Enters the routing map configuration mode	<b>route-map</b> <i>map-name</i> [ { <b>permit</b>   <b>deny</b> } [ <i>seq-number</i> ] ]	-
Specify the AS-PATH list which matches the routing map	<b>match as-path</b> <i>path-list-number</i>	Optional  By default, no AS-PATH list which matches the routing map is specified.
Specify the BGP community-list which matches the routing map	<b>match community</b> <i>community-list-number / community-list-name</i> [ <b>exact-match</b> ]	Optional  By default, no BGP community-list which matches the routing map is specified.
Specify the BGP extcommunity-list which matches the routing map	<b>match extcommunity</b> <i>extcommunity-list-number / extcommunity-list-name</i>	Optional  By default, no BGP extcommunity-list which matches the routing map is specified.
Specify the interface which matches the routing map	<b>match interface</b> <i>interface-names</i>	Optional  By default, no interface which matches the routing map is specified.
Specify the route prefix which matches the routing map	<b>match ip address</b> { <i>access-list-number</i>   <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }	Optional  By default, no route prefix which matches the routing map is specified.

Step	Command	Description
Specify the next hop address which matches the routing map	<b>match ip next-hop</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }	Optional By default, no next hop address which matches the routing map is specified.
Specify the source address of route which matches the routing map	<b>match ip route-source</b> { <i>access-list-name</i>   <b>prefix-list</b> <i>prefix-list-name</i> }	Optional By default, no source address of route which matches the routing map is specified.
Specify the metric value which matches the routing map	<b>match metric</b> <i>metric-value</i> [ <i>+offset</i> ]	Optional By default, no metric value which matches the routing map is specified.
Specify the route type which matches the routing map	<b>match route-type</b> { <b>external</b> / <b>interarea</b> / <b>internal</b> / <b>level-1</b> / <b>level-2</b> / <b>nssa-external</b> / <b>type-1</b> / <b>type-2</b> }	Optional By default, no route type which matches the routing map is specified.
Specify the tag value which matches the routing map	<b>match tag</b> <i>tag-value</i>	Optional By default, no tag value which matches the routing map is specified.

---

## Note

- When no match sub-statement is configured in routing map, all the objects can be successfully matched.
  - When there is no ACL and prefix list associated with the match sub-statements, all the objects cannot be successfully matched.
-

## Configure set Sub-statement of Routing Map

Only when the match mode of the routing map is permit and all the match sub-statements are successfully matched, the set operation can be executed. When the match mode is deny, no set operation will be performed.

Table 63 Configure Set Sub-statements of Routing Map

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enters the routing map configuration mode	<b>route-map</b> <i>map-name</i> [ { <b>permit</b>   <b>deny</b> } [ <i>seq-number</i> ] ]	-
Set the AS path attributes of BGP route	<b>set as-path prepend</b> <i>as-path-number</i>	Optional By default, no AS path attribute of BGP route is set.
Set the community attributes of BGP route	<b>set communitiy</b> { <i>community-number</i>   <b>additive</b>   <b>local-AS</b>   <b>internet</b>   <b>no-advertise</b>   <b>no-export</b>   <b>none</b> }	Optional By default, no community attribute of BGP route is set.
Delete the specified BGP community-list	<b>set comm-list</b> { <i>community-list-number</i> / <i>community-list-name</i> } <b>delete</b>	Optional By default, the BGP community-list is not deleted.
Set BGP route dampening parameters	<b>set dampening</b> <i>half-life start-reusing start-suppress max-duration</i>	Optional By default, no BGP route dampening parameter is set.
Set the extcommunity attributes of MPLS L3VPN route	<b>set extcommunity</b> { <b>rt</b>   <b>soo</b> } <i>extcommunity</i>	Optional By default, no extcommunity attribute

Step	Command	Description
		of MPLS L3VPN route is set.
Set the backup next hop	<b>set fast-reroute</b> [ <b>backup-interface</b> <i>interface-names</i> ] <b>backup-nexthop</b> <i>nexthop-address</i>	Optional By default, the backup next hop of route is not configured.
Set the next hop of route	<b>set ip default next-hop</b> <i>ip-address</i>	Optional By default, the next hop of route is not configured. Set the next hop of route in the redistribution of OSPF route
Set the next hop of route	<b>set ip next-hop</b> <i>ip-address</i>	Optional By default, the next hop of route is not configured. Set the next hop of route for BGP's associated routing map
Set preference of BGP route	<b>set local-preference</b> <i>value</i>	Optional By default, no local preference of BGP route is set.
Set the metric value of route	<b>set metric</b> { <i>metric</i>   <i>+metric</i>   <i>-metric</i>   <i>bandwidth delay reliable loading mtu</i> }	Optional By default, no metric value of route is set.
Set the metric type of route	<b>set metric-type</b> { <b>external</b>   <b>internal</b>   <b>type-1</b>   <b>type-2</b> }	Optional By default, no metric type of route is set.

Step	Command	Description
Set the Origin attributes of BGP route	<b>set origin</b> { <b>egp</b> <i>as-number</i>   <b>igp</b>   <b>incomplete</b> }	Optional By default, no Origin attribute of BGP route is set.
Set the field of external route's tag option	<b>set tag</b> <i>tag-value</i>	Optional By default, no field of external route's tag option is set.
Set the weight of BGP route	<b>set weight</b> <i>weight-value</i>	Optional By default, the weight of BGP route is not set.

## 63.2.6 Configure Key-chain

### Configuration Condition

None

### Configure Key-chain

Key-chain is a password management tool. It provides authentication password when the routing protocol is authenticating protocol packets. Key-chain can provide different passwords for the sending and receiving of packets as well as for different Key IDs. Besides, Key-chain can periodically and automatically switch password according to the effective time of the Key configured, i.e. use different passwords at different time periods, which greatly improves the security of password.

Multiple Key IDs can be configured for a Key-chain. When the protocol uses the Key-chain for authentication, the Key ID is selected according to the following rules:

- Obtain the minimum valid sending password of Key ID when necessary;
- Obtain the minimum valid receiving password of Key ID in the Key where the Key ID is greater than or equals to the given Key ID;
- When the protocol packets received contain Key ID, they will search corresponding valid receiving password in the local port according to this Key ID; otherwise, the minimum valid effective receiving password of the Key ID in the Key-chain of local port will be used.

Table 63 Configuring Key-chain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to generate a Key-chain	<b>key chain</b> <i>keychain-name</i>	Mandatory By default, Key-chain is not configured.
Configure Key ID	<b>key</b> <i>key-id</i>	Mandatory By default, Key ID is not configured.
Configure password	<b>key-string</b> [ <b>0</b>   <b>7</b> ] <i>password</i>	Mandatory By default, password is not configured.  Please note that space is also considered as a password character
Set the valid time of Key as a receiving password	<b>accept-lifetime</b> <i>time-start</i> { <i>time-end</i>   <b>duration</b> <i>second</i>   <b>infinite</b> }	Mandatory By default, the receiving password is always valid.
Set the valid time of Key as a sending password	<b>send-lifetime</b> <i>time-start</i> { <i>time-end</i>   <b>duration</b> <i>second</i>   <b>infinite</b> }	Mandatory By default, the sending password is always valid.

## 63.2.7 Routing policy tool monitoring and maintaining

Table 63 Routing Policy Tool Monitoring and Maintaining

Command	Description
<b>clear ip prefix-list</b> [ <i>prefix-list-name</i> <i>network/length</i> ]	Clears prefix list statistics.
<b>show ip prefix-list</b> [ <i>prefix-list-name</i> [ <i>network/length</i> [ <b>first-match</b>   <b>longer</b> ]   <b>seq sep_value</b> ]   <b>detail</b> [ <i>prefix-list-name</i> ]   <b>orf-prefix</b>   <b>summary</b> [ <i>prefix-list-name</i> ]	Show the information of prefix list
<b>show ip as-path-access-list</b> [ <i>list-name</i> ]	Show the information of AS-PATH list
<b>show ip community-list</b> [ <i>community-list-number</i>   <i>community-list-name</i> ]	Show the information of community-list
<b>show ip extcommunity-list</b> [ <i>extcommunity-list-number</i>   <i>extcommunity-list-name</i> ]	Show the information of extcommunity-list
<b>show route-map</b> [ <i>route-map-name</i> ]	Show the information of routing map
<b>show key chain</b> [ <i>keychain-name</i> ]	Show the information of Key-chain

## 63.3 Example of typical routing policy tool configuration

### 63.3.1 Configure route redistribution and associate routing policy

#### Network Requirements

- OSPF protocol is run between Device1 and Device2, and RIP protocol is run between Device2 and Device3.
- Configure OSPF to redistribute RIP routes on Device2, associate the routing policy, modify the Tag attribute of 100.1.1.0/24 as 5 and the metric value of 110.1.1.0/24 as 50, and keep the attributes of 120.1.1.0/24 unchanged.

#### Network Topology

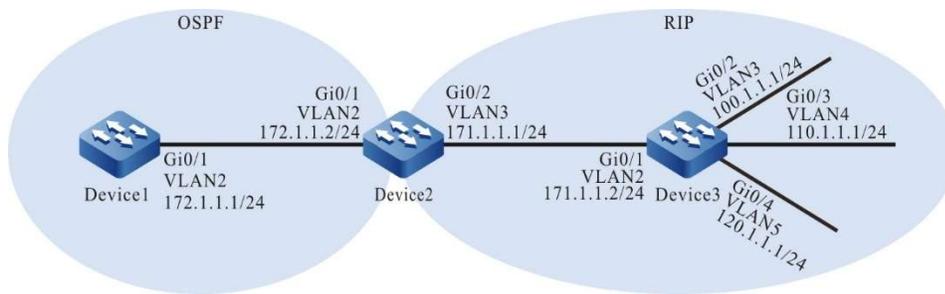

Figure 63-1 Network Topology for Configuring Route Redistribution and Association with Routing Policy

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 172.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 172.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### Step 4: Configure RIP.

#### #Configure Device2.

```
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 171.1.1.0
Device2(config-rip)#exit
```

#### #Configure Device3.

```
Device3(config)#configure terminal
Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 171.1.1.0
Device3(config-rip)#network 100.1.1.0
Device3(config-rip)#network 110.1.1.0
Device3(config-rip)#network 120.1.1.0
Device3(config-rip)#exit
```

Step 5: Configure OSPF to redistribute RIP routes.

#Configure Device2.

```
Device2(config)#router ospf 100
Device2(config-ospf)#redistribute rip
Device2(config-ospf)#exit
```

#View the routing table of Device1.

```
Device1#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

OE 100.1.1.0/24 [150/20] via 172.1.1.2, 02:22:08, vlan2
OE 110.1.1.0/24 [150/20] via 172.1.1.2, 00:49:57, vlan2
OE 120.1.1.0/24 [150/20] via 172.1.1.2, 02:22:08, vlan2
OE 171.1.1.0/24 [150/20] via 172.1.1.2, 02:22:41, vlan2
```

By checking the routing table of Device1, you will find that the RIP routes on Device2, i.e. 100.1.1.0/24, 110.1.1.0/24, and 120.1.1.0/24, have been redistributed to the OSPF process and successfully advertised to Device1.

Step 6: Configure access list and routing policy.

#Configure Device2.

Configure access list, and allow the routes 100.1.1.0/24, 110.1.1.0/24 and 120.1.1.0/24 to pass.

```
Device2(config)#ip access-list standard 1
Device2(config-std-nacl)#permit 100.1.1.0 0.0.0.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#ip access-list standard 2
Device2(config-std-nacl)#permit 110.1.1.0 0.0.0.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#ip access-list standard 3
Device2(config-std-nacl)#permit 120.1.1.0 0.0.0.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
```

Configure the routing policy rip\_to\_ospf. Set the tag attribute of the routes allowed by the access list with a match number of 1, set the metric attribute of the routes allowed by the access list with a match number of 2, and keep the attributes of the routes allowed by the access list with a match number of 3 unchanged.

```
Device2(config)#route-map rip_to_ospf 10
Device2(config-route-map)#match ip address 1
Device2(config-route-map)#set tag 5
Device2(config-route-map)#exit
Device2(config)#route-map rip_to_ospf 20
Device2(config-route-map)#match ip address 2
Device2(config-route-map)#set metric 50
```

```
Device2(config-route-map)#exit
Device2(config)#route-map rip_to_ospf 30
Device2(config-route-map)#match ip address 3
Device2(config-route-map)#exit
```

---

## Note

- When configuring a routing policy, both the prefix list and ACL can create matching rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 7: Configure OSPF to redistribute RIP routes and associate routing policy.

#Configure Device2.

```
Device2(config)#router ospf 100
Device2(config-ospf)#redistribute rip route-map rip_to_ospf
Device2(config-ospf)#exit
```

Step 8: Check the result.

#View the OSPF database of Device1.

```
Device1#show ip ospf database external
      OSPF Router with ID (172.1.1.1) (Process ID 100)

      AS External Link States

      LS age: 1183
      Options: 0x22 (-|-|DC|-|-|E|-)
      LS Type: AS-external-LSA
      Link State ID: 100.1.1.0 (External Network Number)
      Advertising Router: 172.1.1.2
      LS Seq Number: 80000006
      Checksum: 0xbcc0
      Length: 36

        Metric Type: 2 (Larger than any link state path)
        TOS: 0
        Metric: 20
        Forward Address: 0.0.0.0
        External Route Tag: 5

      LS age: 1233
      Options: 0x22 (-|-|DC|-|-|E|-)
      LS Type: AS-external-LSA
      Link State ID: 110.1.1.0 (External Network Number)
      Advertising Router: 172.1.1.2
      LS Seq Number: 80000006
```

Checksum: 0x0d4d  
Length: 36  
Network Mask: /24  
Metric Type: 2 (Larger than any link state path)  
TOS: 0  
Metric: 50  
Forward Address: 0.0.0.0  
External Route Tag: 0

LS age: 1113  
Options: 0x22 (-|DC|E|)  
LS Type: AS-external-LSA  
Link State ID: 120.1.1.0 (External Network Number)  
Advertising Router: 172.1.1.2  
LS Seq Number: 80000005  
Checksum: 0x5f10  
Length: 36  
Network Mask: /24  
Metric Type: 2 (Larger than any link state path)  
TOS: 0  
Metric: 20  
Forward Address: 0.0.0.0  
External Route Tag: 0

### #View the routing table of Device1.

```
Device1#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

OE 100.1.1.0/24 [150/20] via 172.1.1.2, 02:30:28, vlan2
OE 110.1.1.0/24 [150/50] via 172.1.1.2, 00:58:17, vlan2
OE 120.1.1.0/24 [150/20] via 172.1.1.2, 02:30:28, vlan2
```

By checking the OSPF database and routing table of Device1, you will find that the route tag of 100.1.1.0/24 is 5, the metric value of 110.1.1.0/24 is 50, and the route attributes of 120.1.1.0/24 remain the same.

---

### Note

- When external routes are redistributed, the direct routes covered by the RIP process will also be redistributed into the target protocol.
- 

## 63.3.2 Configure BGP to associate with the routing policy

### Network Requirements

- Device1 runs IGP protocol OSPF with Device2 and Device3 to establish IBGP neighbors, and Device4 establishes EBGP neighbors with Device2 and Device3.

- Routing policy is required to be configured on Device2 and Device3. In this case, some data of Device1 will reach the network segment 100.1.1.0/24 through Device2 and some reach the network segment 110.1.1.0/24 through Device3; some data of Device4 will reach the network segment 120.1.1.0/24 through Device2 and some reach the network segment 130.1.1.0/24 through Device3.

### Network Topology

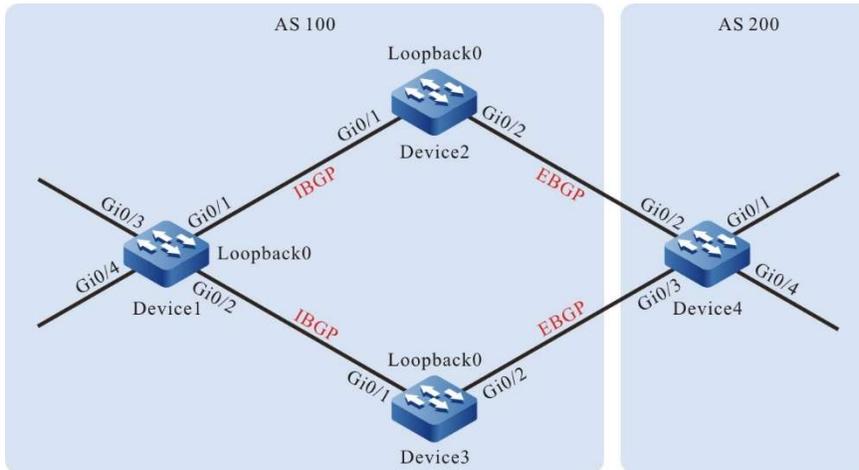

Figure 63-2 Network Topology for Configuring BGP Association with Routing Policy

of equipment	Interface	VLAN	IP address
Device1	Gi0/1	2	1.0.0.1/24
	Gi0/2	3	2.0.0.1/24
	Gi0/3	4	120.1.1.1/24
	Gi0/4	5	130.1.1.1/24
	Loopback0		38.1.1.1/32
Device2	Gi0/1	2	1.0.0.2/24
	Gi0/2	3	3.0.0.1/24
	Loopback0		39.1.1.1/32
Device3	Gi0/1	2	2.0.0.2/24

of equipment	Interface	VLAN	IP address
	Gi0/2	3	4.0.0.1/24
	Loopback0		40.1.1.1/32
Device4	Gi0/1	2	100.1.1.1/24
	Gi0/2	3	3.0.0.2/24
	Gi0/3	4	4.0.0.2/24
	Gi0/4	5	110.1.1.1/24

## Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 38.1.1.1 0.0.0.0 area 0
Device1(config-ospf)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 39.1.1.1 0.0.0.0 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 40.1.1.1 0.0.0.0 area 0
Device3(config-ospf)#exit
```

### #View the routing table of Device1.

```
Device1#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 39.1.1.1/32 [110/2] via 1.0.0.2, 19:11:33, vlan2
O 40.1.1.1/32 [110/2] via 2.0.0.2, 18:56:32, vlan3
```

### #View the routing table of Device 2.

```
Device2#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 2.0.0.0/24 [110/2] via 1.0.0.1, 19:19:10, vlan2
O 38.1.1.1/32 [110/2] via 1.0.0.1, 19:09:43, vlan2
O 40.1.1.1/32 [110/3] via 1.0.0.1, 18:56:49, vlan2
```

### #Check the routing table of Device3.

```
Device3#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 1.0.0.0/24 [110/2] via 2.0.0.1, 19:17:33, vlan2
O 38.1.1.1/32 [110/2] via 2.0.0.1, 19:09:59, vlan2
O 39.1.1.1/32 [110/3] via 2.0.0.1, 19:12:06, vlan2
```

After the configuration, Device1 establishes OSPF neighbors with Device2 and Device3, and learn the Loopback route from each other.

#### Step 4: Configure BGP.

### #Configure Device1.

Configure Device1 to establish IBGP neighbors with Device2 and Device3 using Loopback interface address, and advertise the routes 120.1.1.0/24 and 130.1.1.0/24 to the BGP routing table.

```
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 39.1.1.1 remote-as 100
Device1(config-bgp)#neighbor 39.1.1.1 update-source loopback0
Device1(config-bgp)#neighbor 40.1.1.1 remote-as 100
Device1(config-bgp)#neighbor 40.1.1.1 update-source loopback0
Device1(config-bgp)#network 120.1.1.0 255.255.255.0
Device1(config-bgp)#network 130.1.1.0 255.255.255.0
Device1(config-bgp)#exit
```

### #Configure Device2.

```
Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 38.1.1.1 remote-as 100
Device2(config-bgp)#neighbor 38.1.1.1 update-source loopback0
Device2(config-bgp)#neighbor 38.1.1.1 next-hop-self
Device2(config-bgp)#neighbor 3.0.0.2 remote-as 200
Device2(config-bgp)#exit
```

### #Configure Device3.

```
Device3(config)#router bgp 100
Device3(config-bgp)#neighbor 38.1.1.1 remote-as 100
Device3(config-bgp)#neighbor 38.1.1.1 update-source loopback0
Device3(config-bgp)#neighbor 38.1.1.1 next-hop-self
Device3(config-bgp)#neighbor 4.0.0.2 remote-as 200
Device3(config-bgp)#exit
```

### #Configure Device4.

Configure Device4 to establish EBGP neighbors with Device2 and Device3, and advertise the routes 100.1.1.0/24 and 110.1.1.0/24 to the BGP routing table.

```
Device4#configure terminal
Device4(config)#router bgp 200
Device4(config-bgp)#neighbor 3.0.0.1 remote-as 100
Device4(config-bgp)#neighbor 4.0.0.1 remote-as 100
Device4(config-bgp)#network 100.1.1.0 255.255.255.0
Device4(config-bgp)#network 110.1.1.0 255.255.255.0
Device4(config-bgp)#exit
```

### #View the BGP routing information of Device1.

```
Device1#show ip bgp
BGP table version is 2, local router ID is 38.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
  [B]*>i100.1.1.0/24  39.1.1.1         0  100   0 200 i

```

### #View the routing table of Device1.

```
Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 100.1.1.0/24 [200/0] via 39.1.1.1, 19:03:19, vlan2
B 110.1.1.0/24 [200/0] via 39.1.1.1, 19:03:19, vlan2
```

It can be seen from the BGP routing table of Device1 that there are two valid routes for the data leading to the network segments 100.1.1.0/24 and 110.1.1.0/24. Since the router ID of Device2 is small, the data BGPs all reach the network segments 100.1.1.0/24 and 110.1.1.0/24 through Device2 by default.

### #View the BGP routing information of Device 4.

```
Device4#show ip bgp
BGP table version is 3, local router ID is 110.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
  [B]*> 100.1.1.0/24  0.0.0.0          0   32768 i
  [B]*> 110.1.1.0/24  0.0.0.0          0   32768 i
```

```

[B]* 120.1.1.0/24 4.0.0.1 0 0 100 i
[B]*> 3.0.0.1 0 0 100 i
[B]* 130.1.1.0/24 4.0.0.1 0 0 100 i
[B]*> 3.0.0.1 0 0 100 i

```

#### #View the routing table of Device 4.

```

Device4#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 120.1.1.0/24 [20/0] via 3.0.0.1, 19:25:05, vlan3
B 130.1.1.0/24 [20/0] via 3.0.0.1, 19:25:05, vlan3

```

It can be seen from the BGP routing table of Device4 that there are two valid routes for the data leading to the network segments 120.1.1.0/24 and 130.1.1.0/24. Since Device4 first establishes neighbors with Device2 and it takes longer to learn these two routes from Device2, the data BGP's all reach the network segments 120.1.1.0/24 and 130.1.1.0/24 through Device2 by default.

Step 5: Configure prefix list and routing policy.

#### #Configure Device2.

Configure prefix list, and allow the routes 100.1.1.0/24 and 130.1.1.0/24 to pass.

```

Device2(config)#ip prefix-list 1 permit 100.1.1.0/24
Device2(config)#ip prefix-list 2 permit 130.1.1.0/24

```

Configure routing policy Ip so that Device2 sets local-preference attribute for the routes allowed by the prefix list with the match number of 1.

```

Device2(config)#route-map lp 10
Device2(config-route-map)#match ip address prefix-list 1
Device2(config-route-map)#set local-preference 200
Device2(config-route-map)#exit
Device2(config)#route-map lp 20
Device2(config-route-map)#exit

```

Configure the routing policy med so that Device2 sets MED attribute for the routes allowed by the prefix list with the match number of 2.

```

Device2(config)#route-map med 10
Device2(config-route-map)#match ip address prefix-list 2
Device2(config-route-map)#set metric 10
Device2(config-route-map)#exit
Device2(config)#route-map med 20
Device2(config-route-map)#exit

```

#### #Configure Device3.

Configure prefix list, and allow the routes 110.1.1.0/24 and 120.1.1.0/24 to pass.

```

Device3(config)#ip prefix-list 1 permit 110.1.1.0/24
Device3(config)#ip prefix-list 2 permit 120.1.1.0/24

```

Configure routing policy Ip so that Device3 sets local-preference attribute for the routes allowed by the prefix list with the match number of 1.

```
Device3(config)#route-map lp 10
Device3(config-route-map)#match ip address prefix-list 1
Device3(config-route-map)#set local-preference 200
Device3(config-route-map)#exit
Device3(config)#route-map lp 20
Device3(config-route-map)#exit
```

Configure the routing policy med so that Device3 sets MED attribute for the routes allowed by the prefix list with the match number of 2.

```
Device3(config)#route-map med 10
Device3(config-route-map)# match ip address prefix-list 2
Device3(config-route-map)#set metric 10
Device3(config-route-map)#exit
Device3(config)#route-map med 20
Device3(config-route-map)#exit
```

---

## Note

- When configuring a routing policy, both the prefix list and ACL can create matching rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 6: Configure BGP to associate with the routing policy.

#Configure Device2.

Apply the routing policy lp to the routes of neighbor 38.1.1.1 in the outgoing direction and med to those of neighbor 3.0.0.2 in the outgoing direction.

```
Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 38.1.1.1 route-map lp out
Device2(config-bgp)#neighbor 3.0.0.2 route-map med out
Device2(config-bgp)#exit
```

#Configure Device3.

Apply the routing policy lp to the routes of neighbor 38.1.1.1 in the outgoing direction and med to those of neighbor 4.0.0.2 in the outgoing direction.

```
Device3(config)#router bgp 100
Device3(config-bgp)#neighbor 38.1.1.1 route-map lp out
Device3(config-bgp)#neighbor 4.0.0.2 route-map med out
Device3(config-bgp)#exit
```

Step 7: Check the result.

#View the BGP routing information of Device1.

```

Device1#show ip bgp
BGP table version is 9, local router ID is 38.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]* i100.1.1.0/24  40.1.1.1         0  100   0 200 i
[B]*>i             39.1.1.1         0  200   0 200 i
[B]*>i110.1.1.0/24  40.1.1.1         0  200   0 200 i
[B]* i             39.1.1.1         0  100   0 200 i
[B]*> 120.1.1.0/24  0.0.0.0          0  32768 i
[B]*> 130.1.1.0/24  0.0.0.0          0  32768 i

```

#### #View the routing table of Device1.

```

Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

B 100.1.1.0/24 [200/0] via 39.1.1.1, 02:58:12, vlan2
B 110.1.1.0/24 [200/0] via 40.1.1.1, 02:58:10, vlan3

```

It can be seen from the BGP routing table of Device1 that the route 100.1.1.0/24 has two next hops, i.e. 40.1.1.1 and 39.1.1.1. The local preference of the route with the next hop of 39.1.1.1 becomes 200, so the data prefer to reach the network segment 100.1.1.0/24 through Device2. There are also two next hops on the route 110.1.1.0/24, i.e. 40.1.1.1 and 39.1.1.1. The local preference of the route with the next hop of 40.1.1.1 becomes 200, so the data prefer to reach the network segment 110.1.1.0/24 through Device3.

#### #View the BGP routing information of Device 4.

```

Device4#show ip bgp
BGP table version is 9, local router ID is 110.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]*> 100.1.1.0/24  0.0.0.0          0  32768 i
[B]*> 110.1.1.0/24  0.0.0.0          0  32768 i
[B]* 120.1.1.0/24  4.0.0.1          10   0 100 i
[B]*>             3.0.0.1          0   0 100 i
[B]*> 130.1.1.0/24  4.0.0.1          0   0 100 i
[B]*             3.0.0.1          10   0 100 i

```

#### #View the routing table of Device 4.

```

Device4#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

B 120.1.1.0/24 [20/0] via 3.0.0.1, 03:05:39, vlan3
B 130.1.1.0/24 [20/0] via 4.0.0.1, 03:05:37, vlan4

```

It can be seen from the BGP routing table of Device1 that the route 120.1.1.0/24 has two next hops, i.e. 4.0.0.1 and 3.0.0.1. The metric of the route with the next hop of 4.0.0.1 becomes 10, so the data prefer to reach the network segment 120.1.1.0/24 through Device2. There are also two next hops on the route 130.1.1.0/24, i.e. 4.0.0.1 and 3.0.0.1. The metric of the route with the next hop of 3.0.0.1 becomes 10, so the data prefer to reach the network segment 130.1.1.0/24 through Device3.

---

 **Note**

- When BGP peer or peer group applies the routing policy, it can be used in the receiving and advertising direction of the peer or peer group. This takes effect after resetting BGP.
- 

# 64 L2 Multicast Basics

---

## 64.1 Overview

The main task of L2 multicast basics is to maintain the L2 multicast forwarding table. The application modules of L2 multicast generates their L2 multicast tables by static configuration and dynamic learning, and then synchronize the information to the L2 multicast basis modules. L2 multicast basis modules integrate the information to form the L2 multicast forwarding table.

## 64.2 L2 Multicast Basics Function Configuration

Table 64-1 L2 Multicast Basics Configuration List

Configuration Task	
Configure Unknown Packet Forwarding Policy of L2 Multicast	Configure Unknown Packet MAC Forwarding Policy of L2 Multicast

Configuration Task	
Configure L2 static multicast	Configure L2 static multicast

### 64.2.1 Configure Unknown Packet Forwarding Policy of L2 Multicast

Unknown multicast service packets have two kinds of forwarding policies: drop unknown multicast service packets, or make the unknown multicast service packets flood.

#### Configuration Condition

Before configuring the unknown packet forwarding policy of L2 multicast, first complete the following task:

- Configure corresponding VLAN

#### Configure Unknown Packet MAC Forwarding Policy of L2 Multicast

In the L2 multicast MAC forwarding mode, the multicast service packets are forwarded by matching VLAN and destination MAC address. When the multicast service packet does not match the forwarding table, it is unknown multicast service packet. The device has two kinds of forwarding policies for the unknown multicast service packets: drop unknown multicast service packets, or make unknown multicast service packets flood.

Table 64-2 Configuring Unknown Packet MAC Forwarding Policy of L2 Multicast

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure the forwarding policy of L2 multicast	<b>l2-multicast drop-unknown</b>	Optional By default, the function of dropping unknown multicast service packets is disabled in the VLAN

#### Configure Unknown Packet IP Forwarding Policy of L2 Multicast

In the IPV4 L2 multicast IP forwarding mode, the multicast service packets are forwarded by matching VLAN, multicast source IP address and multicast destination IP address. When the multicast service packet does not match the forwarding table, it is unknown multicast service packet. The device has two kinds of forwarding policies for the unknown multicast service packets: drop unknown multicast service packets, or make unknown multicast service packets flood.

Table 64-3 Configuring Unknown Packet IP Forwarding Policy of L2 Multicast

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure the IP forwarding policy of L2 multicast	<b>I3-multicast drop-unknown</b>	Mandatory By default, the function of dropping unknown multicast service packets is disabled in the VLAN

### Configure Unknown Packet Ipv6 Forwarding Policy of L2 Multicast

In the IPV6 L2 multicast IP forwarding mode, the multicast service packets are forwarded by matching VLAN, multicast source IP address and multicast destination IP address. When the multicast service packet does not match the forwarding table, it is unknown multicast service packet. The device has two kinds of forwarding policies for the unknown multicast service packets: drop unknown multicast service packets, or make unknown multicast service packets flood.

Table 64-4 Configuring Unknown Packet IPv6 Forwarding Policy of L2 Multicast

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure the IP forwarding policy of L2 multicast	<b>I3-multicast ipv6 drop-unknown</b>	Mandatory By default, the function of dropping unknown

Step	Command	Description
		multicast service packets is disabled in the VLAN

### Configure Policy of Forwarding Unknown Multicast to Uplink Port

In the L2 multicast forwarding, the multicast service packets are forwarded by the L2 multicast forwarding table. When the multicast service packet does not match the forwarding table, it is unknown multicast service packet. The function of dropping unknown multicast service packets is enabled in the VLAN, and the unknown multicast service packets will be dropped. In this case, after the function of forwarding unknown multicast to the uplink port is enabled in the VLAN, the effect of flooding the unknown multicast service packets to the uplink port can be realized.

Table 64-5 Configuring the Policy of Forwarding Unknown Multicast to Uplink Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure the IP forwarding policy of L2 multicast	<b>l3-multicast drop-unknown</b>	Mandatory By default, the function of dropping unknown multicast service packets is disabled in the VLAN
Configure the MAC forwarding policy of L2 multicast	<b>l2-multicast drop-unknown</b>	Mandatory By default, the function of dropping unknown multicast service packets is disabled in the VLAN
Configure Policy of Forwarding Unknown Multicast to Uplink Port	<b>multicast mrouter-forwarding</b>	Optional By default, forwarding the unknown multicast to the uplink port is not enabled in the VLAN

## 64.2.2 Configure L2 static multicast

L2 static multicast generates L2 multicast forwarding table by static configuration. It is formed by the user specifying multicast MAC address, VLAN, and port list (including member port list and prohibited port list).

### Configuration Condition

Before configuring L2 static multicast, first complete the following task:

- Configure corresponding VLAN

### Configure L2 static multicast

Table 64-6 Configuring L2 Static Multicast

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create L2 static multicast	<b>l2-multicast mac-entry static mac-address vlan vlan-id</b>	Mandatory By default, no L2 static multicast entry is configured
Configure the member port for L2 static multicast entries	<b>interface interface-list-name { member   forbidden }</b>	Optional By default, the member port for L2 static multicast entries is not configured
Configure the member aggregation group for L2 static multicast entries	<b>interface link-aggregation link-aggregation-id { member   forbidden }</b>	Optional The member aggregation group for L2 static multicast entries is not configured

## 64.2.3 Monitoring and Maintaining of L2 Multicast Basics

Table 64-7 Monitoring and Maintaining of L2 Multicast Basics

Command	Description
<b>show l2-multicast ha { phase batch   phase flat   statistics }</b>	Show the information about high reliability of the L2 multicast
<b>show l2-multicast ip-entry</b>	Show the information of the IP forwarding table of the L2 multicast
<b>show l2-multicast l3-ip-entry</b>	Show the information of the L3 IP forwarding table of the L2 multicast
<b>show l2-multicast mac-entry { all   forward   static }</b>	Show the L2 multicast table
<b>show l2-multicast vlan-setting { all   vlan-id }</b>	Show the VLAN information of the L2 multicast

## 64.3 Typical Configuration Examples of L2 Static Multicast

### 64.3.1 Configure L2 static multicast

#### Network Requirements

- On Device 1, configure the multicast routing protocol, on Device 2, configure the L2 static multicast in VLAN 2, PC1 is the receiver of multicast services, and PC2 and PC3 are not receivers of multicast services.
- Multicast Server sends the multicast service packets, PC 1 can correctly receive the multicast service packets, and PC 2 and PC 3 cannot receive the multicast service packets.

#### Network Topology

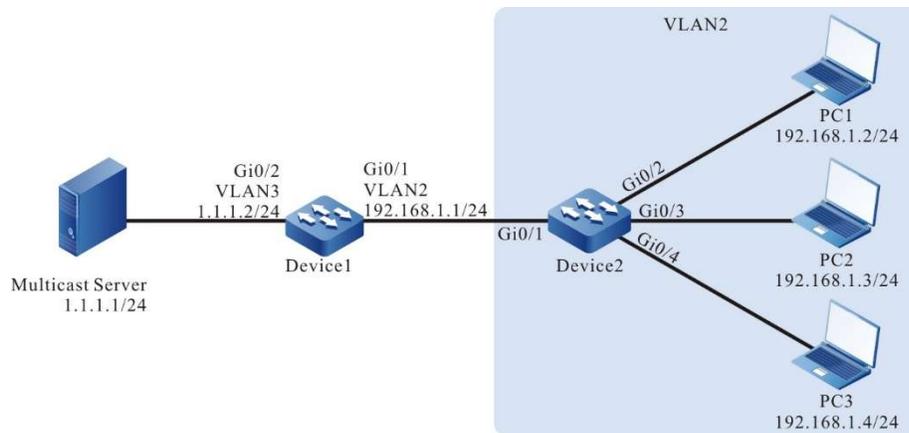

Figure 64-1 Network Topology for Configuring L2 Static Multicast

### Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol. (Omitted)

Step 2: Configure Device2.

Create VLAN2 on #Device 2.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
```

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/4 to Access to allow services of VLAN 2 to pass.

```
Device2(config)#interface gigabitethernet 0/2-0/4
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

#Enable unknown multicast drop in VLAN 2.

```
Device2(config)#vlan 2
Device2(config-vlan2)#l2-multicast drop-unknown
```

```
Device2(config-vlan2)#exit
```

### #Configure L2 static multicast group members.

```
Device2(config)#l2-multicast mac-entry static 0100.5E01.0101 vlan 2
```

```
Device2(config-mcast)#interface gigabitethernet 0/2 member
```

```
Device2(config-mcast)#exit
```

```
Device2(config)#l2-multicast mac-entry static 0100.5E01.0101 vlan 2
```

```
Device2(config-mcast)#interface gigabitethernet 0/3 forbidden
```

```
Device2(config-mcast)#exit
```

### Step 3: Check the result.

### #View the L2 static multicast entries of Device 2.

```
Device2#show l2-multicast mac-entry static
```

```
Current L2 Static Multicast 1 entries
```

```
-----  
NO.  VID   Group MAC address  Interface Name  
-----  
1   2      0100.5E01.0101   [M] gi0/2  
                               [F] gi0/3
```

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1, PC1 can correctly receive the multicast service packet, and PC2 and PC3 cannot receive the multicast service packet.

## 64.3.2 Configure IPv6 L2 Static Multicast

### Network Requirements

- On Device 1, configure the IPv6 multicast routing protocol, on Device 2, configure the IPv6 L2 static multicast in VLAN 2, PC1 is the receiver of multicast services, and PC2 and PC3 are receivers of non-multicast services;
- Multicast Server sends the IPv6 multicast service packets, PC1 can correctly receive the multicast service packets, and PC2 and PC3 cannot receive the multicast service packets.

### Network Topology

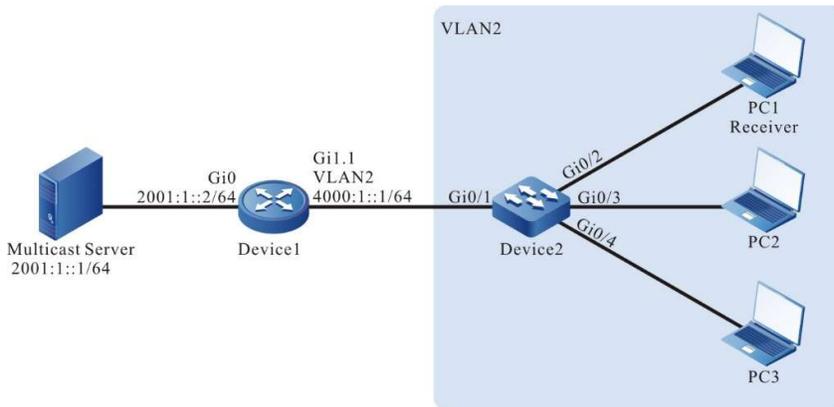

Figure 64-2 Network Topology for Configuring IPv6 L2 Static Multicast

### Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol.  
(Omitted)

Step 2: Configure Device2.

Create VLAN2 on #Device 2.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
```

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/4 to Access to allow services of VLAN 2 to pass.

```
Device2(config)#interface gigabitethernet 0/2-0/4
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

#Enable unknown multicast drop in VLAN 2.

```
Device2(config)#vlan 2
Device2(config-vlan2)#l2-multicast drop-unknown
Device2(config-vlan2)#exit
```

#Configure L2 static multicast group members.

```
Device2(config)# l2-multicast mac-entry static 3333.0000.0001 vlan 2
Device2(config-mcast)#interface gigabitethernet 0/2 member
Device2(config-mcast)#interface gigabitethernet 0/3 forbidden
Device2(config-mcast)#exit
```

Step 3: Check the result.

#View the IPv6 L2 static multicast entries of Device 2.

