 100 full
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 1/1.
Disable the automatic configuration mode.
Port speed 100 MBit/s, full duplex
6.3 **Link monitoring**

Use the *Link monitoring* function for end stations that do not support Far End Fault Indication (FEFI). This function is used on optical links connected with a supported SFP. When the device detects a link up, the LED associated with the Ethernet port illuminates. When the device detects a lost link, the same LED extinguishes.

6.3.1 **Example**

The given example describes activation of the *Link monitoring* function on the selected ports.

Perform the following steps:

- Open the *Basic Settings > Port* dialog, *Configuration* tab.
- To enable the function, mark the checkbox in the *Link monitoring* column.

```
enable
configure
interface 1/1
link-loss-alert
```

- Change to the Privileged EXEC mode.
- Change to the Configuration mode.
- Change to the interface configuration mode of interface 1/1.
- Enable the *Link monitoring* function on the interface.
7 Assistance in the protection from unauthorized access

The device offers functions that help you protect the device against unauthorized access.

After you set up the device, carry out the following steps in order to reduce possible unauthorized access to the device.

- Changing the SNMPv1/v2 community
- Disabling SNMPv1/v2
- Disabling HTTP
- Using your own HTTPS certificate
- Using your own SSH key
- Disabling Telnet
- Disabling HiDiscovery
- Enable IP access restriction
- Adjusting the session timeouts

7.1 Changing the SNMPv1/v2 community

SNMPv1/v2 works unencrypted. Every SNMP packet contains the IP address of the sender and the plaintext community name with which the sender accesses the device. If SNMPv1/v2 is enabled, then the device lets anyone who knows the community name access the device.

The community names public for read accesses and private for write accesses are preset. If you are using SNMPv1 or SNMPv2, then change the default community name. Treat the community names with discretion.

Perform the following steps:

- Open the Device Security > Management Access > SNMPv1/v2 Community dialog.
  The dialog displays the communities that are set up.
- For the Write community, specify in the Name column the community name.
  - Up to 32 alphanumeric characters are allowed.
  - The device differentiates between upper and lower case.
  - Specify a different community name than for read access.
- To save the changes temporarily, click the button.

  enable
  configure
  snmp community rw <community name>
  show snmp community
  save

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Specify the community for read/write access.
Display the communities that have been configured.
Save the settings in the non-volatile memory (nvm) in the “selected” configuration profile.
7.2 Disabling SNMPv1/v2

If you need SNMPv1 or SNMPv2, then use these protocols only in environments protected from eavesdropping. SNMPv1 and SNMPv2 do not use encryption. The SNMP packets contain the community in clear text. We recommend using SNMPv3 in the device and disabling the access using SNMPv1 and SNMPv2.

Perform the following steps:

- Open the Device Security > Management Access > Server dialog, SNMP tab. The dialog displays the settings of the SNMP server.
- To deactivate the SNMPv1 protocol, you unmark the SNMPv1 checkbox.
- To deactivate the SNMPv2 protocol, you unmark the SNMPv2 checkbox.
- To save the changes temporarily, click the button.

```
enable
configure
no snmp access version v1
no snmp access version v2
show snmp access
save
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Deactivate the SNMPv1 protocol.
Deactivate the SNMPv2 protocol.
Display the SNMP server settings.
Save the settings in the non-volatile memory (n.rom) in the “selected” configuration profile.
7.3 Disabling HTTP

The web server provides the Graphical User Interface with the protocol HTTP or HTTPS. HTTPS connections are encrypted, while HTTP connections are unencrypted.

The HTTP protocol is enabled by default. If you disable HTTP, then no unencrypted access to the Graphical User Interface is possible.

Perform the following steps:

2. To disable the HTTP protocol, select the off radio button in the Operation frame.
3. To save the changes temporarily, click the ✓ button.

```bash
enable
configure
no http server
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Disable the HTTP protocol.

If the HTTP protocol is disabled, then you can reach the Graphical User Interface of the device only by HTTPS. In the address bar of the web browser, enter the string https:// before the IP address of the device.

If the HTTPS protocol is disabled and you also disable HTTP, then the Graphical User Interface is unaccessible. To work with the Graphical User Interface, enable the HTTPS server using the Command Line Interface.

Perform the following steps:

```bash
enable
configure
https server
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Enable the HTTPS protocol.
7.4 Disabling Telnet

The device lets you remotely access the device management using Telnet or SSH. Telnet connections are unencrypted, while SSH connections are encrypted.

The Telnet server is enabled in the device by default. If you disable Telnet, then unencrypted remote access to the Command Line Interface is no longer possible.

Perform the following steps:

- Open the **Device Security > Management Access > Server** dialog, **Telnet** tab.
- To disable the Telnet server, select the **Off** radio button in the **Operation** frame.
- To save the changes temporarily, click the **✓** button.

```plaintext
enable
configure
no telnet server
```

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Disable the Telnet server.

If the SSH server is disabled and you also disable Telnet, then access to the Command Line Interface is only possible through the serial interface of the device. To work remotely with the Command Line Interface, enable SSH.

Perform the following steps:

- Open the **Device Security > Management Access > Server** dialog, **SSH** tab.
- To enable the **SSH** server, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **✓** button.

```plaintext
enable
configure
ssh server
```

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Enable the SSH server.
7.5 Disabling the HiDiscovery access

HiDiscovery lets you assign IP parameters to the device over the network during commissioning. HiDiscovery communicates in the device management VLAN without encryption and authentication.

After the device is commissioned, we recommend setting HiDiscovery to read-only or disabling HiDiscovery access completely.

Perform the following steps:

- Open the Basic Settings > Network dialog.
- To take away write permission from the HiDiscovery software, in the HiDiscovery protocol v1/v2 frame, specify the value `readOnly` in the Access field.
- To disable HiDiscovery access completely, select the Off radio button in the HiDiscovery protocol v1/v2 frame.
- To save the changes temporarily, click the apply button.

```
enable
network hidiscovery mode read-only
no network hidiscovery operation
```

Change to the Privileged EXEC mode.
Disable write permission of the HiDiscovery software.
Disable HiDiscovery access.
7.6 **Activating the IP access restriction**

In the default setting, you access the device management from any IP address and with the supported protocols.

The IP access restriction lets you restrict access to the device management to selected IP address ranges and selected IP-based protocols.

Example:

The device is to be accessible only from the company network using the Graphical User Interface. The administrator has additional remote access using SSH. The company network has the address range 192.168.1.0/24 and remote access from a mobile network with the IP address range 109.237.176.0/24. The SSH application program knows the fingerprint of the RSA key.

| Table 13: Parameters for the IP access restriction |
|---------------------------------|-------------------------------------------------|-------------------------------------------------|
| **Parameter**                   | **Company network**                             | **Mobile phone network**                        |
| Network address                 | 192.168.1.0                                    | 109.237.176.0                                   |
| Netmask                         | 24                                              | 24                                              |
| Desired protocols               | https, snmp                                     | ssh                                             |
Perform the following steps:

- Open the **Device Security > Management Access > IP Access Restriction** dialog.
- Unmark the checkbox in the **Active** column for the entry. This entry lets users have access to the device from any IP address and the supported protocols.

**Address range of the company network:**

- To add a table entry, click the ![button](image). Specify the address range of the company network in the **IP address range** column:
  - 192.168.1.0/24

  For the address range of the corporate network, deactivate the undesired protocols. The **HTTPS**, **SNMP**, and **Active** checkboxes remain marked.

**Address range of the mobile phone network:**

- To add a table entry, click the ![button](image). Specify the address range of the mobile network in the **IP address range** column:
  - 109.237.176.0/24

  For the address range of the mobile network, deactivate the undesired protocols. The **SSH** and **Active** checkboxes remain marked.

Before you enable the function, verify that at least one active entry in the table lets you have access. Otherwise, if you change the settings, then the connection to the device terminates. Access to the device management is only possible using the Command Line Interface through the serial interface of the device.

- To enable IP access restriction, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the ![button](image).
7.6 Activating the IP access restriction

- network management access modify 3 ip 109.237.176.0
  - Specify the IP address of the mobile phone network.

- network management access modify 3 mask 24
  - Specify the netmask of the mobile phone network.

- network management access modify 3 snmp disable
  - Deactivate SNMP for the address range of the mobile phone network.

  - Repeat the operation for every unwanted protocol.

- no network management access status 1
  - Deactivate the default entry.
  - This entry lets users have access to the device from any IP address and the supported protocols.

- network management access status 2
  - Activate an entry for the address range of the company network.

- network management access status 3
  - Activate an entry for the address range of the mobile phone network.

- show network management access rules
  - Display the entries that have been configured.

- network management access operation
  - Enable the IP access restriction.
7.7 Adjusting the session timeouts

The device lets you automatically terminate the session upon inactivity of the logged-on user. The session timeout is the period of inactivity after the last user action.

You can specify a session timeout for the following applications:
- Command Line Interface sessions using an SSH connection
- Command Line Interface sessions using a Telnet connection
- Command Line Interface sessions using a serial connection
- Graphical User Interface

**Timeout for Command Line Interface sessions using a SSH connection**

Perform the following steps:

2. Specify the timeout period in minutes in the Configuration frame, Session timeout [min] field.
3. To save the changes temporarily, click the button.

```plaintext
enable
configure
zsh timeout <0..160>
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Specify the timeout period in minutes for Command Line Interface sessions using an SSH connection.

**Timeout for Command Line Interface sessions using a Telnet connection**

Perform the following steps:

2. Specify the timeout period in minutes in the Configuration frame, Session timeout [min] field.
3. To save the changes temporarily, click the button.

```plaintext
enable
configure
telnet timeout <0..160>
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Specify the timeout period in minutes for Command Line Interface sessions using a Telnet connection.
Timeout for Command Line Interface sessions using a serial connection

Perform the following steps:

- Open the Device Security > Management Access > CLI dialog, Global tab.
- Specify the timeout period in minutes in the Configuration frame, Serial interface timeout [min] field.
- To save the changes temporarily, click the ✅ button.

```bash
enable
cli serial-timeout <0..160>
```

Change to the Privileged EXEC mode.
Specify the timeout period in minutes for Command Line Interface sessions using a serial connection.

Session timeout for the Graphical User Interface

Perform the following steps:

- Open the Device Security > Management Access > Web dialog.
- Specify the timeout period in minutes in the Configuration frame, Web interface session timeout [min] field.
- To save the changes temporarily, click the ✅ button.

```bash
enable
network management access web timeout <0..160>
```

Change to the Privileged EXEC mode.
Specify the timeout period in minutes for Graphical User Interface sessions.
8  **Controlling the data traffic**

The device checks the data packets to be forwarded in accordance with defined rules. Data packets to which the rules apply are either forwarded by the device or blocked. If data packets do not correspond to any of the rules, then the device blocks the packets.

Routing ports to which no rules are assigned allow packets to pass. As soon as a rule is assigned, the assigned rules are processed first. After that, the specified standard action of the device takes effect.

The device provides the following functions for controlling the data stream:

- Service request control (Denial of Service, DoS)
- Denying access to devices based on their IP or MAC address (Access Control List)

The device observes and monitors the data stream. The device takes the results of the observation and the monitoring and combines them with the rules for network security to create what is known as a status table. Based on this status table, the device decides whether to accept, drop or reject data.

The data packets go through the filter functions of the device in the following sequence:

- DoS … if `permit` or `accept`, then progress to the next rule
- ACL … if `permit` or `accept`, then progress to the next rule

8.1  **Helping protect against unauthorized access**

With this function, the device supports you in helping protect against invalid or falsified data packets targeted at causing the failure of certain services or devices. You have the option of specifying filters in order to restrict the data stream for protection against denial-of-service attacks. The activated filters check incoming data packets and discard them as soon as a match with the filter criteria is found.

The `Network Security > DoS > Global` dialog contains 2 frames in which you activate different filters. To activate them, mark the corresponding checkboxes.

In the `TCP/UDP` frame, you activate up to 4 filters that only influence TCP and UDP packets. Using this filter, you deactivate port scans, which attackers use to try to recognize devices and services offered. The filters operate as follows:

*Table 14: DoS filters for TCP packets*

<table>
<thead>
<tr>
<th>Filter</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activate Null Scan Filter</td>
<td>The device detects and discards TCP packets for which no TCP flags are set.</td>
</tr>
<tr>
<td>Activate Xmas Filter</td>
<td>The device detects and discards TCP packets for which the TCP flags FIN, URG and PUSH are simultaneously set.</td>
</tr>
<tr>
<td>Activate SYN/FIN Filter</td>
<td>The device detects and discards TCP packets for which the TCP flags SYN and FIN are simultaneously set.</td>
</tr>
<tr>
<td>Activate Minimal Header Filter</td>
<td>The device detects and discards TCP packets for which the TCP header is too short.</td>
</tr>
</tbody>
</table>
The *ICMP* frame offers you 2 filter options for ICMP packets. Fragmentation of incoming ICMP packets is a sign of an attack. If you activate this filter, then the device detects fragmented ICMP packets and discards them. Using the *Allowed payload size [byte]* parameter, you can also specify the maximum permissible size of the payload of the ICMP packets. The device discards data packets that exceed this byte specification.

**Note:** You can combine the filters in any way in the *Network Security > DoS > Global* dialog. When several filters are selected, a logical Or applies: If the first or second (or the third, etc.) filter applies to a data packet, then the device discards it.
In this menu you can enter the parameters for the Access Control Lists (ACLs).

The device uses ACLs to filter data packets received on VLANs or on individual or multiple ports. In a ACL, you specify rules that the device uses to filter data packets. When such a rule applies to a packet, the device applies the actions specified in the rule to the packet. The available actions are as follows:

- **allow (permit)**
- **discard (deny)**
- **redirect to a certain port (see **Redirection port** field)**
- **mirror (see **Mirror port** field)**

The list below contains criteria that you can apply to filter the data packets:

- Source or destination address of a packet (MAC)
- Source or destination address of a data packet (IPv4)
- Type of the transmitting protocol (MAC/IPv4)
- Source or destination port of a data packet (IPv4)
- Service class of a packet (MAC)
- Membership of a specific VLAN (MAC)
- DSCP classification (IPv4)
- ToS classification (IPv4)
- Packet Fragmentation (IPv4)

You can specify the following ACL types:

- IP ACLs for VLANs
- IP ACLs for ports
- MAC ACLs for VLANs
- MAC ACLs for ports

When you assign both an IP ACL and MAC ACL to the same interface, the device first uses the IP ACL to filter the data stream. The device applies the MAC ACL rules only after the packets are filtered through the IP ACL. The priority of an ACL is independent of the index of a rule.

Within an ACL, the device processes the rules in order. The index of the respective rule determines the order in which the device filters the data stream. When you assign an ACL to a port or VLAN, you can specify its priority with the index. The lower the number, the higher the priority. The device processes the rule with the higher priority first.

If none of the rules specified in an ACL applies to a data packet, then the implicit **deny** rule applies. As a result, the device drops the received data packets.

Keep in mind that the device directly implements the implicit **deny** rule.

**Note:** The number of available ACLs depends on the device. You find more information about the ACL values in the chapter “Technical Data” on page 478.

**Note:** You can assign a single ACL to any number of ports or VLANs.

**Note:** If you activate the **Packet fragmented** function for a rule, then the rule processes IPv4 fragments with the offset other than zero. The rule processes every IPv4 fragment except for the initial IPv4 fragment.
The **ACL** menu contains the following dialogs:
- **ACL IPv4 Rule**
- **ACL MAC Rule**
- **ACL Assignment**

These dialogs provide the following options:
- To specify the rules for the various ACL types.
- To provide the rules with the required priorities.
- To assign the ACLs to ports or VLANs.

### 8.2.1 Creating and editing IPv4 rules

When filtering IPv4 data packets, the device lets you:
- create new groups and rules
- add new rules to existing groups
- edit an existing rule
- activate and deactivate groups and rules
- delete existing groups and rules
- change the order of existing rules

Perform the following steps:

- Open the *Network Security > ACL > IPv4 Rule* dialog.
- Click the **Create** button.
  The dialog displays the *Create* window.
- To create a group, specify a meaningful name in the **Group name** field. You can combine several rules in one group.
- To add a rule to an existing group, select the name of the group in the **Group name** field.
- In the **Index** field you specify the number for the rule within the ACL. This number defines the priority of the rule.
- Click the **Ok** button.
  The device adds the rule to the table. Group and role are active immediately.
  To deactivate group or rules, unmark the checkbox in the **Active** column.
  To remove a rule, highlight the affected table entry and click the **Delete** button.
- Edit the rule parameters in the table.
  To change a value, double-click the relevant field.
- To save the changes temporarily, click the **Save** button.

**Note:** The device lets you use wildcards with the **Source IP address** and **Destination IP address** parameters. If you enter for example, **192.168.?.?**, then the device allows addresses that start with **192.168**.

**Note:** The prerequisite for changing the values in the **Source TCP/UDP port** and **Destination TCP/UDP port** column is that you specify the value **tcp** or **udp** in the **Protocol** column.

**Note:** The prerequisite for changing the value in the **Redirection port** and **Mirror port** column is that you specify the value **permit** in the **Action** column.
8.2.2 Creating and configuring an IP ACL using the Command Line Interface

In the following example, you configure ACLs to block communications from computers B and C, to computer A via IP (TCP, UDP, etc.).

Perform the following steps:

```plaintext
enable
configure
ip acl add 1 filter
ip acl rule add 1 1 deny src 10.0.1.11 0.0.0.0 dst 10.0.1.158 0.0.0.0
ip acl rule add 1 2 permit src any any dst any any
show acl ip rules 1
ip acl add 2 filter2
ip acl rule add 2 1 deny src 10.0.1.13 0.0.0.0 dst 10.0.1.158 0.0.0.0
ip acl rule add 2 2 permit src any any dst any any
show acl ip rules 2
interface 1/1
acl ip assign 1 in 1
exit
interface 1/3
acl ip assign 2 in 1
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Adds an IP ACL with the ID 1 and the name filter.
Adds a rule to position 1 of the IP ACL with the ID 1 denying IP data packets from 10.0.1.11 to 10.0.1.158.
Adds a rule to position 2 of the IP ACL with the ID 1 admitting IP data packets.
Displays the rules of the IP ACL with the ID 1.
Adds an IP ACL with the ID 2 and the name filter2.
Adds a rule to position 1 of the IP ACL with the ID 2 denying IP data packets from 10.0.1.13 to 10.0.1.158.
Adds a rule to position 2 of the IP ACL with the ID 2 admitting IP data packets.
Displays the rules of the IP ACL with the ID 2.
Change to the interface configuration mode of interface 1/1.
Assigns the IP ACL with the ID 1 to incoming data packets (in) on interface 1/1, with a priority of 1 (highest priority).
Leaves the interface mode.
Change to the interface configuration mode of interface 1/3.
Assigns the IP ACL with the ID 2 to incoming data packets (in) on interface 1/3, with a priority of 1 (highest priority).
8.2 ACL

8.2.3 Creating and editing MAC rules

When filtering MAC data packets, the device lets you:
- create new groups and rules
- add new rules to existing groups
- edit an existing rule
- activate and deactivate groups and rules
- delete existing groups and rules
- change the order of existing rules

Perform the following steps:

- Open the Network Security > ACL > MAC Rule dialog.
- Click the button. The dialog displays the Create window.
  - To create a group, specify a meaningful name in the Group name field. You can combine several rules in one group.
  - To add a rule to an existing group, select the name of the group in the Group name field.
  - In the Index field you specify the number for the rule within the ACL. This number defines the priority of the rule.
- Click the Ok button. The device adds the rule to the table. Group and role are active immediately.
  - To deactivate group or rules, unmark the checkbox in the Active column.
  - To remove a rule, highlight the affected table entry and click the button.
- Edit the rule parameters in the table. To change a value, double-click the relevant field.
- To save the changes temporarily, click the button.

Note: In the Source MAC address and Destination MAC address fields you can use wildcards in the FF:?:?:?:?:?:? or ?:?:?:?:?:?:00:01 form. Use capital letters here.

8.2.4 Creating and configuring a MAC ACL using the Command Line Interface

In the following example, AppleTalk and IPX are to be filtered out from the entire network.

Perform the following steps:

- enable
  - Change to the Privileged EXEC mode.
- configure
  - Change to the Configuration mode.
- mac acl add 1 macfilter
  - Adds a MAC ACL with the ID 1 and the name macfilter.
**Assigning ACLs to a port or VLAN**

When you assign ACLs to a port or VLAN, the device gives you the following options:
- To select the port or VLAN.
- To specify the ACL priority.
- To select the ACL using the group name.

Perform the following steps:

1. Open the **Network Security > ACL > Assignment** dialog.
2. Click the **Create** button.
   - The dialog displays the **Create** window.
3. In the **Port/VLAN** field, specify the desired port or the desired VLAN.
4. In the **Priority** field, specify the priority.
5. In the **Direction** field, specify the data packets to which the device applies the rule.
6. In the **Group name** field, specify the rule the device assigns to the port or the VLAN.
7. Click the **Ok** button.
8. To save the changes temporarily, click the **✓** button.

---

**8.2.5 Assigning ACLs to a port or VLAN**

When you assign ACLs to a port or VLAN, the device gives you the following options:
- To select the port or VLAN.
- To specify the ACL priority.
- To select the ACL using the group name.

Perform the following steps:

- Open the **Network Security > ACL > Assignment** dialog.
- Click the **Create** button.
  - The dialog displays the **Create** window.
- In the **Port/VLAN** field, specify the desired port or the desired VLAN.
- In the **Priority** field, specify the priority.
- In the **Direction** field, specify the data packets to which the device applies the rule.
- In the **Group name** field, specify the rule the device assigns to the port or the VLAN.
- Click the **Ok** button.
- To save the changes temporarily, click the **✓** button.
8.3 MAC authentication bypass

The MAC authorized bypass function lets clients that do not support 802.1X, such as printers and fax machines, authenticate to the network using their MAC address. The device lets you specify the format of the MAC address used to authenticate the clients on the RADIUS server.

Example:

Split the MAC address into 6 groups of 2 characters. Use uppercase letters and a colon character as separator: AA:BB:CC:DD:EE:FF

Use the password xY-45uM_e.

Perform the following steps:

- Open the Network Security > 802.1X Port Authentication > Global dialog. The following steps you perform in the MAC authentication bypass format options frame.
- In the Group size drop-down list, select the value 2. The device splits the MAC address into 6 groups of 2 characters.
- In the Group separator drop-down list, select the : character.
- In the Upper or lower case drop-down list, select the value upper-case.
- In the Password field, enter the password xY-45uM_e. The device uses this password for every client that authenticates to the RADIUS server. If you leave the field empty, then the device uses the formatted MAC address also as the password.
- To temporarily save the settings, click the button.

```
enable
configure
dot1x mac-authentication-bypass format
group-size 2
dot1x mac-authentication-bypass format
group-separator :
dot1x mac-authentication-bypass format
letter-case upper-case
dot1x mac-authentication-bypass
password xY-45uM_e
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Specify the group size 2.
Specify the group separator :.
Specify that the device formats the authentication data in uppercase letters.
Specify the password xY-45uM_e. The device uses this password to authenticate every client on the RADIUS server.
9 Synchronizing the system time in the network

Many applications rely on a time that is as correct as possible. The necessary accuracy, and thus the allowable deviation from the actual time, depends on the application area.

Examples of application areas include:
- Log entries
- Time stamping of production data
- Process control

The device lets you synchronize the time on the network using the following options:
- The Simple Network Time Protocol (SNTP) is a simple solution for low accuracy requirements. Under ideal conditions, SNTP achieves an accuracy in the millisecond range. The accuracy depends on the signal delay.
- IEEE 1588 with the Precision Time Protocol (PTP) achieves accuracies on the order of fractions of microseconds. This method is suitable even for demanding applications up to and including process control.

When the involved devices support the PTP protocol, it is the better choice. PTP is more accurate, has advanced methods of error correction, and causes a low network load. The implementation of PTP is comparatively easy.

Note: According to the PTP and SNTP standards, both protocols function in parallel in the same network. However, since both protocols influence the system time of the device, situations can occur in which the two protocols conflict with each other.

9.1 Basic settings

In the Time > Basic Settings dialog, you specify general settings for the time.
9.1.1 Setting the time

When no reference time source is available to you, you have the option to set the time in the device.

After a cold start or reboot, if no real-time clock is available or the real-time clock contains an invalid time, then the device initializes its clock with January 1, 00:00h. After the power supply is switched off, the device buffers the settings of the real-time clock up to 24 hours.

Alternatively, you configure the settings in the device so that it automatically obtains the current time from a PTP clock or from an SNTP server.

Perform the following steps:

- Open the Time > Basic Settings dialog.
  - The System time (UTC) field displays the current UTC (Universal Time Coordinated) of the device. UTC is the time relating to the coordinated world time measurement. UTC is the same worldwide and does not take local time shifts into account.
  - The time in the System time field comes from the System time (UTC) plus the Local offset [min] value and a possible shift due to daylight saving time.

- In order to cause the device to apply the time of your PC to the System time field, click the Set time from PC button.
  - Based on the value in the Local offset [min] field, the device calculates the time in the System time (UTC) field: The System time (UTC) comes from the System time minus the Local offset [min] value and a possible shift due to daylight saving time.
  - The Time source field displays the origin of the time data. The device automatically selects the source with the greatest accuracy.
  - The source is initially local. When SNTP is active and the device receives a valid SNTP packet, the device sets its time source to sntp. When PTP is active and the device receives a valid PTP message, the device sets its time source to ptp. The device prioritizes PTP ahead of SNTP.
  - The Local offset [min] value specifies the time difference between the local time and the System time (UTC).

- In order to cause the device to determine the time zone on your PC, click the Set time from PC button. The device calculates the local time difference from UTC and enters the difference into the Local offset [min] field.

Note: The device provides the option to obtain the local offset from a DHCP server.

- To save the changes temporarily, click the button.
9.1.2 Automatic daylight saving time changeover

When you operate the device in a time zone in which there is a summer time change, you set up the automatic daylight saving time changeover on the Daylight saving time tab.

When daylight saving time is enabled, the device sets the local system time forward by 1 hour at the beginning of daylight saving time. At the end of daylight saving time, the device sets the local system time back again by 1 hour.

Perform the following steps:

- Open the Time > Basic Settings dialog, Daylight saving time tab.
- To select a preset profile for the start and end of daylight saving time, click the Profile... button in the Operation frame.
- When no matching daylight saving time profile is available, you specify the changeover times in the Summertime begin and Summertime end fields. For both time points, you specify the month, the week within this month, the weekday, and the time of day.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

```
enable
configure
clock summer-time mode
<disable|recurring|eu|usa>
clock summer-time recurring start
clock summer-time recurring end
save
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Configure the automatic daylight saving time changeover: enable/disable or activate with a profile.
Enter the start time for the changeover.
Enter the end time for the changeover.
Save the settings in the non-volatile memory (nvm) in the “selected” configuration profile.
The Simple Network Time Protocol (SNTP) lets you synchronize the system time in your network. The device supports the SNTP client and the SNTP server function.

The SNTP server makes the UTC (Universal Time Coordinated) available. UTC is the time relating to the coordinated world time measurement. The UTC is the same worldwide and ignores local time shifts.

SNTP is a simplified version of NTP (Network Time Protocol). The data packets are identical with SNTP and NTP. Accordingly, both NTP and SNTP servers serve as a time source for SNTP clients.

Note: Statements in this chapter relating to external SNTP servers also apply to NTP servers.

SNTP knows the following operation modes for the transmission of time:
- **Unicast**
  In Unicast operation mode, an SNTP client sends requests to an SNTP server and expects a response from this server.
- **Broadcast**
  In Broadcast operation mode, an SNTP server sends SNTP messages to the network in specified intervals. SNTP clients receive these SNTP messages and evaluate them.

<table>
<thead>
<tr>
<th>IP destination address</th>
<th>Send SNTP packets to</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>Nobody</td>
</tr>
<tr>
<td>224.0.1.1</td>
<td>Multicast address for SNTP messages</td>
</tr>
<tr>
<td>255.255.255.255</td>
<td>Broadcast address</td>
</tr>
</tbody>
</table>

Note: An SNTP server in Broadcast operation mode also responds to direct requests using Unicast from SNTP clients. In contrast, SNTP clients work in either Unicast or Broadcast operation mode.
9.2.1 Preparation

Perform the following steps:

- To get an overview of how the time is passed on, draw a network plan with the devices participating in SNTP.

When planning, bear in mind that the accuracy of the time depends on the delays of the SNTP messages. To minimize delays and their variance, place an SNTP server in each network segment. Each of these SNTP servers synchronizes its own system time as an SNTP client with its parent SNTP server (SNTP cascade). The highest SNTP server in the SNTP cascade has the most direct access to a reference time source.

Note: For precise time distribution, between SNTP servers and SNTP clients you preferably use network components (routers and switches) that forward the SNTP packets with a low and uniform transmission time (latency).

An SNTP client sends its requests to up to 4 configured SNTP servers. When there is no response from the 1st SNTP server, the SNTP client sends its requests to the 2nd SNTP server. When this request is also unsuccessful, it sends the request to the 3rd and finally the 4th SNTP server. If none of these SNTP servers responds, the SNTP client loses its synchronization. The SNTP client periodically sends requests to each SNTP server until a server delivers a valid time.

Note: The device provides the option of obtaining a list of SNTP server IP addresses from a DHCP server.

- If no reference time source is available to you, then determine a device with an SNTP server as a reference time source. Adjust its system time at regular intervals.
9.2.2 Defining settings of the SNTP client

As an SNTP client, the device obtains the time information from SNTP or NTP servers and synchronizes its system clock accordingly.

Perform the following steps:

- Open the Time > SNTP > Client dialog.
- Set the SNTP operation mode.
  In the Configuration frame, select one of the following values in the Mode field:
  - unicast
    The device sends requests to an SNTP server and expects a response from this server.
  - broadcast
    The device waits for Broadcast messages from SNTP servers on the network.
- To synchronize the time only once, mark the Disable client after successful sync checkbox. After synchronization, the device disables the SNTP Client function.
- The table displays the SNTP server to which the SNTP client sends a request in Unicast operation mode. The table contains up to four SNTP server definitions.
- To add a table entry, click the button.
- Specify the connection data of the SNTP server.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.
- The State field displays the current status of the SNTP Client function.

Table 16: SNTP client settings for the example

</tbody>
</table>
9.2.3 Specifying SNTP server settings

When the device operates as an SNTP server, it provides its system time in coordinated world time (UTC) in the network.

Perform the following steps:

- Open the Time > SNTP > Server dialog.
- To enable the function, select the On radio button in the Operation frame.
- To enable the Broadcast operation mode, select the Broadcast admin mode radio button in the Configuration frame.
  In Broadcast operation mode, the SNTP server sends SNTP messages to the network in specified intervals. The SNTP server also responds to the requests from SNTP clients in Unicast operation mode.
- In the Broadcast destination address field, you set the IP address to which the SNTP server sends the SNTP packets. Set a Broadcast address or a Multicast address.
- In the Broadcast UDP port field, you specify the number of the UDP port to which the SNTP server sends the SNTP packets in Broadcast operation mode.
- In the Broadcast VLAN ID field, you specify the ID of the VLAN to which the SNTP server sends the SNTP packets in Broadcast operation mode.
- In the Broadcast send interval [s] field, you enter the time interval at which the SNTP server of the device sends SNTP Broadcast packets.
- To save the changes temporarily, click the button.
  The State field displays the current status of the SNTP Server function.

Synchronizing the system time in the network

9.3 PTP

In order for LAN-controlled applications to work without latency, precise time management is required. With PTP (Precision Time Protocol), IEEE 1588 describes a method that enables precise synchronization of clocks in the network.

PTP enables synchronization with an accuracy of a few 100 ns. PTP uses Multicasts for the synchronization messages, which keeps the network load low.

### 9.3.1 Types of clocks

PTP defines the roles of “master” and “slave” for the clocks in the network:
- A master clock (reference time source) distributes its time.
- A slave clock synchronizes itself with the timing signal received from the master clock.

#### Boundary clock

The transmission time (latency) in routers and switches has a measurable effect on the precision of the time transmission. To correct such inaccuracies, PTP defines what are known as boundary clocks.

In a network segment, a boundary clock is the reference time source (master clock) to which the subordinate slave clocks synchronize. Typically routers and switches take on the role of boundary clock.

The boundary clock in turn obtains the time from a higher-level reference time source (Grandmaster).

![Figure 22: Position of the boundary clock in a network](image)

#### Transparent Clock

Switches typically take on the Transparent Clock role to enable high accuracy across the cascades. The Transparent Clock is a Slave clock that corrects its own transmission time when it forwards received synchronization messages.
**Ordinary Clock**

PTP designates the clock in an end device as an “Ordinary Clock”. An Ordinary Clock functions either as a master clock or slave clock.

### 9.3.2 Best Master Clock algorithm

The devices participating in PTP designate a device in the network as a reference time source (Grandmaster). Here the “Best Master Clock” algorithm is used, which determines the accuracy of the clocks available in the network.

The “Best Master Clock” algorithm evaluates the following criteria:

- **Priority 1**
- **Clock class**
- **Clock accuracy**
- **Clock variance**
- **Priority 2**

The algorithm first evaluates the value in the **Priority 1** field of the participating devices. The device with the smallest value in the **Priority 1** field becomes the reference time source (Grandmaster). When the value is the same for multiple devices, the algorithm takes the next criterion. When this is also the same, it takes the next criterion after this one. If these values are the same for multiple devices, then the smallest value in the **Clock identity** field decides which device becomes the reference time source (Grandmaster).

In the settings of the boundary clock, the device lets you individually specify the values for **Priority 1** and **Priority 2**. This lets you influence which device will be the reference time source (Grandmaster) in the network.

### 9.3.3 Delay measurement

The delay of the synchronization messages between the devices affects the accuracy. The delay measurement lets the devices take into account the average delay.

PTP version 2 offers the following methods for delay measurement:

- **e2e** (End to End)
  
  The slave clock measures the delay of synchronization messages to the master clock.

- **e2e-optimized**
  
  The slave clock measures the delay of synchronization messages to the master clock. This method is available only for transparent clocks. The device forwards the synchronization messages sent using Multicast only to the master clock, keeping the network load low. When the device receives a synchronization message from another master clock, it forwards the synchronization messages only to this new port. When the device knows no master clock, it forwards synchronization messages to every port.

- **p2p** (Peer to Peer)
  
  The slave clock measures the delay of synchronization messages to the master clock. In addition, the master clock measures the delay to each slave clock, even across blocked ports. This requires that the master and slave clock support Peer-to-Peer (**p2p**). In case of interruption of a redundant ring, for example, the slave clock becomes the master clock and the master clock becomes the slave clock. This switch occurs without loss of precision, because the clocks already know the delay in the other direction.
9.3.4 PTP domains

The device transmits synchronization messages only from and to devices in the same PTP domain. The device lets you set the domain for the boundary clock and for the transparent clock individually.

![Example of PTP domains](image)

**Figure 23: Example of PTP domains**

9.3.5 Using PTP

In order to synchronize the clocks precisely with PTP, only use switches with a boundary clock or transparent clock as nodes.

Perform the following steps:
- To gain an overview of the distribution of clocks, draw a network plan with the devices involved in PTP.
- Specify the role for each participating switch (boundary clock or transparent clock). In the device, this setting is called **PTP mode**.

<table>
<thead>
<tr>
<th>PTP mode</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>v2-boundary-clock</td>
<td>As a boundary clock, the device distributes synchronization messages to the slave clocks in the subordinate network segment. The boundary clock in turn obtains the time from a higher-level reference time source (Grandmaster).</td>
</tr>
<tr>
<td>v2-transparent-clock</td>
<td>As a transparent clock, the device forwards received synchronization messages after they have been corrected by the delay of the transparent clock.</td>
</tr>
</tbody>
</table>

- Enable PTP on each participating switch.
- PTP is then configured on a largely automatic basis.
- Enable PTP on the end devices.
- The device lets you influence which device in the network becomes the reference clock (Grandmaster). Therefore, change the default value in the **Priority 1** and **Priority 2** fields for the Boundary Clock.
10 Network load control

The device features a number of functions that reduce the network load:

- Direct packet distribution
- Multicasts
- Rate limiter
- Prioritization - QoS
- Flow control

10.1 Direct packet distribution

The device reduces the network load with direct packet distribution.

On each of its ports, the device learns the sender MAC address of received data packets. The device stores the combination “port and MAC address” in its MAC address table (FDB).

By applying the “Store and Forward” method, the device buffers data received and checks it for validity before forwarding it. The device rejects invalid and defective data packets.

10.1.1 Learning MAC addresses

When the device receives a data packet, it checks whether the MAC address of the sender is already stored in the MAC address table (FDB). When the MAC address of the sender is unknown, the device generates a new entry. The device then compares the destination MAC address of the data packet with the entries stored in the MAC address table (FDB):

- The device forwards packets with a known destination MAC address directly to ports that have already received data packets from this MAC address.
- The device floods data packets with unknown destination addresses, that is, the device forwards these data packets to every port.

10.1.2 Aging of learned MAC addresses

Addresses that have not been detected by the device for an adjustable period of time (aging time) are deleted from the MAC address table (FDB) by the device. A reboot or resetting of the MAC address table deletes the entries in the MAC address table (FDB).
10.1.3 **Static address entries**

In addition to learning the sender MAC address, the device also provides the option to set MAC addresses manually. These MAC addresses remain configured and survive resetting of the MAC address table (FDB) as well as rebooting of the device.

Static address entries allow the device to forward data packets directly to selected ports. If you do not specify a destination port, then the device discards the corresponding data packets.

You manage the static address entries in the Graphical User Interface or in the Command Line Interface.

Perform the following steps:

- Create a static address entry.
- Convert a learned MAC address into a static address entry.
- Disable a static address entry.

1. Open the Switching > Filter for MAC Addresses dialog.
2. Add a user-configurable MAC address:
   - Click the button.
   - The dialog displays the Create window.
   - In the Address field, specify the destination MAC address.
   - In the VLAN ID field, specify the ID of the VLAN.
   - In the Port list, select the ports to which the device forwards data packets with the specified destination MAC address in the specified VLAN.
   - When you have defined a Unicast MAC address in the Address field, select only one port.
   - When you have defined a Multicast MAC address in the Address field, select one or more ports.
   - If you want the device to discard data packets with the destination MAC address, then do not select any port.
   - Click the Ok button.
3. To save the changes temporarily, click the button.

```
enable
configure
mac-filter <MAC address> <VLAN ID>
interface 1/1
mac-filter <MAC address> <VLAN ID>
save
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Create the MAC address filter, consisting of a MAC address and VLAN ID.
Change to the interface configuration mode of interface 1/1.
Assign the port to a previously created MAC address filter.
Save the settings in the non-volatile memory (nvm) in the “selected” configuration profile.

4. Convert a learned MAC address into a static address entry.
5. Open the Switching > Filter for MAC Addresses dialog.
6. To convert a learned MAC address into a static address entry, select the value permanent in the Status column.
7. To save the changes temporarily, click the button.
8. Disable a static address entry.
☐ Open the **Switching > Filter for MAC Addresses** dialog.

☐ To disable a static address entry, select the value **invalid** in the **Status** column.

☐ To save the changes temporarily, click the ☑ button.

```plaintext
enable
configure
interface 1/1

no mac-filter <MAC address> <VLAN ID>

exit

no mac-filter <MAC address> <VLAN ID>

exit

save
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 1/1.
Cancel the assignment of the MAC address filter on the port.
Change to the Configuration mode.
Deleting the MAC address filter, consisting of a MAC address and VLAN ID.
Change to the Privileged EXEC mode.
Save the settings in the non-volatile memory (nvm) in the “selected” configuration profile.

☐ Delete learned MAC addresses.

☐ To delete the learned addresses from the MAC address table (FDB), open the **Basic Settings > Restart** dialog and click the **Reset MAC address table** button.

```plaintext
clear mac-addr-table
```

Delete the learned MAC addresses from the MAC address table (FDB).
10.2 Multicasts

By default, the device floods data packets with a Multicast address, that is, the device forwards the data packets to every port. This leads to an increased network load.

The use of IGMP snooping can reduce the network load caused by Multicast data traffic. IGMP snooping lets the device send Multicast data packets only on those ports to which devices “interested” in Multicast are connected.

10.2.1 Example of a Multicast application

Surveillance cameras transmit images to monitors in the machine room and in the monitoring room. With an IP Multicast transmission, the cameras transmit their graphic data over the network in Multicast packets.

The Internet Group Management Protocol (IGMP) organizes the Multicast data traffic between the Multicast routers and the monitors. The switches in the network between the Multicast routers and the monitors monitor the IGMP data traffic continuously (“IGMP Snooping”).

Switches register logins for receiving a Multicast stream (IGMP report). The device then creates an entry in the MAC address table (FDB) and forwards Multicast packets only to the ports on which it has previously received IGMP reports.

10.2.2 IGMP snooping

The Internet Group Management Protocol (IGMP) describes the distribution of Multicast information between routers and connected receivers on Layer 3. IGMP Snooping describes the function of a switch of continuously monitoring IGMP traffic and optimizing its own transmission settings for this data traffic.

The IGMP Snooping function in the device operates according to RFC 4541 (Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches).

Multicast routers with an active IGMP function periodically request (query) registration of Multicast streams in order to determine the associated IP Multicast group members. IP Multicast group members reply with a Report message. This Report message contains the parameters required by the IGMP function. The Multicast router enters the IP Multicast group address from the Report message in its routing table. This causes it to forward data packets with this IP Multicast group in the destination address field according to its routing table.

When leaving a Multicast group (IGMP version 2 and higher), receivers log out with a “Leave” message and do not send any more Report messages. If it does not receive any more Report messages from this receiver within a certain time (aging time), then the Multicast router removes the routing table entry of a receiver.

When several IGMP Multicast routers are in the same network, the device with the smaller IP address takes over the query function. When there are no Multicast routers on the network, you have the option to enable the query function in an appropriately equipped switch.

A switch that connects one Multicast receiver with a Multicast router analyzes the IGMP information with the IGMP snooping method.
The IGMP snooping method also makes it possible for switches to use the IGMP function. A switch stores the MAC addresses derived from IP addresses of the Multicast receivers as recognized Multicast addresses in its MAC address table (FDB). In addition, the switch identifies the ports on which it has received reports for a specific Multicast address. In this way, the switch forwards Multicast packets only to ports to which Multicast receivers are connected. The other ports do not receive these packets.

A special feature of the device is the possibility of determining the processing of data packets with unknown Multicast addresses. Depending on the setting, the device discards these data packets or forwards them to every port. By default, the device transmits the data packets only to ports with connected devices, which in turn receive query packets. You also have the option of additionally sending known Multicast packets to query ports.

Setting IGMP snooping

Perform the following steps:

- Open the Switching > IGMP Snooping > Global dialog.
- To enable the function, select the On radio button in the Operation frame.
  - When the IGMP Snooping function is disabled, the device behaves as follows:
    - The device ignores the received query and report messages.
    - The device forwards (floods) received data packets with a Multicast address as the destination address to every port.
- To save the changes temporarily, click the button.

- Specifying the settings for a port:

- Open the Switching > IGMP Snooping > Configuration dialog, Port tab.
- To activate the IGMP Snooping function on a port, mark the checkbox in the Active column for the relevant port.
- To save the changes temporarily, click the button.

- Specifying the settings for a VLAN:

- Open the Switching > IGMP Snooping > Configuration dialog, VLAN ID tab.
- To activate the IGMP Snooping function for a specific VLAN, mark the checkbox in the Active column for the relevant VLAN.
- To save the changes temporarily, click the button.
Setting the IGMP querier function

The device itself optionally sends active query messages; alternatively, it responds to query messages or detects other Multicast queriers in the network (IGMP Snooping Querier function).

Prerequisite:

The IGMP Snooping function is enabled globally.

Perform the following steps:

- Open the Switching > IGMP Snooping > Querier dialog.
- In the Operation frame, enable/disable the IGMP Snooping Querier function of the device globally.
- To activate the IGMP Snooping Querier function for a specific VLAN, mark the checkbox in the Active column for the relevant VLAN.
  - The device carries out a simple selection process: When the IP source address of the other Multicast querier is lower than its own, the device switches to the passive state, in which it does not send out any more query requests.
  - In the Address column, you specify the IP Multicast address that the device inserts as the sender address in generated query requests. You use the address of the Multicast router.
- To save the changes temporarily, click the button.

IGMP snooping enhancements (table)

The Switching > IGMP Snooping > Snooping Enhancements dialog provides you access to enhanced settings for the IGMP Snooping function. You activate or deactivate the settings on a per port basis in a VLAN.

The following settings are possible:

- **Static**
  - Use this setting to set the port as a static query port. The device forwards every IGMP message on a static query port, even if it has previously received no IGMP query messages on this port. When the static option is disabled and the device has previously received IGMP query messages, it forwards IGMP messages on this port. When this is the case, the entry displays L ("learned").
- **Learn by LLDP**
  - A port with this setting automatically discovers other Hirschmann devices using LLDP (Link Layer Discovery Protocol). The device then learns the IGMP query status of this port from these Hirschmann devices and configures the IGMP Snooping Querier function accordingly. The ALA entry indicates that the Learn by LLDP function is activated. When the device has found another Hirschmann device on this port in this VLAN, the entry also displays an A ("automatic").
- **Forward All**
  - With this setting, the device forwards the data packets addressed to a Multicast address to this port. The setting is suitable in the following situations, for example:
    - For diagnostic purposes.
    - For devices in an MRP ring: After the ring is switched, the Forward All function makes it possible to reconfigure the network rapidly for data packets with registered Multicast destination addresses. Activate the Forward All function on every ring port.
Prerequisite:

The *IGMP Snooping* function is enabled globally.

Perform the following steps:

- Open the *Switching > IGMP Snooping > Snooping Enhancements* dialog.
- Double-click the desired port in the desired VLAN.
- To activate one or more functions, select the corresponding options.
- Click the *Ok* button.
- To save the changes temporarily, click the ✅ button.

```text
enable
vlan database
igmp-snooping vlan-id 1 forward-all 1/1
```

**Configure Multicasts**

The device lets you configure the exchange of Multicast data packets. The device provides different options depending on whether the data packets are to be sent to unknown or known Multicast receivers.

The settings for unknown Multicast addresses are global for the entire device. The following options can be selected:

- The device discards unknown Multicasts.
- The device forwards unknown Multicasts to every port.
- The device forwards unknown Multicasts only to ports that have previously received query messages (query ports).

**Note:** The exchange settings for unknown Multicast addresses also apply to the reserved IP addresses from the “Local Network Control Block” (224.0.0.0..224.0.0.255). This behavior can affect higher-level routing protocols.

For each VLAN, you specify the sending of Multicast packets to known Multicast addresses individually. The following options can be selected:

- The device forwards known Multicasts to the ports that have previously received query messages (query ports) and to the registered ports. Registered ports are ports with Multicast receivers registered with the corresponding Multicast group. This option helps ensure that the transfer works with basic applications without further configuration.
- The device forwards known Multicasts only to the registered ports. The advantage of this setting is that it uses the available bandwidth optimally through direct distribution.
Prerequisite:

The *IGMP Snooping* function is enabled globally.

Perform the following steps:

- Open the *Switching > IGMP Snooping > Multicasts* dialog.
  - In the *Configuration* frame, you specify how the device sends data packets to unknown Multicast addresses.
    - *send to registered ports*
      The device forwards packets with unknown Multicast address to every query port.
    - *send to query and registered ports*
      The device forwards packets with unknown Multicast address to every port.
  - In the *Known multicasts* column, you specify how the device sends data packets to known Multicast addresses in the corresponding VLAN. Click the relevant field and select the desired value.
  - To save the changes temporarily, click the **button.
10.3 Rate limiter

The rate limiter function helps ensure stable operation even with high traffic volumes by limiting traffic on the ports. The rate limitation is performed individually for each port, as well as separately for inbound and outbound traffic.

If the data rate on a port exceeds the defined limit, then the device discards the overload on this port.

Rate limitation occurs entirely on Layer 2. In the process, the rate limiter function ignores protocol information on higher levels such as IP or TCP. This can affect the TCP traffic.

To minimize these effects, use the following options:
- Limit the rate limitation to certain packet types, for example, Broadcasts, Multicasts, and Unicasts with an unknown destination address.
- Limit the outbound data traffic instead of the inbound traffic. The outbound rate limitation works better with TCP flow control due to device-internal buffering of the data packets.
- Increase the aging time for learned Unicast addresses.

Perform the following steps:

- Open the Switching > Rate Limiter dialog.
- Activate the rate limiter and set limits for the data rate. The settings apply on a per port basis and are broken down by type of traffic:
  - Received Broadcast data packets
  - Received Multicast data packets
  - Received Unicast data packets with an unknown destination address

  To activate the rate limiter on a port, mark the checkbox for at least one category. In the Threshold unit column, you specify whether the device interprets the threshold values as percent of the port bandwidth or as packets per second. The threshold value 0 deactivates the rate limiter.

- To save the changes temporarily, click the button.
10.4 QoS/Priority

QoS (Quality of Service) is a procedure defined in IEEE 802.1D which is used to distribute resources in the network. QoS lets you prioritize the data of necessary applications.

When there is a heavy network load, prioritizing helps prevent data traffic with lower priority from interfering with delay-sensitive data traffic. Delay-sensitive data traffic includes, for example, voice, video, and real-time data.

10.4.1 Description of prioritization

For data traffic prioritization, traffic classes are defined in the device. The device prioritizes higher traffic classes over lower traffic classes. The number of traffic classes depends on the device type.

To provide for optimal data flow for delay-sensitive data, you assign higher traffic classes to this data. You assign lower traffic classes to data that is less sensitive to delay.

Assigning traffic classes to the data

The device automatically assigns traffic classes to inbound data (traffic classification). The device takes the following classification criteria into account:

Methods according to which the device carries out assignment of received data packets to traffic classes:

- **trustDot1p**
  - The device uses the priority of the data packet contained in the VLAN tag.
- **trustIpDscp**
  - The device uses the QoS information contained in the IP header (ToS/DiffServ).
- **untrusted**
  - The device ignores possible priority information within the data packets and uses the priority of the receiving port directly.
- The priority assigned to the receiving port.

Both classification criteria are configurable.

During traffic classification, the device uses the following rules:

- When the receiving port is set to **trustDot1p** (default setting), the device uses the data packet priority contained in the VLAN tag. When the data packets do not contain a VLAN tag, the device is guided by the priority of the receiving port.
- When the receiving port is set to **trustIpDscp**, the device uses the QoS information (ToS/DiffServ) in the IP header. When the data packets do not contain IP packets, the device is guided by the priority of the receiving port.
- When the receiving port is set to **untrusted**, the device is guided by the priority of the receiving port.
Prioritizing traffic classes

For prioritization of traffic classes, the device uses the following methods:

- **Strict**
  When transmission of data of a higher traffic class is no longer taking place or the relevant data is still in the queue, the device sends data of the corresponding traffic class. If every traffic class is prioritized according to the **Strict** method, then under high network load the device can permanently block the data of lower traffic classes.

- **Weighted Fair Queuing**
  The traffic class is assigned a specific bandwidth. This helps ensure that the device sends the data traffic of this traffic class, although there is a great deal of data traffic in higher traffic classes.

10.4.2 Handling of received priority information

Applications label data packets with the following prioritization information:

- VLAN priority based on IEEE 802.1Q/ 802.1D (Layer 2)
- Type-of-Service (ToS) or DiffServ (DSCP) for VLAN Management IP packets (Layer 3)

The device lets you evaluate this priority information using the following options:

- **trustDot1p**
  The device assigns VLAN-tagged data packets to the different traffic classes according to their VLAN priorities. The corresponding allocation is configurable. The device assigns the priority of the receiving port to data packets it receives without a VLAN tag.

- **trustIpDscp**
  The device assigns the IP packets to the different traffic classes according to the DSCP value in the IP header, although the packet was also VLAN-tagged. The corresponding allocation is configurable. The device prioritizes non-IP packets according to the priority of the receiving port.

- **untrusted**
  The device ignores the priority information in the data packets and assigns the priority of the receiving port to them.

10.4.3 VLAN tagging

For the VLAN and prioritizing functions, the IEEE 802.1Q standard provides for integrating a MAC frame in the VLAN tag. The VLAN tag consists of 4 bytes and is between the source address field ("Source Address Field") and type field ("Length / Type Field").

![Figure 24: Ethernet data packet with tag](image-url)
For data packets with VLAN tags, the device evaluates the following information:

- Priority information
- When VLANs are configured, VLAN tagging

![Structure of the VLAN tagging](image)

*Figure 25: Structure of the VLAN tagging*

Data packets with VLAN tags containing priority information but no VLAN information (VLAN ID = 0), are known as Priority Tagged Frames.

**Note:** Network protocols and redundancy mechanisms use the highest traffic class 7. Therefore, select other traffic classes for application data.

When using VLAN prioritizing, consider the following special features:

- End-to-end prioritizing requires the VLAN tags to be transmitted to the entire network. The prerequisite is that every network component is VLAN-capable.
- Routers are not able to send and receive packets with VLAN tags through port-based router interfaces.

### 10.4.4 IP ToS (Type of Service)

The Type-of-Service field (ToS) in the IP header was already part of the IP protocol from the start, and is used to differentiate different services in IP networks. Even back then, there were ideas about differentiated treatment of IP packets, due to the limited bandwidth available and the unreliable connection paths. Because of the continuous increase in the available bandwidth, there was no need to use the ToS field.

Only with the real-time requirements of today’s networks has the ToS field become significant again. Selecting the ToS byte of the IP header enables you to differentiate between different services. However, this field is not widely used in practice.

10.4.5 Handling of traffic classes

The device provides the following options for handling traffic classes:
- Strict Priority
- Weighted Fair Queuing
- Strict Priority combined with Weighted Fair Queuing
- Queue management

Strict Priority description

With the Strict Priority setting, the device first transmits data packets that have a higher traffic class (higher priority) before transmitting a data packet with the next highest traffic class. When there are no other data packets remaining in the queue, the device transmits a data packet with the lowest traffic class (lowest priority). In unfortunate cases, if there is a high volume of high-priority traffic waiting to be sent on this port, then the device does not send packets with a low priority.

In delay-sensitive applications, such as VoIP or video, Strict Priority lets data to be sent immediately.

