1. IPsec and its protocols

IPsec (Internet Protocol Security) is a security extension of IP protocol based on authentication and encryption of every IP datagram. Within the OSI architecture, it is security at the network layer, which means that IPsec provides security for any transfer (any network application).

IPsec pay attention to these major security issues:

- **Authenticating** – Allows to verify the origin of the data, so if a packet is received, it is possible to verify that the transmitted packet corresponds to the sender or whether the sender exists at all (Phase I, IKE phase, Main mode). At PSK ends with key exchange.

- **Encrypting** – Both of sides agree on the form of packet encryption in advance. Thereafter the entire packet apart from the IP header will be encrypted, alternatively the entire packet will be encrypted and a new IP header will be added (Phase II, IPsec phase, Quick mode). Ends with establishing of a tunnel.

IPsec consists of two basic protocols – Authentication Header (AH) and Encapsulating Security Payload (ESP). Protocols are complementary, so they are usually used simultaneously. A significant advantage of the simultaneous use of these two protocols is a higher level of security. Increased overhead when processing may eliminate this advantage. Part of IPsec is also IKE (Internet Key Exchange) protocol (key management). IKE creates logical channels which are called Security Associations (SA). These channels are always unidirectional therefore it is necessary to use two separate channels (SA) for duplex. IKE also supports automatic generation and recovery of encryption keys.

1.1 Authentication Header (AH)

It provides authentication of sender and recipient, integrity of data in the header and protection against reverse queries. However, AH protocol does not provide confidentiality of data. This means that sent data are unencrypted and can be eavesdropped.

When using the Authentication Header protocol, each packet contains a special header which contains authentication information followed by data of the protocol itself. Authentication information consists of the result of a cryptographic checksum (it’s used the SHA-1 or MD5 algorithm), security parameters (Security Parameter Index, SPI) and pointer to the header of higher level protocol. Items, which are changing in header of higher level protocol during a packet transmission (such as TTL item, for example), are ignored in the calculation of authentication information.
1. **IPSEC AND ITS PROTOCOLS**

1.1.1 **Usage of Authentication Header protocol**

Authentication Header protocol can be used in two ways – in *transport mode* or in *tunnel mode*. Transport mode allows data protection using a header of AH protocol, which is inserted by the sender of the datagram between other extension headers. This mode requires less overhead when processing than the tunnel mode, but does not provide such security of data protection.

![Figure 1: AH – transport mode](image)

Tunnel mode (sometimes tunneling mode) creates a new IP header which is followed by header of Authentication Header protocol. This is followed by the entire original datagram packaged as new data datagram. In this mode, the AH protocol authenticates the entire datagram, which means that it is possible to determine whether the datagram has changed during transmission. The main advantage of the tunnel mode is perfect protection of an encapsulated IP datagram. Furthermore, it allows the use of private addresses.

![Figure 2: AH – tunnel mode](image)

1.2 **Encapsulating Security Payload (ESP)**

Encapsulating Security Payload (ESP) protocol ensures the confidentiality of transmitted data (encrypts packets) and optionally the original authentication, data integrity and protection against reverse queries. As with the Authentication Header (AH) protocol, additional header is attached to an IP packet. This header contains the security parameters which are followed by encrypted data. However, the outer header is not protected and its integrity is not guaranteed.

In case of requirement for encryption and authentication, system which responds first authenticates packet and if the first step is successful, continues with encryption. This type of configuration reduces both overhead of processing and vulnerability in case of attack when denial of service.
1.2.1 Usage of Encapsulating Security Payload protocol

ESP protocol can be used in two ways – in transport mode or in tunnel mode. Transport mode inserts ESP header behind the IP header of the original IP datagram. ESP trailer and optional authentication data follow data of the original datagram. Transport mode requires less overhead when processing than the tunnel mode, but does not provide such security of data protection.

**Figure 3: ESP – transport mode**

Tunnel mode (sometimes tunneling mode) creates a new IP header which is followed by header of Encapsulating Security Payload protocol. This is followed by the entire original datagram packaged as new data datagram. This allows to completely protect original datagram (in case that encryption and authentication are used). ESP trailer and optional authentication data follow data of the original datagram.

**Figure 4: ESP – tunnel mode**
2. Configuration of IPsec tunnel

IPsec tunnel creates a secure (encrypted) connection between two LANs into one that looks like a homogeneous. Hirschmann routers allow users to create up to four IPsec tunnels whose configuration can be called up by selecting the IPsec menu item. There are four lines in the IPsec Tunnels Configuration window, each line corresponds to the configuration of one tunnel.

Table 2: Configuration of IPsec tunnel
## 2. CONFIGURATION OF IPSEC TUNNEL

### Figure 6: Configuration form of IPsec tunnel
3. Examples of use

3.1 IPsec tunnel – initiator on the router

IP address of the SIM card inserted into Hirschmann router can be static or dynamic, because IPsec tunnel is established by initiator on the router. In this case, Linux server (CISCO router) offers services for IPsec tunnel therefore it must always be available on a static IP address or on a domain name.