```
Device2# show l2-multicast mac-entry static
Current L2 Static Multicast 1 entries

-----
NO.  VID   Group MAC address  Interface Name
-----
1   2     3333.0000.0001  [M] gi0/2
                        [F] gi0/3
```

#Multicast Server sends the multicast service packet with the destination address of ff10 ::1, PC 1 can correctly receive the multicast service packet, and PC 2 and PC 3 cannot receive the multicast service packet.

---

## Note

- In the IPv6 L2 static multicast, the multicast service packets are only forwarded to the port whose role is member.
  - For the forbidden port, even if you add the multicast groups corresponding to the static multicast groups by means of mld snooping, the multicast service packet whose destination
-

---

address is the static multicast group will not be forwarded to the forbidden port.

- For the non-member and non-forbidden port, the multicast groups corresponding to the static multicast groups can be added by means of mld snooping, the multicast service packet whose destination address is the static multicast group will be forwarded to such port.
-

# 65 IGMP snooping

## 65.1 Overview

IGMP Snooping (Internet Group Management Protocol snooping) is the function designed for the device that does not support IGMP to reduce the spreading range of the multicast service packet and prevent the multicast packet from being spread to the network segments that do not need the multicast packet. It forms and maintains the downstream member port list of each multicast group at the local by listening to IGMP packets. In this way, when receiving multicast service packet, forward at the specified downstream member port. Meanwhile, IGMP Snooping can listen to the IGMP protocol packets and cooperate with the upstream multicast router to manage and control multicast services.

IGMP Snooping mainly realizes the following functions:

- Listen to the IGMP packets to set up multicast information. IGMP Snooping gets the downstream multicast receiver information by listening to IGMP packets, realizing the forwarding of multicast service packets at the specified member port.
- Listen to the IGMP protocol packets. In this way, the upstream multicast router can correctly maintain IGMP member relation table.

## 65.2 IGMP snooping Function Configuration

Table 65-1 IGMP Snooping Function Configuration List

Configuration Task	
Configure the basic functions of IGMP snooping	Enable the IGMP snooping function
	Configure the IGMP snooping version
	Enable the IGMP snooping L2 forwarding function
Configure IGMP snooping Querier	Enable IGMP snooping Querier
	Configure the source IP address of the IGMP query packet

Configuration Task	
	Configure Query Interval of General Group
	Configure Max. Response Time
	Configure Query Interval of Specified Group
	Configure Fast Leave
Configure IGMP snooping Router Port	Configure IGMP snooping Router Port
	Configure age time for the IGMP snooping dynamic router port
Configure the IGMP snooping TCN event	Enable fast convergence
	Configure TCN event query interval
	Configure TCN event query count
Configure the IGMP snooping policy	Configure the port filtering rules
	Configure the maximum number of port multicast group entries
	Configure the upper limit policy of port multicast groups
Configure IGMP snooping Proxy	Configure IGMP snooping Proxy

### 65.2.1 Configure the basic functions of IGMP snooping

In the various configuration tasks for IGMP snooping, you must first enable the IGMP snooping function so that the configuration of the other function features can take effect.

#### Configuration Condition

Before configuring the basic functions of IGMP snooping, do the following:

- Configure VLAN.

## Enable the IGMP snooping function

The IGMP snooping function will run on the device only after it is enabled.

Table 65-2 Enabling IGMP Snooping Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the global IGMP snooping function	<b>ip igmp snooping</b>	Mandatory By default, the global IGMP snooping function is disabled
Enable the IGMP snooping function of the specified VLAN	<b>ip igmp snooping vlan <i>vlan-id</i></b>	Mandatory By default, the IGMP snooping function is disabled in the VLAN

---

### Note

- The IGMP snooping function of the specified VLAN can be enabled only after the global IGMP snooping function is enabled.
- 

## Configure the IGMP snooping version

The handling rules for the configured IGMP snooping version and IGMP protocol packets are as follows:

If the configured IGMP snooping version is V3, the device can handle IGMP protocol packets of versions V1, V2, and V3;

If the configured IGMP snooping version is V2, the device can handle IGMP protocol packets of versions V1 and V2, and does not handle the protocol packets of version V3 but floods them in the VLAN;

If the configured IGMP snooping version is V1, the device can handle IGMP protocol packets of version V1, and does not handle the protocol packets of versions V2 and V3 but floods them in the VLAN.

Table 65-3 Configuring IGMP Snooping Version

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the IGMP snooping version	<b>ip igmp snooping vlan <i>vlan-id</i> version <i>version-number</i></b>	Optional By default, the IGMP snooping version is 2

### Enable IGMP Snooping L2 Forwarding

Generally, IGMP snooping forwards the multicast service packets in the VLAN based on the multicast source IP address and the multicast destination IP address. After IGMP snooping L2 forwarding, IGMP snooping will forward the multicast service packets in the VLAN based on the multicast destination MAC address.

Table 65-4 IGMP Snooping L2 Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the L2 multicast L2 forwarding function in the specified VLAN	<b>ip igmp snooping vlan <i>vlan-id</i> l2-forwarding</b>	Mandatory By default, the L2 multicast IP forwarding function of IGMP snooping is enabled for the VLAN

### Caution

- As 32 multicast IP addresses correspond to one multicast MAC address, with L2 forwarding being unable to specify the multicast source forwarding, it is possible that multiple IP multicast source groups correspond to the same MAC group, and then forwarding conflicts may occur.

### 65.2.2 Configure IGMP snooping Querier

If there is no L3 multicast device in the network, it cannot realize the related functions of the IGMP querier. To solve the problem, the IGMP snooping querier can be configured on the L2 multicast device to realize

the IGMP querier function. Therefore, the L2 multicast device can set up and maintain the multicast forwarding entry, so as to forward multicast service packets normally.

### Configuration Condition

Before configuring the basic functions of IGMP snooping querier, first complete the following task:

- Enable global and VLAN IGMP snooping function

### Enable IGMP snooping Querier

You should first enable the IGMP snooping querier function so that the configuration of the other features of the querier can take effect.

Table 65-5 Enabling IGMP snooping Querier

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IGMP snooping Querier	<b>ip igmp snooping vlan <i>vlan-id</i> querier</b>	Mandatory  By default, the IGMP snooping querier of the specified VLAN is disabled

### Configure Querier IP Address

The querier configured with IP address takes part in the election of the IGMP querier in VLAN and the querier fills the IP address in the source IP address field of the sent IGMP group query packet.

Table 65-6 Configuring Querier IP Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Querier IP Address	<b>ip igmp snooping vlan <i>vlan-id</i> querier address <i>ip-address</i></b>	Mandatory  By default, the querier IP address of the specified VLAN is not configured

---

 **Note**

- When the querier IP address is not configured, the default source IP address of the querier is 0.0.0.0, but the querier does not send the IGMP group query packet with source IP address 0.0.0.0.
- 

### Configure Query Interval of General Group

IGMP querier periodically sends the query packets of the general group to maintain the group member relation. The interval of sending the IGMP general group query packets can be modified according to the actuality of the network. For example, if the configured general group query interval is long, it can reduce the number of the IGMP protocol packets in the network, avoiding the network congestion.

Table 65-7 Configuring Query Interval of General Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Query Interval of General Group	<b>ip igmp snooping vlan <i>vlan-id</i> querier query-interval <i>interval-value</i></b>	Optional By default, the query interval of the general group is 125 seconds

---

 **Note**

- In the same VLAN, the configured query interval of the general group should be larger than the maximum response time. Otherwise, the configuration cannot succeed.
- 

### Configure Max. Response Time

The general group query packet sent by IGMPv2 querier contains the maximum response time field. The multicast receiver sends the member report packets within the maximum response interval. If the multicast receiver does not send the member report packets within the maximum response time, the device regards that the subnet does not have the receiver of the multicast group and then deletes the multicast group information at once.

Table 65-8 Configuring Maximum Response Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Max. Response Time	<b>ip igmp snooping vlan <i>vlan-id</i> querier max-response-time <i>time-value</i></b>	Optional By default, the maximum response time is 10 seconds

## Note

- In the same VLAN, the configured maximum response time should be smaller than the query interval of the general group. Otherwise, the configuration cannot succeed.

### Configure Query Interval of Specified Group

When the IGMP querier receives the leave packet of one multicast group, it sends the query packet of the specified group to query the segment for the multicast group, so as to know whether the subnet has the member of the multicast group. If not receiving the member report packet of the multicast group after waiting for “maximum response time”, delete the information of the multicast group.

Table 65-9 Configuring Query Interval of Specified Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Query Interval of Specified Group	<b>ip igmp snooping vlan <i>vlan-id</i> last-member-query-interval <i>interval-value</i></b>	Optional By default, the query interval of the specified group is 1000 milliseconds

### Configure Fast Leave

If the device receives the leave packet of one multicast group after configuring fast leave, the device does not send the query packet of the specified group to the port any more and the information of the multicast group is deleted at once.

Table 65-10 Configuring Fast Leave

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Fast Leave	<b>ip igmp snooping vlan <i>vlan-id</i> immediate-leave</b>	Mandatory By default, the fast leave function of the specified VLAN is disabled

---

## Note

- There are multiple receivers of the same multicast group in the device port at the same time. When the port receives the IGMP leave packet of the multicast group sent by one receiver and if fast leave is configured in the VLAN of the device port, the multicast services of the other receivers are interrupted.
- 

### 65.2.3 Configure IGMP snooping Router Port

IGMP snooping router port is the port receiving IGMP group query packets or multicast routing protocol packets. When the device receives the IGMP member report or leave packet, forward the packet via IGMP snooping router port. In this way, the upper-connected router can maintain the IGMP member relation table correctly.

IGMP snooping router port can be dynamically learned or configured manually. IGMP snooping dynamic router port refreshes the age time by regularly receiving the IGMP group query packets or multicast routing protocol packets. IGMP snooping static router port does not age.

#### Configuration Condition

Before configuring the IGMP snooping router port functions, first complete the following tasks:

- Enable global and VLAN IGMP snooping function
- Add port member in VLAN

#### Configure IGMP snooping Static Router Port

After configuring IGMP snooping static router port, the device can forward the IGMP protocol packet via the port even the port does not receive the IGMP group query packet or multicast routing protocol packet. It can prevent the problem that the router port ages because the services of the upper-connected L3 multicast device are interrupted.

Table 65-11 Configuring IGMP snooping Static Router Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IGMP snooping Static Router Port	<b>ip igmp snooping vlan <i>vlan-id</i> mrouter interface { <i>interface-name</i>   link-aggregation <i>link-aggregation-id</i> }</b>	Mandatory  By default, the IGMP snooping static router port is not configured

### Configure age time for the IGMP snooping dynamic router port

As long as the configured age time for the IGMP snooping dynamic router port is longer, the problem can be effectively prevented that the router port ages fast because the services of the uplink L3 multicast device are interrupted.

Table 65-12 Configuring Age Time for IGMP Snooping Dynamic Router Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure age time for the IGMP snooping dynamic router port	<b>ip igmp snooping vlan <i>vlan-id</i> timer router-port expiry <i>expiry-value</i></b>	Optional  By default, the age time of the IGMP snooping dynamic router port is 255 seconds

## 65.2.4 Configure the IGMP snooping TCN event

### Configuration Condition

Before configuring the IGMP snooping TCN event function, do the following:

- Enable global and VLAN IGMP snooping function

### Enable fast convergence

When the network topology varies, a TCN event will be generated. The root port of the spanning tree will actively send a global IGMP leave packet (group address: 0.0.0.0) to request the IGMP querier in order to send a general group query packet, achieving fast convergence.

After you enable the fast convergence of the IGMP snooping TCN event, the root port of the non-spanning tree can also actively send a global IGMP leave packet (group address: 0.0.0.0), achieving the fast convergence.

Table 65-13 Enabling Fast Convergence

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable fast convergence	<b>ip igmp snooping tcn query solicit</b>	Mandatory  By default, fast convergence is disabled in the TCN event

### Configure TCN event query interval

When the TCN event occurs, the IGMP snooping querier will send a general group query at the TCN event query interval.

Table 65-14 Configuring TCN Event Query Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TCN event query interval	<b>ip igmp snooping vlan <i>vlan-id</i> querier tcn query interval <i>interval-value</i></b>	Optional  By default, the TCN event query interval is 31 seconds

### Configure TCN event query count

When the TCN event occurs, the IGMP snooping querier will send a general group query at the TCN event query interval, and will restore to the general group query interval after the number of sending times reaches the configured TCN event query count.

Table 65-15 Configuring Number of TCN Event Queries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TCN event query count	<b>ip igmp snooping vlan <i>vlan-id</i> querier tcn query count <i>count-number</i></b>	Optional By default, the TCN event query count is 2

### 65.2.5 Configure the IGMP snooping policy

The IGMP snooping policy is mainly used to control the receiver on the port, thereby controlling the multicast flow and restricting the receiver's behavior. The IGMP snooping policy can also be applied in the established L2 multicast flow forwarding environment.

#### Configuration Condition

Before configuring the IGMP snooping policy, do the following:

- Enable global and VLAN IGMP snooping function

#### Configure the port filtering rules

When expecting to obtain multicast services, the receiver may actively initiate an IGMP member report packet, and the device will make a judgment according to the port filtering rules applied under the port: deny the user to join the destination multicast group; allow the user to join the destination multicast group; and limit the number of times and duration that the user joins the destination multicast group.

Table 65-16 Configuring Port Filtering Rules

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IGMP profile configuration mode	<b>ip igmp profile <i>profile-id</i></b>	-
Configure the range of denying multicast groups	<b>deny { all   <i>low-ip-address</i> [ <i>high-ip-address</i> ] }</b>	Optional By default, the range of denying multicast groups is not configured

Step	Command	Description
Configure the range of permitting multicast groups	<b>permit</b> { <b>all</b>   <i>low-ip-address</i> [ <i>high-ip-address</i> ] }	Optional By default, the range of permitting multicast groups is not configured
Configure preview rules for multicast groups	<b>preview</b> { <b>all</b>   <i>low-ip-address</i> [ <i>high-ip-address</i> ]   <b>count</b> <i>count-number</i>   <b>interval</b> <i>interval-time</i>   <b>time</b> <i>time-duration</i> }	Optional By default, the preview rules for multicast groups are not configured
Return to the global configuration mode	<b>exit</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Apply the IGMP port filtering rules under the port	<b>ip igmp filter</b> <i>profile-number</i>	Mandatory By default, the IGMP port filtering rules are not applied under the port

## Note

- The multicast group address can only be in one of the IGMP profile filtering rules: deny, permit, and preview. The new rule overrides the old rule.
- Reset cycle of preview count > preview duration × preview count + preview interval × (preview count - 1).

### Configure the maximum number of port multicast group entries

The maximum number of port multicast group entries can limit the number of receivers joining the multicast groups.

Table 65-17 Maximum Number of Port Multicast Group Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the maximum number of the port multicast group entries under the port	<b>ip igmp max-groups</b> <i>number</i>	Optional  By default, the maximum number of the multicast group entries that can dynamically join the port is 6144

### Configure the upper limit policy of port multicast groups

In the case that the number of the multicast groups the receiver joins exceeds the configured maximum number of multicast group entries, if the upper limit policy of port multicast groups is replace, the newly joined multicast group on the device automatically replaces the existing multicast group, and if the upper limit policy of port multicast groups is deny, the newly joined multicast group is denied.

Table 65-18 Configuring Upper Limit Policy of Port Multicast Groups

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the upper limit policy of port multicast groups	<b>ip igmp max-groups action</b> { <b>deny</b>   <b>replace</b> }	Optional By default, when the number of the multicast group entries that dynamically join the port reaches the maximum, the handling action is reject new entries

### Configure Interface Control for PIM JOIN Packet

After Configure Interface for Control PIM JOIN Packet is enabled, the JOIN packet runs through not hardware but software.

Table 65-19 Configuring Interface Control for PIM JOIN Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Interface Control for PIM JOIN Packet	<b>ip igmp snooping vlan</b> <i>vlan-id</i> <b>ctrl-pim</b>	Mandatory

Step	Command	Description
		By default, the PIM JOIN packet of the specified VLAN is not controlled

## Note

- The VLAN will be flooded with the JOIN packets before enabling, and after enabling, the CPU will be captured and the VLAN will not be flooded.

### 65.2.6 Configure IGMP snooping Proxy

When there are many multicast group receivers in the network, you can configure IGMP snooping Proxy on the device in order to reduce the quantity of IGMP member reports and leave packets received by the upstream multicast device and effectively reduce the system overhead.

IGMP snooping Proxy can act as proxy of downstream receivers to send IGMP member report packets and leave packets to upstream devices; it can also respond to the IGMP group query packets sent by the upstream multicast devices, and then send the IGMP group query packets to the downstream devices.

#### Configuration Condition

Before configuring the IGMP snooping function, do the following:

- Enable global and VLAN IGMP snooping function

#### Configure IGMP snooping Proxy

Table 65-20 Configuring IGMP snooping Proxy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IGMP snooping Proxy	<b>ip igmp snooping proxy</b> <b>vlan <i>vlan-id</i> upstream</b> <b>interface { <i>interface-name</i>  </b> <b>link-aggregation <i>link-</i></b> <b>aggregation-id }</b>	Mandatory By default, no IGMP proxy port in the VLAN is configured

## 65.2.7 Configure IGMP snooping Static Group

IGMP snooping static groups are static IGMP snooping group entries generated by means of static configuration. By configuring the IGMP snooping static groups, the aging problem of the multicast groups dynamically learned by IGMP snooping can be effectively solved.

When the device is configured with the IGMP snooping static group in the VLAN, the IGMP snooping querier and querier address in the VLAN, and the IGMP snooping proxy port in the VLAN, the device will generate static IGMP snooping groups entries and send the IGMP member report packet to the IGMP snooping proxy port in the VLAN. The source IP address of this IGMP member report packet is the configured querier address. In this way, the uplink router can correctly maintain the IGMP membership table. When you delete the IGMP snooping static group configuration in the VLAN, the device will delete the corresponding IGMP snooping static group entries and send an IGMP member leave packet to the IGMP snooping proxy port in the VLAN.

### Configuration Condition

Before configuring the IGMP snooping static group function, do the following:

- Enable global and VLAN IGMP snooping function
- Add port member in VLAN

### Configure IGMP snooping Static Group

Table 65-21 Configuring IGMP snooping Static Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IGMP snooping Static Group	<b>ip igmp snooping vlan <i>vlan-id</i> static-group <i>group-ip-address</i> { interface <i>interface-name</i>   interface <b>link-aggregation</b> <i>link-aggregation-id</i> }</b>	Mandatory By default, the IGMP snooping static group in the VLAN is not configured

## 65.2.8 Monitoring and Maintaining of IGMP Snooping

Table 65-6565 Monitoring and Maintaining of IGMP Snooping

Command	Description
<b>clear ip igmp snooping groups</b> [ grp-addr ip-address   vlan vlan-id [ grp-addr ip-address-in-vlan ] ]	Clear IGMP snooping group information
<b>clear ip igmp snooping statistics</b> vlan vlan-id [ interface interface-name   interface link-aggregation link-aggregation-id ]	Clear statistics of IGMP protocol packets
<b>show ip igmp snooping proxy member database</b> [ vlan vlan-id ]	Show IGMP snooping proxy member database information
<b>show ip igmp snooping proxy special query source-list</b> [ vlan vlan-id ]	Show the source list of the specified source queries received by IGMP snooping proxy
<b>show ip igmp snooping proxy upstream</b> [ vlan vlan-id ]	Show the running information of IGMP snooping proxy
<b>show ip igmp snooping debugging</b>	Show IGMP snooping debugging status information
<b>show ip igmp snooping egress_table</b>	Show the IGMP snooping L2 forwarding table
<b>show ip igmp snooping groups</b> [ vlan vlan-id ] [ grp-addr ip-address ]	Show IGMP snooping multicast groups information
<b>show ip igmp snooping groups</b> [ vlan vlan-id ] count	Show the count of the IGMP snooping multicast groups information
<b>show ip igmp snooping groups detail</b> [ vlan vlan-id ] [ grp-addr ip-address ]	Show the detail of IGMP snooping multicast groups
<b>show ip igmp snooping interface statistics</b>	Show statistics about the count of multicast groups joining the IGMP snooping port
<b>show ip igmp snooping l3_ip_table</b>	Show the IGMP snooping L3 forwarding table
<b>show ip igmp snooping mcast_table</b>	Show the IGMP snooping forwarding table
<b>show ip igmp snooping mrouter</b> [ vlan vlan-id ]	Show IGMP snooping router port information

Command	Description
<b>show ip igmp snooping querier</b> [ <i>vlan vlan-id</i> ]	Show IGMP snooping querier information
<b>show ip igmp snooping statistics</b> <i>vlan vlan-id</i> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Show statistics about IGMP packets of the IGMP snooping port
<b>show ip igmp snooping</b> [ <i>vlan vlan-id</i> [ <b>info</b> ] ]	Show IGMP snooping information
<b>show multicast control</b> [ <b>all-info</b>   <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Show L2 multicast control information

## 65.3 Typical Configuration Examples of IGMP Snooping

### 65.3.1 Configure IGMP Snooping

#### Network Requirements

- On Device 1, configure the multicast routing protocol, on Device 2, enable IGMP snooping, PC 1 and PC 2 are the receivers of multicast services, and PC 3 is a receiver of non-multicast services.
- Multicast Server sends the multicast service packets, PC 1 and PC 2 can correctly receive the multicast service packets, and PC 3 cannot receive the multicast service packets.

#### Network Topology

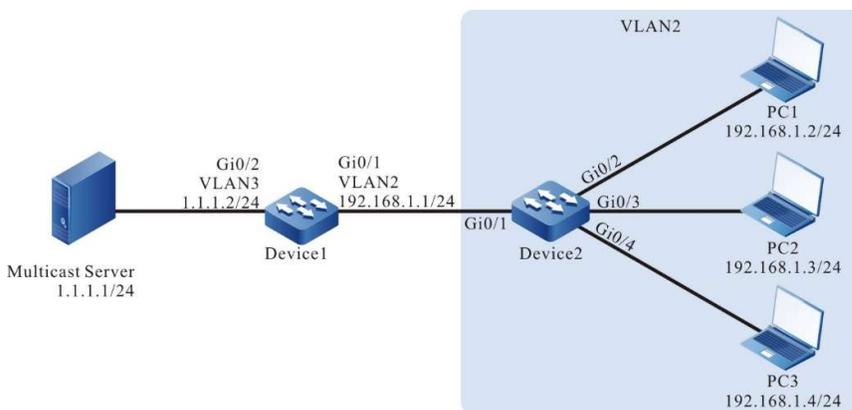

Figure 65-1 Network Topology for configuring IGMP Snooping

## Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol.  
(Omitted)

Step 2: Configure Device2.

Create VLAN2 on #Device 2.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
```

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/4 to Access to allow services of VLAN 2 to pass.

```
Device2(config)#interface gigabitethernet 0/2-0/4
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

#Enable unknown multicast drop in VLAN 2.

```
Device2(config)#vlan 2
Device2(config-vlan2)#l2-multicast drop-unknown
Device2(config-vlan2)#l3-multicast drop-unknown
Device2(config-vlan2)#exit
```

#Enable IGMP Snooping.

```
Device2(config)#ip igmp snooping
Device2(config)#ip igmp snooping vlan 2
```

Step 3: Check the result.

#PC 1 and PC 2 send IGMPv2 member report packets to join the multicast group 224.1.1.1.

#View the multicast membership table of Device 2.

```
Device2#show ip igmp snooping groups
VLAN ID Interface Name Group Address Expires Last Reporter V1 Expires V2 Expires Uptime
```

```

2    gi0/2    224.1.1.1  00:03:26  192.168.1.2  stopped    00:00:55
2    gi0/3    224.1.1.1  00:03:44  192.168.1.3  stopped    00:00:40

```

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1, PC 1 and PC 2 can correctly receive the multicast service packet, and PC 3 cannot receive the multicast service packet.

### 65.3.2 Configure Multicast Receiving Control

#### Network Requirements

- On Device 1, configure the multicast routing protocol.
- Device 2 enables IGMP snooping, configures multicast receiving control and applies it to the corresponding port.
- Multicast Server sends the multicast service packets, and PC 1 and PC 2 can correctly receive the multicast service packets.

#### Network Topology

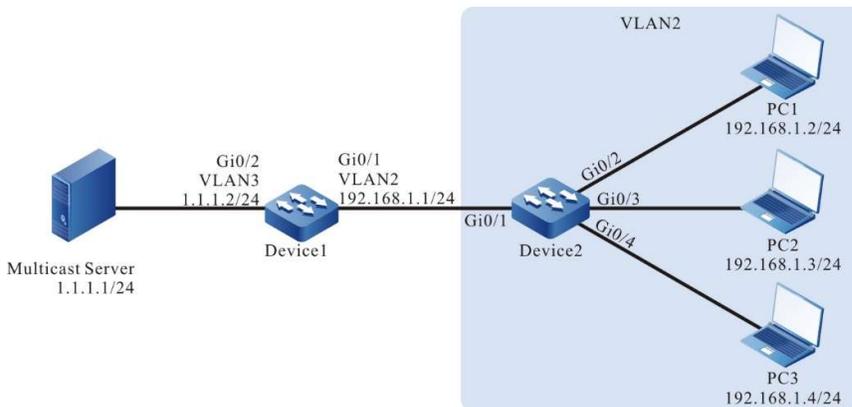

Figure 65-2 Network Topology for configuring Multicast Receiving Control

#### Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol.  
(Omitted)

Step 2: Configure Device2.

#Create VLAN2 on Device2.

```

Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit

```

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/4 to Access to allow services of VLAN 2 to pass.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
Device2(config)#interface gigabitethernet 0/2-0/4
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

#Enable IGMP Snooping.

```
Device2(config)#ip igmp snooping
Device2(config)#ip igmp snooping vlan 2
```

#Configure multicast receiving control policy profile1 to allow joining the multicast group 224.1.1.1 and apply it to port gigabitethernet0/2.

```
Device2(config)#ip igmp profile 1
Device2(config-igmp-profile)#permit 224.1.1.1
Device2(config-igmp-profile)#exit
Device2(config)#interface gigabitethernet 0/2
Device2(config-if-gigabitethernet0/2)#ip igmp filter 1
Device2(config-if-gigabitethernet0/2)#exit
```

#Configure multicast receiving control policy profile2 to allow previewing the multicast group 224.1.1.1 and apply it to port gigabitethernet0/3.

```
Device2(config)#ip igmp profile 2
Device2(config-igmp-profile)#preview 224.1.1.1
Device2(config-igmp-profile)#exit
Device2(config)#interface gigabitethernet 0/3
Device2(config-if-gigabitethernet0/3)#ip igmp filter 2
Device2(config-if-gigabitethernet0/3)#exit
```

#Configure multicast receiving control policy profile3 to deny joining the multicast group 224.1.1.1 and apply it to port gigabitethernet0/4.

```
Device2(config)#ip igmp profile 3
Device2(config-igmp-profile)#permit all
```

```

Device2(config-igmp-profile)#deny 224.1.1.1
Device2(config-igmp-profile)#exit
Device2(config)#interface gigabitethernet 0/4
Device2(config-if-gigabitethernet0/4)#ip igmp filter 3
Device2(config-if-gigabitethernet0/4)#exit

```

Step 3: Check the result.

#PC 1, PC 2, and PC 3 send IGMPv2 member report packets to join the multicast group 224.1.1.1.

#View the multicast membership table of Device 2.

```

Device2#show ip igmp snooping groups
IGMP Snooping Group Membership
Total 2 groups

VLAN ID Interface Name Group Address Expires Last Reporter V1 Expires V2 Expires Uptime
-----
2    gi0/2    224.1.1.1  00:04:19 192.168.1.2 stopped    00:00:01
2    gi0/3    224.1.1.1  00:04:19 192.168.1.3 stopped    00:00:01

```

PC 1 and PC 2 can join the multicast group 224.1.1.1, and PC3 does not join the multicast group 224.1.1.1.

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1.

PC 1 and PC 2 can correctly receive the multicast service packet, and PC 3 cannot receive the multicast service packet.

#After 10 seconds, view the multicast membership table of Device 2 and gigabitethernet0/3 multicast receiving control information.

```

Device2#show ip igmp snooping groups
IGMP Snooping Group Membership
Total 1 group

VLAN ID Interface Name Group Address Expires Last Reporter V1 Expires V2 Expires Uptime
-----
2    gi0/2    224.1.1.1  00:04:10 192.168.1.2 stopped    00:00:10

Device2#show multicast control interface gigabitethemet 0/3
ip multicast control gigabitethernet0/3 vlan 2 information
-----

```

preview count: 3  
preview count remain: 2  
preview time: 10 (s)  
preview interval: 60 (s)  
group information:  
group: 224.1.1.1  
uptime: 00:00:10  
next preview time remain: 00:00:60

When the preview time of gigabitethernet0/3 port expires (10 s later), the group membership table entry is deleted, PC1 can correctly receive multicast service packets, and PC 2 and PC 3 cannot receive multicast service packets.

### 65.3.3 Configure IGMP snooping Proxy

#### Network Requirements

- On Device 1, configure the multicast routing protocol.
- Enable IGMP snooping and IGMP Snooping Proxy on Device 2.
- Multicast Server sends the multicast service packets, and PC 1, PC 2 and PC 3 can correctly receive the multicast service packets.

#### Network Topology

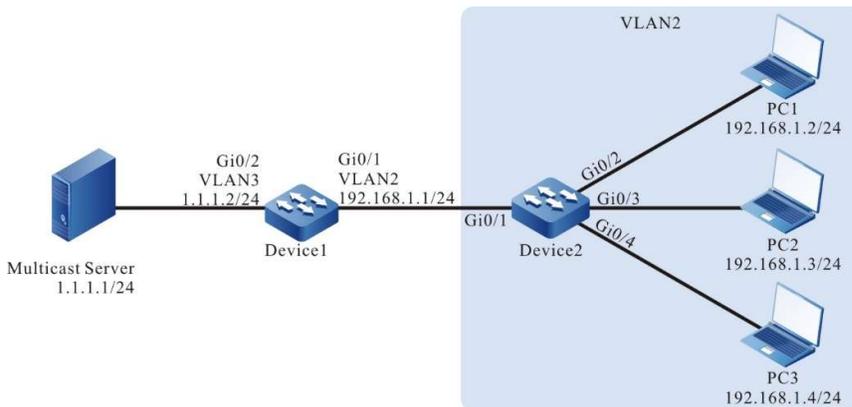

Figure 65-3 Network Topology for configuring IGMP Snooping Proxy

#### Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol.

```
Device1#configure terminal
Device1(config)#ip multicast-routing
Device1(config)#interface gigabitethernet0/1
```

```

Device1(config-if-gigabitethernet0/1)# switchport mode trunk
Device1(config-if-gigabitethernet0/1)# witchport trunk allowed vlan add 2
Device1(config-if-gigabitethernet0/1)# switchport trunk pvid vlan 1
Device1(config-if-gigabitethernet0/1)# exit
Device1(config)#interface gigabitethernet0/2
Device1(config-if-gigabitethernet0/2)# switchport mode trunk
Device1(config-if-gigabitethernet0/2)# witchport trunk allowed vlan add 3
Device1(config-if-gigabitethernet0/2)# switchport trunk pvid vlan 1
Device1(config-if-gigabitethernet0/2)# exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)# ip address 192.168.1.1 255.255.255.0
Device1(config-if-vlan2)# ip pim sparse-mode
Device1(config-if-vlan2)# exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)# ip address 1.1.1.2 255.255.255.0
Device1(config-if-vlan3)# ip pim sparse-mode
Device1(config-if-vlan3)# exit

```

## Step 2: Configure Device2.

### #Create VLAN2 on Device2.

```

Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit

```

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/4 to Access to allow services of VLAN 2 to pass.

```

Device2(config)#interface gigabitethernet 0/2-0/4
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit

```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```

Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit

```

#Enable in VLAN2, IGMP snooping and configure the IGMP snooping querier address as 192.168.1.254.

```

Device2(config)#ip igmp snooping

```

```
Device2(config)#ip igmp snooping vlan 2
Device2(config)#ip igmp snooping vlan 2 querier
Device2(config)#ip igmp snooping vlan 2 querier address 192.168.1.254
```

### #Configure IGMP snooping Proxy.

```
Device2(config)#ip igmp snooping proxy vlan 2 upstream interface gigabitethernet 0/1
Device2(config)#exit
```

Step 3: Check the result.

#PC 1, PC 2 and PC 3 in turn send IGMPv2 member report packets to join the multicast group 224.1.1.1.

#View the IGMP Snooping Proxy information of Device 2.

```
Device2#show ip igmp snooping proxy upstream vlan 2
vlan 2 proxy upstream information:
-----
upstream interface          : gi0/1
upstream querier compatmode version : 2
upstream querier address    : 192.168.1.1
upstream report source address : 192.168.1.254
upstream querier query interval : 125s
upstream querier query response interval: 10s
upstream querier LMQUI      : 1s
upstream querier LMQC      : 2
upstream querier robustness variable : 2
upstream querier present timer : 00:02:50
upstream V1 querier present timer : stopped
upstream V2 querier present timer : 00:02:55
```

#View the Device 2 multicast membership table and the IGMP Snooping Proxy member database.

```
Device2#show ip igmp snooping groups
IGMP Snooping Group Membership
Total 3 groups

VLAN ID Interface Name Group Address Expires Last Reporter V1 Expires V2 Expires Uptime
-----
2   gi0/2   224.1.1.1  00:04:09 192.168.1.2 stopped 00:00:14
2   gi0/3   224.1.1.1  00:04:09 192.168.1.3 stopped 00:00:11
2   gi0/4   224.1.1.1  00:04:12 192.168.1.4 stopped 00:00:07
```

It is indicated that PC 1, PC 2, and PC 3 join the multicast group 224.1.1.1.

```
Device2#show ip igmp snooping proxy member database vlan 2
```

IGMP Snooping Proxy Member Database Table

Total 1 group

VLAN ID	Group Address	Mode	Source Address
---------	---------------	------	----------------

-----

2	224.1.1.1	EXCLUDE *	
---	-----------	-----------	--

#View the multicast membership table of Device 1.

Device1#show ip igmp groups

IGMP Connected Group Membership

Total 1 groups

Group Address	Interface	Uptime	Expires	Last Reporter	V1 Expires	V2 Expires
---------------	-----------	--------	---------	---------------	------------	------------

224.1.1.1	vlan 2	00:00:15	00:04:11	192.168.1.254	stopped	
-----------	--------	----------	----------	---------------	---------	--

It is indicated that when PC joins the multicast group 224.1.1.1, Device 2 only forwards the first IGMPv2 member report packet to Device 1, and drops all other packets.

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1, PC 1, PC 2 and PC 3 can correctly receive the multicast service packet.

PC 1 and PC 2 send an IGMPv2 leave packet to leave the multicast group 224.1.1.1.

Device2#show ip igmp snooping groups

IGMP Snooping Group Membership

Total 1 group

VLAN ID	Interface Name	Group Address	Expires	Last Reporter	V1 Expires	V2 Expires	Uptime
---------	----------------	---------------	---------	---------------	------------	------------	--------

2	gi0/4	224.1.1.1	00:03:54	192.168.1.4	stopped	00:06:37	
---	-------	-----------	----------	-------------	---------	----------	--

Device1#show ip igmp groups

IGMP Connected Group Membership

Total 1 groups

Group Address	Interface	Uptime	Expires	Last Reporter	V1 Expires	V2 Expires
---------------	-----------	--------	---------	---------------	------------	------------

224.1.1.1	vlan 2	00:06:48	00:03:48	192.168.1.2	stopped	
-----------	--------	----------	----------	-------------	---------	--

After PC 1 and PC 2 leave the multicast group 224.1.1.1, because PC 3 has not left this multicast group with the group member PC 3 still being in the multicast membership table, Device 2 will not send a leave packet of this multicast group to Device 1.

#PC 3 sends an IGMPv2 leave packet to leave the multicast group 224.1.1.1, and views the multicast membership tables of Device 2 and Device 1.

Device2#show ip igmp snooping groups

It is indicated that there is no multicast membership table on Device 2.

Device1#show ip igmp groups

There are no multicast members on Device 1. When PC 3, the last group member, leaves the multicast group, Device 2 will send a leave packet of this multicast group to Device 1.

#PC 1, PC 2 and PC 3 cannot receive the multicast service packet.

### 65.3.4 Configure Unknown Multicast Redirection

#### Network Requirements

- On Device 2, configure the multicast routing protocol.
- Enable IGMP snooping, unknown multicast drop and unknown multicast redirection on Device 1.
- Multicast Server sends the multicast service packets, and PC 1, PC 2 and PC 3 can correctly receive the multicast service packets.

#### Network Topology

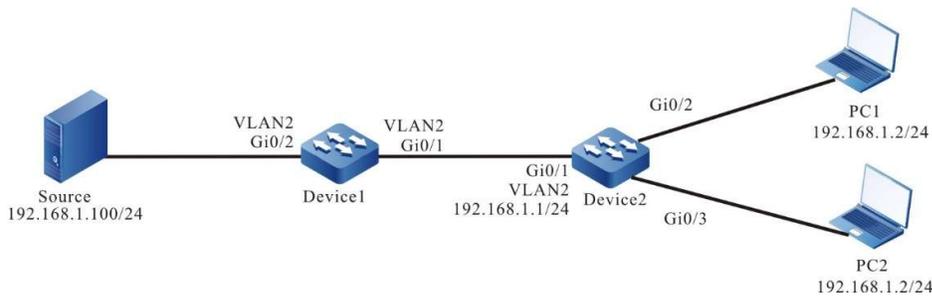

Figure 65-4 Network Topology for configuring Unknown Multicast Redirect

#### Configuration Steps

Step 1: On Device 2, configure the interface IP address and enable the multicast routing protocol.  
(Omitted)

Step 2: Configure Device 2 and Device 1.

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/3 to Access to allow services of VLAN 2 to pass, and configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass. Configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/2-0/3
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
```

```
Device2(config-if-gigabitethernet0/1)#exit
Device2(config-if-vlan2)# ip address 192.168.1.1 255.255.255.0
Device1(config-if-vlan2)# ip pim sparse-mode
Device1(config-if-vlan2)# exit
```

#### #Create VLAN 2 on Device 1.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
```

#On Device 1, configure the link type of port gigabitethernet0/2 to Access to allow services of VLAN 2 to pass, and configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass. Configure PVID to 1.

```
Device1(config)#interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/2)# switchport access vlan 2
Device1(config-if-gigabitethernet0/2)#exit
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#switchport mode trunk
Device1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device1(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device1(config-if-gigabitethernet0/1)#exit
```

#### #Enable unknown multicast drop in VLAN 2.

```
Device1(config)#vlan 2
Device1(config-vlan2)#l2-multicast drop-unknown
Device1(config-vlan2)#l3-multicast drop-unknown
Device1(config-vlan2)#exit
```

#### #Enable IGMP Snooping.

```
Device1(config)#ip igmp snooping
Device1(config)#ip igmp snooping vlan 2
```

#### #Enable unknown multicast redirection in VLAN 2.

```
Device1(config)#vlan 2
Device1(config-vlan2)#multicast mrouter-forwarding
Device1(config-vlan2)#exit
```

Step 3: Check the result.

#PC 1 and PC 2 send IGMPv2 member report packets to join the multicast group 224.1.1.1.

#View the multicast membership table of Device 2.

```
Device1#show ip igmp groups
```

IGMP Connected Group Membership

Total 1 groups

Group Address	Interface	Uptime	Expires	Last Reporter	V1 Expires	V2 Expires
224.1.1.1	vlan2	00:21:02	00:03:47	192.168.1.2	stopped	

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1, PC 1 and PC 2 can correctly receive the multicast service packet.

### 65.3.5 Configure IGMP snooping Static Group

#### Network Requirements

- On Device 1, configure the multicast routing protocol, on Device 2, enable IGMP snooping in VLAN 2, PC 1 and PC 2 are the receivers of IGMP snooping static group services, and PC 3 is not a receiver of multicast services.
- Multicast Server sends the multicast service packets, PC 1 and PC 2 can correctly receive the multicast service packets, and PC 3 cannot receive the multicast service packets.

#### Network Topology

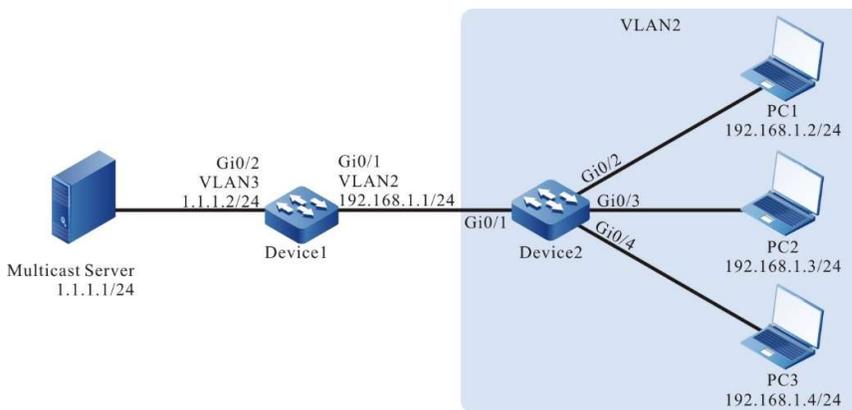

Figure 65-5 Network Topology for configuring IGMP Snooping Static Group

#### Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol. (Omitted)

Step 2: Configure Device2.

Create VLAN2 on #Device 2.

```
Device2#configure terminal
```

```
Device2(config)#vlan 2
```

```
Device2(config-vlan2)#exit
```

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/4 to Access to allow services of VLAN 2 to pass.

```
Device2(config)#interface gigabitethernet 0/2-0/4
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

#Enable unknown multicast drop in VLAN 2.

```
Device2(config)#vlan 2
Device2(config-vlan2)#12-multicast drop-unknown
Device2(config-vlan2)#13-multicast drop-unknown
Device2(config-vlan2)#exit
```

#Enable IGMP snooping and configure IGMP snooping static group.

```
Device2(config)#ip igmp snooping
Device2(config)#ip igmp snooping vlan 2
Device2(config)#ip igmp snooping vlan 2 static-group 224.1.1.1 interface gigabitethernet 0/2
Device2(config)#ip igmp snooping vlan 2 static-group 224.1.1.1 interface gigabitethernet 0/3
Device2(config)#exit
```

Step 3: Check the result.

#View the multicast membership table of Device 2.