Weighted Fair Queuing description

With Weighted Fair Queuing, also called Weighted Round Robin (WRR), the user assigns a minimum or reserved bandwidth to each traffic class. This helps ensure that data packets with a lower priority are also sent although the network is very busy.

The reserved values range from 0% through 100% of the available bandwidth, in steps of 1%.
- A reservation of 0 is equivalent to a "no bandwidth" setting.
- The sum of the individual bandwidths can be up to 100%.

When you assign Weighted Fair Queuing to every traffic class, the entire bandwidth of the corresponding port is available to you.

Combining Strict Priority and Weighted Fair Queuing

When combining Weighted Fair Queuing with Strict Priority, verify that the highest traffic class of Weighted Fair Queuing is lower than the lowest traffic class of Strict Priority.

If you combine Weighted Fair Queuing with Strict Priority, then a high Strict Priority network load can significantly reduce the bandwidth available for Weighted Fair Queuing.
10.4.6 Queue management

Queue Shaping

Queue Shaping throttles the rate at which queues transmit packets. For example, using Queue Shaping, you rate-limit a higher strict-priority queue so that it lets a lower strict-priority queue to send packets even though higher priority packets are still available for transmission. The device lets you setup Queue Shaping for any queue. You specify Queue Shaping as the maximum rate at which traffic passes through a queue by assigning a percentage of the available bandwidth.
Defining settings for queue management

Perform the following steps:

- Open the Switching > QoS/Priority > Queue Management dialog.

  The total assigned bandwidth in the Min. bandwidth [%] column is 100%.

- To activate Weighted Fair Queuing for Traffic class = 0, proceed as follows:
  - Unmark the checkbox in the Strict priority column.
  - In the Min. bandwidth [%] column, specify the value 5.

- To activate Weighted Fair Queuing for Traffic class = 1, proceed as follows:
  - Unmark the checkbox in the Strict priority column.
  - In the Min. bandwidth [%] column, specify the value 20.

- To activate Weighted Fair Queuing for Traffic class = 2, proceed as follows:
  - Unmark the checkbox in the Strict priority column.
  - In the Min. bandwidth [%] column, specify the value 30.

- To activate Weighted Fair Queuing for Traffic class = 3, proceed as follows:
  - Unmark the checkbox in the Strict priority column.
  - In the Min. bandwidth [%] column, specify the value 20.

- To activate Weighted Fair Queuing and Queue Shaping for Traffic class = 4, proceed as follows:
  - Unmark the checkbox in the Strict priority column.
  - In the Min. bandwidth [%] column, specify the value 10.
  - In the Max. bandwidth [%] column, specify the value 10.

  When using a Weighted Fair Queuing and Queue Shaping combination for a specific traffic class, specify a higher value in the Max. bandwidth [%] column than the value specified in the Min. bandwidth [%] column.

- To activate Weighted Fair Queuing for Traffic class = 5, proceed as follows:
  - Unmark the checkbox in the Strict priority column.
  - In the Min. bandwidth [%] column, specify the value 5.

- To activate Weighted Fair Queuing for Traffic class = 6, proceed as follows:
  - Unmark the checkbox in the Strict priority column.
  - In the Min. bandwidth [%] column, specify the value 10.

- To activate Strict Priority and Queue Shaping for Traffic class = 7, proceed as follows:
  - Mark the checkbox in the Strict priority column.
  - In the Max. bandwidth [%] column, specify the value 10.

- To save the changes temporarily, click the button.

```

```
Setting up Queue Shaping
```

Perform the following steps:

```
Setting up Queue Shaping
```

```
10.4.7 Management prioritization

In order for you to constantly have access to the device management, although there is a high network load, the device lets you prioritize management packets.

When prioritizing management packets, the device sends the management packets with priority information.

- On Layer 2, the device modifies the VLAN priority in the VLAN tag.
  The prerequisite for this function is that the corresponding ports are set to allow sending packets with a VLAN tag.
- On Layer 3, the device modifies the IP-DSCP value.

10.4.8 Setting prioritization

Assigning the port priority

Perform the following steps:

- Open the Switching > QoS/Priority > Port Configuration dialog.
- In the Port priority column, you specify the priority with which the device forwards the data packets received on this port without a VLAN tag.
- In the Trust mode column, you specify the criteria the device uses to assign a traffic class to data packets received.
- To save the changes temporarily, click the button.

**Configuring Layer 2 management priority**

Perform the following steps:

- Open the **Switching > QoS/Priority > Global** dialog.
- In the **VLAN priority for management packets** field, specify the VLAN priority with which the device sends management data packets.
- To save the changes temporarily, click the ✓ button.

```
enable
network management priority dotlp 7
show network parms
```

IPv4 Network
-------------
...
Management VLAN priority.................7
...
Configuring Layer 3 management priority

Perform the following steps:

- Open the Switching > QoS/Priority > Global dialog.
- In the IP DSCP value for management packets field, specify the DSCP value with which the device sends management data packets.
- To save the changes temporarily, click the button.

```
enable
network management priority ip-dscp 56
```

Assigning the DSCP value of 56 to management packets. The device sends management packets with the highest priority.

```
show network parms
```

Displaying the priority of the VLAN in which the device management is located.

IPv4 Network
------------
...
Management IP-DSCP value...................56
10.5 Flow control

If a large number of data packets are received in the priority queue of a port at the same time, then this can cause the port memory to overflow. This happens, for example, when the device receives data on a Gigabit port and forwards it to a port with a lower bandwidth. The device discards surplus data packets.

The flow control mechanism described in standard IEEE 802.3 helps ensure that no data packets are lost due to a port memory overflowing. Shortly before a port memory is completely full, the device signals to the connected devices that it is not accepting any more data packets from them.

- In full-duplex mode, the device sends a pause data packet.
- In half-duplex mode, the device simulates a collision.

The following figure displays how flow control works. Workstations 1, 2, and 3 want to simultaneously transmit a large amount of data to Workstation 4. The combined bandwidth of Workstations 1, 2, and 3 is greater than the bandwidth of Workstation 4. This causes an overflow on the receive queue of port 4. The left funnel symbolizes this status.

When the flow control function on ports 1, 2 and 3 of the device is enabled, the device reacts before the funnel overflows. The funnel on the right illustrates ports 1, 2 and 3 sending a message to the transmitting devices to control the transmission speed. This results in the receiving port no longer being overwhelmed and is able to process the incoming traffic.

![Example of flow control](image)

**Figure 26: Example of flow control**

10.5.1 Halfduplex or fullduplex link

Flow Control with a half duplex link

In the example, there is a halfduplex link between Workstation 2 and the device.

Before the send queue of port 2 overflows, the device sends data back to Workstation 2. Workstation 2 detects a collision and stops transmitting.
Flow Control with a full duplex link

In the example, there is a fullduplex link between Workstation 2 and the device.

Before the send queue of port 2 overflows, the device sends a request to Workstation 2 to include a small break in the sending transmission.

10.5.2 Setting up the Flow Control

Perform the following steps:

- Open the Switching > Global dialog.
- Mark the Flow control checkbox.
  With this setting you enable flow control in the device.
- Open the Basic Settings > Port dialog, Configuration tab.
- To enable the Flow Control on a port, mark the checkbox in the Flow control column.
- To save the changes temporarily, click the button.

Note: When you are using a redundancy function, you deactivate the flow control on the participating ports. If the flow control and the redundancy function are active at the same time, it is possible that the redundancy function operates differently than intended.
11 VLANs

In the simplest case, a virtual LAN (VLAN) consists of a group of network participants in one network segment who can communicate with each other as though they belonged to a separate LAN.

More complex VLANs span out over multiple network segments and are also based on logical (instead of only physical) connections between network participants. VLANs are an element of flexible network design. It is easier to reconfiguring logical connections centrally than cable connections.

The device supports independent VLAN learning in accordance with the IEEE 802.1Q standard which defines the VLAN function.

Using VLANs has many benefits. The following list displays the top benefits:

- **Network load limiting**
  VLANs reduce the network load considerably as the devices transmit Broadcast, Multicast, and Unicast packets with unknown (unlearned) destination addresses only inside the virtual LAN. The rest of the data network forwards traffic as normal.

- **Flexibility**
  You have the option of forming user groups based on the function of the participants apart from their physical location or medium.

- **Clarity**
  VLANs give networks a clear structure and make maintenance easier.
11.1 Examples of VLANs

The following practical examples provide a quick introduction to the structure of a VLAN.

**Note:** When configuring VLANs you use an interface for accessing the device management that will remain unchanged. For this example, you use either interface 1/6 or the serial connection to configure the VLANs.

11.1.1 Example 1

The example displays a minimal VLAN configuration (port-based VLAN). An administrator has connected multiple end devices to a transmission device and assigned them to 2 VLANs. This effectively prohibits any data transmission between the VLANs, whose members communicate only within their own VLANs.

![Figure 27: Example of a simple port-based VLAN](image)

When setting up the VLANs, you create communication rules for every port, which you enter in ingress (incoming) and egress (outgoing) tables.

The ingress table specifies which VLAN ID a port assigns to the incoming data packets. Hereby, you use the port address of the end device to assign it to a VLAN.

The egress table specifies on which ports the device sends the packets from this VLAN.

- **T** = Tagged (with a tag field, marked)
- **U** = Untagged (without a tag field, unmarked)
For this example, the status of the TAG field of the data packets has no relevance, so you use the setting \( U \).

**Table 20: Ingress table**

<td>U</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Perform the following steps:

- Setting up the VLAN
  - Open the **Switching > VLAN > Configuration** dialog.
  - Click the **button**.
    - The dialog displays the **Create** window.
  - In the **VLAN ID** field, specify the value **2**.
  - Click the **Ok** button.
  - For the VLAN, specify the name **VLAN2**:
    - Double-click in the **Name** column and specify the name.
    - For VLAN 1, in the **Name** column, change the value **Default** to **VLAN1**.
  - Repeat the previous steps to create a VLAN **3** with the name **VLAN3**.

enable

- Change to the Privileged EXEC mode.
- Change to the VLAN configuration mode.
- Creates a new VLAN with the VLAN ID **2**.
- Assign the name **2** to the VLAN VLAN2.
- Creates a new VLAN with the VLAN ID **3**.
- Assign the name **3** to the VLAN VLAN3.
- Assign the name **1** to the VLAN VLAN1.
Examples of VLANs

Setting up the ports

- Open the Switching > VLAN > Port dialog.
- To assign the port to a VLAN, specify the desired value in the corresponding column. Possible values:
  - T = The port is a member of the VLAN. The port transmits tagged data packets.
  - U = The port is a member of the VLAN. The port transmits untagged data packets.
  - F = The port is not a member of the VLAN.
  - - = The port is not a member of this VLAN.
- Changes using the GVRP function are disabled.
- Changes using the GVRP function are allowed.
- Because end devices usually interpret untagged data packets, you specify the value U.
- To save the changes temporarily, click the button.
- Open the Switching > VLAN > Port dialog.
- In the Port-VLAN ID column, specify the VLAN ID of the related VLAN: 2 or 3
- Because end devices usually interpret untagged data packets, in the Acceptable packet types column, you specify the value admitAll for end device ports.
- To save the changes temporarily, click the button.
- The value in the Ingress filtering column has no affect on how this example functions.

Assign the port VLAN ID 1/4 to port 2.
Change to the Configuration mode.
Change to the Privileged EXEC mode.
Displays details for VLAN 3.

11.1.2 Example 2

The second example displays a more complex configuration with 3 VLANs (1 to 3). Along with the Switch from example 1, you use a 2nd Switch (on the right in the example).

The terminal devices of the individual VLANs (A to H) are spread over 2 transmission devices (Switches). Such VLANs are therefore known as distributed VLANs. If the VLAN is configured correctly, then an optional network management station is also shown, which enables access to every network component.
Note: In this case, VLAN 1 has no significance for the end device communication, but it is required for the administration of the transmission devices via what is known as the Management VLAN.

As in the previous example, uniquely assign the ports with their connected terminal devices to a VLAN. With the direct connection between the 2 transmission devices (uplink), the ports transport packets for both VLANs. To differentiate these uplinks you use “VLAN tagging”, which handles the data packets accordingly. Thus, you maintain the assignment to the respective VLANs.

Perform the following steps:
- Add Uplink Port 5 to the ingress and egress tables from example 1.
- Create new ingress and egress tables for the right switch, as described in the first example.

The egress table specifies on which ports the device sends the packets from this VLAN.
- \( T \) = Tagged (with a tag field, marked)
- \( U \) = Untagged (without a tag field, unmarked)

In this example, tagged packets are used in the communication between the transmission devices (Uplink), as packets for different VLANs are differentiated at these ports.

</tbody>
</table>
The communication relationships here are as follows: end devices on ports 1 and 4 of the left device and end devices on ports 2 and 4 of the right device are members of VLAN 2 and can thus communicate with each other. The behavior is the same for the end devices on ports 2 and 3 of the left device and the end devices on ports 3 and 5 of the right device. These belong to VLAN 3.

The end devices “see” their respective part of the network. Participants outside this VLAN cannot be reached. The device also sends Broadcast, Multicast, and Unicast packets with unknown (unlearned) destination addresses only inside a VLAN.
Here, the devices use VLAN tagging (IEEE 801.1Q) within the VLAN with the ID 1 (Uplink). The letter T in the egress table of the ports indicates VLAN tagging.

The configuration of the example is the same for the device on the right. Proceed in the same way, using the ingress and egress tables created above to adapt the previously configured left device to the new environment.

Perform the following steps:

- Setting up the VLAN

  - Open the **Switching > VLAN > Configuration** dialog.
  - Click the **Create** button. The dialog displays the **Create** window.
  - In the **VLAN ID** field, specify the VLAN ID, for example **2**.
  - Click the **Ok** button.
  - For the VLAN, specify the name **VLAN2**.
    - Double-click in the **Name** column and specify the name.
  - For VLAN 1, in the **Name** column, change the value **Default** to **VLAN1**.
  - Repeat the previous steps to create a VLAN 3 with the name **VLAN3**.

- Setting up the ports

  - Change to the Privileged EXEC mode.
  - vlan database
  - vlan add 2
    - name 2 VLAN2
  - vlan add 3
    - name 3 VLAN3
    - name 1 VLAN1
  - exit
  - show vlan brief

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>VLAN Name</th>
<th>VLAN Type</th>
<th>VLAN Creation Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>VLAN1</td>
<td>default</td>
<td>0 days, 00:00:05</td>
</tr>
<tr>
<td>2</td>
<td>VLAN2</td>
<td>static</td>
<td>0 days, 02:44:29</td>
</tr>
<tr>
<td>3</td>
<td>VLAN3</td>
<td>static</td>
<td>0 days, 02:52:26</td>
</tr>
</tbody>
</table>
Open the Switching > VLAN > Port dialog.

To assign the port to a VLAN, specify the desired value in the corresponding column. Possible values:
- **T** = The port is a member of the VLAN. The port transmits tagged data packets.
- **U** = The port is a member of the VLAN. The port transmits untagged data packets.
- **F** = The port is not a member of the VLAN.
- **-** = The port is not a member of this VLAN.

Because end devices usually interpret untagged data packets, you specify the value **U**.
You specify the **T** setting on the uplink port on which the VLANs communicate with each other.

To save the changes temporarily, click the **✓** button.

Open the Switching > VLAN > Port dialog.

In the **Port-VLAN ID** column, specify the VLAN ID of the related VLAN:
1, 2 or 3

Because end devices usually interpret untagged data packets, in the Acceptable packet types column, you specify the value **admitAll** for end device ports.

For the uplink port, in the Acceptable packet types column, specify the value **admitOnlyVlanTagged**.

Mark the checkbox in the ingress filtering column for the uplink ports to evaluate VLAN tags on this port.

To save the changes temporarily, click the **✓** button.

11.2 Guest VLAN / Unauthenticated VLAN

A Guest VLAN lets a device provide port-based Network Access Control (IEEE 802.1x) to non-802.1x capable supplicants. This feature provides a mechanism to allow guests to access external networks only. If you connect non-802.1x capable supplicants to an active unauthorized 802.1x port, then the supplicants send no responses to 802.1x requests. Since the supplicants send no responses, the port remains in the unauthorized state. The supplicants have no access to external networks.

The Guest VLAN supplicant is a per-port basis configuration. When you configure a port as a Guest VLAN and connect non-802.1x capable supplicants to this port, the device assigns the supplicants to the Guest VLAN. Adding supplicants to a Guest VLAN causes the port to change to the authorized state allowing the supplicants to access to external networks.

An Unauthenticated VLAN lets the device provide service to 802.1x capable supplicants which authenticate incorrectly. This function lets the unauthorized supplicants have access to limited services. If you configure an Unauthenticated VLAN on a port with 802.1x port authentication and the global operation enabled, then the device places the port in an Unauthenticated VLAN. When a 802.1x capable supplicant incorrectly authenticates on the port, the device adds the supplicant to the Unauthenticated VLAN. If you also configure a Guest VLAN on the port, then non-802.1x capable supplicants use the Guest VLAN.

If the port has an Unauthenticated VLAN assigned, then the reauthentication timer counts down. When the time specified in the Reauthentication period [s] column expires and supplicants are present on the port, the Unauthenticated VLAN reauthenticates. When no supplicants are present, the device places the port in the configured Guest VLAN.

The following example explains how to create a Guest VLAN. Create an Unauthorized VLAN in the same manner.
Perform the following steps:

- Open the **Switching > VLAN > Configuration** dialog.
- Click the **Create** button. The dialog displays the **Create** window.
- In the **VLAN ID** field, specify the value **10**.
- Click the **Ok** button.
- For the VLAN, specify the name **Guest:** Double-click in the **Name** column and specify the name.
- Click the **Create** button. The dialog displays the **Create** window.
- In the **VLAN ID** field, specify the value **20**.
- Click the **Ok** button.
- For the VLAN, specify the name **Not authorized:** Double-click in the **Name** column and specify the name.
- Open the **Network Security > 802.1X Port Authentication > Global** dialog.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **Ok** button.
- Open the **Network Security > 802.1X Port Authentication > Port Configuration** dialog.
- Specify the following settings for port **1/4**:
  - The value **auto** in the **Port control** column
  - The value **10** in the **Guest VLAN ID** column
  - The value **20** in the **Unauthenticated VLAN ID** column
- To save the changes temporarily, click the **Ok** button.

```
enable
vlan database
vlan add 10
vlan add 20
name 10 Guest
name 20 Unauth

Change to the interface configuration mode of interface **1/4**.
Assign the guest vlan to port **1/4**.
Assign the unauthorized vlan to port **1/4**.
Change to the Configuration mode.
11.3 RADIUS VLAN assignment

The RADIUS VLAN assignment feature makes it possible for a RADIUS VLAN ID attribute to be associated with an authenticated client. When a client authenticates successfully, and the RADIUS server sends a VLAN attribute, the device associates the client with the RADIUS assigned VLAN. As a result, the device adds the physical port as an untagged member to the appropriate VLAN and sets the port VLAN ID (PVID) with the given value.
11.4 Creating a Voice VLAN

Use the Voice VLAN feature to separate voice and data traffic on a port, by VLAN and/or priority. A primary benefit of using Voice VLAN is to safeguard the sound quality of an IP phone in cases where there is high data traffic on the port.

The device uses the source MAC address to identify and prioritize the voice data flow. Using a MAC address to identify devices helps prevent a rogue client from connecting to the same port causing the voice traffic to deteriorate.

Another benefit of the Voice VLAN feature is that a VoIP phone obtains a VLAN ID or priority information using LLDP-MED. As a result, the VoIP phone sends voice data as tagged, priority tagged or untagged. This depends on the Voice VLAN Interface configuration.

The following Voice VLAN interface modes are possible. The first 3 methods segregate and prioritize voice and data traffic. Traffic segregation results in an increased voice traffic quality during high traffic periods.

- Configuring the port to using the vlan mode lets the device tag the voice data coming from a VoIP phone with the user-defined voice VLAN ID. The device assigns regular data to the default port VLAN ID.
- Configuring the port to use the dot1p-priority mode lets the device tag the data coming from a VoIP phone with VLAN 0 and the user-defined priority. The device assigns the default priority of the port to regular data.
- Configure both the voice VLAN ID and the priority using the vlan/dot1p-priority mode. In this mode the VoIP phone sends voice data with the user-defined voice VLAN ID and priority information. The device assigns the default PVID and priority of the port to regular data.
- When configured as untagged, the phone sends untagged packets.
- When configured as none, the phone uses its own configuration to send voice traffic.
11.5 MAC based VLANs

Use the MAC-based VLAN to forward traffic based on the source MAC address associated with the VLAN. A MAC-based VLAN defines the filtering criteria for untagged or priority tagged packets.

You specify a MAC-based VLAN filter by assigning a specific source address to a MAC-based VLAN. The device forwards untagged packets received with the source MAC address on the MAC-based VLAN ID. The other untagged packets are subject to normal VLAN classification rules.
In an IP subnet-based VLAN, the device forwards traffic based on the source IP address and subnet mask associated with the VLAN. User-defined filters determine whether a packet belongs to a particular VLAN.

Use the IP subnet-based VLAN to specify the filtering criteria for untagged or priority tagged packets. For example, assign a specific subnet address to an IP subnet-based VLAN. When the device receives untagged packets from the subnet address, it forwards them to the IP subnet-based VLAN. Other untagged packets are subject to normal VLAN classification rules.

To configure an IP subnet-based VLAN, specify an IP address, a subnet mask and the associated VLAN ID. In case of multiple matching entries, the device associates the VLAN ID to the entry with the longer prefix first.
11.7 Protocol-based VLAN

In a protocol-based VLAN, the device bridges traffic through specified ports based on the protocol associated with the VLAN. User-defined packet filters determine whether a packet belongs to a particular VLAN.

Configure protocol-based VLANs using the value in the Ethertype column as the filtering criteria for untagged packets. For example, assign a specific protocol to a protocol-based VLAN. When the device receives untagged packets with the protocol, it forwards them to the protocol-based VLAN. The device assigns the other untagged packets to the port VLAN ID.
11.8 VLAN unaware mode

The VLAN unaware mode defines the operation of the device in a LAN segmented by VLANs. The device accepts packets and processes them according to its inbound rules. Based on the IEEE 802.1Q specifications, the function governs how the device processes VLAN tagged packets.

Use the VLAN aware mode to apply the user-defined VLAN topology configured by the network administrator. When the device forwards packets, it uses VLAN tagging in combination with the IP or Ethernet address. The device processes inbound and outbound packets according to the defined rules. VLAN configuration is a manual process.

Use the VLAN unaware mode to forward traffic as received, without any modification. When the device receives packets as tagged, it transmits tagged packets. When the device receives packets as untagged, it transmits untagged packets. Regardless of VLAN assignment mechanisms, the device assigns packets to VLAN ID 1 and to a Multicast group, indicating that the packet flood domain is according to the VLAN.
12 Redundancy

12.1 Network Topology vs. Redundancy Protocols

When using Ethernet, a significant prerequisite is that data packets follow a single (unique) path from the sender to the receiver. The following network topologies support this prerequisite:

- Line topology
- Star topology
- Tree topology

To maintain communication in case a connection fails, install additional physical connections between the network nodes. Redundancy protocols help ensure that the additional connections remain switched off while the original connection is still working. When the connection fails, the redundancy protocol generates a new path from the sender to the receiver via the alternative connection.

To introduce redundancy onto Layer 2 of a network, you first define which network topology you require. Depending on the network topology selected, you then choose from the redundancy protocols that can be used with this network topology.

12.1.1 Network topologies

Meshed topology

For networks with star or tree topologies, redundancy procedures are only possible in connection with physical loop creation. The result is a meshed topology.
For operating in this network topology, the device provides you with the following redundancy protocols:

- Rapid Spanning Tree (RSTP)

### Ring topology

In networks with a line topology, you can use redundancy procedures by connecting the ends of the line. This creates a ring topology.

![Ring topology: Line topology with connected ends](image)

For operating in this network topology, the device provides you with the following redundancy protocols:

- Media Redundancy Protocol (MRP)
- High-availability Seamless Redundancy (HSR) (depends on hardware)
- Rapid Spanning Tree (RSTP)
12.1.2 Redundancy Protocols

For operating in different network topologies, the device provides you with the following redundancy protocols:

**Symbol Meaning**

- ■ Combination applicable
- A HSR/PRP coupling: Same PRP ID on every non-HSR port.
- 1) Redundant coupling between these network topologies will possibly lead to data loops.
- 2) Combination applicable on the same port
- 3) In combination with MSTP, the failover times of other redundancy protocols can slightly increase.
- 4) Available only on port 1 and port 2.
12.2 Media Redundancy Protocol (MRP)

Since May 2008, the Media Redundancy Protocol (MRP) has been a standardized solution for ring redundancy in the industrial environment.

MRP is compatible with redundant ring coupling, supports VLANs, and is distinguished by very short reconfiguration times.

An MRP-Ring consists of up to 50 devices that support the MRP protocol according to IEC 62439. When you only use Hirschmann devices, up to 100 devices are possible in the MRP-Ring.

When you use the fixed MRP redundant port (Fixed Backup) and the primary ring link fails, the Ring Manager forwards data to the secondary ring link. When the primary link is restored, the secondary link continues to be in use.

12.2.1 Network Structure

The concept of ring redundancy lets you construct high-availability ring-shaped network structures.

With the help of the RM (Ring Manager) function, the two ends of a backbone in a line structure can be closed to a redundant ring. The Ring Manager keeps the redundant line open as long as the line structure is intact. When a segment becomes inoperable, the Ring Manager immediately closes the redundant line, and line structure is intact again.

![Figure 32: Line structure](image)

![Figure 33: Redundant ring structure](image)
12.2.2 Reconfiguration time

When a line section fails, the Ring Manager changes the MRP-Ring back into a line structure. You define the maximum time for the reconfiguration of the line in the Ring Manager.

Possible values for the maximum delay time:
- 500 ms
- 200 ms
- 30 ms (depends on hardware)
- 10 ms (depends on hardware)

The delay times 30 ms and 10 ms are available for devices with an FPGA (hardware for extended functions).

In order to use these fast delay times, load the Fast MRP device software.

You can set the delay time to 10 ms, only in rings containing up to 20 devices that support this delay time. If you use more than 20 of these devices in the ring, then set the delay time to at least 30 ms.

Note: If every device in the ring supports the shorter delay time, then you can configure the reconfiguration time with a value less than 500 ms.

Otherwise the devices that only support longer delay times might not be reachable due to overloading. Loops can occur as a result.

12.2.3 Advanced mode

For times even shorter than the specified reconfiguration times, the device provides the advanced mode. When the ring participants inform the Ring Manager of interruptions in the ring via link-down notifications, the advanced mode speeds up the link failure recognition.

Hirschmann devices support link-down notifications. Therefore, you generally activate the advanced mode in the Ring Manager.

When you are using devices that do not support link-down notifications, the Ring Manager reconfigures the line in the selected maximum reconfiguration time.

12.2.4 Prerequisites for MRP

Before setting up an MRP-Ring, verify that the following conditions are fulfilled:
- All ring participants support MRP.
- The ring participants are connected to each other via the ring ports. Apart from the device’s neighbors, no other ring participants are connected to the respective device.
- All ring participants support the configuration time specified in the Ring Manager.
- There is exactly 1 Ring Manager in the ring.
If you are using VLANs, then configure every ring port with the following settings:

- Deactivate ingress filtering - see the Switching > VLAN > Port dialog.
- Define the port VLAN ID (PVID) - see the Switching > VLAN > Port dialog.
  - PVID = 1 in cases where the device transmits the MRP data packets untagged (VLAN ID = 0 in Switching > L2-Redundancy > MRP dialog)
    By setting the PVID = 1, the device automatically assigns the received untagged packets to VLAN 1.
  - PVID = any in cases where the device transmits the MRP data packets in a VLAN (VLAN ID ≥ 1 in the Switching > L2-Redundancy > MRP dialog)
- Define egress rules - see Switching > VLAN > Configuration dialog.
  - U (untagged) for the ring ports of VLAN 1 in cases where the device transmits the MRP data packets untagged (VLAN ID = 0 in the Switching > L2-Redundancy > MRP dialog, the MRP ring is not assigned to a VLAN).
  - T (tagged) for the ring ports of the VLAN which you assign to the MRP ring. Select T, in cases where the device transmits the MRP data packets in a VLAN (VLAN ID ≥ 1 in the Switching > L2-Redundancy > MRP dialog).
12.2.5 Example Configuration

A backbone network contains 3 devices in a line structure. To increase the availability of the network, you convert the line structure to a redundant ring structure. Devices from different manufacturers are used. All devices support MRP. On every device you define ports 1.1 and 1.2 as ring ports.

When the primary ring link fails, the Ring Manager sends data on the secondary ring link. When the primary link is restored, the secondary link reverts back to the backup mode.

![Diagram of MRP-Ring](image)

The following example configuration describes the configuration of the Ring Manager device (1). You configure the 2 other devices (2 to 3) in the same way, but without activating the Ring manager function. This example does not use a VLAN. You specify 200 ms as the ring recovery time. Every device supports the advanced mode of the Ring Manager.

- Set up the network to meet your demands.
- Configure every port so that the transmission speed and the duplex settings of the lines correspond to the following table:

<table>
<thead>
<tr>
<th>Port type</th>
<th>Bit rate</th>
<th>Autonegotiation (automatic configuration)</th>
<th>Port setting</th>
<th>Duplex</th>
</tr>
</thead>
<tbody>
<tr>
<td>TX</td>
<td>100 Mbit/s</td>
<td>off</td>
<td>on</td>
<td>100 Mbit/s full duplex (FDX)</td>
</tr>
<tr>
<td>TX</td>
<td>1 Gbit/s</td>
<td>on</td>
<td>on</td>
<td>-</td>
</tr>
<tr>
<td>Optical</td>
<td>100 Mbit/s</td>
<td>off</td>
<td>on</td>
<td>100 Mbit/s full duplex (FDX)</td>
</tr>
<tr>
<td>Optical</td>
<td>1 Gbit/s</td>
<td>on</td>
<td>on</td>
<td>-</td>
</tr>
<tr>
<td>Optical</td>
<td>10 Gbit/s</td>
<td>-</td>
<td>on</td>
<td>10 Gbit/s full duplex (FDX)</td>
</tr>
</tbody>
</table>
**Redundancy**

12.2 Media Redundancy Protocol (MRP)

**Note:** You configure optical ports without support for autonegotiation (automatic configuration) with 100 Mbit/s full duplex (FDX) or 1000 Mbit/s full duplex (FDX).

**Note:** You configure optical ports without support for autonegotiation (automatic configuration) with 100 Mbit/s full duplex (FDX).

**Note:** Configure every device of the MRP-Ring individually. Before you connect the redundant line, verify that you have completed the configuration of every device of the MRP-Ring. You thus help avoid loops during the configuration phase.

- You deactivate the flow control on the participating ports.
  - If the flow control and the redundancy function are active at the same time, it is possible that the redundancy function operates differently than intended. (Default setting: flow control deactivated globally and activated on every port.)
- Disable Spanning Tree on every device in the network:
  - Open the `Switching > L2-Redundancy > Spanning Tree > Global` dialog.
  - Disable the function.
    - In the state on delivery, Spanning Tree is enabled in the device.
  - `enable`
  - `configure`
  - `no spanning-tree operation`
  - `show spanning-tree global`
    - Change to the Privileged EXEC mode.
    - Change to the Configuration mode.
    - Switches Spanning Tree off.
    - Displays the parameters for checking.

- Enable MRP on every device in the network:
  - Open the `Switching > L2-Redundancy > MRP` dialog.
  - Specify the desired ring ports.
    - **Note:** If the device uses the software supporting Fast MRP, then you cannot select a Link Aggregation port as a ring port.

In the Command Line Interface you first define an additional parameter, the MRP domain ID. Configure every ring participant with the same MRP domain ID. The MRP domain ID is a sequence of 16 number blocks (8-bit values).
When configuring with the Graphical User Interface, the device uses the default value 255 255 255 255 255 255 255 255 255 255 255 255 255.

- `mrp domain add default-domain` Creates a new MRP domain with the ID `default-domain`.
- `mrp domain modify port primary 1/1` Specifies port 1/1 as ring port 1.
- `mrp domain modify port secondary 1/2` Specifies port 1/2 as ring port 2.

- Enable the **Fixed backup** port.

- Enable the Ring Manager.
  - For the other devices in the ring, leave the setting as **Off**.
  - To allow the device to continue sending data on the secondary port after the ring is restored, mark the **Fixed backup** checkbox.

**Note:** When the device reverts back to the primary port, the maximum ring recovery time can be exceeded.

When you unmark the **Fixed backup** checkbox, and the ring is restored, the Ring Manager blocks the secondary port and unblocks the primary port.

- `mrp domain modify port secondary 1/2 fixed-backup enable` Activates the **Fixed backup** function on the secondary port. The secondary port continues forwarding data after the ring is restored.

- Enable the Ring Manager.
  - For the other devices in the ring, leave the setting as **Off**.

- `mrp domain modify mode manager` Specifies that the device operates as the **Ring manager**. For the other devices in the ring, leave the default setting.

- Select the checkbox in the **Advanced mode** field.

- `mrp domain modify advanced-mode enabled` Activates the advanced mode.

- In the **Ring recovery** field, select the value **200ms**.

- `mrp domain modify recovery-delay 200ms` Specifies the value **200ms** as the max. delay time for the reconfiguration of the ring.

**Note:** If selecting 200 ms for the ring recovery does not provide the ring stability necessary to meet the requirements of your network, then select 500 ms.
Redundancy

12.2 Media Redundancy Protocol (MRP)

☐ Switch the operation of the MRP-Ring on.
☐ To save the changes temporarily, click the button.

```
mrp domain modify operation enable
```
Activates the MRP-Ring.

☐ When every ring participant is configured, close the line to the ring. To do this, you connect the devices at the ends of the line via their ring ports.
☐ Check the messages from the device:

```
show mrp
```
Displays the parameters for checking.

The **Operation** field displays the operating state of the ring port.

Possible values:
- **forwarding**
  The port is enabled, connection exists.
- **blocked**
  The port is blocked, connection exists.
- **disabled**
  The port is disabled.
- **not-connected**
  No connection exists.

The **Information** field displays messages for the redundancy configuration and the possible causes of errors.

When the device is operating as a ring client or a Ring Manager, the following messages are possible:
- **Redundancy available**
  The redundancy is set up. When a component of the ring is down, the redundant line takes over its function.
- **Configuration error: Error on ringport link.**
  Error in the cabling of the ring ports.

When the device is operating as a Ring Manager, the following messages are possible:
- **Configuration error: Packets from another ring manager received.**
  Another device exists in the ring that is operating as the Ring Manager. Activate the **Ring manager** function on exactly one device in the ring.
- **Configuration error: Ring link is connected to wrong port.**
  A line in the ring is connected with a different port instead of with a ring port. The device only receives test data packets on 1 ring port.

☐ When applicable, integrate the MRP ring into a VLAN:
12.2.6 MRP over LAG

Hirschmann devices allow you to combine Link Aggregation Groups (LAG) to increase bandwidth with the Media Redundancy Protocol (MRP) providing redundancy. The function lets you increase the bandwidth on individual segments or on the entire network.

The Link Aggregation function helps you overcome bandwidth limitations of individual ports. LAG lets you combine 2 or more links in parallel, creating 1 logical link between 2 devices. The parallel links increase the bandwidth for the data stream between the 2 devices.

An MRP ring consists of up to 50 devices that support the MRP protocol according to IEC 62439. When you use only Hirschmann devices, the protocol lets you configure MRP rings with up to 100 devices.

You use MRP over LAG in the following cases:
- to increase bandwidth only on specific segments of an MRP ring
- to increase bandwidth on the entire MRP ring

Network Structure

When configuring an MRP ring with LAGs, the Ring Manager (RM) monitors both ends of the backbone for continuity. The RM blocks data on the secondary (redundant) port as long as the backbone is intact. When the RM detects an interruption of the data stream on the ring, it begins forwarding data on the secondary port, which restores backbone continuity.

You use LAG instances in MRP rings to increase bandwidth only, in this case MRP provides the redundancy.

In order for the RM to detect an interruption on the ring, MRP requires a device to block every port in the LAG instance in cases where a port in the instance is down.

LAG on a single segment of an MRP ring

The device lets you configure a LAG instance on specific segments of an MRP ring.
You use the LAG Single Switch method for devices in the MRP ring. The Single Switch method provides you an inexpensive way to grow your network by using only 1 device on each side of a segment to provide the physical ports. You group the ports of the device into a LAG instance to provide increased bandwidth on specific segments where needed.

Figure 35: Link Aggregation over a single link of an MRP ring.

**LAG on an entire MRP ring**

Besides being able to configure a LAG instance on specific segments of an MRP ring, Hirschmann devices also allow you to configure LAG instances on every segment, which increases bandwidth on the entire MRP ring.

Figure 36: Link Aggregation over the entire MRP ring.

**Detecting interruptions on the ring**

When configuring the LAG instance, specify the *Active ports (min.)* value to equal the total number of ports used in the LAG instance. When a device detects an interruption on a port in the LAG instance, it blocks data on the other ports of the instance. With every port of an instance blocked, the RM senses that the ring is open and begins forwarding data on the secondary port. This way the RM is able to restore continuity to the devices on the other side of the interrupted segment.

Figure 37: Interruption of a link in an MRP ring.
Example Configuration

In the following example, Switch A and Switch B link to departments together. The departments produce traffic too large for the individual port bandwidth to handle. You configure a LAG instance for the single segment of the MRP ring, increasing the bandwidth of the segment.

The prerequisite for the example configuration is that you begin with an operational MRP ring.

![MRP over LAG Configuration Example](image)

Proceed the following steps to configure Switch A. Configure Switch B using the same steps, substituting the appropriate port and ring port numbers.

- Open the Switching > L2-Redundancy > Link Aggregation dialog.
- Click the button.
  The dialog displays the Create window.
- In the Trunk port drop-down list, select the instance number of the link aggregation group.
- In the Port drop-down list, select the port 1/1.
- Click the Ok button.
- Repeat the preceding steps and select the port 1/2.
- Click the Ok button.
- In the Active ports (min.) column enter 2, which in this case is the total number of ports in the instance. When combining MRP and LAG you specify the total number of ports as the Active ports (min.). When the device detects an interruption on a port, it blocks the other ports in the instance causing the ring to open. The Ring Manager senses that the ring is open, then begins forwarding data on its secondary ring port which restores the connectivity to the other devices in the network.
- To save the changes temporarily, click the button.
- Open the Switching > L2-Redundancy > MRP dialog.
- In the Ring port 2 frame, Port drop-down list, select the port lag/1.

**Note:** If the device uses the software supporting Fast MRP, then you cannot select a Link Aggregation port as a ring port.
- To save the changes temporarily, click the button.

```bash
enable
configure
link-aggregation add lag/1
link-aggregation modify lag/1 addport 1/1
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a Link Aggregation Group lag/1.
Adds port 1/1 to the Link Aggregation Group.
Redundancy
12.2 Media Redundancy Protocol (MRP)

- `link-aggregation modify lag/1 addport 1/2` Adds port 1/2 to the Link Aggregation Group.
- `mrp domain modify port secondary lag/1` Specifies port lag/1 as ring port 2.
- `copy config running-config nvm` Save the current settings in the non-volatile memory (nvm) in the “selected” configuration profile.
12.3 HIPER Ring Client

The concept of HIPER Ring Redundancy enables the construction of high-availability, ring-shaped network structures. The HIPER Ring Client function lets the network administrator extend an existing HIPER Ring or replace a client device already participating in a HIPER Ring.

When the device senses that the link on a ring port goes down, the device sends a LinkDown packet to the Ring Manager (RM) and flushes the FDB table. Once the RM receives the LinkDown packet, it immediately forwards the data stream over both the primary and secondary ring ports. Thus, the RM is able to maintain the integrity of the HIPER Ring.

The device only supports Fast Ethernet and Gigabit Ethernet ports as ring ports. Furthermore, you can include the ring ports in a LAG instance.

In the default state, the HIPER Ring client is inactive, and the primary and secondary ports are set to no Port.

**Note:** Deactivate the Spanning Tree Protocol (STP) for the ring ports in the Switching > L2-Redundancy > Spanning Tree > Port dialog, because STP and HIPER Ring have different reaction times.

**Table 29: Port settings for ring ports**

</tbody>
</table>

12.3.1 VLANS on the HIPER Ring

The device lets you forward VLAN data over the HIPER Ring. Thus the device provides redundancy for your VLAN data. The ring device forwards management data around the ring for example, on VLAN 1. In order for the data to reach the management station, the ring devices forward the untagged management data on the ring ports. Also, specify the ring ports as members in VLAN 1.

When you have other VLANs traversing your ring devices, the ring devices forward the other VLAN data as tagged.

To specify the VLAN settings, perform the following steps:

- Open the Switching > VLAN > Configuration dialog.
- To allow the device to forward untagged VLAN management data on the ring ports, in the VLAN 1 row, ring port drop-down lists, select U.
- To block management packets from being forwarded to the non-ring ports, in the VLAN 1 row, non-ring port drop-down lists, select -.
- To allow a ring device to forward VLAN data to and from ports with VLAN membership, in the VLAN row, ring port drop-down list, select T.
12.3 HIPER Ring Client

12.3.2 HIPER Ring over LAG

The HIPER Ring function lets you link the devices together over a Link Aggregation Group (LAG). The ring clients and Ring Manager behave in the same manner as a ring without a LAG instance.

If a LAG link goes down, then the other link in the instance also goes down making a break in the ring. After detecting a break in the ring, the affected ports send a Link Down packet to the Ring Manager. The Ring Manager unblocks the secondary port, sending data in both directions around the ring, and replies with a Delete packet. Upon receiving a Delete packet the ring participates flush their FDB.

- Open the Switching > VLAN > Port dialog.
- To assign VLAN 1 membership to the ring ports, in the ring port rows, Port-VLAN ID field, enter 1.
- To assign VLAN membership to the non-ring ports, in the port row, Port-VLAN ID field, enter the appropriate VLAN ID.
12.4 Parallel Redundancy Protocol (PRP) (depends on hardware)

Unlike ring redundancy protocols, PRP uses 2 separate LANs for uninterrupted availability. On the path from the sender to the receiver, PRP sends 2 data packets in parallel via the 2 mutually independent LANs. The receiver processes the first data packet received and discards the second data packet of the pair. The international standard IEC 62439-3 defines the Parallel Redundancy Protocol (PRP).

**Note:** When PRP is active, it uses the interfaces 1/1 and 1/2. As seen in the Switching > VLAN, Switching > Rate Limiter and Switching > Filter for MAC Addresses dialogs, the PRP function replaces the interfaces 1/1 and 1/2 with the interface prp/1. Configure the VLAN membership, the rate limiting, and the MAC filtering for the interface prp/1.

### 12.4.1 Implementation

When the upper protocol layers send a data packet, the PRP interface creates a “twin packet” from the original packet. The PRP interface then transmits 1 data packet of the pair to each participating LAN simultaneously. The packets traverse different LANs and therefore have different run times.

The receiving PRP interface forwards the first packet of a pair towards the upper protocol layers and discards the second packet. When viewed from the application, a PRP interface functions like a standard Ethernet interface.

The PRP interface or a Redundancy Box (RedBox) injects a Redundancy Control Trailer (RCT) into each packet. The RCT is a 48-bit identification field and is responsible for the identification of duplicates. This field contains, LAN identification (LAN A or B), information about the length of the payload, and a 16-bit sequence number. The twin packets therefore differ only in the LAN identification and as a result in the FCS checksum. The PRP interface increments the sequence number for each packet sent. Using the unique attributes included in each packet, such as Physical MAC source address and sequence number, the receiving RedBox or Double Attached Node (DAN) interface identifies and discards duplicates.

Depending on the packet size, with PRP it attains a reduced throughput of the available bandwidth, due to the addition of the RCT trailer.

### 12.4.2 LRE functionality

Each Double Attached Node implementing PRP (DANP) has 2 LAN ports that operate in parallel. The Link Redundancy Entity (LRE) connects the upper protocol layers with every individual port.
The LRE has the following tasks:
- Handling of duplicates
- Management of redundancy

When transmitting packets from the upper protocol layers, the LRE sends them from both ports at nearly the same time. The 2 data packets pass through the LANs with different delays. When the device receives the first data packet, the LRE forwards it to the upper protocol layers and discards the second data packet received.

For the upper protocol layers, the LRE behaves like a normal port.

To identify the twin packets, the LRE attaches an RCT with a sequential number to the packets. The LRE also periodically sends multicast PRP supervision packets and evaluates the multicast PRP supervision packets of the other RedBoxes and DANPs.

The device lets you view the received supervision packet entries. The entries in the Switching > L2-Redundancy > PRP > DAN/VDAN Table are helpful for detecting redundancy and connection problems. For example, in an index the Last seen B timestamp resets and the Last seen A timestamp remains the same. The Last seen A and Last seen B timestamps steadily resetting indicate a normal condition.

**Note:** According to IEC 62439, the Entry Forget Time is 400 ms. The Entry Forget Time is the time after which the device removes an entry from the duplicate table. When the device receives the 2nd packet of a pair after 400 ms or later, the device processes the 2nd packet instead of discarding it. To help prevent this, Hirschmann recommends that you use a maximum bandwidth of 90%.

**Note:** If the inter-frame gap is shorter than the latency between the 2 LANs, then a frame-ordering mismatch can occur. Frame-ordering mismatch is a phenomenon of the PRP protocol. The only solution to help avoid a frame-ordering mismatch is to verify that the inter-frame gap is greater than the latency between the LANs.

### 12.4.3 PRP Network Structure

PRP uses 2 independent LANs. The topology of each of these LANs is arbitrary, and ring, star, bus and meshed topologies are possible.

The main advantage of PRP is zero recovery time with an active (transit) LAN. When the end device receives no packets from one of the LANs, the second (transit) LAN maintains the connection. As long as 1 (transit) LAN is available, repairs and maintenance on the other (transit) LAN have no impact on the data packet transmission.

The elementary devices of a PRP network are the RedBox (Redundancy Box) and the DANP (Double Attached Node implementing PRP). Both devices have 1 connection each to the (transit) LANs.
The devices in the (transit) LAN are conventional switches. The devices transmit PRP data packets transparently, without evaluating the RCT information.

Note: The RCT trailer increases packet size. Configure the MTU size equal to or greater than 1524 for LAN A and LAN B devices.

Terminal devices that connect directly to a device in the (transit) LAN are SANs (Single Attached Nodes). SANs connected to a LAN have no redundancy. To use the PRP redundant network, connect the SAN to the PRP network via a RedBox.

12.4.4 Connecting RedBoxes and DANPs to a PRP network

DANPs have 2 interfaces for the connection to the PRP network. A RedBox is a DANP that contains additional switch ports. Use the switch ports to integrate one or more SANs into the PRP network redundantly.

When sending a data packet to the PRP network, the Link Redundancy Entity (LRE) in the RedBox creates a twin packet. When the LRE receives 1 data packet of the twin pair, the LRE forwards the data packet, and discards the 2nd data packet of the twin pair.

Note: The Redbox supports up to 128 hosts. If you attempt to support more than 128 hosts with the Redbox, then device drops packets.
### 12.4.5 Example Configuration

The following example uses a simple PRP network with 4 devices. Verify that the LAN A and LAN B ports contain 100 Mbit/s optical SFP interfaces. Connect Port A to LAN A and the Port B to LAN B.

![Example PRP Network Diagram](image)

**Note:** PRP is available for devices with an FPGA (hardware for extended functions). The product code indicates whether your device supports PRP. In order to use the functions, load the device software supporting PRP.

The PRP function reserves ports 1/1 and 1/2. This removes the possibility of using other redundancy protocols such as Spanning Tree or MRP in parallel on ports 1/1 and 1/2.

- If you use Spanning Tree in parallel to PRP, then deactivate Spanning Tree on ports 1/1 and 1/2. Also deactivate the functions **Root guard**, **TCN guard** and **Loop guard** on ports 1/1 and 1/2.
- If you use MRP in parallel to PRP, then specify the other free device ports as MRP-Ring ports.

Perform the following steps on both the RedBox 1 and DANP 1 devices.

- Open the **Switching > L2-Redundancy > PRP > Configuration** dialog.
  - Perform the following steps in the **Supervision packet receiver** frame:
    - To analyze received PRP supervision packets, activate the **Evaluate supervision packets** checkbox.
  - Perform the following steps in the **Supervision packet sender** frame:
    - To transmit PRP supervision packets from this device, activate **Active**.
    - The device sends either only its own PRP supervision packets, or sends both its own supervision packets and packets of connected devices. To transmit packets for VDANs listed in the **Switching > L2-Redundancy > PRP > DAN/VDAN Table**, activate **Send VDAN packets**. When deactivated, the device forwards only its own supervision packets. After installing new PRP devices, deactivate this function to maintain a clear overview of the PRP supervision packets on remote devices.
    - To enable the ports, in the **Port A** and **Port B** frames, select the value **On**.
    - To enable the function, select in the **Operation** frame the **On** radio button.
    - To save the changes temporarily, click the **✓** button.
The device lets you view the received supervision packet entries. The entries in the Switching > L2-Redundancy > PRP > DAN/VDAN Table are helpful for detecting redundancy and connection problems. For example, in an index the Last seen B timestamp resets and the Last seen A timestamp remains the same. The Last seen A and Last seen A timestamps steadily resetting indicate a normal condition.

**Note:** If you deactivate the PRP function, then deactivate either Port "A" or "B" to help prevent network loops.

Enable the PRP function.
Display the PRP counters.
Display the node table.
Display the proxy node table.
12.5 High-availability Seamless Redundancy (HSR) (depends on hardware)

As with PRP, an HSR ring also offers zero recovery time. HSR is suited for applications that demand high availability and short reaction times. For example, protection applications for electrical station automation and controllers for synchronized drives which require constant connection.

**Note:** When HSR is active, it uses the interfaces 1/1 and 1/2. As seen in the Switching > Rate Limiter and Switching > Filter for MAC Addresses dialogs, the HSR function replaces the interfaces 1/1 and 1/2 with the interface hsr/1. Set up the VLAN membership and the rate limiting for the interface hsr/1.

12.5.1 Implementation

HSR Redundancy Boxes (RedBox) use 2 Ethernet ports operating in parallel to connect to a ring. An HSR RedBox operating in this configuration is a Doubly Attached Node implementing the HSR protocol (DANH). A standard ethernet device connected to the HSR ring through an HSR RedBox is a Virtual DANH (VDANH).

As with PRP, the transmitting HSR Node or HSR RedBox sends twin packets, 1 in each direction, on the ring. For identification, the HSR node injects the twin packets with an HSR tag. The HSR tag consists of a port identifier, the length of the payload and a sequence number. In a normal operating ring, the destination HSR node or RedBox receives both packets within a certain time skew. When the HSR node receives the first packet, the HSR node forwards the packet, and discards the 2nd packet. A RedBox on the other hand forwards the first packet to the VDANHs and discards the second packet.

The HSR Nodes and HSR RedBoxes insert an HSR tag after the source MAC Address in the packet. The advantage to the HSR tag placement is that the device is able to forward the packet immediately after receiving the HSR header and performing duplicate recognition. Affectively decreasing the delay time within the device. In contrast to PRP where the RCT contains a PRP suffix near the end of the packet. Meaning that a PRP device receives the entire packet before forwarding the packet out of the correct port.

HSR Nodes and HSR RedBoxes also use the LRE function as described in the chapter “Parallel Redundancy Protocol (PRP) (depends on hardware)” on page 181. As with PRP, the LRE in the HSR RedBoxes are responsible for tagging and duplicate recognition.

The number of HSR nodes in the ring should not exceed 50. If the HSR interface speed is 1 Gbps, then the number should not exceed 300.

It is useful to limit the traffic injected into the HSR ring. If there are any third party devices with a higher latency in the ring, then you reduce the number of ring participants. Verify that the sum of bandwidths applied to the HSR nodes is less than 84%.

**Note:** HSR is available for devices with an FPGA (hardware for extended functions). The product code indicates whether your device supports HSR. In order to use the functions, load the device software supporting HSR.
12.5.2 HSR Network Structure

An HSR Network consists of a ring, where each HSR device performs a specific role in the network. An HSR device for example, connects standard ethernet devices to an HSR ring, or PRP LANs to an HSR ring.

Connecting SANs to an HSR Network

Standard ethernet devices, such as laptops or printers, have 1 network interface. Therefore, standard ethernet devices transmit traffic across an HSR ring through an HSR RedBox which acts as a proxy for the ethernet devices attached to it. The HSR RedBox interfaces transmit 1 twin packet in each direction around the network.

The host HSR RedBox forwards only the first unicast packet to the destination VDANH and discards the second unicast packet.

The HSR Nodes and RedBoxes forward multicast and broadcast traffic around the ring and also to the connected VDANH devices. To help prevent the traffic from endlessly looping around the ring, the node originally transmitting the traffic on the network discards the data packets it transmitted.

Figure 43: Connecting a VDANH to an HSR network

SAN Device Connection Example Configuration

A simple HSR network consists of 3 HSR devices as seen in the previous figure. The following example configures a host HSR RedBox for standard ethernet devices.

Deactivate STP on the PRP ports or globally. Also, deactivate MRP on the PRP ports or configure MRP on ports other than the PRP ports.

- Open the Switching > L2-Redundancy > MRP dialog.
- To disable the function, select the Off radio button in the Operation frame.
- Verify that the ports in Ring port 1 and Ring port 2 frames are different from the ports used by the HSR function.
- Open the Switching > L2-Redundancy > Spanning Tree > Global dialog.
- To disable the function, select the Off radio button in the Operation frame.
- Open the Switching > L2-Redundancy > Spanning Tree > Port dialog.
- In the CIST tab, deactivate the ports used for HSR in the STP active column.
- In the Guards tab, deactivate the ports used for HSR in the Root guard, TCN guard and Loop guard columns.

Note: If you deactivate the HSR function, then deactivate either Port “A” or “B” to help prevent network loops.
Redundancy
12.5 High-availability Seamless Redundancy (HSR)  (depends on hardware)

The device sends either only its own HSR supervision packets, or sends both its own supervision packets and packets of connected devices. After installing new HSR devices, deactivate this function to maintain a clear overview of the HSR supervision packets on remote devices.