If addresses of tunnel ends are visible to one another, all you have to do is specify these items: Description, Remote IP address, Remote Subnet, Remote Subnet Mask, Local Subnet and Local Subnet Mask. If not (one end of the tunnel is in a private network), it is necessary to enable NAT Traversal.

If NAT Traversal is active, it is also necessary to set Remote ID. As the ID has to be filled FQDN (Fully Qualified Domain Name), which is the designation for a fully specified domain name of the computer. It is also possible to set authentication using certificates, but then there is no need to enter Remote ID.

Figure 7: IPsec tunnel – initiator on the router
The following table provides an example of IPsec tunnel settings which correspond to the figure from the beginning of this chapter:

<table>
<thead>
<tr>
<th>Item</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote IP Address</td>
<td>83.208.155.127</td>
</tr>
<tr>
<td>Remote ID</td>
<td><a href="mailto:ciscoasa@default.domain">ciscoasa@default.domain</a></td>
</tr>
<tr>
<td>Remote Subnet</td>
<td>192.168.1.0</td>
</tr>
<tr>
<td>Remote Subnet Mask</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>Local Subnet</td>
<td>192.168.3.0</td>
</tr>
<tr>
<td>Local Subnet Mask</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>test</td>
</tr>
<tr>
<td>NAT Traversal</td>
<td>enabled</td>
</tr>
</tbody>
</table>

Table 3: IPsec tunnel settings (initiator)

Other parameters can be left in default settings. If the Remote IP Address parameter is empty on one side of IPsec tunnel, then this side will wait for a connection and will not attempt to establish a connection.

All items that are not mentioned in the sample settings and are marked with an asterisk (*) may not be filled in. They are used to accurate identification of the tunnel.

3.1.2 Detection of the successful establishment of the tunnel

Information about the active IPsec tunnel can be found in the Status section on the IPsec page of the router web interface.

It is possible to read the selected encryption in various stages of establishing the tunnel from the figure above:

- IKE: 3DES_CBC_192-MD5-MODP1024
- ESP: 3DES_0-HMAC_MD5, pfsgroup = none

The highlighted part shows information about the successful establishment of IPsec tunnel.
3.2 IPsec tunnel – responder on the router

Hirschmann router must have an available static IP address or dynamic IP address of the SIM card in case of using translation of dynamically assigned IP addresses to DynDNS domain name. In this case, Linux server (CISCO router) is initiator and establishes IPsec tunnel.

![Diagram showing IPsec tunnel - responder on the router](image)

**Figure 9: IPsec tunnel – responder on the router**

### 3.2.1 Configuration via web interface

If addresses of tunnel ends are visible to one another, all you have to do is specify these items: *Description*, *Remote Subnet* and *Remote Subnet Mask*. If not (one end of the tunnel is in a private network), it is necessary to enable *NAT Traversal*.

If *NAT Traversal* is active, it is also necessary to set *Remote ID*. As the ID has to be filled FQDN (Fully Qualified Domain Name), which is the designation for a fully specified domain name of the computer. It is also possible to set authentication using certificates, but then there is no need to enter *Remote ID*.

The following table provides an example of IPsec tunnel settings which correspond to the figure from the beginning of this page:

<table>
<thead>
<tr>
<th>Item</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote ID</td>
<td><a href="mailto:ciscoasa@default.domain">ciscoasa@default.domain</a></td>
</tr>
<tr>
<td>Remote Subnet</td>
<td>192.168.2.219</td>
</tr>
<tr>
<td>Remote Subnet Mask</td>
<td>255.255.255.255</td>
</tr>
<tr>
<td>Pre-shared Key</td>
<td>test</td>
</tr>
<tr>
<td>NAT Traversal</td>
<td>enabled</td>
</tr>
</tbody>
</table>

Table 4: IPsec tunnel settings (responder)
Other parameters can be left in default settings. If the *Remote IP Address* parameter is empty on one side of IPsec tunnel, then this side will wait for a connection and will not attempt to establish a connection.

All items that are not mentioned in the sample settings and are marked with an asterisk (*) may not be filled in. They are used to accurate identification of the tunnel.

### 3.2.2 Detection of the successful establishment of the tunnel

Information about the active IPsec tunnel can be found in the *Status* section on the *IPsec* page of the router web interface.

![Image of IPsec Status](image)

**Figure 10: Information about IPsec tunnel (responder)**

It is possible to read the selected encryption in various stages of establishing the tunnel from the figure above:

- **IKE**: 3DES_CBC_192-MD5-MODP1024
- **ESP**: 3DES_0-HMAC_MD5, pfsgroup = none

The highlighted part shows information about the successful establishment of IPsec tunnel.
3.3 IPsec tunnel – Linux server

On the Linux server is needed to configure `ipsec.conf` and `ipsec.secrets` files. Configuration of `ipsec.conf` file can be performed for example like this:

```
conn hirschmannrouter
  authby=secret
  type=tunnel
  left=83.208.155.127
  leftsubnet=192.168.1.0/24
  right=172.24.68.112
  rightsubnet=192.168.3.0/24
  ikelifetime=3600s
  keylife=3600s
  pfs=no
  auto=add
```

`ipsec.secrets` file shall be configured as follows:

```
83.208.155.127 172.24.68.112: PSK "test"
```
3.4 IPsec tunnel – CISCO router

Please note that CISCO routers support IPsec protocol since IOS version no. 7.1.