```
Device2#show ip igmp snooping groups
IGMP Snooping Static Group Membership
Total 2 group

VLAN ID  Port Name      Group Address  Uptime
-----  -
2        gi0/2          224.1.1.1     00:00:48
2        gi0/3          224.1.1.1     00:00:45
```

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1, PC 1 and PC 2 can correctly receive the multicast service packet, and PC 3 cannot receive the multicast service packet.

# 66 Multicast VLAN

---

## 66.1 Overview

In the traditional L2 multicast on-demand mode, when users in different VLANs request on-demand, each VLAN will replicate a multicast stream in the same VLAN. This multicast on-demand mode wastes a lot of bandwidth.

To solve this problem, you can configure a multicast VLAN so that users in different VLANs share one multicast VLAN. After the multicast VLAN function is enabled, the multicast stream is transmitted only in the multicast VLAN, and the multicast VLAN is completely isolated from the user VLAN. This not only saves bandwidth but also ensures security.

There are two types of multicast VLAN: MVR (Multicast VLAN Registration) and MVP (Multicast VLAN Plus).

## 66.2 Multicast VLAN Configuration

Table 66-1 Multicast VLAN Configuration

Configuration Task	
Configure MVP	Configure MVP Multicast VLAN
	Enable MVP function
Configure MVR	Configure MVR multicast VLAN
	Enable MVR function

### 66.2.1 Configure MVP

MVP is used in edge networks, and the sub-VLAN member ports can be connected to multicast devices or directly to users. When connected to a multicast device, a sub-VLAN member port can send multicast

packets with a VLAN tag; when connected to a user, the sub-VLAN member port can send multicast packets without VLAN tag.

### Configuration Condition

Before configuring MVP multicast VLAN, do the following:

- Configure the VLAN;
- Enable global and VLAN IGMP snooping function

### Configure MVP Multicast VLAN

You can configure MVP to implement cross-VLAN forwarding of multicast packets between the MVP multicast VLAN and member sub-VLANs. The member port of the MVP multicast VLAN needs to be consistent with the VLAN tag of the upstream device connected to it, and the member ports of the MVP sub-VLANs must be consistent with that the VLAN tag of the downstream device connected to it.

Table 66-2 Configuring MVP Multicast VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure MVP Multicast VLAN	<b>multicast-vlan</b> <i>mvlan-id</i> <b>subvlan</b> <i>subvlan-id</i>	Mandatory By default, no MVP multicast VLAN or member sub-VLANs are configured

### Enable MVP function

Only after the MVP function is enabled in the MVP multicast VLAN, can packets be forwarded across VLANs between the MVP multicast VLAN and the member sub-VLANs.

Table 66-3 Enabling MVP Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan</b> <i>vlan-id</i>	-

Step	Command	Description
Enable the MVP function in the VLAN	<b>multicast-vlan enable</b>	Mandatory By default, the MVP function is disabled in the VLAN

## 66.2.2 Configure MVR

MVR is used in edge networks. MVR multicast VLAN member port can only connect to users, and multicast packets sent from the VLAN member port cannot bear the VLAN tag.

### Configuration Condition

Before configuring MVR multicast VLAN, do the following:

- Configure the corresponding VLAN;
- Enable global and corresponding intra-VLAN IGMP snooping functions.

### Configure MVR multicast VLAN

When multiple user ports belong to different VLANs, these ports can be added to the MVR multicast VLAN, so that users in different VLANs can share one multicast VLAN.

Table 66-4 Configuring MVR Multicast VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure MVR multicast VLAN	<b>mvr vlan <i>vlan-id</i></b>	Mandatory By default, the MVP multicast VLAN is not configured

### Enable MVR function

Only after the MVR function is enabled, can the MVR multicast VLAN configuration take effect.

Table 66-5 Enabling MVR Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable MVR function	<b>mvr enable</b>	Mandatory By default, the MVR function is not enabled

### 66.2.3 Monitoring and Maintaining of Multicast VLAN

Table 66-6 Monitoring and Maintaining of Multicast VLAN

Command	Description
<b>show multicast-vlan</b> <i>vlan-id</i>	Show information of MVP multicast VLAN
<b>show mvr</b>	Show MVR information

## 66.3 Typical Configuration Examples of Multicast VLAN

### 66.3.1 Configure MVP

#### Network Requirements

- On Device 1, configure the multicast routing protocol.
- Device 2 enables IGMP snooping and configures MVP.
- Multicast Server sends multicast service packets, and multicast VLAN 2 can copy the multicast service packets to sub-VLAN 4 to sub-VLAN 5. PC 1, PC 2 and PC 3 can correctly receive the multicast service packets.

#### Network Topology

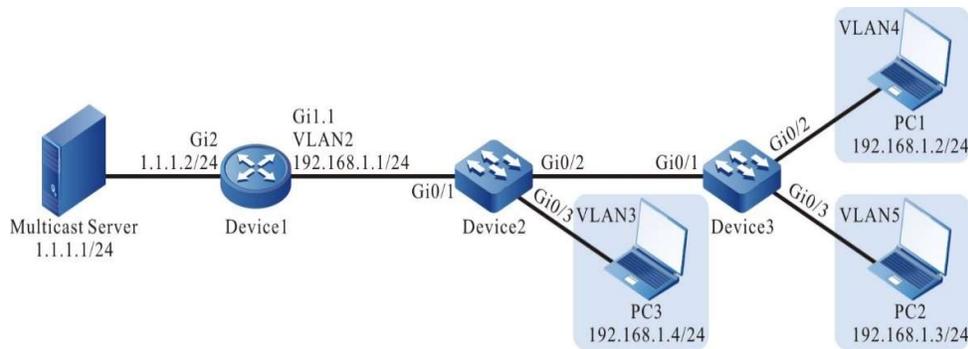

Figure 66-1 MVP Typical Configuration Network Topology

### Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol.  
(Omitted)

Step 2: Configure Device2.

#Create VLAN 2 to VLAN 5 on Device 2.

```
Device2#configure terminal
Device2(config)#vlan 2-5
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device2(config-if-gigabitethernet0/1)# switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 4 to VLAN 5 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/2
Device2(config-if-gigabitethernet0/2)#switchport mode trunk
Device2(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 4-5
Device2(config-if-gigabitethernet0/2)# switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/2)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/3 to Access to allow services of VLAN 3 to pass.

```
Device2(config)#interface gigabitethernet 0/3
Device2(config-if-gigabitethernet0/3)#switchport access vlan 3
Device2(config-if-gigabitethernet0/3)#exit
```

#Configure IGMP Snooping.

```
Device2(config)#ip igmp snooping
Device2(config)#ip igmp snooping vlan 2
Device2(config)#ip igmp snooping vlan 3
Device2(config)#ip igmp snooping vlan 4
Device2(config)#ip igmp snooping vlan 5
```

#### #Configure MVP.

```
Device2(config)#multicast-vlan 2 subvlan 3-5
Device2(config)#vlan 2
Device2(config-vlan2)#multicast-vlan enable
Device2(config-vlan2)#exit
```

#### Step 3: Configure Device 3.

#### #Create VLAN 4 to VLAN 5 on Device 3.

```
Device3#configure terminal
Device3(config)#vlan 4-5
```

#### #On Device 3, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 4 to VLAN 5 to pass, and configure PVID to 1.

```
Device3(config)#interface gigabitethernet 0/1
Device3(config-if-gigabitethernet0/1)#switchport mode trunk
Device3(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 4-5
Device3(config-if-gigabitethernet0/1)# switchport trunk pvid vlan 1
Device3(config-if-gigabitethernet0/1)#exit
```

#### #On Device 3, configure the link type of port gigabitethernet0/2 to Access to allow services of VLAN 4 to pass.

```
Device3(config)#interface gigabitethernet 0/2
Device3(config-if-gigabitethernet0/2)#switchport access vlan 4
Device3(config-if-gigabitethernet0/2)#exit
```

#### #On Device 3, configure the link type of port gigabitethernet0/3 to Access to allow services of VLAN 5 to pass.

```
Device3(config)#interface gigabitethernet 0/3
Device3(config-if-gigabitethernet0/3)#switchport access vlan 5
Device3(config-if-gigabitethernet0/3)#exit
```

#### Step 4: Check the result.

#### #View MVP information.

```
Device2#show multicast-vlan
```

#### Multicast Vlan Table

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1. PC 1, PC 2 and PC 3 can correctly receive the multicast service packets.

## 66.3.2 Configure MVR

### Network Requirements

- On Device 1, configure the multicast routing protocol.

- There are 3 VLANs in the whole network, VLAN 2 to VLAN 4, and the port connected to the PC joins the corresponding VLAN in Hybrid mode.
- On Device 2, enable IGMP snooping and configure MVP.
- Multicast Server sends the multicast service packets, and PC 1, PC 2 and PC 3 can correctly receive the multicast service packets.

### Network Topology

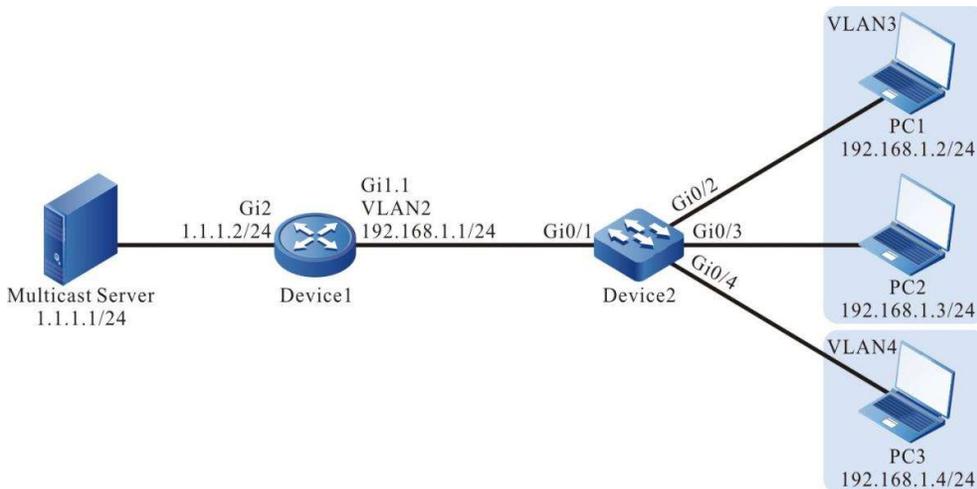

Figure 66-2 Network Topology for Configuring MVP

### Configuration Steps

Step 1: On Device 1, configure the interface IP address and enable the multicast routing protocol.  
(Omitted)

Step 2: Configure Device2.

#Create VLAN 2 to VLAN 4 on Device 2.

```
Device2#configure terminal
Device2(config)#vlan 2-4
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode hybrid
Device2(config-if-gigabitethernet0/1)#switchport hybrid tagged vlan 2
Device2(config-if-gigabitethernet0/1)# switchport hybrid pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

#On Device 2, configure the link types of port gigabitethernet0/2-0/3 to Hybrid to allow services of VLAN 2 to VLAN 3 to pass, and configure PVID to 3.

```
Device2(config)#interface gigabitethernet 0/2-0/3
Device2(config-if-range)#switchport mode hybrid
Device2(config-if-range)#switchport hybrid untagged vlan 2-3
Device2(config-if-range)#switchport hybrid pvid vlan 3
Device2(config-if-range)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/4 to Hybrid to allow services of VLAN 2 and VLAN 4 to pass, and configure PVID to 4.

```
Device2(config)#interface gigabitethernet 0/4
Device2(config-if-gigabitethernet0/4)#switchport mode hybrid
Device2(config-if-gigabitethernet0/4)#switchport hybrid untagged vlan 4
Device2(config-if-gigabitethernet0/4)#switchport hybrid untagged vlan 2
Device2(config-if-gigabitethernet0/4)#switchport hybrid pvid vlan 4
Device2(config-if-gigabitethernet0/4)#exit
```

#Configure IGMP Snooping.

```
Device2(config)#ip igmp snooping
Device2(config)#ip igmp snooping vlan 2
Device2(config)#ip igmp snooping vlan 3
Device2(config)#ip igmp snooping vlan 4
```

#Configure MVR.

```
Device2(config)#mvr vlan 2
Device2(config)#mvr enable
Device2(config)#exit
```

Step 3: Check the result.

#View MVR information.

```
Device2#show mvr
MVR status:enable
multicast-vlan: 2
```

#PC 1, PC 2 and PC 3 send IGMPv2 membership reports to join the multicast group 224.1.1.1.

#View the multicast membership table of Device 2.

```
Device2#show ip igmp snooping groups
IGMP Snooping Group Membership
Total 3 groups

VLAN ID Interface Name Group Address Expires Last Reporter V1 Expires V2 Expires Uptime
-----
2    gi0/2    224.1.1.1  00:04:14 192.168.1.2  stopped    00:00:07
```

2	gi0/3	224.1.1.1	00:04:14	192.168.1.3	stopped	00:00:07
2	gi0/4	224.1.1.1	00:04:14	192.168.1.4	stopped	00:00:07

It is indicated that all ports and groups are present in VLAN 2.

#Multicast Server sends the multicast service packet with the destination address of 224.1.1.1, and PC 1, PC 2 and PC 3 can correctly receive the multicast service packet.

# 67 IPv4 Multicast Basics

---

## 67.1 Overview

The IPv4 multicast basics section is the basics for running the IP multicast protocol and is a common part of all multicast protocols. To run any multicast routing protocol, you need to enable the IP multicast forwarding function before the device can forward multicast service packets.

## 67.2 IPv4 Multicast Basics Function Configuration

Table 67-1 IPv4 Multicast Basics Function Configuration List

Configuration Task	
Enable IP multicast forwarding	Enable IP multicast forwarding
Configure IP multicast forwarding rules	Configure multicast forwarding management boundaries
	Configure the limit of multicast forwarding entries

---

### Caution

- The L3 Ethernet interface does not support the function of IP multicast forwarding rules.
- 

### 67.2.1 Enable IP multicast forwarding

#### Configuration Condition

None

#### Enable IP multicast forwarding

Enabling the IP multicast forwarding function can ensure the normal operation of forwarding multicast services.

Table 67-2 Enabling IP Multicast Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IP multicast forwarding	<b>ip multicast-routing [ vrf vrf-name ]</b>	Mandatory  Enable IP multicast forwarding. By default, IP multicast forwarding is not enabled

## 67.2.2 Configure IP multicast forwarding rules

### Configuration Condition

Before configuring multicast forwarding management boundaries of the interface, do the following:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IP multicast forwarding;
- Configure the multicast routing protocol.

### Configure multicast forwarding management boundaries

After the management boundaries are configured, the device can filter multicast service packets, and those that do not match the access list rules will not be forwarded through this interface.

Table 67-3 Configuring Multicast Forwarding Management Boundaries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface interface-name</b>	-
Configure multicast forwarding	<b>ip multicast boundary</b>	Mandatory

Step	Command	Description
management boundaries	{ <i>access-list-number</i>   <i>access-list-name</i> }	By default, no multicast forwarding management boundary is configured

### Configure the Timeout for Multicast Forwarding Entries

Configure the timeout for multicast forwarding entries, and delete or perform other operations according to the entry tags after the timeout.

Table 67-4 Configuring the Timeout for Multicast Forwarding Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Timeout for Multicast Forwarding Entries	<b>ip multicast mrt-timer</b> <i>timevalue</i>	Optional By default, the timeout for multicast forwarding entries is 180S

### Configure the limit of multicast forwarding entries

Configure the limit on the maximum number of the multicast forwarding entries. After the limit on the maximum number of the multicast forwarding entries is exceeded, newly added multicast forwarding entries will not be created.

Table 67-5 Configuring the Limit of Multicast Forwarding Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the limit of multicast forwarding entries	<b>ip multicast route-limit</b> <i>number-value</i> [ <i>vrf vrf-name</i> ]	Optional By default, the maximum number of the multicast forwarding entries is 2047. The value range can be adjusted

Step	Command	Description
		according to the change of the system working mode

## Monitoring and Maintaining of IPv4 Multicast Basics

Table 67-6 Monitoring and Maintaining of IPv4 Multicast Basics

Command	Description
<b>clear ip mcache</b> [ <b>source</b> <i>source-ip-address</i> ] [ <b>group</b> <i>group-ip-address</i> ] [ <b>all</b>   <b>vrf</b> <i>vrf-name</i> ]	Clear multicast routing entries
<b>show ip mcache</b> [ <b>source</b> <i>source-ip-address</i> ] [ <b>group</b> <i>group-ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show multicast routing table information
<b>show ip mnhp</b> [ [ <b>vrf</b> <i>vrf-name</i> ]   [ <b>vlan</b> <i>vlan-id</i> ] ]	Show multicast next hop information
<b>show ip mvif</b> [ <b>vrf</b> <i>vrf-name</i> ]	Show multicast virtual interface information
<b>show ip mvrf</b>	Show multicast VRF information

# 68 IGMP

---

## 68.1 Overview

IGMP (Internet Group Management Protocol) is a protocol responsible for IP multicast member management in the TCP/IP protocol family, which is used to establish and maintain multicast group membership between an IP host and multicast devices directly adjacent to it.

There are 3 versions of IGMP, and IGMPv2 is currently widely used. IGMPv2 has three types of packet: query packets, group membership reports, and group member leave packets.

Query packets include: general query packets and specified group query packets. The device learns which members are in the directly connected network via the general query packets, and learns whether there are members of a specified group in the directly connected network via the specified group query packets.

Group membership report: When the host wants to join one multicast group, it will immediately send a group membership report to the multicast group it wants to join. When the host receives one query packet, it also sends one group membership report.

Group member leave packet: When the host leaves one multicast group, it sends one group member leave report. When the device receives the group member leave packet, it sends one specified group query to determine whether the certain specific group has no members.

## 68.2 IGMP Function Configuration

Table 68-1 IGMP Function Configuration List

Configuration Task	
Configure basic IGMP functions	Enable IGMP protocol
	Configure IGMP version
	Configure static group joining
	Configure multicast group filter

Configuration Task	
	Configure SSM multicast group filter
Adjust and optimize IGMP network	Configure Query Interval of General Group
	Configure robustness variable
	Configure Max. Response Time
	Configure specified group query
	Configure the timeout of other queriers
	Configure Fast Leave

## Caution

- The L3 Ethernet interface does not support the IGMP function.

### 68.2.1 Configure basic IGMP functions

#### Configuration Condition

Before configuring the basic IGMP functions, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.

#### Enable IGMP protocol

Table 68-2 Enabling IGMP Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable IP multicast forwarding	<b>ip multicast-routing</b>	Mandatory By default, IP multicast forwarding is not enabled
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable IGMP protocol	<b>ip pim sparse-mode</b>	Mandatory By default, IGMP is not enabled. IGMP is automatically enabled when the multicast routing protocol is enabled on the interface. All IGMP-related configurations can only take effect after IGMP is enabled

### Configure IGMP version

Table 68-3 Configuring IGMP Version

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure IGMP version	<b>ip igmp version</b> <i>version-number</i>	Mandatory By default, the version of IGMP is 2

---

 **Note**

- Because the packet structures and types of different versions of IGMP protocol are different, it is recommended that all devices on the same subnet be configured with the same version of IGMP.
- 

### Configure static group joining

After the certain static group or source group is configured on the interface, the device considers that there are receivers of this multicast group or source group on the interface.

Table 68–4 Configuring Static Group Joining

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure static group joining	<b>ip igmp static-group</b> <i>group-ip-address</i> [ <i>source-ip-address</i> ]	Mandatory  By default, the interface does not statically join any multicast group or source group

### Configure multicast group filter

The interface configured with the IGMP multicast group filter will filter the group membership reports in that network segment according to the ACL rules. Only the group membership reports allowed by the ACL will be processed, and those that are not allowed will be dropped. For the existing multicast group that is not allowed by the ACL, the information of this multicast group will be deleted immediately.

Table 68–5 Configuring Multicast Group Filter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure IGMP multicast group filter	<b>ip igmp access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no multicast group filter is configured

## Note

- The command **ip igmp access-group** only supports standard ACL.

### Configure SSM multicast group filter

After configuring the range of source groups accepted by IGMP, the received source group membership reports are filtered to limit the range of source groups served by the interface. For groups within the range of PIM-SSM, only IGMPv3 non-(IS\_EX, TO\_EX) membership reports of (S, G) allowed by the access list can be accepted.

Table 68–6 Configuring SSM Multicast Group Filter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure SSM multicast group filter	<b>ip igmp ssm-access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, SSM group members are not limited for filtering

## Note

- The command **ip igmp ssm-access-group** takes effect only when IGMPv3 is enabled on the interface.

- 
- The command **ip igmp ssm-access-group** only takes effect for source groups within the range of PIM SSM.
  - The command **ip igmp access-group** only supports extended ACL.
- 

## 68.2.2 Adjust and optimize IGMP network

### Configuration Condition

Before adjusting and optimizing the IGMP network, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Enable the IGMP protocol.

### Configure Query Interval of General Group

IGMP querier periodically sends the query packets of the general group to maintain the group member relation. You can modify the interval of sending the IGMP general group query packets according to the actuality of the network.

Table 68-7 Configuring Query Interval of General Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Query Interval of General Group	<b>ip igmp query-interval</b> <i>interval-value</i>	Optional By default, the interval of sending the IGMP general group query packets is 125 seconds

---

### Note

- The value of the general query interval of the devices on the same network segment should
-

---

be kept as consistent as possible.

- The query interval of the general group should be larger than the maximum response time. Otherwise, the configuration cannot succeed.
- 

### Configure robustness variable

Table 68-8 Configuring Robustness Variable

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure robustness variable	<b>ip igmp robustness-variable</b> <i>variable-value</i>	Optional By default, the robustness variable of the IGMP querier is 2

---

### Note

- After configuring the robustness variable, the following parameters will also vary as the robustness parameter varies:
    - 1, group member timeout = robustness variable \* general group query time + maximum response time;
    - 2, other querier timeout = robustness variable \* general group query time + maximum response time / 2;
    - 3, it thus appears that the larger the value of the robustness variable, the longer the timeout of IGMP group members and the longer the timeout of other queriers. The user should set this value according to the actuality of the network.
- 

### Configure Max. Response Time

The general group query packet sent by the IGMPv2 querier contains the maximum response time field. The receiver sends the membership report packet within the maximum response interval.

Table 68-9 Configuring Maximum Response Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Max. Response Time	<b>ip igmp query-max-response-time</b> <i>seconds</i>	Optional By default, the maximum response time for IGMP general group query is 10 seconds

### Configure specified group query

When the IGMP querier receives the leave packet of the certain multicast group, it sends the specified group query packet "specified group query count" times to query this segment for the multicast group, to learn whether the subnet has the members of the multicast group. If not receiving the membership report on the multicast group after waiting for "final lifecycle", delete the information of the multicast group.

Table 68-10 Configuring Specified Group Query

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Query Interval of Specified Group	<b>ip igmp last-member-query-interval</b> <i>interval-value</i>	Optional By default, the interval of sending the specified group query packets is 1 second
Configure specified group query count	<b>ip igmp last-member-query-count</b> <i>count-value</i>	Optional By default, the count of sending

Step	Command	Description
		the specified group query packets is 2

## Note

- The command **ip igmp last-member-query-interval** and the command **ip igmp last-member-query-count** are invalid in the IGMPv1 version, because the IGMPv1 host will not send the leave packet when leaving the certain multicast group.

### Configure the timeout of other queriers

In the same subnet, the device with a smaller address is elected as the querier, and other devices are called non-queriers. On non-queriers, the querier will be set a timer (there is a timer for each other querier) having a timeout of 'other querier timeout'. When the non-querier receives the query packet from the querier, this timer will be refreshed. When the timer expires, it means that the current IGMP querier has expired and a new one must be re-elected.

Table 68-11 Configuring the Timeout of Other Queriers

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the timeout of other queriers	<b>ip igmp query-timeout</b> <i>seconds</i>	Optional By default, the timeout of other queriers is 255 seconds

## Caution

- If the configured timeout of other queriers is less than the query interval, the querier in the

---

network may change repeatedly.

---

### Configure Fast Leave

Only one host is connected to the stub segment of the network to frequently switch the multicast groups. To reduce the leave delay, you can configure the multicast group fast leave on the device.

If the device receives the leave packet of one multicast group after configuring fast leave, the device checks whether the multicast group is within the fast leave range. If yes, the device does not send the specified group query packet within the network segment any more and the information of the multicast group is deleted at once.

Table 68-11 Configuring Fast Leave

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the range of fast leave from the multicast group	<b>ip igmp immediate-leave group-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, fast leave from the multicast group is not allowed, and this is applicable to IGMPv2
Configure the range of fast leave from the source group	<b>ip igmp sg-immediate-leave sg-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, fast leave from the source group is not allowed, and this is applicable to IGMPv3

### 68.2.3 Configure IGMP SSM Mapping

#### Configuration Condition

Before configuring IGMP SSM Mapping, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Enable the IGMP protocol.

### Configure IGMP SSM Mapping

In order to provide PIM-SSM services to receivers who do not support IGMPv3 in the PIM-SSM network, you can configure the IGMP SSM mapping function on the device.

The user can configure IGMP SSM mapping rules according to the needs of the network receivers. The group membership reports allowed by the rules are converted into IGMPv3 non-(IS\_EX, TO\_EX) membership reports, and the multicast source address is the source address specified by the IGMP SSM mapping rules.

Table 68-12 Configuring IGMP SSM Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IGMP SSM Mapping	<b>ip igmp ssm-map enable [ vrf vrf-name ]</b>	Mandatory By default, IGMP SSM Mapping is not enabled
Configure IGMP SSM Mapping rules	<b>ip igmp ssm-map static</b> <i>{ access-list-number   access-list-name }</i> <i>source-ip-address [ vrf vrf-name ]</i>	Mandatory By default, there is no IGMP SSM Mapping rule

---

### Note

- The command `ip igmp ssm-map static` only supports standard ACL.
- 

## 68.2.4 IGMP Monitoring and Maintaining

Table 68-13 IGMP Monitoring and Maintaining

Command	Description
<b>clear ip igmp group</b> [ <i>group-ip-address</i> ] [ <i>interface-name</i> ] [ <i>vrf vrf-name</i> ]	Clear IGMP multicast group information
<b>clear ip igmp statistic interface</b> <i>interface-name</i> [ <i>vrf vrf-name</i> ]	Clear IGMP packet statistics on the interface
<b>show ip igmp groups</b> [ [ <i>static</i> ]   [ <i>interface-name</i> ] [ <i>group-ip-address</i> ] [ <i>detail</i> ] ] [ <i>vrf vrf-name</i> ]	Show IGMP multicast group information
<b>show ip igmp interface</b> [ <i>interface-name</i> ] [ <i>vrf vrf-name</i> ]	Show interface IGMP information
<b>show ip igmp statistic interface</b> <i>interface-name</i> [ <i>vrf vrf-name</i> ]	Show statistics of IGMP packets

## 68.3 IGMP Typical Configuration Example

### 68.3.1 Configure IGMP

#### Network Requirements

- The PIM-SM protocol runs on the entire network.
- Device 1, Device 2, and Receiver are in the same LAN, and Device 2 is the querier.
- Receiver is one receiver of the Device 1 and Device 2 stub network.
- IGMPv2 runs between Device 1 and 2 and the stub network.

#### Network Topology

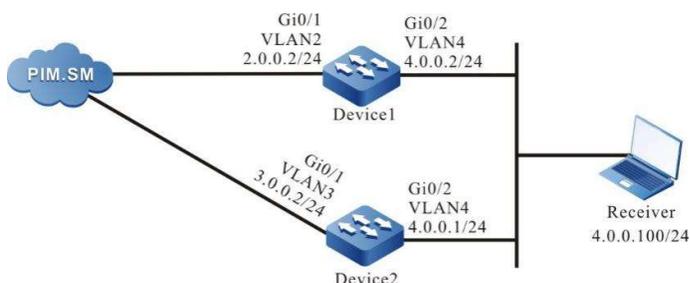

Figure 68-1 Network Topology for Configuring IGMP

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

#Configure Device1.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device1(config)#configure terminal
Device1(config)#ip multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ip pim sparse-mode
Device1(config-if-vlan4)#exit
```

#Configure Device2.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device2(config)#configure terminal
Device2(config)#ip multicast-routing
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip pim sparse-mode
Device2(config-if-vlan3)#exit
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ip pim sparse-mode
Device2(config-if-vlan4)#exit
```

Step 3: Check the result.

#View the IGMP version information and querier election result of Device 1 interface vlan 4.

```
Device1#show ip igmp interface vlan4
Interface vlan4 (Index 50331921)
IGMP Active, Non-Querier (4.0.0.1, Expires: 00:02:15)
Default version 2
IP router alert option in IGMP V2 msgs: EXCLUDE
Internet address is 4.0.0.2
IGMP query interval is 125 seconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds configged, and 10 seconds is adopted
```

Last member query response interval is 1 seconds  
Last member query count is 2  
Group Membership interval is 260 seconds  
IGMP robustness variable is 2

#### #View the IGMP version information and querier election result of Device 2 interface vlan 4.

```
Device2#show ip igmp interface vlan4
Interface vlan4 (Index 50331921)
IGMP Active, Querier (4.0.0.1)
Default version 2

IP router alert option in IGMP V2 msgs: EXCLUDE
Internet address is 4.0.0.1
IGMP query interval is 125 seconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 1 seconds
Last member query count is 2
Group Membership interval is 260 seconds
IGMP robustness variable is 2
```

#### #Receiver sends an IGMPv2 membership report to join the multicast group 225.1.1.1.

#### #View the multicast membership table of Device 1.

```
Device1#show ip igmp groups
IGMP Connected Group Membership
Total 1 groups
Group Address  Interface      Uptime   Expires   Last Reporter  V1 Expires  V2 Expires
225.1.1.1     vlan4           00:21:02 00:03:47 4.0.0.100      stopped
```

#### #View the multicast membership table of Device 2.

```
Device2#show ip igmp groups
IGMP Connected Group Membership
Total 1 groups
Group Address  Interface      Uptime   Expires   Last Reporter  V1 Expires  V2 Expires
225.1.1.1     vlan4           00:21:02 00:03:47 4.0.0.100      stopped
```

---

### Note

- After the multicast protocol is configured on the interface, the IGMP function is automatically enabled, and the IGMPv2 version is run by default. By the command **ip igmp version** you can configure the IGMP version that runs on the interface.
- When multiple devices in the same LAN run IGMP, the election of IGMP queriers will be

---

performed, and one with the smaller IP address is elected as the IGMP querier of this LAN.

---

## 68.3.2 Configure IGMP SSM Mapping

### Network Requirements

- The PIM-SSM protocol runs on the entire network.
- Receiver 1, Receiver 2, Receiver 3, and Device 2 are in the same LAN.
- IGMPv3 runs between Device 2 and the stub network.
- By using IGMP SSM mapping on Device 2, Receiver 2 and Receiver 3 can only receive multicast packets sent by Source 1.

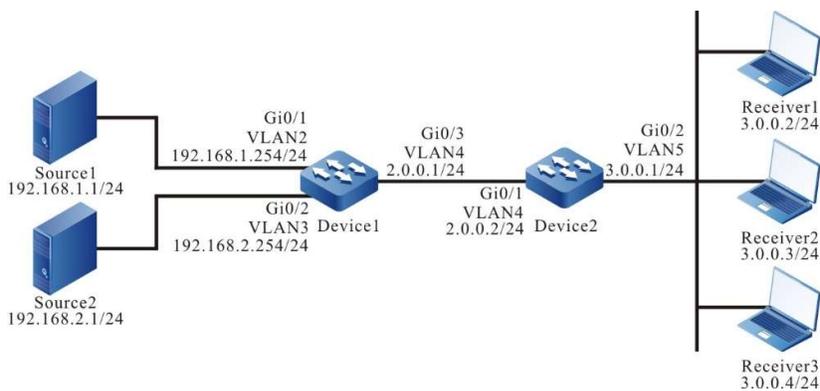

Figure 68-2 Network Topology for Configuring IGMP SSM Mapping

### Configuration Steps

Step 1: Configure IP addresses for the interfaces (omitted).

Step 2: Enable the unicast routing protocol OSPF, so that all network devices in the network can communicate with each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 192.168.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 192.168.2.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
```

```
Device2(config)#router ospf 100
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

### #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS
```

```
Gateway of last resort is not set
```

```
C 2.0.0.0/24 is directly connected, 00:16:05, vlan4
C 3.0.0.0/24 is directly connected, 00:06:36, vlan5
O 192.168.1.0/24 [110/2] via 2.0.0.1, 00:15:17, vlan4
O 192.168.2.0/24 [110/2] via 2.0.0.1, 00:00:51, vlan4
```

---

## Note

- Device 1 is viewed the same way as Device 2, and the viewing process is omitted.
- 

Step 3: Enable multicast forwarding globally, and configure PIM-SSM globally. The range of multicast groups served by SSM is 232.0.0.0/8. Enable the multicast protocol PIM-SM on the interfaces. IGMPv3 runs on the interface vlan 5 of Device 2.

### #Configure Device1.

Enable multicast forwarding globally, configure PIM-SSM globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device1(config)#ip multicast-routing
Device1(config)#ip pim ssm default
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ip pim sparse-mode
Device1(config-if-vlan4)#exit
```

#Configure Device2.

Enable multicast forwarding globally, configure PIM-SSM globally, and enable the multicast protocol PIM-SSM on related interfaces, with IGMPv3 running on the interface vlan 5.

```
Device2(config)#ip multicast-routing
Device2(config)#ip pim ssm default
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ip pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ip pim sparse-mode
Device2(config-if-vlan5)#ip igmp version 3
Device2(config-if-vlan5)#exit
```

#View the IGMP information of the interface vlan 5 of Device 2.

```
Device2#show ip igmp interface vlan5
Interface vlan5 (Index 50331921)
IGMP Enabled, Active, Querier (3.0.0.1)
Configured for version 3
IP router alert option in IGMP V2 msgs: EXCLUDE
Internet address is 3.0.0.1
IGMP query interval is 125 seconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 1 seconds
Last member query count is 2
Group Membership interval is 260 seconds
IGMP robustness variable is 2
```

Step 4: Enable IGMP SSM mapping on Device 2 and configure IGMP SSM mapping rules so that Receiver 1 and Receiver 2 can only receive multicast packets sent by Source 1.

#Configure Device2.

Enable IGMP SSM mapping, configure the multicast group range for IGMP SSM mapping to 232.0.0.0-232.0.0.255, with the multicast source address of 192.168.1.1.

```
Device2(config)#ip access-list standard 1
Device2(config-std-nacl)#permit 232.0.0.0 0.255.255.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#ip igmp ssm-map enable
Device2(config)#ip igmp ssm-map static 1 192.168.1.1
```

#View the IGMP SSM mapping rules of Device 2.

```
Device2#show ip igmp ssm-map

IGMP SSM-MAP Information : enable

acl-name source-addr

#Receiver 1 can only receive multicast packets sent by Source 2, and Receiver 2 and Receiver 3 can only receive multicast packets sent by Source 1.

---

## Note

- Device 1 is viewed the same way as Device 2, and the viewing process is omitted.
  - IGMP SSM mapping needs to be used in conjunction with PIM-SSM. The multicast group range in the IGMP SSM mapping rules must be within the multicast group range of PIM-SSM. IGMP SSM mapping mainly provides support for the SSM model for the receiver host that runs IGMPv1 or IGMPv2 and cannot be upgraded to IGMPv3.
  - IGMP SSM mapping is invalid to IGMPv3 membership reports.
- 

### 68.3.3 Configure IGMP Static Group Joining

#### Network Requirements

- The PIM-SM protocol runs on the entire network.
- Receiver is one receiver of Device stub network.
- IGMPv2 runs between Device and the stub network.
- The interface vlan 3 of Device joins the multicast group 225.1.1.1 in a static joining manner.

#### Network Topology

Figure 68-3 Network Topology for Configuring IGMP Static Group Joining

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

#Configure Device.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device(config)#configure terminal
Device(config)#ip multicast-routing
Device(config)#interface vlan2
Device(config-if-vlan2)#ip pim sparse-mode
Device(config-if-vlan2)#exit
Device(config)#interface vlan3
Device(config-if-vlan3)#ip pim sparse-mode
Device(config-if-vlan3)#exit
```

**#View the IGMP information of the interface vlan 3 of Device.**

```
Device#show ip igmp interface vlan3
Interface vlan3 (Index 50331921)
IGMP Active, Querier (3.0.0.1)
Default version 2
IP router alert option in IGMP V2 msgs: EXCLUDE
Internet address is 3.0.0.1
IGMP query interval is 125 seconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 1 seconds
Last member query count is 2
Group Membership interval is 260 seconds
IGMP robustness variable is 2
```

**Step 3:** The interface vlan 3 of Device joins the multicast group 225.1.1.1 in a static joining manner.

**#Configure Device.**

**Configure the static multicast group 225.1.1.1 on the interface vlan 3 of Device.**

```
Device(config)#interface vlan3
Device(config-if-vlan3)#ip igmp static-group 225.1.1.1
Device(config-if-vlan3)#exit
```

**Step 4:** Check the result.

**#Source sends the multicast packet of the multicast group 225.1.1.1.**

**#View the multicast membership table of Device.**

```
Device#show ip igmp groups
IGMP Static Group Membership
```

#Receiver can receive the multicast packet of the multicast group 225.1.1.1 sent by Source.

### 68.3.4 Configure IGMP Multicast Group Filtering

#### Network Requirements

- The PIM-SM protocol runs on the entire network.
- Receiver is one receiver of Device stub network.
- IGMPv2 runs between Device and the stub network.
- The interface vlan 3 of Device filters the multicast groups, and the range of multicast groups that Receiver is allowed to join is 225.1.1.0-225.1.1.255.

#### Network Topology

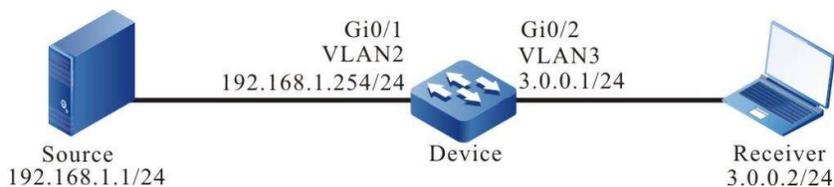

Figure 68-4 Network Topology for Configuring IGMP Multicast Group Filtering

## Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

#Configure Device.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device(config)#configure terminal
Device(config)#ip multicast-routing
Device(config)#interface vlan2
Device(config-if-vlan2)#ip pim sparse-mode
Device(config-if-vlan2)#exit
Device(config)#interface vlan3
Device(config-if-vlan3)#ip pim sparse-mode
Device(config-if-vlan3)#exit
```

#View the IGMP information of the interface vlan 3 of Device.

```
Device#show ip igmp interface vlan3
Interface vlan3 (Index 50331921)
IGMP Enabled, Active, Querier (3.0.0.1)
Default version 2

Internet address is 3.0.0.1
IGMP query interval is 125 seconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 1 seconds
Last member query count is 2
Group Membership interval is 260 seconds
IGMP robustness variable is 2
```

Step 3: Configure multicast group filtering on the interface vlan 3 of Device.

#Configure Device.

Configure multicast group filtering on the interface vlan 3 of Device, with the range of multicast groups that Receiver is allowed to join being 225.1.1.0-225.1.1.255.

```

Device(config)#ip access-list standard 1
Device(config-std-nacl)#permit 225.1.1.0 0.0.0.255
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
Device(config)#interface vlan3
Device(config-if-vlan3)#ip igmp access-group 1
Device(config-if-vlan3)#exit

```

Step 4: Check the result.

#Receiver sends an IGMPv2 leave packet to join the multicast groups 225.1.1.1. and 226.1.1.1.

#Source sends the multicast packet of the multicast groups 225.1.1.1 and 226.1.1.1.

#View the multicast membership table of Device.

```

#Receiver can only receive the multicast packet of the multicast group 225.1.1.1 sent by Source.

---

## Note

- If you want to filter based on the multicast source group, you can use the command **ip igmp ssm-access-group** to achieve this. When using this command, the device is required to run PIM-SSM and the interface to run IGMPv3 version.
-

# 69 PIM-DM

---

## 69.1 Overview

PIM-DM (Protocol Independent Multicast-Dense Mode) is mainly applicable to the cases where the distribution of group members is relatively concentrated and the range is small, or the network bandwidth resources are abundant.

PIM-DM is independent of the specific unicast routing protocol for RPF inspection.

PIM-DM uses "Push" to transmit the multicast data packets. When the multicast source starts to send the multicast data packets, it is assumed that all subnets in the multicast domain have multicast receivers, so the multicast data packets will be pushed to all nodes in the network. PIM-DM will prune the multicast forwarding branches without receivers. When the receiver of the multicast source appears on the node of the pruned multicast forwarding branch, PIM-DM uses the grafting mechanism to actively resume the forwarding of multicast data.

PIM-DM uses a status refresh mechanism to periodically refresh the downstream status so that the pruned branch will not time out.

## 69.2 PIM-DM Function Configuration

Table 69-1 PIM-DM Function Configuration List

Configuration Task	
Configure basic functions of PIM-DM	Configure PIM-DM protocol
Configure PIM-DM neighbors	Configure sending period of HELLO packets
	Configure PIM-DM neighbor keepalive time

Configuration Task	
	Configure PIM-DM neighbor filtering
Configure state refresh parameters	Configure PIM-DM state refresh interval

## Caution

- The L3 Ethernet interface does not support the PIM-DM function.

### 69.2.1 Configure basic functions of PIM-DM

#### Configuration Condition

Before configuring PIM-DM, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable IP multicast forwarding function.

#### Configure PIM-DM protocol

Table 69-2 Configuring PIM-DM Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Enable PIM-DM protocol	<b>ip pim dense-mode</b>	Either-or
	<b>ip pim dense-mode passive</b>	By default, the interface is in PIM-DM disabled status  The command <b>ip pim dense-mode passive</b> enables the PIM-DM protocol, and the interface does not send the hello packet to neighbors

## 69.2.2 Configure PIM-DM neighbors

### Configuration Condition

Before configuring PIM-DM neighbors, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-DM protocol.