- Open the Switching > L2-Redundancy > HSR > Configuration dialog.
- To analyze received HSR supervision packets, activate the Evaluate supervision packets checkbox in the Supervision packet receiver frame.
- To transmit HSR supervision packets from this device, activate Active in the Supervision packet sender frame.
- To transmit packets for VDANs listed in the Switching > L2-Redundancy > HSR > DAN/VDAN Table dialog, activate Send VDAN packets.

Use the following steps to configure HSR RedBox 1:

- To configure the device to forward unicast traffic around the ring and to the destination device, set the HSR mode to modeu.
- To configure the device as an HSR host, set the Switching node type to hsrredboxsan.

Note: Setting Switching node type to hsrredboxsan disables the Redbox identity function.

- To enable the ports, select the On radio button in the Port Port A and Port Port B frames.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.
- To load the configuration saved in the volatile memory, click the button.
- Open the Switching > L2-Redundancy > HSR > DAN/VDAN Table dialog to view the traffic received from the LAN. This information helps you in detecting how the LANs are functioning.
- To remove this list, click Reset.
- To update the table entries, click the button.
- Open the Switching > L2-Redundancy > HSR > Proxy Node Table dialog to view the terminating VDAN devices for which this device provides HSR conversion.
- To remove the entries in the proxy table, click Reset.
- To update the table entries, click the button.

The device detects errors and displays them according to MIB Managed Objects and the respective link.

- Open the Switching > L2-Redundancy > HSR > Statistics dialog to view the quality of the traffic that traverses the device.
- To remove the entry in the statistics table, click Reset.
- To load the current statistics, click the button.
Another possibility is to configure the host HSR RedBox 1 using the following commands:

```
enable
configure
no mrp operation
no spanning-tree operation
interface 1/1
no shutdown
exit
interface 1/2
no shutdown
exit
hsr instance 1 mode modeu
hsr instance 1 port-a
hsr instance 1 port-b
hsr instance 1 switching-node-type redboxsan
hsr instance 1 supervision evaluate
hsr instance 1 supervision send
hsr instance 1 supervision redbox-exclusively
hsr operation
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Disable the option.
Disable the option.
Change to the interface configuration mode of interface 1/1.
Enable the interface.
Change to the Configuration mode.
Change to the interface configuration mode of interface 1/2.
Enable the interface.
Change to the Configuration mode.
The HSR host forwards unicast traffic to the connected VDANs and around the ring.
Activate the HSR Port A.
Activate the HSR Port B.
Enable the device to process traffic destine for LAN B of the PRP network.
Enable evaluation of received supervision packets.
Enable supervision packet transmission.
Sends supervision packets only for this RedBox.
Use the `no` form of the command to send supervision packets for each connected VDAN and this RedBox. The prerequisite is that you enable the supervision packet send function.
Enable the HSR function.

View traffic statistics on a device using the show commands:

```
show hsr counters
show hsr node-table
show hsr proxy-node-table
```

Display the HSR counters.
Display the node table.
Display the proxy node table.

**HSR and PRP network connections**

When connecting PRP networks to an HSR network, the HSR device uses 2 interfaces to connect to the HSR ring. The HSR device uses a third interface to connect to either LAN A or LAN B of the PRP network as seen in the following figure. The HSR device transmitting the traffic across the HSR ring identifies traffic destine for PRP networks with the appropriate tag. The HSR devices then forward the PRP traffic through LAN A or LAN B. The PRP device receives the traffic and processes it as described in the PRP chapter.
The HSR devices identify and tag traffic for up to 7 PRP networks connected to 1 HSR ring.

HSR Redboxes use 2 interfaces for the HSR ring. When configured to manage PRP traffic, a third interface connects to a LAN of the PRP network. The other interfaces provide HSR network access for VDANs. The HSR RedBox lists the connected VDANs in the Switching > L2-Redundancy > HSR > Proxy Node Table.

**PRP Network Connection Example Configuration**

The following example configures a simple HSR network with 3 HSR devices as shown in the previous figure. Use the HSR RedBox configured in the previous example to connect the standard ethernet devices to the HSR ring. HSR RedBox 1 sends 1 twin packet toward DANH 1 and 1 twin packet toward DANH 2. When the first packet of a pair arrives, DANH 1 sends the packet to PRP network 1 LAN A and DANH 2 sends the packet to PRP network 1 LAN B.

Deactivate STP on the PRP ports or globally. Also, deactivate MRP on the PRP ports or configure MRP on ports other than the PRP ports.

Use the HSR RedBox configured in the previous example for HSR RedBox 1. Perform the following steps on the DANH 1 and 2.
Open the Switching > L2-Redundancy > MRP dialog.
- To disable the function, select the Off radio button in the Operation frame.
- Verify that the ports in Ring port 1 and Ring port 2 frames are different from the ports used by the HSR function.

Open the Switching > L2-Redundancy > Spanning Tree > Global dialog.
- To disable the function, select the Off radio button in the Operation frame.

Open the Switching > L2-Redundancy > Spanning Tree > Port dialog.
- In the CIST tab, deactivate the ports used for HSR in the STP active column.
- In the Guards tab, deactivate the ports used for HSR in the Root guard, TCN guard and Loop guard columns.

Note: If you deactivate the HSR function, then deactivate either Port “A” or “B” to help prevent network loops.

The device sends either only its own HSR supervision packets, or sends both its own supervision packets and packets of connected devices. After installing new HSR devices, deactivate this function to maintain a clear overview of the HSR supervision packets on remote devices.

Open the Switching > L2-Redundancy > HSR > Configuration dialog.
- To analyze received HSR supervision packets, activate the Evaluate supervision packets checkbox in the Supervision packet receiver frame.
- To transmit HSR supervision packets from this device, activate Active in the Supervision packet sender frame.
- To transmit packets for VDANs listed in the Switching > L2-Redundancy > HSR > DAN/VDAN Table dialog, activate Send VDAN packets.

Use the following steps to configure DANH 1:

Open the Switching > L2-Redundancy > HSR > Configuration dialog.
- To configure the device to forward unicast traffic around the ring and to the destination device, set the HSR mode to modeu.
- To configure the device to forward traffic to PRP LAN A, set the Switching node type to hsrredboxprpa.
- To configure the device to forward traffic to PRP network 1 LAN A, set Redbox identity to id1a.
- To enable the ports, select the On radio button in the Port Port A and Port Port B frames.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.
- To load the configuration saved in the volatile memory, click the button.
Redundancy
12.5 High-availability Seamless Redundancy (HSR)  (depends on hardware)

Use the following configuration for DANH 2:

- Open the Switching > L2-Redundancy > HSR > Configuration dialog.
- To configure the device to forward unicast traffic around the ring and to the destination device, set the HSR mode to modeu.
- To configure the device to forward traffic to PRP LAN A, set the Switching node type to harrredboxprpb.
- To configure the device to forward traffic to PRP network 1 LAN B, set Redbox identity to id1b.
- To enable the ports, select the On radio button in the Port Port A and Port Port B frames.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.
- To load the configuration saved in the volatile memory, click the button.

Another possibility is to use the following commands to configure the HSR devices 1 and 2.

```bash
enable
configure
no mrp operation
no spanning-tree operation
interface 1/1
no shutdown
exit
interface 1/2
no shutdown
exit
hsr instance 1 mode modeu
hsr instance 1 port-a
hsr instance 1 port-b
hsr instance 1 switching-node-type harrredboxprpb
hsr instance 1 redbox-id id1a
hsr instance 1 supervision evaluate
hsr instance 1 supervision send
hsr instance 1 supervision redbox-exclusively
hsr operation
```

Use the following commands to configure DANH 1 to process traffic for PRP network 1 LAN A.

- The HSR host forwards unicast traffic to the connected VDANs and around the ring.
- Activate the HSR Port A.
- Activate the HSR Port B.
- Enable the device to process traffic destine for LAN A of the PRP network.
- Enable the device to process traffic destine for LAN A of the PRP network 1.
- Enable evaluation of received supervision packets.
- Enable supervision packet transmission.
- Sends supervision packets only for this RedBox. Use the no form of the command to send supervision packets for each connected VDAN and this RedBox. The prerequisite is that you enable the supervision packet send function.
- Enable the HSR function.
Use the following commands to configure DANH 2 to process traffic for PRP network 1 LAN B.

```bash
hsr instance 1 mode modeu
hsr instance 1 port-a
hsr instance 1 port-b
hsr instance 1 switching-node-type hsrredboxprpb
hsr instance 1 redbox-id id1b
hsr instance 1 supervision evaluate
hsr instance 1 supervision send
hsr instance 1 supervision redbox-exclusively
hsr operation
```

The HSR host forwards unicast traffic to the connected VDANs and around the ring.

Activate the HSR Port A.

Activate the HSR Port B.

Enable the device to process traffic destine for LAN B of the PRP network.

Enable the device to process traffic destine for LAN B of the PRP network 1.

Enable evaluation of received supervision packets.

Enable supervision packet transmission.

Sends supervision packets only for this RedBox. Use the `no` form of the command to send supervision packets for each connected VDAN and this RedBox. The prerequisite is that you enable the supervision packet send function.

Enable the HSR function.

View traffic statistics on a device using the show commands.

```bash
show hsr counters
show hsr node-table
show hsr proxy-node-table
```

Display the HSR counters.

Display the node table.

Display the proxy node table.
12.6 Device Level Ring (DLR)

The Device Level Ring (DLR) protocol is a Layer 2 protocol that provides redundancy for Ethernet data using a ring topology. The primary implementation for the DLR protocol is to control and monitor EtherNet/IP devices.

The DLR protocol operates at Layer 2 in the OSI model. The presence of the ring topology and the operation of the DLR protocol are transparent to higher layer protocols such as TCP/IP and EtherNet/IP. The DLR protocol is transparent with the exception of a DLR Object. The DLR Object provides a configuration and diagnostic interface for the EtherNet/IP protocol.

The DLR protocol also lets you install non-DLR multi-port Layer 2 switches in the ring. Non-DLR Layer 2 switches are subject to certain restrictions. For example, the Layer 2 switch has the MAC table filtering disabled. Non-DLR devices have an impact on the ring recovery time.

In the delivery setting the function is disabled.

![Figure 45: DLR Network with ring participants](image)

12.6.1 Device Roles

A DLR network includes at least 1 ring supervisor, and a DLR capable ring participant. Every participant in the ring has at least 2 Ethernet ports, and implements Layer 2 switching technology. After a ring participant receives a packet on a ring port, it determines whether to process or forward the packet depending on the MAC address contained in the packet.

Active Ring Supervisor

The active ring supervisor is responsible for monitoring and controlling the network. To monitor the network the active ring supervisor uses Beacon and Announce packets. The Beacon packets contain configuration information that the active ring supervisor sends to the ring participants. The ring participants configure their DLR parameters with the information contained in the Beacon packets.

The following list contains the configuration information sent in the Beacon packet:
- Beacon interval
- Beacon timeout
- Supervisor Precedence, entered in the Beacon-based participant configuration only
- DLR VLAN ID

Note: The default VLAN ID used for DLR is 0. Verify that the VLAN unaware mode in the Switching > Global dialog is activated.
An active ring supervisor boots in the FAULT_STATE and forwards Beacon and Announce packets on both Ethernet ports. During boot up the Beacon and Announce packets contain the value RING_FAULT_STATE as the ring state.

Once the active ring supervisor receives Beacon packets on both ports, it transitions the ring state to the NORMAL_STATE, sets a port to blocking, and flushes its unicast MAC address table. The active ring supervisor continues to send Beacon packets on both ports and sends Announce packets only on the unblocked port. By blocking a ring port, the active ring supervisor provides only 1 path for the ring participants to send and receive data. The active ring supervisor sends an Announce packet on the forwarding port, with the ring state set to RING_NORMAL_STATE.

Since the active ring supervisor is responsible for controlling and monitoring the ring, it needs to know who is on the ring. The active ring supervisor does this by initiating the Sign_On process.

**Backup Supervisors**

When the ring contains multiple supervisors, each supervisor sends Beacon packets during boot up. Besides ring state messages, and configuration information, the Beacon packets also contain a supervisor precedence value. When an active ring supervisor receives a Beacon packet, it checks the precedence value. If the precedence value in the Beacon packet is higher than its own, then the active ring supervisor transitions to the FAULT_STATE and assumes the backup supervisor role. When the precedence values are the same, the ring supervisor with the numerically higher MAC address assumes the role of the active ring supervisor.

The backup supervisors configure their DLR parameters, except for the supervisor precedence value, and the DLR VLAN ID with the information contained in the Beacon packets. The backup supervisors continue to monitor both ports for a timeout of the Beacon packets. When the backup supervisor times out the Beacon packets on both ports, it waits an extra Beacon Timeout period before sending its Beacon packets.

**Beacon-based Nodes**  
(depends on hardware)

When the supervisor function on a ring participant is inactive, it assumes the role of a Beacon-based participant. Beacon-based participants process both Beacon packets and Announce packets. This makes it possible for a quicker response to detected ring breaks.

A Beacon-based ring participant boots up in the IDLE_STATE, and presumes the network is a linear topology. Upon receiving a Beacon packet on either the primary or the secondary port, the participant transitions to the FAULT_STATE, and presumes the network is a ring topology. The ring participant flushes its unicast MAC address table and saves the DLR parameters received in the Beacon packets.
The ring participants save the following DLR parameters in their configuration:
- Supervisor addresses, MAC and IP address
- Supervisor precedence
- Beacon interval
- Beacon timeout
- DLR VLAN ID

Upon receiving the Beacon packets on both ports, the ring participant transitions to the NORMAL_STATE. Then the ring participant flushes its unicast MAC address table.

**Non-DLR Nodes**

The DLR protocol does not require that every ring participant implement the protocol. The network administrator can install non-DLR participants in the ring. This assumes that the devices support certain required configurations.

**Note:** Using non-DLR participants in the ring lengthens the recovery time. When possible, connect the non-DLR participants to the ring through a DLR capable device.

If you install non-DLR participants directly in the ring, then the participants require certain configurations. The following list describes the configurations required:
- Disable unicast MAC address learning.
  - Beacon packets arrive on both ports with the MAC address of the active ring supervisor. Address learning causes the MAC address of the active ring supervisor to bounce from port to port.
- Disable multicast filtering on DLR ring ports.
  - The Beacon and Announce packets used in the DLR protocol are multicast messages. When unsupported, the participant filters out the DLR messages.
- Support the reception of 802.1Q packets and preservation of the VLAN ID and tag priority.
  - If unsupported, then the device can drop or incorrectly queue the DLR messages.
- Implement priority queues with strict priority scheduling.
  - Assign the DLR messages the highest priority queue. If unsupported, then the device delays DLR messages which affects ring recovery performance.

**Note:** Using non-DLR participants can result in loss of unicast packets for some time following a detected error or ring restoration. If the non-DLR participant maintains the MAC address table after a detected error, then the participant can send unicast packets on the wrong port. For this reason, DLR capable participants flush their MAC address table.

**12.6.2 Error Detection**

The active ring supervisor is responsible for ring integrity. In order to control and monitor the ring, the active ring supervisor sends Beacon and Announce packets. The Beacon and Announce packets contain various status messages. The status messages inform the ring participants about the health of the ring.

The ring participants also monitor connections to their neighbors. When a ring participant detects that the link to a neighbor is down, it sends a Link_Status message to the active ring supervisor.

After receipt of the Link_Status message, the ring supervisor unblocks its previously blocked port. Unblocking the port transitions the network from a ring to a linear topology. The active ring supervisor then flushes its unicast MAC table, and immediately sends Beacon and Announce packets. The ring state set to RING_FAULT_STATE.
**Active Ring Supervisor**

The following list contains events in which the active ring supervisor transitions to the FAULT_STATE:

- Receiving Beacon packets from another supervisor with a higher precedence value.
- Loss of Beacon packets on either port for the specified Beacon Timeout period, indicating a break somewhere in the ring.
- Interruption of link with the neighboring participant detected on either port.
- Receiving a Link_Status message from a ring participant, indicating that a ring participant has detected an error.

In the cases listed above, the active ring supervisor responds with the following actions:

- Transition to FAULT_STATE
- Flush the unicast MAC address table
- Unblock the blocked port
- Send Beacon packets out both ports, with ring state set to the RING_FAULT_STATE
- Send Announce packets out both ports, with ring state set to the RING_FAULT_STATE

When the active ring supervisor times out a Beacon packet, it initiates the Neighbor Check process by sending a Locate Fault packet. The supervisor also sends Neighbor Check packets to the neighbor connected to the ports on which it timed out the Beacon packet.

When in the FAULT_STATE, the active ring supervisor continues to send Beacon packets. Sending Beacon packets lets the active ring supervisor detect ring restoration.

**Ring Participants**

The following list contains events in which the ring participant transitions from the NORMAL_STATE:

- Receipt of a Beacon packet with the ring state set to RING_FAULT_STATE.
- Receipt of a Beacon packet with a different MAC address and higher precedence than the current active ring supervisor.
- Loss of Beacon packets on both ports for the specified Beacon Timeout period. Losing the Beacon packets on both ports causes the participant to transition to IDLE_STATE. The ring participant assumes that the topology has transitioned from a ring to a linear network.
- Loss of Beacon packets on a single port for the specified Beacon Timeout period.

In the cases listed above, the ring participant responds with the following actions:

- Flush the unicast MAC address table
- A loss of Beacon packets on both ports or the loss of Announce packets causes the ring participant to transition to the IDLE_STATE.
- A loss of Beacon packets on a single port causes the ring participant to transition to the FAULT_STATE.

**12.6.3 Neighbor Check process**

When the active ring supervisor detects the loss of Beacon packets, it sends a Locate_Fault packet to the ring participants through both ports.

Upon receipt of the Locate_Fault packet, each ring participant sends a Neighbor_Check_Request packet to its immediate neighbors. The supervisor also sends its own Neighbor_Check_Request to its immediate neighbors.
When the ring participant receives a Neighbor_Check_Request packet, it responds with a Neighbor_Check_Response packet on the port from which it received the request. When the participant sending the Neighbor_Check_Request does not receive a response, it sends another request. When the participant receives no responses after 3 attempts, it sends a Neighbor_Status packet to the ring supervisor.

Figure 47: Neighbor Check process

12.6.4 Sign On Process

To identify ring participants, the active ring supervisor sends Sign_On packets after transiting to the NORMAL_STATE. The active supervisor sends a Sign_On packet once every minute while in the NORMAL_STATE. When the active supervisor receives a Sign_On packet that it previously sent, it discontinues sending Sign_On packets. The device displays the ring participant list in the Switching > L2-Redundancy > Statistics dialog.

The active ring supervisor sends the multicast Sign_On packets from the unblocked port. When a ring participant receives the Sign_On packet, it forwards the packet to the CPU of the device only. The CPU adds the addresses of the participant and sends the Sign_On packet out of the port opposite from the receiving port.

The ring participants send the Sign_On packet around the ring. Each participant processes the Sign_On packet in similar manner. Eventually the Sign_On packet returns to the active ring supervisor. The active supervisor verifies that it sent the Sign_On packet. For this purpose the active supervisor checks the first entry in the ring participant list.

Figure 48: Sign On Process

If adding an address of a participant to the Sign_On packet exceeds the maximum packet size, then the participant does not add its address to the received packet. The participant saves the port on which it received the packet. Then the participant sends the Sign_On packet directly to the unicast MAC address of the active ring supervisor.
When the ring supervisor receives the Sign_On packet sent to its unicast MAC address, it assumes this is due to the Sign_On packet size reaching its maximum capacity. The supervisor restarts the process by sending a new Sign_On packet directly to the unicast MAC address of the participant from which it received the unicast Sign_On packet.

Upon receiving the new Sign_On packet from the active ring supervisor, the ring participant adds its address to the Sign_On packet. The participant then sends the multicast Sign_On packet on the ring port opposite from the port saved in memory.

12.6.5 Example Configuration

The Device Level Ring (DLR) protocol provides redundancy for Ethernet data in a ring topology. Using the DLR protocol you control and monitor Ethernet and IP devices.

EtherNet/IP Environments

If you use the DLR function in conjunction with Ethernet environments, then verify that the parameters are specified as follows:

- **DLR:**
  - The DLR function is enabled.
  - The ports 1/1 and 1/2 are specified as the DLR ring ports.
  - The Supervisor active function is active.

- **EtherNet/IP:**
  - The EtherNet/IP function is enabled.
  - The Write access function is active.

- **Spanning Tree:**
  - The Spanning Tree function is disabled.

- **VLANs:**
  - The VLAN unaware mode function is active.

- **IGMP Snooping:**
  - The IGMP Snooping function is enabled, and active on every port.
  - The IGMP Snooping Querier function is enabled.
  - The Snooping Enhancements on DLR ring ports are specified as Static (S) and Forward all (F).

When you order the device using the hardware code D, the values of parameters listed above are specified as the default settings.
For **DLR** operation within an *EtherNet/IP* environment for example, Rockwell or Allen-Bradley devices, you proceed as follows.

- Open the **Switching > Global** dialog.
- In the **Configuration** frame, mark the **VLAN unaware mode** checkbox.
- To save the changes temporarily, click the ✓ button.
- Open the **Switching > L2-Redundancy > DLR > Configuration** dialog.
- To add a table entry, click the ☑ button.
- In the **Name** column, specify the value **DLR_Ring_1**.
- In the **VLAN ID** column, specify the value **0**.
- To activate the configuration, mark the checkbox in the **Active** column.
- To enable the function, select the On radio button in the **Operation** frame.
- To save the changes temporarily, click the ✓ button.

```bash
enable
vlan database
vlan-unaware-mode
exit
configure
dlr ring add 1
dlr ring modify 1 name DLR_Ring_1
dlr ring modify 1 port-1 1/1
dlr ring modify 1 port-2 1/2
dlr ring modify 1 precedence 250
dlr ring modify 1 supervisor enable
dlr ring modify 1 vlan 0
dlr ring modify 1 operation enable
dlr operation
```

Change to the Privileged EXEC mode.
Change to the VLAN configuration mode.
Activate the **VLAN unaware mode** function.
Change to the Privileged EXEC mode.
Change to the Configuration mode.
Create the **DLR** ring 1.
Specify the value **DLR_Ring_1** as the name of the **DLR** ring.
Specify port 1/1 as the **DLR** ring port 1.
Specify port 1/2 as the **DLR** ring port 2.
Specify the value **250** as the supervisor precedence.
Enable the ring supervisor function.
Specify the value **0** as the VLAN identifier. The device uses the VLAN to forward the **DLR** protocol messages.
Enable the **DLR** function for ring 1.
Enable the global **DLR** function.
12.7 **Spanning Tree**

**Note:** The Spanning Tree Protocol is a protocol for MAC bridges. For this reason, the following description uses the term bridge for the device.

Local networks are getting bigger and bigger. This applies to both the geographical expansion and the number of network participants. Therefore, it is advantageous to use multiple bridges, for example:
- to reduce the network load in sub-areas,
- to set up redundant connections and
- to overcome distance limitations.

However, using multiple bridges with multiple redundant connections between the subnetworks can lead to loops and thus interruption of communication across the network. In order to help avoid this, you can use Spanning Tree. Spanning Tree enables loop-free switching through the systematic deactivation of redundant connections. Redundancy enables the systematic reactivation of individual connections as needed.

RSTP is a further development of the Spanning Tree Protocol (STP) and is compatible with it. When a connection or a bridge becomes inoperable, the STP requires a maximum of 30 seconds to reconfigure. This is no longer acceptable in time-sensitive applications. RSTP achieves average reconfiguration times of less than a second. When you use RSTP in a ring topology with 10 to 20 devices, you can even achieve reconfiguration times in the order of milliseconds.

**Note:** RSTP reduces a layer 2 network topology with redundant paths into a tree structure (Spanning Tree) that does not contain any more redundant paths. One of the devices takes over the role of the root bridge here. The maximum number of devices permitted in an active branch (from the root bridge to the tip of the branch) is specified by the variable *Max age* for the current root bridge. The preset value for *Max age* is 20, which can be increased up to 40.

If the device working as the root is inoperable and another device takes over its function, then the *Max age* setting of the new root bridge determines the maximum number of devices allowed in a branch.

**Note:** The RSTP standard dictates that every device within a network work with the (Rapid) Spanning Tree Algorithm. When STP and RSTP are used at the same time, the advantages of faster reconfiguration with RSTP are lost in the network segments that are operated in combination.

A device that only supports RSTP works together with MSTP devices by not assigning an MST region to itself, but rather the CST (Common Spanning Tree).
12.7 Spanning Tree

12.7.1 Basics

Because RSTP is a further development of the STP, every of the following descriptions of the STP also apply to RSTP.

The tasks of the STP

The Spanning Tree Algorithm reduces network topologies built with bridges and containing ring structures due to redundant links to a tree structure. In doing so, STP opens ring structures according to preset rules by deactivating redundant paths. When a path is interrupted because a network component becomes inoperable, STP reactivates the previously deactivated path again. This lets redundant links increase the availability of communication.

STP determines a bridge that represents the STP tree structure's base. This bridge is called root bridge.

Features of the STP algorithm:
- automatic reconfiguration of the tree structure in the case of a bridge becoming inoperable or the interruption of a data path
- the tree structure is stabilized up to the maximum network size,
- stabilization of the topology within a short time period
- topology can be specified and reproduced by the administrator
- transparency for the end devices
- low network load relative to the available transmission capacity due to the tree structure created

Bridge parameters

In the context of Spanning Tree, each bridge and its connections are uniquely described by the following parameters:
- Bridge Identifier
- Root Path Cost for the bridge ports,
- Port Identifier

Bridge Identifier

The Bridge Identifier consists of 8 bytes. The 2 highest-value bytes are the priority. When configuring the network, the Management Administrator can change the default setting for the priority number which is 32768. The 6 lowest-value bytes of the bridge identifier are the bridge's MAC address. The MAC address lets each bridge have unique bridge identifiers.

The bridge with the smallest number for the bridge identifier has the highest priority.

Figure 49: Bridge Identifier, Example (values in hexadecimal notation)
Root Path Cost

Each path that connects 2 bridges is assigned a cost for the transmission (path cost). The device determines this value based on the transmission speed (see table 30). It assigns a higher path cost to paths with lower transmission speeds.

Alternatively, the Administrator can set the path cost. Like the device, the Administrator assigns a higher path cost to paths with lower transmission speeds. However, since the Administrator can choose this value freely, he has a tool with which he can give a certain path an advantage among redundant paths.

The root path cost is the sum of the individual costs of those paths that a data packet has to traverse from a connected bridge’s port to the root bridge.

![Figure 50: Path costs](image)

</tbody>
</table>

1. Bridges that conform with IEEE 802.1D 1998 and only support 16-bit values for the path costs should use the value 65,535 (FFFFH) for path costs in cases where they are used in conjunction with bridges that support 32-bit values for the path costs.

Port Identifier

The port identifier consists of 2 bytes. One part, the lower-value byte, contains the physical port number. This provides a unique identifier for the port of this bridge. The second, higher-value part is the port priority, which is specified by the Administrator (default value: 128). It also applies here that the port with the smallest number for the port identifier has the highest priority.

![Figure 51: Port Identifier](image)
Max Age and Diameter

The “Max Age” and “Diameter” values largely determine the maximum expansion of a Spanning Tree network.

Diameter

The number of connections between the devices in the network that are furthest removed from each other is known as the network diameter.

![Diagram of network diameter](image)

Figure 52: Definition of diameter

The network diameter that can be achieved in the network is MaxAge-1.

In the state on delivery, MaxAge = 20 and the maximum diameter that can be achieved = 19. When you set the maximum value of 40 for MaxAge, the maximum diameter that can be achieved = 39.

MaxAge

Every STP-BPDU contains a “MessageAge” counter. When a bridge is passed through, the counter increases by 1.

Before forwarding a STP-BPDU, the bridge compares the “MessageAge” counter with the “MaxAge” value specified in the device:

- When MessageAge < MaxAge, the bridge forwards the STP-BPDU to the next bridge.
- When MessageAge = MaxAge, the bridge discards the STP-BPDU.

![Diagram of STP-BPDU transmission depending on MaxAge](image)

Figure 53: Transmission of an STP-BPDU depending on MaxAge
12.7.2 Rules for Creating the Tree Structure

Bridge information

To determine the tree structure, the bridges need more detailed information about the other bridges located in the network.

To obtain this information, each bridge sends a BPDU (Bridge Protocol Data Unit) to the other bridges.

The contents of a BPDU include:

- Bridge identifier
- Root path costs
- Port identifier

(see IEEE 802.1D)

Setting up the tree structure

- The bridge with the smallest number for the bridge identifier is called the root bridge. It is (or will become) the root of the tree structure.
- The structure of the tree depends on the root path costs. Spanning Tree selects the structure so that the path costs between each individual bridge and the root bridge become as small as possible.
When there are multiple paths with the same root path costs, the bridge further away from the root decides which port it blocks. For this purpose, it uses the bridge identifiers of the bridge closer to the root. The bridge blocks the port that leads to the bridge with the numerically higher ID (a numerically higher ID is the logically worse one). When 2 bridges have the same priority, the bridge with the numerically larger MAC address has the numerically higher ID, which is logically the worse one.

When multiple paths with the same root path costs lead from one bridge to the same bridge, the bridge further away from the root uses the port identifier of the other bridge as the last criterion (see figure 51). In the process, the bridge blocks the port that leads to the port with the numerically higher ID (a numerically higher ID is the logically worse one). When 2 ports have the same priority, the port with the higher port number has the numerically higher ID, which is logically the worse one.

Figure 54: Flow diagram for specifying the root path
12.7.3 Examples

Example of determining the root path

You can use the network plan (see figure 55) to follow the flow chart (see figure 54) for determining the root path. The administrator has specified a priority in the bridge identification for each bridge. The bridge with the smallest numerical value for the bridge identification takes on the role of the root bridge, in this case, bridge 1. In the example every sub-path has the same path costs. The protocol blocks the path between bridge 2 and bridge 3 as a connection from bridge 3 via bridge 2 to the root bridge would result in higher path costs.

The path from bridge 6 to the root bridge is interesting:
- The path via bridge 5 and bridge 3 creates the same root path costs as the path via bridge 4 and bridge 2.
- STP selects the path using the bridge that has the lowest MAC address in the bridge identification (bridge 4 in the illustration).
- There are also 2 paths between bridge 6 and bridge 4.
  The port identifier is decisive here (Port 1 < Port 3).

![Figure 55: Example of determining the root path](image)

Note: When the current root bridge goes down, the MAC address in the bridge identifier alone determines which bridge becomes the new root bridge, because the Administrator does not change the default values for the priorities of the bridges in the bridge identifier, apart from the value for the root bridge.
Example of manipulating the root path

You can use the network plan (see figure 56) to follow the flow chart (see figure 54) for determining the root path. The Administrator has performed the following:

- Left the default value of 32768 (8000H) for every bridge apart from bridge 1 and bridge 5, and
- assigned to bridge 1 the value 16384 (4000H), thus making it the root bridge.
- To bridge 5 he assigned the value 28672 (7000H).

The protocol blocks the path between bridge 2 and bridge 3 as a connection from bridge 3 via bridge 2 to the root bridge would mean higher path costs.

The path from bridge 6 to the root bridge is interesting:
- The bridges select the path via bridge 5 because the value 28672 for the priority in the bridge identifier is smaller than value 32768.

The Management Administrator soon discovers that this configuration with bridge 1 as the root bridge is invalid. On the paths from bridge 1 to bridge 2 and bridge 1 to bridge 3, the control packets which the root bridge sends to every other bridge add up.
When the Management Administrator configures bridge 2 as the root bridge, the burden of the control packets on the subnetworks is distributed much more evenly. The result is the configuration shown here (see figure 57). The path costs for most of the bridges to the root bridge have decreased.

**Figure 57:** Example of manipulating the tree structure
12.8 The Rapid Spanning Tree Protocol

The RSTP uses the same algorithm for determining the tree structure as STP. When a link or bridge becomes inoperable, RSTP merely changes parameters, and adds new parameters and mechanisms that speed up the reconfiguration.

The ports play a significant role in this context.

12.8.1 Port roles

RSTP assigns each bridge port one of the following roles (see figure 58):

- **Root Port:**
  This is the port at which a bridge receives data packets with the lowest path costs from the root bridge.
  When there are multiple ports with equally low path costs, the bridge ID of the bridge that leads to the root (designated bridge) decides which of its ports is given the role of the root port by the bridge further away from the root.
  When a bridge has multiple ports with equally low path costs to the same bridge, the bridge uses the port ID of the bridge leading to the root (designated bridge) to decide which port it selects locally as the root port (see figure 54).
  The root bridge itself does not have a root port.

- **Designated port:**
  The bridge in a network segment that has the lowest root path costs is the designated bridge.
  When more than 1 bridge has the same root path costs, the bridge with the smallest value bridge identifier becomes the designated bridge. The designated port on this bridge is the port that connects a network segment leading away from the root bridge. When a bridge is connected to a network segment with more than one port (via a hub, for example), the bridge gives the role of the designated port to the port with the better port ID.

- **Edge port:**
  Every network segment with no additional RSTP bridges is connected with exactly one designated port. In this case, this designated port is also an edge port. The distinction of an edge port is the fact that it does not receive any RST BPDUs (Rapid Spanning Tree Bridge Protocol Data Units).

- **Alternate port:**
  When the connection to the root bridge is lost, this blocked port takes over the task of the root port. The alternate port provides a backup for the connection to the root bridge.
12.8.2 Port states

Depending on the tree structure and the state of the selected connection paths, the RSTP assigns the ports their states.

Table 31: Relationship between port state values for STP and RSTP

<table>

</tbody>
</table>

1. The dot1d-MIB displays “Disabled”
2. The dot1d-MIB displays “Blocked”

Meaning of the RSTP port states:

- Disabled: Port does not belong to the active topology
- Discarding: No address learning in FDB, no data traffic except for STP-BPDUs
12.8 The Rapid Spanning Tree Protocol

Learning: Address learning active (FDB), no data traffic apart from STP-BPDUs
Forwarding: Address learning active (FDB), sending and receiving of every packet type (not only STP-BPDUs)

12.8.3 Spanning Tree Priority Vector

To assign roles to the ports, the RSTP bridges exchange configuration information with each other. This information is known as the Spanning Tree Priority Vector. It is part of the RSTP BPDUs and contains the following information:

- Bridge identification of the root bridge
- Root path costs of the sending bridge
- Bridge identification of the sending bridge
- Port identifiers of the ports through which the message was sent
- Port identifiers of the ports through which the message was received

Based on this information, the bridges participating in RSTP are able to determine port roles themselves and define the port states of their own ports.

12.8.4 Fast reconfiguration

Why can RSTP react faster than STP to an interruption of the root path?

- Introduction of edge-ports:
  During a reconfiguration, RSTP sets an edge port into the transmission mode after 3 seconds (default setting). To ascertain that no bridge sending BPDUs is connected, RSTP waits for the “Hello Time” to elapse.
  When the user verifies that an end device is and remains connected to this port, there are no waiting times at this port in the case of a reconfiguration.

- Introduction of alternate ports:
  As the port roles are already distributed in normal operation, a bridge can immediately switch from the root port to the alternate port after the connection to the root bridge is lost.

- Communication with neighboring bridges (point-to-point connections):
  Decentralized, direct communication between neighboring bridges enables reaction without wait periods to status changes in the spanning tree topology.

- Address table:
  With STP, the age of the entries in the FDB determines the updating of communication. RSTP immediately deletes the entries in those ports affected by a reconfiguration.

- Reaction to events:
  Without having to adhere to any time specifications, RSTP immediately reacts to events such as connection interruptions, connection reinstatements, etc.

Note: Data packages could be duplicated and/or arrive at the recipient in the wrong order during the reconfiguration phase of the RSTP topology. You may also use the Spanning Tree Protocol or select another redundancy procedure described in this manual.

12.8.5 STP compatibility mode

The STP compatibility mode lets you operate RSTP devices in networks with old installations. If an RSTP device detects an older STP device, then it switches on the STP compatibility mode on the relevant port.
12.8.6 Configuring the device

RSTP configures the network topology completely independently. The device with the lowest bridge priority automatically becomes the root bridge. However, to define a specific network structure regardless, you specify a device as the root bridge. In general, a device in the backbone takes on this role.

- Set up the network to meet your requirements, initially without redundant lines.
- You deactivate the flow control on the participating ports.
  If the flow control and the redundancy function are active at the same time, it is possible that the redundancy function operates differently than intended. (Default setting: flow control deactivated globally and activated on every port.)
- Disable MRP on every device.
- Enable Spanning Tree on every device in the network.
  In the state on delivery, Spanning Tree is switched on in the device.

1. Open the Switching > L2-Redundancy > Spanning Tree > Global dialog.
2. Enable the function.
3. To save the changes temporarily, click the button.

```
enable
configure
spanning-tree operation
show spanning-tree global
```

4. Now connect the redundant lines.
5. Define the settings for the device that takes over the role of the root bridge.

- In the Priority field you enter a numerically lower value.
  The bridge with the numerically lowest bridge ID has the highest priority and becomes the root bridge of the network.
- To save the changes temporarily, click the button.

```
spanning-tree mst priority 0 <0..61440
```

After saving, the dialog shows the following information:

- The Bridge is root checkbox is marked.
- The Root port field shows the value 0.0.
- The Root path cost field shows the value 0.

```
show spanning-tree global
```

6. If applicable, then change the values in the Forward delay [s] and Max age fields.
   - The root bridge transmits the changed values to the other devices.
7. To save the changes temporarily, click the button.
Redundancy
12.8 The Rapid Spanning Tree Protocol

spanning-tree forward-time <4..30> Specifies the delay time for the status change in seconds.
spanning-tree max-age <6..40> Specifies the maximum permissible branch length, for example the number of devices to the root bridge.
show spanning-tree global Displays the parameters for checking.

Note: The parameters Forward delay [s] and Max age have the following relationship:

Forward delay [s] ≥ (Max age/2) + 1

If you enter values in the fields that contradict this relationship, then the device replaces these values with the last valid values or with the default value.

Note: When possible, do not change the value in the “Hello Time” field.

☐ Check the following values in the other devices:
  – Bridge ID (bridge priority and MAC address) of the corresponding device and the root bridge.
  – Number of the device port that leads to the root bridge.
  – Path cost from the root port of the device to the root bridge.

show spanning-tree global Displays the parameters for checking.
The device lets you activate various protection functions (guards) in the device ports.

The following protection functions help protect your network from incorrect configurations, loops and attacks with STP-BPDUs:

- **BPDU Guard** – for manually specified edge ports (end device ports)
  You activate this protection function globally in the device.

  Terminal device ports do not normally receive any STP-BPDUs. If an attacker still attempts to feed in STP-BPDUs on this port, then the device deactivates the device port.

- **Root Guard** – for designated ports
  You activate this protection function separately for every device port.

  When a designated port receives an STP-BPDU with better path information to the root bridge, the device discards the STP-BPDU and sets the transmission state of the port to **discarding** instead of **root**.

  When there are no STP-BPDUs with better path information to the root bridge, after $2 \times \text{Hello time [s]}$ the device resets the state of the port to a value according to the port role.
TCN Guard – for ports that receive STP-BPDUs with a Topology Change flag
You activate this protection function separately for every device port.

If the protection function is activated, then the device ignores Topology Change flags in received STP-BPDUs. This does not change the content of the address table (FDB) of the device port. However, additional information in the BPDU that changes the topology is processed by the device.

Loop Guard – for root, alternate and backup ports
You activate this protection function separately for every device port.

If the port does not receive any more STP-BPDUs, then this protection function helps prevent the transmission status of a port from unintentionally being changed to forwarding. If this situation occurs, then the device designates the loop status of the port as inconsistent, but does not forward any data packets.

Activating the BPDU Guard

- Open the Switching > L2-Redundancy > Spanning Tree > Global dialog.
- Mark the BPDU guard checkbox.
- To save the changes temporarily, click the button.
- Change to the Privileged EXEC mode.
- Change to the Configuration mode.
- Activates the BPDU Guard.
- Displays the parameters for checking.
When an edge port receives an STP-BPDU, the device behaves as follows:

- The device deactivates this port.
- The device designates the port.

To reset the status of the device port to the value forwarding, you proceed as follows:

- When the port still receives BPDUs:
  - Remove the manual definition as an edge port (end device port).
  - Deactivate the BPDU Guard.
- Activate the device port again.

**CLI Commands**

- `interface <x/y>`: Change to the interface configuration mode of interface `<x/y>`.
- `spanning-tree edge-port`: Designates the port as a terminal device port (edge port).
- `show spanning-tree port x/y`: Displays the parameters for checking.
- `exit`: Leaves the interface mode.

In the Switching > L2-Redundancy > Spanning Tree > Port dialog, Guards tab, the checkbox in the BPDU guard effect column is marked.

- `show spanning-tree port x/y`: Displays the parameters of the port for checking.
  - The value of the BPDU guard effect parameter is enabled.
Activating Root Guard / TCN Guard / Loop Guard

- Open the Switching > L2-Redundancy > Spanning Tree > Port dialog.
- Switch to the Guards tab.
- For designated ports, select the checkbox in the Root guard column.
- For ports that receive STP-BPDUs with a Topology Change flag, select the checkbox in the TCN guard column.
- For root, alternate or backup ports, mark the checkbox in the Loop guard column.

**Note:** The Root guard and Loop guard functions are mutually exclusive. If you try to activate the Root guard function while the Loop guard function is active, then the device deactivates the Loop guard function.

- To save the changes temporarily, click the button.

```plaintext
enable
configure
interface <x/y>
spanning-tree guard-root
spanning-tree guard-tcn
spanning-tree guard-loop
exit
show spanning-tree port x/y
```

12.8.8 Ring only mode

You use the Ring only mode function to recognize full-duplex connectivity and to configure the ports that are connected to the end stations. The Ring only mode function lets the device transition to the ‘forwarding’ state, and suppress the Topology Change Notification PDUs.

Configuring the Ring only mode

When you activate the Ring only mode function on the ports, and the device ignores the message age of normal BDPUs, the device sends Topology Change messages with the message age of 1.
Example
The given example describes the configuration of the *Ring only mode* function.

- Open the *Switching > L2-Redundancy > Spanning Tree > Global* dialog.
- In the *Ring only mode* frame, select the port 1/1 in the *First port* field.
- In the *Ring only mode* frame, select the port 1/2 in the *Second port* field.
- To activate the function, in the *Ring only mode* frame, mark the *Active* checkbox.
- To save the changes temporarily, click the ☑ button.

```plaintext
enable
configure
spanning-tree ring-only-mode operation
spanning-tree ring-only-mode first-port 1/1
spanning-tree ring-only-mode second-port 1/2
```

12.8.9 RSTP over HSR
The RSTP over HSR function lets you redundantly couple an RSTP network to an HSR ring.

By doing this:
- The device uses the logical port `hsr/1`.
- When the logical port `hsr/1` changes from the RSTP state to ‘forwarding’, the device flushes the Proxy Node Table.

Configuring RSTP over HSR
HSR limits the bandwidth. In case of redundancy, RSTP is configured in a way that the traffic is forwarded over the HSR ring only.

Example
You use the RSTP over HSR function to redundantly couple an RSTP network to an HSR ring.

- Open the *Switching > L2-Redundancy > Spanning Tree > Port* dialog.
- In the *Port priority* column, specify the value 240 for port `hsr/1`.
- In the *Port path cost* column, specify the value 200000000 for port `hsr/1`.
- Enable the *Spanning Tree* function on port `hsr/1`. In the *STP active* column, mark the checkbox for port `hsr/1`.
12.9 **Link Aggregation**

Link Aggregation using the single switch method helps you overcome 2 limitations with ethernet links, namely bandwidth, and redundancy.

The Link Aggregation Group (LAG) function helps you overcome bandwidth limitations of individual ports. LAG lets you combine 2 or more links in parallel, creating 1 logical link between 2 devices. The parallel links increase the bandwidth for traffic between the 2 devices.

You typically use Link Aggregation on the network backbone. The function provides you an inexpensive way to incrementally increase bandwidth.

Furthermore, Link Aggregation provides for redundancy with a seamless failover. When a link goes down, with 2 or more links configured in parallel, the other links in the group continue to forward traffic.

The device uses a hash option to determine load balancing across the port group. Tagging the egress traffic lets the device transmit associated packets across the same link.

The default settings for a new Link Aggregation instance are as follows:
- In the **Configuration** frame, the value in the **Hashing option** field is `sourceDestMacVlan`.
- In the **Active** column, the checkbox is marked.
- In the **Send trap (Link up/down)** column, the checkbox is marked.
- In the **Static link aggregation** column, the checkbox is unmarked.
- In the **Hashing option** column, the value is `sourceDestMacVlan`.
- In the **Active ports (min.)** column, the value is 1.

12.9.1 **Methods of Operation**

The device operates on the Single Switch method. The Single Switch method provides you an inexpensive way to grow your network. The single switch method states that you need 1 device on each side of a link to provide the physical ports. The device balances the traffic load across the group member ports.

The device also uses the Same Link Speed method in which the group member ports are full-duplex, point-to-point links having the same transmission rate. The first port the user adds to the group is the master port and determines the bandwidth for the other member ports of the Link Aggregation Group.

The device lets you set up up to 4 Link Aggregation groups. The number of useable ports per Link Aggregation group depends on the device.

**Hash Algorithm**

The frame distributor is responsible for receiving frames from the end devices and transmitting them over the Link Aggregation Group. The frame distributor implements a distribution algorithm responsible for choosing the link used for transmitting any given packet. The hash option helps you achieve load balancing across the group.

The following list contains options which you set for link selection.
- Source MAC address, VLAN ID, EtherType, and receiving port
- Destination MAC address, VLAN ID, EtherType, and receiving port
Redundancy
12.9 Link Aggregation

- Source/Destination MAC address, VLAN ID, EtherType, and receiving port
- Source IP address and Source TCP/UDP port
- Destination IP address and destination TCP/UDP port
- Source/destination IP address and source/destination TCP/UDP port

Static and Dynamic Links

The device lets you set up static and dynamic links.
- Static Links - The administrator sets up and maintains the links manually. For example, when a link fails and there is a media converter between the devices, the media converter continues forwarding traffic on the link causing the link to fail. Another possibility is that cabling or an undetected configuration mistake causes undesirable network behavior. In this case, the network administrator manually changes the link setup to restore traffic.
- Dynamic Links - The device confirms that the setup on the remote device is able to handle link aggregation and failover occurs automatically.

12.9.2 Link Aggregation Example

Connect multiple workstations using one aggregated link group between Switch 1 and 2. By aggregating multiple links, higher speeds are achievable without a hardware upgrade.

Figure 59: Link Aggregation Switch to Switch Network

Use the following steps to setup Switch 1 and 2 in the Graphical User Interface.

- Open the Switching > L2-Redundancy > Link Aggregation dialog.
- Click the button. The dialog displays the Create window.
- In the Trunk port drop-down list, select the instance number of the link aggregation group.
- In the Port drop-down list, select the port 1/1.
- Click the Ok button.
- Repeat the preceding steps and select the port 1/2.
- Click the Ok button.
- To save the changes temporarily, click the button.

```
enable
configure
link-aggregation add lag/1
link-aggregation modify lag/1 addport 1/1
link-aggregation modify lag/1 addport 1/2
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a Link Aggregation Group lag/1.
Adds port 1/1 to the Link Aggregation Group.
Adds port 1/2 to the Link Aggregation Group.
12.10 Link Backup

Link Backup provides a redundant link for traffic on Layer 2 devices. When the device detects an error on the primary link, the device transfers traffic to the backup link. You typically use Link Backup in service-provider or enterprise networks.

You set up the backup links in pairs, one as a primary and one as a backup. When providing redundancy for enterprise networks for example, the device lets you set up more than 1 pair. The maximum number of link backup pairs is: total number of physical ports / 2. Furthermore, when the state of a port participating in a link backup pair changes, the device sends an SNMP trap.

When configuring link backup pairs, remember the following rules:
- A link pair consists of any combination of physical ports. For example, 1 port is a 100 Mbit port and the other is a 1000 Mbit SFP port.
- A specific port is a member of 1 link backup pair at any given time.
- Verify that the ports of a link backup pair are members of the same VLAN with the same VLAN ID. When the primary port or backup port is a member of a VLAN, assign the second port of the pair to the same VLAN.

The default setting for this function is inactive without any link backup pairs.

Note: Verify that the Spanning Tree Protocol is disabled on the Link Backup ports.

12.10.1 Fail Back Description

Link Backup also lets you set up a Fail Back option. When you activate the fail back function and the primary link returns to normal operation, the device first blocks traffic on the backup port and then forwards traffic on the primary port. This process helps protect the device from causing loops in the network.

When the primary port returns to the link up and active state, the device supports 2 modes of operation:
- When you inactivate Fail back, the primary port remains in the blocking state until the backup link fails.
- When you activate Fail back, and after the Fail back delay [s] timer expires, the primary port returns to the forwarding state and the backup port changes to down.

In the cases listed above, the port forcing its link to forward traffic, first sends a "flush FDB" packet to the remote device. The flush packet helps the remote device quickly relearn the MAC addresses.

12.10.2 Example Configuration

In the example network below, you connect ports 2/3 and 2/4 on Switch A to the uplink Switches B and C. When you set up the ports as a Link Backup pair, 1 of the ports forwards traffic and the other port is in the blocking mode.

The primary, port 2/3 on Switch A, is the active port and is forwarding traffic to port 1 on Switch B. Port 2/4 on Switch A is the backup port and is blocking traffic.

When Switch A disables port 2/3 because of a detected error, port 2/4 on Switch A starts forwarding traffic to port 2 on Switch C.
When port 2/3 returns to the active state, “no shutdown”, with Fail back activated, and Fail back delay [s] set to 30 seconds. After the timer expires, port 2/4 first blocks the traffic and then port 2/3 starts forwarding the traffic.

![Diagram of Link Backup example network](image)

Figure 60: Link Backup example network

The following tables contain examples of parameters for Switch A set up.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Configure</th>
<th>Interface 2/3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link-backup add 2/4</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Link-backup modify 2/4 description Link_Backup_1 |
| Link-backup modify 2/4 failback-status enable |
| Link-backup modify 2/4 failback-time 30 |
| Link-backup modify 2/4 status enable exit |
| Link-backup operation enable |

Change to the Privileged EXEC mode. Change to the Configuration mode.

Change to the interface configuration mode of interface 2/3.

Creates a Link Backup instance where port 2/3 is the primary port and port 2/4 is the backup port.

Specifies the string Link_Backup_1 as the name of the backup pair.

Enable the fail back timer.

Specify the fail back delay time as 30 s. Enable the Link Backup instance.

Change to the Configuration mode. Enable the Link Backup function globally in the device.
The **FuseNet** protocols let you couple rings that are operating with one of the following redundancy protocols:

- MRP
- Fast MRP (depends on hardware)
- HIPER ring
- DLR (depends on hardware)
- RSTP

**Note:** When you use the *Ring/Network Coupling* protocol to couple a network to the main ring, verify that the networks contain only Hirschmann devices.

Use the following table to select the *FuseNet* coupling protocol to be used in your network:

<table>
<thead>
<tr>
<th>Main Ring</th>
<th>Connected Network</th>
<th>RSTP</th>
<th>HIPER ring</th>
<th>Fast MRP</th>
<th>DLR</th>
</tr>
</thead>
<tbody>
<tr>
<td>MRP</td>
<td>Sub Ring&lt;sup&gt;1)&lt;/sup&gt;</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
</tr>
<tr>
<td>Fast MRP&lt;sup&gt;2)&lt;/sup&gt;</td>
<td>Sub Ring&lt;sup&gt;1)&lt;/sup&gt;</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Ring/Network Coupling</td>
<td>Ring/Network Coupling</td>
</tr>
<tr>
<td>HIPER ring</td>
<td>Sub Ring</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>

<tr>
<td>DLR&lt;sup&gt;2)&lt;/sup&gt;</td>
<td>Sub Ring</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>Redundant Coupling Protocol Ring/Network Coupling</td>
<td>–</td>
<td>–</td>
</tr>
</tbody>
</table>

**Explanation:**

- no suitable coupling protocol
- with MRP configured on different VLANs
- depending on the device configuration
12.12 Subring

The Sub Ring function is an extension of the Media Redundancy Protocol (MRP). This function lets you couple a subring to a main ring using various network structures.

The Subring protocol provides redundancy for devices by coupling both ends of an otherwise flat network to a main ring.

Setting up subrings has the following advantages:
- Through the coupling process, you include the new network segment in the redundancy concept.
- Subrings allow easy integration of new areas into existing networks.
- Subrings allow you easy mapping of the organizational structure of an area in a network topology.
- In an MRP ring, the failover times of the subring in redundancy cases are typically < 100 ms.

12.12.1 Subring description

The subring concept lets you couple new network segments to suitable devices in an existing ring (main ring). The devices with which you couple the subring to the main ring are Subring Managers (SRM).

The Subring Manager capable devices support up to 8 instances and thus manages up to 8 subrings at the same time.

The Sub Ring function lets you integrate devices that support MRP as participants. The devices with which you couple the subring to the main ring require the Sub Ring Manager function.

Each subring can consist of up to 200 participants, excluding the Subring Managers themselves and the devices between the Subring Managers in the main ring.
The following figures display examples of possible subring topologies:

Figure 62: Example of an overlapping subring structure

Figure 63: Special case: A Subring Manager manages 2 subrings (2 instances). The Subring Manager is capable of managing up to 8 instances.

Figure 64: Special case: a Subring Manager manages both ends of a subring on different ports (Single Subring Manager).

Note: In the previous examples, the Subring Managers only couple subrings to existing main rings. The Sub Ring function prohibits cascaded subrings, for example coupling a new subring to another existing subring.
If you use MRP for the main ring and the subring, then specify the VLAN settings as follows:

- VLAN X for the main ring
  - on the ring ports of the main ring participants
  - on the main ring ports of the Subring Manager
- VLAN Y for the Subring
  - on the ring ports of the Subring participants
  - on the subring ports of the Subring Manager

You can use the same VLAN for multiple subrings.

### 12.12.2 Subring example

In the following example, you couple a new network segment with 3 devices to an existing main ring which uses the MRP protocol. When you couple the network at both ends instead of 1 end, the subring provides increased availability with the corresponding configuration.

You couple the new network segment as a subring. You couple the subring to the existing devices of the main ring using the following configuration types.