3.5 IPsec tunnel – Computer with Windows

Recommended program for Windows operating system is *NCP Secure Entry Client* on which the following description is based on.

3.5.1 IPsec configuration (NCP Secure Entry Client)

The figure below shows the environment of the NCP Secure Entry Client (version 9.32, build 218).
First it is necessary to create a profile for establishing IPsec tunnel. Select Configuration tab in the menu (of NCP Secure Entry Client program) and then select Profiles item. The following window will be open:

![Profiles](image1.png)

Figure 15: NCP Secure Entry Client – Profiles

Add a new profile using the Add/Import button. On the second screen, you must enter the profile name. In other cases (on the other screens) it is possible only to confirm using the Next button (on the last screen using the Finish button) and make the necessary settings later.

Configuration of the IPsec tunnel is done by marking the profile and pressing Edit button.

![Edit](image2.png)

Figure 16: NCP Secure Entry Client – Edit
Select **IPsec General Settings** item in the menu on the left side. Then press **Police Editor**… button on the right side.

![Figure 17: NCP Secure Entry Client – IPsec General Settings](image)

In the new window highlight the **Pre-shared Key** item (in **IKE Policy** section) and then press **Edit** button.

![Figure 18: NCP Secure Entry Client – Policy Editor](image)
3. EXAMPLES OF USE

This opens a window in which select encryption and hash algorithm (for example Triple DES and MD5) and then confirm by pressing the OK button.

![IKE Policy](image1.png)

Figure 19: NCP Secure Entry Client – Pre-shared Key

Now, select the only available item in IPsec Policy section of configuration window. The item has a name ESP - AES128 - MD5. Then press Edit button.

![IPsec Configuration](image2.png)

Figure 20: NCP Secure Entry Client – Policy Editor
Enter the desired name (for example IPsec) in the new window and select encryption and hash algorithm (for example Triple DES and MD5). Then confirm it by pressing the OK button.

![Figure 21: NCP Secure Entry Client – IPsec Policy](image1)

Go back to the main window of IPsec General Settings item and set IKE Policy and IPsec Policy items based on the previous configuration (see figure below). IKE DH Group item will have a value of DH-Group 2 (2014 bit).

![Figure 22: NCP Secure Entry Client – IPsec General Settings](image2)
Now, select *Identities* item in the menu on the left side and fill in the configuration form as shown below. Note that the IP address corresponds to the exemplary situation from the beginning of this section.

![NCP Secure Entry Client – Identities](image1)

**Figure 23: NCP Secure Entry Client – Identities**

The same IP address (192.168.2.219 according to the exemplary situation) is also required on the *IPsec Address Assignment* page.

![NCP Secure Entry Client – IPsec Address Assignment](image2)

**Figure 24: NCP Secure Entry Client – IPsec Address Assignment**
Press *Add* button on the *Split Tunneling* page and enter the IP address of the subnet behind the router Hirschmann (192.168.3.0 in the exemplary situation) and relevant subnet mask (255.255.255.0) to the newly opened window. Confirm it by pressing the *OK* button.

![IP Network](image1.png)

Figure 25: NCP Secure Entry Client – Add IP network

Specified data are displayed in the original window of the *Split Tunneling* page.

![Profile Settings](image2.png)

Figure 26: NCP Secure Entry Client – Split Tunneling

### 3.5.2 Configuration of Hirschmann router

On the following page is displayed configuration form with IPsec tunnel settings. Entered values correspond to the exemplary situation from the beginning of this section.
### 3. EXAMPLES OF USE

4. Recommended literature

Application Notes, the “Installation” user manual, the “Configuration” user manual and documentation of several OWL user modules can be found as PDF files for downloading on the Internet at:

https://www.doc.hirschmann.com/
5. Further support

Technical questions
For technical questions, please contact any Hirschmann dealer in your area or Hirschmann directly.

You find the addresses of our partners on the Internet at http://www.hirschmann.com
A list of local telephone numbers and email addresses for technical support directly from Hirschmann is available at https://hirschmann-support.belden.com
This site also includes a free of charge knowledge base and a software download section.

Customer Innovation Center
The Customer Innovation Center is ahead of its competitors on three counts with its complete range of innovative services:

- Consulting incorporates comprehensive technical advice, from system evaluation through network planning to project planning.

- Training offers you an introduction to the basics, product briefing and user training with certification. You find the training courses on technology and products currently available at https://www.belden.com/solutions/customer-innovation-center

- Support ranges from the first installation through the standby service to maintenance concepts.

With the Customer Innovation Center, you decide against making any compromises in any case. Our client-customized package leaves you free to choose the service components you want to use.