### Configure sending period of HELLO packets

The interface with the PIM-DM protocol enabled will periodically send the Hello packet to establish and maintain PIM-DM neighbors.

Table 69-3 Configuring Sending Period of HELLO Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface	<b>interface <i>interface-name</i></b>	-

Step	Command	Description
configuration mode		
Configure sending period of HELLO packets	<b>ip pim dense-mode hello-interval</b> <i>interval-value</i>	Optional By default, the interval of sending the Hello packet is 30 seconds

### Configure PIM-DM neighbor keepalive time

When the Hello packet from one neighbor is received on the interface, the holdtime carried in the Hello packet will be recorded as the keepalive time of this neighbor. If no Hello packet of the neighbor is received within the keep-alive period, this neighbor is considered invalid.

Table 69-4 Configuring PIM-DM Neighbor Keepalive Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure PIM-DM neighbor keepalive time	<b>ip pim dense-mode hello-holdtime</b> <i>holdtime-value</i>	Optional By default, the keepalive time of a PIM-DM neighbor is 105 seconds

### Configure PIM-DM neighbor filtering

To save system resources, you can use the neighbor filtering function to selectively establish neighbors, thereby saving device resources.

Table 69-5 Configuring PIM-DM Neighbor Filtering

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure PIM-DM neighbor filtering	<b>ip pim dense-mode neighbor-filter</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional By default, the PIM-DM neighbor filtering function is not enabled

### 69.2.3 Configure state refresh parameters

#### Configuration Condition

Before configuring PIM-DM state refresh parameters, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-DM protocol.

#### Configure PIM-DM state refresh interval

For PIM-DM, it is required to set the interval for the router directly connected to the source to generate the status refresh packet.

Table 69-6 Configuring PIM-DM State Refresh Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure PIM-DM state refresh interval	<b>ip pim dense-mode state-refresh origination-interval</b> <i>interval-value</i>	Optional By default, the PIM-DM state refresh interval is 60 seconds

## 69.2.4 PIM-DM Monitoring and Maintaining

Table 69-7 PIM-DM Monitoring and Maintaining

Command	Description
<b>clear ip pim dense-mode mroute</b> [ <i>group-ip-address source-ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Clear PIM-DM multicast routing information
<b>show ip pim dense-mode interface</b> [ <b>detail</b> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show PIM-DM interface information
<b>show ip pim dense-mode neighbor</b> [ <b>detail</b> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show PIM-DM neighbor information
<b>show ip pim dense-mode nexthop</b> [ <i>source-ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show the unicast next hop information from PIM-DM to the source
<b>show ip pim dense-mode mroute</b> [ [ <b>group</b> <i>group-ip-address</i> ] [ <b>source</b> <i>source-ip-address</i> ] ]	Show the routing table information for the PIM-DM protocol

Command	Description
[ <b>source</b> <i>source-ip-address</i> <b>group</b> <i>group-ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	

## 69.3 PIM-DM Typical Configuration Example

### 69.3.1 Configure basic functions of PIM-DM

#### Network Requirements

- Enable the PIM-DM protocol on the entire network.
- Receiver is one receiver of Device 2 stub network.
- IGMPv2 runs between Device 2 and the stub network.

#### Network Topology

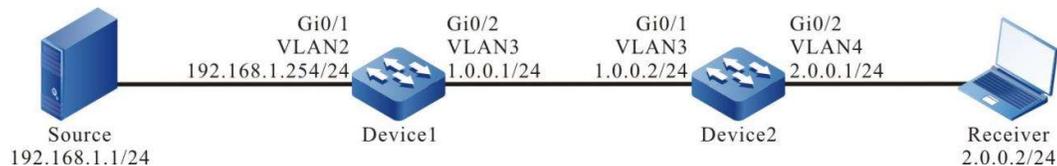

Figure 69-1 Network Topology for Configuring Basic Functions of PIM-DM

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Enable the unicast routing protocol OSPF, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```

Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 192.168.1.0 0.0.0.255 area 0
Device1(config-ospf)#exit
  
```

## #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

## #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, Ex - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

C 1.0.0.0/24 is directly connected, 00:07:30, vlan3
C 2.0.0.0/24 is directly connected, 00:07:14, vlan4
O 192.168.1.0/24 [110/2] via 1.0.0.1, 00:00:16, vlan3
```

---

### Note

- The routing table of Device 1 is viewed the same way as that of Device 2.
- 

Step 4: Enable multicast forwarding globally, and enable the multicast protocol PIM-DM on the interfaces.

## #Configure Device1.

Enable multicast forwarding globally, and enable the multicast protocol PIM-DM on related interfaces.

```
Device1(config)#ip multicast-routing
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ip pim dense-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ip pim dense-mode
Device1(config-if-vlan3)#exit
```

## #Configure Device2.

Enable multicast forwarding globally, and enable the multicast protocol PIM-DM on related interfaces.

```
Device2(config)#ip multicast-routing
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ip pim dense-mode
Device2(config-if-vlan3)#exit
Device2(config)#interface vlan 4
Device2(config-if-vlan4)#ip pim dense-mode
Device2(config-if-vlan4)#exit
```

#View, for Device 2, interface information with PIM-DM protocol enabled and PIM-DM neighbor information.

```
Device2#show ip pim dense-mode interface
Total 2 Interface entries

IGMP max query response time is 10 seconds
Last member query response interval is 1 seconds
```

Last member query count is 2  
Group Membership interval is 260 seconds  
IGMP robustness variable is 2

---

## Note

- Information of Device 1 is viewed the same way as that of Device 2.
  - After the multicast protocol is configured on the interface, the IGMP function is automatically enabled, and IGMPv2 is run by default. By executing the command **ip igmp version** you can configure the IGMP version that runs on the interface.
- 

Step 5: Check the result.

#Receiver sends an IGMPv2 member report packet to join the multicast group 225.1.1.1.

#Source sends a multicast service packet of the multicast group 225.1.1.1.

#View the multicast membership table on Device 2.

#Receiver can only receive the multicast service packet of the multicast group 225.1.1.1 sent by Source.

---

 **Note**

- Information of Device 1 is viewed the same way as that of Device 2.
-

# 70 PIM-SM

---

## 70.1 Overview

PIM-SM (Protocol Independent Multicast-Spare Mode) is mainly applicable to the cases where the distribution of group members is relatively spare and the range is wide, or the network bandwidth resources are limited.

PIM-SM is independent of the specific unicast routing protocol. The device actively sends a join packet to request the establishment of a multicast distribution tree, and sets RP (Rendezvous Point) and BSR (Bootstrap Router) to advertise the multicast information to all the PIM-SM routers. When the receiver joins one multicast group, the receiving DR (Designated Router) sends a PIM join packet to RP to construct the shared tree rooted at RP—RPT. The source DR registers the multicast source with RP and constructs the active tree rooted at the multicast source. Multicast service packets are transmitted down the active tree and the shared tree to the receiver. The receiving DR will send the PIM join packet to the multicast source, and finally switch from RPT to the source-based shortest path tree SPT to reduce network latency.

PIM-SSM is Protocol Independent Multicast-Source Specific Multicast. PIM-SSM is a subset of the PIM-SM protocol and must run on the basis of PIM-SM. The PIM-SSM protocol stipulates that IPv4 addresses 232.0.0.0-232.255.255.255 are reserved for SSM. PIM-SSM needs to be used in conjunction with IGMPv3, because IGMPv3 can send IGMP membership reports for specified sources and groups.

## 70.2 PIM-SM Function Configuration

Table 70-1 PIM-SM Function Configuration List

Configuration Task	
Configure basic functions of PIM-SM	Enable PIM-SM protocol
	Configure C-RP

Configuration Task	
Configure PIM-SM aggregation router	Configure static RP
Configure PIM-SM bootstrap router	Configure C-BSR
	Configure BSR Border
Configure PIM-SM multicast source registration	Configure RP reachability check
	Configure sending rate of register packets
	Configure sending rate of register-stop packets
	Configure source address of register packets
	Configure register packet filtering
Configure PIM-SM neighbor parameters	Configure sending period of HELLO packets
	Configure keepalive time of neighbors
	Configure neighbor filtering
	Configure DR priority
Configure PIM-SM SPT switching	Configure SPT switching conditions
Configure PIM-SSM	Configure PIM-SSM
Configure PIM-SDM	Enable PIM-SDM

## Caution

- The L3 Ethernet interface does not support the PIM-SM function.

## 70.2.1 Configure basic functions of PIM-SM

### Configuration Condition

Before configuring PIM-SM, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain.

### Enable PIM-SM protocol

Table 70–2 Enabling PIM-SM Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IP multicast forwarding	<b>ip multicast-routing</b>	Mandatory By default, IP multicast forwarding is not enabled
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable PIM-SM protocol	<b>ip pim sparse-mode</b>	Either-or
	<b>ip pim sparse-mode passive</b>	By default, the interface is in PIM-SM shut-down state

---

 **Note**

- After enabling the PIM-SM protocol, the IGMP protocol is automatically enabled.
  - All PIM-SM-related configurations can only take effect after PIM-SM is enabled.
- 

## 70.2.2 Configure PIM-SM aggregation router

### Configuration Condition

Before configuring RP, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-SM protocol.

### Configure C-RP

RP results from C-RP election. After BSR election, all C-RPs (Candidate-Rendezvous Point, candidate aggregation routers) regularly unicast C-RP packets to BSR. BSR integrates the C-RP information and conveys the information to all the devices within the SM domain via bootstrap packets.

Table 70–3 Configuring C-RP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure C-RP	<b>ip pim rp-candidate</b> <i>interface-name</i> [ [ <i>priority-value</i> [ <i>interval-value</i> [ <b>group-list</b> { <i>access-list-number</i>   <i>access-list-name</i> } ] ] ]   [ <b>group-list</b> { <i>access-list-number</i>	Mandatory  By default, there are no C-RPs

Step	Command	Description
	<code>access-list-name } ] ] [ vrf vrf-name ]</code>	

## Note

- RP election is performed based on the following rules:
  - 1, the longest mask matching is performed on the range of groups served by C-RP services;
  - 2, compare the C-RP priorities if there are multiple C-RPs in the longest mask matching, the smaller the value, the higher the priority, and those with the higher priority win;
  - 3, calculate the HASH value for the C-RP addresses and groups if there is more than one C-RP with the highest priority, and the C-RP with the largest HASH value wins;
  - 4, if there is more than one RP with the largest HASH value, the C-RP with the largest IP address wins.

### Configure static RP

For simple PIM-SM networks, the static RP is recommended. The use of the static RP eliminates the need for BSR configuration and eliminates frequent interaction between RPs and BSRs, thereby saving network bandwidth.

Table 70–4 Configuring Static RP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure static RP	<b>ip pim rp-addressess</b> <i>ip-address</i> [ <i>access-list-name</i>   <i>access-list-number</i> ] [ <b>override</b> ] [ <i>vrf vrf-name</i> ]	Mandatory By default, there are no static RPs

---

 **Note**

- All devices in the same PIM-SM domain must be configured with the same static RP to work normally.
- 

### 70.2.3 Configure PIM-SM bootstrap router

#### Configuration Condition

Before configuring BSR, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-SM protocol.

#### Configure C-BSR

In one PIM-SM domain, there must be unique BSR. Multiple C-BSRs (Candidate-Bootstrap Routers) result in the only recognized BSR via bootstrap packet election.

Table 70-5 Configuring C-BSR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure C-BSR	<b>ip pim bsr-candidate</b> <i>interface_name</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ] [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory  By default, there are no C-BSRs

---

 **Note**

- 
- BSR election is performed based on the following rules:
    - 1, compare the priorities, the larger the value, the higher the priority, and those with the higher priority win;
    - 2, in the case of the same priority, those with the larger IP address win.
- 

### Configure BSR Border

BSR is responsible for collecting C-RP information and conveying this information to all devices within the PIM-SM domain via bootstrap packets. The range of BSR is also the range of the multicast domain. Bootstrap packets cannot pass through the interfaces configured with BSR border. The devices outside the multicast domain cannot forward multicast service packets within the multicast domain. In this way, the multicast domain is divided.

Table 70-6 Configure BSR Border

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure BSR Border	<b>ip pim bsr-border</b>	Mandatory By default, there are no multicast borders

## 70.2.4 Configure PIM-SM multicast source registration

### Configuration Condition

Before configuring multicast source registration, do the following:

- Configure the network layer address of the interface so that all neighbor

nodes are reachable at the network layer;

- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-SM protocol.

### Configure RP reachability check

Before the source DR sends the register packet to RP, you may run the reachability check on RP. If RP routing is found to be unreachable, skip registering with RP, thereby reducing the overhead of this DR.

Table 70-7 Configuring RP Reachability Check

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure RP reachability check	<b>ip pim register-rp-reachability</b> [ <i>vrf vrf-name</i> ]	Mandatory  By default, RP reachability is not checked before the registration process of PIM

---

### Note

- To reduce the overhead of the source DR, it is recommended to configure this command on all source DRs of PIM-SM.
- 

### Configure sending rate of register packets

When the source DR receives a multicast data packet, it encapsulates the multicast data packet into a register message and sends it to RP for source registration until the registration is completed.

When the source DR has not completed the registration of the multicast source and the multicast traffic is large, a large number of register packets will be generated, which will

increase the burden on the RP device, and even may cause RP not to work normally. Because it is not necessary for the source DR to send all the register packets of the same flow to RP, configuring the sending rate of the register packets at the source DR can meet the purpose of source registration and reduce the burden on RP.

Table 70-8 Configuring Sending Rate of Register Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure sending rate of register packets	<b>ip pim register-rate-limit <i>rate-limit-value</i> [ <i>vrf vrf-name</i> ]</b>	Mandatory By default, the sending rate of register packets is not limited

---

 **Note**

- To reduce the burden on RP, it is recommended to configure the source registration sending rate on all source DRs.
- 

### Configure sending rate of register-stop packets

After RP receives a register packet from the source DR, it will send a register-stop packet to the source DR to complete the registration process. When RP receives many register packets, it is necessary to reply to all the register packets(that is, to send register-stop packets). In actual situations, there are many duplicate packets in these register-stop packets. The sending rate of the register-stop packets on RP can be limited to achieve the purpose of reducing the overhead on RP.

Table 70-9 Configuring Sending Rate of Register-stop Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure sending rate of register-stop packets	<b>ip pim register-stop-rate-limit</b> <i>rate-limit-value</i> [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, the sending rate of register-stop packets is not limited

### Note

- To improve the robustness of the entire PIM-SM network, it is recommended to limit the rate of source register-stop packets in all RPs.

### Configure source address of register packets

When the source DR performs source registration, the source address of the register packet uses the register interface IP address automatically generated by the system. This command can specify the source address of the register packet as the IP address of one interface on this device to satisfy some special needs of the network.

Table 70-10 Configuring Source Address of Register Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure source address of register packets	<b>ip pim register-source</b> <b>interface</b> <i>interface-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, the IP address of the register interface automatically generated by the

Step	Command	Description
		system is used as the source address of the register packet

### Configure register packet filtering

To prevent source registration attacks, ACL can be used on RP to filter the multicast source for the register packets. Only the multicast sources allowed by the ACL can successfully register with RP.

Table 70-11 Configuring Register Packet Filtering

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure register packet filtering	<b>ip pim accept-register list</b> { <i>access-list-number</i>   <i>aces-list-name</i> } [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, register packets are not filtered

## 70.2.5 Configure PIM-SM neighbor parameters

### Configuration Condition

Before configuring PIM-SM neighbor parameters, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-SM protocol.

### Configure sending period of HELLO packets

The interface with the PIM protocol enabled will periodically send the Hello packet to establish and maintain PIM neighbors.

Table 70-12 Configuring Sending Period of Hello packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure sending period of HELLO packets	<b>ip pim hello-interval</b> <i>interval-value</i>	Optional By default, the interval of sending the Hello packet is 30 seconds

### Configure keepalive time of neighbors

When the Hello packet from one neighbor is received on the interface, the holdtime carried in the Hello packet will be recorded as the keepalive time of this neighbor. If no Hello packet of the neighbor is received within the keepalive period, this neighbor is considered invalid.

Table 70-13 Configuring PIM-DM Neighbor Keepalive Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure keepalive time of neighbors	<b>ip pim hello-holdtime</b> <i>holdtime-value</i>	Optional

Step	Command	Description
		By default, the keepalive time of the PIM-DM neighbors is 105 seconds

### Configure neighbor filtering

If there are many PIM neighbors in one subnet, you can use the neighbor filtering function to selectively establish the neighbor, thereby saving device resources.

Table 70-14 Configuring Neighbor Filtering

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure neighbor filtering	<b>ip pim neighbor-filter</b> { <i>access-list-number</i>   <i>aces-list-name</i> }	Mandatory By default, the neighbor filtering function is not enabled

### Configure DR priority

DR plays a very important role in the PIM-SM network, so it is very important to select the appropriate DR. You can select the appropriate device as DR by configuring the DR priority.

Only one DR is allowed in one PIM-SM subnet, which can be divided into source DR and receiving DR according to functionality.

The main function of the source DR is to register the source with RP.

The main function of the receiving DR is to join RP and establish a switch between RPT and SPT.

Table 70-15 Configuring DR Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure DR priority	<b>ip pim dr-priority</b> <i>priority-value</i>	Optional By default, the DR priority is 1

### Note

- DR election is performed based on the following rules:
  - 1、 compare the priorities, the larger the value, the higher the priority, and those with the higher priority win;
  - 2, in the case of the same priority, those with the larger IP address win.

## 70.2.6 Configure PIM-SM SPT switching

### Configuration Condition

Before configuring SPT, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-SM protocol.

### Configure SPT switching conditions

The receiving DR does not know the address of the multicast source, so it can only join RP to form RPT. The source DR will register the source with RP to form the active tree between the source DR and RP. At the beginning, the direction of the multicast stream is from the multicast source to RP, and then from RP to the receiver. When the receiving DR receives the first multicast data packet, it joins the multicast source to form SPT and prunes RPT. This process is called SPT switching.

This command functions to configure SPT switching conditions at the receiving DR.

Table 70-16 Configuring SPT Switching Conditions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure SPT switching conditions	<b>ip pim spt-threshold infinity</b> [ <b>group-list</b> { <i>access-list-number</i>   <i>access-list-name</i> } ] [ <b>vrf vrf-name</b> ]	Mandatory  By default, all multicast groups undergo SPT switching

---

### Caution

- You must not configure SPT on RP to never switch; otherwise, this will cause multicast forwarding to fail.
- 

## 70.2.7 Configure PIM-SSM

PIM-SSM is a subset of PIM-SM. In PIM-SSM, there is no need for RP, BSR, or RPT, and there is no SPT switching. Instead, the receiving DR directly joins the multicast source and establishes the shortest path tree (SPT) rooted on the source.

### Configuration Condition

Before configuring PIM-SSM, do the following:

- Configure the network layer address of the interface so that all neighbor

nodes are reachable at the network layer;

- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Enable the PIM-SM protocol on all interfaces on which multicast routing forwarding is to be carried.

### Configure PIM-SSM

Table 70-17 Configuring PIM-SSM

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure PIM-SSM	<b>ip pim ssm { default   range { access-list-number   access-list-name } } [ vrf vrf-name ]</b>	Mandatory By default, the SSM function is not enabled

---

### Caution

- When using PIM-SSM, ensure that IGMPv3 is enabled on the receiving DR;
  - In the case that the receiver cannot upgrade to IGMPv3, you can use the IGMP SSM Mapping function with PIM-SSM;
  - Ensure that the SSM multicast group address ranges configured on all devices in the domain are consistent, otherwise PIM-SSM may be abnormal.
- 

## 70.2.8 Configure Adaptive Basic Functions of PIM

### Configuration Condition

Before configuring PIM-SDM, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;

## Configure Adaptive Basic Functions of PIM

Table 70–18 Configuring PIM-SDM

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IP multicast forwarding	<b>ip multicast-routing [ vrf vrf-name ]</b>	Mandatory By default, IP multicast forwarding is not enabled
Enter the interface configuration mode	<b>interface interface-name</b>	-
Configure adaptive function of PIM	<b>ip pim sparse-dense-mode</b>	Either-or By default, the adaptive function of PIM are shut down
	<b>ip pim sparse-dense-mode passive</b>	

---

### Note

After the adaptive function of PIM is enabled on the interface, the PIM-SM, PIM-DM, and IGMP protocols will be automatically enabled.

---

## 70.2.9 Configure PIM-SM Control Policy

### Configure Interface Attention for DR State Change

For non-DR, enable L2 multicast forwarding and stop L3 multicast forwarding. DR is not affected.

Table 70–19 Configuring DR Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure DR priority	<b>ip pim drchg-attention</b>	L3 multicast forwarding is on by default

### Configure Interface Suppression for PIM JOIN Packets

Configuring interface requires suppression of PIM JOIN packets.

Table 70-20 Configuring Interface Suppression for PIM JOIN Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Interface Suppression for PIM JOIN Packets	<b>ip pim join-suppression</b>	By default, interface PIM JOIN packets are not suppressed

### 70.2.10 Configure PIM-SM Support (\*, \*, rp)

#### Configuration Condition

Before configuring PIM-SM Support (\*, \*, rp), do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.
- Enable the PIM-SM protocol.

### Enable Support (\*, \*, rp)

Table 70–21 Enabling PIM-SM Protocol Support (\*, \*, rp)

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable PIM-SM support (*, *, rp)	<b>ip pim mbr [vrf vrf-name]</b>	Mandatory By default, support (*, *, rp) is not enabled

## 70.2.11 Configure PIM-SM BFD

### Configuration Condition

Before configuring PIM-SM BFD, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain.

### Configure PIM-SM BFD

Table 70–22 Configuring PIM-SM BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable PIM-SM BFD	<b>ip pim bfd</b>	By default, the PIM-SM BFD function is not enabled

## 70.2.12 PIM-SM Monitoring and Maintaining

Table 70-23 PIM-SM Monitoring and Maintaining

Command	Description
<b>clear ip pim bsr rp-set</b> [ <i>vrf vrf-name</i> ]	Clear RP set information of PIM-SM
<b>clear ip pim mroute</b> [ <i>group-address</i> [ <i>source-address</i> ] ] [ <i>vrf vrf-name</i> ]	Clear multicast routing information of PIM-SM
<b>clear ip pim statistics</b> [ <i>interface interface-name</i>   <i>vrf vrf-name</i> ]	Clear statistics of PIM-SM protocol packets
<b>show ip pim bsr-router</b> [ <i>vrf vrf-name</i> ]	Show PIM-SM bootstrap router information
<b>show ip pim interface</b> [ [ <i>interface-name</i> ] <b>detail</b> ] [ <i>vrf vrf-name</i> ]	Show PIM-SM interface information
<b>show ip pim local-members</b> [ <i>interface-name</i>   <i>vrf vrf-name</i> ]	Show PIM-SM local member information
<b>show ip pim mroute</b> [ <i>ssm</i>   <i>group group-ip-address</i> [ <i>source source-</i>	Show PIM-SM multicast routing table information

Command	Description
<i>ip-address</i> ]   <b>source</b> <i>source-ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	
<b>show ip pim neighbor</b> [ <b>detail</b> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show PIM-SM neighbor information
<b>show ip pim nexthop</b> [ <i>ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show PIM-SM next hop router information
<b>show ip pim rp mapping</b> [ <b>vrf</b> <i>vrf-name</i> ]	Show PIM-SM RP information
<b>show ip pim rp-hash</b> <i>group-address</i> [ <b>vrf</b> <i>vrf-name</i> ]	Show RP information for multicast group mapping
<b>show ip pim statistics</b> [ <b>vrf</b> <i>vrf-name</i> ]	Show statistics of PIM-SM protocol packets

## 70.3 PIM-SM Typical Configuration Example

### 70.3.1 Configure basic functions of PIM-SM

#### Network Requirements

- The PIM-SM protocol runs on the entire network.
- Receiver 1 and Receiver 2 are two receivers of the Device 3 stub network.
- Device 1 and Device 2 are C-BSR and C-RP.
- IGMPv2 runs between Device 3 and the stub network.

#### Network Topology

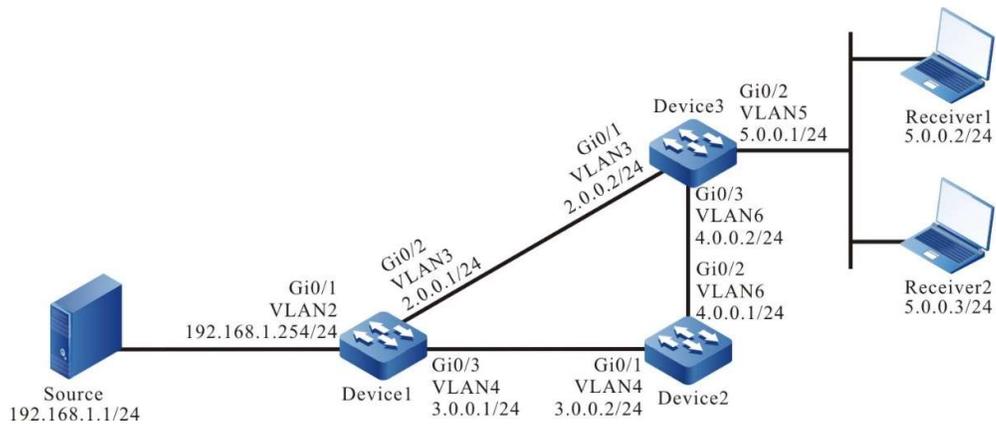

Figure 70-1 Network Topology for Configuring Basic Functions of PIM-SM

### Configuration Steps

- Step 1: Configure IP addresses for the ports. (Omitted)
- Step 2: Enable the unicast routing protocol OSPF, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 192.168.1.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

C 2.0.0.0/24 is directly connected, 14:48:47, vlan3
O 3.0.0.0/24 [110/2] via 2.0.0.1, 14:31:14, vlan3
   [110/2] via 4.0.0.1, 14:31:04, vlan6
C 4.0.0.0/24 is directly connected, 15:36:57, vlan6
C 5.0.0.0/24 is directly connected, 14:09:18, vlan5
O 192.168.1.0/24 [110/2] via 2.0.0.1, 00:30:55, vlan3
```

---

### Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 3: Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

### #Configure Device1.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device1(config)#ip multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ip pim sparse-mode
Device1(config-if-vlan4)#exit
```

### #Configure Device2.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device2(config)#ip multicast-routing
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ip pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan6
Device2(config-if-vlan6)#ip pim sparse-mode
Device2(config-if-vlan6)#exit
```

### #Configure Device3.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device3(config)#ip multicast-routing
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip pim sparse-mode
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan5
Device3(config-if-vlan5)#ip pim sparse-mode
Device3(config-if-vlan5)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ip pim sparse-mode
Device3(config-if-vlan6)#exit
```

#View, for Device 3, interface information with PIM-SM protocol enabled and PIM-SM neighbor information.

```
Device3#show ip pim interface
PIM Interface Table:
PIM VRF Name: Default
Total 3 Interface entries
Total 0 External Interface entry
Total 0 Sparse-Dense Mode Interface entry
```

Address	Interface	VIF Index	Ver/ Mode	VIF Flag	Nbr Count	DR	DR	BSR	CISCO	Neighbor
								Border	Neighbor	Filter
2.0.0.2	vlan3	0	v2/S	UP	1 1	2.0.0.2		FALSE	FALSE	
5.0.0.1	vlan5	2	v2/S	UP	0 1	5.0.0.1		FALSE	FALSE	

```
4.0.0.2    vlan6          3    v2/S  UP  1    1    4.0.0.2    FALSE FALSE
```

```
Device3#show ip pim neighbor
```

```

```
Last member query response interval is 1 seconds
```

```
Last member query count is 2
```

```
Group Membership interval is 260 seconds
```

```
IGMP robustness variable is 2
```

---

## Caution

- After the multicast protocol is configured on the interface, the IGMP function is automatically enabled, and IGMPv2 is run by default. By means of the
-

---

command **ip igmp version** you can configure the version of IGMP that runs on the interface.

---

Step 4: Configure the interface vlan 3 of Device 1 as C-BSR and C-RP, and configure the interface vlan 4 of Device 2 as C-BSR and C-RP.

#### #Configure Device1.

Configure the interface vlan 3 of Device 1 as C-BSR and C-RP. The priority of C-BSR is 200, and the range of multicast groups served by C-RP is 230.0.0.0/8.

```
Device1(config)#ip pim bsr-candidate vlan 3 10 200
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 230.0.0.0 0.255.255.255
Device1(config-std-nacl)#commit
Device1(config-std-nacl)#exit
Device1(config)#ip pim rp-candidate vlan 3 group-list 1
```

#### #Configure Device2.

Configure vlan 4 of Device 2 as C-BSR and C-RP. The priority of C-BSR is 0, and the range of multicast groups served by C-RP of Device2 is 224.0.0.0/4.

```
Device2(config)#ip pim bsr-candidate vlan4
Device2(config)#ip pim rp-candidate vlan4
```

#### #View the BSR and RP information of Device 3

```
Device3#show ip pim bsr-router
PIMv2 Bootstrap information
PIM VRF Name: Default
  BSR address: 2.0.0.1
  BSR Priority: 200
Hash mask length: 10
Up time: 01:03:30
Expiry time: 00:01:46
Role: Non-candidate BSR
State: Accept Preferred

Device3#show ip pim rp mapping
PIM Group-to-RP Mappings Table:
```

PIM VRF Name: Default

Total 2 RP set entries

Total 2 RP entries

Group(s): 224.0.0.0/4

RP count: 1

RP: 3.0.0.2

Info source: 2.0.0.1, via bootstrap, priority 192

Up time: 01:03:29

Expiry time: 00:02:02

Group(s): 230.0.0.0/8

RP count: 1

RP: 2.0.0.1

Info source: 2.0.0.1, via bootstrap, priority 192

Up time: 01:15:50

Expiry time: 00:02:02

---

## Caution

- Device 1 and Device 2 are viewed the same way as Device 3, and the viewing process is omitted;
  - When multiple C-BSRs are configured in one multicast domain, BSR will be elected according to the priority first, and C-BSR with the highest priority will be elected as BSR. When the priorities of the C-BSRs are the same, the C-BSR with the largest ip address is elected as BSR;
  - When multiple C-RPs are configured in one multicast domain and the ranges of multicast groups served are the same, RP corresponding to the multicast group G will be calculated according to the hash algorithm;
  - You can also use the command **ip pim rp-address** in the multicast domain to configure RP, but the static RP addresses configured on all devices in the entire multicast domain must be consistent.
- 

Step 5: Check the result.

#Receiver 1 and Receiver 2 send IGMPv2 membership reports to join the multicast groups 225.1.1.1 and 230.1.1.1, respectively.

#Source sends the multicast service packets of the multicast groups 225.1.1.1 and 230.1.1.1.

#View the multicast membership table on Device 3.

```
Device3#show ip igmp groups

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
  - By default, SPT switching is enabled on the device.
- 

### 70.3.2 Configure PIM-SSM

#### Network Requirements

- The PIM-SSM protocol runs on the entire network.
- Receiver is one receiver of the Device 3 stub network.
- IGMPv3 runs between Device 3 and the stub network.

#### Network Topology

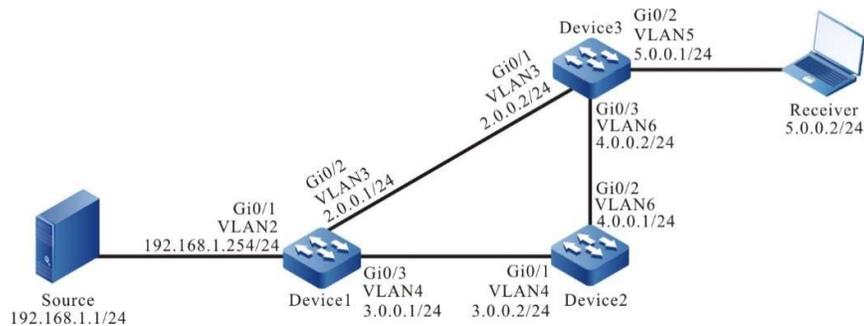

Figure 70-2 Network Topology for Configuring PIM-SSM

#### Configuration Steps

- Step 1: Configure IP addresses for the ports. (Omitted)
- Step 2: Enable the unicast routing protocol OSPF, so that all devices in the network can communicate with each other.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 192.168.1.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

C 2.0.0.0/24 is directly connected, 14:48:47, vlan3
O 3.0.0.0/24 [110/2] via 2.0.0.1, 14:31:14, vlan3
   [110/2] via 4.0.0.1, 14:31:04, vlan6
C 4.0.0.0/24 is directly connected, 15:36:57, vlan6
C 5.0.0.0/24 is directly connected, 14:09:18, vlan5
O 192.168.1.0/24 [110/2] via 2.0.0.1, 00:30:55, vlan3
```

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.

Step 3: Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

#### #Configure Device1.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device1(config)#ip multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ip pim sparse-mode
Device1(config-if-vlan4)#exit
```

#### #Configure Device2.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device2(config)#ip multicast-routing
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ip pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan6
Device2(config-if-vlan6)#ip pim sparse-mode
Device2(config-if-vlan6)#exit
```

#### #Configure Device3.

Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on related interfaces.

```
Device3(config)#ip multicast-routing
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip pim sparse-mode
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan5
```

```

Device3(config-if-vlan5)#ip pim sparse-mode
Device3(config-if-vlan5)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ip pim sparse-mode
Device3(config-if-vlan6)#exit

```

#View, for Device 3, interface information with PIM-SM protocol enabled and PIM-SM neighbor information.

```

Device3#show ip pim interface
PIM Interface Table:
PIM VRF Name: Default
Total 3 Interface entries
Total 0 External Interface entry
Total 0 Sparse-Dense Mode Interface entry

```

		Priority/Mode		
2.0.0.1	vlan3	01:12:00/00:01:39	v2	1 /
4.0.0.1	vlan6	01:13:19/00:01:35	v2	1 /

---

### Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
-

Step 4: Configure PIM-SSM on all devices. The range of multicast groups served by SSM is 232.0.0.0/8. IGMPv3 is run on vlan 5 of Device 3.

#Configure Device1.

```
Device1(config)#ip pim ssm default
```

#Configure Device2.

```
Device2(config)#ip pim ssm default
```

#Configure Device3.

```
Device3(config)#ip pim ssm default
Device3(config)#interface vlan5
Device3(config-if-vlan5)#ip igmp version 3
Device3(config-if-vlan5)#exit
```

#View the IGMP information of the interface vlan 5 of Device 3.

```
Device3#show ip igmp interface vlan5
Interface vlan5 (Index 50332250)
IGMP Enabled, Active, Querier (5.0.0.1)
Configured for version 3

#Receiver can receive the multicast service packet of the multicast group 232.1.1.1 sent by Source.

---

## Note

- Device 1 and Device 2 are viewed the same way as Device 3, and the viewing process is omitted.
  - The default multicast group range of PIM-SSM is 232.0.0.0/8. The range of multicast groups served by PIM-SSM can be modified with the command `ip pim ssm range`.
  - For the multicast group G that meets the SSM conditions, the multicast routing table will not generate entry (\*, G), but only entry (S, G).
- 

### 70.3.3 Configure PIM-SM Multicast Forwarding Control

#### Network Requirements

- The PIM-SM protocol runs on the entire network.
- Receiver is one receiver of the Device 3 stub network.
- Device 2 is C-BSR and C-RP.
- On Device 2 and Device 3, the multicast source is controlled so that Receiver can only receive the multicast service packet sent by Source 1.
- IGMPv2 runs between Device 3 and the stub network.

#### Network Topology

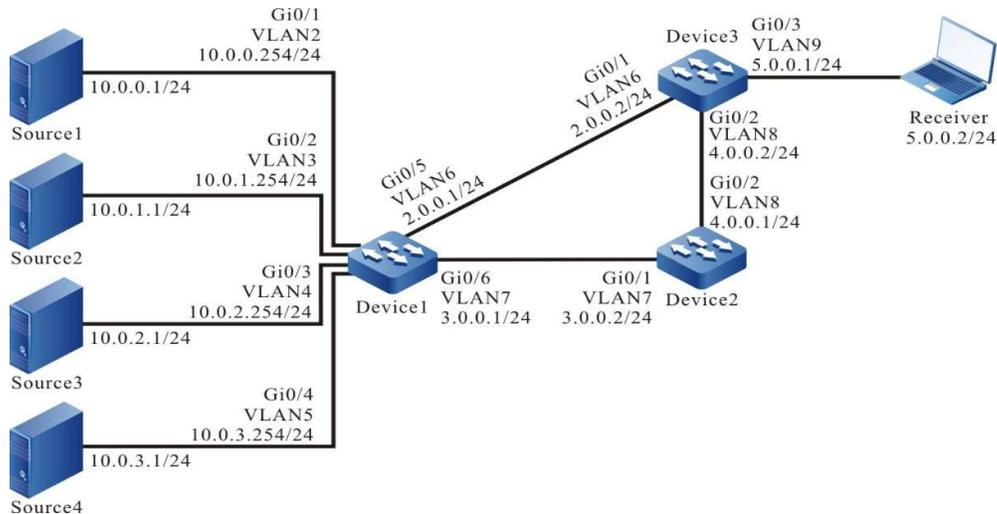

Figure 70-3 Network Topology for Configuring PIM-SM Multicast Forwarding Control

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Enable the unicast routing protocol OSPF, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.0.0.0 0.0.255.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
```

```
Device3(config-ospf)#exit
```

### #Check the routing table of Device3.

```
Device3#show ip route
```

Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management

#Receive can only receive multicast service packets sent by Source 1.

---

## Caution

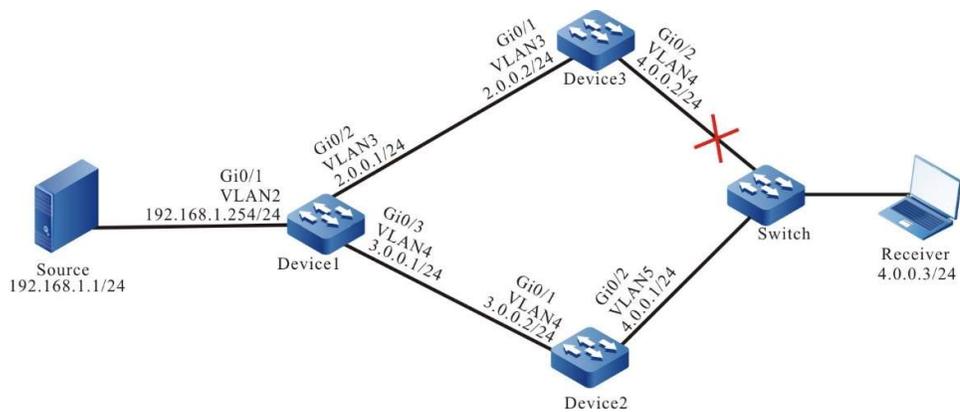

- When performing multicast source control, you are advised to configure multicast source control first and then demand the multicast source. By default, the receiving DR will switch SPTs after receiving the multicast service packet. If the multicast source is demanded before the multicast forwarding control is performed, the multicast forwarding control will not take effect. To prevent the multicast forwarding control from failing, you can configure SPT switching disallowed on the receiving DR.
- 

### 70.3.4 Configure DR Switching Convergence with PIM-SM and BFD Linkage

#### Network Requirements

- The PIM-SM protocol runs on the entire network.
- Device 1 is C-BSR and C-RP.
- Device 2 and Device 3 are located in the stub network where Receiver is located, and Device 3 acts as the receiver DR.
- PIM BFD is enabled on the line between Device 2 and Device 3. When the line between Device 3 and Receiver fails, Device 2 quickly switches to the receiver DR.

#### Network Topology

## 70-4 Network Topology for Configuring DR Switching with PIM-SM and BFD Linkage

### Configuration Steps

Step 1: Configure IP addresses for the interfaces (omitted).

Step 2: Enable the unicast routing protocol OSPF, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 192.168.1.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

C 2.0.0.0/24 is directly connected, 14:48:47, vlan3
O 3.0.0.0/24 [110/2] via 2.0.0.1, 14:31:14, vlan3
   [110/2] via 4.0.0.1, 14:31:04, vlan4
C 4.0.0.0/24 is directly connected, 15:36:57, vlan4
O 192.168.1.0/24 [110/2] via 2.0.0.1, 00:30:55, vlan3
```

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 3: Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

### #Configure Device1.

Enable multicast forwarding globally and enable the multicast protocol PIM-SM on related interfaces.

```
Device1(config)#ip multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ip pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan 4
Device1(config-if-vlan4)#ip pim sparse-mode
Device1(config-if-vlan4)#exit
```

### #Configure Device2.

Enable multicast forwarding globally and enable the multicast protocol PIM-SM on related interfaces.

```
Device2(config)#ip multicast-routing
Device2(config)#interface vlan 4
Device2(config-if-vlan4)#ip pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan 5
Device2(config-if-vlan5)#ip pim sparse-mode
Device2(config-if-vlan5)#exit
```

### #Configure Device3.

Enable multicast forwarding globally and enable the multicast protocol PIM-SM on related interfaces.

```
Device3(config)#ip multicast-routing
Device3(config)#interface vlan 3
Device3(config-if-vlan3)#ip pim sparse-mode
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan 4
Device3(config-if-vlan4)#ip pim sparse-mode
Device3(config-if-vlan4)#exit
```

#View, for Device 3, interface information with PIM-SM protocol enabled and PIM-SM neighbor information.

```
Device3#show ip pim interface
```

PIM Interface Table:

#It is indicated that Device 3 is the receiver DR of the stub network where Receiver is located.