![Figure 65: Example of a subring structure](image)

- orange line= Main ring members in VLAN 1
- black line= Subring members in VLAN 2
- orange dash line= Main ring loop open
- black dash line= Subring loop open
- red line = Redundant link member in VLAN 1
- SRM = Subring Manager
- RM = Ring Manager

Proceed as follows to configure a subring:

- Configure the three devices of the new network segment as participants in an MRP ring:
  - Configure the transmission rate and the duplex mode for the ring ports in accordance with the following table:

<table>
<thead>
<tr>
<th>Port type</th>
<th>Bit rate</th>
<th>Autonegotiation (automatic configuration)</th>
<th>Port setting</th>
<th>Duplex</th>
</tr>
</thead>
<tbody>
<tr>
<td>TX</td>
<td>100 Mbit/s</td>
<td>off</td>
<td>on</td>
<td>100 Mbit/s full duplex (FDX)</td>
</tr>
<tr>
<td>TX</td>
<td>1 Gbit/s</td>
<td>on</td>
<td>on</td>
<td>-</td>
</tr>
<tr>
<td>Optical</td>
<td>100 Mbit/s</td>
<td>off</td>
<td>on</td>
<td>100 Mbit/s full duplex (FDX)</td>
</tr>
<tr>
<td>Optical</td>
<td>1 Gbit/s</td>
<td>on</td>
<td>on</td>
<td>-</td>
</tr>
<tr>
<td>Optical</td>
<td>10 Gbit/s</td>
<td>-</td>
<td>on</td>
<td>10 Gbit/s full duplex (FDX)</td>
</tr>
</tbody>
</table>
The following steps contain additional settings for subring configuration:

- To help prevent loops during configuration, deactivate the Subring Manager function on the main ring and subring devices. After you completely configure every device participating in the main ring and subrings activate the global Sub Ring function and Subring Managers.
- Disable the RSTP function on the MRP ring ports used in the subring.
- Verify that the Link Aggregation function is inactive on ports participating in the main ring and subring.
- Specify a different VLAN membership for the main ring ports and subring ports although the main ring is using the MRP protocol. For example, use VLAN ID 1 for the main ring and the redundant link, then use VLAN ID 2 for the subring.
  - For the devices participating in the main ring for example, open the Switching > VLAN > Configuration dialog. Create VLAN 1 in the static VLAN table. Tag the main ring ports for membership in VLAN 1 by selecting T from the drop-down list of the appropriate port columns.
  - For the devices participating in the subring use the step above and add the ports to VLAN 2 in the static VLAN table.
- Activate the MRP function for the main ring and subring devices.
  - In the Switching > L2-Redundancy > MRP dialog, configure the 2 ring ports participating in the main ring on the main ring devices.
  - For the devices participating in the subring use the step above and configure the 2 ring ports participating in the subring on the subring devices.
  - Assign the same MRP domain ID to the main ring and subring devices. When you only use Hirschmann devices, the default values suffice for the MRP domain ID.

Note: The MRP domain is a sequence of 16 numbers in the range from 0 to 255. The default value is 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . 255 . A MRP domain consisting entirely of zeroes is invalid.

The Sub Ring dialog lets you change the MRP domain ID. Otherwise open the Command Line Interface and proceed as follows:

```plaintext
enable
configure
mrp domain delete
mrp domain add domain-id 0.0.1.2.3.4.111.222.123.0.0.66.99
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Deletes the current MRP domain.
Creates a new MRP domain with the specified MRP domain ID. Any subsequent MRP domain changes apply to this domain ID.

### 12.12.3 Subring example configuration

Note: Help avoid loops during configuration. Configure every device of the subring individually. Before you activate the redundant link, completely configure every subring device.

Proceed as follows to configure the 2 Subring Managers in the example:

- Open the Switching > L2-Redundancy > Sub Ring dialog.
- To add a table entry, click the button.
- In the Port column, select the port that couples the device to the subring.
  Use port 1/3 for this example.
  For coupling, use one of the available ports with the exception of the ports which are already connected to the main ring.
In the **Name** column, assign a name to the subring. For this example enter Test.

In the **SRM mode** column, select Subring Manager mode. You thus specify which port for coupling the subring to the main ring becomes the redundant manager.

The options for the coupling are:

- **manager**
  - When you specify both Subring Managers with the same value, the device with the higher MAC address manages the redundant link.
- **redundant manager**
  - This device manages the redundant link, as long as you have specified the other Subring Manager as a manager. Otherwise the device with the higher MAC address manages the redundant link.

Specify Subring Manager 1 as **manager**, in accordance with the figure depicting this example.

Leave the values in the **VLAN** column and **MRP domain** column unchanged. The default values are correct for the example configuration.

To save the changes temporarily, click the **✓** button.

---

**enable**

**configure**

**sub-ring add 1**

**sub-ring modify 1 port 1/3**

**sub-ring modify 1 name Test**

**sub-ring modify 1 mode manager**

**show sub-ring ring**

**show sub-ring global**

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Creates a new subring with the subring ID 1.

Specify port 1/3 as subring port.

Assign the name Test to the subring 1.

Assign the manager mode to the subring 1.

Display the subrings state on this device.

Display the subring global state on this device.

---

Configure the 2nd Subring Manager in the same way.

Specify Subring Manager 2 as **redundant manager**, in accordance with the figure depicting this example.

To activate the Subring Manager function, mark the **Active** checkbox in the appropriate row.

After you have configured both Subring Managers and the devices participating in the subring, enable the function and close the redundant link.

To save the changes temporarily, click the **✓** button.

**enable**

**configure**

**sub-ring enable 1**

**sub-ring enable 2**

**exit**

**show sub-ring ring <Domain ID>**

**show sub-ring global**

**copy config running-config nvm profile Test**

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Activate subring 1.

Activate subring 2.

Change to the Privileged EXEC mode.

Display the settings of the selected subrings.

Display global subring settings.

Save the current settings in the configuration profile named Test in non-volatile memory (nvm).
12.13 **Subring with LAG**

When at least two parallel redundant connecting lines exist (known as a trunk) between two devices, and these lines are combined into one logical connection, this is a Link Aggregation (LAG) connection.

The device lets you use the LAG ports as ring ports with the *Sub Ring* protocol.

12.13.1 **Example**

The following example is a simple setup between an MRP ring and a Subring.

![Figure 66: Subring with Link Aggregation](image)

The following table describes the device roles as seen in the figure above. The table provides information of how you use the ring ports and Subring ports as LAG ports.

<table>
<thead>
<tr>
<th>Device Name</th>
<th>Ring Port</th>
<th>Main Ring Role</th>
<th>Sub Ring Role</th>
<th>Subring Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>MRC1</td>
<td>1/3, 1/4</td>
<td>MRP client</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>SRM1</td>
<td>1/3, 1/4</td>
<td>MRP client</td>
<td>Redundant Manager</td>
<td>lag/1</td>
</tr>
<tr>
<td>SRM2</td>
<td>2/4, 2/5</td>
<td>MRP manager</td>
<td>Manager</td>
<td>lag/1</td>
</tr>
<tr>
<td>MRC2</td>
<td>lag/1, 1/3</td>
<td>-</td>
<td>MRP client</td>
<td>-</td>
</tr>
<tr>
<td>MRC3</td>
<td>lag/1, 1/3</td>
<td>-</td>
<td>MRP client</td>
<td>-</td>
</tr>
</tbody>
</table>

**MRP ring configuration**

The devices participating in the Main ring are members of VLAN 300.
Redundancy
12.13 Subring with LAG

**SRM2**

```plaintext
enable
configure
mrp domain add default-domain
mrp domain modify port primary 2/4
mrp domain modify port secondary 2/5
mrp domain modify mode manager
mrp domain modify operation enable
mrp domain modify vlan 300
mrp operation
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a new MRP domain with the ID `default-domain`.
Specifies port 2/4 as ring port 1.
Specifies port 2/5 as ring port 2.
Specifies that the device operates as the `Ring manager`. Do not activate the `Ring manager` function on any other device.
Activates the MRP-Ring.
Specifies the VLAN ID as 300.
Enable the MRP function in the device.

**MRC1, SRM1**

```plaintext
enable
configure
mrp domain add default-domain
mrp domain modify port primary 1/3
mrp domain modify port secondary 1/4
mrp domain modify mode client
mrp domain modify operation enable
mrp domain modify vlan 300
mrp operation
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a new MRP domain with the ID `default-domain`.
Specifies port 1/3 as ring port 1.
Specifies port 1/4 as ring port 2.
Specifies the device role as ring client.
Activates the MRP-Ring.
Specifies the VLAN ID as 300.
Enable the MRP function in the device.

**Subring configuration**

The devices participating in the attached Sub-ring are members of VLAN 200.

**SRM1**

```plaintext
enable
configure
link-aggregation add lag/1
link-aggregation modify lag/1 addport 1/1
link-aggregation modify lag/1 addport 1/2
link-aggregation modify lag/1 adminmode
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a Link Aggregation Group `lag/1`.
Adds port 1/1 to the Link Aggregation Group.
Adds port 1/2 to the Link Aggregation Group.
Activate the Link Aggregation Group.

```plaintext
enable
configure
sub-ring add 1
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a new subring with the subring ID 1.
Assign the name **SRM1** to the subring 1.
Assign the device the role of **Sub-ring redundant manager** in subring 1. If the subring is closed, then the device blocks the ring port. VLAN 200 is the set for the VLAN ID of the domain. The lag/1 port is set as a member in VLAN 200.
Activate subring 1.
Enable the global Subring Manager functionality on this device.

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a Link Aggregation Group lag/1.
Adds port 2/7 to the Link Aggregation Group.
Adds port 2/8 to the Link Aggregation Group.
Activate the Link Aggregation Group.

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a new subring with the subring ID 1.
Assign the device the role of **Subring manager** in subring 1. VLAN 200 is the set for the VLAN ID of the domain. The lag/1 port is set as a member in VLAN 200.
Assign the name **SRM2** to the subring 1.
Activate subring 1.
Enable the global Subring Manager functionality on this device.

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creates a new MRP domain with the ID default-domain.
Specifies port lag/1 as ring port 1.
Specifies port 1/3 as ring port 2.
Specifies the device role as ring client.
Activates the MRP-Ring.
Specifies the VLAN ID as 200.
Enable the **MRP** function in the device.
Disable STP

Disable the *Spanning Tree* function on every port that you specified as an MRP or Sub-ring port. In the following steps, port 1/3 is used as an example.

```
enable
configure
interface 1/3
no spanning-tree operation
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 1/3.
Disable the option.
12.14 **Ring/Network Coupling**

Based on a ring, the *Ring/Network Coupling* function couples rings or network segments redundantly. *Ring/Network Coupling* connects 2 rings/network segments through 2 separate paths.

When the devices in the coupled network are Hirschmann devices, the *Ring/Network Coupling* function supports the coupling following ring protocols in the primary and secondary rings:

- HIPER-Ring
- Fast HIPER-Ring
- MRP

The *Ring/Network Coupling* function can also couple network segments of a bus and mesh structures.

12.14.1 **Methods of Ring/Network Coupling**

**The One-Switch coupling**

Two ports of **one** device in the first ring/network connect to one port each of **two** devices in the second ring/network (see figure 67). In the One-Switch coupling method, the main line forwards data and the device blocks the redundant line.

When the main line no longer functions, the device immediately unblocks the redundant line. When the main line is restored, the device blocks data on the redundant line. The main line forwards data again.

The ring coupling detects and handles an error within 500 ms (typically 150 ms).

**The Two-Switch coupling**

One port each from **two** devices in the first ring/network connect to one port each of **two** devices in the second ring/network segment (see figure 69).

The device in the redundant line and the device in the main line use control packets to inform each other about their operating states, using the Ethernet or a control line.

When the main line no longer functions, the redundant device (Stand-by) immediately unblocks the redundant line. As soon as the main line is restored, the device on the main line informs the redundant device of this. The Stand-by device blocks data on the redundant line. The main line forwards data again.

The ring coupling detects and handles an error within 500 ms (typically 150 ms).
The type of coupling configuration is primarily determined by the network topological and the desired level of availability (see table 34).

Table 34: Selection criteria for the configuration types for redundant coupling

<table>
<thead>
<tr>
<th></th>
<th>One-Switch coupling</th>
<th>Two-Switch coupling</th>
<th>Two-Switch coupling with Control line</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Application</strong></td>
<td>The 2 devices are in impractical topological positions. Therefore, putting a link between them would involve a lot of effort for two-Switch coupling.</td>
<td>The 2 devices are in practical topological positions. Installing a control line would involve a lot of effort.</td>
<td>The 2 devices are in practical topological positions. Installing a control line would not involve much effort.</td>
</tr>
<tr>
<td><strong>Disadvantage</strong></td>
<td>If the Switch configured for the redundant coupling becomes inoperable, then no connection remains between the networks.</td>
<td>More effort for connecting the 2 devices to the network (compared with one-Switch coupling).</td>
<td>More effort for connecting the two devices to the network (compared with one-Switch and two-Switch coupling).</td>
</tr>
<tr>
<td><strong>Advantage</strong></td>
<td>Less effort involved in connecting the 2 devices to the network (compared with two-Switch coupling).</td>
<td>When one of the devices configured for the redundant coupling becomes inoperable, the coupled networks are still connected.</td>
<td>When one of the devices configured for the redundant coupling becomes inoperable, the coupled networks are still connected. The partner determination between the coupling devices occurs more secure and faster than without the control line.</td>
</tr>
</tbody>
</table>

12.14.2 Prepare the Ring/Network Coupling

Using the images in the dialog you define the role of the devices within the Ring/Network Coupling.

In the following screen shots and diagrams, the following conventions are used:
- Blue boxes and lines indicate devices or connections of the items currently being described.
- Solid lines indicate a main connection.
- Dash lines indicate a stand-by connection.
- Dotted lines indicate the control line.

- Open the Switching > L2-Redundancy > Ring/Network Coupling dialog.
- In the Mode frame, Type option list, select the required radio button.
- one-switch coupling
- two-switch coupling, master
- two-switch coupling, slave
- two-switch coupling with control line, master
- two-switch coupling with control line, slave

Note: Refrain from combining the Rapid Spanning Tree Protocol and Ring/Network Coupling.
One-Switch coupling

Figure 67: Example of One-Switch coupling
1: Ring
2: Backbone
3: Partner coupling port
4: Coupling port
5: Main line
6: Redundant line

The main line, indicated by the solid blue line, which is connected to the partner coupling port provides coupling between the two networks in the normal mode of operation. If the main line is inoperable, then the redundant line, indicated by the dashed blue line, which is connected to the coupling port takes over the ring/network coupling. One switch performs the coupling switch-over.

The following settings apply to the device displayed in blue in the selected graphic.

Perform the following steps:

- Open the Switching > L2-Redundancy > Ring/Network Coupling dialog.
- In the Mode frame, Type option list, select the one-switch coupling radio button.

Note: Configure the Partner coupling port and the ring ports on different ports.
Perform the following steps for the coupling ports:

**Note:** The following settings are required for the coupling ports.

- Open the **Basic Settings > Port** dialog, **Configuration** tab.
- For the ports selected as the coupling ports, specify the settings according to the parameters in the following table.
- To save the changes temporarily, click the ✓ button.

**Table 35: Port settings for ring ports**

</tbody>
</table>

If you have configured VLANs on the coupling ports, then perform the following steps to specify the VLAN settings on the coupling and partner coupling ports:

- Open the **Switching > VLAN > Port** dialog.
- Change the **Port-VLAN ID** setting to the value of the VLAN ID configured on the ports.
- Unmark the **Ingress filtering** checkbox for both coupling ports.
- Open the **Switching > VLAN > Configuration** dialog.
- To tag the redundant connections for VLAN 1 and VLAN Membership, enter the value T in the cells corresponding to both coupling ports on the VLAN 1 row.
- To save the changes temporarily, click the ✓ button.

The coupling devices send the redundancy packets with the highest priority on VLAN 1.
Perform the following steps to reset the coupling settings to the default state:

1. In the Configuration frame, Redundancy mode option list, specify the type of redundancy:
   - With the redundant ring/network coupling setting, either the main line or the redundant line is active. The setting lets the devices toggle between both lines.
   - When you activate the extended redundancy setting, the main line and the redundant line are active simultaneously. The setting lets you add redundancy to the coupling network. When the connection between the coupling devices in the second network becomes inoperable the coupling devices continue to transmit and receive data.

   Note: During the reconfiguration period, packet duplications can occur. Therefore, if your devices detect package duplications, then select this setting.

   The Coupling mode describes the type of the backbone network to which you connect the ring network (see figure 67).

2. In the Configuration frame, Coupling mode option list, specify the type of the second network:
   - If you connect to a ring network, then select the ring coupling radio button.
   - If you connect to a bus or mesh structure, then select the network coupling radio button.

3. To save the changes temporarily, click the button.

Two-Switch coupling

Figure 69: Example of Two-Switch coupling
1: Ring
2: Backbone
3: Main line
4: Redundant line
The coupling between 2 networks is performed by the main line, indicated by the solid blue line. If the main line or one of the adjacent devices becomes inoperable, then the redundant line, indicated by the dashed black line, takes over the network coupling. The coupling is performed by 2 devices.

The devices send control packages to each other over the Ethernet.

The primary device connected to the main line, and the stand-by device connected to the redundant line are partners with regard to the coupling.

Connect the 2 partners using the ring ports.

**Two-Switch coupling, Primary device**

The following settings apply to the device displayed in blue in the selected graphic.

Perform the following steps:

1. Open the Switching > L2-Redundancy > Ring/Network Coupling dialog.
2. In the Mode frame, Type option list, select the two-switch coupling, master radio button.
3. In the Coupling port frame, Port drop-down list, select the port on which you connect the network segments.
   Configure the Coupling port and the ring ports on different ports.
4. To enable the function, select the On radio button in the Operation frame.
5. To save the changes temporarily, click the button.
6. Connect the main line to the Coupling port.
   In the Coupling port frame, the State field displays the status of the Coupling port.
   When the partner is already operating in the network, the IP address field in the Partner coupling port frame displays the IP address of the partner port.

   In the Information frame, the Redundancy available field displays whether or not the redundancy is available. The Configuration failure field displays whether or not the settings are complete and correct.

   **Note:** If you operate the Ring manager function and a two-switch coupling function on the same device, then there is the possibility of creating a loop.

   To help prevent continuous loops while the connections are in operation on the ring coupling ports, perform one of the following actions. The device sets the port state of the coupling port to "off":
   - disable the operation
   - change the configuration
Perform the following steps for the coupling ports:

- Open the **Basic Settings > Port** dialog, **Configuration** tab.
- For the ports selected as the coupling ports, specify the settings according to the parameters in the following table.
- To save the changes temporarily, click the **✓** button.

### Table 36: Port settings for ring ports

If you have configured VLANs on the coupling ports, then perform the following steps to specify the VLAN settings on the coupling and partner coupling ports:

- Open the **Switching > VLAN > Port** dialog.
- Change the **Port-VLAN ID** setting to the value of the VLAN ID configured on the ports.
- Unmark the **Ingress filtering** checkbox for both coupling ports.
- Open the **Switching > VLAN > Configuration** dialog.
- To tag the redundant connections for VLAN 1 and VLAN Membership, enter the value `T` in the cells corresponding to both coupling ports on the VLAN 1 row.
- To save the changes temporarily, click the **✓** button.

The coupling devices send the redundancy packets with the highest priority on VLAN 1.

### Two-Switch coupling, Stand-by device

The following settings apply to the device displayed in blue in the selected graphic.

**Figure 71**: Two-Switch coupling, Stand-by device

1: Coupling port
2: Partner coupling port
Perform the following steps:

- Open the Switching > L2-Redundancy > Ring/Network Coupling dialog.
- In the Mode frame, Type option list, select the two-switch coupling, slave radio button.
- In the Coupling port frame, Port drop-down list, select the port on which you connect the network segments.
- Configure the Coupling port and the ring ports on different ports.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the ✓ button.
- Connect the redundant line to the Coupling port.
  - In the Coupling port frame, the State field displays the status of the Coupling port.
  - When the partner is already operating in the network, the IP address field in the Partner coupling port frame displays the IP address of the partner port.
  - In the Information frame, the Redundancy available field displays whether or not the redundancy is available. The Configuration failure field displays whether or not the settings are complete and correct.

**Note:** If you operate the Ring manager function and a two-switch coupling function on the same device, then there is the possibility of creating a loop.

To help prevent continuous loops while the connections are in operation on the ring coupling ports, perform one of the following actions. The device sets the port state of the coupling port to "off":
- disable the operation
- change the configuration

Perform the following steps for the coupling ports:

- Open the Basic Settings > Port dialog, Configuration tab.
- For the ports selected as the coupling ports, specify the settings according to the parameters in the following table.
- To save the changes temporarily, click the ✓ button.

Redundancy
12.14 Ring/Network Coupling

If you have configured VLANs on the coupling ports, then perform the following steps to specify the VLAN settings on the coupling and partner coupling ports:

- Open the **Switching > VLAN > Port** dialog.
- Change the **Port-VLAN ID** setting to the value of the VLAN ID configured on the ports.
- Unmark the **Ingress filtering** checkbox for both coupling ports.
- Open the **Switching > VLAN > Configuration** dialog.
- To tag the redundant connections for VLAN 1 and VLAN Membership, enter the value T in the cells corresponding to both coupling ports on the VLAN 1 row.
- To save the changes temporarily, click the ✓ button.

The coupling devices send the redundancy packets with the highest priority on VLAN 1.

Perform the following steps to specify the **Redundancy mode** and **Coupling mode** settings:

- Open the **Switching > L2-Redundancy > Ring/Network Coupling** dialog.
- In the **Configuration** frame, **Redundancy mode** option list, select one of the following radio buttons:
  - redundant ring/network coupling
    With this setting, either the main line or the redundant line is active. The setting lets the devices toggle between both lines.
  - extended redundancy
    With this setting, the main line and the redundant line are active simultaneously. The setting lets you add redundancy to the second network. When the connection between the coupling devices in the second network becomes inoperable, the coupling devices continue to transmit and receive data.

During the reconfiguration period, packet duplications can occur. Therefore, select this setting only if your devices detect package duplications.

- In the **Configuration** frame, **Coupling mode** option list, select one of the following radio buttons:
  - If you connect to a ring network, then select the **ring coupling** radio button.
  - If you connect to a bus or mesh structure, then select the **network coupling** radio button.
  The **Coupling mode** describes the type of the backbone network to which you connect the ring network (see figure 69).
- To save the changes temporarily, click the ✓ button.

Perform the following steps to reset the coupling settings to the default state:

- Click the button and then the Reset item.
Two-Switch Coupling with Control Line

![Diagram](image)

**Figure 72: Example of Two-Switch coupling with control line**

1: Ring  
2: Backbone  
3: Main line  
4: Redundant line  
5: Control line

The coupling between 2 networks is performed by the main line, indicated by the solid blue line. If the main line or one of the adjacent devices become inoperable, then the redundant line, indicated by the dashed blue line, takes over coupling the 2 networks. The ring coupling is performed by 2 devices.

The devices send control packets over a control line indicated by the dotted blue line in the figure below (see figure 73).

The primary device connected to the main line, and the stand-by device connected to the redundant line are partners with regard to the coupling.

- Connect the 2 partners using the ring ports.
Two-Switch coupling with Control Line, Primary device

The following settings apply to the device displayed in blue in the selected graphic.

![Diagram of two-switch coupling with control line, primary device]

Perform the following steps:

- Open the **Switching > L2-Redundancy > Ring/Network Coupling** dialog.
- In the **Mode** frame, **Type** option list, select the **two-switch coupling with control line, master** radio button.
- In the **Coupling port** frame, **Port** drop-down list, select the port on which you connect the network segments.
  - Configure the **Coupling port** and the ring ports on different ports.
- In the **Control port** frame, **Port** drop-down list, select the port on which you connect the control line.
  - Configure the **Coupling port** and the ring ports on different ports.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **✓** button.
- Connect the redundant line to the Coupling port.
  - In the **Coupling port** frame, the **State** field displays the status of the Coupling port.
  - When the partner is already operating in the network, the **IP address** field in the **Partner coupling port** frame displays the IP address of the partner port.
- Connect the control line to the Control port.
  - In the **Control port** frame, the **State** field displays the status of the Control port.
  - When the partner is already operating in the network, the **IP address** field in the **Partner coupling port** frame displays the IP address of the partner port.

In the **Information** frame, the **Redundancy available** field displays whether or not the redundancy is available. The **Configuration failure** field displays whether or not the settings are complete and correct.

**Note:** If you operate the **Ring manager** function and a two-switch coupling function on the same device, then there is the possibility of creating a loop.

To help prevent continuous loops while the connections are in operation on the ring coupling ports, perform one of the following actions. The device sets the port state of the coupling port to "off":

- disable the operation
- change the configuration
Perform the following steps for the coupling ports:

- Open the Basic Settings > Port dialog, Configuration tab.
- For the ports selected as the coupling ports, specify the settings according to the parameters in the following table.
- To save the changes temporarily, click the button.

<table>
<thead>
<tr>
<th>Port type</th>
<th>Bit rate</th>

</tr>
</tbody>
</table>

If you have configured VLANs on the coupling ports, then perform the following steps to specify the VLAN settings on the coupling and partner coupling ports:

- Open the Switching > VLAN > Port dialog.
- Change the Port-VLAN ID setting to the value of the VLAN ID configured on the ports.
- Unmark the Ingress filtering checkbox for both coupling ports.
- Open the Switching > VLAN > Configuration dialog.
- To tag the redundant connections for VLAN 1 and VLAN Membership, enter the value T in the cells corresponding to both coupling ports on the VLAN 1 row.
- To save the changes temporarily, click the button.

The coupling devices send the redundancy packets with the highest priority on VLAN 1.

**Two-Switch coupling with Control Line, Stand-by device**

The following settings apply to the device displayed in blue in the selected graphic.
Perform the following steps:

- Open the **Switching > L2-Redundancy > Ring/Network Coupling** dialog.
- In the **Mode** frame, **Type** option list, select the **two-switch coupling with control line, slave** radio button.
- In the **Coupling port** frame, **Port** drop-down list, select the port on which you connect the network segments.
  Configure the **Coupling port** and the ring ports on different ports.
- In the **Control port** frame, **Port** drop-down list, select the port on which you connect the control line.
  Configure the **Coupling port** and the ring ports on different ports.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **✓** button.
- Connect the redundant line to the Coupling port.
  In the **Coupling port** frame, the **State** field displays the status of the Coupling port.
  When the partner is already operating in the network, the **IP address** field in the **Partner coupling port** frame displays the IP address of the partner port.
- Connect the control line to the Control port.
  In the **Control port** frame, the **State** field displays the status of the Control port.
  When the partner is already operating in the network, the **IP address** field in the **Partner coupling port** frame displays the IP address of the partner port.

  In the **Information** frame, the **Redundancy available** field displays whether or not the redundancy is available. The **Configuration failure** field displays whether or not the settings are complete and correct.

**Note:** If you operate the **Ring manager** function and a two-switch coupling function on the same device, then there is the possibility of creating a loop.

To help prevent continuous loops while the connections are in operation on the ring coupling ports, perform one of the following actions. The device sets the port state of the coupling port to “off”:
- disable the operation
- change the configuration

Perform the following steps for the coupling ports:

- Open the **Switching > VLAN > Port** dialog.
- Change the **Port-VLAN ID** setting to the value of the VLAN ID configured on the ports.
- Unmark the **Ingress filtering** checkbox for both coupling ports.
- Open the **Switching > VLAN > Configuration** dialog.
- To tag the redundant connections for **VLAN 1** and VLAN Membership, enter the value **T** in the cells corresponding to both coupling ports on the **VLAN 1** row.
- To save the changes temporarily, click the **✓** button.

The coupling devices send the redundancy packets with the highest priority on **VLAN 1**.
Perform the following steps to specify the Redundancy mode and Coupling mode settings:

- Open the Switching > L2-Redundancy > Ring/Network Coupling dialog.
- In the Configuration frame, Redundancy mode option list, select one of the following radio buttons:
  - redundant ring/network coupling
    With this setting, either the main line or the redundant line is active. The setting lets the devices toggle between both lines.
  - extended redundancy
    With this setting, the main line and the redundant line are active simultaneously. The setting lets you add redundancy to the second network. When the connection between the coupling devices in the second network becomes inoperable, the coupling devices continue to transmit and receive data.

During the reconfiguration period, packet duplications can occur. Therefore, select this setting only if your devices detect package duplications.

- In the Configuration frame, Coupling mode option list, select one of the following radio buttons:
  - If you connect to a ring network, then select the ring coupling radio button.
  - If you connect to a bus or mesh structure, then select the network coupling radio button.

The Coupling mode describes the type of the backbone network to which you connect the ring network (see figure 72).

- To save the changes temporarily, click the button.

Perform the following steps to reset the coupling settings to the default state:

- Click the button and then the Reset item.
Industrial applications require your networks to have high availability. This also involves maintaining deterministic, short interruption times for the communication in cases where a network device becomes inoperable.

A ring topology provides short transition times with a minimal use of resources. However, ring topology brings the challenge of coupling these rings together redundantly.

The Redundant Coupling Protocol \textit{RCP} lets you couple rings that are operating with one of the following redundancy protocols:

- MRP
- Fast MRP (depends on hardware)
- HIPER ring
- DLR (depends on hardware)
- RSTP

The \textit{RCP} function also lets you couple multiple secondary rings to a primary ring (see figure 75). Only the switches which couple the rings require the \textit{RCP} function.

You can also use devices other than Hirschmann devices within the coupled networks.

The \textit{RCP} function uses a master and a slave device to transport data between the networks. Only the master device forwards frames between the rings.

Using Hirschmann proprietary multicast messages, the \textit{RCP} master and slave devices inform each other about their operating state. Configure the devices in the ring which are not coupling devices to forward the following multicast addresses:

- 01:80:63:07:00:09
- 01:80:63:07:00:0A

Connect the master and slave devices as direct neighbors.
You use 4 ports per device to create the redundant coupling. Install the coupling devices with 2 inner and 2 outer ports in each network.

- The inner port connects the master and slave devices together.
- The outer port connects the devices to the network.

When the role is set to the value `auto`, the coupler devices automatically selects its role as `master` or `slave`. When you want a permanent master or slave device, configure the roles manually.

If the master is no longer reachable using the inner coupling ports, then the slave device waits for the timeout period to expire before taking over the master role. During the specified timeout period, the slave attempts to reach the master using the outer coupling ports. When the master is still not reachable, the slave assumes the master role. To maintain stability in the network connected to the outer coupling ports, configure the timeout period for a longer duration than the recovery time in the coupled rings.

**Note:** Disable RSTP on the `RCP` redundant coupling inner and outer ports not connected to the RSTP ring. In the example configuration, you disable RSTP on ports 1 and 2 of every device.
12.15.1 Application example for RCP coupling

The Hirschmann devices support the two switch Redundant Coupling Protocol method. You can use the RCP function to provide a network installed in a train for example. The network provides information for the passengers about the train location or the different stops on the line. The network can also help provide passenger safety, for example using video surveillance.

The primary rings in the figure represent an MRP ring network within a car. The secondary rings in the figure are RSTP ring networks. Each ring contains 4 devices (see figure 76).

To simplify the train topology in the figure, the MRP ring ports and the RCP inner and outer ports are assigned the same port numbers. Specify the same values for the parameters of the ports according to their function in the network. For example, specify ports 1/1 and 1/2 on Switch 1D and 1C as MRP ring ports. Port 1/4 as an RCP inner port, and port 1/3 as an RCP outer port.

![Redundant Coupling Protocol Train Topology](image)

*Figure 76: Redundant Coupling Protocol Train Topology*

The following list specifies roles of the ports on each device.
1: ports 1 and 2 are MRP ring ports
2: port 3 is an RCP outer port
3: port 4 is an RCP inner port

The following steps describe how to specify the parameters for Switch 1D in Coupler A. Configure the other devices used for Coupler A and the devices used in Coupler B in the same manner.
Disable the RSTP function in the MRP Ring

MRP and RSTP do not work together. Therefore, deactivate the RSTP function on the RCP ports used in the MRP ring. In the example configuration, ports x/1 and x/2 are used for the MRP ring. Activate the RSTP function only on the RCP inner and outer ports used in the secondary ring. For example, activate the RSTP function on ports x/3 and x/4.

- Open the Switching > L2-Redundancy > Spanning Tree > Port dialog, CIST tab.
- In the default setting, the RSTP function is active on the ports. To deactivate the RSTP function on the MRP ring ports, unmark the STP active checkboxes for ports x/1 and x/2.
- Open the Switching > L2-Redundancy > Spanning Tree > Global dialog.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

```bash
enable
configure
interface x/1
no spanning-tree mode
exit
interface x/2
no spanning-tree mode
exit
spanning-tree operation
cist
```

Specify the Ring Master in the MRP ring

In the figure, Switch D of each MRP ring is designated as the ring manager (see figure 76). Specify the other switches in the rings as ring clients.

- Open the Switching > L2-Redundancy > MRP dialog.
- Specify the first ring port in the Ring port 1 frame. In the Port drop-down list, select the port x/1.
- Specify the second ring port in the Ring port 2 frame. In the Port drop-down list, select the port x/2.
- To designate the device as the Ring Manager, activate the function in the Ring manager frame.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

```bash
enable
configure
mrp domain add default-domain
mrp domain modify port primary x/1
```

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Create a new MRP domain with the ID default-domain.

Specify port x/1 as ring port 1.
Specify the devices in the redundant coupler

- Open the Switching > L2-Redundancy > RCP dialog.
- Specify the Inner port in the Primary ring/network frame. Select port x/2.
- Specify the Outer port in the Primary ring/network frame. Select port x/1.
- Specify the Inner port in the Secondary ring/network frame. Select port x/4.
- Specify the Outer port in the Secondary ring/network frame. Select port x/3.

- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

Enable the MRP function.
13 Routing

13.1 Configuration

Because the configuration of a router is very dependent on the conditions in your network, you are first provided with a general list of the individual configuration steps. To optimally cover the large number of options, this list is followed by examples of networks that usually occur in the industry sector.

The configuration of the Routing function usually contains the following steps:

- **Drawing a network plan**
  Create a picture of your network so that you can clearly see the division into subnetworks and the related distribution of the IP addresses. This step is necessary. Good planning of the subnetworks with the corresponding network masks makes the router configuration much easier.

- **Router basic settings**
  Along with the global switching on of the Routing function, the router basic settings also contain the assignment of IP addresses and network masks to the router interfaces.

**Note:** Adhere to the sequence of the individual configuration steps so that the configuration computer has access to every Layer 3 device throughout the entire configuration phase.

**Note:** When you assign an IP address from the subnetwork of the device management IP address to a router interface, the device deletes the IP address of the device management. You access the device management via the IP address of the router interface.

Activate the routing globally before you assign an IP address from the subnetwork of the device management IP address to a router interface.

**Note:** When you assign the VLAN ID of the device management VLAN to a router interface, the device deactivates the IP address of the device management. You access the device management via the IP address of the router interface. The device management VLAN is the VLAN by means of which you access the device management of every device.

**Note:** Depending on your configuration steps, it can be necessary to change the IP parameters of your configuration computer to enable access to the Layer 3 devices.

- **Selecting a routing procedure**
  On the basis of the network plan and the communication requirements of the connected devices, you select the optimal routing procedure (static routes, RIP, OSPF) for your situation. In doing so, consider which routing procedures the routers can use along a route.

- **Configuring a routing procedure**
  Configure the selected routing procedure.
13.2 Routing - Basics

A router is a node for exchanging data on the Layer 3 of the ISO/OSI reference model.

This ISO/OSI reference model had the following goals:
- To define a standard for information exchange between open systems;
- To provide a common basis for developing additional standards for open systems;
- To provide international teams of experts with functional framework as the basis for independent development of every layer of the model;
- To include in the model developing or already existing protocols for communications between heterogeneous systems;
- To leave sufficient room and flexibility for the inclusion of future developments.

The OSI reference model consists of 7 layers, ranging from the application layer to the physical layer.

<table>
<thead>
<tr>
<th>Layer</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Physical</td>
</tr>
<tr>
<td>2</td>
<td>Data-Link</td>
</tr>
<tr>
<td>3</td>
<td>Network</td>
</tr>
<tr>
<td>4</td>
<td>Transport</td>
</tr>
<tr>
<td>5</td>
<td>Session</td>
</tr>
<tr>
<td>6</td>
<td>Presentation</td>
</tr>
<tr>
<td>7</td>
<td>Application</td>
</tr>
</tbody>
</table>

What does the data exchange on the Layer 3 mean in comparison with the data exchange on the Layer 2?

On the Layer 2, the MAC address signifies the destination of a data packet. The MAC address is an address tied to the hardware of a device. The Layer 2 expects the receiver in the connected network. The data exchange to another network is the task of Layer 3. Layer 2 data traffic is spread over the entire network. Every subscriber filters the data relevant for him from the data stream. Layer 2 devices are capable of steering the data traffic that is intended for a specific MAC address. It thus relieves some of the load on the network. Broadcast and multicast data packets are forwarded by the Layer 2 devices on every port.
IP is a protocol on the Layer 3. IP provides the IP address for addressing data packets. The IP address is assigned by the network administrator. By systematically assigning IP addresses, he can thus structure his network, breaking it down into subnets (see on page 257 “CIDR”). The bigger a network gets, the greater the data volume. Because the available bandwidth has physical limitations, the size of a network is also limited. Dividing large networks into subnets limits the data volume on these subnets. Routers divide the subnets from each other and only transmit the data that is intended for another subnet.

Figure 78: MAC Data Transmission: Unicast Data Packet (left) and Broadcast Data Packet (right)

This illustration clearly shows that broadcast data packets can generate a considerable load on larger networks. You also make your network easier to understand by forming subnets, which you connect with each other using routers and, strange as it sounds, also separate securely from each other.

A switch uses the MAC destination address to transmit, and thus uses Layer 2. A router uses the IP destination address to transmit, and thus uses Layer 3.

The subscribers associate the MAC and IP addresses using the Address Resolution Protocol (ARP).

13.2.1 ARP

The Address Resolution Protocol (ARP) determines the MAC address that belongs to an IP address. What is the benefit of this?

Let’s suppose that you want to configure the device using the Web-based interface. You enter the IP address of the device in the address line of your browser. But which MAC address will your PC now use to display the information in the device in your browser window?

If the IP address of the device is in the same subnetwork as your PC, then your PC sends what is known as an ARP request. This is a MAC broadcast data packet that requests the owner of the IP address to send back his MAC address. The device replies with a unicast data packet containing its MAC address. This unicast data packet is called an ARP reply.

Figure 79: ARP request and reply
When the IP address of the device is in a different subnetwork, the PC asks for the MAC address of the gateway entered in the PC. The gateway/router replies with its MAC address.

Now the PC packs the IP data packet with the IP address of the device, the final destination, into a MAC frame with the MAC destination address of the gateway/router and sends the data.

The router receives the data and releases the IP data packet from the MAC frame, so that it can then forward it in accordance with its transmission rules.

All end devices still working with IPs of the first generation, for example, are not yet familiar with the term 'subnet'. When they are looking for the MAC address for an IP address in a different subnet, they also send an ARP request. They neither have a network mask with which they could recognize that the subnet is a different one, nor do they have a gateway entry. In the example below, the left PC is looking for the MAC address of the right PC, which is in a different subnet. In this example, it would normally not get a reply.

Because the router knows the route to the right PC, the Proxy ARP function replies to this router interface on behalf of the right PC with its own MAC address. Thus the left PC can address its data to the MAC address of the router, which then forwards the data to the right PC.

The Proxy ARP function is available on the router interfaces on which you enable the proxy ARP.

Note: The 1:1 NAT function also lets you integrate the devices into a larger L3 network.
13.2.2 CIDR

The original class allocation of the IP addresses only planned for three address classes to be used by the users.

Since 1992, five classes of IP address have been defined in the RFC 1340.

Table 40: IP address classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Network part</th>
<th>Host part</th>
<th>Address range</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1.0.0.0 … 126.255.255.255</td>
</tr>
<tr>
<td>B</td>
<td>2 bytes</td>
<td>2 bytes</td>
<td>128.0.0.0 … 191.255.255.255</td>
</tr>
<tr>
<td>C</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>192.0.0.0 … 223.255.255.255</td>
</tr>
<tr>
<td>D</td>
<td></td>
<td></td>
<td>224.0.0.0 … 239.255.255.255</td>
</tr>
<tr>
<td>E</td>
<td></td>
<td></td>
<td>240.0.0.0 … 255.255.255.255</td>
</tr>
</tbody>
</table>

Class C with a maximum of 254 addresses was too small, and class B with a maximum of 65534 addresses was too large for most users, as they would not require so many addresses. This resulted in ineffective usage of the class B addresses available.

Class D contains reserved multicast addresses. Class E is reserved for experimental purposes. A gateway not participating in these experiments ignores datagrams with this destination address.

The Classless Inter-Domain Routing (CIDR) provides a solution to these problems. The CIDR overcomes these class boundaries and supports classless address ranges.

With CIDR, you enter the number of bits that designate the IP address range. You represent the IP address range in binary form and count the mask bits that designate the network mask. The network mask indicates the number of bits that are identical for every IP address, the network part, in a given address range. Example:

<table>
<thead>
<tr>
<th>IP address, decimal</th>
<th>Network mask, decimal</th>
<th>IP address, binary</th>
</tr>
</thead>
<tbody>
<tr>
<td>149.218.112.1</td>
<td>255.255.255.128</td>
<td>10010101 11011010 01110000 00000001</td>
</tr>
<tr>
<td>149.218.112.127</td>
<td>255.255.255.128</td>
<td>10010101 11011010 01110000 01111111</td>
</tr>
</tbody>
</table>

CIDR notation: 149.218.112.0/25

The combination of a number of class C address ranges is known as “super.netting”. This enables you to subdivide class B address ranges to a very fine degree.

Using mask bits simplifies the routing table. The router determines in that direction in which most of the mask bits match (longest prefix match).

13.2.3 Net-directed Broadcasts

A net-directed Broadcast is an IP data packet that a device sends to the network Broadcast address of a network to contact every receiver of the network. A net-directed Broadcast is sent as a MAC Unicast packet in a transfer network. When the router locally responsible for this network supports net-directed Broadcasts, it transmits this data packet as a MAC Broadcast packet into its local network. With VLAN-based router interfaces it transmits the packet to every port that is member in the VLAN of the Router interface.1
Thus net-directed Broadcasts can relieve your transfer network of the multiple IP Unicasts that would be necessary to replace a net-directed Broadcast.

When the router does not support net-directed Broadcasts or you deactivate this function for a router interface, the router discards IP data packets received on the network Broadcast address of the router interface. With multinetting, this also applies to the secondary IP addresses of the router interface.

1. The device determines the Broadcast address from its interface IP address and the related netmask. For example, when a router interface has the IP address 192.168.1.1 and the netmask 255.255.255.0, it is responsible for network 192.168.1.0/24. The network Broadcast address here is 192.168.1.255.
13.3  **Static Routing**

Static routes are user-defined routes which the router uses to transmit data from one subnet to another.

The user specifies to which router (next hop) the local router forwards data for a particular subnet. Static routes are kept in a table which is permanently stored in the router.

Compared to dynamic routing, the advantage of this transparent route selection is offset by the increased workload involved in configuring the static routes. Static routing is therefore suited to very small networks or to selected areas of larger networks. Static routing makes the routes transparent for the administrator and can be easily configured in small networks.

If, for example, a line interruption causes the topology to change, then the dynamic routing can react automatically to this, in contrast to the static routing. When you combine static and dynamic routing, you can configure the static routes in such a way that they have a higher priority than a route selected by a dynamic routing procedure.

The first step in configuring the router is to globally enable the **Routing** function and configure the router interfaces.

The device lets you define port-based and VLAN-based router interfaces (see figure 82).

**Example: Connecting two production cells**

![Figure 82: Static routes](image)

**13.3.1 Port-based Router Interface**

A characteristic of the port-based router interface is that a subnet is connected to a port (see figure 82).

Special features of port-based router interfaces:

- When there is no active connection, the entry is omitted from the routing table, because the router transmits only to those ports for which the data transfer is likely to be successful.
- The entry in the interface configuration table remains.
- A port-based router interface does not recognize VLANs, which means that the router rejects tagged packets which it receives on a port-based router interface.
- A port-based router interface rejects the non-routable packets.

Below (see figure 83) you will find an example of the simplest case of a routing application with port-based router interfaces.
Configuration of the router interfaces

10.0.1.5/24 | Interface 2.1 | Interface 2.2 | 10.0.2.5/24
| IP=10.0.1.1/24 | IP=10.0.2.1/24 |

Figure 83: Simplest case of a route

Note:

To be able to see these entries in the routing table, you need an active connection on the interfaces.

```
enable
configure

interface 2/1
ip address primary 10.0.1.1 255.255.255.0
ip routing
exit

interface 2/2
ip address primary 10.0.2.1 255.255.255.0
ip routing
ip netdirbcast
exit
ip routing
exit
show ip interface 2/1

<tr>
<td>10.0.2.0/24</td>
<td>Local</td>
<td>10.0.2.1</td>
<td>2/2</td>
<td>0</td>
<td>[x]</td>
</tr>
</tbody>
</table>
13.3.2 VLAN-based Router-Interface

A characteristic of the VLAN-based router interface is that a number of devices in a VLAN are connected to different ports.

Within a VLAN, the switch exchanges data packets on Layer 2.

Terminal devices address data packets with a destination address in another subnet to the router. The device then exchanges the data packets on Layer 3.

Below you will find an example of the simplest case of a routing application with VLAN-based router interfaces. For VLAN 2, the router combines interfaces 3/1 and 3/2 into the VLAN router interface vlan/2. A VLAN router interface remains in the routing table as long as at least one port of the VLAN has a connection.

Use the following steps and tables to configure a VLAN router interface:

- Create a VLAN and assign ports to the VLAN.
- Create a VLAN-based router interface.
- Assign an IP address to the VLAN-based router interface.
Activate routing on the VLAN-based router interface.

Enable theRoutingfunction globally.

enable
vlan database
vlan add 2
name 2 VLAN2
routing add 2
exit

show ip interface

<table>
<thead>
<tr>
<th>Interface</th>
<th>IP Address</th>
<th>IP Mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan/2</td>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
</tr>
</tbody>
</table>

configure
interface vlan/2

ip address primary 10.0.2.1
255.255.255.0
ip routing
ip netdirbcast
exit

interface 3/1
vlan participation exclude 1
vlan participation include 2
vlan pvid 2
exit

interface 3/2
vlan participation exclude 1
vlan participation include 2
vlan pvid 2
exit
Enable the **Routing** function globally.

Change to the Privileged EXEC mode.

Check your entries in the static VLAN table.

```
ip routing
exit

show vlan id 2

VLAN ID...........................2
VLAN Name..........................VLAN002
VLAN Creation Time..............0 days, 01:47:17
VLAN Type..........................static

<table>
<thead>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>
Routing
13.3 Static Routing

You delete a router interface highlighted in the Routing > Interfaces > Configuration dialog by clicking the button.

After deleting a VLAN router interface the associated VLAN is maintained. In the Switching > VLAN > Configuration dialog, the table still displays the VLAN.

After deleting a VLAN in the Switching > VLAN > Configuration dialog, the device also deletes the associated VLAN router interface.

13.3.3 Configuration of a Static Route

In the example below, router A requires the information that it can reach the subnet 10.0.3.0/24 via the router B (next hop). It can obtain this information via a dynamic routing protocol or via a static routing entry. With this information, router A can transmit data from subnet 10.0.1.0/24 via router B into subnet 10.0.3.0/24.

Vice versa to be able to forward data of subnet 10.0.1.0/24 router B also needs an equivalent route.

You can enter static routing for port-based and VLAN-based router interfaces.
Configuration of a simple static route

Enter a static route for router A based on the configuration of the router interface in the previous example (see figure 83):

```
enable
configure
ip route add 10.0.3.0 255.255.255.0 10.0.2.2
ip routing
exit
```

```
show ip route all
```

```
Network Address  Protocol Next Hop IP   Next Hop If  Pref Active
---------------  -------- ------------  ------------ ---- -------
 10.0.1.0    Local    10.0.1.1      2/1          1      [x]
 10.0.2.0    Local    10.0.2.1      2/2          1      [x]
 10.0.3.0    Static   10.0.2.2      2/2          1      [x]
```

☐ Configure router B in the same way.

Configuration of a redundant static route

To establish a stable connection between the two routers, you can connect the two routers with two or more links.

```
Subnet 10.0.1.0/24
10.0.1.5/24
Interface 2.1
IP=10.0.1.1
```

```
Interface 2.2
IP=10.0.2.1
```

```
Interface 2.3
IP=10.0.4.1
```

```
Subnet 10.0.3.0/24
10.0.3.5/24
Interface 2.2
IP=10.0.3.1
```

```
Interface 2.3
IP=10.0.4.2
```

Figure 86: Redundant static route
You have the option of assigning *Preference* (distance) to a route. When there are a number of routes to a destination, the router chooses the route with the highest *Preference*.

- **Configure router A.**

```console
enable
configure
interface 2/3
ip address primary 10.0.4.1 255.255.255.0
ip routing
exit
ip route add 10.0.3.0 255.255.255.0 10.0.4.2 preference 2
```

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Select the port at which you want to connect the redundant route.

Assign the IP parameters to the port.

Activate the *Routing* function on this interface.

Change to the Configuration mode.

Create the static routing entry for the redundant route. The value 2 at the end of the command indicates the Preference value.

When both routes are available, the router uses the route via subnetwork 10.0.2.0/24, because this route has the higher preference (see on page 265 “Configuration of a simple static route”).

You have the option of changing the default value of the *Preference*. When you do not assign a value for the *Preference* during the configuration, the router uses the default value.

```console
ip route distance
show ip route all
```

Sets the default preference for static routes.

*(default setting: 1)*

Verify the routing table:

<table>
<thead>
<tr>
<th>Network Address</th>
<th>Protocol</th>
<th>Next Hop IP</th>
<th>Next Hop If</th>
<th>Pref</th>
<th>Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.1.0</td>
<td>Local</td>
<td>10.0.1.1</td>
<td>2/1</td>
<td>1</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.2.0</td>
<td>Local</td>
<td>10.0.2.1</td>
<td>2/2</td>
<td>1</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.3.0</td>
<td>Static</td>
<td>10.0.2.2</td>
<td>2/2</td>
<td>1</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.3.0</td>
<td>Static</td>
<td>10.0.4.2</td>
<td>-</td>
<td>2</td>
<td>[ ]</td>
</tr>
<tr>
<td>10.0.4.0</td>
<td>Local</td>
<td>10.0.4.1</td>
<td>2/3</td>
<td>1</td>
<td>[x]</td>
</tr>
</tbody>
</table>

- **Configure router B in the same way.**

**Configuration of a redundant static route with load sharing**

When the routes have the same *Preference* (distance), the router shares the load between the 2 routes (load sharing).

```console
enable
configure
ip route modify 10.0.3.0 255.255.255.0 10.0.2.2 preference 2
```

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Assigns a Preference of 2 to the existing static routing entry (see on page 265 “Configuration of a simple static route”).

When both routes are available, the router uses both routes for the data transmission.
### 13.3.4 Static route tracking

**Description of the static route tracking function**

With static routing, when there are a number of routes to a destination, the router chooses the route with the highest preference. The router detects an existing route by the state of the router interface. While connection L 1 on the router interface can be fine, the connection to remote router B via L 2 can be interrupted. In this case, the router continues transmitting via the interrupted route.

With the static route tracking function, the router uses a tracking object such as a ping tracking object to detect the connection interruption. The active static route tracking function then deletes the interrupted route from the current routing table. When the tracking object returns to the up state, the router enters the static route in the current routing table again.

**Application example for the static route tracking function**

The figure displays an example of the static route tracking function (see figure 88).

Router A monitors the best route via L 1 with ping tracking. If there is a connection interruption, then router A transmits using the redundant connection L 3.

For the example the following information is known:

```plaintext
<table>
<thead>
<tr>
<th>Network Address</th>
<th>Protocol</th>
<th>Next Hop IP</th>
<th>Next Hop If</th>
<th>Pref</th>
<th>Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.1.0</td>
<td>Local</td>
<td>10.0.1.1</td>
<td>2/1</td>
<td>1</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.2.0</td>
<td>Local</td>
<td>10.0.2.1</td>
<td>2/2</td>
<td>1</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.3.0</td>
<td>Static</td>
<td>10.0.2.2</td>
<td>2/2</td>
<td>2</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.3.0</td>
<td>Static</td>
<td>10.0.4.2</td>
<td>2/3</td>
<td>2</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.4.0</td>
<td>Local</td>
<td>10.0.4.1</td>
<td>2/3</td>
<td>1</td>
<td>[x]</td>
</tr>
</tbody>
</table>
```
### Parameter | Router A | Router B
--- | --- | ---
IP address interface (IF) 1/1 | 10.0.4.1 | 10.0.4.2
IP address interface (IF) 1/2 | 10.0.2.1 | 10.0.2.53
IP address interface (IF) 1/4 | 10.0.1.112 | 10.0.5.1
Netmask | 255.255.255.0 | 255.255.255.0

![Figure 88: Configuring static route tracking](image)

**Figure 88**: Configuring static route tracking
The following list contains prerequisites for further configuration:

- The IP parameters of the router interfaces are configured. (see on page 260 "Configuration of the router interfaces")
- The Routing function is activated globally and on the router interface.
- Ping tracking on interface 1/2 of router A is configured (see on page 277 “Ping tracking”).
- Create the tracking objects on router A for the routes to the destination network 10.0.5.0/24. The default values, entered in the other cells, remain unchanged for this example.