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 4: Configure C-BSR and C-RP.

#Configure Device1.

Configure vlan 2 of Device 1 as C-BSR and C-RP of the entire network. The range of multicast groups served by C-RP is 224.0.0.0/8.

```
Device1(config)#ip pim bsr-candidate vlan 2
Device1(config)#ip pim rp-candidate vlan 2
```

#View the BSR and RP information of Device 3.

```
Device3#show ip pim bsr-router

Up time: 00:00:16
Expiry time: 00:02:14
```

---

## Note

- Device 1 and Device 2 are viewed the same way as Device 3, and the viewing process is omitted.
- 

Step 5: Configure PIM and BFD linkage on Device 2 and Device 3.

#Configure Device2.

```
Device2(config)#interface vlan 5
Device2(config-if-vlan5)#ip pim bfd
Device2(config-if-vlan5)#exit
```

#Configure Device3.

```
Device3(config)#interface vlan 4
Device3(config-if-vlan4)#ip pim bfd
Device3(config-if-vlan4)#exit
```

#View the BFD session information of Device 3.

#It is indicated that after the receiver DR Device 3 fails, the BFD session responds immediately, Device 2 switches to the receiver DR, and multicast service packets are forwarded to Receiver via Device 2.

---

## Note

- BFD and PIM linkage is also applicable to the scenario of Assert election on the shared network segment. When the Assert Winner interface malfunctions, Assert Loser can respond quickly to resume forwarding of multicast packets.
- 

### 70.3.5 Configure RPF Routing Switching Convergence with PIM-SM and BFD

#### Linkage

#### Network Requirements

- The PIM-SM protocol runs on the entire network.
- Device 2 is C-BSR and C-RP.
- The entire network uses OSPF to allow for interaction of unicast routing.
- The PIM BFD and OSPF BFD detection function is enabled on the line between Device 1 and Device 3. After the line fails, BFD can quickly detect the failure and notify the PIM and OSPF protocols, so that the RPF neighbor from Device 3 to the multicast source can be quickly switched to Device 2.

#### Network Topology

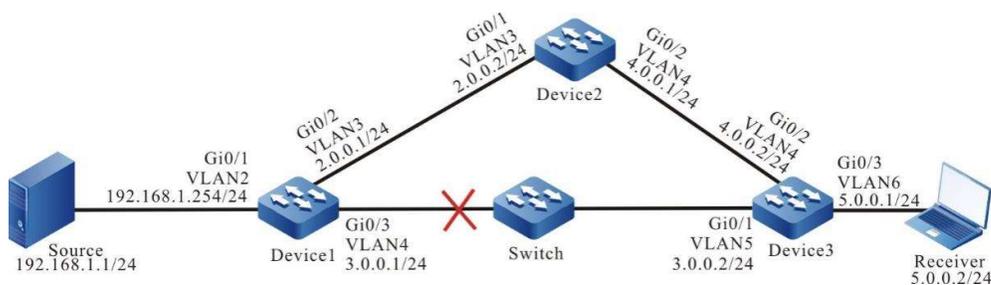

Figure 70-5 Network Topology for Configuring RPF Routing Switching with PIM-SM and BFD Linkage

## Configuration Steps

Step 1: Configure IP addresses for the interfaces (omitted).

Step 2: Enable the unicast routing protocol OSPF, so that all devices in the network can communicate with each other.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 192.168.1.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 5.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

### #View the unicast routing table of Device 3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNRP, B - BGP, i-ISIS

Gateway of last resort is not set

C 3.0.0.0/24 is directly connected, 00:01:40, vlan5
C 4.0.0.0/24 is directly connected, 00:00:46, vlan4
C 5.0.0.0/24 is directly connected, 03:45:18, vlan6
```

- C 127.0.0.0/8 is directly connected, 2d:08:42:01, lo0
- O 192.168.1.0/24 [110/2] via 3.0.0.1, 00:01:29, vlan5
- O 2.0.0.0/24 [110/2] via 4.0.0.1, 00:01:29, vlan4  
[110/2] via 3.0.0.1, 00:01:29, vlan5

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 3: Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

### #Configure Device1.

Enable multicast forwarding globally and enable the multicast protocol PIM-SM on related interfaces.

```
Device1(config)#ip multicast-routing
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ip pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ip pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan 4
Device1(config-if-vlan4)#ip pim sparse-mode
Device1(config-if-vlan4)#exit
```

### #Configure Device2.

Enable multicast forwarding globally and enable the multicast protocol PIM-SM on related interfaces.

```
Device2(config)#ip multicast-routing
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ip pim sparse-mode
Device2(config-if-vlan3)#exit
Device2(config)#interface vlan 4
Device2(config-if-vlan4)#ip pim sparse-mode
Device2(config-if-vlan4)#exit
```

### #Configure Device3.

Enable multicast forwarding globally and enable the multicast protocol PIM-SM on related interfaces.

```
Device3(config)#ip multicast-routing
Device3(config)#interface vlan 4
Device3(config-if-vlan4)#ip pim sparse-mode
Device3(config-if-vlan4)#exit
Device3(config)#interface vlan 6

#It is indicated that the RPF neighbor from Device 3 to the multicast source is Device 2, and the incoming interface for multicast service packets is vlan 4.

---

 **Note**

- Since the RPF routing convergence with PIM and BFD linkage also depends on the convergence speed of unicast routing, BFD also needs to be linked with the related unicast routing protocol OSPF.
-

# 71 MSDP

---

## 71.1 Overview

RP in the PIM-SM network only knows the multicast source information in the multicast domain to which it belongs. However, in practical applications, the entire network is usually divided into multiple multicast domains. In this case, RP in the domain cannot know the multicast source information outside the domain, and the receiver cannot receive multicast data packets from other domains.

MSDP (Multicast Source Discovery Protocol) provides a multicast cross-domain solution. The MSDP mechanism allows for transmission of the multicast source information of the local multicast domain to RP of another multicast domain, and RPs of other multicast domains can join the multicast source of the local multicast domain and establish a multicast distribution tree, thereby allowing for cross-domain transmission of multicast data packets.

## 71.2 MSDP Function Configuration

Table 71-1 MSDP Function Configuration List

Configuration Task	
Configure basic functions of MSDP	Configure MSDP peer
	Shut down MSDP peer
Configure MSDP peer connection	Configure default MSDP peer
	Configure MSDP mesh group
Configure SA packet	Configure SA request packet
	Configure SA packet filtering policy

- 
- The L3 Ethernet interface does not support the MSDP function.
- 

### 71.2.1 Configure MSDP peer

MSDP peer-to-peer connections are established between various multicast domains through MSDP peers to form an "MSDP connected graph" with the domains connected to each other. When the MSDP peer of a certain domain senses a new multicast source, it will encapsulate the new multicast source information in the SA (Source-Active) packet and send it to all remote peers with the MSDP peer-to-peer connections established. After the MSDP peer receives the SA packet, the SA packet that passed an RPF (Reverse Path Forwarding) check will be forwarded. Through the relay between the MSDP peers, the SA packet sent by a certain RP can be transferred to all other RPs, and the multicast source information is finally shared among the multicast domains.

MSDP peers use TCP as their transmission protocol, and use the reliability of TCP to ensure that MSDP protocol packets can be correctly transmitted to the remote peers.

#### Configuration Condition

Before configuring MSDP, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Configure the PIM-SM protocol to implement intra-domain multicast.

#### Configure MSDP peer

The local device establishes an MSDP peer-to-peer connection with the specified remote device, and the remote device must also specify the local end as the MSDP peer to successfully establish the peer-to-peer connection. After the peer-to-peer connection is successfully established, the peers exchange MSDP protocol packets through this connection.

Table 71-2 Configuring MSDP Peer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure MSDP peer	<b>ip msdp [ vrf vrf-name ] peer peer-ip-address [ connect-source interface-name ] [ remote-as as-number-value ]</b>	Mandatory By default, no MSDP peer is configured

---

### Note

- When configuring the first MSDP peer, the MSDP protocol is automatically enabled.
- 

### Shut down MSDP peer

The administrator can use this command to shut down the specified MSDP peer-to-peer connection according to the network needs. After the MSDP peer-to-peer connection is shut down, the exchange of the MSDP protocol packets between the MSDP peers will be stopped.

Table 71-3 Shutting Down MSDP Peer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Shut down MSDP peer	<b>ip msdp [ vrf vrf-name ] shutdown peer-ip-address</b>	Mandatory By default, no MSDP peer is shut down

## 71.2.2 Configure MSDP peer connection

After the device receives an SA packet, it will perform an RPF check. The packet that passed the check will be forwarded to other peers that have established the peer-to-peer connection. If it fails the RPF check, the packet will be dropped.

For the default peers, the mesh group can omit the RPF check for SA packets between the specified peers.

### Configuration Condition

Before configuring MSDP, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Configure the PIM-SM protocol to implement intra-domain multicast;
- Configure MSDP peers.

### Configure default MSDP peer

When specifying the default MSDP peer, you can configure the RP range. When receiving an SA packet from the default peer, if RP in the packet falls within the allowable range, the RPF check will not be performed. Otherwise the RPF check will be performed on RP in the packet.

Table 71-4 Configuring Default MSDP Peer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure default MSDP peer	<b>ip msdp [ vrf vrf-name ] default-peer peer-ip-address [ prefix-list prefix-list-name ]</b>	Mandatory By default, no MSDP default peer is configured

### Configure MSDP mesh group

When the device receives an SA packet from the peer in the group, it directly passes the RPF check and does not forward the SA packet to other peers in the group, but only forwards it to peers outside the group. This can reduce the burden on the device and avoid repeated forwarding of SA packets, thereby saving network bandwidth;

Table 71-5 Configuring MSDP Mesh Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure MSDP mesh group	<b>ip msdp [ vrf vrf-name ] mesh-group mesh-group-name peer-ip-address</b>	Mandatory By default, no peer joins the mesh group

### 71.2.3 Configure SA packet

#### Configuration Condition

Before configuring MSDP, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes within the domain;
- Configure the PIM-SM protocol to implement intra-domain multicast;
- Configure MSDP peers.

#### Configure SA request packet

After the device is configured to send an SA request packet, when the device receives a new multicast group join packet, it will immediately send the SA request packet to the MSDP peer, thereby reducing the delay in joining the multicast group.

Some RPs do not want to be known by receivers of other unrecognized multicast domains. The filtering policy for SA request packets can be configured on all peers in the multicast domain to which the RP belongs, and only SA request packets from the peer allowed by the policy will be responded.

Table 71-6 Configuring SA Request Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to send SA request packet	<b>ip msdp [ vrf vrf-name ] sa-request peer-ip-address</b>	Mandatory By default, when the device receives a new multicast group join packet, it will not send an SA request packet to the MSDP peer, but will wait for the SA packet in the next period
Configure filtering policy for receiving SA request packets	<b>ip msdp [ vrf vrf-name ] filter-sa-request peer-ip-address [ list access-list-number   access-list-name ]</b>	Mandatory By default, SA request packets are not filtered

### Note

- The command **ip msdp filter-sa-request** only supports standard ACL.

### Configure SA packet filtering policy

Generally, the MSDP peer accepts the SA packets from all peers that pass the RPF check, and forward them to all peers outside the mesh group. The user can configure the SA packet filtering policy on peers as needed to control the SA packets from or sent to the specified peer. When receiving or forwarding the SA packet, the device filters the multicast source group and RP of the SA packet.

Table 71-7 Configuring SA Packet Filtering Policy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure SA packet filtering policy	<b>ip msdp [ vrf vrf-name ] sa-filter { in   out } peer-ip-address [ list { access-list-name   access-list-number } ] [ rp-list { access-list-name   access-list-number } ]</b>	Mandatory By default, SA packets are not filtered

### Note

- The parameter **list** of the command **ip msdp sa-filter** only supports extended ACL.
- The parameter **rp-list** of the command **ip msdp sa-filter** only supports standard ACL.

## 71.2.4 MSDP Monitoring and Maintaining

Table 71-8 MSDP Monitoring and Maintaining

Command	Description
<b>clear ip msdp [ vrf vrf-name ] peer [ peer-ip-address ]</b>	Clear MSDP peer information
<b>clear ip msdp [ vrf vrf-name ] sa-cache [ group-ip-address ]</b>	Clear SA cache information
<b>clear ip msdp [ vrf vrf-name ] statistics [ peer-ip-address ]</b>	Clear MSDP peer statistics
<b>show ip msdp [ vrf vrf-name ] count [ as-number-value ]</b>	Show SA information received by MSDP from AS domain

Command	Description
<b>show ip msdp</b> [ vrf <i>vrf-name</i> ] <b>peer</b> [ <i>peer-ip-address</i> [ <b>accepted-SAs</b>   <b>advertised-SAs</b> ] ]	Show MSDP peer information
<b>show ip msdp</b> [ vrf <i>vrf-name</i> ] <b>rpf</b> [ <i>peer-ip-address</i> ]	Show MSDP next hop routing information
<b>show ip msdp</b> [ vrf <i>vrf-name</i> ] <b>sa-cache</b> [ <i>group-ip-address</i> [ <i>source-ip-address</i> ] ] [ <i>as-number-value</i> ]	Show MSDP SA cache information
<b>show ip msdp</b> [ vrf <i>vrf-name</i> ] <b>summary</b>	Show MSDP peer summary

## 71.3 MSDP Typical Configuration Example

### 71.3.1 Configure PIM-SM Inter-domain Multicast

#### Network Requirements

- The entire network includes two autonomous systems: AS100 and AS200. The BGP protocol is run between ASes, and MBGP is used for multicast routing exchanging. The OSPF protocol is run within the AS for routing exchanging.
- The multicast domain PIM-SM1 is located in AS100, and the multicast domain PIM-SM2 is located in AS200. Source is one multicast source of PIM-SM1, and Receiver is one receiver of PIM-SM2.
- Loopback 1 of Device 2 is C-BSR of PIM-SM1, Loopback 0 is C-RP of PIM-SM1, Loopback 1 of Device 3 is C-BSR of PIM-SM2, and Loopback 0 is C-RP of PIM-SM2.
- An MSDP peer-to-peer connection is established between Device 2 and Device 3 to allow for the cross-domain forwarding of multicast service packets, so that Receiver can receive the multicast service packets sent by Source.

#### Network Topology

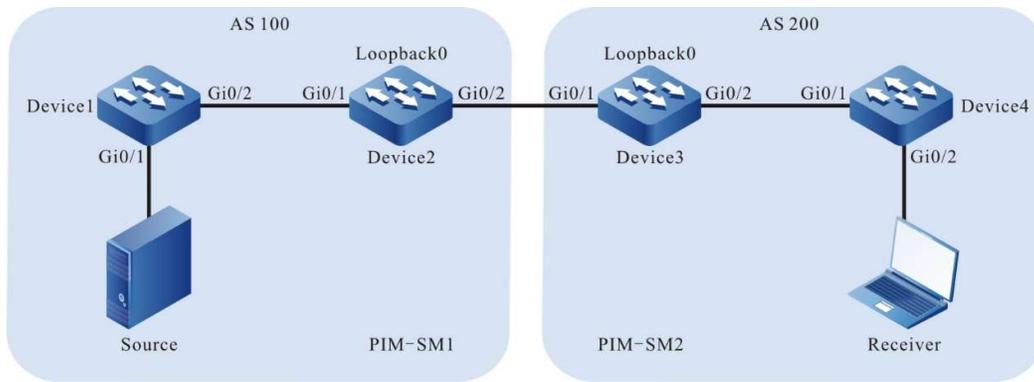

Figure 71-1 Network Topology for Configuring PIM-SM Inter-domain Multicast

of equipment	Interface	VLAN	IP address
Device1	Gi0/1	2	10.1.1.1/24
	Gi0/2	3	10.1.2.1/24
Device2	Gi0/1	3	10.1.2.2/24
	Gi0/2	4	10.1.3.1/24
	Loopback0		11.11.11.11/32
	Loopback1		12.12.12.12/32

	Gi0/2	5	10.1.4.1/24
	Loopback0		22.22.22.22/32
	Loopback1		23.23.23.23/32
Device4	Gi0/1	5	10.1.4.2/24
	Gi0/2	6	10.1.5.1/24
Source			10.1.1.2/24

## Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF so that all devices in each AS domain can communicate with each other.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100

```

```
O 23.23.23.23/32 [110/2] via 10.1.4.1, 01:19:33, vlan5
```

It is indicated that Device 1 and Device 4 have only learned the routing of their AS domains.

---

### Note

- Device 2 and Device 3 are viewed the same way as Device 1, and Device 4, and the viewing process is omitted.
- 

Step 4: Enable multicast forwarding globally, enable the multicast protocol PIM-SM on the interfaces, and configure C-BSR and C-RP.

#Configure Device 1. Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

```
Device1(config)#ip multicast-routing
```

```
Device1(config)#interface vlan 2
```

```
Device1(config-if-vlan2)#ip pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ip pim sparse-mode
Device1(config-if-vlan3)#exit
```

**#Configure Device 2. Enable multicast forwarding globally, enable the multicast protocol PIM-SM on the interfaces, and configure Loopback 1 as C-BSR, Loopback 0 as C-RP. The range of multicast groups served by C-RP is 224.0.0.0/4.**

```
Device2(config)#ip multicast-routing
Device2(config)#interface loopback 0
Device2(config-if-loopback0)#ip pim sparse-mode
Device2(config-if-loopback0)#exit
Device2(config)#interface loopback 1
Device2(config-if-loopback1)#ip pim sparse-mode
Device2(config-if-loopback1)#exit

Expiry time: 00:01:58

It is indicated that only the BSR and RP information of the multicast domain to which they belong are present on Device 4 and Device 1.

---

### Note

- Device 2 and Device 3 are viewed the same way as Device 1, and Device 4, and the viewing process is omitted.
- 

Step 5: Configure MP-EBGP. A directly connected EBGP peer is established between Device 2 and Device 3, and multicast routing is exchanged using MBGP.

#Configure Device 2. Configure the EBGP peer directly connected with Device 3, enable Multicast address family, and advertise multicast routing.

```
Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 10.1.3.2 remote-as 200
Device2(config-bgp)#address-family ipv4 multicast
Device2(config-bgp-af)#network 10.1.1.0 255.255.255.0
Device2(config-bgp-af)#network 11.11.11.11 255.255.255.255
```

```

Device2(config-bgp-af)#neighbor 10.1.3.2 activate
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit

```

#Configure Device 3. Configure the EBGp peer directly connected with Device 2, enable Multicast address family, and advertise multicast routing.

```

Device3(config)#router bgp 200
Device3(config-bgp)#neighbor 10.1.3.1 remote-as 100
Device3(config-bgp)#address-family ipv4 multicast
Device3(config-bgp-af)#network 10.1.5.0 255.255.255.0
Device3(config-bgp-af)#network 22.22.22.22 255.255.255.255
Device3(config-bgp-af)#neighbor 10.1.3.1 activate
Device3(config-bgp-af)#exit-address-family
Device3(config-bgp)#exit

```

#View the BGP neighbor state of Device 3.

```

Device3#show ip bgp summary
BGP router identifier 22.22.22.22, local AS number 200
BGP table version is 2
2 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
10.1.3.1     4 100   114    111     2    0   00:35:00   0

Total number of neighbors 1

```

From the case where the content of the State/PfxRcd column is displayed as a digit (from the number of unicast routing prefixes received by the neighbor), It is indicated that Device 3 and Device 2 successfully established the BGP neighbor.

#View the BGP Multicast routing table of Device 3.

```

Device3#show bgp ipv4 multicast
BGP table version is 9, local router ID is 22.22.22.22
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network        Next Hop        Metric LocPrf Weight Path
[B]*> 10.1.1.0/24  10.1.3.1         2         0 100 i
[B]*> 10.1.5.0/24  10.1.4.2         2        32768 i
[B]*> 11.11.11.11/32  10.1.3.1         0         0 100 i

```

```
[B]*> 22.22.22.22/32 0.0.0.0 0 32768 i
```

It is indicated that Device 3 has learned Source and RP routing of the multicast domain PIM-SM1, and the next hop is the MSDP peer 10.1.3.1.

---

 **Note**

- Device 2 is viewed the same way as Device 3, and the viewing process is omitted.
- 

Step 6: Configure MSDP.

#Configure Device 2. Configure a MSDP peer-to-peer connection that is directly connected to Device 3; enable the function of actively sending the SA request packet to the specified peer; configure to use RFC3618 rules to perform the RPF check on MSDP packets.

```
Device2(config)#ip msdp peer 10.1.3.2 remote-as 200
```

```
Device2(config)#ip msdp sa-request 10.1.3.2
```

```
Device2(config)#ip msdp rpf rfc3618
```

#Configure Device 3. Configure a MSDP peer-to-peer connection that is directly connected to Device 2; enable the function of actively sending the SA request packet to the specified peer; configure to use RFC3618 rules to perform the RPF check on MSDP packets.

```
Device3(config)#ip msdp peer 10.1.3.1 remote-as 100
```

```
Device3(config)#ip msdp sa-request 10.1.3.1
```

```
Device3(config)#ip msdp rpf rfc3618
```

#View the MSDP peer-to-peer connection status and details of Device 3.

```
Device3#show ip msdp summary
```

```
MSDP Peer Status Summary
```

```
Total 1 Peer entry
```

```
Peer Address AS State Reset Uptime/Downtime
```

```
10.1.3.1 100 Up 0 02:21:18
```

```
Device3#show ip msdp peer
```

```
MSDP Peer Table:
```

```
Total 1 Peer entry
```

```
MSDP Peer 10.1.3.1, AS 100 (configured AS)
```

```
Connection status:
```

```

State: Established, Resets: 0, Connection source: none configured
Uptime(Downtime): 02:50:00, Message sent/received: 136/161
Connection and counters cleared 02:13:25 ago
Local Address of connection: 10.1.3.2
Remote Address of connection: 10.1.3.1
Local Port: 639, Remote Port: 1179
SA-Requests:
Input filter: none
Sending SA-Requests to peer: enabled
SA:
Input filter: none
Message counters:
RPF Failure count: 0
SA Messages in/out: 47/0
SA Requests in/out: 0/3
SA Responses in/out: 3/0
Data Packets in/out: 0/0

```

It is indicated that Device 3 and Device 2 have successfully established the MSDP peer-to-peer connection.

---

### Note

- Device 2 is viewed the same way as Device 3, and the viewing process is omitted.
- 

Step 7: Check the result.

#Receiver sends an IGMPv2 member report to join the multicast group 225.1.1.1. Source sends the multicast service packet of the multicast group 225.1.1.1.

#View the multicast membership table on Device 4.

```

Device4#show ip igmp groups
IGMP Connected Group Membership
Total 1 groups

```

Group Address	Interface	Uptime	Expires	Last Reporter	V1 Expires	V2 Expires
225.1.1.1	vlan6	00:05:11	00:02:38	10.1.5.2	stopped	

#View the MSDP SA cache information of Device 2.

```
Device2#show ip msdp sa-cache
MSDP Source-Active Cache - 1 entries
(10.1.1.2, 225.1.1.1), RP 11.11.11.11, Originated, 00:11:45/00:05:39
```

It is indicated that the SA packet is generated and cached on Device 2. In the SA packet, the multicast source address is 10.1.1.2, the multicast group address is 225.1.1.1, and the RP address is 11.11.11.11.

#View the MSDP SA cache information and RPF checklist of Device 3.

```
Device3#show ip msdp sa-cache
MSDP Source-Active Cache - 1 entries
(10.1.1.2, 225.1.1.1), RP 11.11.11.11, Recv From Peer 10.1.3.1, 00:08:39/00:05:21
```

```
Device3#show ip msdp rpf
Destination  Nexthop      Nexthop      Nexthop Metric Pref
Address      Address      From          RefCnt
10.1.3.1     0.0.0.0     0.0.0.0      1   10   0
11.11.11.11 10.1.3.1    10.1.3.1     1   0   20
```

It is indicated that Device 3 has received and cached the SA packet. The SA packet came from the peer 10.1.3.1. In the packet, the multicast source address is 10.1.1.2, the multicast group address is 225.1.1.1, and the RP address is 11.11.11.11. The next hop on the best path for Device 3 to reach the source RP (11.11.11.11) is 10.1.3.1.

#View the PIM-SM multicast routing table of Device 3.

## Note

- Device 2 is viewed the same way as Device 3, and the viewing process is omitted.
- 

### 71.3.2 Configure Anycast RP

#### Network Requirements

- The PIM-SM protocol runs on the entire PIM multicast domain.
- Loopback 0 interface of Device 3 is C-BSR, and Loopback 1 interface of each of Device 2 and Device 4 is C-RP and has the same IP address.
- Use the IP address of Loopback 0 to establish the MSDP peer-to-peer connection between Device 2 and Device 4.
- Configure multiple RPs with the same address in the domain. Non-RP devices will select the nearest RP for multicast source and receiver management. These RPs exchange multicast source information through MSDP, allowing for interaction of the multicast services of the entire multicast domain. If there is a problem with one RP, its management area will be shared by other RPs.

#### Network Topology

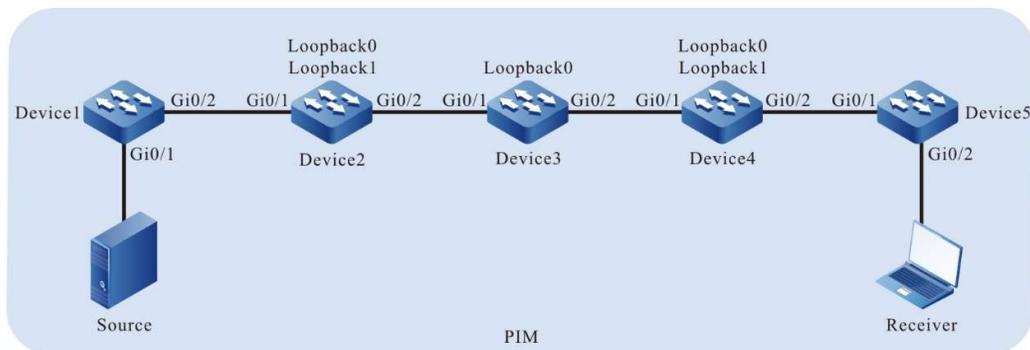

Figure 71-2 Network Topology for Configuring Anycast RP

of equipment	Interface	VLAN	IP address
Device1	Gi0/1	2	10.1.1.1/24
	Gi0/2	3	10.1.2.1/24
Device2	Gi0/1	3	10.1.2.2/24

Source	-		10.1.1.2/24

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF so that all devices in the network can communicate with each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device2(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device2(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
Device2(config-ospf)#network 55.55.55.55 0.0.0.0 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device3(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
Device3(config-ospf)#network 44.44.44.44 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router ospf 100
Device4(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
Device4(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
Device4(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
Device4(config-ospf)#network 55.55.55.55 0.0.0.0 area 0
Device4(config-ospf)#exit
```

#### #Configure Device5.

```
Device5#configure terminal
Device5(config)#router ospf 100
Device5(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
```

```
Device5(config-ospf)#network 10.1.6.0 0.0.0.255 area 0
```

```
Device5(config-ospf)#exit
```

#View the routing table of Device5.

```

---

## Note

- Device 1, Device 2, Device 3 and Device 4 are viewed the same way as that for Device 5, and the viewing process is omitted.
- 

Step 4: Enable multicast forwarding globally, enable the multicast protocol PIM-SM on the interfaces, and configure C-BSR and C-RP.

#Configure Device 1. Enable multicast forwarding globally, and enable the multicast protocol PIM-SM on the interfaces.

```
Device1(config)#ip multicast-routing
```

```
Device1(config)#interface vlan 2
```

```
Device1(config-if-vlan2)#ip pim sparse-mode
```

```
Device1(config-if-vlan2)#exit
```

```
Device1(config)#interface vlan 3
```

```
Device1(config-if-vlan3)#ip pim sparse-mode
```

```
Device1(config-if-vlan3)#exit
```

#Configure Device 2. Enable multicast forwarding globally, enable the multicast protocol PIM-SM on the interfaces, and configure Loopback 1 as C-RP. The range of multicast groups served by C-RP is 224.0.0.0/4.

```
Device2(config)#ip multicast-routing
Device2(config)#interface loopback0
Device2(config-if-loopback0)#ip pim sparse-mode
Device2(config-if-loopback0)#exit
Device2(config)#interface loopback1
Device2(config-if-loopback1)#ip pim sparse-mode
Device2(config-if-loopback1)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ip pim sparse-mode
Device2(config-if-vlan3)#exit
Device2(config)#interface vlan 4
Device2(config-if-vlan4)#ip pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#ip pim rp-candidate loopback1
```

#Configure Device 3. Enable multicast forwarding globally, enable the multicast protocol PIM-SM on the interfaces, and configure Loopback 0 as C-BSR.

```
Device3(config)#ip multicast-routing
Device3(config)#interface loopback0
Device3(config-if-loopback0)#ip pim sparse-mode
Device3(config-if-loopback0)#exit
Device3(config)#interface vlan 4
Device3(config-if-vlan4)#ip pim sparse-mode
Device3(config-if-vlan4)#exit
Device3(config)#interface vlan 5
Device3(config-if-vlan5)#ip pim sparse-mode
Device3(config-if-vlan5)#exit
Device3(config)#ip pim bsr-candidate loopback0
```

#Configure Device 4. Enable multicast forwarding globally, enable the multicast protocol PIM-SM on the interfaces, and configure Loopback 1 as C-RP. The range of multicast groups served by C-RP is 224.0.0.0/4.

```
Device4(config)#ip multicast-routing
Device4(config)#interface loopback0
Device4(config-if-loopback0)#ip pim sparse-mode
```

```

Device4(config-if-loopback0)#exit
Device4(config)#interface loopback1
Device4(config-if-loopback1)#ip pim sparse-mode
Device4(config-if-loopback1)#exit
Device4(config)#interface vlan 5
Device4(config-if-vlan5)#ip pim sparse-mode

---

### Note

- Device 1, Device 2, Device 3 and Device 4 are viewed the same way as that for Device 5, and the viewing process is omitted.
- 

Step 5: Configure MSDP.

#Configure Device 2. Configure to establish a non-direct MSDP peer-to-peer connection with Loopback 0 of Device 4 via Loopback 0; enable the function of actively sending the SA request packet to the specified peer; configure the RP address in the SA packet as the IP address of Loopback 0; configure the use of RFC3618 rules to perform the RPF check on MSDP packets.

```
Device2(config)#ip msdp peer 22.22.22.22 connect-source loopback0
Device2(config)#ip msdp sa-request 22.22.22.22
Device2(config)#ip msdp originator-id loopback0
Device2(config)#ip msdp rpf rfc3618
```

#Configure Device 4. Configure to establish a non-direct MSDP peer-to-peer connection with Loopback 0 of Device 2 via Loopback 0; enable the function of actively sending the SA request packet to the specified peer; configure the RP address in the SA packet as the IP address of Loopback 0; configure the use of RFC3618 rules to perform the RPF check on MSDP packets.

```
Device4(config)#ip msdp peer 11.11.11.11 connect-source loopback0
Device4(config)#ip msdp sa-request 11.11.11.11
Device4(config)#ip msdp originator-id loopback0
Device4(config)#ip msdp rpf rfc3618
```

#View the MSDP peer-to-peer connection status and details of Device 4.

```
Device4#show ip msdp summary
MSDP Peer Status Summary
Total 1 Peer entry
Peer Address  AS   State  Reset  Uptime/Downtime
11.11.11.11  ?   Up     0      05:49:35

Device4#show ip msdp peer
MSDP Peer 11.11.11.11, AS ?
Connection status:
State: Established, Resets: 0, Connection source: loopback0
Uptime(Downtime): 05:49:39, Message sent/received: 352/528
Connection and counters cleared 05:53:24 ago
Local Address of connection: 22.22.22.22
Remote Address of connection: 11.11.11.11
Local Port: 639, Remote Port: 1053
SA-Requests:
Input filter: none
Sending SA-Requests to peer: enabled
SA:
```

```
Input filter: none
Message counters:
RPF Failure count: 3
SA Messages in/out: 348/0
SA Requests in/out: 0/3
SA Responses in/out: 2/0
Data Packets in/out: 0/0
```

It is indicated that Device 4 and Device 2 have successfully established the MSDP peer-to-peer connection.

---

### Note

- Device 2 is viewed the same way as Device 4, and the viewing process is omitted.
- 

Step 6: Check the result.

#Source sends the multicast service packet of the multicast group 225.1.1.1.

#View the MSDP SA cache information of Device 2.

```
Device2#show ip msdp sa-cache
MSDP Source-Active Cache - 1 entries
(10.1.1.2, 225.1.1.1), RP 55.55.55.55, Originated, 00:03:34/00:05:43
```

It is indicated that the SA packet is generated and cached on Device 2. In the SA packet, the multicast source address is 10.1.1.2, the multicast group address is 225.1.1.1, and the RP address is 55.55.55.55.

#View the MSDP SA cache information and RPF checklist of Device 4.

```
Device4#show ip msdp sa-cache
MSDP Source-Active Cache - 1 entries
(10.1.1.2, 225.1.1.1), RP 11.11.11.11, Recv From Peer 11.11.11.11, 00:07:02/00:05:58
```

```
Device4#show ip msdp rpf
Destination  Nexthop    Nexthop    Nexthop Metric Pref
Address      Address     From        RefCnt
10.1.4.1     0.0.0.0    0.0.0.0     1    10    0
```

```
11.11.11.11  10.1.4.1  55.55.55.55  3  3  110
55.55.55.55  0.0.0.0  0.0.0.0  2  1  0
```

It is indicated that Device 4 has received and cached the SA packet. This SA packet came from the peer 11.11.11.11. In the packet, the multicast source address is 10.1.1.2, the multicast group address is 225.1.1.1, and the RP address is 11.11.11.11.

---

## Note

- If **ip msdp originator-id** is configured on the source RP, it replaces the RP address in the SA packet with the IP address of the specified interface when sending the SA packet to the MSDP peer.
- 

#View the PIM-SM multicast routing table of Device 2.

```
Device2#show ip pim mroute
IP Multicast Routing Table:
PIM VRF Name: Default
Total 0 (*,*,RP) entry
Total 0 (*,G) entry
Total 1 (S,G) entry
Total 1 (S,G,rpt) entry
Total 0 FCR entry

It is indicated that there is entry (\*,225.1.1.1) on Device 4, and there is no entry (\*,225.1.1.1) on Device 2, indicating that Receiver initiates a PIM-SM join to the nearest RP, Device 4.

#Receiver can only receive the multicast service packet of the multicast group 225.1.1.1 sent by Source.

# 72 MLD

---

## 72.1 Overview

MLD is the abbreviation of Multicast Listener Discovery Protocol. It is used to establish and maintain multicast group membership between an IPv6 host and multicast devices directly adjacent thereto. The MLD router uses the IPv6 unicast link local address as the source address to send MLD packets.

MLD uses ICMPv6 (Internet Control Message Protocol for IPv6) packet type. All MLD packets are restricted to the local link with a hop count of 1.

There are 2 versions of MLD, MLDv1 corresponds to IGMPv2, and MLDv2 corresponds to IGMPv3. Unlike the IGMP protocol that uses the packet type of IP protocol number 2, the MLD protocol uses the ICMPv6 (IP protocol number 58) packet type, including MLD query packet (type value 130), MLDv1 report packet (type value 131), MLDv1 leave packet (type value 132) and MLDv2 report packet (type value 143). Except for the different packet formats, the MLD protocol and the IGMP protocol have exactly the same protocol behavior.

## 72.2 MLD Function Configuration

### 72.2.1 Configure Basic Functions of MLD

#### Configuration Condition

Before configuring the basic functions of MLD, do the following:

- Configure interface IPv6 enable.
- Configure interface MLD enable.

#### Enable MLD Protocol

Table 72-1 Enabling MLD Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable IPv6 multicast forwarding	<b>ipv6 multicast-routing</b> [ <i>vrf vrf-name</i> ]	Mandatory By default, IPv6 multicast forwarding is not enabled
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable MLD Protocol	<b>ipv6 mld enable</b>	Mandatory By default, MLD is not enabled. All MLD-related configurations can only take effect after MLD is enabled

### Configure MLD Version

Table 72-2 Configuring MLD Version

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure MLD Version	<b>ipv6 mld version</b> <i>version-number</i>	Mandatory By default, the MLD version is 2

---

 **Note**

- Because the packet structures and types of different versions of MLD protocol are different, it is recommended that all devices on the same subnet be configured with the same version of MLD.
- 

### Configure static group joining

After the certain static group or source group is configured on the interface, the device considers that there are receivers of this multicast group or source group on the interface.

Table 72–3 Configuring Static Group Joining

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure static group joining	<b>ipv6 mld static-group</b> <i>group-ipv6-address</i> [ <i>source-ipv6-address</i> ]	Mandatory By default, the interface does not statically join any multicast group or source group

### Configure multicast group filter

The interface configured with the MLD multicast group filter will filter the group membership reports in that network segment according to the ACL rules. Only the group membership reports allowed by the ACL will be processed, and those that are not allowed will be dropped. For the existing multicast group that is not allowed by the ACL, the information of this multicast group will be deleted immediately.

Table 72–4 Configuring Multicast Group Filter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure MLD multicast group filter	<b>ipv6 mld access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, no multicast group filter is configured

---

### Note

- The command `ipv6 mld access-group` only supports extended ACL.
- 

## 72.2.2 Adjust and Optimize MLD Network

### Configuration Condition

Before adjusting and optimizing the MLD network, do the following:

- Enable the IPv6 protocol.
- Enable the MLD protocol.

### Configure Query Interval of General Group

MLD querier periodically sends the query packets of the general group to maintain the group membership. The interval of sending the MLD general group query packets can be modified according to the actuality of the network.

Table 72-5 Configure Query Interval of General Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Query Interval of General Group	<b>ipv6 mld query-interval</b> <i>interval-value</i>	Optional By default, the interval of sending the MLD general group query packets is 125 seconds

---

### Note

- The value of the general query interval of the devices on the same network segment should be kept as consistent as possible.
  - The query interval of the general group should be larger than the maximum response time. Otherwise, the configuration cannot succeed
- 

### Configure robustness variable

Table 72–6 Configuring Robustness Variable

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
configuration mode		
Configure robustness variable	<b>ipv6 mld robustness-variable</b> <i>variable-value</i>	Optional By default, the robustness variable of the MLD querier is 2

### Note

- After configuring the robustness variable, the following parameters will also vary as the robustness parameter varies:
  1. group member timeout = robustness variable \* general group query time + maximum response time;
  2. other querier timeout = robustness variable \* general group query time + maximum response time / 2;

### Configure Max. Response Time

The general group query packet sent by the MLDv1 querier contains the maximum response time field. The receiver sends the membership report packet within the maximum response interval. If the receiver does not send the group membership report within the maximum response time interval, the device considers that this subnet does not have a receiver for this multicast group and immediately deletes the multicast group information.

Table 72-7 Configure Maximum Response Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure Max. Response Time	<b>ipv6 mld query-max-response-time</b> <i>seconds</i>	Optional By default, the maximum response time for MLD general group query is 10 seconds

### Configure specified group query

When the MLD querier receives the leave packet of the certain multicast group, it sends the specified group query packet "specified group query count" times to query this network segment for the multicast group, so as to learn whether the subnet has the members of the multicast group. If not receiving the membership report on the multicast group after waiting for "max response time", delete the information of the multicast group.

Table 72–8 Configuring Specified Group Query

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Query Interval of Specified Group	<b>ipv6 mld last-member-query-interval</b> <i>interval-value</i>	Optional By default, the interval of sending the specified group query packets is 1 second
Configure specified group query count	<b>ipv6 mld last-member-query-count</b> <i>count-value</i>	Optional By default, the count of sending the specified

Step	Command	Description
		group query packets is 2

### Configure Fast Leave

Only one host is connected to the stub segment of the network to frequently switch the multicast groups. To reduce the leave delay, you can configure the multicast group fast leave on the device.

If the device receives the leave packet of one multicast group after configuring fast leave, the device checks whether the multicast group is within the fast leave range. If yes, the device does not send the specified group query packet within the network segment any more and the information of the multicast group is deleted at once.

Table 72-9 Configuring Fast Leave

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the range of fast leave from the multicast group	<b>ipv6 mld immediate-leave</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, fast leave from the multicast group is not allowed.

## 72.2.3 Configure MLD SSM Mapping

### Configuration Condition

Before configuring IGMP SSM mapping, do the following:

- Enable IPv6

- Enable the MLD protocol.

### Configure MLD SSM Mapping

In the IPv6 PIM-SSM network, you can configure the MLD SSM mapping (MLD SSM Mapping) function on the device, in order to provide IPv6 PIM-SSM services to receivers that do not support MLDv2.

The user can configure MLD SSM mapping rules according to the needs of the network receivers. The group membership reports allowed by the rules are converted into MLD non-(IS\_EX, TO\_EX) membership reports, and the multicast source address is the source address specified by the MLD SSM mapping rules.