- Open the Routing > Tracking > Configuration dialog.
- Click the button. The dialog displays the Create window.
- Enter the data for the first tracking rule:
  - Type: ping
  - Track ID: 1
- Click the Ok button.
- In the ping-1 row, IP address column, specify the IP address 10.0.2.53.
- In the ping-1 row, Ping port column, specify the interface 1/2.
- To activate the row, mark the Active checkbox.
- Click the button. The dialog displays the Create window.
- Enter the data for the first static route:
  - Type: ping
  - Track ID: 2
- Click the Ok button.
- In the ping-2 row, IP address column, specify the IP address 10.0.4.2.
- In the ping-2 row, Ping port column, specify the interface 1/1.
- To activate the row, mark the Active checkbox.
- To temporarily save the settings, click the button.

```
enable
configure
track add ping 1
track modify ping 1 address 10.0.2.53
track modify ping 1 interface 1/2
track enable ping 1
track add ping 2
track modify ping 2 address 10.0.4.2
track modify ping 2 interface 1/1
track enable ping 2
exit
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Create a tracking object with track ID 1.
Modify the ping-1 entry with the IP address 10.0.2.53.
Set the source interface number of the ping tracking instance to 1/2.
Activate the tracking object.
Create a tracking object with track ID 2.
Modify the ping-2 entry with the IP address 10.0.4.2.
Set the source interface number of the ping tracking instance to 1/1.
Activate the tracking object.
Change to the Privileged EXEC mode.
show track ping

Verify the entries in the tracking table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Interface</th>
<th>Intv [ms]</th>
<th>Succ</th>
<th>TTL</th>
<th>BR-If</th>
<th>State Active</th>
<th>Inet-Address</th>
<th>Timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>ping-1</td>
<td>1/2</td>
<td>1000</td>
<td>2</td>
<td>128</td>
<td>0</td>
<td>up [x]</td>
<td>10.0.2.53</td>
<td>100</td>
</tr>
<tr>
<td>ping-2</td>
<td>1/1</td>
<td>1000</td>
<td>2</td>
<td>128</td>
<td>0</td>
<td>down [x]</td>
<td>10.0.4.2</td>
<td>100</td>
</tr>
</tbody>
</table>
Note: In order to activate the row, verify that the link on the interface is up.

Next enter the routes to the destination network 10.0.5.0/24 in the static routing table of router A.

- Open the Routing > Routing Table dialog.
- Click the button.
  The dialog displays the Create window.
- Enter the data for the first static route:
  - Network address: 10.0.5.0
  - Netmask: 255.255.255.0
  - Next hop IP address: 10.0.2.53
  - Preference: 1
  - Track name: ping-1
- Click the Ok button.
- Click the button.
  The dialog displays the Create window.
- Enter the data for the first static route:
  - Network address: 10.0.5.0
  - Netmask: 255.255.255.0
  - Next hop IP address: 10.0.4.2
  - Preference: 2
  - Track name: ping-2
- Click the Ok button.
- To temporarily save the settings, click the button.

Note: To make the configuration available even after a restart, save the settings permanently in the Basic Settings > Load/Save dialog.

enable
configure

13.4 NAT – Network Address Translation

The Network Address Translation (NAT) protocol describes a procedure for automatically and transparently changing IP address information in data packets while still transmitting the data packets to their precise destination.

When you do not want IP addresses of an internal network to be visible from outside, use NAT. The reasons for this can include, for example:

- Keeping the structure of the internal network hidden from the outside world.
- Keeping private IP addresses hidden.
- Using IP addresses multiple times – by forming identical production cells, for example.

Depending on your reason for using NAT, it offers you various procedures for using the IP address information. In the following sections, you will find additional information on this process.
13.4.1 1:1 NAT

The 1:1 NAT function lets you establish communication links within a local network to devices that are actually located in other networks. The NAT router virtually “shifts” the devices into the public network. To do this, the NAT router replaces the virtual with the actual IP address in the data packet while sending it. A typical application is the connecting of several identically structured production cells with the same IP address to a server farm.

**Figure 89:** How the 1:1 NAT method works

*Note:* With 1:1 NAT the device responds to ARP requests from the external network to addresses which it maps from the internal network. This is also the case where no device with the IP address exists in the internal network. Therefore, in the external network, only allocate to devices IP addresses located outside the area which 1:1 NAT maps from the internal network to the external network.

**Application example for 1:1 NAT**

You have multiple identical production cells and want to connect them with the host computer. As even the IP addresses used in the production cells are identical, you convert the IP addresses using the 1:1 NAT function.

**Figure 90:** Connect identical production cells with the host computer (application example)

Prerequisites for further configuration:

- You need two NAT routers.
- The *Routing* function is enabled in every device.
Two router interfaces are configured in every device. One router interface is connected to the company network and one to the network of the production cell.

The IP address and gateway are set in the devices of the production cell. The devices use the IP address of the egress interface of the NAT router as the gateway.

Perform the following steps:

- Generate rule.

- Open the Routing > NAT > 1:1 NAT > Rule dialog.
- In the Configuration frame, Application-level gateway drop-down list, select the type of filter used in the application-level gateway for the 1:1 NAT rules.
- In the Configuration frame, Public interface drop-down list, select the router interface that is connected to the egress interface.
- To add a table entry, click the button.
- In the Rule name column, specify the name of the NAT rule.
- In the Destination address column, specify the virtual IP address of the device in the production cell; in the example this is 192.168.1.100 in NAT router 1 and 192.168.1.200 in NAT router 2.
- In the New destination address column, specify the IP address of the device in the production cell; in the example this is 192.168.2.100 in NAT router 1 and in NAT router 2.
- Activate the rule:
  Mark the checkbox in the Active column.
- To save the changes temporarily, click the button.
### 13.5 Tracking

The tracking function lets you monitor certain objects, such as the availability of an interface or reachability of a network.

A special feature of this function is that it forwards an object status change to an application, for example VRRP, which previously registered as an interested party for this information.

Tracking can monitor the following objects:
- Link status of an interface (interface tracking)
- Accessibility of a device (ping tracking)
- Result of logical connections of tracking entries (logic tracking)

An object can have the following statuses:
- up (OK)
- down (not OK)
- notReady (not enabled)

The definition of "up" and "down" depends on the type of the tracking object (for example interface tracking).

Tracking can forward the state changes of an object to the following applications:
- VRRP
- Static routing

#### 13.5.1 Interface tracking

With interface tracking the device monitors the link status of:
- physical ports
- Link Aggregation interfaces
- VLAN router interfaces

![Figure 91: Monitoring a line with interface tracking](image)

Ports/interfaces can have the following link statuses:
- interrupted physical link (link down)
- existing physical link (link up)

If the link to the participating ports is interrupted, then a Link Aggregation interface has link status "down".

If the link is interrupted from the physical ports/Link Aggregation interfaces that are members of the corresponding VLAN, then the VLAN router interface has the link status "down".

Setting a delay time enables you to insert a delay before informing the application about an object status change.
If the physical link interruption remains for longer than the “link down delay” delay time, then the interface tracking object has the status “down”.

When the physical link holds for longer than the “link up delay” delay time, the interface tracking object has the status “up”.

State on delivery: delay times = 0 seconds.

This means that in case where a status changes, the registered application is informed immediately.

You can set the “link down delay” and “link up delay” delay times independently of each other in the range from 0 to 255 seconds.

You can define an interface tracking object for each interface.

### 13.5.2 Ping tracking

With ping tracking, the device uses ping requests to monitor the link status to other devices.

![Diagram](image)

**Figure 92: Monitoring a line with ping tracking**

The device sends ping requests to the device with the IP address that you entered in the IP address column.

The Ping interval [ms] column lets you define the frequency for sending ping requests, and thus the additional network load.

When the response comes back within the time entered in the Ping timeout [ms] column, this response is a valid Ping replies to receive.

When the response comes back after the time entered in the Ping timeout [ms] column, or not at all, this response is evaluated as Ping replies to lose.

Ping tracking objects can have the following statuses:

- the number of Ping replies to lose is greater than the number entered (down)
- the number of Ping replies to receive is greater than the number entered (up)
- the instance is inactive (notReady)

Entering a number for unreceived or received ping responses enables you to set the sensitivity of the ping behavior of the device. The device informs the application about an object status change.

Ping tracking enables you to monitor the accessibility of specified devices. As soon as a monitored device can no longer be accessed, the device can choose to use an alternative path.
13.5.3 **Logical tracking**

Logical tracking enables you to logically link multiple tracking objects with each other and thus perform relatively complex monitoring tasks.

You can use logical tracking, for example, to monitor the link status for a network node to which redundant paths lead (see on page 281 "Application example for logical tracking").

The device provides the following options for a logical link:

- and
- or

For a logical link, you can combine up to 2 operands with one operator.

Logical tracking objects can have the following statuses:

- The result of the logical link is incorrect (down).
- The result of the logical link is correct (up).
- The monitoring of the tracking object is inactive (notReady).

When a logical link delivers the result down, the device can choose to use an alternative path.

13.5.4 **Configuring the tracking**

You configure the tracking by setting up tracking objects. The following steps are required to set up a tracking object:

- Enter the tracking object ID number (track ID).
- Select a tracking type, for example interface.
- Depending on the track type, enter additional options such as “port” or “link up delay” in the interface tracking.

**Note:** The registration of applications (for example VRRP) to which the tracking function reports status changes is performed in the application itself.
Configuring interface tracking

- Set up interface tracking on port 1/1 with a link down delay of 0 seconds and a link up delay of 3 seconds.

- Open the **Routing > Tracking > Configuration** dialog.
- Click the **Create** button. The dialog displays the **Create** window.
- **Select type:**
  - Enter the values you desire, for example:
    - **Type:** interface
    - **Track ID:** 11
- Click the **Ok** button.
- **Properties:**
  - Enter the values you desire, for example:
    - **Port:** 1/1
    - **Link up delay [s]:** 3
    - **Link down delay [s]:** 0

- To temporarily save the settings, click the **button**.

```
enable
configure
track add interface 11
track modify interface 11 ifnumber 1/1
   link-up-delay 3 link-down-delay 0
track enable interface 11
Tracking ID interface-11 created  Target interface set to 1/1
   Link Up Delay for target interface set to 3 sec
   Link Down Delay for target interface set to 0 sec
Tracking ID 11 activated
exit
show track interface
Name     If-Number  Link-Up-Delay  Link-Down-Delay  State  Active
-------- ---------- -------------- -------------- ---- ----
if-11     1/1       0              3              up    [x]
```
**Application example for ping tracking**

While the interface tracking monitors the directly connected link (see figure 91), the ping tracking monitors the entire link to device S2 (see figure 92).

- Set up ping tracking at port 1/2 for IP address 10.0.2.53 with the preset parameters.

- Open the **Routing > Tracking > Configuration** dialog.
- To add a table entry, click the button.
  
  Select type:
  - Enter the values you desire, for example:
    - **Type:** 21
    - **Track ID:** ping
- Click **Ok**.

  Properties:
  - Enter the values you desire, for example:
    - **Port:** 1/2
    - **IP address:** 10.0.2.53
    - **Ping interval [ms]:** 500
    - **Ping replies to lose:** 3
    - **Ping replies to receive:** 2
    - **Ping timeout [ms]:** 100
- To temporarily save the settings, click the button.

```plaintext
enable
cconfigure
track add ping 21
track modify ping 21 ifnumber 1/2
  address 10.0.2.53
  interval 500
  miss 3
  success 2
  timeout 100
track enable ping 21
```

Tracking ID ping-21 created
- Target IP address set to 10.0.2.53
- Interface used for sending pings to target set to 1/2
- Ping interval for target set to 500 ms
- Max. no. of missed ping replies from target set to 3
- Min. no. of received ping replies from target set to 2
- Timeout for ping replies from target set to 100 ms

Tracking ID 21 activated
Application example for logical tracking

The figure (see figure 93) displays an example of monitoring the connection to a redundant ring.

By monitoring lines L 2 and L 4, you can detect a line interruption from router A to the redundant ring.

With a ping tracking object on port 1/1 of router A, you monitor the connection to device S2.

With an additional ping tracking object on port 1/1 of router A, you monitor the connection to device S4.

Only the OR link of both ping tracking objects delivers the precise result that router A has no connection to the ring.

One ping tracking object for device S3 could indicate an interrupted connection to the redundant ring, but in this case there could be another reason for the lack of a ping response from device S3. For example, there could be a power failure at device S3.

The following is known:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operand No. 1 (track ID)</td>
<td>21</td>
</tr>
<tr>
<td>Operand No. 2 (track ID)</td>
<td>22</td>
</tr>
</tbody>
</table>

Prerequisites for further configuration:
- The ping tracking objects for operands 1 and 2 are configured (see on page 280 “Application example for ping tracking”).
Set up a logical tracking object as an OR link.

- Open the **Routing > Tracking > Configuration** dialog.
- Click the **Ok** button. The dialog displays the **Create window**.

**Select type:**
- Enter the values you desire, for example:
  - **Type:** 31
  - **Track ID:** logical
- Click the **Ok** button.

**Properties:**
- Enter the values you desire, for example:
  - **Logical operand A:** ping-21
  - **Logical operand B:** ping-22
  - **Operator:** or
- To temporarily save the settings, click the **Ok** button.

13.6 VRRP/HiVRRP

End devices usually let you enter 1 default gateway for transmitting data packets in external subnetworks. Here the term “Gateway” applies to a router with which end devices communicate with other subnetworks.

If this router fails, then the end device cannot send any more data to the external subnetworks.

In this case, the Virtual Router Redundancy Protocol (VRRP) provides assistance.

VRRP is a type of “gateway redundancy”. VRRP describes a process that groups multiple routers into 1 virtual router. End devices constantly address the virtual router, and VRRP helps ensure that a physical router belonging to the virtual router transmits the data.

When a physical router fails, VRRP helps ensure that another physical router continues to route the data as part of the virtual router.

When a physical router fails, VRRP has a typical failover time of 3 to 4 seconds.

In many cases, such as Voice over IP, Video over IP, or industrial controllers these long failover times are unacceptable.

Hirschmann has further developed VRRP into the Hirschmann Virtual Router Redundancy Protocol (HiVRRP). With the appropriate configuration, HiVRRP provides a maximum failover time of 400 milliseconds.

Thanks to this failover time, HiVRRP helps to enable the use of “gateway redundancy” in time-sensitive applications. Even in tunnel controllers that require failover times of less than 1 second, the user improves the network availability with this form of “gateway redundancy”.

Note: The device supports only VRRP packets without authentication information. In order for the device to operate in conjunction with other devices that support VRRP authentication, verify that on those devices the VRRP authentication is not applied.

13.6.1 VRRP

The routers within a network on which VRRP is active specify among themselves which router is the master. The master router controls the IP and MAC address of the virtual router. The devices in the network that have entered this virtual IP address as the default gateway use the master as the default gateway.
When the master fails, then the remaining backup routers use VRRP to specify a new master. The backup router that wins the election process then controls the IP address and MAC address of the virtual router. Thus, the devices find the route through the default gateway, as before. The devices see only the master router with the virtual MAC and IP addresses, regardless of which physical router is actually behind this virtual address.

The administrator assigns the virtual router IP address.

VRRP specifies the virtual MAC address with: 00:00:5e:00:01:<VRID>.

The first 5 octets form the fixed part in accordance with RFC 3768. The last octet is the virtual router ID (VRID). The VRID is a number from 1 through 255. Based on the number of VRIDs, VRRP lets the administrator specify up to 255 virtual routers within a network.

\[ \text{constant element} \]  
\[ \text{variable element} = \text{VRID} \]

**Figure 96: Virtual MAC address**

In order to determine the master, a VRRP router sends IP Multicast messages to the IP Multicast address 224.0.0.18. The physical router with the higher VRRP priority becomes the master. The administrator specifies the VRRP priority of each physical router. When the VRRP priorities are the same, the physical router with higher IP interface address in the VRRP domain becomes the master. When the virtual IP address is the same as the IP address of a router interface, this router is the IP address owner. VRRP sets the VRRP priority of an IP address owner to the value of 255 and thus declares this router the master. When there is no IP address owner, VRRP declares the router with the higher VRRP priority the master.

In order to signal that the master router is ready for operation, the master router sends IP Multicast advertisements in regular intervals (default: 1 s) to the other VRRP routers (backup routers). When 3 intervals pass without the other VRRP routers receiving an advertisement, VRRP initiates the master router election process. The VRRP backup router with the higher VRRP priority declares itself the new master.

**Table 42: Who shall be the master?**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>The IP address owner as it has the higher VRRP priority (255) by definition.</td>
</tr>
<tr>
<td>2.</td>
<td>The VRRP router with the higher VRRP priority.</td>
</tr>
<tr>
<td>3.</td>
<td>When the priorities are the same, the VRRP router with the higher IP address.</td>
</tr>
</tbody>
</table>

**VRRP terms:**

- **Virtual router**
  A virtual router is a physical router or group of physical routers that act as the default gateway in a network using the Virtual Router Redundancy Protocol.
- **VRRP router**
  A VRRP router is a physical router with VRRP enabled. The VRRP router is part of 1 or more virtual routers.
- **Master router**
  The master router is the physical router within a virtual domain that is responsible for forwarding data packets and responding to ARP queries. The master router periodically sends messages (advertisements) to the backup routers in the virtual domain to inform them about its existence. The backup routers save the advertisement interval and VRRP priority contained in the master router advertisements to calculate the master down time and skew time.
IP address owner
The IP address owner is the VRRP router whose IP address is identical to the IP address of the virtual router. By definition, it has the VRRP priority of 255 and is thus automatically the master router.

Backup router
When the master router fails, the backup router is a VRRP router providing a stand-by route for the master router. The backup router is ready to take over the master role.

VRRP priority
The VRRP priority is a number from 1 through 255. VRRP uses the priority number to determine the master router. VRRP reserves the priority value 255 for the IP address owner.

VRID
The virtual router ID (VRID) uniquely identifies a virtual router. The VRID defines the last octet of the virtual router MAC address.

Virtual router MAC address
The MAC address of the virtual router instance (see figure 96).

Virtual router IP address
The IP address of the virtual router instance.

Advertisement interval
The advertisement interval describes the frequency with which the master router sends advertisements to the backup routers within the same virtual router. The values for the advertisement interval are from 1 through 255 seconds. The default interval value for VRRP advertisements is 1 second.

Skew time
The skew time uses the VRRP priority of the master router to determine how long a backup router waits, after declaring the master down, until it initiates the master router election process. Skew time = ((256 - VRRP priority) / 256) * 1 second

Master down interval
The master down interval uses the advertisement interval of the master router to specify the time that elapses before a backup router declares the master down. Master down interval = 3 * advertisement interval + skew time

Configuration of VRRP
The configuration of VRRP requires the following steps:
- Enable the Routing function globally.
- Enable VRRP globally.
- Assign an IP address and subnet mask to the port.
- Enable VRRP on the port.
- Create the virtual router ID (VRID), because you have the option of activating multiple virtual routers on each port.
- Assign the virtual router IP address.
- Enable the virtual router.
- Assign the VRRP priority.
You specify every active VRRP port the same way.
You also perform the same configuration on the backup router.

13.6.2 HiVRRP

HiVRRP provides a number of mechanisms for shortening the failover times or reducing the number of Multicasts:
- shorter advertisement intervals
- link-down notification
- pre-empt delay
- Unicast advertisement
- domains

```
enable
configure
ip routing
ip vrrp operation
interface 1/3
ip address primary 10.0.1.1 255.255.255.0
ip routing
ip vrrp add 1
ip vrrp virtual-address add 1 10.0.1.100
ip vrrp 1 priority 200
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Enable the Routing function globally.
Enables VRRP globally.
Change to the interface configuration mode of interface 1/3.
Specifies the primary IP address and the netmask of the router interface.
Enables the Routing function on this interface.
Creates the VRID for the first virtual router on this port.
Assigns virtual router 1 its IP address.
Assigns virtual router 1 the router priority 200.
As defined in RFC 3768, the VRRP master sends IP Multicast messages (advertisements) at intervals of 1 second to the backup routers. When 3 intervals pass without the backup routers receiving an advertisement, the backup routers initiate a master router election process to select a new master. VRRP has a typical failover time of 3 to 4 seconds.

**Figure 97:** Master router <-> backup router failover times according to RFC 2338

- **VRRP priority router A = 64**
- **VRRP priority router B = 128**
- **VRRP priority router C = 254**
To be able to achieve faster failover times, Hirschmann developed HiVRRP which shortens the cycle for sending the IP Multicast message to as little as 0.1 seconds. You thus achieve failover times that are up to 10 times faster than VRRP.

The router supports up to 16 VRRP router interfaces with this shortened sending cycle.

- **HiVRRP skew time**
  The HiVRRP skew time uses the VRRP priority of the master router to determine how long a HiVRRP backup router waits, after declaring the HiVRRP master down, until it initiates the master router election process.
  \[ \text{HiVRRP skew time} = \frac{(256 - \text{VRRP priority})}{256} \times \text{advertisement interval} \]
  Times displayed in milliseconds.

- **HiVRRP master down interval**
  The HiVRRP master down interval uses the advertisement interval of the HiVRRP master router to specify the time the elapse before a HiVRRP backup router declares the HiVRRP master down.
  \[ \text{HiVRRP master down interval} = 3 \times \text{advertisement interval} + \text{HiVRRP skew time} \]
  Times displayed in milliseconds.

![Figure 98: Master router <-> backup router failover times according to HiVRRP](image)

Another option provided by HiVRRP for shortening the failover times dramatically is the link-down notification. When the virtual router consists of 2 VRRP routers, you use this function. When 2 VRRP routers are participating, it is sufficient to send the link-down notification in the form of a Unicast message. In contrast to the Multicast message, the Unicast message travels beyond the boundaries of the subnetwork. This means that in cases where the data link is down to your own subnetwork, the link-down notification also travels through other subnetworks to reach the second router of the virtual router.

As soon as HiVRRP detects that the data link is down, it sends the link-down notification to the second router through a different route. The second router takes over the master function immediately after receiving the link-down notification.
In the pre-empt mode, the backup router takes over the master role from the master router as soon as the backup router receives an advertisement from the master router in which the VRRP priority of the master router is lower than its own.

Thus, the pre-empt mode enables a failover to a better router. However, dynamic routing procedures take a certain amount of time to react to changed routes and refill their routing table.

To help protect against losing packets during this time, delayed failover (pre-empt delay) from the master router to the backup router enables the dynamic routing procedure to fill the routing tables.

HiVRRP provides an additional advantage for networks with devices that have difficulties with higher volumes of Multicasts. When using up to 2 HiVRRP routers, instead of sending advertisements in the form of Multicasts, HiVRRP sends the advertisements in the form of Unicast data packets on the VRRP destination address.

Note: When you want the advantages of HiVRRP, only use VRRP routers equipped with the HiVRRP function from Hirschmann in the virtual router.

### 13.6.3 HiVRRP Domains

Large HiVRRP domains with a flat network structure enable you to:

- use the HiVRRP routers very rapid failover for redundancy
- use the available bandwidth more effectively
- specify more than 16 VRRP router interfaces for each router using HiVRRP
- operate Multicast-sensitive end devices in large HiVRRP networks

An HiVRRP instance is a router interface specified as HiVRRP with functions that HiVRRP contains. In an HiVRRP domain you combine multiple HiVRRP instances of the routers into 1 administrative unit. You nominate 1 HiVRRP instance as the supervisor of the HiVRRP domain. This supervisor regulates the behavior of the HiVRRP instances in its domain.

- The supervisor sends its advertisements on behalf of every HiVRRP instance in its domain.
- The supervisor assigns itself the master role and the other HiVRRP instances the backup role.

See figure 99 for an example of a flat network structure. Every cross-VLAN data stream passes through the ring.

![HiVRRP Diagram](image-url)

**Figure 99:** Example of how a HiVRRP domain is used
Configuration of HiVRRP domains

The configuration of HiVRRP domains consists of the following steps:

- Create VLANs
- Specify VLAN router interfaces
- Assign the IP addresses to the router interfaces
- Specify HiVRRP instances
  - Activate every VRRP instance
  - Assign an IP address to every instance
    - Within a router, you either specify every instance as IP address owners, or every instance as an IP address non-owner.
  - Assign a priority to the supervisor
    - Assign the supervisors different priorities so that the VRRP routers agree on a master router.
  - Enable every HiVRRP instance
  - Assign an interface to the domain for every instance
  - Specify the sending interval of the supervisor
- Configure the HIPER-Ring for applications as in the above example
- Define the Ring ports as members of the VLANs
- Enable the Routing and VRRP functions globally
Example of configuration of HiVRRP domains

Example of possible settings for the application in figure 99:

Table 43: Configuration of the Switches in the subnetwork

<table>

<td>13</td>
</tr>
</tbody>
</table>

- Set up the VLAN router interface and assign an IP address:
  ```
  enable
  vlan database
  vlan add 11
  name 11 VLAN1
  routing add 11
  exit
  configure
  interface 1/1
  ip address primary 10.0.11.2 255.255.255.0
  ip routing
  exit
  interface vlan/11
  ip address primary 10.0.12.2 255.255.255.0
  ip routing
  exit
  ```

- Set up the virtual router and configure the port
Define the Ring port as a member of the VLAN

```plaintext
enable
configure
interface 1/2
vlan participation include 11
exit
```

---

### Define the Ring port as a member of the VLAN

1. `interface 1/1`
   - Change to the interface configuration mode of interface 1/1.
2. `ip vrrp add 1`
   - Creates the VRID for the first virtual router on this port.
3. `ip vrrp 1 virtual-address add 1 10.0.11.1`
   - Assigns virtual router 1 its IP address.
4. `ip vrrp modify 1 priority 200`
   - Assigns virtual router 1 the router priority 200.
5. `ip vrrp modify 1 domain-id 1`
   - Assigns the HiVRRP instance to domain 1.
6. `ip vrrp modify 1 domain-role supervisor`
   - Assigns the HiVRRP domain role to the interface.
7. `ip vrrp modify 1 interval 100`
   - Assigns the HiVRRP notification interval to the interface.
8. `ip vrrp enable 1`
   - Enables the first virtual router on this port.
9. `exit`
   - Change to the Configuration mode.
10. `exit`
    - Change to the Privileged EXEC mode.

---

### Show VRRP Configuration for VLAN 11

```
show ip vrrp interface 1/1 1
```

**VRRP instance information**

- **Admin State**: enabled
- **State**: init
- **Virtual MAC Address**: 00:00:5e:00:01:01
- **Base Priority**: 100
- **Current Priority**: 100
- **Advertisement Interval (milliseconds)**: 100
- **Pre-empt Mode**: enable
- **Accept ICMP Echo Requests**: enable
- **Preemption Delay (seconds)**: 0
- **Advertisement Address**: 224.0.0.18
- **Notification Address**: 0.0.0.0
- **Current Master Address**: 0.0.0.0
- **Master Candidate Address**: 0.0.0.0
- **Domain ID**: 1
- **Domain Role**: supervisor
- **Domain Status**: supervisor down

---

### Define the Ring port as a member of the VLAN

1. `enable`
2. `configure`
3. `interface 1/2`
4. `vlan participation include 11`
5. `exit`
Enable the **Routing** and **VRRP** functions globally.

```bash
exit
show vlan id 11
VRP preferences

VLAN ID......................... 11
VLAN Name...................... VLAN1
VLAN Type...................... static
VLAN Creation Time............ 0 days, 00:00:06 (System Uptime)

</tbody>
</table>
```

**13.6.4 VRRP with load sharing**

With the simple configuration, a router performs the gateway function for the end devices. The capacity of the backup router lies idle. VRRP lets you also use the capacity of the backup router. Setting up a number of virtual routers lets you enter different default gateways on the connected end devices and thus steer the data flow.

When both routers are active, the data flows through the router on which the IP address of the default gateway has the higher VRRP priority. When a router fails, the data flows through the remaining routers.

To use load sharing, you perform the following configuration steps:
- Define a second VRID for the same router interface.
- Assign the router interface its own IP address for the second VRID.
- Assign the second virtual router a lower priority than the first virtual router.
When configuring the backup router, verify that you assign the second virtual router a higher priority than the first.

Give the end devices one of the virtual router IP addresses as a default gateway.

### 13.6.5 VRRP with Multinetting

The router lets you combine VRRP with Multinetting.

To use VRRP with multinetting, you perform the following configuration steps on the basis of an existing VRRP configuration (see figure 95):

- Assign a second (secondary) IP address to the port.
- Assign a second (secondary) IP address to the virtual router.

```
Interface 2/3

ip address secondary 10.0.2.1 255.255.255.0
ip vrrp virtual-address add 1 10.0.2.100

Select the port at which you want to configure multinetting.
Assign the second IP address to the port.
Assign a second IP address to the virtual router with the VRID 1.
```

Perform the same configuration on the backup router.
13.7 RIP

The Routing Information Protocol (RIP) is a routing protocol based on the distance vector algorithm. It is used for the dynamic creation of the routing table for routers.

When you start a router, the router only knows the networks directly connected to it, and it sends this routing table to the neighboring routers. At the same time, it requests the routing tables of its neighboring routers. The router adds this information to its routing table and thus learns which networks can be accessed via which routers, and how much effort is involved in this. In order to detect changes in the network (when a router fails or starts), the routers regularly exchange the routing tables, usually every 30 seconds.

The costs, also known as the metric, refer to the work involved in reaching a particular network. RIP uses the Hop count for this, which describes the number of routers that are traversed along the path to the destination network. The name 'distance vector' is derived from the fact that the distance (metric) is the criterion for determining the route, and the direction is specified by the next hop (vector). The next hop refers to the neighboring router along the path to the destination address.

An entry in the routing table consists of the address of the next hop, the destination address and the metric. The RIP routing table contains the direct route to the destination. This is the route with the smallest metric and the longest suitable network mask prefix.

![Figure 102: Counting Hops](image)

Table 45: Routing table to the figure above

<table>
<thead>
<tr>
<th>Router A</th>
<th>Router B</th>
<th>Router D</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Destination</strong></td>
<td><strong>Next Hop</strong></td>
<td><strong>Metric</strong></td>
</tr>
<tr>
<td>SN 10</td>
<td>local</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>SN 11</td>
<td>Router B</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In contrast to OSPF, a RIP router regularly exchanges the content of its entire routing table with its direct neighbor. Every router knows only its own routes and the routes of its neighbor. Thus it only has a local perspective.

When changes are made in the network, it takes a while until the routers have the same uniform view of the network. The process of achieving this condition is known as convergence.
13.7.1 Convergence

How does RIP react to changes in the topography?

In the following example of a line interruption between router B and router C, you can see the resulting changes in the address table:

Assumptions:
- The interruption occurs 5 seconds after router B sent its routing table.
- The routers send their routing table every 30 seconds (= factory setting).
- The interval between the time router A sends its routing table and router B sends its routing table is 15 seconds.

Time elapsing before convergence:

0 seconds:

Interruption

Link down between Router B and C identified, RIPv2 sends triggered updates

After 10 seconds:

Router A sends its routing table:

<table>
<thead>
<tr>
<th>Router A</th>
<th>Destination</th>
<th>Next Hop</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SN 10</td>
<td>local</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>SN 11</td>
<td>router B</td>
<td>2</td>
</tr>
</tbody>
</table>

Using the routing table from router A, router B sees that router A knows a connection to destination SN 11 with a metric of 2. Because it does not have its own connection to router C as the next hop to SN 11, router B changes its entry to destination SN 11. It enters router A as the next hop and increases the metric from router A by 1 to 3 (distance = learned distance + 1).

After 25 seconds router B sends its routing table:

<table>
<thead>
<tr>
<th>Router B</th>
<th>Destination</th>
<th>Next Hop</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SN 10</td>
<td>router A</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>SN 11</td>
<td>router A</td>
<td>3</td>
</tr>
</tbody>
</table>

Using the routing table from router B, router A sees that router B knows a connection to SN 11 with a metric of 3. So router A increases its metric for SN 11 by 1 to 4.
After 40 seconds router A sends its routing table:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Next Hop</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>SN 10</td>
<td>local</td>
<td>1</td>
</tr>
<tr>
<td>SN 11</td>
<td>router B</td>
<td>4</td>
</tr>
</tbody>
</table>

Using the routing table from router A, router B sees that router A knows a connection to destination SN 11 with a metric of 4. So router B increases its metric for SN 11 by 1 to 5.

After 55 seconds router B sends its routing table:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Next Hop</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>SN 10</td>
<td>router A</td>
<td>1</td>
</tr>
<tr>
<td>SN 11</td>
<td>router A</td>
<td>5</td>
</tr>
</tbody>
</table>

Using the routing table from router B, router A sees that router B knows a connection to SN 11 with a metric of 5. So router A increases its metric for SN 11 by 1 to 6. Because router A can see in the routing table from router D that router D has a connection to SN 11 with the smaller metric of 3, router A changes its entry for SN 11.

After 70 seconds router A sends its routing table:

<table>
<thead>
<tr>
<th>Destination</th>
<th>Next Hop</th>
<th>Metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>SN 10</td>
<td>Router A</td>
<td>1</td>
</tr>
<tr>
<td>SN 11</td>
<td>Router D</td>
<td>4</td>
</tr>
</tbody>
</table>

After 70 seconds, convergence has been achieved again.

### 13.7.2 Maximum Network Size

The main disadvantage of RIP is that routers only know their neighbors directly. This results in long convergence times and the count-to-infinity problem. Infinity refers to the inaccessibility of a destination, and it is designated by Hop count 16 in RIP. If the above example did not contain the parallel path via routers D, E and F, then routers A and B would keep sending their routing tables until the metric reached a value of 16. Then the routers recognize that the destination is inaccessible.
Using the “split horizon” approach decreases possible looping problems between two neighboring routers. Split horizon has two operating modes.

Simple split horizon When sending the routing table to a neighbor, simple split horizon omits the entries known by the neighbor.

Simple split horizon with poison reverse Sends the routing table to a neighbor with the entries known by this neighbor, but denotes these entries with the infinity metric (=16).

Thus the Hop count 16 specifies the maximum size of a network with RIP as the routing procedure. The longest paths can pass through up to 15 routers.

13.7.3 General Properties of RIP

The RFC 1058 from June 1988 specifies RIP version 1. Version 1 has the following restrictions:
- Use of broadcasts for protocol messages.
- Does not support subnetworks/CIDR.
- No authentication.

The standardization of RIP version 2 in the RFC 2453 in 1998 does away with the above restrictions.

RIP V2 sends its protocol messages as a multicast with the destination address 224.0.0.9, and supports subnetwork masks and authentication.

However, the restrictions relating to the size of the network remain.

Table 46: Advantages and disadvantages of Vector Distance Routing

<table>
<thead>
<tr>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Easy to implement</td>
<td>Routing tables in large networks very comprehensive</td>

</tr>
<tr>
<td></td>
<td>the routing table only contains existing paths.</td>
</tr>
<tr>
<td></td>
<td>Count-to-infinity</td>
</tr>
</tbody>
</table>

13.7.4 Configuring the RIP

The advantage of RIP is the simple configuration. After the router interface is defined and the RIP is switched on, RIP automatically enters the required routes in the routing table.

Figure 104: Example of the configuration of RIP
The configuration of RIP requires the following steps:
- Configure router interfaces – assign IP address and network mask.
- Activate RIP on the port.
- Enable RIP globally.
- Enable routing globally (if this has not already been done).

**Configuration for Router B**

```plaintext
enable
configure

interface 2/2
ip address primary 10.0.3.1 255.255.255.0
ip routing
exit

interface 2/1
ip address primary 10.0.2.2 255.255.255.0
ip routing
ip rip operation
exit

show ip rip interface 2/1
```

Admin mode............................... active
IP address................................. 10.0.2.2
Send version.............................. ripv2
Receive version........................... both
Authentication Type...................... none

Change to the Privileged EXEC mode.
Change to the Configuration mode.

Change to the interface configuration mode of interface 2/2.
Assign the IP parameters to the interface.

Activate the *Routing* function on this interface.
Change to the Configuration mode.

Change to the interface configuration mode of interface 2/1.
Assign the IP parameters to the interface.

Activate the *Routing* function on this interface.
Activate RIP on this interface.
Change to the Configuration mode.

Verify the settings for the RIP configuration.
The IP address entries remain at 0.0.0.0 as long as the Routing function is globally inactive.

```plaintext
ip rip re-distribute connected
Tell RIP to send the routes of the locally connected interfaces along with the learned routes in the RIP information

ip rip operation
Activate RIP globally.

ip routing
Enable the Routing function globally.

show ip rip interface
Verify the settings for the RIP configuration.

```

### Interface IP Address Send Version Receive Version Authent Active
```

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2/1</td>
<td>10.0.2.2</td>
<td>ripv2</td>
<td>both</td>
<td>none</td>
</tr>
</tbody>
</table>
```

Show ip route all
Verify the routing table:

```plaintext
```

### Network Address Protocol Next Hop IP Next Hop IF Pref Active
```

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.1.0/24</td>
<td>RIP</td>
<td>10.0.2.1</td>
<td>2/1</td>
<td>0</td>
</tr>
<tr>
<td>10.0.2.0/24</td>
<td>Local</td>
<td>10.0.2.2</td>
<td>2/1</td>
<td>0</td>
</tr>
<tr>
<td>10.0.3.0/24</td>
<td>Local</td>
<td>10.0.3.1</td>
<td>2/2</td>
<td>0</td>
</tr>
</tbody>
</table>
```

Also perform the corresponding configuration on the other RIP routers.
13.8 OSPF

Open Shortest Path First (OSPF) is a dynamic routing protocol based on the Link State Algorithm. This algorithm is based on the link states between the routers involved.

The significant metric in OSPF is the "OSPF costs", which is calculated from the available bit rate of a link.

OSPF was developed by IETF. OSPF is currently specified as OSPFv2 in RFC 2328. Along with many other advantages of OSPF, the fact that it is an open standard has contributed to the wide usage of this protocol. OSPF has replaced the Routing Information Protocol (RIP) as the standard Interior Gateway Protocol (IGP) in large networks.

OSPF has a number of significant advantages to offer:
- Cost-based routing metrics: In contrast to RIP, OSPF provides clear metrics based on the bandwidth of each individual network connection. OSPF provides major flexibility in designing a network, because the user can change these costs.
- Routing using multiple paths (equal cost multiple path/ECMP): OSPF is able to support a number of equal paths to a given destination. OSPF thus provides efficient utilization of the network resources (load distribution) and improves the availability (redundancy).
- Hierarchical routing: By logically dividing the network into areas, OSPF shortens the time required to distribute routing information. The messages about changes in a subnetwork remain within the subnetwork, without putting any load on the rest of the network.
- Support of Classless Inter-Domain Routing (CIDR) and Variable Length Subnet Mask (VLSM): This lets the network administrator assign the IP address resources efficiently.
- Fast tuning time: OSPF supports the fast distribution of messages about route changes. This speeds up the tuning time for updating the network topology.
- Saving network resources / bandwidth optimization: Because OSPF, in contrast to RIP, does not exchange the routing tables at regular, short intervals, no bandwidth is unnecessarily "wasted" between the routers.
- Support of authentication: OSPF supports the authentication of nodes that send routing information.

### Table 47: Advantages and disadvantages of Link State Routing

<table>
<thead>
<tr>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Every router calculates its routes independently of the other routers.</td>
<td>Complicated to implement</td>
</tr>
<tr>
<td>The routers have the same basic information.</td>
<td>Complex administration due to the large number of options.</td>
</tr>
<tr>
<td>Rapid detection of link interruptions and rapid calculation of alternative routes.</td>
<td></td>
</tr>
<tr>
<td>The data volume for router information is relatively small, because information is only sent in cases where it is required, and only the information that applies to the immediate neighbors.</td>
<td></td>
</tr>
<tr>
<td>Optimal path selection through evaluation of the link quality.</td>
<td></td>
</tr>
<tr>
<td>OSPF is a routing protocol based on the states of the links between the routers.</td>
<td></td>
</tr>
</tbody>
</table>

Using the link states collected from every router and the Shortest Path First algorithm, an OSPF router dynamically creates its routing table.
13.8.1 OSPF-Topology

OSPF is hierarchically structured in order to limit the scope of the OSPF information to be exchanged in large networks. You divide up your network using what are known as areas.

Autonomous System

An Autonomous System (AS) is a number of routers that are managed by a single administration and use the same Interior Gateway Protocol (IGP). Exterior Gateway Protocols (EGP), on the other hand, are used to connect a number of autonomous systems. OSPF is an Interior Gateway Protocol.

Figure 105: Autonomous System

An AS uses an “Autonomous System Boundary Router” (ASBR) to connect with the outside world. An ASBR understands multiple protocols and serves as a gateway to routers outside the areas. An ASBR is able to transfer routes from different protocols into OSPF. This process is known as redistribution.

Router ID

The router ID in the form of an IP address is used to uniquely identify every router within an autonomous system. To improve the transparency, it is necessary to manually configure the router ID of every OSPF router. Thus there is no automatic function that selects the router ID from the IP interfaces of the router.

```
enable
configure
ip ospf router-id 192.168.1.2
ip ospf operation
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Assign router ID, for example 192.168.1.2.
Enable OSPF globally.
Areas

Each area first forms its own database using the link states within the area. The data exchange required for this remains within the area. Each area uses an Area Border Router (ABR) to link to other areas. The routing information is summarized as much as possible between the areas (route summarization).

Every OSPF router has to be a member of at least one area.

An individual router interface can only be assigned to one area. By default, every router interface is assigned to the backbone area.
OSPF distinguishes between the following particular area types:

► Backbone Area:
This is by definition the area 0.0.0.0. An OSPF network consists of at least the backbone area. It is the central area, which is linked to the other areas directly. The backbone area receives the routing information and is responsible for forwarding this information.

► Stub Area:
When external LSAs are not to be flooded into the area, you define an area as a stub area. External means outside the autonomous system. These external LSAs are the yellow and orange links in the See figure 106 on page 307. illustration. Thus the routers within a stub area only learn internal routes (blue links – for example no routes that are exported into OSPF from another log / redistributing). The destinations outside the autonomous system are assigned to a default route. Stub areas are thus generally used in cases where only 1 router in the area has a link to outside the area. The use of stub areas keeps the routing table small within the stub area.

Configuration notes:
► For a stub area, the routers within the stub area have to be specified as stub routers.
► A stub area does not allow passage for a virtual link.
► The backbone area cannot be specified as a stub area.

► Not So Stubby Area (NSSA):
You define an area as NSSA in cases where the external (yellow) routes of a system directly connected to the NSSA that is outside your autonomous system are to be led into the area (redistributed). These external (yellow) LSAs then also lead from the NSSA to other areas in your autonomous system. External (orange) LSAs within your own autonomous system do not, on the other hand, lead into an NSSA.

By using NSSAs, you can integrate ASBRs into the area without foregoing the advantage of stub areas, namely that external routes from the backbone are not flooded into the corresponding area.

Thus NSSAs have the advantage that external routes coming from the backbone are not entered in the routing tables of the internal routers. At the same time, however, a limited number of external networks, which can be reached across the boundaries of the NSSA, can be propagated into the backbone area.

![Figure 106: LSA distribution into the area types](image)

Virtual Link

OSPF requires that the backbone area to be connected to every area. However, when this is not actually possible, OSPF provides a virtual link (VL) to connect parts of the backbone area with each other. See figure 108 on page 308. A VL even lets you connect an area that is connected with the backbone area via another area.

![Figure 107: Linking a remote area to the backbone area using a virtual link (VL)](image1)

![Figure 108: Expanding the backbone area using a virtual link (VL)](image2)

Configuration for expanding the backbone area (see figure 108):

**Router 1:**

1. `enable`
2. `configure`
3. `ip ospf area 1.1.1.1 virtual-link add 2.2.2.2`

   Change to the Privileged EXEC mode.
   Change to the Configuration mode.
   Enter the neighboring router ID for a virtual link in area 1.1.1.1.

**Router 2:**

1. `enable`
2. `configure`
3. `ip ospf area 1.1.1.1 virtual-link add 1.1.1.1`

   Change to the Privileged EXEC mode.
   Change to the Configuration mode.
   Enter the neighboring router ID for a virtual link in area 1.1.1.1.
**OSPF Router**

OSPF distinguishes between the following router types:

- **Internal router:**
  The OSPF interfaces of an internal router are within the same area.

- **Area Border Router (ABR):**
  ABRs have OSPF interfaces in a number of areas, including the backbone area. The ABRs thus participate in multiple areas. Where possible, you summarize a number of routes and send “Summary LSAs” to the backbone area.

- **Autonomous System Area Border Router (ASBR):**
  An ASBR is located on the boundary of an autonomous system and links OSPF to other autonomous systems / routing protocols. These external routes are transferred into OSPF using what is known as redistribution and are then summarized as “AS-external LSAs” and flooded into the area.
  Enable the redistributing explicitly.
  When you want to use subnetting, you enter this explicitly.
  In OSPF, the following “routing protocols” can be exported:
  - connected (local subnetworks on which OSPF is not switched on)
  - static (static routes)
  - RIP

**Link State Advertisement**

As a basis for building up a database using the link states, OSPF uses Link State Advertisements (LSA).

An LSA contains the following information:

- the router,
- the connected subnets,
- the routes that can be reached,
- the network masks and
- the metric.

OSPF distinguishes between the following LSA types:

- **Router LSAs (type 1 LSAs):**
  Every router sends a router LSA to every other router in the same area. They describe the state and the costs of the router links (router interfaces) that the router has in the corresponding area. Router LSAs are only flooded within the area.

- **Network LSAs (type 2 LSAs):**
  These LSAs are generated by the designated router, DR (see on page 311 “Setting up the Adjacency”) and are sent for every connected network/subnet within an area.

- **Summary LSAs (type 3 /type 4 LSAs):**
  Summary LSAs are generated by ABRs and describe inter-area destinations, meaning destinations in different areas of the same autonomous system.
  Type 3 LSAs describe targets for IP networks (individual routes or summarized routes).
  Type 4 LSAs describe routes to ASBRs.
AS-external LSAs (type 5 LSAs):
These LSAs are generated by ASBRs and describe routes outside the autonomous system. These LSAs are flooded everywhere except for stub areas and NSSAs.

NSSA external LSAs (type 7 LSAs):
A stub area does not flood any external routes (represented by type 5 LSAs) and therefore does not support any Autonomous System Border Routers (ASBRs) at its boundaries. Thus an ASBR cannot carry any routes from other protocols into a stub area.
RFC 1587 specifies the NSSAs functions. According to RFC 1587, the ASBRs send type 7 LSAs instead of type 5 LSAs for the external routes within an NSSA. These type 7 LSAs are then converted into type 5 LSAs by an ABR and flooded into the backbone area. This “translator role” is negotiated among the ABRs in an NSSA (the router with the highest router ID), but it can also be configured manually.

13.8.2 General Operation of OSPF

OSPF was specially tailored to the needs of larger networks and provides a fast convergence and minimum usage of protocol messages.

The concept of OSPF is based on the creation, maintenance and distribution of what is called the link state database. This data base describes

- every router within a routing domain (area) and
- their active interfaces and routes,
- how they are linked to each other and
- the costs of these links.

The routers within an area have an identical data base, which means that every router knows the exact topology within its area.

Every router plays its part in setting up the respective data base by propagating its local viewpoint as Link State Advertisements (LSAs). These LSAs are then flooded to the other routers within an area.

OSPF supports a range of different network types such as point-to-point networks (for example, packet over SONET/SDH), broadcast networks (Ethernet) or non-broadcast networks.

Broadcast networks are distinguished by the fact that a number of systems (end devices, switches, routers) are connected to the same segment and thus can be addressed simultaneously using broadcasts/multicasts.

OSPF generally performs the following steps in carrying out its tasks in the network:
- Setting up the Adjacencies using the Hello protocol
- Synchronizing the link state database
- Route calculation
13.8.3 Setting up the Adjacency

When a router boots, it uses what are called Hello packets to contact its neighboring routers. With these Hello packets, an OSPF router finds out which OSPF routers are near it and whether they are suitable for setting up an adjacency.

In broadcast networks such as Ethernet, the number of neighbors increases with the number of routers connected, as does the information exchange for clarifying and maintaining the Adjacency. To reduce these volumes within an area, OSPF uses the “Hello” protocol to determine a designated router (DR) within the corresponding area. Thus every router in an area only sets up the Adjacency with its designated router, instead of with every neighbor. The designated router is responsible for the distribution of the link state information to its neighbor routers.

For security reasons, OSPF provides for the selection of a backup designated router (BDR), which takes over the tasks of the DR in case the DR fails. The OSPF router with the highest router priority is the DR. The router priority is specified by the administrator. When routers have the same priority, the router with the higher router ID is selected. The router ID is the smallest IP address of a router interface. You configure this router ID manually during booting of the OSPF router “Router ID” on page 305.

![Figure 109: LSA distribution with designated router and backup designated router](image)

To exchange information, OSPF uses reserved multicast addresses.

<table>
<thead>
<tr>
<th>Destination</th>
<th>Multicast IP address</th>
<th>Mapped Multicast MAC address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Every OSPF router</td>
<td>224.0.0.5</td>
<td>01:00:5E:00:00:05</td>
</tr>
<tr>
<td>Designated routers</td>
<td>224.0.0.6</td>
<td>01:00:5E:00:00:06</td>
</tr>
</tbody>
</table>
Hello packets are also used to check the configuration within an area (area ID, timer values, priorities) and to monitor the Adjacencies. Hello packets are sent cyclically (Hello interval). When Hello packets are not received for a specific period (Dead interval), the Adjacency is terminated and the corresponding routes are deleted.

The Hello interval (default setting: 10 seconds) and the Dead interval (default setting: 40 seconds) can be configured for each router interface. When reconfiguring the timers, verify that they are uniform within an area.

```
enable
configure
interface 1/1
ip ospf hello-interval 20
ip ospf dead-interval 60
exit
exit
show ip ospf neighbor 1/1
```

<table>
<thead>
<tr>
<th>Neighbor ID</th>
<th>IP Address</th>
<th>Interface</th>
<th>State</th>
<th>Dead Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.1.1</td>
<td>10.0.1.1</td>
<td>1/1</td>
<td>Full</td>
<td></td>
</tr>
<tr>
<td>192.168.1.2</td>
<td>11.0.1.1</td>
<td>1/2</td>
<td>Full</td>
<td></td>
</tr>
<tr>
<td>192.168.1.3</td>
<td>12.0.1.1</td>
<td>1/3</td>
<td>Full</td>
<td></td>
</tr>
<tr>
<td>192.168.1.4</td>
<td>13.0.1.1</td>
<td>1/4</td>
<td>Full</td>
<td></td>
</tr>
</tbody>
</table>

The following list contains the states of the Adjacencies:

- **Down**: No Hello packets received yet
- **Init**: Receiving Hello packets
- **2-way**: Bidirectional communication, determination of the DR and the BDR
- **Exstart**: Determination of master/slave for LSA exchange
- **Exchange**: LSAs are exchanged or flooded
- **Loading**: Completion of the LSA exchange
- **Full**: Data basis complete and uniform in the area. Routes can now be calculated

### 13.8.4 Synchronization of the LSDB

The central part of the OSPF is the link state database (LSDB). This database contains a description of the network and the states of every router. The LSDB is the source for calculating the routing table and reflects the topology of the network. The LSDB is set up after the designated router or the backup designated router has been determined within an area (Broadcast networks).

To set up the LSDB and update any topology changes, the OSPF router sends link status advertisements (LSA) to the directly accessible OSPF routers. These link state advertisements consist of the interfaces and the neighbors of the sending OSPF router reachable through these interfaces. OSPF routers put this information into their databases and flood the information to the ports.

When no topology changes occur, the routers send a LSA every 30 minutes.
You can view the content of the Link State Database with the command `show ip ospf database` using the Command Line Interface, whereby the entries are output in accordance with the areas.

```
enable
show ip ospf database internal
LSDB type Link ID
Area ID Adv Router Age Sequence Checksum
----------- --------------- ----- -------- ------
router link 192.168.1.1 122 80000007 0x5380
0.0.0.0 192.168.1.1
router link 192.169.1.1 120 80000007 0xbf0e
1.1.1.1 192.169.1.1
show ip ospf database external
Area ID Adv Router Age Sequence Checksum
----------- --------------- ----- -------- ------
1.1.1.1 192.169.1.1 178 80000002 0xcac
```

**13.8.5 Route Calculation**

After the LSDs are learned and the neighbor relationships go to the full state, every router calculates a path to every destination using the Shortest Path First (SPF) algorithm. After the optimal path to every destination has been determined, these routes are entered in the routing table. The route calculation is generally based on the accessibility of a hop and the metric (costs). The costs are added up for every hop to the destination.

The cost of individual router interfaces are based on the available bandwidth of this link. The calculation for the standard setting is based on the following formula:

\[
\text{Metric} = \frac{\text{Autocost reference bandwidth}}{\text{bandwidth (bits/sec)}}
\]

For Ethernet, this leads to the following costs:

<table>
<thead>
<tr>
<th>Bandwidth</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Mbit</td>
<td>10</td>
</tr>
<tr>
<td>100 Mbit</td>
<td>1</td>
</tr>
<tr>
<td>1000 Mbit</td>
<td>1 (0.1 rounded up to 1)</td>
</tr>
</tbody>
</table>

The table displays that this form of calculation in the standard configuration does not permit any distinction between Fast Ethernet and Gigabit Ethernet.

You can change the standard configuration by assigning a different value for the costs to each OSPF interface. This enables you to differentiate between Fast Ethernet and Gigabit Ethernet.

```
enable
configure
interface 1/1
ip ospf cost 2
```

Assigns the value 1/1 to port 2 for the OSPF costs.
13.8.6 Configuring OSPF

In the delivery state, the default values are selected so that you can configure simple OSPF functions in a few steps. After the router interface is specified and OSPF is enabled, OSPF automatically enters the required routes in the routing table.

The example below displays a simple OSPF configuration. Area 0.0.0.0 is already specified by default. The end devices do not have an OSPF function, so you do not have to activate OSPF on the corresponding router interface. By activating the Redistribution function, you can inject the routes to the end devices into the OSPF.

Figure 110: Example of the configuration of OSPF

The configuration of OSPF requires the following steps:

- Configure router interfaces – assign IP address and network mask.
- Activate OSPF on the port.
- Enable OSPF globally.
- Enable routing globally (if this has not already been done).
Configuration for Router B

```
enable
configure
interface 2/2
   ip address primary 10.0.3.1 255.255.255.0
   ip routing
   ip ospf operation
   exit

interface 2/1
   ip address primary 10.0.2.2 255.255.255.0
   ip routing
   ip ospf operation
   exit

   ip ospf router-id 10.0.2.2
   ip ospf operation
   ip ospf re-distribute connected
       [subnets]

   exit
   exit

show ip ospf global
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 2/2.
Assign the IP parameters to the port.
Activate routing on this port.
Activate OSPF on this port.
Change to the Configuration mode.
Change to the interface configuration mode of interface 2/1.
Assign the IP parameters to the port.
Activate routing on this port.
Activate OSPF on this port.
Change to the Configuration mode.
Assign router ID 10.0.2.2 to router B.
Enable OSPF globally.
Specify the OSPF parameters for the following actions:
- send the routes of the locally connected interfaces along with the routes learned from the RIP information
- include subnetworks without OSPF in OSPF (CIDR).
Change to the Configuration mode.
Change to the Privileged EXEC mode.
Display the settings for the global OSPF configuration.
Also perform the corresponding configuration on the other OSPF routers.

```
show ip ospf interface 2/1
```

Display the settings for the OSPF interface configuration.

```

Routing
13.8 OSPF

13.8.7 Limiting the distribution of the routes using an ACL

With Redistributing enabled, OSPF distributes every static route configured in the device without further interference. The distribution of the `rip` routes and `connected` routes is analogous. You can restrict this behavior using Access Control Lists.

Using IP rules, you specify which routes the device distributes to other devices in OSPF:
- To distribute a few routes in OSPF, you use the explicit `permit` rules. Using the `permit` rules, you specify exactly which routes the device distributes in OSPF.
- To distribute many routes in OSPF, you use the explicit `deny` rules, combined with an explicit `permit` rule. The device then distributes every route except those specified with a `deny` rule.

In the following example, you restrict the distribution of static routes in OSPF using Access Control Lists.

The example contains the following sections:
- Setting up and distributing routes
- Explicitly enabling a route using a permit rule
- Explicitly disabling a route using a deny rule

Setting up and distributing routes

On Router A, you configure 2 static routes for the subnets 8.1.2.0/24 and 8.1.4.0/24. Router A distributes these routes in OSPF to Router B. On router B, you check the distribution of the routes configured on router A.