Table 72-10 Configuring MLD SSM Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable MLD SSM Mapping	<b>ipv6 mld ssm-map enable</b>	Mandatory By default, MLD SSM Mapping is not enabled
Configure MLD SSM Mapping rules	<b>ipv6 mld ssm-map static</b> <i>{ access-list-number   access-list-name }</i> <i>source-ipv6-address</i>	Mandatory By default, there are no MLD SSM Mapping rules

---

### Note

- The command `ipv6 mld ssm-map static` only supports extended ACL.
-

## 72.2.4 MLD Monitoring and Maintaining

Table 72-11 MLD Monitoring and Maintaining

Command	Description
<b>clear ipv6 mld group</b> [ <i>group-ipv6-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ] [ <i>interface-name</i> ]	Clear MLD multicast group information
<b>clear ipv6 mld statistic interface</b> <i>interface-name</i>	Clear MLD packet statistics on the interface
<b>show ipv6 mld groups</b> [ [ <b>static</b> ]   [ <i>interface-name</i> ] [ <i>group-ipv6-address</i> ] [ <b>detail</b> ] ] [ <b>vrf</b> <i>vrf-name</i> ]	Show MLD multicast group information
<b>show ipv6 mld interface</b> [ <i>interface-name</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show interface MLD information
<b>show ipv6 mld statistic interface</b> <i>interface-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	Show statistics of MLD packets

## 72.3 MLD Typical Configuration Example

### 72.3.1 Configure Basic Functions of MLD

#### Network Requirements

- The IPv6 PIM-SM protocol runs on the entire network.
- Device 1, Device 2, and Receiver are in the same LAN, and Device 1 is the querier.
- Receiver is one receiver of the Device 1 and Device 2 stub network.
- MLDv2 runs between the Device 1 and Device 2 and the stub network.

#### Network Topology

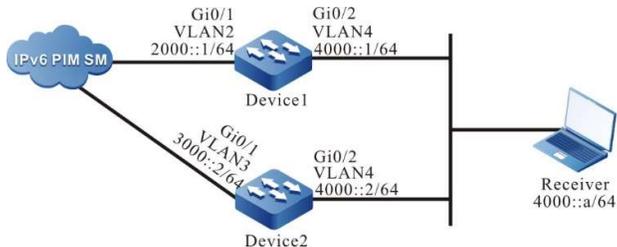

Figure 72-1 Network Topology for Configuring Basic Functions of MLD

### Configuration Steps

- Step 1: Configure VLANs, and add the port to the corresponding VLAN (omitted).
- Step 2: Configure the IPv6 address of each interface (omitted).
- Step 3: Enable IPv6 multicast forwarding globally, enable the multicast protocol IPv6 PIM-SM on each interface, and enable MLD on the interface connecting Device 1 and Device 2 to Receiver.

#### #Configure Device1.

Enable IPv6 multicast forwarding globally, enable the multicast protocol IPv6 PIM-SM on related interfaces, and enable MLD on the interface connecting to Receiver.

```
Device1#configure terminal
Device1(config)#ipv6 multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 pim sparse-mode
Device1(config-if-vlan4)#ipv6 mld enable
Device1(config-if-vlan4)#exit
```

#### #Configure Device2.

Enable IPv6 multicast forwarding globally, enable the multicast protocol IPv6 PIM-SM on related interfaces, and enable MLD on the interface connecting to Receiver.

```
Device2#configure terminal
Device2(config)#ipv6 multicast-routing
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 pim sparse-mode
Device2(config-if-vlan3)#exit
```

```
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ipv6 pim sparse-mode
Device2(config-if-vlan4)#ipv6 mld enable
Device2(config-if-vlan4)#exit
```

Step 4: Check the result.

#View the MLD version information and querier election result of Device 1 interface vlan 4.

```
Device1#show ipv6 mld interface vlan4
Interface vlan4 (Index 23)
MLD Enabled, Active
Querier: fe80::201:2ff:fe03:406 (Self)
Default version: 2
Querier parameter:
  Query interval is 125 seconds
  Querier timeout is 255 seconds
  Query response time is 10 seconds
  Last member query response interval is 1 seconds
  Last member query count is 2
  Group Membership interval is 260 seconds
  Robustness variable is 2
```

#View the MLD version information and querier election result of Device 2 interface vlan 4.

```
Device2#show ipv6 mld interface vlan4
Interface vlan4 (Index 50331674)
MLD Enabled, Active
Querier: fe80::201:2ff:fe03:406
Non-Querier: fe80::201:7aff:febc:662b Expires: 00:04:07
Default version: 2
Querier parameter:
  Query interval is 125 seconds
  Querier timeout is 255 seconds
  Query response time is 10 seconds
  Last member query response interval is 1 seconds
  Last member query count is 2
  Group Membership interval is 260 seconds
  Robustness variable is 2
```

#Receiver sends an MLDv2 membership report to join the multicast group FF1E::1.

#View the multicast membership table of Device 1.

```

Device1#show ipv6 mld groups
MLD Connected Group Membership
Total 1 Connected Groups
Group          Interface    Uptime    Expires V1-Expires Last Reporter
ff1e::1       vlan4        00:00:02  00:04:17 not used  fe80::b

```

#View the multicast membership table of Device 2.

```

Device2#show ipv6 mld groups
MLD Connected Group Membership
Total 1 Connected Groups
Group          Interface    Uptime    Expires V1-Expires Last Reporter
ff1e::1       vlan4        00:00:02  00:04:17 not used  fe80::b

```

---

## Note

- The interface runs the MLDv2 version by default, which is compatible with MLDv1 membership reports and MLDv1 member leave packets. By means of the command `ipv6 mld version` you can configure the version of IGMP that runs on the interface.
  - When multiple devices in the same LAN run MLD, the election of MLD queriers will be performed, and one with the smaller Link-Local address is elected as the IGMP querier of this LAN.
- 

## 72.3.2 Configure MLD Static Group Joining

### Network Requirements

- The IPv6 PIM-SM protocol runs on the entire network.
- Receiver is one receiver of Device stub network.
- MLDv2 runs between Device and the stub network.
- Interface vlan 3 of Device joins the multicast group FF1E::1 in a static way.

### Network Topology

Figure 72-2 Network Topology for Configuring MLD Static Group Joining

### Configuration Steps

- Step 1: Configure VLANs, and add the port to the corresponding VLAN (omitted).
- Step 2: Configure the IPv6 address of each interface (omitted).
- Step 3: Enable IPv6 multicast forwarding globally, enable the multicast protocol IPv6 PIM-SM on each interface, and enable MLD on the interface connecting to Receiver.

#### #Configure Device.

Enable IPv6 multicast forwarding globally, enable the multicast protocol IPv6 PIM-SM on related interfaces, and enable MLD on the interface connecting to Receiver.

```
Device#configure terminal
Device(config)#ipv6 multicast-routing
Device(config)#interface vlan2
Device(config-if-vlan2)#ipv6 pim sparse-mode
Device(config-if-vlan2)#exit
Device(config)#interface vlan3
Device(config-if-vlan3)#ipv6 pim sparse-mode
Device(config-if-vlan3)#ipv6 mld enable
Device(config-if-vlan3)#exit
```

#### #View the MLD information of the interface vlan 3 of Device.

```
Device#show ipv6 mld interface vlan3
Interface vlan3 (Index 23)
MLD Enabled, Active
Querier: fe80::201:2ff:fe03:406 (Self)
Default version: 2
Querier parameter:
  Query interval is 125 seconds
  Querier timeout is 255 seconds
  Query response time is 10 seconds
  Last member query response interval is 1 seconds
  Last member query count is 2
  Group Membership interval is 260 seconds
  Robustness variable is 2
```

- Step 4: Interface vlan 3 of Device joins the multicast group FF1E::1 in a static way.

## #Configure Device.

Configure the static multicast group FF1E::1 on the interface vlan 3 of Device.

```
Device(config)#interface vlan3
Device(config-if-vlan3)#ipv6 mld static-group ff1e::1
Device(config-if-vlan3)#exit
```

Step 5: Check the result.

#Source sends the multicast packet of the multicast group FF1E::1.

#View the multicast membership table of Device.

```
Device#show ipv6 mld groups
MLD Static Group Membership
Total 1 Static Groups
Group      Source      Interface
ff1e::1    ::         vlan3
```

#View the multicast routing table of Device.

```
Device#show ipv6 pim mroute

#Receiver can receive multicast packets of the multicast group FF1E::1 sent by Source.

### 72.3.3 Configure MLD SSM Mapping

#### Network Requirements

- The IPv6 PIM-SSM protocol runs on the entire network.

- Receiver 1, Receiver 2, and Device 2 are in the same LAN.
- MLDv2 runs between Device 2 and the stub network.
- By using MLD SSM mapping on Device 2, Receiver 2 can only receive multicast packets sent by Source 1.

### Network Topology

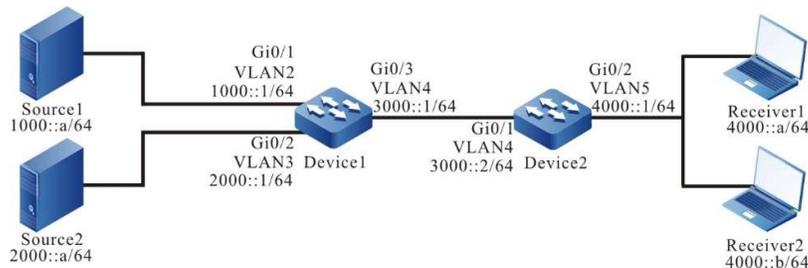

Figure 72-3 Network Topology for Configuring MLD SSM Mapping

### Configuration Steps

- Step 1: Configure VLANs, and add the port to the corresponding VLAN (omitted).
- Step 2: Configure the IPv6 address of each interface (omitted).
- Step 3: Enable IPv6 unicast routing protocol OSPFv3, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```

Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 0
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 router ospf 100 area 0
Device1(config-if-vlan4)#exit

```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ipv6 router ospf 100 area 0
Device2(config-if-vlan4)#exit
```

## #View the routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route

   via ::, 00:31:53, lo0
```

---

### Note

- Device 1 is viewed the same way as Device 2, and the viewing process is omitted.
-

Step 4: Enable IPv6 multicast forwarding globally, and configure IPv6 PIM-SSM globally. The range of multicast groups served by SSM is FF3X::/32. Enable the multicast protocol IPv6 PIM-SM on the interfaces. Interface vlan 5 of Device 2 runs MLDv2.

#### #Configure Device1.

Enable IPv6 multicast forwarding globally, configure IPv6 PIM-SSM globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device1(config)#ipv6 multicast-routing
Device1(config)#ipv6 pim ssm default
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 pim sparse-mode
Device1(config-if-vlan4)#exit
```

#### #Configure Device2.

Enable IPv6 multicast forwarding globally, configure IPv6 PIM-SSM globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces. Interface vlan 5 runs MLDv2.

```
Device2(config)#ipv6 multicast-routing
Device2(config)#ipv6 pim ssm default
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ipv6 pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ipv6 pim sparse-mode
Device2(config-if-vlan5)#ipv6 mld enable
Device2(config-if-vlan5)#exit
```

#### #View the MLD information of the interface vlan 5 of Device 2.

```
Device2#show ipv6 mld interface vlan5
Interface vlan5 (Index 23)
MLD Enabled, Active
Querier: fe80::201:2ff:fe03:406 (Self)
Default version: 2
```

Querier parameter:  
Query interval is 125 seconds  
Querier timeout is 255 seconds  
Query response time is 10 seconds  
Last member query response interval is 1 seconds  
Last member query count is 2  
Group Membership interval is 260 seconds  
Robustness variable is 2

Step 5: Enable MLD SSM mapping on Device 2 and configure MLD SSM mapping rules so that Receiver 1 and Receiver 2 can only receive multicast packets sent by Source 1.

#Configure Device2.

Enable MLD SSM mapping, and configure the range of multicast groups for MLD SSM mapping to FF3E::/64. The multicast source address is 1000::a.

```
Device2(config)#ipv6 access-list extended 7001
Device2(config-std-nacl)#permit ipv6 any ff3e::/64
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#ipv6 mld ssm-map enable
Device2(config)#ipv6 mld ssm-map static 7001 1000::a
```

Step 6: Check the result.

#Receiver1 sends an MLDv2 membership report of the specified source group to join the multicast group FF3E::1, and the specified multicast source is 2000::a; Receiver 2 sends an MLDv1 membership report to join the multicast group FF3E::2.

#Both Source 1 and Source 2 send multicast packets of the multicast groups FF3E::1 and FF3E::2.

#View the multicast membership table of Device 2.

#Receiver 1 can only receive multicast packets sent by Source 2, and Receiver 2 can only receive multicast packets sent by Source 1.

---

## Note

- Device 1 is viewed the same way as Device 2, and the viewing process is omitted.
  - MLD SSM mapping needs to be used with IPv6 PIM-SSM. The range of multicast groups in the MLD SSM mapping rules must be within the range
-

---

of multicast groups of IPv6 PIM-SSM. The MLD SSM mapping provides support for the SSM model mainly for receiver hosts that run MLDv1 and cannot be upgraded to MLDv2.

- MLD SSM mapping is invalid to MLDv2 membership reports.
- 

### 72.3.4 Configure MLD Multicast Group Filtering

#### Network Requirements

- The IPv6 PIM-SM protocol runs on the entire network.
- Receiver is one receiver of Device stub network.
- MLDv2 runs between Device and the stub network.
- The interface vlan 3 of Device filters the multicast groups, and the range of multicast groups that Receiver is allowed to join is ff10::/16.

#### Network Topology

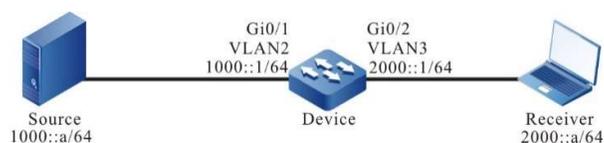

Figure 72-4 Network Topology for Configuring MLD Multicast Group Filtering

#### Configuration Steps

- Step 1: Configure VLANs, and add the port to the corresponding VLAN (omitted).
- Step 2: Configure the IPv6 address of each interface (omitted).
- Step 3: Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on the interfaces.

#Configure Device.

Enable IPv6 multicast forwarding globally, enable the multicast protocol IPv6 PIM-SM on related interfaces, and enable MLD on the interface connecting to Receiver.

```
Device#configure terminal
Device(config)#ipv6 multicast-routing
Device(config)#interface vlan2
```

```
Device(config-if-vlan2)#ipv6 pim sparse-mode
Device(config-if-vlan2)#exit
Device(config)#interface vlan3
Device(config-if-vlan3)#ipv6 pim sparse-mode
Device(config-if-vlan3)#ipv6 mld enable
Device(config-if-vlan3)#exit
```

**#View the MLD information of the interface vlan 3 of Device.**

```
Device#show ipv6 mld interface vlan3
Interface vlan3 (Index 23)
MLD Enabled, Active
Querier: fe80::201:2ff:fe03:406 (Self)
Default version: 2
Querier parameter:
  Query interval is 125 seconds
  Querier timeout is 255 seconds
  Query response time is 10 seconds
  Last member query response interval is 1 seconds
  Last member query count is 2
  Group Membership interval is 260 seconds
  Robustness variable is 2
```

**Step 4: Configure multicast group filtering on the interface vlan 3 of Device.**

**#Configure Device.**

Configure multicast group filtering on the interface vlan3 of the Device. The range of multicast groups that Receiver is allowed to join is ff10::/16.

```
Device(config)#ipv6 access-list extended 7001
Device(config-std-nacl)#permit ipv6 any ff10::/16
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
Device(config)#interface vlan3
Device(config-if-vlan3)#ipv6 mld access-group 7001
Device(config-if-vlan3)#exit
```

**Step 5: Check the result.**

#Receiver can only receive the multicast service packet of the multicast group FF10::1 sent by Source.

---

### Note

- For filtering based on the multicast source group, you still use `ipv6 mld access-group` to implement it, and configure the corresponding source address in the associated ACL. For example, `permit ipv6 1000::/16 ff10::/16` means to permit the join of source groups having the group range within FF10::/16 and the specified source range of 1000::/16. When using this function, the interface is required to run the MLDv2 version.
-

# 73 MLD snooping

## 73.1 Overview

MLD Snooping is short for Multicast Listener Discovery Snooping. It is IPv6 multicast constraint mechanism that runs on L2 devices and is used to manage and control IPv6 multicast groups.

IGMP Snooping mainly provides the following functions:

- Listen to the MLD packets to set up multicast information. IGMP Snooping gets the downstream multicast receiver information by listening to MLD packets, realizing the forwarding of multicast service packets at the specified member port;
- Listening to MLD protocol packets. In this way, the upstream multicast router can correctly maintain the MLD membership table.

## 73.2 MLD snooping Function Configuration

Table 73-1 MLD Snooping Function Configuration List

Configuration Task	
Configure basic functions of MLD snooping	Enable MLD snooping function
	Configure MLD snooping version
	Enable MLD snooping MAC forwarding function
Configure MLD snooping querier	Enable MLD snooping querier
	Configure source IPv6 address of MLD query packet
	Configure Query Interval of General Group

Configuration Task	
	Configure Max. Response Time
	Configure Query Interval of Specified Group
	Configure Fast Leave
Configure MLD snooping router port	Configure MLD snooping router port
	Configure age time for MLD snooping dynamic router port
Configure MLD snooping TCN event	Enable fast convergence
	Configure TCN event query interval
	Configure TCN event query count

### 73.2.1 Configure basic functions of MLD snooping

In the various configuration tasks for MLD snooping, you must first enable the MLD snooping function so that the configuration of the other function features can take effect.

#### Configuration Condition

Before configuring the basic functions of MLD snooping, do the following:

- Configure VLAN.

#### Enable MLD snooping function

The MLD snooping function will run on the device only after it is enabled.

Table 73-2 Enabling MLD Snooping Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable the global MLD snooping function	<b>ipv6 mld snooping</b>	Mandatory  By default, the global MLD snooping function is not enabled
Enable the MLD snooping function of the specified VLAN	<b>ipv6 mld snooping</b> <b>vlan <i>vlan-id</i></b>	Mandatory  By default, the MLD snooping function is not enabled in the VLAN

---

### Note

- The MLD snooping function of the specified VLAN can be enabled only after the global MLD snooping function is enabled.
- 

### Configure MLD snooping version

The handling rules for the configured MLD snooping version and MLD protocol packets are as follows:

If the configured MLD snooping version is V2, the device can handle IGMP protocol packets of versions V1 and V2.

If the configured MLD snooping version is V1, the device can handle MLD protocol packets of version V1, and does not handle the protocol packets of versions V2 but floods them in the VLAN.

Table 73-3 Configuring MLD snooping Version

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure MLD snooping version	<b>ipv6 mld snooping</b> <b>vlan <i>vlan-id</i> version</b> <i>version-number</i>	Optional  By default, the MLD snooping version is 2

### Enable MLD snooping MAC Forwarding

Generally, MLD snooping forwards multicast service packets based on the destination MAC address in the VLAN. After configuring MLD snooping MAC forwarding, MLD snooping will forward multicast service packets based on the multicast source MAC address and multicast destination MAC address in the VLAN.

Table 73-4 MLD snooping MAC Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the L2 multicast MAC forwarding function in the specified VLAN	<b>ipv6 mld snooping</b> <b>vlan <i>vlan-id</i> l2-</b> <b>forwarding</b>	Mandatory  By default, the L2 multicast IP forwarding function of MLD snooping is enabled for the VLAN

### 73.2.2 Configure MLD snooping querier

If there is no L3 multicast device in the network, it cannot realize the related functions of the MLD querier. To solve the problem, you can configure the MLD snooping querier on the L2 multicast device to realize the MLD querier function. Therefore, the L2 multicast device can set up and maintain the multicast forwarding entry, so as to forward multicast service packets normally.

#### Configuration Condition

Before configuring the basic functions of MLD snooping querier, do the following:

- Enable global and intra-VLAN MLD snooping functions.

### Enable MLD snooping querier

You should first enable the MLD snooping querier function so that the configuration of the other features of the querier can take effect.

Table 73-5 Enabling IGMP snooping Querier

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable MLD snooping querier	<b>ipv6 mld snooping vlan <i>vlan-id</i> querier</b>	Mandatory  By default, the MLD snooping querier of the specified VLAN is not enabled

### Configure IPv6 Address of the Querier

The querier with IPv6 address configured takes part in the election of the MLD querier in VLAN and the querier fills the IPv6 address in the source IPv6 address field of the sent MLD group query packet.

Table 73-6 Configuring IPv6 Address of the Querier

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv6 Address of the Querier	<b>ipv6 mld snooping vlan <i>vlan-id</i> querier address <i>ipv6-address</i></b>	Mandatory  By default, the querier IPv6 address of the specified VLAN is not configured

**Note**

- 
- When the querier IPv6 address is not configured, the default source IPv6 address of the querier is 0:::0, but the querier does not send the IGMP group query packet with source IP address 0.0.0.0.
- 

### Configure Query Interval of General Group

MLD querier periodically sends the query packets of the general group to maintain the group membership. You can modify the interval of sending the MLD general group query packets according to the actuality of the network. For example, if the configured general group query interval is long, it can reduce the number of the MLD protocol packets in the network, avoiding the network congestion.

Table 73-7 Configuring Query Interval of General Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Query Interval of General Group	<b>ipv6 mld snooping</b> <b>vlan <i>vlan-id</i> querier</b> <b>query-interval</b> <i>interval-value</i>	Optional By default, the query interval of the general group is 125 seconds

---

### Note

- In the same VLAN, the configured query interval of the general group should be larger than the maximum response time. Otherwise, the configuration cannot succeed.
- 

### Configure Max. Response Time

The general group query packet sent by the MLD querier contains the maximum response time field. The multicast receiver sends the membership report packet within the maximum response interval. If the multicast receiver does not send the group member report packet within the maximum response time interval, the device considers that this subnet does not

have a receiver for this multicast group and immediately deletes the multicast group information.

Table 73-8 Configuring Maximum Response Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Max. Response Time	<b>ipv6 mld snooping</b> <b>vlan <i>vlan-id</i> querier</b> <b>max-response-time</b> <i>time-value</i>	Optional By default, the maximum response time is 10 seconds

### Note

- In the same VLAN, the configured maximum response time should be smaller than the query interval of the general group. Otherwise, the configuration cannot succeed.

### Configure Query Interval of Specified Group

When the MLD querier receives the leave packet of the certain multicast group, it sends the specified group query packet to query this segment for the multicast group, so as to learn whether the subnet has the members of the multicast group. If not receiving the member report packet of the multicast group after waiting for “max response time”, delete the information of the multicast group.

Table 73-9 Configuring Query Interval of Specified Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Query Interval of Specified Group	<b>ipv6 mld snooping</b> <b>vlan <i>vlan-id</i> last-</b> <b>member-query-</b> <b>interval <i>interval-value</i></b>	Optional By default, the query interval of the

Step	Command	Description
		specified group is 1000 milliseconds

### Configure Fast Leave

If the device receives the leave packet of one multicast group after configuring fast leave, the device does not send the query packet of the specified group to the port any more and the information of the multicast group is deleted at once.

Table 73-10 Configuring Fast Leave

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Fast Leave	<b>ipv6 mld snooping vlan <i>vlan-id</i> immediate-leave</b>	Mandatory  By default, the fast leave function of the specified VLAN is disabled

### Note

- There are multiple receivers of the same multicast group in the device port at the same time. When the port receives the MLD leave packet of the multicast group sent by one receiver and if fast leave is configured in the VLAN that the device port is within, the multicast services of the other receivers are interrupted.

### 73.2.3 Configure MLD snooping router port

MLD snooping router port is the port receiving MLD group query packets or multicast routing protocol packets. When the device receives the MLD member report or leave packet, it forwards the packet via MLD snooping router port. In this way, the uplink router can maintain the MLD membership table correctly.

MLD snooping router port can be dynamically learned or configured manually. MLD snooping dynamic router port refreshes the age time by regularly receiving the MLD group query packets or multicast routing protocol packets. MLD snooping static router port does not age.

### Configuration Condition

Before configuring the MLD snooping router port function, do the following:

- Enable global and intra-VLAN MLD snooping functions;
- Add port member in VLAN

### Configure IGMP snooping Static Router Port

After configuring MLD snooping static router port, the device can forward the MLD protocol packet via the port even the port does not receive the MLD group query packet or multicast routing protocol packet. It can prevent the problem that the router port ages because the services of the uplink L3 multicast device are interrupted.

Table 73-11 Configuring MLD snooping Static Router Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IGMP snooping Static Router Port	<b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface { <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> }</b>	Mandatory By default, the MLD snooping static router port is not configured

### Configure age time for MLD snooping dynamic router port

As long as the configured age time for the MLD snooping dynamic router port is longer, the problem can be effectively prevented that the router port ages fast because the services of the uplink L3 multicast device are interrupted.

Table 73-12 Configuring Age Time for MLD Snooping Dynamic Router Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure age time for MLD snooping dynamic router port	<b>ipv6 mld snooping vlan <i>vlan-id</i> timer router-port expiry expiry-value</b>	Optional  By default, the age time of the MLD snooping dynamic router port is 255 seconds

### 73.2.4 Configure MLD snooping TCN event

#### Configuration Condition

Before configuring the MLD snooping TCN event function, do the following:

- Enable global and intra-VLAN MLD snooping functions.

#### Enable fast convergence

When the network topology varies, a TCN event will be generated. The root port of the spanning tree will actively send a global MLD leave packet to request the MLD querier in order to send a general group query packet, achieving fast convergence.

After you enable the fast convergence of the MLD snooping TCN event, the root port of the non-spanning tree can also actively send a global MLD leave packet, achieving the fast convergence.

Table 73-13 Enabling Fast Convergence

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable fast convergence	<b>ipv6 mld snooping tcn query solicit</b>	Mandatory  By default, fast convergence is disabled in the TCN event

#### Configure TCN event query interval

When the TCN event occurs, the MLD snooping querier will send a general group query at the TCN event query interval.

Table 73-14 Configuring TCN Event Query Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TCN event query interval	<b>ipv6 mld snooping vlan <i>vlan-id</i> querier tcn query interval <i>interval-value</i></b>	Optional  By default, the TCN event query interval is 31 seconds

#### Configure TCN event query count

When the TCN event occurs, the MLD snooping querier will send a general group query at the TCN event query interval. The interval will restore to the general group query interval after the number of sending times reaches the configured TCN event query count.

Table 73-15 Configuring TCN Event Query Count

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TCN event query count	<b>ipv6 mld snooping vlan <i>vlan-id</i> querier tcn query count <i>count-number</i></b>	Optional  By default, the TCN event query count is 2

## 73.3 Typical Configuration Example of MLD Snooping

### 73.3.1 Configure MLD snooping

#### Network Requirements

- Device 1 configures the IPv6 multicast routing protocol, Device 2 enables MLD snooping, PC 1 and PC 2 are the receivers of multicast services, and PC 3 is the receiver of non-multicast services;

- Multicast Server sends the IPv6 multicast service packets, PC 1 and PC 2 can correctly receive the multicast service packets, and PC 3 cannot receive the multicast service packets.

### Network Topology

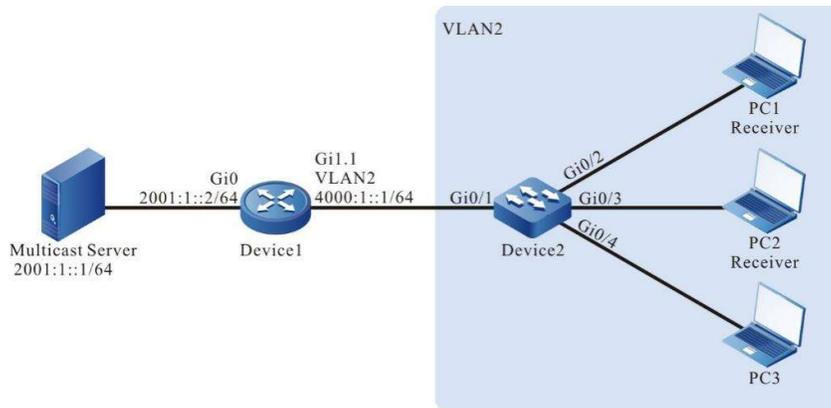

Figure 73-1 Network Topology for Configuring MLD snooping

### Configuration Steps

- Step 1: On Device 1, configure the interface IPv6 address and enable the IPv6 multicast routing protocol (omitted).
- Step 2: Configure Device2.

Create VLAN2 on #Device 2.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
```

#On Device 2, configure the link type of ports gigabitethernet0/2-gigabitethernet0/4 Access to allow services of VLAN 2 to pass.

```
Device2(config)#interface gigabitethernet 0/2-0/4
Device2(config-if-range)#switchport access vlan 2
Device2(config-if-range)#exit
```

#On Device 2, configure the link type of port gigabitethernet0/1 to Trunk to allow services of VLAN 2 to pass, and configure PVID to 1.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
```

```
Device2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/1)#exit
```

**#Enable unknown multicast drop in VLAN 2.**

```
Device2(config)#vlan 2
Device2(config-vlan2)#l2-multicast drop-unknown
Device2(config-vlan2)#l3-multicast ipv6 drop-unknown
Device2(config-vlan2)#exit
```

**#Enable MLD snooping and enable the routing port dynamic learning function of VLAN 2.**

```
Device2(config)#ipv6 mld snooping
Device2(config)#ipv6 mld snooping vlan 2
Device2(config)#ipv6 mld snooping vlan 2 mrouter-learning
```

**Step 3: Check the result.**

**#PC 1 and PC 2 send MLDv1 member report packets to join the IPv6 multicast group FF10::1.**

**#View the multicast membership table of Device 2.**

```
Device2#show ipv6 mld snooping groups
MLD Snooping Group Membership
Total 2 groups

VLAN ID  Port Name  Group Address  Expires  Last Reporter  V1 Expires  Uptime
-----  -
2        gi0/2     ff10::1  00:03:59  fe80::b        stopped    00:00:16
2        gi0/3     ff10::1  00:03:59  fe80::c        stopped    00:00:16
```

**#Multicast Server sends the IPv6 multicast service packet with the destination address of FF10::1, PC 1 and PC 2 can correctly receive the multicast service packet, and PC 3 cannot receive the multicast service packet.**

# 74 IPv6 Multicast Basics

## 74.1 Overview

The IPv6 multicast basics section is the basics for running the IPv6 multicast protocol and is a common part of all multicast protocols. To run any multicast routing protocol, you need to enable the IPv6 multicast forwarding function before the device can forward multicast service packets.

## 74.2 IPv6 Multicast Basics Function Configuration

Table 74-1 IPv6 Multicast Basics Function Configuration List

Configuration Task	
Enable IPv6 multicast forwarding	Enable IPv6 multicast forwarding

### 74.2.1 Enable IPv6 multicast forwarding

IPv6 multicast forwarding is the basic module of multicast forwarding. You must enable the IPv6 multicast forwarding function on the device to forward IPv6 multicast service packets. Both general IPv6 multicast forwarding and IPv6 multicast fast forwarding are to be controlled by whether IPv6 multicast forwarding is enabled.

IPv6 multicast fast forwarding refers to the design of an IPv6 fast multicast forwarding technology in order to improve the forwarding performance for service data packets. Its core is to move down the routing and service processing process, and complete routing and service processing at one time, thereby greatly reducing resource consumption caused by such as internal task switching and packet cache management in the system, and ultimately improving the data forwarding performance of the entire system.

#### Configuration Condition

Before configuring the IPv6 multicast forwarding function, do the following:

- Configure the IPv6 address of the interface so that neighbor nodes are reachable at the network layer;
- Configure any unicast routing protocol to achieve reachable routes

within the domain;

- Configure any multicast routing protocol.

### Enable IPv6 Multicast Forwarding

You must enable the IPv6 multicast forwarding function on the device to forward IPv6 multicast service packets.

Table 74-2 Enabling IPv6 Multicast Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IPv6 multicast forwarding	<b>ipv6 multicast-routing [ vrf vrf-name ]</b>	Mandatory Enable IPv6 multicast forwarding. By default, IPv6 multicast forwarding is not enabled

## 74.2.2 Configure IPV6 Multicast Forwarding Rules

### Configuration Condition

Before configuring the IPV6 multicast forwarding rules, do the following:

- Configure the IPV6 address of the interface so that neighbor nodes are reachable at the network layer;
- Configure any IPV6 unicast routing protocol to achieve reachable routes within the domain;
- Enable IPV6 multicast forwarding;
- Configure any IPV6 multicast routing protocol.

### Configure IPV6 Multicast Routing Table Limit

Configure the limit on the maximum number of entries in the IPV6 multicast routing table. After the maximum number of entries in the IPV6 multicast routing table exceeds the limit, no new IPV6 multicast routing table will be created.

Table 74-3 Configuring IPv6 Multicast Routing Table Limit

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure multicast routing table limit	<b>ipv6 multicast route-limit</b> <i>number-value [ vrf vrf-name ]</i>	Optional  By default, the maximum number of entries in the multicast routing table is 4096

### 74.2.3 Monitoring and Maintaining of IPv6 Multicast Basics

Table 74-4 Monitoring and Maintaining of IPv6 Multicast Basics

Command	Description
<b>clear ipv6 mcache</b> [ <i>source source-ipv6-address</i> ] [ <b>group</b> <i>group-ipv6-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]   [ <b>all</b> ]	Clear the multicast core routing table
<b>show ipv6 mcache</b> [ <b>source</b> <i>source-ipv6-address</i> ] [ <b>group</b> <i>group-ipv6-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Show multicast core routing table information
<b>show ipv6 mvif</b> [ <b>vrf</b> <i>vrf-name</i> ]	Show multicast virtual interface information

# 75 IPv6 PIM-SM

## 75.1 Overview

The IPv6 PIM protocol is basically the same as the IPv4 PIM protocol in behavior except for the IP address structure in the packet.

See the overview.

## 75.2 IPv6 PIM-SM Function Configuration

Table 75-1 IPv6 PIM-SM Function Configuration List

Configuration Task	
Configure basic functions of IPv6 PIM-SM	Enable IPv6 PIM-SM protocol
Configure IPv6 PIM-SM Aggregation Router	Configure C-RP
	Configure static RP
Configure IPv6 PIM-SM bootstrap router	Configure C-BSR
	Configure BSR Border
Configure IPv6 PIM-SM multicast source registration	Configure RP reachability check
	Configure sending rate of register packets

Configuration Task	
	Configure sending rate of register-stop packets
	Configure source address of register packets
	Configure register packet filtering
Configure IPv6 PIM-SM neighbor parameters	Configure sending period of HELLO packets
	Configure keepalive time of neighbors
	Configure neighbor filtering
	Configure DR priority
Configure IPv6 PIM-SM SPT switching	Configure SPT switching conditions
Configure IPv6 PIM-SSM	Configure IPv6 PIM-SSM

### 75.2.1 Configure basic functions of IPv6 PIM-SM

#### Configuration Condition

Before configuring IPv6 PIM-SM, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.

#### Enable IPv6 PIM-SM protocol

Table 75–2 Enabling IPv6 PIM-SM Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IPv6 multicast forwarding	<b>ipv6 multicast-routing</b>	Mandatory By default, IPv6 multicast forwarding is not enabled
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	-
Enable IPv6 PIM-SM protocol	<b>ipv6 pim sparse-mode</b>	Either-or
	<b>ipv6 pim sparse-mode passive</b>	By default, the interface is in IPv6 PIM-SM shut-down status

---

### Note

- All IPv6 PIM-SM related configurations can only take effect after the IPv6 PIM-SM function is enabled.
- 

## 75.2.2 Configure IPv6 PIM-SM Aggregation Router

### Configuration Condition

Before configuring RP, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.
- Enable the IPv6 PIM-SM protocol.

## Configure C-RP

RP results from C-RP election. After BSR election, all C-RPs (Candidate-Rendezvous Point, candidate aggregation routers) regularly unicast C-RP packets to BSR. BSR integrates the C-RP information and conveys the information to all the devices within the SM domain via bootstrap packets.

Table 753 Configuring C-RP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure C-RP	<b>ipv6 pim rp-candidate interface-name</b> [ [ <i>priority-value</i> [ <i>interval-value</i> [ <b>group-list</b> { <i>access-list-number</i>   <i>access-list-name</i> } ] ] ]   [ <b>group-list</b> { <i>access-list-number</i>   <i>access-list-name</i> } ] ] [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory  By default, there are no C-RPs

---

### Note

- RP election is performed based on the following rules:
    1. the longest mask matching is performed on the range of groups served by C-RP services;
    2. compare the C-RP priorities if there are multiple C-RPs in the longest mask matching, the smaller the value, the higher the priority, and those with the higher priority win;
    3. calculate the HASH value for the C-RP addresses and groups if there is more than one C-RP with the highest priority, the C-RP with the largest HASH value wins;
    4. if there is more than one RP with the largest HASH value, the C-RP with the largest IPv6 address wins.
- 

## Configure static RP

For simple IPv6 PIM-SM networks, the static RP is recommended. The use of the static RP eliminates the need for BSR configuration and eliminates frequent interaction between RPs and BSRs, thereby saving network bandwidth.

Table 75-4 Configuring Static RP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure static RP	<b>ipv6 pim rp-address</b> <i>ipv6-address</i> [ <i>access-list-name</i>   <i>access-list-number</i> ] [ <b>override</b> ] [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, there are no static RPs

### Note

- All devices in the same IPv6 PIM-SM domain must be configured with the same static RP to work normally.

## 75.2.3 Configure IPv6 PIM-SM bootstrap router

### Configuration Condition

Before configuring BSR, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.
- Enable the IPv6 PIM-SM protocol.

### Configure C-BSR

In one IPv6 PIM-SM domain, there must be unique BSR. Multiple C-BSRs (Candidate-Bootstrap Routers) result in the only recognized BSR via bootstrap packet election.

Table 75-5 Configuring C-BSR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure C-BSR	<b>ipv6 pim bsr-candidate</b> <i>interface_name</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ] [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, there are no C-BSRs

## Note

- BSR election is performed based on the following rules:
  1. compare the priorities, the larger the value, the higher the priority, and those with the higher priority win;
  2. in the case of the same priority, those with the larger IPv6 address win.

### Configure BSR Border

BSR is responsible for collecting C-RP information and conveying this information to all devices in the IPv6 PIM-SM domain via bootstrap packets. The range of BSR is also the range of the multicast domain. Bootstrap packets cannot pass through the interfaces configured with BSR border. The devices outside the multicast domain cannot forward multicast service packets within the multicast domain. In this way, the multicast domain is divided.

Table 75-6 Configuring BSR Border

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure BSR Border	<b>ipv6 pim bsr-border</b>	Mandatory By default, there are no multicast borders

## 75.2.4 Configure IPv6 PIM-SM multicast source registration

### Configuration Condition

Before configuring multicast source registration, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.
- Enable the IPv6 PIM-SM protocol.

### Configure RP reachability check

Before the source DR sends the register packet to RP, you may run the reachability check on RP. If RP routing is found to be unreachable, skip registering with RP, thereby reducing the overhead of this DR.

Table 75-7 Configuring RP Reachability Check

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure RP reachability check	<b>ipv6 pim register-rp-reachability</b>	Mandatory By default, RP reachability is not checked before the registration process of PIM

---

## Note

- To reduce the overhead of the source DR, it is recommended to configure this command on all source DRs of IPv6 PIM-SM.
- 

### Configure sending rate of register packets

When the source DR receives a multicast data packet, it encapsulates the multicast data packet into a register message and sends it to RP for source registration until the registration is completed.

When the source DR has not completed the registration of the multicast source and the multicast traffic is large, a large number of register packets will be generated, which will increase the burden on the RP device, and even may cause RP not to work normally. Because it is not necessary for the source DR to send all the register packets of the same flow to RP, configuring the sending rate of the register packets at the source DR can meet the purpose of source registration and reduce the burden on RP.

Table 75-8 Configuring Sending Rate of Register Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure sending rate of register packets	<b>ipv6 pim register-rate-limit</b> <i>rate-limit-value</i> [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, the sending rate of register packets is not limited

---

## Note

- To reduce the burden on RP, it is recommended to configure the source registration sending rate on all source DRs.
- 

### Configure sending rate of register-stop packets

After RP receives a register packet from the source DR, it will send a register-stop packet to the source DR to complete the registration process. When RP receives many register packets, it is necessary to reply to all the register packets(that is, to send register-stop packets). In actual situations, there are many duplicate packets in these register-stop packets. The sending rate of the register-stop packets on RP can be limited to achieve the purpose of reducing the overhead on RP.

Table 75-9 Configuring Sending Rate of Register-stop Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure sending rate of register-stop packets	<b>ipv6 pim register-stop-rate-limit</b> <i>rate-limit-value</i> [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory  By default, the sending rate of register-stop packets is not limited

### Note

- To improve the robustness of the entire IPv6 PIM-SM network, it is recommended to limit the rate of source register-stop packets in all RPs.

### Configure source address of register packets

When the source DR performs source registration, the source address of the register packet uses the register interface IPv6 address automatically generated by the system. This command can specify the source address of the register packet as the IPv6 address of one interface on this device to satisfy some special needs of the network.

Table 75-10 Configuring Source Address of Register Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure source address of register packets	<b>ipv6 pim register-source interface</b> <i>interface-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory  By default, the IPv6 address of the register interface automatically generated by the system is used as the source address of the register packet

### Configure register packet filtering

To prevent source registration attacks, ACL can be used on RP to filter the multicast source for the register packets. Only the multicast sources allowed by the ACL can successfully register with RP.

Table 75-11 Configuring Register Packet Filtering

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure register packet filtering	<b>ipv6 pim accept-register list</b> { <i>access-list-number</i>   <i>access-list-name</i> }[ <b>vrf</b> <i>vrf-name</i> ]	Mandatory  By default, register packets are not filtered

## 75.2.5 Configure IPv6 PIM-SM neighbor parameters

### Configuration Condition

Before configuring IPv6 PIM-SM neighbor parameters, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.
- Enable the IPv6 PIM-SM protocol.

### Configure sending period of HELLO packets

The interface with the IPv6 PIM-SM protocol enabled will periodically send the Hello packet to establish and maintain PIM neighbors.

Table 75-12 Configuring Sending Period of HELLO Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure sending period of HELLO packets	<b>ipv6 pim hello-interval</b> <i>interval-value</i>	Optional By default, the interval of sending the Hello packet is 30 seconds

### Configure keepalive time of neighbors

When the Hello packet from one neighbor is received on the interface, the holdtime carried in the Hello packet will be recorded as the keepalive time of this neighbor. If no Hello packet of the neighbor is received within the keepalive period, this neighbor is considered invalid.

Table 75-13 Configuring IPv6 PIM-DM Neighbor Keepalive Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure keepalive time of neighbors	<b>ipv6 pim hello-holdtime</b> <i>holdtime-value</i>	Optional By default, the keepalive time of the IPv6 PIM-DM neighbors is 105 seconds

## Configure neighbor filtering

If there are many PIM neighbors in one subnet, you can use the neighbor filtering function to selectively establish the neighbor, thereby saving device resources.

Table 75-14 Configuring Neighbor Filtering

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure neighbor filtering	<b>ipv6 pim neighbor-filter</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, the neighbor filtering function is not enabled

## Configure DR priority

DR plays a very important role in the IPv6 PIM-SM network, so it is very important to select the appropriate DR. You can select the appropriate device as DR by configuring the DR priority.

Only one DR is allowed in one IPv6 PIM-SM subnet, which can be divided into source DR and sink DR according to functionality.

The main function of the source DR is to register the source with RP.

The main function of the receiving DR is to join RP and establish a switch between RPT and SPT.

Table 75-15 Configuring DR Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure DR priority	<b>ipv6 pim dr-priority</b> <i>priority-value</i>	Optional By default, the DR priority is 1

---

## Note

- DR election is performed based on the following rules:
    1. compare the priorities, the larger the value, the higher the priority, and those with the higher priority win;
    2. in the case of the same priority, those with the larger IPv6 address win.
- 

## 75.2.6 Configure IPv6 PIM-SM SPT switching

### Configuration Condition

Before configuring SPT, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.
- Enable the IPv6 PIM-SM protocol.

### Configure SPT switching conditions

The receiving DR does not know the address of the multicast source, so it can only join RP to form RPT. The source DR will register the source with RP to form the active tree between the source DR and RP. At the beginning, the direction of the multicast stream is from the multicast source to RP, and then from RP to the receiver. When the receiving DR receives the first multicast data packet, it joins the multicast source to form SPT and prunes RPT. This process is called SPT switching.

This command functions to configure SPT switching conditions at the receiving DR.

Table 75-16 Configuring SPT Switching Conditions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure SPT switching conditions	<b>ipv6 pim spt-threshold infinity</b> [ <b>group-list</b> { <i>access-list-number</i>   <i>access-list-name</i> } ] [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, all multicast groups undergo SPT switching

---

## Caution

- You must not configure SPT on RP to never switch; otherwise, this will cause multicast forwarding to fail.
- 

### 75.2.7 Configure IPv6 PIM-SSM

IPv6 PIM-SSM is a subset of IPv6 PIM-SM. In IPv6 PIM-SSM, there is no need for RP, BSR, or RPT, and there is no SPT switching. Instead, the receiving DR directly joins the multicast source and establishes the shortest path tree (SPT) rooted on the source.

#### Configuration Condition

Before configuring IPv6 PIM-SSM, do the following:

- Configure the network layer address of the interface so that all neighbor nodes are reachable at the network layer.
- Configure any unicast routing protocol to achieve reachable routes within the domain.
- Enable the IPv6 PIM-SM protocol on all interfaces on which multicast routing forwarding is to be carried.

#### Configure IPv6 PIM-SSM

Table 75-17 Configuring IPv6 PIM-SSM

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv6 PIM-SSM	<b>ipv6 pim ssm</b> { <b>default</b>   <b>range</b> { <i>access-list-number</i>   <i>access-list-name</i> } } [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, the SSM function is not enabled

## Caution

- When using IPv6 PIM-SSM, ensure that MLDv2 is enabled on the receiving DR;
- In the case that the receiver cannot upgrade to MLDv2, you can use the MLD SSM Mapping function with IPv6 PIM-SSM;

Ensure that the SSM multicast group address ranges configured on all devices in the domain are consistent, otherwise IPv6 PIM-SSM may be abnormal.

## 75.2.8 Monitoring and Maintaining of IPv6 PIM-SM

Table 75-18 Monitoring and Maintaining of IPv6 PIM-SM

Command	Description
<b>clear ipv6 pim bsr rp-set</b> [ <b>vrf</b> <i>vrf-name</i> ]	Clear RP set information of IPv6 PIM-SM
<b>clear ipv6 pim mroute</b> [ <i>group-address</i> [ <i>source-address</i> ] ] [ <b>vrf</b> <i>vrf-name</i> ]	Clear multicast routing information of IPv6 PIM-SM
<b>clear ipv6 pim statistics</b> [ [ <b>interface</b> <i>interface-name</i>   [ <b>vrf</b> <i>vrf-name</i> ] ]	Clear statistics of IPv6 PIM-SM protocol packets
<b>show ipv6 pim bsr-router</b> [ <b>vrf</b> <i>vrf-name</i> ]	Show IPv6 PIM-SM bootstrap router information

Command	Description
<b>show ipv6 pim interface</b> [ detail ]	Show IPv6 PIM-SM interface information
<b>show ipv6 pim local-members</b> <i>interface-name</i> [ vrf <i>vrf-name</i> ]	Show IPv6 PIM-SM local member information
<b>show ipv6 pim mroute</b> [   ssm   group <i>group-address</i> [ source <i>source-address</i> ]   source <i>source-address</i> ] [ vrf <i>vrf-name</i> ]	Show IPv6 PIM-SM multicast routing table information
<b>show ipv6 pim neighbor</b> [ detail ] [ vrf <i>vrf-name</i> ]	Show IPv6 PIM-SM neighbor information
<b>show ipv6 pim nexthop</b> [ <i>ipv6-address</i> ] [ vrf <i>vrf-name</i> ]	Show IPv6 PIM-SM next hop router information
<b>show ipv6 pim rp mapping</b> [ vrf <i>vrf-name</i> ]	Show IPv6 PIM-SM RP information
<b>show ipv6 pim rp-hash</b> <i>group-address</i> [ vrf <i>vrf-name</i> ]	Show RP information for IPv6 multicast group mapping
<b>show ipv6 pim statistics</b>	Show statistics of IPv6 PIM-SM protocol packets

## 75.3 Typical Configuration Example of IPv6 PIM-SM

### 75.3.1 Configure basic functions of IPv6 PIM-SM

#### Network Requirements

- The IPv6 PIM-SM protocol runs on the entire network.
- PC 1 and PC 2 are two receivers of the Device 3 stub network.
- Device 1 and Device 2 are C-BSR and C-RP.
- MLDv2 runs between Device 3 and the stub network.

#### Network Topology

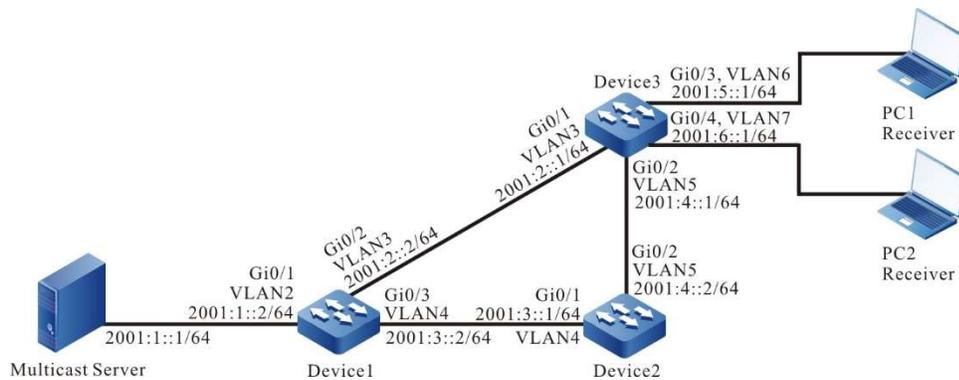

Figure 75-1 Network Topology for Configuring Basic Functions of IPv6 PIM-SM

### Configuration Steps

- Step 1: Configure VLANs, and add the port to the corresponding VLAN (omitted).
- Step 2: Configure the IPv6 address of each interface (omitted).
- Step 3: Enable the unicast routing protocol OSPFv3, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```

Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 0
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 router ospf 100 area 0
Device1(config-if-vlan4)#exit

```

#### #Configure Device2.

```

Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan4

```

```
Device2(config-if-vlan4)#ipv6 router ospf 100 area 0
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ipv6 router ospf 100 area 0
Device2(config-if-vlan5)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan5
Device3(config-if-vlan5)#ipv6 router ospf 100 area 0
Device3(config-if-vlan5)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 router ospf 100 area 0
Device3(config-if-vlan6)#exit
Device3(config)#interface vlan7
Device3(config-if-vlan7)#ipv6 router ospf 100 area 0
Device3(config-if-vlan7)#exit
```

### #Check the routing table of Device3.

```
Device3#show ipv6 route

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 4: Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on the interfaces.

### #Configure Device1.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device1(config)#ipv6 multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 pim sparse-mode
Device1(config-if-vlan4)#exit
```

### #Configure Device2.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device2(config)#ipv6 multicast-routing
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ipv6 pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ipv6 pim sparse-mode
Device2(config-if-vlan5)#exit
```

### #Configure Device3.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device3(config)#ipv6 multicast-routing
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 pim sparse-mode
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan5
Device3(config-if-vlan5)#ipv6 pim sparse-mode
Device3(config-if-vlan5)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 pim sparse-mode
Device3(config-if-vlan6)#exit
Device3(config)#interface vlan7
Device3(config-if-vlan7)#ipv6 pim sparse-mode
Device3(config-if-vlan7)#exit
```

#View, for Device 3, interface information with IPv6 PIM-SM protocol enabled and IPv6 PIM-SM neighbor information.

```
Device3#show ipv6 pim interface

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 5: Enable MLD on vlan 6 and vlan 7 of Device 3.

#Configure Device3.

Enable MLD on vlan 6 and vlan 7 of Device 3.

```

Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 mld enable
Device3(config-if-vlan6)#exit
Device3(config)#interface vlan7
Device3(config-if-vlan7)#ipv6 mld enable
Device3(config-if-vlan7)#exit

```

#View the MLD information of the interfaces vlan 5 and vlan 7 of Device 3.

```
Device3#show ipv6 mld interface
Interface vlan6 (Index 11)
MLD Enabled, Active
Querier: fe80::201:7aff:fe5e:6d2f (Self)
Default version: 2
Querier parameter:
  Query interval is 125 seconds
  Querier timeout is 255 seconds
  Query response time is 10 seconds
  Last member query response interval is 1 seconds
  Last member query count is 2
  Group Membership interval is 260 seconds
  Robustness variable is 2
Interface vlan7 (Index 12)
MLD Enabled, Active
Querier: fe80::201:7aff:fe5e:6d30 (Self)
Default version: 2
Querier parameter:
  Query interval is 125 seconds
  Querier timeout is 255 seconds
  Query response time is 10 seconds
  Last member query response interval is 1 seconds
  Last member query count is 2
  Group Membership interval is 260 seconds
  Robustness variable is 2
```

---

### Note

- By means of the command `ip v6 mld version` you can configure the version of IGMP that runs on the interface.
- 

Step 6: Configure the interface vlan 3 of Device 1 as C-BSR and C-RP, and configure the interface vlan 4 of Device 2 as C-BSR and C-RP.

#Configure Device1.

Configure the interface vlan 3 of Device 1 as C-BSR and C-RP. The priority of C-BSR is 200, and the range of multicast groups served by C-RP is FF10::/16.

```
Device1(config)#ipv6 pim bsr-candidate vlan3 10 200
Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 any ff10::/16
Device1(config-v6-list)#commit
Device1(config-v6-list)#exit
Device1(config)#ipv6 pim rp-candidate vlan3 group-list 7001
```

#Configure Device2.

Configure vlan 4 of Device 2 as C-BSR and C-RP. The priority of C-BSR is 0, and the range of multicast groups served by C-RP of Device 2 is FF00::/8.

```
Device2(config)#ipv6 pim bsr-candidate vlan4
Device2(config)#ipv6 pim rp-candidate vlan4
```

#View the BSR and RP information of Device 3

```
Device3#show ipv6 pim bsr-router

    RP: 2001:3::1
    Info source: 2001:2::2, via bootstrap, priority 192
    Up time: 00:21:30
    Expiry time: 00:02:24

  Group(s): ff10::/16
  RP count: 1
```

RP: 2001:2::2  
Info source: 2001:2::2, via bootstrap, priority 192  
Up time: 00:04:31  
Expiry time: 00:02:24

---

## Note

- Device 1 and Device 2 are viewed the same way as Device 3, and the viewing process is omitted;
  - When multiple C-BSRs are configured in one multicast domain, BSR will be elected according to the priority first, and C-BSR with the highest priority will be elected as BSR. When the priorities of the C-BSRs are the same, the C-BSR with the largest ip address is elected as BSR;
  - When multiple C-RPs are configured in one multicast domain and the ranges of multicast groups served are the same, RP corresponding to the multicast group G will be calculated according to the hash algorithm;
  - In the multicast domain, you can also configure RP with the command `ipv6 pim rp-address`, but the static RP addresses configured on all devices in the entire multicast domain must be consistent.
- 

Step 7: Check the result.

#PC 1 and PC 2 send MLDv2 membership reports to join the multicast groups FF10::1 and FF50::1, respectively.

#Multicast Server sends multicast service packets of the multicast groups FF10::1 and FF50::1.

#View the multicast membership table on Device 3.

```
Device3#show ipv6 mld groups

#PC 1 can only receiver the multicast service packet of the multicast group FF10::1 sent by Multicast Server. #PC 2 can only receiver the multicast service packet of the multicast group FF50::1 sent by Multicast Server.

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
  - By default, SPT switching is enabled on the device.
- 

### 75.3.2 Configure IPv6 PIM-SSM

#### Network Requirements

- The IPv6 PIM-SSM protocol runs on the entire network.
- PC is one receiver of the Device 3 stub network.
- MLDv2 runs between Device 3 and the stub network.

#### Network Topology

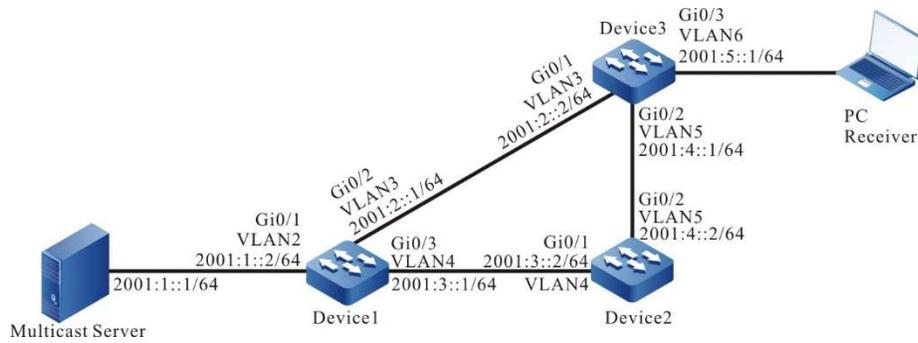

Figure 75-2 Network Topology for Configuring IPv6 PIM-SSM

### Configuration Steps

- Step 1: Configure VLANs, and add the port to the corresponding VLAN (omitted).
- Step 2: Configure the IPv6 address of each interface (omitted).
- Step 3: Enable the unicast routing protocol OSPFv3, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```

Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 0
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 router ospf 100 area 0
Device1(config-if-vlan4)#exit

```

#### #Configure Device2.

```

Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ipv6 router ospf 100 area 0

```

```
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ipv6 router ospf 100 area 0
Device2(config-if-vlan5)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)#exit
Device3(config0)#interface vlan5
Device3(config-if-vlan5)#ipv6 router ospf 100 area 0
Device3(config-if-vlan5)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 router ospf 100 area 0
Device3(config-if-vlan6)#exit
```

### #Check the routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
```

```

  via ::, 00:00:42, lo0
```

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 4: Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on the interfaces.

### #Configure Device1.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device1(config)#ipv6 multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 pim sparse-mode
Device1(config-if-vlan4)#exit
```

### #Configure Device2.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device2(config)#ipv6 multicast-routing
Device2(config)#interface vlan4
Device2(config-if-vlan4)#ipv6 pim sparse-mode
Device2(config-if-vlan4)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ipv6 pim sparse-mode
```

```
Device2(config-if-vlan5)#exit
```

### #Configure Device3.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device3(config)#ipv6 multicast-routing
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 pim sparse-mode
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan5
Device3(config-if-vlan5)#ipv6 pim sparse-mode
Device3(config-if-vlan5)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 pim sparse-mode
Device3(config-if-vlan6)#exit
```

### #View, for Device 3, interface information with IPv6 PIM-SM protocol enabled and IPv6 PIM-SM neighbor information.

```

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 5: Enable MLD on vlan 6 of Device 3.

#Configure Device3.

Enable MLD on vlan 6 of Device 3.

```
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 mld enable
Device3(config-if-vlan6)#exit
```

#View the MLD information of the interface vlan 6 of Device 3.

```
Device3#show ipv6 mld interface vlan6
Interface vlan6 (Index 11)
MLD Enabled, Active
Querier: fe80::201:7aff:fe5e:6d2f (Self)
Default version: 2
Querier parameter:
Query interval is 125 seconds
Querier timeout is 255 seconds
Query response time is 10 seconds
Last member query response interval is 1 seconds
Last member query count is 2
Group Membership interval is 260 seconds
Robustness variable is 2
```

---

## Note

- 
- By means of the command `ipv6 mld version` you can configure the version of IGMP that runs on the interface.
- 

Step 6: Configure IPv6 PIM-SSM on all devices. The range of multicast groups served by SSM is FF3X::/32.

#Configure Device1.

```
Device1(config)#ipv6 pim ssm default
```

#Configure Device2.

```
Device2(config)#ipv6 pim ssm default
```

#Configure Device3.

```
Device3(config)#ipv6 pim ssm default
```

Step 7: Check the result.

#PC sends the MLDv2 membership report of the specified source group to join the multicast group FF30::1, and the specified multicast source is 2001:1::1.

#Multicast Server sends the multicast service packet of the multicast group FF30::1.

#View the multicast membership table of Device 3.

```

Packet count 275560

#PC can only receive the multicast service packet of the multicast group FF30::1 sent by Source.

---

## Note

- Device 1 and Device 2 are viewed the same way as Device 3, and the viewing process is omitted.
  - The default multicast group range of IPv6 PIM-SSM is FF3X::/32. The range of multicast groups served by IPv6 PIM-SSM can be modified with the command `ipv6 pim ssm range`.
  - For the multicast group G that meets the SSM conditions, the multicast routing table will not generate entry (\*, G), but only entry (S, G).
-

## 75.3.3 Configure IPv6 PIM-SM Multicast Forwarding Control

### Network Requirements

- The IPv6 PIM-SM protocol runs on the entire network.
- PC is one receiver of the Device 3 stub network.
- Device 2 is C-BSR and C-RP.
- On Device 2 and Device 3, the multicast source is controlled so that PC can only receive the multicast service packet sent by Multicast Server 1.
- MLDv2 runs between Device 3 and the stub network.

### Network Topology

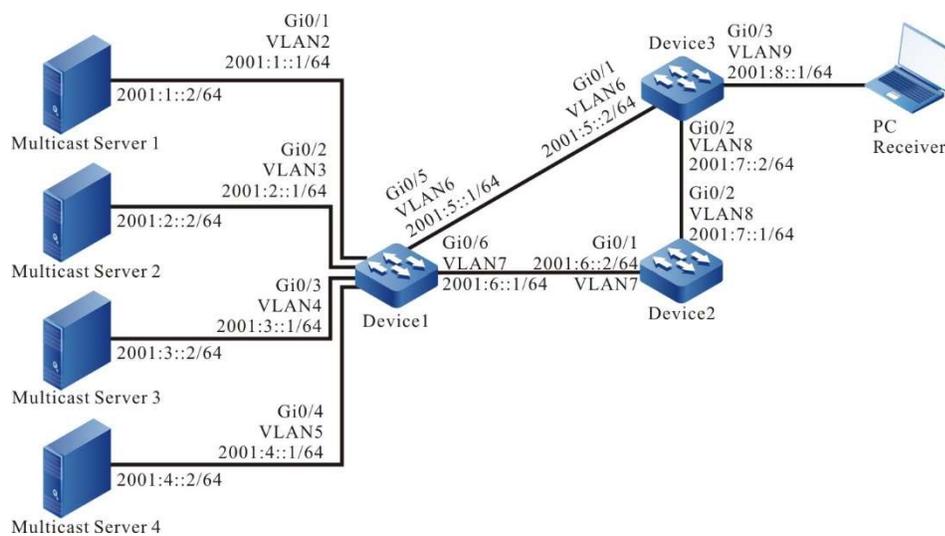

Figure 75-3 Network Topology for Configuring IPv6 PIM-SM Multicast Forwarding Control

### Configuration Steps

- Step 1: Configure VLANs, and add the port to the corresponding VLAN (omitted).
- Step 2: Configure the IPv6 address of each interface (omitted).
- Step 3: Enable the unicast routing protocol OSPFv3, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
```

```
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 0
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 router ospf 100 area 0
Device1(config-if-vlan4)#exit
Device1(config)#interface vlan5
Device1(config-if-vlan5)#ipv6 router ospf 100 area 0
Device1(config-if-vlan5)#exit
Device1(config)#interface vlan6
Device1(config-if-vlan6)#ipv6 router ospf 100 area 0
Device1(config-if-vlan6)#exit
Device1(config)#interface vlan7
Device1(config-if-vlan7)#ipv6 router ospf 100 area 0
Device1(config-if-vlan7)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan7
Device2(config-if-vlan7)#ipv6 router ospf 100 area 0
Device2(config-if-vlan7)#exit
Device2(config)#interface vlan8
Device2(config-if-vlan8)#ipv6 router ospf 100 area 0
Device2(config-if-vlan8)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 router ospf 100 area 0
Device3(config-if-vlan6)#exit
Device3(config)#interface vlan8
```

```
Device3(config-if-vlan8)#ipv6 router ospf 100 area 0
Device3(config-if-vlan8)#exit
Device3(config)#interface vlan9
Device3(config-if-vlan9)#ipv6 router ospf 100 area 0
Device3(config-if-vlan9)#exit
```

### #Check the routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
```

```

```

---

 **Note**

- Device 1 and Device 2 are viewed the same way as Device 3, and the viewing process is omitted.
- 

Step 4: Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on the interfaces.

#### #Configure Device1.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device1(config)#ipv6 multicast-routing
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 pim sparse-mode
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 pim sparse-mode
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 pim sparse-mode
Device1(config-if-vlan4)#exit
Device1(config)#interface vlan5
Device1(config-if-vlan5)#ipv6 pim sparse-mode
Device1(config-if-vlan5)#exit
Device1(config)#interface vlan6
Device1(config-if-vlan6)#ipv6 pim sparse-mode
Device1(config-if-vlan6)#exit
Device1(config)#interface vlan7
Device1(config-if-vlan7)#ipv6 pim sparse-mode
Device1(config-if-vlan7)#exit
```

#### #Configure Device2.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```
Device2(config)#ipv6 multicast-routing
Device2(config)#interface vlan7
Device2(config-if-vlan7)#ipv6 pim sparse-mode
```

```

Device2(config-if-vlan7)#exit
Device2(config)#interface vlan8
Device2(config-if-vlan8)#ipv6 pim sparse-mode
Device2(config-if-vlan8)#exit

```

### #Configure Device3.

Enable IPv6 multicast forwarding globally, and enable the multicast protocol IPv6 PIM-SM on related interfaces.

```

Device3(config)#ipv6 multicast-routing
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 pim sparse-mode
Device3(config-if-vlan6)#exit
Device3(config)#interface vlan8
Device3(config-if-vlan8)#ipv6 pim sparse-mode
Device3(config-if-vlan8)#exit
Device3(config)#interface vlan9
Device3(config-if-vlan9)#ipv6 pim sparse-mode
Device3(config-if-vlan9)#exit

```

#View, for Device 3, interface information with IPv6 PIM-SM protocol enabled and IPv6 PIM-SM neighbor information.

```

Device3#show ipv6 pim interface

## Note

- Device 1 and Device 2 are viewed the same way as Device 3, and the viewing process is omitted.
- 

Step 6: On Device 2 and Device 3, the multicast source is controlled so that PC can only receive the multicast service packet sent by Multicast Server 1.

#On Device 2, configure the access list of accepted registration messages to filter out the registration messages of Multicast Server 4.

```
Device2(config)#ipv6 access-list extended 7001
Device2(config-std-nacl)#deny ipv6 host 2001:4::2 any
Device2(config-std-nacl)#permit ipv6 any any
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#ipv6 pim accept-register list 7001
```

#Configure incoming IPv6 acl on interfaces vlan 6 and vlan 8 of Device 3 to filter out the multicast service packet of Multicast Server 3.

```
Device3(config)#ipv6 access-list extended 7001
Device3(config-v6-list)#deny ipv6 host 2001:3::2 any
Device3(config-v6-list)#permit ipv6 any any
Device3(config-v6-list)#commit
Device3(config-v6-list)#exit
Device3(config)#interface vlan6
Device3(config-if-vlan6)#ipv6 access-group 7001 in
Device3(config-if-vlan6)#exit
Device3(config)#interface vlan8
```

```
Device3(config-if-vlan8)#ipv6 access-group 7001 in
Device3(config-if-vlan8)#exit
```

#Configure outgoing IPv6 acl on interface vlan 9 of Device 3 to filter out the multicast service packet of Multicast Server 2.

```
Device3(config)#ipv6 access-list extended 7002
Device3(config-v6-list)#deny ipv6 host 2001:2::2 any
Device3(config-v6-list)#permit ipv6 any any
Device3(config-v6-list)#commit
Device3(config-v6-list)#exit
Device3(config)#interface vlan9
Device3(config-if-vlan9)#ipv6 access-group 7002 out
Device3(config-if-vlan9)#exit
```

Step 7: Check the result.

#PC sends an MLDv2 membership report to join the multicast group FF10::1.

#Multicast Server 1, Multicast Server 2, Multicast Server 3, Multicast Server 4 all send multicast service packets of the multicast group FF10::1.

#View the multicast membership table of Device 3.

#PC can only receive the multicast service packet sent by Multicast Server 1.

---

## Caution

- When performing multicast source control, you are advised to configure multicast source control first and then demand the multicast source. By default, the receiving DR will switch SPTs after receiving the multicast service packet. If the multicast source is demanded before the multicast forwarding control is performed, the multicast forwarding control will not take effect. To prevent the multicast forwarding control from failing, you can configure SPT switching disallowed on the receiving DR.
- 

# 76 Hardware QoS

---

## 76.1 Overview

### 76.1.1 Background

In the traditional IP network, the forwarding device treats all packets equally, adopts “First in, first out” (FIFO) to process all packets and tries best effort to transmit the packet to the destination, so it cannot provide any guarantee for the reliability and delay of the packet transmission.

However, with the development of the IP network, the new applications based on the IP network emerge in endlessly, which put forward new requirements for the service quality of the IP network, especially the demand for the service packets with high real-time requirement is more obvious. For example, the network flow media, VoIP and other real-time services put forward high requirement for the transmission delay of the packets. If the packet transmission delay is long, the user cannot accept (relatively, E-mail and FTP services are not sensitive to the transmission delay). To support the communication services with different service quality requirements, it is required that the network can intelligently distinguish different communication types, so as to provide the corresponding service. The capability of distinguishing the communication types is the basic premise of providing different service qualities for different communications, so the best-effort service mode of the traditional IP network cannot meet the requirements of the present IP network application. The QoS (Quality of Service) technology is to solve the problem, so as to meet the different service quality requirements of the users for the network.

### 76.1.2 Service Model

QoS provides the following three kinds of service models, that is, Best-Effort service, Integrated service, and Differentiated service (DiffServ for short).

Best-Effort is a single service model and also the simplest service model. The application program can send out any quantity of packets at any time without getting the permission or informing the network in advance. For the best-effort service, the network tries best to send the packets, but does not provide any guarantee for the transmission delay and reliability of the packets. Best-Effort is the default service model of Internet and is applicable to most of network applications, such as FTP and E-Mail. It is realized via the FIFO queue mechanism.

IntServ is one service model that can provide various service types. It can meet various QoS requirements. Before sending packets, the service model needs to apply for the specified service resources from the network. The request is completed via the RSVP signaling. RSVP applies for the network resources for the application before the application program starts to send packets, so it belongs to the out-band signaling. Before sending data, the application program first informs the network of its own traffic parameters and the needed specified service quality request, including bandwidth, delay and so on. After receiving the resource request of the application program, the network executes the resource distributing check, that is, judge whether to distribute resources for the application program based on the resource application of the application program and the present

resources of the network. Once the network confirms to distribute resources for the application program, the network maintains one state for the specified flow (Flow, confirmed by the IP addresses, port numbers and protocol numbers of the two sides) and executes the packet classification, traffic monitoring, queuing and scheduling based on the state. After receiving the confirming information of the network (that is, confirm that the network already reserves resources for the packets of the application program), the application program can send packets. As long as the packets of the application program are controlled within the range described by the traffic parameters, the network will undertake to meet the QoS requirements of the application program.

DiffServ classifies the communications according to the service requirements, and then processes the ingress and egress packets according to the classification result, so as to ensure that the network is always in the good communication connection status. It is one multi-channel service model and can meet the QoS requirements of different flows. The largest difference with IntServ is that DiffServ can reserve resources in the network without signaling exchange. It just functions on one port of one transmission device in the network, processing the ingress and egress packets of the port. DiffServ does not need to maintain the status information for each kind of communication. It distinguishes the QoS level of each packet according to the configured QoS mechanism and provides the service for the packet according to the level. Therefore, the mechanism providing the QoS scheme is also called CoS. There are many classification methods and the common modes are to classify according to the priority of the IP packet, classify according to the source, destination address and port of the packet, classify according to the packet protocol, classify according to the packet size and packet ingress port, and so on.

Priority mapping, flow classification, traffic monitoring, traffic shaping, congestion management and congestion avoidance are the main components of DiffServ. The flow classification identifies the packets according to some matching rules and is the basis and premise of DiffServ; traffic monitoring, traffic shaping, congestion management and congestion avoidance distribute and schedule the resources for the network traffic from different aspects and they are the embodiment of the DiffServ idea.

### **76.1.3 Introduction to QoS Functions**

#### **Priority Mapping**

Priority mapping includes the ingress mapping and egress mapping. Ingress mapping maps to the local priority (LP) according to the 802.1p priority and DSCP value in the packet; egress mapping maps to the 802.1p priority and DSCP value according to the local priority (LP) of the packet. Priority mapping serves for the queue scheduling and congestion control.

The device supports four kinds of priority mapping: mapping the packet DSCP to the local priority (LP); mapping the 802.1p priority of the packet to the local priority (LP); mapping the local priority (LP) of the packet to the egress 802.1p priority of the packet; mapping the local priority (LP) of the packet to the egress DSCP value of the packet. The diagram of the priority mapping relation is as follows:

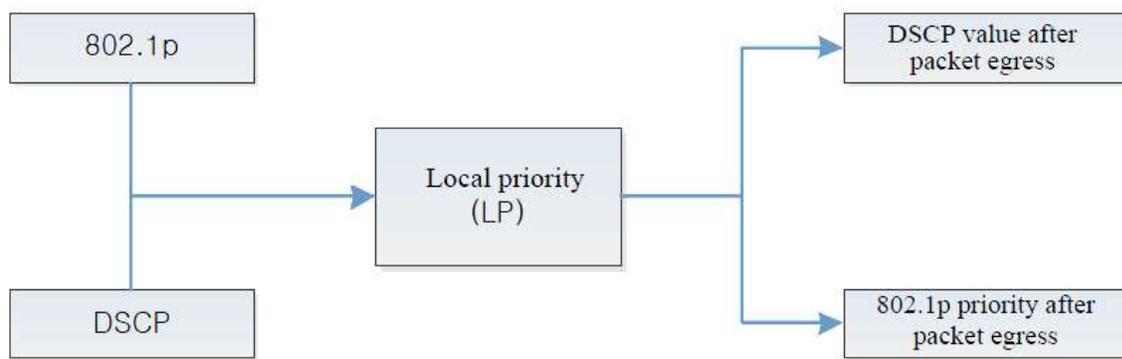

Figure 76-1 Diagram of Priority Mapping Relation

### Flow Classification

Flow classification adopts some rule to identify the packets that comply with one feature, divides the packets of different features to multiple classes, and then uses the corresponding QoS mechanism to provide different services for different classes. Therefore, the flow classification is the premise and basis of providing different services.

Flow classification includes counter, meter, flow mirror, redirection and re-remarking.

Counter and meter perform the counting and metering actions according to the result of the flow classification.

Flow mirror means to mirror the matched packets to the specified ports.

Redirection means to redirect the matched packets to the specified port or the specified next hop.

Re-marking means to set or modify the attributes of one kind of packets. After dividing the packets to different kinds via the flow classification, re-marking can modify the attributes of the packet. Prepare for the subsequent processing of the packet.

### Traffic Monitoring

Traffic monitoring limits the speed of the ingress packets via the token bucket. To ensure that the overload does not happen to the traffic passing the network and causes the congestion, the device provides the rate limitation based on the port receiving direction, limiting the total rate at the receiving direction of the port. The speeding traffic is dropped.

### Traffic Shaping

The typical function of the traffic shaping means to limit the traffic of flowing out from one network, making the packets sent with an average rate. Usually, it is divided to the port traffic shaping and queue traffic shaping. When the sending rate of the packets exceeds the shaping rate, the speeding packets are buffered in the queue and then are sent out with an average rate. The difference between the traffic shaping and traffic monitoring: When using the traffic monitoring to control the packet traffic, the speeding packets are not buffered, but are directly dropped, while the traffic shaping buffers the

speeding packets, reducing the dropped packets caused by the burst traffic. However, the traffic shaping may increase the delay, while the traffic monitoring nearly does not increase the delay.

### **Congestion Management**

When the device traffic load is light, do not generate the congestion and the packets are forwarded out when reaching the port. When the arriving rate of the packets is larger than the sending rate of the port and exceeds the processing limit of the port or the device resources are not enough, congestion happens to the device. The congestion may make the communication of the whole network become unreliable. The end-to-end delay, jitter and packet loss rate used to measure the network service quality all increase. If enabling the congestion management and when the congestion happens, the packets queue at the port and waits for the port to forward. The congestion management usually adopts the queue technology and the port determines which queue the packet should be placed according to the packet priority and queue mechanism and how to schedule and forward packets.

The common scheduling includes SP (Strict Priority), RR (Round Robin), and WDRR (Weighted Deficit Round Robin).

SP (Strict Priority): There are eight queues on the port, queue 0-7. Queue 7 has the highest priority and queue 0 has the lowest priority.

RR (Round Robin): After one queue schedules one packet, turn to the next queue.

WDRR (Weighted Deficit Round Robin): The algorithm is based on two variables, that is, quantum and credit counter. The quantum means the weight in the unit of byte and it is a configurable parameter. The credit counter means the accumulation and consumption of the quantum, which is a status parameter and cannot be configured. In the initial state, the credit counter of each queue is equal to the quantum. Every time the queue sends a packet, subtract the byte number of the packet from the credit counter. When the credit counter is lower than 0, stop the scheduling of the queue. When all queues stop scheduling, supplement quantum for all queues.

### **Congestion Avoidance**

The congestion avoidance technology monitors the communication load of the network, so as to avoid the congestion before the network congestion happens. The common used technology is WRED (Weighted Random Early Detection). The difference with the tail drop method is that WRED selects the dropped packet according to the DSCP or IP priority and can provide different performance features for different service types of data. It also can avoid the TCP global synchronization.

In the WRED algorithm, the start point of the queue drop packet is marked as DropStartPoint and the end point of the drop is marked as DropEndPoint. When the average length of the queue is between DropStartPoint and DropEndPoint, WRED drops the packet at random by the corresponding drop rate, while when the queue length exceeds DropEndPoint, drop the packet by 100%. When the queue length is smaller than DropStartPoint, WRED does not drop the packet.

The following figure is a schematic diagram on How WRED Works:

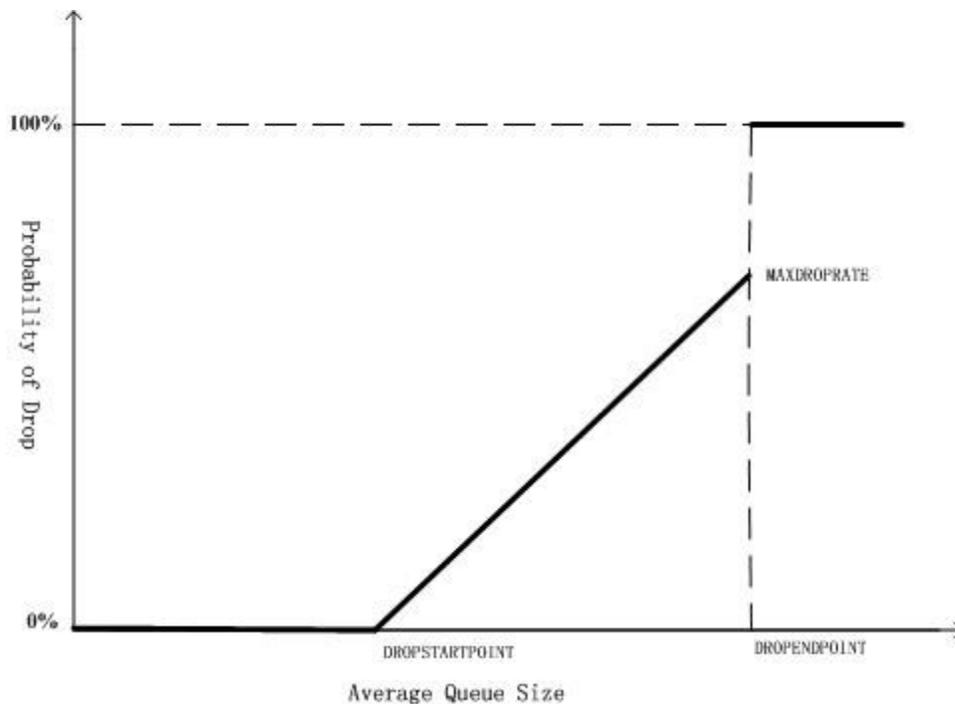

Figure 76-2 Schematic Diagram on How WRED Works

### Action Group Function

To support the flow classification and traffic control, the device extends the traditional ACL so that ACL and ACL rule can be bound with one action group respectively, adopting the corresponding action for the matched packet. The action group contains the configurations of the counter, meter, flow mirror, redirection and remarking.

For various ACLs and ACL rules being used in different function domains, the configurations of the action groups are different. For the ingress ACL, the used action group of IP ACL is L3 action group and the used action group of MAC ACL is L2 action group. The egress action group is used at the egress direction of ACL. The VFP action group is used to realize the flow-based QinQ. Each ACL can be bound with various action groups, but the effective one depends on the function domain bound with the ACL. For example, one rule of IP ACL is configured with L3 action group, egress action group and VFP action group at the same time. When the IP ACL is applied at the ingress direction, the action in the L3 action group take effect and the actions in the other two action groups do not take effect.

The policy route in the action group is one packet forwarding mechanism for flexible routing based on the destination network. The policy route classifies the packets via Content Aware Processor and forwards the data flow that complies with the classification rule according to the specified next hop. When some packet is routed by other path, but not the shortest path, we can enable the policy route. The policy route can be enabled when some packets need to be routed by other paths instead of the clear shortest path. The priority of the policy route is higher than any other route. Therefore, once the user configures enabling the policy route, the packet sending is processed according to the policy route. Only when the access list matching fails, we can continue to forward according to the searching result of the forwarding table. Otherwise, forward the packet according to the specified next-hop information of

the route policy. The specified next hop of the policy route should be the direct-connected next hop. For the non-direct-connected next-hop address, the system permits to configure, but in fact, it is invalid.

## 76.2 Hardware QoS Function Configuration

Table 76-1 Hardware QoS Function Configuration List

Configuration Task	
Configure Priority Mapping	Configure Priority Mapping
	Configure Default Priority Mapping
Configure Flow Classification	Configure Counter
	Configure Meter
	Configure Flow Mirror
	Configure Redirection
	Configure Re-marking I2-priority
	Configure Re-marking I3-priority
Configure Traffic Monitoring	Configure Port-based Rate Limitation
Configure Traffic Shaping	Configure Queue-based Traffic Shaping
	Configure Port-based Traffic Shaping
Configure Congestion Management	Configure Scheduling Policy of Port Queue
Configure Congestion Avoidance	Configure Drop Mode
Configure VFP Action Group	Configure Processing of Single VLAN Tag Packets
	Configure Processing of Double VLAN Tag Packets
	Configure Processing of Packets without VLAN Tags

Configuration Task	
	Configure Binding of VRF in VFP Action Group
Configure Priority-Based Flow Control	Configure Priority-Based Flow Control
Configure explicit congestion notification	Configure explicit congestion notification

### 76.2.1 Configure Priority Mapping

Priority mapping is the mapping among the 802.1p priority, DSCP value and local priority (LP) in the packet. Modify or distribute the priority field of the packet to serve for the congestion avoidance and congestion management.