```
show ip route all
Display the router table:

<table>
<thead>
<tr>
<th>Network Address</th>
<th>Protocol</th>
<th>Next Hop IP</th>
<th>Next Hop If</th>
<th>Pref</th>
<th>Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.1.0</td>
<td>OSPF</td>
<td>10.0.2.1</td>
<td>2/1</td>
<td>110</td>
<td>[x]</td>
</tr>
</tbody>
</table>
```

8.1.2.0/24

8.1.4.0/24
**Router A**

- **Enable routing globally.**
  - `enable`
  - `configure`
  - `ip routing`

- **Setting up the first router interface 10.0.1.1/24.**
  - Activate routing.
  - Activate OSPF on the router interface.
  - `interface 1/1`
  - `ip address primary 10.0.1.1 255.255.255.0`
  - `ip routing`
  - `ip ospf operation`
  - `exit`

- **Setting up the second router interface 10.0.2.1/24.**
  - Activate routing.
  - Activate OSPF on the router interface.
  - `interface 1/2`
  - `ip address primary 10.0.2.1 255.255.255.0`
  - `ip routing`
  - `ip ospf operation`
  - `exit`

- **Enable OSPF globally.**
  - `ip ospf router-id 10.0.1.1`
  - `ip ospf operation`
  - `show ip route all`

- **Configure and distribute static routes**
  - `enable`
  - `configure`

---

**Routing**

**13.8 OSPF**

UM Config RSP

Release 8.1 12/2019
Configure the static route 8.1.2.0 through the gateway 10.0.2.2.
Configure the static route 8.1.4.0 through the gateway 10.0.2.4.
Distribute the configured routes in OSPF.

- ip route add 8.1.2.0 255.255.255.0 10.0.2.2
- ip route add 8.1.4.0 255.255.255.0 10.0.2.4
- ip ospf re-distribute static subnets enable
Router B

- Enable routing globally.
  ```
  enable
  configure
  ip routing
  ```

- Setting up the router interface 10.0.1.2/24.
  Activate routing.
  Activate OSPF on the router interface.
  ```
  interface 2/2
  ip address primary 10.0.1.2 255.255.255.0
  ip routing
  ip ospf operation
  exit
  show ip route all
  ```

- Enable OSPF globally.
  ```
  ip ospf router-id 10.0.1.2
  ip ospf operation
  ```

- Directly connect the port of the router interface 10.0.1.2 to the first router interface of router A.
  Check the availability of the OSPF neighbors.
  ```
  show ip ospf neighbor
  ```

- Check the distribution of the routes configured on router A.
  Router A distributes both configured routes.
  ```
  show ip route all
  ```
To explicitly enable a route with a permit rule, refer to the “Explicitly enabling a route using a permit rule” on page 321 section.

To explicitly disable a route with a deny rule, refer to the “Explicitly disabling a route using a deny rule” on page 323 section.

**Explicitly enabling a route using a permit rule**

The route for the 8.1.2.0/24 subnet is enabled for distribution in OSPF.

- Using a **permit** rule, you explicitly enable the route for the 8.1.2.0/24 subnet.
- Due to the implicit **deny** rule embedded in the device, every other route is disabled for distribution in OSPF.
Router A

- Set up an Access Control List with an explicit permit rule.

```plaintext
ip access-list extended name OSPF-rule
permit src 8.1.2.0-0.0.0.0 dst 255.255.255.0-0.0.0.0 proto ip
```

Create the OSPF-rule Access Control List and set up a permit rule for the 8.1.2.0 subnet.
* src 8.1.2.0-0.0.0.0 = address of the destination network and inverse mask
* dst 255.255.255.0-0.0.0.0 = mask of the destination network and inverse mask

The device lets you assign the address and mask of the destination network with bit-level accuracy using the inverse mask.

- Check the configured rules.

```plaintext
show access-list ip
```

Display the configured Access Control Lists and rules.

<table>
<thead>
<tr>
<th>Index</th>
<th>AcName</th>
<th>RuleNo</th>
<th>Action</th>
<th>SrcIP</th>
</tr>
</thead>
<tbody>

<tr>
<td>Established</td>
<td>False</td>
</tr>
<tr>
<td>ICMP Type</td>
<td>0</td>
</tr>
<tr>
<td>ICMP Code</td>
<td>0</td>
</tr>
</tbody>
</table>

```

- Apply the Access Control List to OSPF.

```plaintext
ip ospf distribute-list out static OSPF-rule
```

Apply the OSPF-rule Access Control List to OSPF.
Router B

- Check the distribution of the routes configured on router A
- Router A only distributes the route for the subnet 8.1.2.0/24 due to the configured Access Control List.

show ip route all

<table>
<thead>
<tr>
<th>Network Address</th>
<th>Protocol</th>
<th>Next Hop IP</th>
<th>Next Hop If</th>
<th>Pref</th>
<th>Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1.2.0/24</td>
<td>OSPF</td>
<td>10.0.1.2</td>
<td>2/2</td>
<td>0</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.1.0/24</td>

<td>0</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.2.0/24</td>
<td>OSPF</td>
<td>10.0.1.2</td>
<td>2/2</td>
<td>0</td>
<td>[x]</td>
</tr>
</tbody>
</table>

Checking the router table:

Explicitly disabling a route using a deny rule

The route for the 8.1.4.0/24 subnet is disabled for distribution in OSPF.

- Using an explicit **permit**-rule, you enable every rule for distribution in OSPF.
- Using a **deny** rule, you explicitly disable the route for the 8.1.4.0/24 subnet.
Router A
- Delete permit rule.
  These steps are necessary only in case you have configured a permit rule, as described in section “Explicitly enabling a route using a permit rule” on page 321.

  ```
  no ip ospf distribute-list out static OSPF-rule
  ip access-list extended del OSPF-rule
  ```

- Set up an Access Control List with an explicit deny rule.

  ```
  ip access-list extended name OSPF-rule
deny src 8.1.4.0-0.0.0.0 dst 255.255.255.0-0.0.0.0 proto ip
  ```

- Apply the Access Control List to OSPF.

  ```
  ip ospf distribute-list out static OSPF-rule
  ```

Router B
- Check the distribution of the routes configured on router A
  Due to the implicit deny rule embedded in the device, Router A does not distribute routes.

  ```
  show ip route all
  ```

  Checking the router table:

<table>
<thead>
<tr>
<th>Network Address</th>
<th>Protocol</th>
<th>Next Hop IP</th>
<th>Next Hop If</th>
<th>Pref</th>
<th>Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1.2.0/24</td>
<td>OSPF</td>
<td>10.0.1.2</td>
<td>2/2</td>
<td>0</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.1.0/24</td>
<td>Local</td>
<td>10.0.1.2</td>
<td>2/2</td>
<td>0</td>
<td>[x]</td>
</tr>
<tr>
<td>10.0.2.0/24</td>
<td>OSPF</td>
<td>10.0.1.2</td>
<td>2/2</td>
<td>0</td>
<td>[x]</td>
</tr>
</tbody>
</table>

  The route 10.0.2.0/24 remains available because the Access Control List helps prevent only the distribution of static routes.
**Router A**

- Adding the explicit `permit` rule to Access Control List.

```
ip access-list extended name OSPF-rule
permit src any dst any proto ip
```

Add a permit rule for every subnet to the OSPF-rule Access Control List.

- Check the configured rules.

```
show access-list ip
```

Display the configured Access Control Lists and rules.

<table>
<thead>
<tr>
<th>Index</th>
<th>AclName</th>
<th>RuleNo</th>
<th>Action</th>
<th>SrcIP</th>
<th>DestIP</th>
</tr>

Checking the router table:
13.9 Protocol-based VLANs

Along with port-based VLANs based on IEEE 802.1Q, the device also supports protocol-based VLANs based on IEEE 802.1v.

With port-based VLANs, the device uses the port VLAN ID of the receiving port to determine which VLAN a data packet belongs to in cases where it is received without a VLAN tag.

With protocol-based VLANs, the router uses the protocol of the received data packet to determine which VLAN a data packet belongs to in cases where it is received without a VLAN tag.

The router lets you use the following protocols by name.

- IP
- ARP
- IPX

The device also supports other protocols using their numerical value. When the router receives data packets from protocols for which a rule does not exist, the router assigns the packets to the port VLAN.

For VLAN assignment, the router takes the following items into account in the order in which they are listed:

- the VLAN tag
- the protocol to which the data packet belongs
- the port VLAN ID

Protocol-based VLANs enable you to transfer data packets not relevant to routing across IP subnetwork boundaries. Data packets relevant to routing are IP and ARP data packets.

![Figure 111: Example of a protocol-based VLAN](image)

In the example, PC2 and Se1 communicate via IP. These data packets are routed.

The devices Ro1, Ro2 and PC1 communicate via other Ethernet-based protocols. These data packets are switched in VLAN 2.

Thus, every IP data packet remains in its subnetwork, apart from the IP data packets that are meant for a different subnetwork.

13.9.1 General Configuration

- Create a VLAN protocol group for each subnetwork.
- Assign the protocols to the VLAN protocol group for each subnetwork.
- Create the VLANs.
- Activate VLAN routing on the VLANs affected and thus creating the virtual router interfaces.
13.9 Protocol-based VLANs

- Assign the VLAN protocol groups to the VLANs.
- Configure the port interfaces:
  - VLAN membership
  - Port VLAN ID for non-ARP/IP data packets
  - Port of a VLAN protocol group and thus assign to a VLAN
- Configure the virtual router interfaces:
  - Assign IP address.
  - Activate routing.
- Enable routing globally.

### 13.9.2 Configuration of the Example

**enable**

Change to the Privileged EXEC mode.

**vlan database**

Change to the VLAN configuration mode.

**vlan add 3**

Create the VLAN 3.

**vlan add 4**

Create the VLAN 4.

**name 3 VLAN3**

Assign the name **VLAN3** to the VLAN 3.

**name 4 VLAN4**

Assign the name **VLAN4** to the VLAN 4.

**vlan protocol group add 1 name alpha**

Create VLAN protocol group 1 for the alpha subnet and assign the group to VLAN 3.

**vlan-id 3**

Create VLAN protocol group 2 for the alpha subnet and assign the group to VLAN 4.

**exit**

Change to the Privileged EXEC mode.

**show port protocol**

Display the VLAN protocol groups created.

<table>
<thead>
<tr>
<th>Idx</th>
<th>Group name</th>
<th>VLAN</th>
<th>Protocol(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>alpha</td>
<td>3</td>
<td>ip, arp</td>
</tr>
<tr>
<td>2</td>
<td>beta</td>
<td>4</td>
<td>ip, arp</td>
</tr>
</tbody>
</table>

**vlan database**

Change to the VLAN configuration mode.

**vlan protocol group add 1 ethertype ip**

Add the IP protocol to VLAN protocol group 1.

**vlan protocol group add 1 ethertype arp**

Add the ARP protocol to VLAN protocol group 1.

**exit**

Change to the Privileged EXEC mode.

**show port protocol**

Display the protocols assigned to the protocol groups.

<table>
<thead>
<tr>
<th>Idx</th>
<th>Group name</th>
<th>VLAN</th>
<th>Protocol(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>alpha</td>
<td>3</td>
<td>ip, arp</td>
</tr>
<tr>
<td>2</td>
<td>beta</td>
<td>4</td>
<td>ip, arp</td>
</tr>
</tbody>
</table>
Routing

13.9 Protocol-based VLANs

```bash
vlan database
vlan add 2
name 2 VLAN 2
routing add 3
routing add 4
exit

configure
interface 2/1
vlan participation exclude 1
vlan participation include 2
vlan participation include 3
vlan pvid 2
protocol vlan group 1
exit

interface 2/2
vlan participation exclude 1
vlan participation include 2
vlan participation include 4
vlan pvid 2
protocol vlan group 2
exit

interface 2/3
vlan participation exclude 1
vlan participation include 2
vlan pvid 2
exit

interface vlan/3
ip address primary 10.0.1.1 255.255.255.0
ip routing
```

Change to the VLAN configuration mode.
Create the VLAN 2.
Assign the name VLAN2 to the VLAN 2.
Create a virtual router interface and activate the Routing function on this interface.
Create a virtual router interface and activate the Routing function on this interface.
Change to the Privileged EXEC mode.

Change to the Configuration mode.
Change to the interface configuration mode of interface 2/1.
Remove port 2/1 from VLAN 1.
Declare port 2/1 a member of VLAN 2.
Declare port 2/1 a member of VLAN 3.
Specify port VLAN ID 2. Therefore, the device assigns non-IP/ARP data packets to VLAN 2.
Assign VLAN protocol group 1 to interface 2/1, which means that the device assigns non-IP/ARP data packets to VLAN 3.

Change to the Configuration mode.

Change to the interface configuration mode of interface 2/2.
Remove port 2/2 from VLAN 1.
Declare port 2/2 a member of VLAN 2.
Declare port 2/2 a member of VLAN 4.
Specify port VLAN ID 2. Therefore, the device assigns non-IP/ARP data packets to VLAN 2.
Assign VLAN protocol group 2/2 to interface 2, which means that the device assigns non-IP/ARP data packets to VLAN 4.

Change to the Configuration mode.

Change to the interface configuration mode of interface 2/3.
Remove port 2/3 from VLAN 1.
Declare port 2/3 a member of VLAN 2.
Specify port VLAN ID 2. Therefore, the device assigns data packets that the port receives without a VLAN tag to VLAN 2.

Change to the Configuration mode.

Change to the interface configuration mode of interface vlan/3.
Assign the IP parameters to the router interface.
Activate the Routing function on this interface.
exit

interface vlan/4

ip address primary 10.0.2.1 255.255.255.0
ip routing
exit

show ip interface

<table>
<thead>
<tr>
<th>Interface IP Address</th>
<th>IP Mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan/3  10.0.1.1</td>

</tr>
<tr>
<td>vlan/4  10.0.2.1</td>
<td>255.255.255.0</td>
</tr>
</tbody>
</table>

ip routing operation

Enable the Routing function globally.
Multicast data streams are data packets that a source sends to multiple recipients. To reduce the network load, the source uses a multicast address. The source thus sends each packet only once to the multicast address instead of sending it to each recipient individually. The recipients recognize a multicast data stream intended for them by the multicast address.

A common reason for introducing subnetworks is the restriction of broadcast data streams. Switches flood broadcast/multicast data streams to every port, while routers block broadcast/multicast data streams. Multicast routing enables you to accurately transmit multicast data streams beyond the boundaries of subnetworks. Accurate transmission means sending data streams with specified multicast addresses only to those devices that have requested the multicast data stream.

When using multicast routing observe the following guidelines:

- Defined multicast addresses
- Defined a protocol for multicast group registration that organizes the exchange of information by means of multicast data streams (for example IGMP). This information relates to reporting the network participants who request to receive multicast data streams and querying the request by means of intermediate devices.
- Defined a protocol that guides the multicast data streams in accordance with the information contained in the multicast datagrams (for example PIM, DVMRP).
### 13.10.1 Multicast Addresses

#### IP Multicast Addresses

The Internet Assigned Numbers Authority (IANA) defined the IP addresses of the class D IP address space as multicast addresses. IP multicast addresses are in the range from 224.0.0.0 to 239.255.255.255.

**Table 49: Assignment of the IP multicast address range**

<table>
<thead>
<tr>
<th>IP address range</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>224.0.0.0</td>
<td>Base address, reserved</td>
</tr>
<tr>
<td>224.0.0.1 - 224.0.0.255</td>
<td>Local Network Control Block, reserved for routing protocols, IGMP, etc. For example: 224.0.0.1 - every host of a subnetwork 224.0.0.2 - every router of a subnetwork 224.0.0.4 - every DVMRP router 224.0.0.5 - every OSPF router 224.0.0.6 - every OSPF DR router 224.0.0.9 - every RIP v2 router 224.0.0.13 - every PIM router 224.0.0.18 - every VRRP router 224.0.0.22 - every IGMP v3 report</td>
</tr>
<tr>
<td>224.0.1.0 - 224.0.1.255</td>
<td>Internetwork Control Block</td>
</tr>
<tr>
<td>224.0.2.0 - 224.0.255.255</td>
<td>AD HOC Block</td>
</tr>
<tr>
<td>224.1.0.0 - 238.255.255.255</td>
<td>Various organizations, protocols, applications, reservations. For example: 232.0.0.0-232.255.255.255 - Source-Specific Multicasts</td>
</tr>
<tr>
<td>239.0.0.0 - 239.255.255.255</td>
<td>Administratively scoped IP v4 multicast space These multicast addresses are not transferred by any router beyond the local boundaries and into the internet. Therefore the administrator can assign these addresses any way he wants within these local boundaries.</td>
</tr>
</tbody>
</table>

The administratively scoped IP v4 multicast area is subdivided further by the IANA:

**Table 50: Assignment of the administratively scoped IP v4 multicast area**

<table>
<thead>
<tr>
<th>IP address range</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>239.000.000.000 - 239.191.255.255</td>
<td>Reserved [IANA]</td>
</tr>
<tr>
<td>239.192.000.000 - 239.251.255.255</td>
<td>Organization-local scope [Meyer, RFC2365]</td>
</tr>
<tr>
<td>239.252.000.000 - 239.254.255.255</td>
<td>Site-local scope (reserved) [Meyer, RFC2365]</td>
</tr>
<tr>
<td>239.255.000.000 - 239.255.255.255</td>
<td>Site-local scope [Meyer, RFC2365]</td>
</tr>
</tbody>
</table>

In the end, the following multicast IP address ranges are left over for disposal by an organization's administrator:

- 239.192.000.000 - 239.251.255.255 for the local areas of an organization.
- 239.255.000.000 - 239.255.255.255 for the local areas of an organization.

**Note:** When selecting the multicast IP addresses, verify that they can be uniquely mapped onto MAC multicast addresses (see on page 334 “Mapping IP MAC Multicast Addresses”).
MAC Multicast Addresses

The IEEE calls the 48-bit MAC address an “Extended Unique Identifier”. It is the unique identifier of a device. The first 24 bits of the MAC address (Organizationally Unique Identifier, OUI) is assigned by the IEEE to the manufacturer. The manufacturer uses the last 24 bits to uniquely identify their device interfaces.

A number of MAC addresses are reserved for specific applications:

Table 51: Examples of reserved MAC addresses

<table>
<thead>
<tr>
<th>MAC-Address</th>
<th>Type</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>01-00-5E-00-00-00</td>
<td>0800</td>
<td>Internet multicast [RFC1112]</td>
</tr>
<tr>
<td>01-80-C2-00-00-00</td>
<td>-802-</td>
<td>Spanning tree (for bridges)</td>
</tr>
<tr>
<td>FF-FF-FF-FF-FF</td>
<td>0806</td>
<td>ARP (for IP and CHAOS) as needed</td>
</tr>
<tr>
<td>FF-FF-FF-FF-FF</td>
<td>8035</td>
<td>Reverse ARP</td>
</tr>
</tbody>
</table>

Mapping IP MAC Multicast Addresses

When IP data packets are sent via an ethernet, the IP address is assigned to a MAC address, and therefore IP multicast addresses are also mapped to MAC multicast addresses.

The 23 lower-value bits of the 32-bit IP multicast address make up the 23 lower-value bits of the 48-bit MAC multicast address.

Of the remaining 9 bits of the IP multicast address, 4 bits are used as the class D identification for the multicast address.

The remaining 5 bits help ensure that 32 IP multicast addresses can be mapped to one and the same MAC multicast address.

13.10.2 Multicast Group Registration

The Internet Group Management Protocol (IGMP) describes the distribution of multicast information between routers and end devices on Layer 3.

Routers with an active IGMP function periodically send queries to find out which IP multicast group members are connected to the LAN, or to find out who is interested in becoming a group member.
Multicast group members reply with a Report message. The Report message contains the parameters required by the IGMP. The router records the IP multicast group address from the Report message in its routing table. The result of this is that it transfers frames with this IP multicast group address in the target address field only in accordance with the routing table.

Devices which no longer want to be members of a multicast group can cancel their membership by means of a Leave message (from IGMP version 2), and they do not transmit any more Report messages. When the router does not receive any Report messages from a device within a specified period of time (aging time), the router removes it from the routing table.

When there are multiple routers with an active IGMP function in the subnetwork, the following rules apply:
- for IGMP version 1, every router in this subnetwork periodically sends a query
- for IGMP versions 2 and 3, the routers decide which router takes over the query function (Querier Election).

An advantage that IGMP version 2 has over IGMP version 1 is that a multicast recipient can cancel his membership in a multicast group, thus freeing up his bandwidth more quickly. Another advantage is the introduction of the Querier Election.

IGMP version 3 provides more security with the Source Filtering option. Multicast recipients can define the sources from which they want to receive multicast data streams. The router blocks multicast data streams with other source addresses.

The different versions of IGMP are backwards compatible.

This means that an IGMP version 3 router can also process version 1 and version 2. When there are different IGMP versions in a subnetwork, the participating routers agree on the earliest version.

### Table 52: Standards which describe the Multicast Group Membership Discovery

<table>
<thead>
<tr>

</tbody>
</table>

### Source of Information

- [RFC 1112](https://tools.ietf.org/html/rfc1112)
- [RFC 2236](https://tools.ietf.org/html/rfc2236)
- [RFC 3376](https://tools.ietf.org/html/rfc3376)
13.10.3 Scoping

In the multicast transmission, the protocol provides two options for limiting the expansion of the multicast data stream:

- **Multicast Address Scoping / Boundary**
  
  In the multicast Address Scoping, the administrator assigns a multicast IP address range to a router interface (see table 50). The router interface blocks the multicast data streams with addresses within this address range.
  
  **Example:**
  
  `ip mcast boundary 239.193.122.0 255.255.255.0`
  
  In this example, the router interface blocks multicast data streams with a multicast IP address in the range 239.193.122.0-239.193.122.255.

- **TTL Scoping**
  
  Every multicast data packet contains a Time To Live (TTL). When a router re-transmits a multicast data packet, the router decreases the TTL counter by 1. In TTL Scoping, the administrator assigns a TTL threshold to an interface. The router interface blocks every multicast data packet for which the TTL is below the TTL threshold.
  
  **Example:**
  
  `ip multicast ttl-threshold 64`
  
  In this example, the router interface blocks multicast data streams with a TTL whose value is less than 64.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Range</th>
</tr>
</thead>
<tbody>

<td>Restricted to the same region</td>
</tr>
<tr>
<td>&lt; 128</td>
<td>Restricted to the same continent</td>
</tr>
<tr>
<td>&lt; 255</td>
<td>Unrestricted, global</td>
</tr>
</tbody>
</table>
13.11 **Entering the IP Parameters**

To configure the Layer 3 function, you require access to the device management.

Depending on your own application, you will find many options for assigning IP addresses to the devices. The following example describes one option that often arises in practice. Although you have other prerequisites, this example shows the general method for entering the IP parameters and points out significant things that you should note.

The prerequisites for the following example are:

- All Layer 2 and Layer 3 devices have the IP address 0.0.0.0 (= default setting)
- The IP addresses of the devices and router interfaces and the gateway IP addresses are specified in the network plan.
- The devices and their connections are installed.
- Redundant connections are open (see VRRP and HIPER ring). To help avoid loops in the configuration phase, close the redundant connections only after the configuration phase.
Assign the IP parameters to your configuration computer. During the configuration phase, the configuration computer is located in subnet 100. This is necessary, so that the configuration computer has access to the Layer 3 devices throughout the entire configuration phase.

Start HiDiscovery on your configuration computer.

Assign the IP parameters to every Layer 2 and Layer 3 device in accordance with the network plan. When you have completed the following router configuration, you can access the devices in subnets 10 to 14 again.

Configure the **Routing** function for the Layer 3 devices. Note the sequence:
1. Layer 3 device C
2. Layer 3 device B

The sequence is necessary; you thus retain access to the devices.

When you assign an IP address from the subnetwork of the device management IP address (= SN 100) to a router interface, the device deletes the IP address of the device management. You access the device management via the IP address of the router interface.
Configure the **Routing** function for Layer 3 device A.
You first configure the router interface at a port to which the configuration computer is connected. The result of this is that in future you will access the Layer 3 device via subnet 10.

- Change the IP parameters of your configuration computer to the values for subnetwork 10. You thus access Layer 3 device A again, namely via the IP address of the router interface set up beforehand.

- Finish the router configuration for Layer 3 device A (see figure 116).

After configuring the **Routing** function on every Layer 3 device, you have access to every device.
14 Operation diagnosis

The device provides you with the following diagnostic tools:
- Sending SNMP traps
- Monitoring the Device Status
- Out-of-Band signaling using the signal contact
- Port status indication
- Event counter at port level
- Detecting non-matching duplex modes
- Auto-Disable
- Displaying the SFP status
- Topology discovery
- Detecting IP address conflicts
- Detecting loops
- Reports
- Monitoring data traffic on a port (port mirroring)
- Syslog
- Event log
- Cause and action management during selftest

14.1 Sending SNMP traps

The device immediately reports unusual events which occur during normal operation to the network management station. This is done by messages called SNMP traps that bypass the polling procedure ("polling" means querying the data stations at regular intervals). SNMP traps allow you to react quickly to unusual events.

Examples of such events are:
- Hardware reset
- Changes to the configuration
- Segmentation of a port

The device sends SNMP traps to various hosts to increase the transmission reliability for the messages. The unacknowledged SNMP trap message consists of a packet containing information about an unusual event.

The device sends SNMP traps to those hosts entered in the trap destination table. The device lets you configure the trap destination table with the network management station using SNMP.
### 14.1.1 List of SNMP traps

The following table displays possible SNMP traps sent by the device.

<table>
<thead>
<tr>
<th>Name of the SNMP trap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>authenticationFailure</td>
<td>When a station attempts to access an agent without authorisation, this trap is sent.</td>
</tr>
<tr>
<td>coldStart</td>
<td>Sent after a restart.</td>
</tr>
<tr>
<td>hm2DevMonSenseExtNvmRemoval</td>
<td>When the external memory has been removed, this trap is sent.</td>
</tr>
<tr>
<td>linkDown</td>
<td>When the connection to a port is interrupted, this trap is sent.</td>
</tr>
<tr>
<td>linkUp</td>
<td>When connection is established to a port, this trap is sent.</td>
</tr>
<tr>
<td>hm2DevMonSensePSState</td>
<td>When the status of a power supply unit changes, this trap is sent.</td>
</tr>
<tr>
<td>hm2SigConStateChange</td>
<td>When the status of the signal contact changes in the operation monitoring, this trap is sent.</td>
</tr>
<tr>
<td>newRoot</td>
<td>When the sending agent becomes the new root of the spanning tree, this trap is sent.</td>
</tr>
<tr>
<td>topologyChange</td>
<td>When the port changes from blocking to forwarding or from forwarding to blocking, this trap is sent.</td>
</tr>
<tr>
<td>alarmRisingThreshold</td>
<td>When the RMON input exceeds its upper threshold, this trap is sent.</td>
</tr>
<tr>
<td>alarmFallingThreshold</td>
<td>When the RMON input goes below its lower threshold, this trap is sent.</td>
</tr>
<tr>
<td>hm2AgentPortSecurityViolation</td>
<td>When a MAC address detected on this port does not match the current settings of the parameter hm2AgentPortSecurityEntry, this trap is sent.</td>
</tr>
<tr>
<td>hm2DiagSelftestActionTrap</td>
<td>When a self test for the four categories “task”, “resource”, “software”, and “hardware” is performed according to the configured settings, this trap is sent.</td>
</tr>
<tr>
<td>hm2MrpReconfig</td>
<td>When the configuration of the MRP ring changes, this trap is sent.</td>
</tr>
<tr>
<td>hm2DiagIfaceUtilizationTrap</td>
<td>When the threshold of the interface exceeds or undercuts the upper or lower threshold specified, this trap is sent.</td>
</tr>
<tr>
<td>hm2LogAuditStartNextSector</td>
<td>When the audit trail after completing one sector starts a new one, this trap is sent.</td>
</tr>
<tr>
<td>hm2PtpSynchronizationChange</td>
<td>When the status of the PTP synchronization has been changed, this trap is sent.</td>
</tr>
<tr>
<td>hm2ConfigurationSavedTrap</td>
<td>After the device has successfully saved its configuration locally, this trap is sent.</td>
</tr>
<tr>
<td>hm2ConfigurationChangedTrap</td>
<td>When you change the configuration of the device for the first time after it has been saved locally, this trap is sent.</td>
</tr>
<tr>
<td>hm2PlatformStpInstanceLoopInconsistentStartTrap</td>
<td>When the port in this STP instance changes to the “loop inconsistent” status, this trap is sent.</td>
</tr>
<tr>
<td>hm2PlatformStpInstanceLoopInconsistentEndTrap</td>
<td>When the port in this STP instance leaves the “loop inconsistent” status receiving a BPDU packet, this trap is sent.</td>
</tr>
</tbody>
</table>
14.1.2 SNMP traps for configuration activity

After you save a configuration in the memory, the device sends a **hm2ConfigurationSavedTrap**. This SNMP trap contains both the Non-Volatile Memory (NVM) and External Non-Volatile Memory (ENVM) state variables indicating whether the running configuration is in sync with the NVM, and with the ENVM. You can also trigger this SNMP trap by copying a configuration file to the device, replacing the active saved configuration.

Furthermore, the device sends a **hm2ConfigurationChangedTrap** whenever you change the local configuration, indicating a mismatch between the running and saved configuration.

14.1.3 SNMP trap setting

The device lets you send an SNMP trap as a reaction to specific events. Create at least 1 trap destination that receives SNMP traps.

Perform the following steps:

- Open the Diagnostics > Status Configuration > Alarms (Traps) dialog.
- Click the button. The dialog displays the Create window.
- In the Name frame, specify the name that the device uses to identify itself as the source of the SNMP trap.
- In the Address frame, specify the IP address of the trap destination to which the device sends the SNMP traps.
- In the Active column you select the entries that the device should take into account when it sends SNMP traps.
- To save the changes temporarily, click the button.

For example, in the following dialogs you specify when the device triggers an SNMP trap:

- **Basic Settings > Port** dialog
- **Network Security > Port Security** dialog
- **Switching > L2-Redundancy > Link Aggregation** dialog
- **Routing > OSPF > Global** dialog
- **Routing > Tracking > Configuration** dialog
- **Routing > L3-Redundancy > VRRP > Configuration** dialog
- **Diagnostics > Status Configuration > Device Status** dialog
- **Diagnostics > Status Configuration > Security Status** dialog
- **Diagnostics > Status Configuration > Signal Contact** dialog
- **Diagnostics > Status Configuration > MAC Notification** dialog
- **Diagnostics > System > IP Address Conflict Detection** dialog
- **Diagnostics > System > Selftest** dialog
- **Diagnostics > Ports > Port Monitor** dialog
14.1.4 ICMP messaging

The device lets you use the Internet Control Message Protocol (ICMP) for diagnostic applications, for example ping and trace route. The device also uses ICMP for time-to-live and discarding messages in which the device forwards an ICMP message back to the packet source device.

Use the ping network tool to test the path to a particular host across an IP network. The traceroute diagnostic tool displays paths and transit delays of packets across a network.
14.2 Monitoring the Device Status

The device status provides an overview of the overall condition of the device. Many process visualization systems record the device status for a device in order to present its condition in graphic form.

The device displays its current status as error or ok in the Device status frame. The device determines this status from the individual monitoring results.

The device enables you to:
- Out-of-Band signalling using a signal contact
- signal the changed device status by sending an SNMP trap
- detect the device status in the Basic Settings > System dialog of the Graphical User Interface
- query the device status in the Command Line Interface

The Global tab of the Diagnostics > Status Configuration > Device Status dialog lets you configure the device to send a trap to the management station for the following events:
- Incorrect supply voltage
  - at least one of the 2 supply voltages is not operating
  - the internal supply voltage is not operating
- When the device is operating outside of the user-defined temperature threshold
- Loss of the redundancy (in ring manager mode)
- The interruption of link connection(s)

Configure at least one port for this feature. When the link is down, you specify which ports the device signals in the Port tab of the Diagnostics > Status Configuration > Device Status dialog in the Propagate connection error row.
- The removal of the external memory.
- The configuration in the external memory is out-of-sync with the configuration in the device.

Select the corresponding entries to decide which events the device status includes.

Note: With a non-redundant voltage supply, the device reports the absence of a supply voltage. To disable this message, feed the supply voltage over both inputs or ignore the monitoring.

14.2.1 Events which can be monitored

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>Monitors in case the temperature exceeds or falls below the value specified.</td>
</tr>
<tr>
<td>Ring redundancy</td>
<td>When ring redundancy is present, enable this function.</td>
</tr>
<tr>
<td>Connection errors</td>
<td>Enable this function to monitor every port link event in which the Propagate connection error checkbox is active.</td>
</tr>
<tr>
<td>External memory removal</td>
<td>Enable this function to monitor the presence of an external storage device.</td>
</tr>
<tr>
<td>External memory not in sync</td>
<td>The device monitors synchronization between the device configuration and the configuration stored on the ENVM.</td>
</tr>
<tr>
<td>Power supply</td>
<td>Enable this function to monitor the power supply.</td>
</tr>
</tbody>
</table>
14.2.2 Configuring the Device Status

Perform the following steps:

- Open the Diagnostics > Status Configuration > Device Status dialog, Global tab.
- For the parameters to be monitored, mark the checkbox in the Monitor column.
- To send an SNMP trap to the management station, activate the Send trap function in the Traps frame.
- In the Diagnostics > Status Configuration > Alarms (Traps) dialog, create at least 1 trap destination that receives SNMP traps.
- To save the changes temporarily, click the button.
- Open the Basic Settings > System dialog.
- To monitor the temperature, at the bottom of the System data frame, you specify the temperature thresholds.
- To save the changes temporarily, click the button.

```
enable
configure
device-status trap

device-status monitor envm-not-in-sync
  Monitors the configuration profiles in the device and in the external memory. The Device status changes to error in the following situations:
  - The configuration profile only exists in the device.
  - The configuration profile in the device differs from the configuration profile in the external memory.

device-status monitor envm-removal
  Monitors the active external memory. When you remove the active external memory from the device, the value in the Device status frame changes to error.

device-status monitor power-supply 1
  Monitors the power supply unit 1. When the device has a detected power supply fault, the value in the Device status frame changes to error.

device-status monitor ring-redundancy
  Monitors the ring redundancy. The Device status changes to error in the following situations:
  - The redundancy function becomes active (loss of redundancy reserve).
  - The device is a normal ring participant and detects an error in its settings.

device-status monitor temperature
  Monitors the temperature in the device. When the temperature exceeds or falls below the specified limit, the value in the Device status frame changes to error.
```

In order to enable the device to monitor an active link without a connection, first enable the global function, then enable the individual ports.
Perform the following steps:

- Open the Diagnostics > Status Configuration > Device Status dialog, Global tab.
- For the Connection errors parameter, mark the checkbox in the Monitor column.
- Open the Diagnostics > Status Configuration > Device Status dialog, Port tab.
- For the Propagate connection error parameter, mark the checkbox in the column of the ports to be monitored.
- To save the changes temporarily, click the button.

```
enable
configure
device-status monitor link-failure
interface 1/1
device-status link-alarm
```

**Note:** The above commands activate monitoring and trapping for the supported components. When you want to activate or deactivate monitoring for individual components, you will find the corresponding syntax in the “Command Line Interface” reference manual or in the help of the Command Line Interface console. To display the help in Command Line Interface, insert a question mark ? and press the <Enter> key.

### 14.2.3 Displaying the Device Status

Perform the following steps:

- Open the Basic Settings > System dialog.

```
show device-status all
```

In the EXEC Privilege mode: Displays the device status and the setting for the device status determination.
14.3 Security Status

The Security Status provides an overview of the overall security of the device. Many processes aid in system visualization by recording the security status of the device and then presenting its condition in graphic form. The device displays the overall security status in the Basic Settings > System dialog, Security status frame.

In the Global tab of the Diagnostics > Status Configuration > Security Status dialog the device displays its current status as error or ok in the Security status frame. The device determines this status from the individual monitoring results.

The device enables you to:
- Out-of-Band signalling using a signal contact
- signal the changed security status by sending an SNMP trap
- detect the security status in the Basic Settings > System dialog of the Graphical User Interface
- query the security status in the Command Line Interface

14.3.1 Events which can be monitored

Specify the events that the device monitors.
For the corresponding parameter, mark the checkbox in the Monitor column.

Table 56: Security Status events

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password default settings unchanged</td>
<td>After installation change the passwords to increase security. When active and the default passwords remain unchanged, the device displays an alarm.</td>
</tr>
<tr>
<td>Min. password length &lt; 8</td>
<td>Create passwords more than 8 characters long to maintain a high security posture. When active, the device monitors the Min. password length setting.</td>
</tr>
<tr>
<td>Password policy settings deactivated</td>
<td>The device monitors the settings located in the Device Security &gt; User Management dialog for password policy requirements.</td>
</tr>
<tr>
<td>User account password policy check deactivated</td>
<td>The device monitors the settings of the Policy check checkbox. When Policy check is inactive, the device sends an SNMP trap.</td>
</tr>
<tr>
<td>Telnet server active</td>
<td>The device monitors when you enable the Telnet function.</td>
</tr>
<tr>
<td>HTTP server active</td>
<td>The device monitors when you enable the HTTP function.</td>
</tr>
<tr>
<td>SNMP unencrypted</td>
<td>The device monitors when you enable the SNMPv1 or SNMPv2 function.</td>
</tr>
<tr>
<td>Access to system monitor with serial interface possible</td>
<td>The device monitors the System Monitor status.</td>
</tr>
<tr>
<td>Saving the configuration profile on the external memory possible</td>
<td>The device monitors the possibility to save configurations to the external non-volatile memory.</td>
</tr>
<tr>
<td>Link interrupted on enabled device ports</td>
<td>The device monitors the link status of active ports.</td>
</tr>
<tr>
<td>Access with HiDiscovery possible</td>
<td>The device monitors when you enable the HiDiscovery read/write access function.</td>
</tr>
<tr>
<td>Load unencrypted config from external memory</td>
<td>The device monitors the security settings for loading the configuration from the external NVM.</td>
</tr>
</tbody>
</table>
### 14.3 Security Status

#### 14.3.2 Configuring the Security Status

Perform the following steps:

- Open the Diagnostics > Status Configuration > Security Status dialog, Global tab.
- For the parameters to be monitored, mark the checkbox in the Monitor column.
- To send an SNMP trap to the management station, activate the Send trap function in the Traps frame.
- To save the changes temporarily, click the button.
- In the Diagnostics > Status Configuration > Alarms (Traps) dialog, create at least 1 trap destination that receives SNMP traps.

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEC61850-MMS active</td>
<td>The device monitors the IEC 61850-MMS protocol activation setting.</td>
</tr>
<tr>
<td>Modbus TCP active</td>
<td>The device monitors the Modbus TCP/IP protocol activation setting.</td>
</tr>
<tr>
<td>Self-signed HTTPS certificate present</td>
<td>The device monitors the HTTPS server for self-created digital certificates.</td>
</tr>
</tbody>
</table>

**Table 56: Security Status events (cont.)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>security-status monitor pwd-change</td>
<td>Monitors the password for the locally set up user accounts user and admin. When the password for the user or admin user accounts is the default setting, the value in the Security status frame changes to error.</td>
</tr>
<tr>
<td>security-status monitor pwd-min-length</td>
<td>Monitors the value specified in the Min. password length policy. When the value for the Min. password length policy is less than 8, the value in the Security status frame changes to error.</td>
</tr>
</tbody>
</table>
| security-status monitor pwd-policy-config | Monitors the password policy settings. When the value for at least one of the following policies is specified as 0, the value in the Security status frame changes to error.  
  - Upper-case characters (min.)  
  - Lower-case characters (min.)  
  - Digits (min.)  
  - Special characters (min.) |
| security-status monitor pwd-policy-inactive | Monitors the password policy settings. When the value for at least one of the following policies is specified as 0, the value in the Security status frame changes to error.  
  - Upper-case characters (min.)  
  - Lower-case characters (min.)  
  - Digits (min.)  
  - Special characters (min.) |
| security-status monitor telnet-enabled | Monitors the Telnet server. When you enable the Telnet server, the value in the Security status frame changes to error. |
In order to enable the device to monitor an active link without a connection, first enable the global function, then enable the individual ports.

Perform the following steps:

- Open the Diagnostics > Status Configuration > Security Status dialog, Global tab.
- For the Link interrupted on enabled device ports parameter, mark the checkbox in the Monitor column.
- To save the changes temporarily, click the button.
- Open the Diagnostics > Status Configuration > Device Status dialog, Port tab.
- For the Link interrupted on enabled device ports parameter, mark the checkbox in the column of the ports to be monitored.
- To save the changes temporarily, click the button.

- enable
- configure
- security-status monitor no-link-enabled
- interface 1/1
- security-status monitor no-link

Example commands:

```
security-status monitor http-enabled
security-status monitor snmp-unsecure
security-status monitor sysmon-enabled
security-status monitor extnvm-upd-enabled
security-status monitor iec61850-mms-enabled
security-status trap
```

Monitors the HTTP server. When you enable the HTTP server, the value in the Security status frame changes to error.

Monitors the SNMP server. When at least one of the following conditions applies, the value in the Security status frame changes to error:
- The SNMPv1 function is enabled.
- The SNMPv2 function is enabled.
- The encryption for SNMPv3 is disabled.

You enable the encryption in the Device Security > User Management dialog, in the SNMP encryption type field.

To monitor the activation of System Monitor 1 in the device.

To monitor the activation of the external non volatile memory update.

Monitors the IEC61850-MMS function. When you enable the IEC61850-MMS function, the value in the Security status frame changes to error.

When the device status changes, it sends an SNMP trap.

- interface 1/1

Change to the interface configuration mode of interface 1/1.

Monitors the link on active ports. When the link interrupts on an active port, the value in the Security status frame changes to error.

Monitors the link on interface/port 1.
14.3.3 Displaying the Security Status

Perform the following steps:

- Open the **Basic Settings > System** dialog.

  ```
  show security-status all
  ```

In the EXEC Privilege mode, display the security status and the setting for the security status determination.
14.4 Out-of-Band signaling

The device uses the signal contact to control external devices and monitor device functions. Function monitoring enables you to perform remote diagnostics.

The device reports the operating status using a break in the potential-free signal contact (relay contact, closed circuit) for the selected mode. The device monitors the following functions:

- Incorrect supply voltage
  - at least one of the 2 supply voltages is not operating
  - the internal supply voltage is not operating
- When the device is operating outside of the user-defined temperature threshold
- Events for ring redundancy
  - Loss of the redundancy (in ring manager mode)
  - In the default setting, ring redundancy monitoring is inactive. The device is a normal ring participant and detects an error in the local configuration.
- The interruption of link connection(s)
  - Configure at least one port for this feature. In the Propagate connection error frame, you specify which ports the device signals for a link interruption. In the default setting, link monitoring is inactive.
- The removal of the external memory.
- The configuration in the external memory does not match the configuration in the device.

Select the corresponding entries to decide which events the device status includes.

Note: With a non-redundant voltage supply, the device reports the absence of a supply voltage. To disable this message, feed the supply voltage over both inputs or ignore the monitoring.

14.4.1 Controlling the Signal contact

With the Manual setting mode you control this signal contact remotely.

Application options:

- Simulation of an error detected during SPS error monitoring
- Remote control of a device using SNMP, such as switching on a camera

Perform the following steps:

- Open the Diagnostics > Status Configuration > Signal Contact dialog, Global tab.
- To control the signal contact manually, in the Configuration frame, Mode drop-down list, select the value Manual setting.
- To open the signal contact, you select the open radio button in the Configuration frame.
- To close the signal contact, you select the close radio button in the Configuration frame.
- To save the changes temporarily, click the ✅ button.

enable

configure

Change to the Privileged EXEC mode.
Change to the Configuration mode.
14.4 Out-of-Band signaling

14.4.2 Monitoring the Device and Security Statuses

In the Configuration field, you specify which events the signal contact indicates.

- **Device status**
  Using this setting the signal contact indicates the status of the parameters monitored in the Diagnostics > Status Configuration > Device Status dialog.

- **Security status**
  Using this setting the signal contact indicates the status of the parameters monitored in the Diagnostics > Status Configuration > Security Status dialog.

- **Device/Security status**
  Using this setting the signal contact indicates the status of the parameters monitored in the Diagnostics > Status Configuration > Device Status and the Diagnostics > Status Configuration > Security Status dialog.

Configuring the operation monitoring

Perform the following steps:

- Open the Diagnostics > Status Configuration > Signal Contact dialog, Global tab.
- To monitor the device functions using the signal contact, in the Configuration frame, specify the value Monitoring correct operation in the Mode field.
- For the parameters to be monitored, mark the checkbox in the Monitor column.
- To send an SNMP trap to the management station, activate the Send trap function in the Traps frame.
- To save the changes temporarily, click the yes button.
- In the Diagnostics > Status Configuration > Alarms (Traps) dialog, create at least 1 trap destination that receives SNMP traps.
- To save the changes temporarily, click the yes button.
- You specify the temperature thresholds for the temperature monitoring in the Basic Settings > System dialog.

Enable
configure
signal-contact 1 monitor temperature

Select the manual setting mode for signal contact 1.

Open signal contact 1.

Close signal contact 1.
signal-contact 1 monitor ring-redundancy

Monitors the ring redundancy.
The signal contact opens in the following situations:
- The redundancy function becomes active (loss of redundancy reserve).
- The device is a normal ring participant and detects an error in its settings.

signal-contact 1 monitor link-failure

Monitors the ports/interfaces link. When the link interrupts on a monitored port/interface, the signal contact opens.

signal-contact 1 monitor envm-removal

Monitors the active external memory. When you remove the active external memory from the device, the signal contact opens.

signal-contact 1 monitor envm-not-in-sync

Monitors the configuration profiles in the device and in the external memory. The signal contact opens in the following situations:
- The configuration profile only exists in the device.
- The configuration profile in the device differs from the configuration profile in the external memory.

signal-contact 1 monitor power-supply 1

Monitors the power supply unit 1. When the device has a detected power supply fault, the signal contact opens.

signal-contact 1 monitor module-removal 1

Monitors module 1. When you remove module 1 from the device, the signal contact opens.

signal-contact 1 trap

Enables the device to send an SNMP trap when the status of the operation monitoring changes.

no signal-contact 1 trap

Disabling the SNMP trap

In order to enable the device to monitor an active link without a connection, first enable the global function, then enable the individual ports.

Perform the following steps:

- In the Monitor column, activate the Link interrupted on enabled device ports function.
- Open the Diagnostics > Status Configuration > Device Status dialog, Port tab.

enable

Change to the Privileged EXEC mode.

configure

Change to the Configuration mode.

signal-contact 1 monitor link-failure

Monitors the ports/interfaces link. When the link interrupts on a monitored port/interface, the signal contact opens.

interface 1/1

Change to the interface configuration mode of interface 1/1.

signal-contact 1 link-alarm

Monitors the port/interface link. When the link interrupts on the port/interface, the signal contact opens.
Events which can be monitored

Table 57: Device Status events

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>When the temperature exceeds or falls below the value specified.</td>
</tr>
<tr>
<td>Ring redundancy</td>
<td>When ring redundancy is present, enable this function to monitor.</td>
</tr>
<tr>
<td>Connection errors</td>
<td>Enable this function to monitor every port link event in which the Propagate connection error checkbox is active.</td>
</tr>
<tr>
<td>External memory not in sync with NVM</td>
<td>The device monitors synchronization between the device configuration and the configuration stored on the ENVM.</td>

<td>Enable this function to monitor the presence of an external storage device.</td>
</tr>
<tr>
<td>Power supply</td>
<td>Enable this function to monitor the power supply.</td>
</tr>
</tbody>
</table>

Displaying the signal contact's status

The device gives you additional options for displaying the status of the signal contact:
- Display in the Graphical User Interface
- Query in the Command Line Interface

- Open the Basic Settings > System dialog. The Signal contact status frame displays the signal contact status and informs you about alarms that have occurred. When an alarm currently exists, the frame is highlighted.

- show signal-contact 1 all Displays signal contact settings for the specified signal contact.
14.5 Port status indication

Perform the following steps:

- Open the Basic Settings > System dialog.

The dialog displays the device with the current configuration. Furthermore, the dialog indicates the status of the individual ports with a symbol.

The following symbols represent the status of the individual ports. In some situations, these symbols interfere with one another. When you position the mouse pointer over the port icon, a bubble help displays a detailed description of the port state.

**Table 58: Symbols identifying the status of the ports**

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth of the port</td>
<td>10 Mbit/s&lt;br&gt;Port activated, connection okay, full-duplex mode&lt;br&gt;100 Mbit/s&lt;br&gt;Port activated, connection okay, full-duplex mode&lt;br&gt;1000 Mbit/s&lt;br&gt;Port activated, connection okay, full-duplex mode</td>
</tr>
<tr>
<td>Operating state</td>
<td>Half-duplex mode enabled&lt;br&gt;See the Basic Settings &gt; Port dialog, Configuration tab, Automatic configuration checkbox, Manual configuration field and Manual cable crossing (Auto. conf. off) field. Autonegotiation enabled&lt;br&gt;See the Basic Settings &gt; Port dialog, Configuration tab, Automatic configuration checkbox. The port is blocked by a redundancy function.</td>
</tr>
<tr>
<td>AdminLink</td>
<td>The port is deactivated, connection okay&lt;br&gt;The port is deactivated, no connection set up&lt;br&gt;See the Basic Settings &gt; Port dialog, Configuration tab, Port on checkbox and Link/Current settings field.</td>
</tr>
</tbody>
</table>
14.6  Port event counter

The port statistics table lets experienced network administrators identify possible detected problems in the network.

This table displays the contents of various event counters. The packet counters add up the events sent and the events received. In the Basic Settings > Restart dialog, you can reset the event counters.

Table 59: Examples indicating known weaknesses

<table>
<thead>
<tr>
<th>Counter</th>
<th>Indication of known possible weakness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received fragments</td>
<td>• Non-functioning controller of the connected device</td>
</tr>
<tr>
<td></td>
<td>• Electromagnetic interference in the transmission medium</td>
</tr>
<tr>
<td>CRC Error</td>

</tr>
<tr>
<td></td>
<td>• Electromagnetic interference in the transmission medium</td>
</tr>
<tr>
<td></td>
<td>• Inoperable component in the network</td>
</tr>
<tr>
<td>Collisions</td>
<td>• Non-functioning controller of the connected device</td>
</tr>
<tr>
<td></td>
<td>• Network over extended/lines too long</td>
</tr>
<tr>
<td></td>
<td>• Collision or a detected fault with a data packet</td>
</tr>
</tbody>
</table>

Perform the following steps:

- To display the event counter, open the Basic Settings > Port dialog, Statistics tab.
- To reset the counters, in the Basic Settings > Restart dialog, click the Clear port statistics button.

14.6.1 Detecting non-matching duplex modes

Problems occur when 2 ports directly connected to each other have mismatching duplex modes. These problems are difficult to track down. The automatic detection and reporting of this situation has the benefit of recognizing mismatching duplex modes before problems occur.

This situation arises from an incorrect configuration, for example, deactivation of the automatic configuration on the remote port.

A typical effect of this non-matching is that at a low data rate, the connection seems to be functioning, but at a higher bi-directional traffic level the local device records a lot of CRC errors, and the connection falls significantly below its nominal capacity.

The device lets you detect this situation and report it to the network management station. In the process, the device evaluates the error counters of the port in the context of the port settings.

Possible causes of port error events

The following table lists the duplex operating modes for TX ports, with the possible fault events. The meanings of terms used in the table are as follows:

- **Collisions**
  - In half-duplex mode, collisions mean normal operation.
- **Duplex problem**
  - Mismatching duplex modes.
- **EMI**
  - Electromagnetic interference.

- **Network extension**
  - The network extension is too great, or too many cascading hubs.

- **Collisions, Late Collisions**
  - In full-duplex mode, no incrementation of the port counters for collisions or Late Collisions.

- **CRC Error**
  - The device evaluates these errors as non-matching duplex modes in the manual full duplex mode.

### Table 60: Evaluation of non-matching of the duplex mode

</tbody>
</table>
14.7 Auto-Disable

The device can disable a port due to several configurable reasons. Each reason causes the port to "shut down". In order to recover the port from the shut down state, you can manually clear the condition which caused the port to shut down or specify a timer to automatically re-enable the port.

If the configuration displays a port as enabled, but the device detects an error or change in the condition, then the software shuts down that port. In other words, the device software disables the port because of a detected error or change in the condition.

If a port is auto-disabled, then the device effectively shuts down the port and the port blocks traffic. The port LED blinks green 3 times per period and identifies the reason for the shutdown. In addition, the device creates a log file entry which lists the causes of the deactivation. When you re-enable the port after a timeout using the Auto-Disable function, the device generates a log entry.

The Auto-Disable function provides a recovery function which automatically enables an auto-disabled port after a user-defined time. When this function enables a port, the device sends an SNMP trap with the port number, but without a value for the Reason parameter.

The Auto-Disable function serves the following purposes:
- It assists the network administrator in port analysis.
- It reduces the possibility that this port causes the network to be instable.

The Auto-Disable function is available for the following functions:
- Link flap (Port Monitor function)
- CRC/Fragments (Port Monitor function)
- Duplex Mismatch detection (Port Monitor function)
- DHCP Snooping
- Dynamic ARP Inspection
- Spanning Tree
- Port Security
- Overload detection (Port Monitor function)
- Link speed/Duplex mode detection (Port Monitor function)

In the following example, you configure the device to disable a port due to detected violations to the thresholds specified in the Diagnostics > Ports > Port Monitor dialog, CRC/Fragments tab, and then automatically re-enable the disabled port.

Perform the following steps:

- Open the Diagnostics > Ports > Port Monitor dialog, CRC/Fragments tab.
- Verify that the thresholds specified in the table concur to your preferences for port 1/1.
- Open the Diagnostics > Ports > Port Monitor dialog, Global tab.
- To enable the function, select the On radio button in the Operation frame.
- To allow the device to disable the port due to detected errors, mark the checkbox in the CRC/Fragments on column for port 1/1.
In the **Action** column you can choose how the device reacts to detected errors. In this example, the device disables port 1/1 for threshold violations and then automatically re-enables the port.

- To allow the device to disable and automatically re-enable the port, select the value **auto-disable** and configure the **Auto-Disable** function. The value **auto-disable** only works in conjunction with the **Diagnostics > Ports > Auto-Disable** function.

The device can also disable a port without auto-re-enabling.

- To allow the device to disable the port only, select the value **disable port**.

To manually re-enable a disabled port, highlight the port.

  - Click the **Enable** button and then the **Reset** item.
  - When you configure the **Auto-Disable** function, the value **disable port** also automatically re-enables the port.

Open the **Diagnostics > Ports > Port Monitor** dialog, **Auto-disable** tab.

To allow the device to auto re-enable the port after it was disabled due to detected threshold violations, mark the checkbox in the **CRC error** column.

Open the **Diagnostics > Ports > Port Monitor** dialog, **Port** tab.

Specify the delay time as 120 s in the **Reset timer [s]** column for the ports you want to enable.

**Note:** The **Reset** item lets you enable the port before the time specified in the **Reset timer [s]** column counts down.

---

```
enable
configure
interface 1/1

port-monitor condition crc-fragments count 2000
port-monitor condition crc-fragments interval 15
auto-disable timer 120

exit
auto-disable reason crc-error
port-monitor condition crc-fragments mode
port-monitor operation
```

When the device disables a port due to threshold violations, the device lets you use the following commands to manually reset the disabled port.

**Perform the following steps:**

```
enable
configure
interface 1/1

auto-disable reset
```

When the device disables a port due to threshold violations, the device lets you use the following commands to manually reset the disabled port.
14.8 Displaying the SFP status

The SFP status display lets you look at the current SFP module connections and their properties. The properties include:
- module type
- serial number of media module
- temperature in °C
- transmission power in mW
- receive power in mW

Perform the following steps:

- Open the Diagnostics > Ports > SFP dialog.
IEEE 802.1AB defines the Link Layer Discovery Protocol (LLDP). LLDP lets the user automatically detect the LAN network topology.

Devices with LLDP active:
- broadcast their connection and management information to neighboring devices on the shared LAN. When the receiving device has its LLDP function active, evaluation of the devices occurs.
- receive connection and management information from neighbor devices on the shared LAN, provided these adjacent devices also have LLDP active.
- build a management information database and object definitions for storing information about adjacent devices with LLDP active.

As the main element, the connection information contains an exact, unique identifier for the connection end point: MAC (Service Access Point). This is made up of a device identifier which is unique on the entire network and a unique port identifier for this device.

- Chassis identifier (its MAC address)
- Port identifier (its port-MAC address)
- Description of port
- System name
- System description
- Supported system capabilities
- System capabilities currently active
- Interface ID of the management address
- VLAN-ID of the port
- Auto-negotiation status on the port
- Medium, half/full duplex setting and port speed setting
- Information about the VLANs installed in the device (VLAN-ID and VLAN name, irrespective of whether the port is a VLAN participant).

A network management station can call up this information from devices with activated LLDP. This information enables the network management station to map the topology of the network.

Non-LLDP devices normally block the special Multicast LLDP IEEE MAC address used for information exchange. Non-LLDP devices therefore discard LLDP packets. If you position a non-LLDP capable device between 2 LLDP capable devices, then the non-LLDP capable device prohibits information exchanges between the 2 LLDP capable devices.

The Management Information Base (MIB) for a device with LLDP capability holds the LLDP information in the lldp MIB and in the private HM2-LLDP-EXT-HM-MIB and HM2-LLDP-MIB.

### 14.9.1 Displaying the Topology discovery results

To show the topology of the network:

- Open the Diagnostics > LLDP > Topology Discovery dialog, LLDP tab.

When you use a port to connect several devices, for example via a hub, the table contains a line for each connected device.

Activating Display FDB Entries at the bottom of the table lets you display devices without active LLDP support in the table. In this case, the device also includes information from its FDB (forwarding database).
If you connect the port to devices with the topology discovery function active, then the devices exchange LLDP Data Units (LLDPDU) and the topology table displays these neighboring devices.

When a port connects only devices without an active topology discovery, the table contains a line for this port to represent the connected devices. This line contains the number of connected devices.

The FDB address table contains MAC addresses of devices that the topology table hides for the sake of clarity.

14.9.2 LLDP-Med

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices. Endpoints include devices such as IP phones, or other Voice over IP (VoIP) devices or servers and network devices such as switches. It specifically provides support for VoIP applications. LLDP-MED provides this support using an additional set of common type-length-value (TLV) advertisement messages, for capabilities discovery, network policy, Power over Ethernet, inventory management and location information.

The device supports the following TLV messages:
- capabilities TLV
  - Lets the LLDP-MED endpoints determine the capabilities that the connected device supports and what capabilities the device has enabled.
- Network policy TLV
  - Lets both network connectivity devices and endpoints advertise VLAN configurations and associated attributes for the specific application on that port. For example, the device notifies a phone of the VLAN number. The phone connects to a switch, obtain its VLAN number, and then starts communicating with the call control.

LLDP-MED provides the following functions:
- Network policy discovery, including VLAN ID, 802.1p priority and Diffserv code point (DSCP)
- Device location and topology discovery based on LAN-level MAC/port information
- Endpoint move detection notification, from network connectivity device to the associated VoIP management application
- Extended device identification for inventory management
- Identification of endpoint network connectivity capabilities, for example, multi-port IP Phone with embedded switch or bridge capability
- Application level interactions with the LLDP protocol elements to provide timely startup of LLDP to support rapid availability of an Emergency Call Service
- Applicability of LLDP-MED to Wireless LAN environments, support for Voice over Wireless LAN
**14.10 Detecting loops**

Loops in the network cause connection interruptions or data losses. This also applies to temporary loops. The automatic detection and reporting of this situation lets you detect it faster and diagnose it more easily.

An incorrect configuration causes loops, for example, deactivating Spanning Tree.

The device lets you detect the effects typically caused by loops and report this situation automatically to the network management station. You have the option here to specify the magnitude of the loop effects that trigger the device to send a report.

BPDU frames sent from the designated port and received on either a different port of the same device or the same port within a short time, is a typical effect of a loop.

- Open the **Switching > L2-Redundancy > Spanning Tree > Port** dialog, **CIST** tab.
- Check the value in the fields **Port state** and **Port role**. If the **Port state** field displays the value **discarding** and the **Port role** field displays the value **backup**, then the port is in a loop status.
  - or
- Open the **Switching > L2-Redundancy > Spanning Tree > Port** dialog, **Guards** tab.
- Check the value in the **Loop state** column. If the field displays the value **true**, then the port is in a loop status.
14.11 **Email Notification**

The device lets you inform users by email about events that have occurred. Prerequisite is that a mail server is available through the network on which the device transfers the emails.

To setup the device to send emails, use the following steps:
- Specify the sender address
- Specify the triggering events
- Specify the recipients
- Specify the mail server
- Enable/disable the function
- Send a test email

### 14.11.1 Specify the sender address

The sender address is the email address that indicates the device which sent the email. In the device, the default setting is **switch@hirschmann.com**.

To change the preset value, perform the following steps:
- Open the Diagnostics > Email Notification > Global dialog.
- In the Sender frame, change the value in the Address field. Add a valid email address.
- To save the changes temporarily, click the ✅ button.

### 14.11.2 Specify the triggering events

The device differentiates between the following severities:

<table>
<thead>
<tr>
<th>Severity</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>emergency</td>
<td>Device not ready for operation</td>
</tr>
<tr>
<td>alert</td>
<td>Immediate user intervention required</td>
</tr>
<tr>
<td>critical</td>
<td>Critical status</td>
</tr>
<tr>
<td>error</td>
<td>Error status</td>
</tr>
<tr>
<td>warning</td>
<td>Warning</td>
</tr>
<tr>
<td>notice</td>
<td>Significant, normal status</td>
</tr>
<tr>
<td>informational</td>
<td>Informal message</td>
</tr>
<tr>
<td>debug</td>
<td>Debug message</td>
</tr>
</tbody>
</table>

**Table 61: Meaning of the severities for events**
You have the option of specifying the events of which the device informs you. For this, assign the desired minimum severity to the notification levels of the device.

The device informs the recipients as follows:

- **Notification immediate**
  - When an event of the severity assigned or more severe occurs, the device sends an email immediately.

- **Notification periodic**
  - When an event of the severity assigned or more severe occurs, the device logs the event in the buffer.
  - The device sends an email with the log file periodically or in case of a buffer overflow.
  - When an event of a lesser severity occurs, the device does not log this event.

Perform the following steps:

1. Open the **Diagnostics > Email Notification > Global** dialog.
2. In the **Notification immediate** frame, you specify the settings for emails which the device sends immediately.
   - In the **Severity** field, you specify the minimum severity.
   - In the **Subject** field, you specify the subject of the email.
3. In the **Notification periodic** frame, you specify the settings for emails which the device sends periodically.
   - In the **Severity** field, you specify the minimum severity.
   - In the **Subject** field, you specify the subject of the email.
4. To save the changes temporarily, click the **✓** button.

Change to the Privileged EXEC mode.

- **enable**
- **configure**
- **logging email severity immediate <level>**
- **logging email severity periodic <level>**
- **logging email subject add <immediate | periodic> TEXT**

Change to the Configuration mode.

- Specifies the minimum severity for events for which the device sends an email immediately.
- Specifies the minimum severity for events for which the device sends an email periodically.
- Creates a subject line with the content **TEXT**.
14.11.3 Change the send interval

The device lets you specify in which interval it sends emails with the log file. The default setting is 30 minutes.

Perform the following steps:

- Open the Diagnostics > Email Notification > Global dialog.
- In the Notification periodic frame, you specify the settings for emails which the device sends periodically.
- Change the value in the Sending interval [min] field to change the interval.
- To save the changes temporarily, click the button.

```
enable
configure
logging email duration <30..1440>
```

Change to the Privileged EXEC mode. Change to the Configuration mode. Specifies the interval at which the device sends emails with log file.

14.11.4 Specify the recipients

The device lets you specify up to 10 recipients.

Perform the following steps:

- Open the Diagnostics > Email Notification > Recipients dialog.
- To add a table entry, click the button.
- In the Notification type column, specify whether the device sends the emails to this recipient immediately or periodically.
- In the Address column, specify the email address of the recipient.
- In the Active column, mark the checkbox.
- To save the changes temporarily, click the button.

```
enable
configure
logging email to-addr add <1..10>
addr <user@doma.in> msgtype <immediately | periodically>
```

Change to the Privileged EXEC mode. Change to the Configuration mode. Specifies the recipient with the email address user@doma.in. The device manages the settings in memory 1..10.
14.11.5 Specify the mail server

The device supports encrypted and unencrypted connections to the mail server.

Perform the following steps:

- Open the Diagnostics > Email Notification > Mail Server dialog.
- To add a table entry, click the button.
- In the IP address column, specify the IP address or the DNS name of the server.
- In the Encryption column, specify the protocol which encrypts the connection between the device and the mail server.
- When the mail server uses a port other than the well-known port, specify the TCP port in the Destination TCP port column.

When the mail server requests an authentication:

- In the User name and Password columns, specify the account credentials which the device uses to authenticate on the mail server.
- In the Description column, enter a meaningful name for the mail server.
- In the Active column, mark the checkbox.
- To save the changes temporarily, click the button.

enable
configure
logging email mail-server add <1..5> addr <IP ADDRESS> [security <none|tlsv1>] [username <USER NAME>] [password <PASSWORD>] [port <1..65535>]

Specifies the mail server with the IP address IP ADDRESS. The device manages the settings in memory 1..5.

14.11.6 Enable/disable the function

Perform the following steps:

- Open the Diagnostics > Email Notification > Global dialog.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

enable
configure
logging email operation

Enables the sending of emails.

no logging email operation

Disables the sending of emails.
14.11.7 **Send a test email**

The device lets you check the settings by sending a test email.

**Prerequisite:**
- The email settings are completely specified.
- The `Email Notification` function is enabled.

Perform the following steps:

- Open the `Diagnostics > Email Notification > Mail Server` dialog.
- Click the button and then the `Connection test` item. The dialog displays the `Connection test` window.
- In the `Recipient` drop-down list, select to which recipients the device sends the test email.
- In the `Message text` field, specify the text of the test email.
- Click the `Ok` button to send the test email.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Change to the Privileged EXEC mode.</td>
</tr>
<tr>
<td><code>configure</code></td>
<td>Change to the Configuration mode.</td>
</tr>
<tr>
<td>`logging email test msgtype &lt;urgent</td>
<td>non-urgent&gt; TEXT`</td>
</tr>
</tbody>
</table>

When you do not see any error messages and the recipients obtain the email, the device settings are correct.
14.12 Reports

The following lists reports and buttons available for diagnostics:

- **System Log file**
  The log file is an HTML file in which the device writes device-internal events.
- **Audit Trail**
  Logs successful commands and user comments. The file also includes SNMP logging.
- **Persistent Logging**
  When the external memory is present, the device saves log entries in a file in the external memory. These files are available after power down. The maximum size, maximum number of retainable files and the severity of logged events are configurable. After obtaining the user-defined maximum size or maximum number of retainable files, the device archives the entries and starts a new file. The device deletes the oldest file and renames the other files to maintain the configured number of files. To review these files use the Command Line Interface or copy them to an external server for future reference.
- **Download support information**
  This button lets you download system information as a ZIP archive.

In service situations, these reports provide the technician with the necessary information.

14.12.1 Global settings

Using this dialog you enable or disable where the device sends reports, for example, to a Console, a Syslog Server, or a connection to the Command Line Interface. You also set at which severity level the device writes events into the reports.

Perform the following steps:

2. To send a report to the console, specify the desired level in the Console logging frame, Severity field.
3. To enable the function, select the On radio button in the Console logging frame.
4. To save the changes temporarily, click the ✅ button.

The device buffers logged events in 2 separate storage areas so that the device keeps log entries for urgent events. Specify the minimum severity for events that the device logs to the buffered storage area with a higher priority.

Perform the following steps:

1. To send events to the buffer, specify the desired level in the Buffered logging frame, Severity field.
2. To save the changes temporarily, click the ✅ button.
When you activate the logging of SNMP requests, the device logs the requests as events in the Syslog. The Log SNMP get request function logs user requests for device configuration information. The Log SNMP set request function logs device configuration events. Specify the minimum level for events that the device logs in the Syslog.

Perform the following steps:

- Enable the Log SNMP get request function for the device in order to send SNMP Read requests as events to the Syslog server. To enable the function, select the On radio button in the SNMP logging frame.
- Enable the Log SNMP set request function for the device in order to send SNMP Write requests as events to the Syslog server. To enable the function, select the On radio button in the SNMP logging frame.
- Choose the desired severity level for the get and set requests.
- To save the changes temporarily, click the button.

When active, the device logs configuration changes made using the Command Line Interface, to the audit trail. This feature is based on the IEEE 1686 standard for Substation Intelligent Electronic Devices.

Perform the following steps:

- Open the Diagnostics > Report > Global dialog.
- To enable the function, select the On radio button in the CLI logging frame.
- To save the changes temporarily, click the button.

The device lets you save the following system information data in one ZIP file on your PC:
- audittrail.html
- CLICommands.txt
- defaultconfig.xml
- script
- runningconfig.xml
- supportinfo.html
- systeminfo.html
- systemlog.html

The device creates the file name of the ZIP archive automatically in the format <IP_address>_<system_name>.zip.

Perform the following steps:

- Click the button and then the Download support information item.
- Select the directory in which you want to save the support information.
- To save the changes temporarily, click the button.
### 14.12.2 Syslog

The device enables you to send messages about device internal events to one or more Syslog servers (up to 8). Additionally, you also include SNMP requests to the device as events in the Syslog.

**Note:** To display the logged events, open the Diagnostics > Report > Audit Trail dialog or the Diagnostics > Report > System Log dialog.

Perform the following steps:

- Open the Diagnostics > Syslog dialog.
- To add a table entry, click the button.
- In the IP address column, enter the IP address of the Syslog server.
- In the Destination UDP port column, specify the TCP or UDP port on which the Syslog server expects the log entries.
- In the Min. severity column, specify the minimum severity level that an event requires for the device to send a log entry to this Syslog server.
- Mark the checkbox in the Active column.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

In the SNMP logging frame, configure the following settings for read and write SNMP requests:

Perform the following steps:

- Open the Diagnostics > Report > Global dialog.
- Enable the Log SNMP get request function for the device in order to send SNMP Read requests as events to the Syslog server.
  - To enable the function, select the On radio button in the SNMP logging frame.
- Enable the Log SNMP set request function for the device in order to send SNMP Write requests as events to the Syslog server.
  - To enable the function, select the On radio button in the SNMP logging frame.
- Choose the desired severity level for the get and set requests.
- To save the changes temporarily, click the button.
14.12 Reports

14.12.3 System Log

The device lets you call up a log file of the system events. The table in the Diagnostics > Report > System Log dialog lists the logged events.

Perform the following steps:

- To update the content of the log, click “Reload”.
- To search the content of the log for a key word, click “Search”.
- To archive the content of the log as an html file, click “Save”.

Note: You have the option to also send the logged events to one or more Syslog servers.

14.12.4 Syslog over TLS

The Transport Layer Security (TLS) is a cryptographic protocol designed to provide communications security over a computer network. The primary goal of the TLS protocol is to provide privacy and data integrity between two communicating computer applications.

After initiating a connection with a Syslog server, using a TLS handshake, the device validates the certificate received from the server. For this purpose, you transfer the PEM certificate from a remote server or from the external memory onto the device. Verify that the configured IP address or DNS name of the server matches the information provided in the certificate. You find the information in the Common Name or in the Subject Alternative Name fields of the certificate.
The device sends the TLS encrypted Syslog messages over the TCP port specified in the Destination UDP port column.

**Note:** Specify the IP address or DNS name on the server to match the IP Address or DNS name provided in the server certificate. You find the values entered in the certificate as the Common Name or the Subject Alternative Name.

**Example**

The given example describes the configuration of the Syslog function. By following these steps, the device lets you send the TLS encrypted Syslog messages over the TCP port specified in the Destination UDP port column.

The Syslog messages that are sent from a device to a syslog server can pass through unsecured networks. To configure a Syslog server over TLS, transfer the Certificate Authority (CA) certificate onto the device.

**Note:** In order for the changes to take effect after loading a new certificate, restart the Syslog function.

Perform the following steps:

- Open the Diagnostics > Syslog dialog.
- To initiate a connection with the Syslog servers, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.
- Transfer the PEM certificate from the remote server or from the external memory onto the device.
- Change to the Privileged EXEC mode.
- Add index 1 to the Syslog server with IP address 192.168.3.215.
- Specifying the port number 6512 and logging the events in the system log.
- Specify the type of transmission as tls.
- Specifying the type of event to log into the system log as informational.
- Change to the Privileged EXEC mode.
- Copy CA certificates from external memory to the device.
- Display the Syslog host settings.
14.12.5 Audit Trail

The Diagnostics > Report > Audit Trail dialog contains system information and changes to the device configuration performed through the Command Line Interface and SNMP. In the case of device configuration changes, the dialog displays Who changed What and When. To log changes to the device configuration, use in the Diagnostics > Report > Audit Trail dialog the functions Log SNMP get request and Log SNMP set request.

The Diagnostics > Syslog dialog lets you specify up to 8 Syslog servers to which the device sends Audit Trails.

The following list contains log events:

- changes to configuration parameters
- Commands (except show commands) using the Command Line Interface
- Command logging audit-trail <string> using the Command Line Interface which logs the comment
- Automatic changes to the System Time
- watchdog events
- locking a user after several unsuccessful login attempts
- User login, either locally or remote, using the Command Line Interface
- Manual, user-initiated, logout
- Timed logout after a user-defined period of inactivity in the Command Line Interface
- file transfer operation including a Firmware Update
- Configuration changes using HiDiscovery
- Automatic configuration or firmware updates using the external memory
- Blocked access to the device management due to invalid login
- rebooting
- opening and closing SNMP over HTTPS tunnels
- Detected power failures
14.13 Network analysis with TCPdump

Tcpdump is a packet-sniffing UNIX utility used by network administrators to sniff and analyze traffic on a network. A couple of reasons for sniffing traffic on a network is to verify connectivity between hosts, or to analyze the traffic traversing the network.

TCPDump in the device provides the possibility to decode or capture packets received and transmitted by the Management CPU. This function is available using the debug command. Refer to the “Command Line Interface” reference manual for further information about the TCPDump function.
14.14 Monitoring the data traffic

The device lets you forward data packets that pass through the device to a destination port. There you can monitor and evaluate the data packets.

The device provides you with the following options:
- Port Mirroring
- VLAN mirroring
- Remote SPAN

14.14.1 Port Mirroring

The Port Mirroring function lets you copy data packets from physical source ports to a physical destination port.

You monitor the data traffic on the source ports in the sending and receiving directions with a management tool connected on the destination port, for example an RMON probe. The function has no affect on the data traffic running on the source ports.

On the destination port, the device only forwards the data packets copied from the source ports.

Before you switch on the Port Mirroring function, mark the checkbox Allow management to access the device management via the destination port. The device lets users access the device management via the destination port without interrupting the active Port Mirroring session.

Note: The device duplicates multicasts, broadcasts and unknown unicasts on the destination port.

The VLAN settings on the destination port remain unchanged. Prerequisite for access to the device management on the destination port is that the destination port is a member of the device management VLAN.
Restrictions apply to ports on which the following redundancy protocols are active:

- **Fast MRP** (depends on hardware)
  - No port mirroring of sent MRP test packets.
- **HSR, PRP** (depends on hardware)
  - To monitor the data stream on HSR/PRP ports, specify the source port 1/1. On the source port 1/1, the Port Mirroring function records:
    - Data packets coming into the HSR/PRP network from the outside through the device
    - Data packets after duplicate recognition that leave the HSR/PRP network through the device
    - No Link Local packets that protocols like LLDP work with

**Enabling the Port Mirroring function**

Perform the following steps:

- Open the *Diagnostics > Ports > Port Mirroring* dialog.
- Specify the source ports.
  - Mark the checkbox in the *Enabled* column for the relevant ports.
- Specify the destination port.
  - In the *Destination port* frame, select the desired port in the *Primary port* drop-down list.
  - The drop-down list only displays available ports. Ports that are already specified as source ports are unavailable.
- In order to access the device management via the destination port:
  - In the *Destination port* frame, mark the *Allow management* checkbox.
- To save the changes temporarily, click the ✅ button.

To deactivate the *Port Mirroring* function and restore the default settings, click the reset button and then the *Reset config* item.

**14.14.2 VLAN mirroring**

The *VLAN mirroring* function lets you mirror the received data stream that matches a specific VLAN to a selected destination port. The device only copies the data on the VLAN, and sends the original data to the intended recipients. For example, the device can mirror data to a network analyzer connected to the destination port.

Only one of the functions, either the *VLAN mirroring* function or the *Port Mirroring* function, can be active at the same time. When you select VLAN 0 as the source VLAN, the *VLAN mirroring* function is inactive. To disable the *VLAN mirroring* function, unmark the checkbox in the *Enabled* column for the source port.

If the data stream received on the mirrored VLAN exceeds the maximum bandwidth of the destination port, then the device drops some packets to accommodate the maximum bandwidth of the destination port. Even though the device drops some packets, the device continues to mirror packets that match the specified VLAN.

When you specify the PVID on a port as the source VLAN ID, the device mirrors the untagged packets received, but without a VLAN tag. In this case, the device mirrors the packet exactly as it received the packet.
Example configuration

In this example configuration, Sw 4 mirrors data received on VLAN 20 to a network analyzer on the destination port.

To configure VLAN mirroring on Sw 4 use the following steps:

- Create the mirrored VLAN.
- Configure VLAN mirroring

Perform the following steps:

- Open the Switching > VLAN > Configuration dialog.
- Add the VLAN:
  - Click the button.
  - The dialog displays the Create window.
  - In the VLAN ID field, specify the value 20.
  - Click the Ok button.
  - In the Name column, enter the value VLAN mirroring port.
- To save the changes temporarily, click the button.
- Open the Diagnostics > Ports > Port Mirroring dialog.
- Deactivating the Port Mirroring function:
  - Unmark every checkbox in the Enabled column.
- Specifying the destination port:
  - In the Destination port frame, specify the value 3/4.
- Specifying the data source:
  - In the VLAN mirroring frame, Source VLAN ID field, specify the value 20.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

```
enable
vlan database
vlan add 20
name 20 VLAN mirroring port
exit
configure
```

Change to the Privileged EXEC mode.
Change to the VLAN configuration mode.
Create VLAN 20 in the device.
Assign the name 20 to the VLAN VLAN mirroring port.
Change to the Privileged EXEC mode.
Change to the Configuration mode.
14.14.3 Remote SPAN

Remote Switch Port Analysis (RSPAN) lets the network administrator forward mirrored data across multiple devices to a destination port. The network administrator can then analyze the data or diagnose detected errors on the network from a central location. The device lets the network administrator analyze data from a single source or from multiple sources.

The mirrored data traverses the network on a specified VLAN. Each RSPAN device uses the same RSPAN VLAN to forward mirrored data. Furthermore, any port, except the mirrored ports, can be a member of the RSPAN VLAN.

Depending on the amount of data and the port bandwidth, the device can drop some of the mirrored data. To reduce the loss of mirrored data packets, use Gigabit ports and/or LAG interfaces to forward the RSPAN data to the destination device.

The network administrator configures the devices, used for RSPAN, depending on the various roles. RSPAN uses the following device configurations:

- **A Source device** mirrors and tags the data with the RSPAN VLAN ID and forwards the data only to the destination port of the source device. On the source device, specify the RSPAN VLAN in the **Destination VLAN ID** field.
  
  IF the source device forwards the uplink data and the RSPAN data on the same link, then the device requires a Reflector port. The reflector port tags the RSPAN VLAN data with the RSPAN VLAN ID. The device then forwards the tagged data to the destination device. In order to accomplish this task, the network administrator connects 2 ports on the source device together with an Ethernet cable.

- **The Destination device** aggregates the data tagged with the RSPAN VLAN ID and then forwards the data to the destination port. On the destination device, specify the RSPAN VLAN in the **Source VLAN ID** field. The normal data stream can share the port with the RSPAN VLAN data.

- **An Intermediate device** floods the data tagged with the RSPAN VLAN ID to the ports with RSPAN VLAN membership. On an intermediate device, specify the RSPAN VLAN in the **VLAN ID** field. The device can transmit the RSPAN VLAN data over a LAG link toward the RSPAN destination device.

The device can forward RSPAN data to the destination device over an MRP ring network as long as the destination ring device is not a ring member. The device can also forward RSPAN data over a LAG instance as long as the LAG ports are not destination ports.

**Note:** To help prevent erroneous loop detection in case you use the RSPAN function. If you connect to the neighboring devices using separate paths for uplink and RSPAN data, then verify that the Spanning-Tree Protocol is inactive on both ports of the RSPAN data links. If you use a reflector port, then verify that the Spanning-Tree protocol is inactive on the links forwarding the RSPAN data.
In the following examples the network administrator desires to mirror the data stream to a network analyzer located somewhere in the network. The examples demonstrate the various ways to integrate the source device in your network.

In the examples, the network administrator desires to mirror the data packets received from switch 1, on port 2/1 of switch 2 to the network analyzer connected to switch 4. The network administrator has specified VLAN 30 as the RSPAN VLAN ID.

Note: Use only RSPAN-aware devices to forward the RSPAN data.

**Example 1**

In the example, you configure a reflector port on switch 2. Connect the ports 2/3 and 2/4 together with an ethernet cable. The links between switch 2, switch 3 and switch 4 carry both the RSPAN and the uplink data stream. Afterwards, perform the following steps:
Configure switch 2 as a port mirroring source.

Perform the following steps:

- Open the **Switching > VLAN > Configuration** dialog.
- Add the VLAN:
  - Click the **Add** button.
  - The dialog displays the **Create** window.
  - In the **VLAN ID** field, specify the value 30.
  - Click the **Ok** button.
  - In the **Name** column, specify the value **RSPAN_VLAN**.
- Specifying port 2/2 as a member of the RSPAN VLAN:
  - For VLAN 30, specify in the 2/2 column the value **T**.
- Block management packets from being forwarded to port 2/4:
  - For VLAN 1, specify in the 2/4 column the value **-**.
- To save the changes temporarily, click the **✓** button.
- Open the **Diagnostics > Ports > Port Mirroring** dialog.
- Specifying the destination port:
  - In the **Destination port** frame, specify the value 2/3.
- Specifying the RSPAN VLAN:
  - In the **RSPAN** frame, **VLAN ID** field, specify the value 30.
- Specifying the destination VLAN:
  - In the **RSPAN** frame, **Destination VLAN ID** field, specify the value 30.
- Specifying the data source:
  - For port 2/1, mark the checkbox in the **Enabled** column.
- Specifying the direction:
  - For port 2/1, specify in the **Type** column the value **txrx**.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **✓** button.
- Open the **Switching > L2-Redundancy > Spanning Tree > Port** dialog.
- Deactivating the **Spanning Tree** function on port 2/4:
  - For port 2/4, unmark the checkbox in the **STP active** column.
- To save the changes temporarily, click the **✓** button.

```sh
enable
vlan database
vlan add 30
name 30 RSPAN_VLAN
rspan-vlan 30
exit
configure
monitor session 1 source add interface 2/1
monitor session 1 destination interface 2/3
monitor session 1 destination remote vlan 30
monitor session 1 mode
```

- Change to the Privileged EXEC mode.
- Change to the VLAN configuration mode.
- Create VLAN 30 in the device.
- Assign the name 30 to the VLAN **RSPAN_VLAN**.
- Specify VLAN 30 as the RSPAN VLAN.
- Change to the Privileged EXEC mode.
- Change to the Configuration mode.
- Add port 2/1 to session 1 as a source port.
- Add port 2/3 to session 1 as a source port.
- Create VLAN mirroring session 1. The source is VLAN 30.
- Activate the VLAN mirroring session 1.
Configure switch 3 as an intermediate device.

Perform the following steps:

1. Open the `Switching > VLAN > Configuration` dialog.
2. Add the VLAN:
   - Click the button.
   - The dialog displays the Create window.
   - In the VLAN ID field, specify the value \(30\).
   - Click the Ok button.
   - In the Name column, specify the value `RSPAN_VLAN`.
3. Specifying port 3/2 as a member of the RSPAN VLAN:
   - For VLAN 30, specify in the 3/2 column the value `T`.
4. To save the changes temporarily, click the button.

Configure switch 3 as the destination device.
Perform the following steps:

- Open the Switching > VLAN > Configuration dialog.
- Add the VLAN:
  - Click the button.
  - The dialog displays the Create window.
  - In the VLAN ID field, specify the value 30.
  - Click the Ok button.
  - In the Name column, specify the value RSPAN_VLAN.
- To save the changes temporarily, click the button.
- Open the Diagnostics > Ports > Port Mirroring dialog.
- Specifying the destination port:
  - In the Destination port frame, specify the value 4/2.
- Specifying the RSPAN VLAN:
  - In the RSPAN frame, VLAN ID field, specify the value 30.
- Specifying the data source:
  - In the RSPAN frame, Source VLAN ID field, specify the value 30.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

```
enable
vlan database
vlan add 30
name 30 RSPAN_VLAN
rspan-vlan 30
exit
configure
monitor session 1 source remote vlan 30
monitor session 1 destination interface 4/2
monitor session 1 mode
```

Example 2

In this example, the network forwards the RSPAN data and the uplink data on parallel paths from the source device to the destination device.

```
<table>

</tr>
<tr>
<td>3/1</td>
<td>3/4</td>
<td>4/3</td>
<td></td>
</tr>
</tbody>
</table>
```

RSPAN data only
Uplink data only
Configure switch 2 as a port mirroring source.

Perform the following steps:

- Open the Switching > VLAN > Configuration dialog.
- Add the VLAN:
  - Click the New button.
  - The dialog displays the Create window.
  - In the VLAN ID field, specify the value 30.
  - Click the Ok button.
  - In the Name column, specify the value RSPAN_VLAN.
- Specifying port 2/3 as a non-member of the RSPAN VLAN:
  - For VLAN 30, specify in the 2/3 column the value -. 
- To save the changes temporarily, click the ✓ button.
- Open the Diagnostics > Ports > Port Mirroring dialog.
- Specifying the destination port:
  - In the Destination port frame, specify the value 2/2.
- Specifying the destination VLAN:
  - In the RSPAN frame, Destination VLAN ID field, specify the value 30.
- Specifying the data source:
  - For port 2/1, mark the checkbox in the Enabled column.
- Specifying the direction:
  - For port 2/1, specify in the Type column the value txrx.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the ✓ button.

```
enable
vlan database
vlan add 30
name 30 RSPAN_VLAN
rspan-vlan 30
exit
configure
monitor session 1 source add interface 2/1
monitor session 1 destination interface 2/3
monitor session 1 destination remote vlan 30
monitor session 1 mode interface 2/3
vlan participation auto 30
exit
```

Change to the Privileged EXEC mode.

Change to the VLAN configuration mode.

Create VLAN 30 in the device.

Assign the name 30 to the VLAN RSPAN_VLAN.

Specify VLAN 30 as the RSPAN VLAN.

Change to the Privileged EXEC mode.

Change to the Configuration mode.

Add port 2/1 to session 1 as a source port.

Add port 2/3 to session 1 as a source port.

Create VLAN mirroring session 1. The source is VLAN 30.

Activate the VLAN mirroring session 1.

Change to the interface configuration mode of interface 2/3.

When requested, the port participates in this VLAN.

Change to the Configuration mode.
Configure switch 3 as an intermediate device.

Perform the following steps:

- Open the **Switching > VLAN > Configuration** dialog.
- Add the VLAN:
  - Click the button.
  - The dialog displays the **Create** window.
  - In the **VLAN ID** field, specify the value 30.
  - Click the **Ok** button.
  - In the **Name** column, specify the value **RSPAN_VLAN**.
- Specifying port 3/1 as a non-member of the management VLAN:
  - For VLAN 1, specify in the 3/1 column the value -. 
- Specifying port 3/2 as a non-member of the management VLAN:
  - For VLAN 1, specify in the 3/2 column the value -. 
- Specifying port 3/2 as a member of the RSPAN VLAN:
  - For VLAN 30, specify in the 3/2 column the value T. 
- Specifying port 3/3 as a non-member of the RSPAN VLAN:
  - For VLAN 30, specify in the 3/3 column the value -. 
- Specifying port 3/4 as a non-member of the RSPAN VLAN:
  - For VLAN 30, specify in the 3/4 column the value -. 
- To save the changes temporarily, click the **✓** button.
- Open the **Switching > L2-Redundancy > Spanning Tree > Port** dialog.
- Deactivating the **Spanning Tree** function on port 3/1:
  - For port 3/1, unmark the checkbox in the **STP active** column.
- Deactivating the **Spanning Tree** function on port 3/2:
  - For port 3/2, unmark the checkbox in the **STP active** column.
- To save the changes temporarily, click the **✓** button.

```

Create VLAN 30 in the device.
Assign the name 30 to the VLAN RSPAN_VLAN.
Specify VLAN 30 as the RSPAN VLAN.
Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 3/1.
When requested, the port participates in this VLAN.
Deactivate STP on the port.
Change to the Configuration mode.
Change to the interface configuration mode of interface 3/2.
Specify that port 3/2 is a member of VLAN 30.
Specify that port 3/2 forwards VLAN 30 data.
When requested, the port participates in this VLAN.
Deactivate STP on the port.
Perform the following steps:

- Open the **Switching > VLAN > Configuration** dialog.
- Add the VLAN:
  - Click the **button**.
  - The dialog displays the **Create** window.
  - In the **VLAN ID** field, specify the value 30.
  - Click the **Ok** button.
  - In the **Name** column, specify the value **RSPAN_VLAN**.
- To save the changes temporarily, click the **button**.
- Open the **Diagnostics > Ports > Port Mirroring** dialog.
- Specifying the destination port:
  - In the **Destination port** frame, specify the value 4/2.
- Specifying the data source:
  - In the **RSPAN** frame, **Source VLAN ID** field, specify the value 30.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **button**.
- Open the **Switching > L2-Redundancy > Spanning Tree > Port** dialog.
- Deactivating the **Spanning Tree** function on port 4/1:
  - For port 4/1, unmark the checkbox in the **STP active** column.
- To save the changes temporarily, click the **button**.

```plaintext
exit
interface 3/3
vlan participation auto 30
exit
interface 3/4
vlan participation auto 30
exit
```

Configure switch as the destination device.

```plaintext
open the Switching > VLAN > Configuration dialog.
add the VLAN:
  click the button.
  the dialog displays the Create window.
  in the VLAN ID field, specify the value 30.
  click the Ok button.
  in the Name column, specify the value RSPAN_VLAN.
- to save the changes temporarily, click the button.
- open the Diagnostics > Ports > Port Mirroring dialog.
- specifying the destination port:
  in the Destination port frame, specify the value 4/2.
- specifying the data source:
  in the RSPAN frame, Source VLAN ID field, specify the value 30.
- to enable the function, select the On radio button in the Operation frame.
- to save the changes temporarily, click the button.
- open the Switching > L2-Redundancy > Spanning Tree > Port dialog.
- deactivating the Spanning Tree function on port 4/1:
  for port 4/1, unmark the checkbox in the STP active column.
- to save the changes temporarily, click the button.
```

```plaintext
enable
disable
vlan database
vlan add 30
name 30 RSPAN_VLAN
rspan-vlan 30
exit
configure
monitor session 1 destination interface 4/2
monitor session 1 source remote vlan 30
monitor session 1 mode
```

Change to the Privileged EXEC mode.
Change to the VLAN configuration mode.
Create VLAN 30 in the device.
Assign the name 30 to the VLAN RSPAN_VLAN.
Specify VLAN 30 as the RSPAN VLAN.
Change to the Privileged EXEC mode.
Change to the Configuration mode.
Specify port 4/2 as the destination port.
Specify VLAN 30 as the RSPAN data source.
Activate the VLAN mirroring session 1.
Example 3

In the example, the source device switch 2 sends the uplink data and the RSPAN data to the intermediate device switch 3. The intermediate device switch 3 then forwards the combined traffic on a single link to the destination device switch 4.

interface 4/1
spanning-tree mode disable
exit

Change to the interface configuration mode of interface 4/1.
Deactivate STP on the port.
Change to the Configuration mode.

Network Analyzer

RSPAN data only
Uplink and RSPAN data
Uplink data only
Configure switch 2 as a port mirroring source.

Perform the following steps:

- Open the **Switching > VLAN > Configuration** dialog.
- Add the VLAN:
  - Click the **Create** button. The dialog displays the **Create** window.
  - In the **VLAN ID** field, specify the value **30**.
  - Click the **Ok** button.
  - In the **Name** column, specify the value **RSPAN_VLAN**.
- Specifying port 2/3 as a member of the RSPAN VLAN:
  - For VLAN **30**, specify in the 2/3 column the value **-**.
- To save the changes temporarily, click the **OK** button.
- Open the **Diagnostics > Ports > Port Mirroring** dialog.
- Specifying the destination port:
  - In the **Destination port** frame, specify the value **2/2**.
- Specifying the destination VLAN:
  - In the **RSPAN** frame, **Destination VLAN ID** field, specify the value **30**.
- Specifying the data source:
  - For port **2/1**, mark the checkbox in the **Enabled** column.
- Specifying the direction:
  - For port **2/1**, specify in the **Type** column the value **txrx**.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **OK** button.

```
enable
vlan database
vlan add 30
name 30 RSPAN_VLAN
rspan-vlan 30
exit
configure
monitor session 1 destination interface 2/2
monitor session 1 destination remote vlan 30
monitor session 1 source add interface 2/1
monitor session 1 mode
interface 2/3
vlan participation auto 30
exit
```

Change to the Privileged EXEC mode.
Change to the VLAN configuration mode.
Create VLAN **30** in the device.
Assign the name **30** to the VLAN **RSPAN_VLAN**.
Specify VLAN **30** as the RSPAN VLAN.
Change to the Privileged EXEC mode.
Change to the Configuration mode.
Add port **2/3** to session **1** as a source port.

```
Create VLAN mirroring session **1**. The source is VLAN **30**.
Add port **2/1** to session **1** as a source port.
```

Activate the VLAN mirroring session **1**.
Change to the interface configuration mode of interface **2/3**.
When requested, the port participates in this VLAN.
Change to the Configuration mode.
Configure switch 3 as an intermediate device.

Perform the following steps:

- Open the Switching > VLAN > Configuration dialog.
- Add the VLAN:
  - Click the Create button.
  - In the VLAN ID field, specify the value 30.
  - Click the Ok button.
  - In the Name column, specify the value RSPAN_VLAN.
- Specifying port 3/1 as a non-member of the management VLAN:
  - For VLAN 1, specify in the 3/1 column the value -.
- Specifying port 3/2 as a member of the RSPAN VLAN:
  - For VLAN 30, specify in the 3/2 column the value T.
- Specifying port 3/3 as a non-member of the management VLAN:
  - For VLAN 1, specify in the 3/3 column the value -.
- To save the changes temporarily, click the button.
- Open the Switching > L2-Redundancy > Spanning Tree > Port dialog.
- Deactivating the Spanning Tree function on port 3/1:
  - For port 3/1, unmark the checkbox in the STP active column.
- To save the changes temporarily, click the button.

```bash
enable
vlan database
vlan add 30
name 30 RSPAN_VLAN
rspan-vlan 30
exit
configure
interface 3/1
vlan participation auto 1
spanning-tree mode disable
exit
interface 3/2
vlan participation include 30
vlan tagging 30
exit
interface 3/3
vlan participation auto 30
exit
```

Configure switch 3 as the destination device.
Perform the following steps:

- Open the **Switching > VLAN > Configuration** dialog.
- Add the VLAN:
  - Click the **button**.
  - The dialog displays the **Create** window.
  - In the **VLAN ID** field, specify the value **30**.
  - Click the **Ok** button.
  - In the **Name** column, specify the value **RSPAN_VLAN**.
- To save the changes temporarily, click the **button**.
- Open the **Diagnostics > Ports > Port Mirroring** dialog.
- Specifying the destination port:
  - In the **Destination port** frame, specify the value **4/2**.
- Specifying the data source:
  - In the **RSPAN** frame, **Source VLAN ID** field, specify the value **30**.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **button**.

```plaintext
enable
vlan database
vlan add 30
name 30 RSPAN_VLAN
rspan-vlan 30
exit
configure
monitor session 1 destination interface 4/2
monitor session 1 source remote vlan 30
monitor session 1 mode
```

- Change to the Privileged EXEC mode.
- Change to the VLAN configuration mode.
- Create VLAN **30** in the device.
- Assign the name **30 RSPAN_VLAN**.
- Specify VLAN **30** as the RSPAN VLAN.
- Change to the Privileged EXEC mode.
- Change to the Configuration mode.
- Specify port **4/2** as the destination port.
- Specify VLAN **30** as the RSPAN data source.
- Activate the VLAN mirroring session 1.
14.15 Self-test

The device checks its assets during the boot process and occasionally thereafter. The device checks system task availability or termination and the available amount of memory. Furthermore, the device checks for application functionality and any hardware degradation in the chip set.

If the device detects a loss in integrity, then the device responds to the degradation with a user-defined action. The following categories are available for configuration.

- **task**
  
  Action to be taken in case a task is unsuccessful.

- **resource**
  
  Action to be taken due to the lack of resources.

- **software**
  
  Action taken for loss of software integrity; for example, code segment checksum or access violations.

- **hardware**
  
  Action taken due to hardware degradation

Configure each category to produce an action in case the device detects a loss in integrity. The following actions are available for configuration.

- **log only**
  
  This action writes a message to the logging file.

- **send trap**
  
  Sends an SNMP trap to the trap destination.

- **reboot**
  
  If activated, then an error in the category will cause the device to reboot.
Perform the following steps:

- Open the **Diagnostics > System > Selftest** dialog.
- In the **Action** column, specify the action to perform for a cause.
- To save the changes temporarily, click the **✓** button.

Disabling these functions lets you decrease the time required to restart the device after a cold start. You find these options in the **Diagnostics > System > Selftest** dialog, **Configuration** frame.

- **RAM test**
  - Activates/deactivates the **RAM test** function during a cold start.
- **SysMon1 is available**
  - Activates/deactivates the System Monitor function during a cold start.
- **Load default config on error**
  - Activates/deactivates the loading of the default device configuration in case no readable configuration is available during a restart.

The following settings block your access to the device permanently in case the device does not detect any readable configuration profile at restart.

- The **SysMon1 is available** checkbox is unmarked.
- The **Load default config on error** checkbox is unmarked.

This is the case, for example, when the password of the configuration profile that you are loading differs from the password set in the device. To have the device unlocked again, contact your sales partner.

14.16 Copper cable test

Use this feature to test copper cables attached to an interface for a short or open circuit. The test interrupts traffic flow, when in progress, on this port.

The table displays the state and lengths of each individual pair. The device returns a result with the following meaning:

- normal - indicates that the cable is operating properly
- open - indicates an interruption in the cable
- short circuit - indicates a short circuit in the cable
- untested - indicates an untested cable
- Unknown - cable unplugged
14.17 Network monitoring with sFlow

**sFlow** is a standard protocol for monitoring networks. The device provides this function for visibility into network activity, enabling effective management and control of network resources.

The **sFlow** monitoring system consists of an **sFlow** agent, embedded in the device and a central **sFlow** collector. The agent uses sampling technology to capture traffic statistics. **sFlow** instances associated with individual data sources within the agent perform packet flow and counter sampling. Using **sFlow** datagrams the agent forwards the sampled traffic statistics to an **sFlow** collector for analysis.

The agent uses 2 forms of sampling, a statistical packet based sampling of packet flows and a timed based sampling of counters. An **sFlow** datagram contains both types of samples. Packet flow sampling, based on a sampling rate, sends a steady, but random stream of datagrams to the collector. For time-based sampling, the agent polls the counters at set intervals to fill the datagrams.

The device implements datagram version 5 for the **sFlow** agent.

The user-defined **sFlow** functions are:

- **Sampler configuration, packet flow sampling:**
  - data source port number, to sample physical ports
  - receiver index associated with the sampler
  - Sampling rate
    - The device counts the packets of received data. When the count reaches the user-defined number, the agent samples the packet.
    - Range: 256..65535
    - 0 = function inactive
  - Header size in bytes to sample
    - Range: 20..256

- **Poller configuration, counter sampling:**
  - data source port number, available for physical ports
  - receiver index associated with the poller
  - Interval, in seconds, between samples
    - Range: 0..86400

- **Receiver configuration, up to 8 entries:**
  - Owner name, to claim an **sFlow** entry
  - timeout, in seconds, until sampling is stopped and the device releases the receiver along with the sampler and the poller
  - datagram size
  - IP address
  - port number

To configure the **sFlow** agent for a monitoring session, first configure an available receiver. Then, configure a sampling rate to perform packet flow sampling. Additionally configure a polling interval for counter sampling.

For example, Company XYZ wishes to monitor data flow on a device. The IP address for the remote server containing the sFlow collector, is 10.10.10.10. XYZ requires a sample of the first 256 bytes of every 300th packet. Furthermore, XYZ requires counter polling every 400 s.
Perform the following steps:

- Open the Diagnostics > SFlow > Receiver dialog.
- For the name of the person or organization controlling the receiver, enter the value XYZ in the Name column.
- For the remote server IP Address, on which the SFlow collector software runs, enter the value 10.10.10.10 in the IP address column.
- Open the Diagnostics > SFlow > Configuration dialog, Sampler tab.
- In the Receiver column, select the index number of the receiver specified in the previous steps.
- In the Sampling rate column, specify the value 300.
- In the Max. header size [byte] column, specify the value 256.
- Open the Diagnostics > SFlow > Configuration dialog, Poller tab.
- In the Receiver column, select the index number of the receiver specified in the previous steps.
- In the Interval [s] column, specify the value 400.
- To save the changes temporarily, click the button.

```bash
enable
configure
sflow receiver 1 owner XYZ ip 10.10.10.10
interface 1/1
sflow sampler receiver 1 rate 300
sflow sampler maxheadersize 256
sflow poller receiver 1 interval 400
```

Change to the Privileged EXEC mode. Change to the Configuration mode. Configure an SFlow receiver

Change to the interface configuration mode of interface 1/1.

To assign the SFlow sampler on the port to the previously configured receiver with a sampling rate of 300.

To configure the maximum header size of the SFlow sampler to the value 256.

To assign the SFlow poller to the previously configured receiver and to sample data for 400 s.
15  Advanced functions of the device

15.1  Using the device as a DHCP server

A DHCP server ("Dynamic Host Configuration Protocol") assigns IP addresses, Gateways, and other networking definitions such as DNS and NTP parameters to clients.

The DHCP operations fall into 4 basic phases: IP discovery, IP lease offer, IP request, and IP lease acknowledgment. Use the acronym DORA which stands for Discovery, Offer, Request, and Acknowledgement to help remember the phases. The server receives client data on UDP port 67 and forwards data to the client on UDP port 68.

The DHCP server provides an IP address pool or "pool", from which it allocates IP addresses to clients. The pool consists of a list of entries. An entry defines either a specific IP address or an IP address range.

The device lets you activate the DHCP server globally and per interface.

15.1.1  IP Addresses assigned per port or per VLAN

The DHCP server assigns a static IP address or dynamic range of IP addresses to a client connected to a port or a VLAN. The device lets you create entries for either a port or a VLAN. When creating an entry to assign an IP address to a VLAN, the port entry grays out. When creating an entry to assign an IP address to a port, the VLAN entry grays out.

Static allocation means that the DHCP server assigns the same IP address to a specific client. The DHCP server identifies the client using a unique hardware ID. A static address entry contains 1 IP address, and applies it to a port or VLAN on which the server receives a request from a specific client. For static allocation, create a pool entry for the ports or one specific port, enter the IP address, and leave the Last IP address column empty. Specify a hardware ID with which the DHCP server uniquely identifies the client. This ID is either a MAC address, a client ID, a remote ID, or a circuit ID. When a client contacts the server with the configured hardware ID, the DHCP server allocates the static IP address.

The device also lets you assign a dynamic IP address range to ports or VLANs from which the DHCP server allocates a free IP address from a pool. To add a dynamic pool entry for the ports or VLANs, specify the first and last IP addresses for the IP address range, leaving the MAC address, Client ID, Remote ID, and Circuit ID columns empty. Creating multiple pool entries lets you have IP address ranges that contain gaps.
15.1.2 DHCP server static IP address example

In this example, configure the device to allocate a static IP address to a port. The device recognizes clients with unique hardware identification. The Hardware ID in this case is the client MAC address 00:24:E8:D6:50:51.

Perform the following steps:

- Open the Advanced > DHCP Server > Pool dialog.
- To add a table entry, click the button.
- In the IP address column, specify the value 192.168.23.42.
- In the Port column, specify the value 1/1.
- In the MAC address column, specify the value 00:24:E8:D6:50:51.
- To assign the IP address to the client infinitely, in the Lease time [s] column, specify the value 4294967295.
- Mark the checkbox in the Active column.
- Open the Advanced > DHCP Server > Global dialog.
- For port 1/1, mark the checkbox in the DHCP server active column.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

enable
configure
dhcp-server pool add 1 static 192.168.23.42
dhcp-server pool modify 1 mode interface 1/1
dhcp-server pool modify 1 mode mac 00:24:E8:D6:50:51
dhcp-server pool modify 1 lease time infinite
dhcp-server operation interface 1/1
dhcp-server operation

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Creating an entry with index 1 and adding the IP address 192.168.23.42 to the static pool.
Assign the static address in index 1 to interface 1/1.
Assign the IP address in index 1 to the device with the MAC address 00:24:E8:D6:50:51.
Enable the index 1 pool entry.
To allocate the IP address to the client infinitely, modify the entry with index 1.
Enable the DHCP server globally.
Change to the interface configuration mode of interface 1/1.
Activate the DHCP Server server function on this port.
15.1.3 DHCP server dynamic IP address range example

The device lets you create dynamic IP address ranges. Leave the MAC address, Client ID, Remote ID and Circuit ID fields empty. To create dynamic IP address ranges with gaps between the ranges add several entries to the table.

Perform the following steps:

- Open the Advanced > DHCP Server > Pool dialog.
- To add a table entry, click the \( \text{button.} \)
- In the IP address column, specify the value \( 192.168.23.92 \). This is the first IP address of the range.
- In the Last IP address column, specify the value \( 192.168.23.142 \). This is the last IP address of the range.
- In the Lease time [s] column, the default setting is 60 days.
- In the Port column, specify the value \( 1/2 \).
- Mark the checkbox in the Active column.
- Open the Advanced > DHCP Server > Global dialog.
- For port \( 1/2 \), mark the checkbox in the DHCP server active column.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the \( \text{button.} \)

Advanced functions of the device

15.2 DHCP L2 Relay

A network administrator uses the DHCP Layer 2 Relay agent to add DHCP client information. This information is required by Layer 3 Relay agents and DHCP servers to assign an address and configuration to a client.

When a DHCP client and server are in the same IP subnet, they exchange IP address requests and replies directly. However, having a DHCP server on each subnet is expensive and often impractical. An alternative to having a DHCP server in every subnet is to use the network devices to relay packets between a DHCP client and a DHCP server located in a different subnet.

A Layer 3 Relay agent is generally a router that has IP interfaces in both the client and server subnets and routes traffic between them. However, in Layer 2 switched networks, there are one or more network devices, switches for example, between the client and the Layer 3 Relay agent or DHCP server. In this case, this device provides a Layer 2 Relay agent to add the information that the Layer 3 Relay agent and DHCP server require to perform their roles in address and configuration assignment.

The following list contains the default settings for this function:

- **Global setting:**
  - Active setting: disable
- **Interface settings:**
  - Active setting: disable
  - Trusted Port: disable
- **VLAN settings:**
  - Active setting: disable
  - Circuit ID: enable
  - Remote ID Type: mac
  - Remote ID: blank

15.2.1 Circuit and Remote IDs

Before forwarding the request of a client to the DHCP server, the device adds the Circuit ID and the Remote ID to the Option 82 field of the DHCP request packet.

- The Circuit ID stores on which port the device received the request of the client.
- The remote ID contains the MAC address, the IP address, the system name, or a user-defined character string. Using it, the participating devices identify the relay agent that received the request of the client.

The device and other relay agents use this information to re-direct the answer from the DHCP relay agent to the original client. The DHCP server is able to analyze this data for example to assign the client an IP address from a specific address pool.

Also, the replay packet of the DHCP server contains the Circuit-ID and the Remote ID. Before forwarding the answer to the client, the device removes the information from the Option 82 field.
15.2.2 DHCP L2 Relay configuration

The Advanced > DHCP L2 Relay > Configuration dialog lets you activate the function on the active ports and on the VLANs.

The device forwards DHCP packets with Option 82 information on those ports for which the checkbox in the DHCP L2 Relay column and in the Trusted port column is marked. Typically, these are ports in the network of the DHCP server.

The ports to which the DHCP clients are connected, you activate the DHCP L2 Relay function, but leave the Trusted port checkbox unmarked. On these ports, the device discards DHCP packets with Option 82 information.

Perform the following steps on Switch 1:

- Open the Advanced > DHCP L2 Relay > Configuration dialog, Interface tab.
- For port 1/1, specify the settings as follows:
  - Mark the checkbox in the Active column.
- For port 1/2, specify the settings as follows:
  - Mark the checkbox in the Active column.
  - Mark the checkbox in the Trusted port column.
- Open the Advanced > DHCP L2 Relay > Configuration dialog, VLAN tab.
- Specify the settings for VLAN 2 as follows:
  - Mark the checkbox in the Active column.
  - Mark the checkbox in the Circuit ID column.
  - To use the IP address of the device as the Remote ID, in the Remote ID type column, specify the value ip.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

Perform the following steps on Switch 2:

- Open the Advanced > DHCP L2 Relay > Configuration dialog, Interface tab.
- For port 1/1 and 1/2, specify the settings as follows:
  - Mark the checkbox in the Active column.
  - Mark the checkbox in the Trusted port column.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.
Verify that VLAN 2 is present then perform the following steps on Switch 1:

- **Configure VLAN 2, and specify port 1/1 as a member of VLAN 2.**
  ```
  enable
  vlan database
  dhcp-l2relay circuit-id 2
  dhcp-l2relay remote-id ip 2
  dhcp-l2relay mode 2
  exit
  ```

- **Perform the following steps on Switch 2:**
  ```
  enable
  configure
  interface 1/1
  dhcp-l2relay trust
  dhcp-l2relay mode
  exit
  interface 1/2
  dhcp-l2relay trust
  dhcp-l2relay mode
  exit
  ```

Perform the following steps on Switch 2:

- **Configure VLAN 2, and specify port 1/1 as a member of VLAN 2.**
  ```
  enable
  vlan database
  dhcp-l2relay circuit-id 2
  dhcp-l2relay remote-id ip 2
  dhcp-l2relay mode 2
  exit
  ```

- **Perform the following steps on Switch 2:**
  ```
  enable
  configure
  interface 1/1
  dhcp-l2relay trust
  dhcp-l2relay mode
  exit
  interface 1/2
  dhcp-l2relay trust
  dhcp-l2relay mode
  exit
  ```
15.3 Using the device as a DNS client

The Domain Name System (DNS) client queries DNS servers to resolve host names and IP addresses of network devices. Much like a telephone book, the DNS client converts names of devices into IP addresses. When the DNS client receives a request to resolve a new name, the DNS client first queries its internal static database, then the assigned DNS servers for the information. The DNS client saves the queried information in a cache for future requests. The device lets you configure the DNS client from the DHCP server using the device management VLAN. The device also lets you assign host names to IP addresses statically.

The DNS client provides the following user functions:
- DNS server list, with space for 4 domain name server IP addresses
- static hostname to IP address mapping, with space for 64 configurable static hosts
- host cache, with space for 128 entries
15.3.1 Configuring a DNS server example

Name the DNS client and configure it to query a DNS server to resolve host names.

Perform the following steps:

- Open the Advanced > DNS > Client > Static dialog.
- In the Configuration frame, Configuration source field, specify the value user.
- In the Configuration frame, Domain name field, specify the value device1.
- To add a table entry, click the button.
- In the Address column, specify the value 192.168.3.5 as the IP address of the DNS server.
- Mark the checkbox in the Active column.
- Open the Advanced > DNS > Client > Global dialog.
- To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.

enable
configure
dns client source user

Specify that the user manually configures the DNS client settings.

dns client domain-name device1

Specifying the string device1 as a unique domain name for the device.

dns client servers add 1 ip 192.168.3.5

to add a DNS name server with an IP address of 192.168.3.5 as index 1.

dns client adminstate

Enable the DNS Client function globally.

Configure the DNS client to map static hosts with IP addresses.

Perform the following steps:

- Open the Advanced > DNS > Client > Static Hosts dialog.
- To add a table entry, click the button.
- In the Name column, enter the value example.com. This is a name of a device in the network.
- In the IP address column, specify the value 192.168.3.9.
- Mark the checkbox in the Active column.
- To save the changes temporarily, click the button.

enable
configure
dns client host add 1 name example.com
ip 192.168.3.9

dns client adminstate

Add example.com as a static host with an IP address of 192.168.3.9.

Enable the DNS Client function globally.
15.4 **GARP**

The Generic Attribute Registration Protocol (GARP) is defined by the IEEE to provide a generic framework so switches can register and deregister attribute values, such as VLAN identifiers and Multicast group membership.

If an attribute for a participant is registered or deregistered according to the GARP function, then the participant is modified according to specific rules. The participants are a set of reachable end stations and network devices. The defined set of participants at any given time, along with their attributes, is the reachability tree for the subset of the network topology. The device forwards the data frames only to the registered end stations. The station registration helps prevent attempts to send data to the end stations that are unreachable.

15.4.1 **Configuring GMRP**

The GARP Multicast Registration Protocol (GMRP) is a Generic Attribute Registration Protocol (GARP) that provides a mechanism allowing network devices and end stations to dynamically register group membership. The devices register group membership information with the devices attached to the same LAN segment. The GARP function also lets the devices disseminate the information across the network devices that support extended filtering services.

**Note:** Before you enable the GMRP function, verify that the MMRP function is disabled.

The following example describes the configuration of the GMRP function. The device provides a constrained multicast flooding facility on a selected port.

Perform the following steps:

1. Open the **Switching > GARP > GMRP** dialog.
2. To provide constrained Multicast Flooding on a port, mark the checkbox in the **GMRP active** column.
3. To save the changes temporarily, click the **✓** button.

```
enable
configure
interface 1/1
  garg gmrp operation
exit
  garg gmrp operation
```

- Change to the Privileged EXEC mode.
- Change to the Configuration mode.
- Change to the interface configuration mode of interface 1/1.
- Enabling the GMRP function on the port.
- Change to the Configuration mode.
- Enabling the GMRP function globally.
15.4.2 Configuring GVRP

You use the GVRP function to allow the device to exchange VLAN configuration information with other GVRP devices. Thus reducing unnecessary Broadcast and unknown Unicast traffic. Besides the GVRP function dynamically creates and manages VLANs on devices connected through 802.1Q trunk ports.

The following example describes the configuration of the GVRP function. The device lets you exchange VLAN configuration information with other GVRP devices.

Perform the following steps:

- Open the Switching > GARP > GVRP dialog.
- To exchange VLAN configuration information with other GVRP devices, mark checkbox in the GVRP active column for the port.
- To save the changes temporarily, click the button.

```
enable
configure
interface 3/1
garp gvrp operation
exit
garp gvrp operation
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 3/1.
Enabling the GVRP function on the port.
Change to the Configuration mode.
Enabling the GVRP function globally.
15.5 MRP-IEEE

The IEEE 802.1ak amendment to the IEEE 802.1Q standard introduced the Multiple Registration Protocol (MRP) to replace the Generic Attribute Registration Protocol (GARP). The IEEE also modified and replaced the GARP applications, GARP Multicast Registration Protocol (GMRP) and GARP VLAN Registration Protocol (GVRP), with the Multiple MAC Registration Protocol (MMRP) and the Multiple VLAN Registration Protocol (MVRP).

To confine traffic to the required areas of a network, the MRP applications distribute attribute values to MRP enabled devices across a LAN. The MRP applications register and de-register Multicast group memberships and VLAN identifiers.

Note: The Multiple Registration Protocol (MRP) requires a loop free network. To help prevent loops in your network, use a network protocol such as the Media Redundancy Protocol, Spanning Tree Protocol, or Rapid Spanning Tree Protocol with MRP.

15.5.1 MRP operation

Each participant contains an applicant component and an MRP Attribute Declaration (MAD) component. The applicant component is responsible for forming the attribute values and their registration and de-registration. The MAD component generates MRP messages for transmission and processes messages received from other participants. The MAD component encodes and transmits the attributes to other participants in MRP Data Units (MRPDU). In the switch, an MRP Attribute Propagation (MAP) component distributes the attributes to participating ports.

A participant exists for each MRP application and each LAN port. For example, a participant application exists on an end device and another application exists on a switch port. The Applicant state machine records the attribute and port for each MRP participant declaration on an end device or switch. Applicant state machine variable changes trigger the transmission of MRPDUs to communicate the declaration or withdrawal.

To establish an MMRP instance, an end device first sends a Join empty (JoinMt) message with the appropriate attributes. The switch then floods the JoinMt to the participating ports and to the neighboring switches. The neighboring switches flood the message to their participating port, and so on, establishing a path for the group traffic.

15.5.2 MRP timers

The default timer settings help prevent unnecessary attribute declarations and withdrawals. The timer settings allow the participants to receive and process MRP messages before the Leave or LeaveAll timers expire.

When you reconfigure the timers, maintain the following relationships:

- To allow for re-registration after a Leave or LeaveAll event, although there is a lost message, set the value of the LeaveTime as follows: \( \geq (2 \times \text{JoinTime}) + 60 \) in 1/100 s
- To minimize the volume of rejoining traffic generated following a LeaveAll, specify the value for the LeaveAll timer larger than the LeaveTime.
The following list contains various MRP events that the device transmits:

- **Join** - Controls the interval for the next Join message transmission
- **Leave** - Controls the length of time that a switch waits in the Leave state before changing to the withdraw state
- **LeaveAll** - Controls the frequency with which the switch generates LeaveAll messages

When expired, the Periodic timer initiates a Join request MRP message that the switch sends to participants on the LAN. The switches use this message to help prevent unnecessary withdraws.

### 15.5.3 MMRP

When a device receives Broadcast, Multicast or unknown traffic on a port, the device floods the traffic to the other ports. This process causes unnecessary use of bandwidth on the LAN.

The Multiple MAC Registration Protocol (MMRP) lets you control the traffic flooding by distributing an attribute declaration to participants on a LAN. The attribute values that the MAD component encodes and transmits on the LAN in MRP messages are Group service requirement information and 48-bit MAC addresses.

The switch stores the attributes in a filtering database as MAC address registration entries. The forwarding process uses the filtering database entries only to transmit data through those ports necessary to reach Group member LANs.

Switches facilitate the group distribution mechanisms based on the Open Host Group concept, receiving packets on the active ports and forwarding only to ports with group members. This way, any MMRP participants requiring packets transmitted to a particular group or groups, requests membership in the group. MAC service users send packets to a particular group from anywhere on the LAN. A group receives these packets on the LANs attached to registered MMRP participants. MMRP and the MAC Address Registration Entries thus restrict the packets to required segments of a loop-free LAN.

In order to maintain the registration and deregistration state and to receive traffic, a port declares interest periodically. Every device on a LAN with the MMRP function enabled maintains a filtering database and forwards traffic having the group MAC addresses to listed participants.

### MMRP example

In this example, Host A intends to listen to traffic destined to group G1. Switch A processes the MMRP Join request received from host A and sends the request to both of the neighboring switches. The devices on the LAN now recognize that there is a host interested in receiving traffic destined for group G1. When Host B starts transmitting data destined for group G1, the data flows on the path of registrations and Host A receives it.
To enable the **MMRP** function on the switches, proceed as follows.

Perform the following steps:

- Open the Switching > MRP-IEEE > MMRP dialog, Configuration tab.
- To activate port 1 and port 2 as **MMRP** participants, mark the checkbox in the **MMRP** column for port 1 and port 2 on switch 1.
- To activate port 3 and port 4 as **MMRP** participants, mark the checkbox in the **MMRP** column for port 3 and port 4 on switch 2.
- To activate port 5 and port 6 as **MMRP** participants, mark the checkbox in the **MMRP** column for port 5 and port 6 on switch 3.
- To send periodic events allowing the device to maintain the registration of the MAC address group, enable the **Periodic state machine**. Select the On radio button in the Configuration frame.
- To save the changes temporarily, click the ✓ button.

To enable the **MMRP** ports on switch 1, use the following commands. Substituting the appropriate interfaces in the commands, enable the **MMRP** functions and ports on switches 2 and 3.

```plaintext
enable
configure
interface 1/1
  mrp-ieee mmrp operation
interface 1/2
  mrp-ieee mmrp operation
exit
  mrp-ieee mrrp periodic-state-machine
  mrp-ieee mmrp operation
```

### 15.5.4 MVRP

The Multiple VLAN Registration Protocol (**MVRP**) is an MRP application that provides dynamic VLAN registration and withdraw services on a LAN.

The **MVRP** function provides a maintenance mechanism for the Dynamic VLAN Registration Entries, and for transmitting the information to other devices. This information lets **MVRP**-aware devices establish and update their VLAN membership information. When members are present on a VLAN, the information indicates through which ports the switch forwards traffic to reach those members.

The main purpose of the **MVRP** function is to allow switches to discover some of the VLAN information that you otherwise manually set up. Discovering this information lets switches overcome the limitations of bandwidth consumption and convergence time in large VLAN networks.
MVRP example

Set up a network comprised of MVRP aware switches (1 - 4) connected in a ring topology with end device groups, A1, A2, B1, and B2 in 2 different VLANs, A and B. With STP enabled on the switches, the ports connecting switch 1 to switch 4 are in the discarding state, helping prevent a loop condition.

Figure 121: MVRP Example Network for VLAN Registration

In the MVRP example network, the LANs first send a Join request to the switches. The switch enters the VLAN registration in the forwarding database for the port receiving the frames.

The switch then propagates the request to the other ports, and sends the request to the neighboring LANs and switches. This process continues until the switches have registered the VLANs in the forwarding database of the receive port.

To enable MVRP on the switches, use the following steps.

- Open the **Switching > MRP-IEEE > MVRP** dialog, **Configuration** tab.
- To activate the ports 1 through 3 as **MVRP** participants, mark the checkbox in the **MVRP** column for the ports 1 through 3 on switch 1.
- To activate the ports 2 through 4 as **MVRP** participants, mark the checkbox in the **MVRP** column for the ports 2 through 4 on switch 2.
- To activate the ports 3 through 6 as **MVRP** participants, mark the checkbox in the **MVRP** column for the ports 3 through 6 on switch 3.
- To activate port 7 and port 8 as **MVRP** participants, mark the checkbox in the **MVRP** column for port 7 and port 8 on switch 4.
- To maintain the registration of the VLANs, enable the **Periodic state machine**. Select the **On** radio button in the **Configuration** frame.
- To enable the function, select the **On** radio button in the **Operation** frame.
- To save the changes temporarily, click the **✓** button.

To enable the **MVRP** ports on switch 1, use the following commands. Substituting the appropriate interfaces in the commands, enable the **MVRP** functions and ports on switches 2, 3 and 4.

```
enable
configure
interface 1/1
```

Change to the Privileged EXEC mode.
Change to the Configuration mode.
Change to the interface configuration mode of interface 1/1.

Change to the interface configuration mode of interface 1/2.
Enabling the MVRP function on the port.
Change to the Configuration mode.
Enabling the Periodic state machine function globally.
Enabling the MVRP function globally.
16 Industry Protocols

For a long time, automation communication and office communication were on different paths. The requirements and the communication properties were too different.

Office communication moves large quantities of data with low demands with respect to the transfer time. Automation communication moves small quantities of data with high demands with respect to the transfer time and availability.

While the transmission devices in the office are usually kept in temperature-controlled, relatively clean rooms, the transmission devices used in automation are exposed to wider temperature ranges. Dirty, dusty and damp ambient conditions make additional demands on the quality of the transmission devices.

With the continued development of communication technology, the demands and the communication properties have moved closer together. The high bandwidths now available in Ethernet technology and the protocols they support enable large quantities to be transferred and exact transfer times to be specified.

With the creation of the first optical LAN to be active worldwide, at the University of Stuttgart in 1984, Hirschmann laid the foundation for industry-compatible office communication devices. Thanks to Hirschmann's initiative with the world's first rail hub in the 1990s, Ethernet transmission devices such as switches, routers and firewalls are now available for the toughest automation conditions.

The desire for uniform, continuous communication structures encouraged many manufacturers of automation devices to come together and use standards to aid the progress of communication technology in the automation sector. This is why we now have protocols that enable us to communicate via Ethernet from the office right down to the field level.
16.1 IEC 61850/MMS

IEC 61850/MMS is an industrial communication protocol standardized by the International Electrotechnical Commission (IEC). The protocol is to be found in substation automation, for example in the control technology of energy suppliers.

This protocol, which works in a packet-oriented way, is based on the TCP/IP transport protocol and uses the Manufacturing Messaging Specification (MMS) for the client-server communication. The protocol is object-oriented and defines a standardized configuration language that comprises, among other things, functions for SCADA, Intelligent Electronic Devices (IED) and for the network control technology.

Part 6 of the IEC 61850 standard defines the configuration language SCL (Substation Configuration Language). SCL describes the properties of the device and the system structure in an automatically processable form. The properties of the device described with SCL are stored in the ICD file in the device.

16.1.1 Switch model for IEC 61850

The Technical Report, IEC 61850 90-4, specifies a bridge model. The bridge model represents the functions of a switch as objects of an Intelligent Electronic Device (IED). An MMS client (for example the control room software) uses these objects to monitor and configure the device.

![Figure 123: Bridge model based on Technical Report IEC 61850 90-4](image)

**Table 62: Classes of the bridge model based on TR IEC61850 90-4**

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Physical Device logical node of the Bridge IED: Defines the physical properties of the device.</td>
</tr>
<tr>
<td>LN LBRI</td>
<td>Bridge logical node: Represents general settings of the bridge functions of the device.</td>
</tr>
<tr>
<td>LN LCCH</td>
<td>Communication Channel logical node: Defines the logical Communication Channel that consists of one or more physical device ports.</td>
</tr>
</tbody>
</table>
16.1.2 Integration into a Control System

**Preparation of the device**
- Check that the device has an IP address assigned.
- Open the Advanced > Industrial Protocols > IEC61850-MMS dialog.
- To start the MMS server, select in the Operation frame the On radio button, and click the button. Afterwards, an MMS client is able to connect to the device and to read and monitor the objects defined in the bridge model.

**NOTICE**

**Risk of unauthorized access to the device**

IEC61850/MMS does not provide any authentication mechanisms. If the write access for IEC61850/MMS is activated, then every client that can access the device using TCP/IP is capable of changing the settings of the device. This in turn can result in an incorrect configuration of the device and to failures in the network.

Only activate the write access if you have taken additional measures (for example Firewall, VPN, etc.) to reduce possible unauthorized access.

Failure to follow these instructions can result in equipment damage.

- To allow the MMS client to change the settings, mark the Write access checkbox, and click the button.

**Offline configuration**

The device lets you download the ICD file using the Graphical User Interface. This file contains the properties of the device described with SCL and enables you to configure the substation without directly connecting to the device.
- Open the Advanced > Industrial Protocols > IEC61850-MMS dialog.
- To load the ICD file to your PC, click the button and then the Download item.
Monitoring the device

The IEC61850/MMS server integrated into the device lets you monitor multiple statuses of the device by means of the Report Control Block (RCB). Up to 5 MMS clients can register for a Report Control Block at the same time.

The device lets you monitor the following statuses:

Table 63: Statuses of the device that can be monitored with IEC 61850/MMS

16.2 Modbus TCP

Modbus TCP is an application layer messaging protocol providing client/server communication between the client and devices connected in Ethernet TCP/IP networks.

The Modbus TCP function lets you install the device in networks already using Modbus TCP and retrieve information saved in the registers in the device.

16.2.1 Client/Server Modbus TCP/IP Mode

The device supports the client/server model of Modbus TCP/IP. This device operates as a server in this constellation and responds to requests from a client for information saved in the registers. The client/server model uses four types of messages to exchange data between the client and server:

- Modbus TCP/IP Request, the client creates a request for information and sends it to the server.
- Modbus TCP/IP Indication, the server receives a request as an indication that a client requires information.
- Modbus TCP/IP Response, when the required information is available, the server sends a reply containing the requested information. When the requested information is unavailable, the server sends an Exception Response to notify the client of the error detected during the processing. The Exception Response contains an exception code indicating the reason for the detected error.
- Modbus TCP/IP Confirmation, the client receives a response from the server, containing the requested information.

16.2.2 Supported Functions and Memory Mapping

The device supports functions with the public codes 0x03 (Read Holding Registers) and 0x05 (Write Single Coil). The codes allow the user to read information saved in the registers such as the system information, including the system name, system location, software version, IP address, MAC address. The codes also allow the user to read the port information and port statistics. The 0x05 code lets the user reset the port counters individually or globally.

The following list contains definitions for the values entered in the Format column:
- Bitmap: a group of 32-bits, encoded into the Big-endian byte order and saved in 2 registers. Big-endian systems save the most significant byte of a word in the smallest address and save the least significant byte in the largest address.
- F1: 16-bit unsigned integer
- F2: Enumeration - power supply alarm
  - 0 = power supply good
  - 1 = power supply failure detected
- F3: Enumeration - OFF/ON
  - 0 = Off
  - 1 = On
F4: Enumeration - port type
- 0 = Giga - Gigabit Interface Converter (GBIC)
- 1 = Copper - Twisted Pair (TP)
- 2 = Fiber - 10 Mb/s
- 3 = Fiber - 100 Mb/s
- 4 = Giga - 10/100/1000 Mb/s (triple speed)
- 5 = Giga - Copper 1000 Mb/s TP
- 6 = Giga - Small Form-factor Pluggable (SFP)

F9: 32-bit unsigned long
String: octets, saved in sequence, 2 octets per register.

Modbus TCP/IP Codes

The table below lists addresses that allow the client to reset port counters and retrieve specific information from the device registers.

</tbody>
</table>
16.2.3 Example Configuration

In this example, you configure the device to respond to client requests. The prerequisite for this configuration is that the client device is configured with an IP address within the given range. The Write access function remains inactive for this example. When you activate the Write access function, the device lets you reset the port counters only. In the default configuration the Modbus TCP and Write access functions are inactive.

**NOTICE**

**RISK OF UNAUTHORIZED ACCESS TO THE DEVICE**

The Modbus TCP protocol does not provide any authentication mechanisms. If the write access for Modbus TCP is activated, then every client that can access the device using TCP/IP is capable of changing the settings of the device. This in turn can result in an incorrect configuration of the device and to failures in the network.

Only activate the write access if you have taken additional measures (for example Firewall, VPN, etc.) to reduce possible unauthorized access.

Failure to follow these instructions can result in equipment damage.

- Open the Device Security > Management Access > IP Access Restriction dialog.
- To add a table entry, click the button.
- Specify the IP address range, in **Index** row 2, enter 10.17.1.0/29 in the **IP address range** column.
- Verify that the Modbus TCP function is enabled.
- To activate the range, mark the Active checkbox.
- Open the Diagnostics > Status Configuration > Security Status dialog, Global tab.
- Verify that the Modbus TCP active checkbox is marked.
- Open the Advanced > Industrial Protocols > Modbus TCP dialog.
- The standard Modbus TCP listening port, port 502, is the default value. However, when you wish to listen on another TCP port, enter the value for the listening port in the TCP port field.
- To enable the function, select the On radio button in the Operation frame.

When you enable the Modbus TCP function, the Security Status function detects the activation and displays an alarm in the Basic Settings > System dialog, Security status frame.

```
enable
network management access add 2

network management access modify 2 ip 10.17.1.0
network management access modify 2 mask 29
network management access modify 2 modbus-tcp enable
network management access operation configure
```

Change to the Privileged EXEC mode.

Creates the entry for the address range in the network. Number of the next available index in this example: 2.

Specifies the IP address.

Specifies the netmask.

Specifies that the device lets Modbus TCP have access to the device management.

Enables the IP access restriction.

Change to the Configuration mode.

16.3 EtherNet/IP

EtherNet/IP is accepted worldwide as a standardized industrial communication protocol and is maintained by the Open DeviceNet Vendor Association (ODVA). The protocol is based on the widely used standard Ethernet transport protocols TCP/IP and UDP/IP. EtherNet/IP is supported by leading manufacturers, thus providing a wide base for effective data communication in the industry sector.

![EtherNet/IP network](image)

EtherNet/IP adds the industry protocol CIP (Common Industrial Protocol) to the standard Ethernet protocols. EtherNet/IP implements CIP at the Session layer and above and adapts CIP to the specific EtherNet/IP technology at the Transport layer and below. In the case of automation applications, EtherNet/IP implements CIP on the application level. Therefore, EtherNet/IP is ideally suited to the industrial control technology sector.

![IEEE802.3 EtherNet/IP](image)

In particular, you find EtherNet/IP in the USA and in conjunction with Rockwell controllers.

For detailed information on EtherNet/IP, see the ODVA website at [www.odva.org/Home/ODVATECHNOLOGIES/EtherNetIP.aspx](http://www.odva.org/Home/ODVATECHNOLOGIES/EtherNetIP.aspx).

16.3.1 Integration into a Control System

Use the following steps to integrate the device into a Control System:

- Open the **Switching > IGMP Snooping > Global** dialog.
  Verify that the **IGMP Snooping** function is enabled.
Industry Protocols
16.3 EtherNet/IP

Note: If EtherNet/IP and the Routing function are enabled at the same time, then malfunctions are possible with EtherNet/IP for example, in connection with “RS Who”. Therefore, if the Routing function is active, then disable the Routing function in the device.

To disable the Routing function, perform the following steps:

- Open the Advanced > Industrial Protocols > EtherNet/IP dialog.
- To disable the routing function in the device, open the Routing > Global dialog.
- In the Operation frame, select the off radio button.

To save the changes temporarily, click the button.

Configuration of a PLC using the example of Rockwell software
- Open the “EDS Hardware Installation Tool” of RSLinx.
- Use the “EDS Hardware Installation Tool” to add the EDS file.
- Restart the “RSLinx” service so that RSLinx takes over the EDS file of the device.
- Use RSLinx to check whether RSLinx has detected the device.
- Open your Logix 5000 project.
- Integrate the device into the Ethernet port of the controller as a new module (Generic Ethernet Module).

Table 66: Settings for integrating a Generic Ethernet Module

</tbody>
</table>

- In the module properties, enter a value of at least 100 ms for the Request Packet Interval (RPI).
**Note:** Monitoring the I/O connection to the CPU of the device as a failure can result in a system failure. Therefore, monitoring the I/O connection as a failure criterion is less suitable.

The I/O connection between the programmable logic controller (PLC) and the device can be interrupted by a management program. For example, a management station can saturate the CPU of the device with higher priority Real Time (RT) data. In this case, the device can still transmit or receive data packets and the system remains operational.

**Example of integration from the Sample Code Library**

The Sample Code Library is a website from Rockwell. The object of the website is to provide users with a place where they can exchange their best architecture integration applications.

On the website `samplecode.rockwellautomation.com`, search for catalog number 9701. This is the catalog number of an example for integrating the Hirschmann device into RS Logix 5000 rel. 16, PLC firmware release 16.

### 16.3.2 EtherNet/IP Entity Parameters

The following paragraphs identify the objects and operations supported by the device.

**Supported operations**

1. The DLR participants list (attribute 0x9) is not included in the Get Attribute All service. Read it using the Get Attribute Single service.

Identity object

The device supports the identity object (Class Code 0x01) of EtherNet/IP. The Hirschmann manufacturer ID is 634. Hirschmann uses the ID 44 (0x2C) to indicate the product type "Managed Ethernet Switch".

Table 68: Instance attributes (only instance 1 is available)

</tbody>
</table>
The device supports only Instance 1 of the TCP/IP Interface Object (Class Code 0xF5) of **EtherNet/IP**.

Depending on the write access status, the device stores the complete configuration in its flash memory. Saving the configuration file can take up to 10 seconds. If the saving process is interrupted for example, due to a power supply failure, then the operation of the device might be impossible.

**Note:** The device replies to the configuration change **Get Request** with a **Response** although the configuration has not yet been saved completely.

**Note:** The number of ports depends on the type of hardware used. The Ethernet Link Object only exists, if the port is connected.
Switch Agent object

The device supports the Hirschmann specific Ethernet Switch Agent Object (Class Code 0x95) for the device configuration and information parameters with Instance 1.

</table>
The Hirschmann specific Ethernet Switch Agent Object provides you with the additional vendor specific service, with the Service Code 0x35 for saving the Switch configuration. When you send a request from your PC to save a device configuration, the device sends a reply after saving the configuration in the flash memory.

**Base Switch object**

The Base Switch object provides the CIP application-level interface to basic status information for a managed Ethernet switch (revision 1).

Only Instance 1 of the Base Switch (Class Code 0x51) is available.

16.4 PROFINET

PROFINET is an industrial communication network based on Ethernet that is accepted worldwide. It is based on the widely used transport protocols TCP/IP and UDP/IP (standard). This is a crucial aspect for fulfilling the requirements for consistency from the management level down to the field level.

PROFINET enhances the existing Profibus technology for such applications that require fast data communication and the use of industrial IT functions.

![Diagram of communication between the Controller and the device](image)

**Figure 127: Communication between the Controller and the device**

In particular, you will find PROFINET in Europe and in conjunction with Siemens controllers.

PROFINET uses the device description language GSDML (Generic Station Description Markup Language, based on XML - eXtended Markup Language) to describe devices and their properties so that they can be processed automatically. You will find the device description in the GSD(ML) file of the device.

You will find detailed information on PROFINET on the website of the PROFIBUS Organization at www.profibus.com.

The devices conform to class B for PROFINET.

**Device Models for PROFINET GSDML Version 2.3**

The device creates GSDML files in the GSDML V.2.3 format. Within the GSDML file, the device is modeled according to GSDML standard V.2.2.
Graphical User Interface and Command Line Interface

When the device is set up successfully in PROFINET environments, the automation process establishes an application relation (AR) to the device.

After the login of a user, the device displays a corresponding message via the Graphical User Interface and Command Line Interface.

16.4.1 Integration into a Control System

Preparing the device

After installing, connecting and configuring the device, proceed using the following steps:

- Open the Basic Settings > System dialog.
- Verify that a valid system name for the device is specified in the System name field.
- To save the changes temporarily, click the button.
- Open the Basic Settings > Network dialog.
- In the Management interface frame, select the Local radio button.
- To save the changes temporarily, click the button.
- Open the Switching > Global dialog, mark the VLAN unaware mode checkbox.
To save the changes temporarily, click the button.

Open the Diagnostics > Status Configuration > Device Status dialog, Global and Port tabs.

Configure the alarm setting and the threshold value for the alarms you want to monitor.

To save the changes temporarily, click the button.

Open the Advanced > Industrial Protocols > PROFINET dialog.

Load the GSD(ML) file and the icon onto your local computer.

Use the following methods to get the GSD(ML) file and the icon:
- Download the file from the Advanced > Industrial Protocols > PROFINET dialog.

To enable the function, select the On radio button in the Operation frame.

To save the changes temporarily, click the button.

**Default values to be changed**

Functions that directly affect the PROFINET function require the following default values to be changed. When you obtain the device as a specially available PROFINET variant, the following values are already predefined:

<table>
<thead>
<tr>
<th>PROFINET</th>
<th>Advanced &gt; Industrial Protocols &gt; PROFINET dialog</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Operation = On</td>
</tr>
<tr>
<td></td>
<td>• Name of station = &lt;empty&gt;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Network</th>
<th>Basic Settings &gt; Network dialog</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address assignment = Local</td>
<td></td>
</tr>
<tr>
<td>HiDiscovery protocol v1/v2Access = readOnly</td>
<td></td>
</tr>
<tr>
<td>IP address = 0.0.0.0</td>
<td></td>
</tr>
<tr>
<td>Netmask = 0.0.0.0</td>
<td></td>
</tr>
<tr>
<td>Gateway address = 0.0.0.0</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Switching &gt; Global dialog</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN unaware mode = marked</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>LLDP</th>
<th>Diagnostics &gt; LLDP dialog</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit interval [s] = 5</td>
<td></td>
</tr>
<tr>
<td>Transmit delay [s] = 1</td>
<td></td>
</tr>
</tbody>
</table>
**Configuration of the PLC**

The following illustrates the configuration of the PLC using the example of the Simatic S7 software from Siemens, and assumes that you are familiar with operating the software.

The device also supports Network management stations from other manufacturers, such as PC Worx from Phönix.

In the PLC default setting, the PLC detects the interruption of the I/O connection to the device as a failure. The PLC considers three consecutive Real Time packets missing from the PLC or from the device as an interruption. According to the default setting, this leads to a system failure. To change this default setting, you employ Step7 programming measures.

**Note:** Monitoring the I/O connection to the CPU of the device as a failure can result in a system failure. Therefore, monitoring the I/O connection as a failure criterion is less suitable.

The I/O connection between the programmable logic controller (PLC) and the device can be interrupted by a management program. For example, a management station can saturate the CPU of the device with higher priority Real Time (RT) data. In this case, the device can still transmit or receive data packets and the system remains operational.

**Providing the GDSML file**

The Hirschmann device provides you with the following options for generating GDSML files and icons:

- You can use the Graphical User Interface in the Advanced > Industrial Protocols > PROFINET dialog to download the GSDML file and the icon of the device.

**Incorporating the device in the configuration**

- Open the Simatic Manager application from Simatic S7.
- Open your project.
- Go to the hardware configuration.
- Install the GSD(ML) file:
  - In the menu bar, click Options > Install GSD File.
  - Select the GSD file previously saved on your PC.
  - Simatic S7 installs the file together with the icon.
- You will find the new device under:
  - PROFINET IO > Additional Field Devices > Switching Devices > Hirschmann.
  - or under
  - PROFINET IO > Additional Field Devices > Network Components > Hirschmann.
- Use the Drag-and-Drop function, pull the device onto the bus cable.

To rename the device, use the following steps:

- Highlight the device.
- In the menu bar, click PLC > Ethernet > Edit Ethernet Node.
- In the Edit Ethernet Node dialog, enter the name of the device in the Assign device name frame, Device name field.
- Click the Browse… button.
- Select the device.
- Click the OK button.
- Specify the name of the device.
- Click the Assign Name button.
☐ Click the Close button.
☐ In the hardware configuration, right-click the device and select Object properties from the drop-down list.
☐ Enter the same name as specified in the Edit Ethernet Node dialog.
☐ Click the Ethernet button.
☐ Enter the IP parameters.
☐ To close the Properties - Ethernet interface... window, click the OK button.
☐ To close the Properties window, click the OK button.

The device is now included in the configuration.

### Configuring IO Cycle
☐ In the hardware configuration, click the device.
☐ In the Slot/Module View dialog, right-click the X1 / PN-IO row.
☐ In the drop-down list, select Object properties.
☐ In the Properties window, open the IO Cycle tab.
☐ In the Update Time frame, Update time[msec] field, select the required update time in ms, for the IO Cycle.
☐ In the Watchdog Time frame, Number of accepted update cycles with missing IO data field, select the required number for the IO Cycle.
☐ To close the Properties window, click the OK button.

### Configuring Media Redundancy
☐ In the hardware configuration, left-click the device.
☐ In the Slot/Module View dialog, right-click the X1 / PN-IO row.
☐ In the drop-down list, select Object properties.
☐ In the Properties window, open the Media Redundancy tab.
☐ In the MRP Configuration frame, Domain field, select the required MRP domain for the node.
☐ In the MRP Configuration frame, Role field, select the required role of the node in the ring.
☐ In the Ring Port 1 and Ring Port 2 fields select the active MRP Ring Ports.
☐ To close the Properties window, click the OK button.

### Adding modules for modular devices
☐ Use the Drag & Drop function to pull a module from the library into a slot.
☐ Simatic S7 adds the ports using the Module properties.

### Configuring device property
In slot 0 you enter the settings for the entire device.
☐ Select the device.
☐ Right-click slot 0.
☐ To configure the entire device, select Object properties.
☐ In the Properties window, open the Parameters tab.

### Configuring the port properties
For modular devices, slots 1 through n represent the modules. The ports are represented as subslots/submodules.

For non-Modular devices, the subslots 1 through n in slot 0 represent the ports.
Configuring Port Alarms
- Right-click a port, 1 through n, and select Object properties.
- In the Properties window, open the Parameters tab.
- Select the desired alarms and close the window.

Special case: “LinkDown” alarm:

The LinkDown alarm is made up of the AND-link
- of the Hirschmann-specific status for connection errors and
- of the Simatic S7-specific option for the connection.

Activating the LinkDown alarm:
- In the Properties dialog, open the Parameters tab (Hirschmann-specific).
- To enable the Alarms parameter, select the value On in the Value column.
- Enable the Link state monitoring parameter and select the Generate diagnosis alarm when link goes down option in the Value column.
- Open the Options tab.
- To activate link monitoring, select a fixed setting for the port in the Connection frame, Transmission medium/duplex field.

Configuring Connection Options
- Right-click a port, 1 through n, and select Object properties.
- In the Properties dialog, open the Options tab.
- In the Connection frame, Transmission medium/duplex field, select the desired setting for the port.
- To close the Properties window, click the OK button.

If you change the port setting to a value other than Automatic settings, then the device disables the port for a short time. If the port is situated on the path between the I/O controller and the I/O device, then the interruption can possibly lead to a failure in establishing the Application Relation. Make the following provisions before changing the port setting:

Note: Beware of Loops! Deactivate RSTP in the device ports between the I/O controller and the I/O device.

- Open the Switching > L2-Redundancy > Spanning Tree > Port dialog, CIST tab.
- Unmark the STP active checkbox for the relevant ports.
- To save the changes temporarily, click the button.

Configuring Topology
- Right-click a port, 1 through n, and select Object properties.
- In the Properties dialog, open the Topology tab.
- In the Partners frame, Partner port field select the required setting for the partner port.
- To close the Properties window, click the OK button.

Swapping devices

Hirschmann devices support the device swapping function with an engineering station.

When identical devices are being swapped, the Network management station assigns the parameters of the original device to the new device.
The device swapping function with Simatic S7 requires the following prerequisites:
- S7 300 with SW release from V2.7 (currently available for CPU 319) or S7 400 with SW release from V5.2
- Hirschmann device SW release from 05.0.00
- Neighboring device(s) support(s) LLDP
- Topology (=neighborhood relationships) is configured and loaded onto SPS

Device swapping requires the following conditions:
- the replacement device is exactly the same type as the device to be replaced.
- the replacement device is connected to the exact same place in the network (same ports and neighboring devices).
- the replacement device has a PROFINET default configuration. Set the device name to "" (null string).

When these conditions are met, the Network management station automatically assigns the parameters of the original device (device name, IP parameters and configuration data) to the replacement device.

Procedure for swapping devices:
- System name "" (= null string)
  - IP address = 0.0.0.0 or DHCP
  - PROFINET activated
- Make a note of the port assignment on the original device and remove the original device from the system.
  The PLC now detects an error.
- Now insert the replacement device in the same position in the network. Verify that the port assignments are the same as the original device.

The PLC finds the replacement device and configures it like the original device.

The PLC detects proper operation.

When necessary, reset the PLC to “Run”.

**Swapping modules**

The PROFINET stack in the device detects a change in the connected modules and reports the change to the engineering station. When a previously configured module is removed from the device, the engineering station reports an error. When a configured module that was missing is connected, the Network management station removes the error message.

**Topology Discovery**

After the user initializes the Topology Discovery, the Network management station looks for connected devices.

**Configuring the topology**

Simatic S7 gives the user the option to configure the topology and monitor it accordingly.

Simatic S7 displays the connection parameters (quality and settings) in a colored graphic.
Communication diagnosis

Simatic S7 monitors the communication quality and outputs messages relating to communication problems.

Outputting port statistics

Simatic S7 counts for each port the number of data packets received and sent, the collisions, etc. You can view these figures in the form of statistic tables in Simatic S7.

16.4.2 PROFINET Parameter

Alarms

The device supports alarms in the device and port levels.

Table 81: Alarms supported

<table>
<thead>
<tr>
<th>Alarms on device level</th>

- 7: Port 16 activated
A Setting up the configuration environment

A.1 Setting up a DHCP/BOOTP server

The following example describes the configuration of a DHCP server using the haneWIN DHCP Server software. This shareware software is a product of IT-Consulting Dr. Herbert Hanewinkel. You can download the software from https://www.hanewin.net. You can test the software for 30 calendar days from the date of the first installation, and then decide whether you want to purchase a license.

To install the DHCP servers on your PC put the product CD in the CD drive of your PC and under Additional Software select haneWIN DHCP Server. To carry out the installation, follow the installation assistant.

- Start the haneWIN DHCP Server program.

![Figure 131: Start window of the haneWIN DHCP Server program](image)

**Note:** When Windows is activated, the installation procedure includes a service that is automatically started in the basic configuration. This service is also active although the program itself has not been started. When started, the service responds to DHCP queries.

- Open the window for the program settings in the menu Options > Preferences and select the DHCP tab.
- Specify the settings displayed in the figure.
- Click the OK button.
To enter the configuration profiles, select **Options > Configuration Profiles** in the menu bar.

- Specify the name for the new configuration profile.
- Click the **Add** button.

- Specify the netmask.
- Click the **Apply** button.

- Select the **Boot** tab.
- Enter the IP address of your tftp server.
Enter the path and the file name for the configuration file.

Click the **Apply** button and then the **OK** button.

![Configuration file on the tftp server](image)

Add a profile for each device type.

When devices of the same type have different configurations, you add a profile for each configuration.

To complete the addition of the configuration profiles, click the **OK** button.

![Managing configuration profiles](image)

To enter the static addresses, in the main window, click the **Static** button.

![Static address input](image)

Click the **Add** button.

![Adding static addresses](image)

Enter the MAC address of the device.
Setting up a DHCP/BOOTP server

- Enter the IP address of the device.
- Select the configuration profile of the device.
- Click the Apply button and then the OK button.

Figure 139: Entries for static addresses

- Add an entry for each device that will get its parameters from the DHCP server.

Figure 140: DHCP server with entries
A.2 Setting up a DHCP server with Option 82

The following example describes the configuration of a DHCP server using the haneWIN DHCP Server software. This shareware software is a product of IT-Consulting Dr. Herbert Hanewinkel. You can download the software from https://www.hanewin.net. You can test the software for 30 calendar days from the date of the first installation, and then decide whether you want to purchase a license.

- To install the DHCP servers on your PC put the product CD in the CD drive of your PC and under Additional Software select haneWIN DHCP Server. To carry out the installation, follow the installation assistant.
- Start the haneWIN DHCP Server program.

![Figure 141: Start window of the haneWIN DHCP Server program](image)

**Note:** When Windows is activated, the installation procedure includes a service that is automatically started in the basic configuration. This service is also active although the program itself has not been started. When started, the service responds to DHCP queries.

![Figure 142: DHCP setting](image)

- To enter the static addresses, click the Add button.

![Figure 143: Adding static addresses](image)

- Mark the Circuit Identifier checkbox.
- Mark the Remote Identifier checkbox.
In the Hardware address field, specify the value Circuit Identifier and the value Remote Identifier for the switch and port.

The DHCP server assigns the IP address specified in the IP address field to the device that you connect to the port specified in the Hardware address field.

The hardware address is in the following form:

ci cl hh vvvv ss mm pp ri xxxxxxxxxxx

- ci Sub-identifier for the type of the Circuit ID
- cl Length of the Circuit ID.
- hh Hirschmann identifier: 01 when a Hirschmann device is connected to the port, otherwise 00.
- vvvv VLAN ID of the DHCP request.
- Default setting: 0001 = VLAN 1
- ss Socket of device at which the module with that port is located to which the device is connected. Specify the value 00.
- mm Module with the port to which the device is connected.
- pp Port to which the device is connected.
- ri Sub-identifier for the type of the Remote ID
- rl Length of the Remote ID.
- xxxxxxxxxxx Remote ID of the device (for example MAC address) to which a device is connected.
Figure 146: Application example of using Option 82
A.3 Preparing access via SSH

To access the device using SSH, perform the following steps:

- Generate a key in the device.
- Transfer your own key onto the device.
- Prepare access to the device in the SSH client program.

Note: In the default setting, the key is already existing and access using SSH is enabled.

A.3.1 Generating a key in the device

The device lets you generate the key directly in the device.

Perform the following steps:

- Open the Device Security > Management Access > Server dialog, SSH tab.
- Disable the SSH server.
  - To disable the function, select the off radio button in the Operation frame.
- To save the changes temporarily, click the ✓ button.
- To create a RSA key, in the Signature frame, click the Create button.
- Enable the SSH server.
  - To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the ✓ button.

`enable` Change to the Privileged EXEC mode.
`configure` Change to the Configuration mode.
`ssh key rsa generate` Generate a new RSA key.
A.3.2 Loading your own key onto the device

OpenSSH gives experienced network administrators the option of generating an own key. To generate the key, enter the following commands on your PC:

```
ssh-keygen(.exe) -q -t rsa -f rsa.key -C '' -N ''
rsaparam -out rsaparam.pem 2048
```

The device lets you transfer your own SSH key onto the device.

Perform the following steps:

- Open the Device Security > Management Access > Server dialog, SSH tab.
- Disable the SSH server. To disable the function, select the Off radio button in the Operation frame.
- To save the changes temporarily, click the button.
- When the host key is located on your PC or on a network drive, drag and drop the file that contains the key in the area. Alternatively click in the area to select the file.
- Click the Start button in the Key import frame to load the key onto the device.
- Enable the SSH server. To enable the function, select the On radio button in the Operation frame.
- To save the changes temporarily, click the button.
- Copy the self-generated key from your PC to the external memory.
- Copy the key from the external memory into the device.

```
enable
```

Change to the Privileged EXEC mode.

```
copy sshkey envm <file name>
```

Load your own key onto the device from the external memory.

A.3.3 Preparing the SSH client program

The PuTTY program lets you access the device using SSH. This program is provided on the product CD.

Perform the following steps:
- Start the program by double-clicking on it.
Setting up the configuration environment
A.3 Preparing access via SSH

In the **Host Name (or IP address)** field you enter the IP address of your device. The IP address (a.b.c.d) consists of 4 decimal numbers with values from 0 to 255. The 4 decimal numbers are separated by points.

To select the connection type, select the **SSH** radio button in the **Connection type** range.

Click the **Open** button to set up the data connection to your device.

Before the connection is established, the PuTTY program displays a security alarm message and lets you check the key fingerprint.

Check the fingerprint of the key to help ensure that you have actually connected to the desired device.

When the fingerprint matches your key, click the **Yes** button.

For experienced network administrators, another way of accessing your device through an SSH is by using the OpenSSH Suite. To set up the data connection, enter the following command:

```
ssh admin@10.0.112.53
```

*admin* is the user name.

*10.0.112.53* is the IP address of your device.
A.4 HTTPS certificate

Your web browser establishes the connection to the device using the HTTPS protocol. The prerequisite is that you enable the HTTPS server function in the Device Security > Management Access > Server dialog, HTTPS tab.

Note: Third-party software such as web browsers validate certificates based on criteria such as their expiration date and current cryptographic parameter recommendations. Old certificates can cause errors for example, an expired certificate or cryptographic recommendations change. To solve validation conflicts with third-party software, transfer your own up-to-date certificate onto the device or regenerate the certificate with the latest firmware.
A.4.1 HTTPS certificate management

A standard certificate according to X.509/PEM (Public Key Infrastructure) is required for encryption. In the default setting, a self-generated certificate is already present in the device.

- Open the Device Security > Management Access > Server dialog, HTTPS tab.
- To create a X509/PEM certificate, in the Certificate frame, click the Create button.
- To save the changes temporarily, click the button.
- Restart the HTTPS server to activate the key. Restart the server using the Command Line Interface.

To activate the certificate after you created or transferred it, reboot the device or restart the HTTPS server. Restart the HTTPS server using the Command Line Interface.

The device also enables you to transfer an externally generated X.509/PEM certificate onto the device:

- Open the Device Security > Management Access > Server dialog, HTTPS tab.
- When the certificate is located on your PC or on a network drive, drag and drop the certificate in the area. Alternatively click in the area to select the certificate.
- Click on the Start button to copy the certificate to the device.
- To save the changes temporarily, click the button.

Note: To activate the certificate after you created or transferred it, reboot the device or restart the HTTPS server. Restart the HTTPS server using the Command Line Interface.
A.4 HTTPS certificate

A.4.2 Access through HTTPS

The default setting for HTTPS data connection is TCP port 443. If you change the number of the HTTPS port, then reboot the device or the HTTPS server. Thus the change becomes effective.

Perform the following steps:

- Open the Device Security > Management Access > Server dialog, HTTPS tab.
- To enable the function, select the On radio button in the Operation frame.
- To access the device by HTTPS, enter HTTPS instead of HTTP in your browser, followed by the IP address of the device.

When you make changes to the HTTPS port number, disable the HTTPS server and enable it again in order to make the changes effective.

The device uses HTTPS protocol and establishes a new data connection. When the user logs out at the end of the session, the device terminates the data connection.

B.2 Maintenance

Hirschmann is continually working on improving and developing their software. Check regularly whether there is an updated version of the software that provides you with additional benefits. You find information and software downloads on the Hirschmann product pages on the Internet at www.hirschmann.com.
B.3 Management Information Base (MIB)

The Management Information Base (MIB) is designed in the form of an abstract tree structure.

The branching points are the object classes. The "leaves" of the MIB are called generic object classes.

When this is required for unique identification, the generic object classes are instantiated, that means the abstract structure is mapped onto reality, by specifying the port or the source address.

Values (integers, time ticks, counters or octet strings) are assigned to these instances; these values can be read and, in some cases, modified. The object description or object ID (OID) identifies the object class. The subidentifier (SID) is used to instantiate them.
Example:

The generic object class `hm2PSState (OID = 1.3.6.1.4.1.248.11.1.1.1.1.1.2)` is the description of the abstract information `power supply status`. However, it is not possible to read any value from this, as the system does not know which power supply is meant.

Specifying the subidentifier 2 maps this abstract information onto reality (instantiates it), thus identifying it as the operating status of power supply 2. A value is assigned to this instance and can be read. The instance `get 1.3.6.1.4.1.248.11.1.1.1.1.1.1.2.1` returns the response 1, which means that the power supply is ready for operation.

### Definition of the syntax terms used:

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>An integer in the range $-2^{31}$ - $2^{31}$ - 1</td>
</tr>
<tr>
<td>IP address</td>
<td><code>xxx.xxx.xxx.xxx</code> (<code>xxx</code> = integer in the range 0..255)</td>
</tr>
<tr>
<td>MAC address</td>
<td>12-digit hexadecimal number in accordance with ISO/IEC 8802-3</td>
</tr>
<tr>
<td>Object Identifier</td>
<td><code>x.x.x.x...</code> (for example 1.3.6.1.1.4.1.248...)</td>
</tr>
<tr>
<td>Octet String</td>
<td>ASCII character string</td>
</tr>
<tr>
<td>PSID</td>
<td>Power supply identifier (number of the power supply unit)</td>
</tr>
<tr>
<td>TimeTicks</td>
<td>Stopwatch, Elapsed time = numerical value / 100 (in seconds)</td>
</tr>
<tr>
<td></td>
<td>numerical value = integer in the range 0-$2^{32}$-1</td>
</tr>
<tr>
<td>Timeout</td>
<td>Time value in hundredths of a second</td>
</tr>
<tr>
<td></td>
<td>time value = integer in the range 0-$2^{32}$-1</td>
</tr>
<tr>
<td>Type field</td>
<td>4-digit hexadecimal number in accordance with ISO/IEC 8802-3</td>
</tr>
</tbody>
</table>
| Counter    | Integer ($0-2^{32}$-1), when certain events occur, the value increases by 1.
A description of the MIB can be found on the product CD provided with the device.

D Further support

Technical questions

For technical questions, please contact any Hirschmann dealer in your area or Hirschmann directly.

You find the addresses of our partners on the Internet at www.hirschmann.com.

A list of local telephone numbers and email addresses for technical support directly from Hirschmann is available at hirschmann-support.belden.com.

This site also includes a free of charge knowledge base and a software download section.

Technical Documents

The current manuals and operating instructions for Hirschmann products are available at doc.hirschmann.com.

Hirschmann Competence Center

The Hirschmann Competence Center is ahead of its competitors on three counts with its complete range of innovative services:

- Consulting incorporates comprehensive technical advice, from system evaluation through network planning to project planning.
- Training offers you an introduction to the basics, product briefing and user training with certification.
  You find the training courses on technology and products currently available at www.hicomcenter.com.
- Support ranges from the first installation through the standby service to maintenance concepts.

With the Hirschmann Competence Center, you decided against making any compromises. Our client-customized package leaves you free to choose the service components you want to use.
E Readers’ Comments

What is your opinion of this manual? We are constantly striving to provide as comprehensive a description of our product as possible, as well as important information to assist you in the operation of this product. Your comments and suggestions help us to further improve the quality of our documentation.