#### Configuration Condition

None

#### Configure Priority Mapping

Priority mapping includes the ingress mapping and egress mapping. The ingress mapping maps to the local priority (LP) according to the 802.1p priority and DSCP value in the packet; the egress mapping maps to the 802.1p priority and DSCP value according to the local priority (LP).

Table 76-2 Configuring Priority Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure priority mapping template	<b>qos map-table {ingress   egress } <i>template-name</i></b>	Mandatory Configure egress and ingress priority templates

Step	Command	Description
Enter the template view	<b>{ dot1p-lp   dscp-lp   lp-dot1p   lp-dscp } index to value</b>	Optional By default, priority mapping under the template is default mapping relation
Binding the priority mapping template to the port	<b>map-table template-name { ingress   egress }</b>	Mandatory By default, no priority mapping template is bound

 说明:

- For the packet with the specified priority entering the queue, you'd better not let the packet enter queue 7, because the packets sent out from CPU all enter queue 7. If queue 7 has too many packets, the packets from CPU may be dropped.
- The dscp-lp mapping and dot1p-lp are configured on the port at the same time. The dscp-lp has higher priority and it takes effect first.
- After enabling the ingress dot1p-lp mapping, the 802.1p priority of the forwarded packet is modified according to the local priority (LP) by default. For example, the dot1p-lp mapping relation is 1 to 5; after matching the 802.1p of the VLAN Tag in the ingress packet to 1, the 802.1p priority of the forwarded packet with VLAN Tag is modified to 5.
- The priority mapping does not take effect for the packet remarked by the action group. First, remark the local priority (LP) at the ingress action group, and then mapping to the 802.1p priority and DSCP value of the packet via the local priority (LP) at the egress takes effect. Remark the 802.1p priority at the ingress and then mapping the local priority and DSCP value via the 802.1p priority does not take effect, but remarking the 802.1p priority itself takes effect. Mapping according to the 802.1p priority of the original packet also takes effect. That is to say, remarking takes effect separately, the priority mapping takes effect separately, and the priority mapping according to the remarked value does not take effect.
- If the QINQ function is enabled on the port, and the template bound to the port includes dot1p-lp and dscp-lp mappings, maybe you cannot get the desired mapping result. Therefore, it is recommended not to enable QinQ and bind the priority mapping function on one port at the same time.
- After configuring the lp-dscp mapping, the default mapping of lp-dscp is 0 to 7, 1 to 8, 2 to 16, 3 to 24, 4 to 32, 5 to 40, 6 to 48, and 7 to 56.

## Configure Default Priority Mapping

The default priority mapping, the same as the priority mapping, has the ingress and egress mapping. The difference lies in that the default priority mapping maps the entries not configured with priority mapping to the default value.

Table 76-3 Configuring Default Priority Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure priority mapping template	<b>qos map-table {ingress   egress } <i>template-name</i></b>	Mandatory Configure egress and ingress priority templates
Configure Default Priority Mapping	<b>{ dot1p-lp   dscp-lp   lp-dot1p   lp-dscp } default <i>value</i></b>	Mandatory By default, no default priority mapping is configured

## 76.2.2 Configure Flow Classification

Flow classification adopts some rule to identify the packets that comply with one feature, divides the packets of different features to multiple classes, and then uses the corresponding QoS mechanism to provide different services for different classes. Therefore, the flow classification is the premise and basis of providing different services.

### Configuration Condition

Before configuring the flow classification, first complete the following task:

- Configure the ACL.

### Configure Counter

Configuring counting action in the action group aims to count the number of the matched packets.

Table 76-4 Configuring the Counter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure L3 action group and enter L3 action group configuration mode	<b>l3-action-group</b> <i>l3-action-group-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current L3 action group after you enter the L3 action group configuration mode, only on the current L2 action group after you enter the L2 action group configuration mode, only on the current egress action group after you enter the egress action group configuration mode
Configure L2 action group and enter L2 action group configuration mode	<b>l2-action-group</b> <i>l2-action-group-name</i>	
Configure egress action group and enter egress action group configuration mode	<b>egr-action-group</b> <i>egr-action-group-name</i>	
Configure Counter	<b>count { all-colors }</b>	Mandatory  By default, packets are not counted in the action group

## Configure Meter

Configure the meter in the action group to limit the rate or mark the matched packets. When configuring a nonexistent meter, the meter takes effect immediately when the specified meter is configured. When no meter is configured in the action group, all matched packets are considered as green packets. When a meter is configured in the action group for coloring the packets, the packets will be marked in green, yellow, and red according to the packet traffic, and then the counter will count the number of the packets of different colors.

Table 76-5 Configuring Meter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the meter and enter the meter mode	<b>traffic-meter</b> <i>traffic-meter-name</i>	Mandatory  By default, the action for yellow packets in the meter is drop, and the meter mode is not configured  After entering the meter configuration, one complete meter configuration contains the meter action for yellow packets and meter mode configuration, and the incomplete configuration will not take effect
Configure meter action	<b>meter action {yellow   red} { drop   transmit }</b>	Optional  By default, the action for yellow packets in the meter is drop
Configure meter mode	<b>meter mode { srtcm cir cbs ebs   trtcm cir cbs pir pbs }</b>	Mandatory  By default, the meter mode is not configured
Enter the global configuration mode.	<b>exit</b>	-
Configure L3 action group and enter L3 action group configuration mode	<b>l3-action-group</b> <i>l3-action-group-name</i>	At least one option must be selected.  The subsequent
Configure L2 action group and enter L2 action group configuration mode	<b>l2-action-group</b> <i>l2-action-group-name</i>	configuration takes effect only on the current L3 action group after you enter the L3 action group

Step	Command	Description
Configure egress action group and enter egress action group configuration mode	<b>egr-action-group</b> <i>egr-action-group-name</i>	configuration mode, only on the current L2 action group after you enter the L2 action group configuration mode, only on the current egress action group after you enter the egress action group configuration mode
Configure to bind the meter	<b>meter</b> <i>traffic-meter-name</i>	Mandatory  By default, no meter is bound

 说明:

- If the ACL bound to the objects is configured with the action group and the action group is configured with a meter for limiting the rate, conflicted rate limitation actions may exist. When the rate limitation is applied, the packets in red and yellow are dropped. For example, port 0/1 belongs to VLAN 1, ACL on port 0/1 permits the packets with the source IP address 1.1.1.1 to pass, and the action to limit its traffic to 5Mbps is configured. Whereas, ACL on VLAN 1 permits the packets with the IP address 1.1.1.1 to pass, and the action to limit its traffic to 1Mbps is configured. In this situation, the minimum rate in the packet channel will take effect and the traffic is configured within 1 Mbps. Specially, due to the hardware limitation, the actual traffic for multi-level rate limitation will be less than the minimum rate in the packet channel. Therefore, multi-level rate limitation is not recommended when an accurate rate limitation is needed.
- The meter in the egress action group does not support the remark lp or remark dotlp-lp action.
- Remarking of yellow packets is not supported.
- The meter is based on the chips. That is, the meter on each chip limits the traffic rate over the port. If the meter exists in two different chips under the link aggregation port, a meter exists in each chip and thus the rate limitation has the effect twice of the expected rate limitation effect.
- If a meter is applied to the VLAN, the meter takes effect for each chip on each line card. VLAN objects are limited within 10 Mbps. If five single-core line cards exist on the device, the 10 Mbps traffic takes effect for a pair of line cards. That is, the traffic on each line card complying with the VLAN rate limitation is 10 Mbps. If two chips exist on a line card, the traffic for each chip on the line card is 10 Mbps.

## Configure Flow Mirror

Configuring the flow mirror in the action group aims to specify the matched packet to the port.

Table 76-6 Configuring Flow Mirror

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure L3 action group and enter L3 action group configuration mode	<b>l3-action-group</b> <i>l3-action-group-name</i>	At least one option must be selected.
Configure L2 action group and enter L2 action group configuration mode	<b>l2-action-group</b> <i>l2-action-group-name</i>	The subsequent configuration takes effect only on the current L3 action group after you enter the L3 action group configuration mode, and only on the current L2 action group after you enter the L2 action group configuration mode
Configure Flow Mirror	<b>mirror interface</b> <i>interface-name</i>	Mandatory By default, no flow mirror is configured

## Configure Redirection

Configuring the packet redirection in the action group aims to redirect the matched packets to the specified port or the specified next hop.

Table 76-7 Configuring Redirection

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure L3 action group and enter L3 action group configuration mode	<b>I3-action-group</b> <i>l3-action-group-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current L3 action group after you enter the L3 action group configuration mode, and only on the current L2 action group after you enter the L2 action group configuration mode
Configure L2 action group and enter L2 action group configuration mode	<b>I2-action-group</b> <i>l2-action-group-name</i>	
Configure Redirection	<b>redirect { interface</b> <i>interface-name</i> <b>  interface link-aggregation</b> <i>link-aggregation-id</i> <b>}</b>	Mandatory  By default, no packet redirection is configured

### Configure Re-marking I2-priority

Configuring packet remarking in the action group aims to classify the matched packets. So users are allowed to adopt different QoS policies in the subsequent data communications.

Table 76-8 Configuring Remarking I2-priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure L3 action group and enter L3 action group configuration mode	<b>I3-action-group</b> <i>l3-action-group-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current L3 action group after you enter the L3 action group
Configure L2 action group and enter L2 action group configuration mode	<b>I2-action-group</b> <i>l2-action-group-name</i>	

Step	Command	Description
Configure egress action group and enter egress action group configuration mode	<b>egr-action-group</b> <i>egr-action-group-name</i>	configuration mode, only on the current L2 action group after you enter the L2 action group configuration mode, only on the current egress action group after you enter the egress action group configuration mode
Configure Re-marking l2-priority	<b>remark l2-priority</b> { <b>dscp</b> <i>dscp-value</i>   {{ <b>dot1p</b>   <b>dot1p-lp</b>   <b>lp</b> }} { <i>priority-value</i>   <b>precedence</b> }}	Mandatory  By default, remarking l2-priority is not configured

 说明:

- The action group does not support using the priority field in the IP packet TOS to remark the 802.1p priority in the VLAN Tag.
- The egress action group does not support the remark action.

### Configure Re-marking l3-priority

Configuring packet remarking in the action group aims to classify the matched packets. So users are allowed to adopt different QoS policies in the subsequent data communications.

Table 76-9 Configuring Remarking l3-priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure L3 action group and enter L3 action group configuration mode	<b>l3-action-group</b> <i>l3-action-group-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current L3 action group after you
Configure egress action group and enter egress	<b>egr-action-group</b> <i>egr-action-group-name</i>	

Step	Command	Description
action group configuration mode		enter the L3 action group configuration mode, and only on the current egress group after you enter the egress action group configuration mode
Configure Re-marking l3-priority	<b>remark l3-priority</b> { <b>dscp</b> <i>dscp-value</i>   <b>precedence</b> { <i>priority-value</i>   <b>dot1p</b> }}	Mandatory By default, remarking l3-priority is not configured

 说明:

- If the ACL bound to the objects is configured with the action group, re-marking confliction may exist. For example, port 0/1 belongs to VLAN1, the ACL on port 0/1 permits the packets of the source IP address 1.1.1.1 to pass, and the action for re-marking the DSCP field as 5 is configured. The ACL of VLAN 1 permits the packets of the IP address 1.1.1.1 to pass and the action for remarking the DSCP field as 4 is configured. In this situation, this situation is handled based on port > VLAN > global and MAC ACL > IP ACL by priority and the final remarking value is 5.
- If the ACL bound to the objects is configured with the action group, conflict-free re-marking action may exist. For example, port 0/1 belongs to VLAN1, the ACL on port 0/1 permits the packets of the source IP address 1.1.1.1 to pass, and the action for re-marking the DSCP field as 5 is configured. The ACL of VLAN 1 permits the packets of the IP address 1.1.1.1 to pass and the 802.1p priority is re-marked as 4. For the conflict-free remarking action, the packet DSCP will be marked as 5 and the 802.1p priority will be marked as 4.
- The action group does not support using the 802.1p priority in the VLAN Tag to remark the priority field in the IP packet TOS.
- The egress action group does not support the remark action.

### 76.2.3 Configure Traffic Monitoring

To ensure that the overload does not happen to the traffic passing the network and causes the congestion, the device provides the rate limitation based on the port receiving direction, limiting the total rate at the receiving direction of the port. The speeding traffic is dropped.

#### Configuration Condition

None

### Configure Port-based Rate Limitation

To provide different rate limitations for ports at different time periods, each port is configured with eight rate limitations of different priorities. Each rate is limited and then bound to a time domain. For the entries taking effect at the same time, determine which entry takes effect by priority. The number 0 indicates the highest priority and the number 7 indicates the lowest priority. The rate limitation over the port can be configured directly without the time domain.

Table 76-10 Configuring Port-based Rate Limitation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure port-based rate limiting	<b>rate-limit</b> { <b>default rate</b> <i>burst-size</i>   <i>priority rate</i> <i>burst-size</i> [ <b>time-range</b> <i>time-range-name</i> ] }	Mandatory By default, no flow limit is configured on the port

## 76.2.4 Configure Traffic Shaping

The traffic shaping enables the packets to be sent out at an average rate. The difference between the traffic shaping and traffic monitoring: the traffic monitoring takes effect in the ingress direction and the traffic shaping takes effect in the egress direction. The excessive traffic at the ingress direction will be dropped, but the excessive traffic at the egress direction will be cached.

### Configuration Condition

None

### Configure Queue-based Traffic Shaping

Queue-based traffic shaping enables the traffic in the queue to be sent out at an average rate. Different traffic shaping can be performed for different queues as required.

Table 76-11 Configuring Queue-based Traffic Shaping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Queue-based Traffic Shaping	<b>traffic-shape queue</b> <i>queue-id</i> { { <b>cir</b> <i>cir</i> [ <b>cbs</b> <i>cbs</i> ] <b>pir</b> <i>pir</i> [ <b>pbs</b> <i>pbs</i> ] }   { <b>cir</b> <i>cir</i> [ <b>cbs</b> <i>cbs</i> ] }   { <b>pir</b> <i>pir</i> [ <b>pbs</b> <i>pbs</i> ] } }	Mandatory  By default, queue-based traffic shaping is not configured

### Configure Port-based Traffic Shaping

The port-based traffic shaping allows the time domain binding to achieve different bandwidths in different time periods. Each port is configured with eight traffic shaping of different priorities and each traffic shaping is bound to a time domain. For the entries taking effect at the same time, determine which entry takes effect by priority. The number 0 indicates the highest priority and the number 7 indicates the lowest priority.

Table 76-12 Configuring Port-based Traffic Shaping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Port-based Traffic Shaping	<b>traffic-shape</b> { { <b>pir</b> <i>rate</i> [ <b>pbs</b> <i>burst-size</i> ] } / { <i>priority</i> <b>pir</b> <i>rate</i> [ <b>pbs</b>	Mandatory

Step	Command	Description
	<i>burst-size</i> ][ <b>time-range</b> <i>range-name</i> ] } }	By default, queue-based traffic shaping is not configured on the port

## 76.2.5 Configure Congestion Management

In a complex network, congestion is common because the current bandwidth cannot satisfy the normal forwarding. Congestion may cause a series of negative problems as follows: the system breaks down because of abundant network resources, the network resource utility is low because of decreased network throughput, and packet transmission delay and jitter increase. Scheduling policy for the port queue is a method for managing the congestion.

### Configuration Condition

None

### Configure Scheduling Policy of Port Queue

The queue-based scheduling policy sends out the classified traffic by a certain priority-level algorithm. Each queue algorithm solves a certain network traffic problem and has great influence on bandwidth resource allocation, delay, and jitter. Queue scheduling processes the packets of different priorities in levels. A packet with high priority will be sent preferentially.

The common scheduling includes SP (Strict Priority), RR (Round Robin) and WDRR (Weighted Deficit Round Robin).

SP (Strict Priority): There are eight queues on the port, queue 0-7. Queue 7 has the highest priority and queue 0 has the lowest priority.

RR (Round Robin): After one queue schedules one packet, turn to the next queue; WRR is Weighted Round Robin. You can configure the number of the packets scheduled by each queue before turning to the next queue;

WDRR (Weighted Deficit Round Robin): The algorithm is based on two variables, that is, quantum and credit counter. The quantum means the weight in the unit of byte and it is a configurable parameter. The credit counter means the accumulation and consumption of the quantum, which is a status parameter and cannot be configured. In the initial state, the credit counter of each queue is equal to the quantum. Every time the queue sends a packet, subtract the byte number of the packet from the credit counter. When the credit counter is lower than 0, stop the scheduling of the queue. When all queues stop scheduling, supplement quantum for all queues.

Table 76-13 Configuring Scheduling Policy of Port Queue

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Scheduling Policy of Port Queue	<b>queue-schedule</b> { <b>sp</b>   <b>rr</b>   {{ <b>wdr</b>   <b>wrr</b> } <i>weight0 weight1 weight2 weight3 weight4 weight5 weight6 weight7</i> }}	Mandatory  By default, strict priority (SP) scheduling is used as the scheduling policy of port queue

## 76.2.6 Configure Congestion Avoidance

The congestion avoidance technology monitors the network resource utility and communication load of the network, so as to avoid the congestion by actively dropping packets before the network congestion happens or worsens. Excessive congestion exerts great harm on network resources and therefore, a certain measure must be adopted to relieve the congestion. The common measure is to configure the packet drop mode.

### Configuration Condition

None

### Configure Drop Mode

Tail drop and WRED (Weighted Random Early Detection) are two common packet drop modes.

**Tail drop:** It is a traditional packet drop policy. When the queue length reaches the maximum value, all new packets will be dropped. This packet drop policy may cause TCP global synchronization. When the packets connected by multiple TCPs are dropped in a queue, multiple TCP connections will enter the congestion avoidance and slow-start status to decrease and adjust the traffic, and then the traffic peak may occur simultaneously at a time. Repeatedly, the traffic and network are unstable.

**WRED:** When the queue length exceeds its own length, the packets are dropped by 100%. When the queue length is less than the start-value, do not drop any packet. When the queue length is greater than the start-value, drop packets at random according to the configured value. The random number generated by the WRED is based on the priority. The WRED introduces the IP priority to distinguish from

the packet drop policy. The packet with high priority is considered for its benefit and this packet will be dropped in a relatively low probability.

Table 76-14 Configuring Drop Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Drop Mode	<b>drop-mode</b> <i>cos-value</i> { <b>tail-drop</b>   <b>wred drop-start</b> start-value <b>drop-rate</b> drop-rate-value [ <b>only-tcp</b>   <b>all</b> ] }	Mandatory  By default, the drop mode of port queue is tail-drop

### 76.2.7 Configure VFP Action Group

The VFP (VLAN Filter Processor) action group involves actions used to classify packets and re-specify single VLAN Tag packets, double VLAN Tag packets, and packets without VLAN tags.

#### Configuration Condition

Before configuring the VFP action group, do the following:

- Configure the ACL.

#### Configure Processing of Single VLAN Tag Packets

Configuring processing of single VLAN Tag packets in the VFP action group is mainly concerned with matching and processing of the 802.1P priorities and VLAN numbers in the VLAN Tags.

Table 76-15 Configuring Processing of Single VLAN Tag Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure the VFP action group and enter the VFP action group configuration mode	<b>vfp-action-group</b> <i>vfp-action-group-name</i>	Mandatory  By default, no VFP action group is configured
Configure Processing of Single VLAN Tag Packets	<b>one-tag</b> { <b>match-vlan</b> { <b>any</b>   <i>vlan-id</i> }   <b>ovlan-act</b> { <b>add-ovlan</b> <i>vlan-id</i> [ <b>priority</b> <i>priority-value</i> ] }   <b>replace-vlan</b> <i>vlan-id</i> }	Mandatory  By default, processing of single VLAN Tag packets is not configured

### Configure Processing of Double VLAN Tag Packets

Configuring processing of double VLAN Tag packets in the VFP action group is mainly concerned with matching and processing of the 802.1P priorities and VLAN numbers in the inner and outer VLAN Tags.

Table 76-16 Configuring Processing of Double VLAN Tag Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the VFP action group and enter the VFP action group configuration mode	<b>vfp-action-group</b> <i>vfp-action-group-name</i>	Mandatory  By default, no VFP action group is configured
Configure Processing of Double VLAN Tag Packets	<b>double-tag</b> { <b>invlan-act</b> { <b>delete-invlan</b>   <b>replace-invlan</b> <i>vlan-id</i> }   <b>match-invlan</b> { <b>any</b>   <i>vlan-id</i> }   <b>match-ovlan</b> { <b>any</b>   <i>vlan-id</i> }   <b>ovlan-act</b> <b>replace-ovlan</b> <i>vlan-id</i> }	Mandatory  By default, processing of double VLAN Tag packets is not configured

### Configure Processing of Packets without VLAN Tags

Configuring processing of packets without VLAN tags in the VFP action group is mainly concerned with configuring the addition of actions into the inner and outer VLAN Tags.

Table 76-17 Configuring Processing of Packets without VLAN Tags

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the VFP action group and enter the VFP action group configuration mode	<b>vfp-action-group</b> <i>vfp-action-group-name</i>	Mandatory By default, no VFP action group is configured
Configure Processing of Packets without VLAN Tags	<b>untag { invlan-act add- invlan <i>vlan-id</i> }   ovlan-act add-ovlan <i>vlan-id</i></b>	Mandatory By default, processing of packets without VLAN Tags is not configured

### Configure Binding of VRF in VFP Action Group

Table 76-18 Configuring Binding of VRF in VFP Action Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the VFP action group and enter the VFP action group configuration mode	<b>vfp-action-group</b> <i>vfp-action-group-name</i>	Mandatory By default, no VFP action group is configured
Configure Binding of VRF in VFP Action Group	<b>vrfset <i>vrf-name</i></b>	Mandatory By default, binding VRF is not performed in the VFP action group

## 76.2.8 Configure explicit congestion notification

In the case of explicit congestion notification, when congestion occurs on the device, the ECN field in the header of IP packets is marked. Then, the receiving end sends Congestion Notification Packets (CNP packets) to the sending end to alleviate congestion and implement end-to-end congestion management

### Configuration Condition

None

### Configure explicit congestion notification

In the case of ECN (Explicit Congestion Notification), it defines a traffic control and end-to-end congestion notification mechanism based on IP layer and transport layer. The ECN function uses the DS field in the IP packet header to mark the congestion status on the packet transport path. The terminal device that supports this function can identify congestion on the transport path based on the packet content and adjust the sending mode of packets to avoid intensified congestion.

Table 76-19 Configuring Explicit Congestion Notification Function Of Device

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Turn on the explicit congestion notification function	<b>ecn</b>	-

## 76.2.9 Configure Traffic Flooding

By default, unknown broadcast, unknown multicast, and unknown unicast packets will flood in the VLAN. If the masking function is enabled on the port, the port will not send these packets.

### Configuration Condition

None

### Configure Port-based Traffic Flooding

Table 7620 Configuring Explicit Congestion Notification Function Of Device

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Port-based Traffic Flooding	<b>flood-control { bcast   unknown-mcast   unknown-ucast }</b>	Mandatory  By default, traffic flooding is enabled on the port.

## 76.2.10 Hardware QoS Monitoring and Maintaining

Table 76-21 Hardware QoS Monitoring and Maintaining

Command	Description
<b>show drop-mode</b> [ <b>interface</b> <i>interface-name</i> ]	Show the drop mode of the port queue
<b>show egr-action-group</b> [ <i>egr-action-group-name</i> ]	Show related configuration information of the egress action group
<b>show l2-action-group</b> [ <i>l2-action-group-name</i> ]	Show related configuration information of the L2 action group
<b>show l3-action-group</b> [ <i>l3-action-group-name</i> ]	Show related configuration information of the L3 action group
<b>show map-table user-name</b> [ <i>template name</i> { <b>ingress</b>   <b>egress</b> } ]	Show priority mapping template information
<b>show queue-schedule</b> [ <b>interface</b> <i>interface-name</i> ]	Show the scheduling policy of the port queue

Command	Description
<b>show rate-limit</b> [ <b>interface</b> <i>interface-name</i> ]	Show rate limit information on the port
<b>show traffic-count</b> { <b>inst-all</b>   <b>inst-global</b>   <b>inst-vlan-range</b>   <b>inst-interface-vlan-range</b>   { <b>inst-interface</b> <i>interface-name</i>   <b>inst-interface-vlan</b> <i>vlan-id</i>   <b>inst-link-aggregation</b> <i>link-aggregation-id</i>   <b>inst-vlan</b> <i>vlan-id</i> } { <b>ip-in</b>   <b>ip-out</b>   <b>ipv6-in</b>   <b>ipv6-out</b>   <b>mac-in</b>   <b>mac-out</b> }	Show counter information of the ACL applied to the specified object
<b>show traffic-meter</b> [ <i>traffic-meter-name</i> ]	Show all information of the traffic meter
<b>show traffic-shape</b> [ <b>interface</b> <i>interface-name</i> ]	Show traffic shaping information on the port and queue
<b>show vfp-action-group</b> [ <i>vfp-action-group-name</i> ]	Show related configuration information of the VFP action group
<b>show ecn</b>	Show whether the explicit congestion notification is enabled on the device

## 76.3 Typical Configuration Example of Hardware QoS

### 76.3.1 Configure Priority Mapping

#### Network Requirements

- There are two servers on the network, namely Video Server and Data Server;
- the DSCP value in the video traffic packet is 34, and the DSCP value in the data traffic packet is 38;
- You can configure the priority mapping function so that the 802.1p priority of video traffic packets is 5 and that of data traffic packets is 1.

#### Network Topology

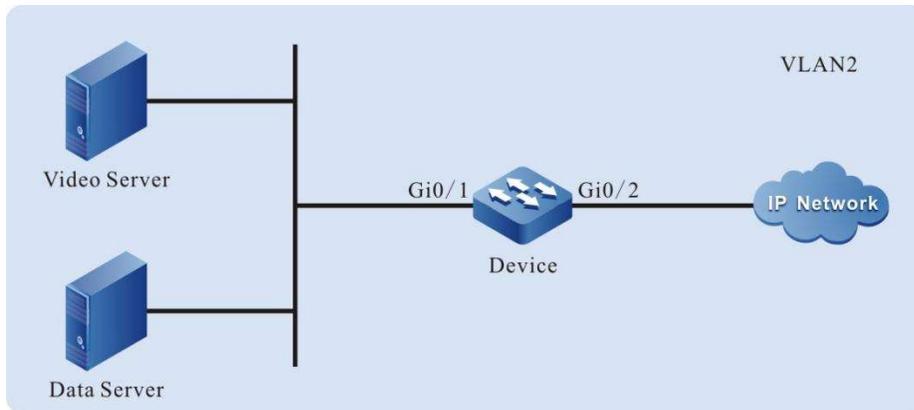

Figure 76-3 Network Topology for Configuring Priority Mapping

### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

*Step 2:* Configure the priority mapping function.

#Configure the priority mapping function globally to map packets with DSCP value 34 to queue 2 and packets with DSCP value 38 to queue 3.

```
Device(config)#qos map-table ingress a
```

```
Device(config-mactable-ingress)#dscp-lp 34 to 2
Device(config-if-gigabitethernet0/1)# dscp-lp 38 to 3
```

#Configure the priority mapping function globally to map 802.1p priority of packets in the queue 2 as 5 and that of packets in the queue 3 as 1.

```
Device(config)#qos map-table egress b
Device(config-mactable-egress)#lp-dot1p 2 to 5
Device(config- mactable-egress)# lp-dot1p 3 to 1
```

#Bind the template and configure trust on the port

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)# map-table a ingress
Device(config-if-gigabitethernet0/1)#qos map-table trust dscp ingress
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)# map-table b egress
```

```
Device(config-if-gigabitethernet0/2)#qos map-table trust dot1p egress
```

*Step*  
3:

Check the result.

#After video traffic and data traffic are processed by Device, the 802.1p priority of the video traffic packets sent from port gigabitethernet0/2 are 5 and the 802.1p priority of the data traffic packets are 1.

## 76.3.2 Configure Remarking

### Network Requirements

- There are two servers on the network, namely Video Server and Data Server;
- You can configure the remarking function so that the 802.1p priority of video traffic packets can be marked as 5 and that of data traffic packets remains unchanged.

### Network Topology

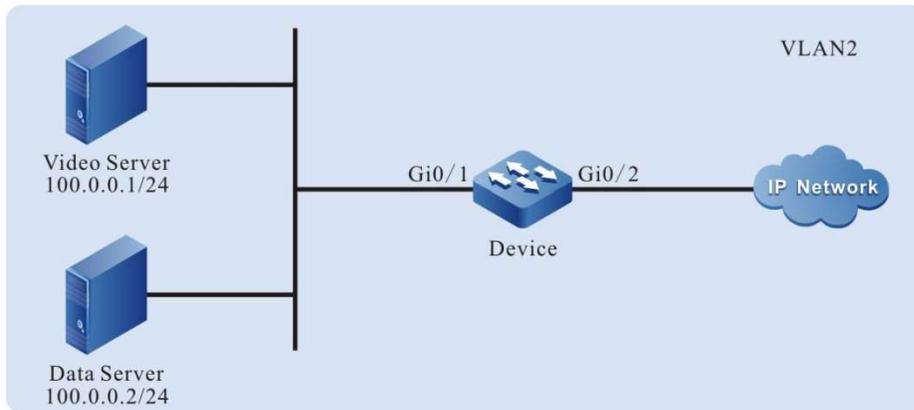

Figure 76-4 Network Topology for Configuring Remarking

### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

*Step 2:* Configure the L3 action group.

#Configure the L3 action group named remark. The action is to remark the 802.1p priority of the packets to 5.

```
Device(config)#l3-action-group remark
Device(config-action-group)#remark l2-priority dot1p 5
Device(config-action-group)#exit
```

*Step*  
3:

Configure the standard IP ACL.

#Configure the standard IP ACL numbered 1 on Device.

```
Device(config)#ip access-list standard 1
```

#Configure binding of rules to the L3 action group named remark so that the 802.1p priority of the video traffic packets can be remarked as 5.

```
Device(config-std-nacl)#permit host 100.0.0.1 l3-action-group remark
```

#Configure rules to allow data traffic to pass without changing the 802.1p priority of packets.

```
Device(config-std-nacl)#permit host 100.0.0.2
```

```
Device(config-std-nacl)#commit
```

```
Device(config-std-nacl)#exit
```

*Step*  
4:

Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the ingress direction of port gigabitethernet0/1 of Device.

```
Device(config)#interface gigabitethernet 0/1
```

```
Device(config-if-gigabitethernet0/1)#ip access-group 1 in
```

```
Device(config-if-gigabitethernet0/1)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
```

```
-----Interface----Bind----Instance-----
```

```
Interface-----Direction----AclType----AclName
```

```
gi0/1          IN      IP      1
```

*Step*  
5:

Check the result.

#After video traffic and data traffic are processed by Device, the 802.1p priority of the video traffic packets sent from port gigabitethernet0/2 is modified into 5, and that of the data traffic packets remains unchanged.

### 76.3.3 Configure Traffic Shaping

#### Network Requirements

- There are two servers on the network, namely Video Server and Data Server;
- Configure the traffic shaping function to ensure that the video traffic rate is 20,000 kbps but the maximum is less than 20,000 kbps, and the sum of the video traffic rate and data traffic rate does not exceed 50,000 kbps. If the video traffic rate is greater than 20,000 kbps, you need to limit the video traffic rate to 20,000 kbps. If the video traffic rate is less than 20,000 kbps, the remaining bandwidth can be occupied by data traffic.

#### Network Topology

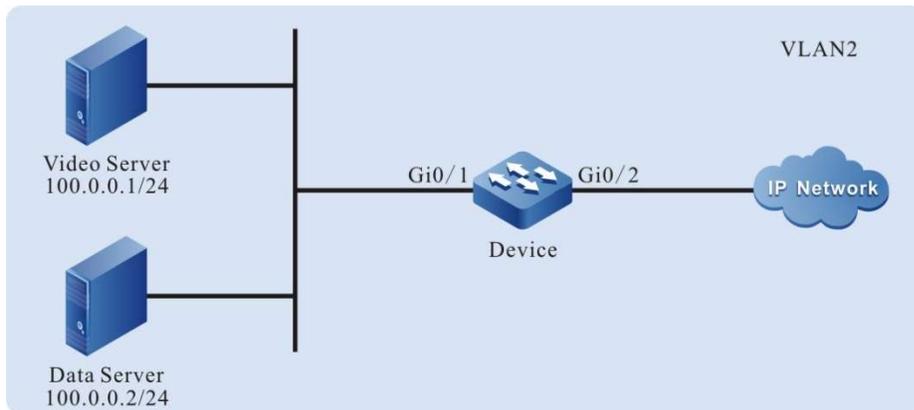

Figure 76-5 Network Topology for Configuring Traffic Shaping

#### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

**#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.**

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

**#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.**

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

*Step  
2:*

**Configure the L3 action group.**

**#Configure the L3 action group named LP7. The action is to remark the packets to queue 7.**

```
Device(config)#l3-action-group LP7
Device(config-action-group)#remark l2-priority 1p 7
Device(config-action-group)#exit
```

**#Configure the L3 action group named LP6. The action is to remark the packets to queue 6.**

```
Device(config)#l3-action-group LP6
Device(config-action-group)#remark l2-priority 1p 6
Device(config-action-group)#exit
```

*Step  
3:*

**Configure the standard IP ACL.**

**#Configure the standard IP ACL numbered 1 on Device.**

```
Device(config)#ip access-list standard 1
```

**#Configure binding of rules to the L3 action group named LP7 so that the video traffic packets can be remarked to the queue 7.**

```
Device(config-std-nacl)#permit host 100.0.0.1 l3-action-group LP7
```

**#Configure binding of rules to the L3 action group named LP6 so that the data traffic packets can be remarked to the queue 6.**

```
Device(config-std-nacl)#permit host 100.0.0.2 13-action-group LP6
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
```

*Step*  
4:

Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the ingress direction of port gigabitethernet0/1 of Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip access-group 1 in
Device(config-if-gigabitethernet0/1)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface-----Bind----Instance-----
Interface-----Direction----AclType----AclName
gi0/1             IN      IP      1
```

*Step*  
5:

Configure the traffic shaping function.

#Configure queue-based traffic shaping on port gigabitethernet0/2. The traffic rate of the queue 7 is limited to 20000 kbps.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#traffic-shape queue 7 cir 20000 pir 20000
```

#Configure queue-based traffic shaping on port gigabitethernet0/2. The traffic rate of the whole port is limited to 50000 kbps.

```
Device(config-if-gigabitethernet0/2)#traffic-shape pir 50000
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
6:

Check the result.

#After video traffic and data traffic are processed by Device, the sum of the video traffic rate and data traffic rate from port gigabitethernet0/2 does not exceed 50000 kbps. If the video traffic rate is greater than 20,000 KBPS, limit the video

traffic rate to 20000 kbps. If the video traffic rate is less than 20000 kbps, the remaining bandwidth can be occupied by data traffic.

### 76.3.4 Configure Rate Limiting

#### Network Requirements

- There are two servers on the network, namely Video Server and Data Server;
- Configure the rate limiting function to limit the sum of the video traffic rate and data traffic rate to not exceed 50000 kbps with the data traffic rate not exceeding 20000 kbps.

#### Network Topology

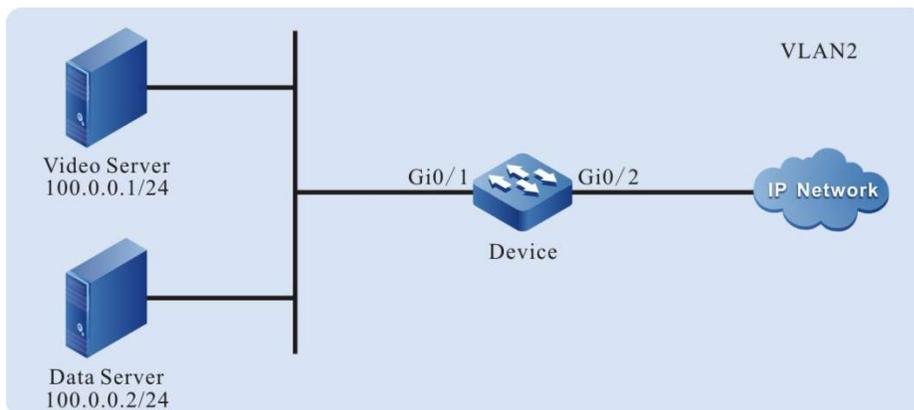

Figure 76-6 Network Topology for Configuring Rate Limiting

#### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
2:

Configure the rate limiting function.

#Configure queue-based traffic limiting on port gigabitethernet0/1. The traffic rate is limited to 50000 kbps.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#rate-limit default 50000 4096
Device(config-if-gigabitethernet0/1)#exit
```

*Step*  
3:

Configure the meter function.

#Configure the traffic meter named data\_stream. The traffic rate is limited to 20000 kbps.

```
Device(config)#traffic-meter data_stream
Device(config-meter)#meter mode srtcm 20000 4096 4096
Device(config-meter)#exit
```

*Step*  
4:

Configure the egress action group.

#Configure the egress action group named data\_stream, and apply the traffic meter in the egress action group.

```
Device(config)#egr-action-group data_stream
Device(config-egract-group)#meter data_stream
Device(config-egract-group)#exit
```

*Step*  
5:

Configure the standard IP ACL.

#Configure the standard IP ACL numbered 1 on Device.

```
Device(config)#ip access-list standard 1
```

#Configure binding of rules to the egress action group named data\_stream. The data rate is limited to 20000 kbps.

```
Device(config-std-nacl)#permit host 100.0.0.2 egr-action-group data_stream
```

#Configure rules to allow video traffic to pass.

```
Device(config-std-nacl)#permit host 100.0.0.1
```

```
Device(config-std-nacl)#commit
```

```
Device(config-std-nacl)#exit
```

*Step*  
*6:*

Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the egress direction of port gigabitethernet0/2 of Device.

```
Device(config)#interface gigabitethernet 0/2
```

```
Device(config-if-gigabitethernet0/2)#ip access-group 1 out
```

```
Device(config-if-gigabitethernet0/2)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
```

```
-----Interface-----Bind----Instance-----
```

```
Interface-----Direction----AclType----AclName
```

```
gi0/2          OUT      IP      1
```

*Step*  
*7:*

Check the result.

#After video traffic and data traffic are processed by Device, the sum of the video traffic rate and data traffic rate from port gigabitethernet0/2 does not exceed 50000 kbps with the data traffic rate not exceeding 20000 kbps.

## 76.3.5 Configure WRED

### Network Requirements

- Numerous terminals download files from the FTP server.
- Configure the WRED function on Device to prevent the global synchronization of TCP from causing intermittent FTP connections.

## Network Topology

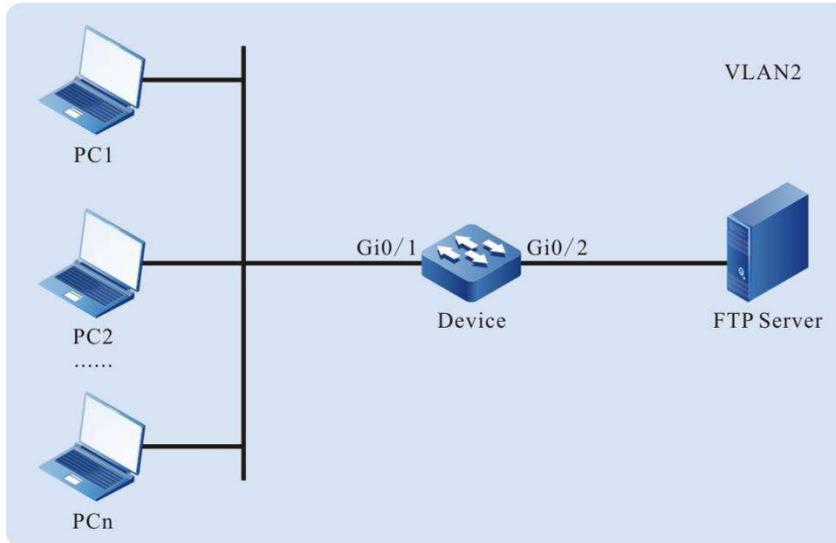

Figure 76-7 Network Topology for Configuring WRED

## Configuration Steps

*Step 1:*

Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
```

```
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
2:

Configure the WRED function.

#Configure the drop-start value of queue 0 packets on port gigabitethernet0/2 to 80, with drop rate of 45.

```
Device(config)#interface gigabitethernet 0/2
```

```
Device(config-if-gigabitethernet0/2)#drop-mode 0 wred drop-start 80 drop-rate 45
```

```
Device(config-if-gigabitethernet0/2)#exit
```

---

### Note

- The packets sent by PC are all Untag packets and enter the queue 0 by default.
- 

*Step*  
3:

Check the result.

#When numerous terminals download files from the FTP server, there will be no intermittent connection to FTP.

## 76.3.6 Configure SP

### Network Requirements

- There are authentication server (AAA Server), video server (Video Server) and one terminal device (PC) on the network;
- Configure the SP function to guarantee, when egress port traffic is congested, the traffic of the authentication server first, the video traffic second, and the terminal traffic last.

### Network Topology

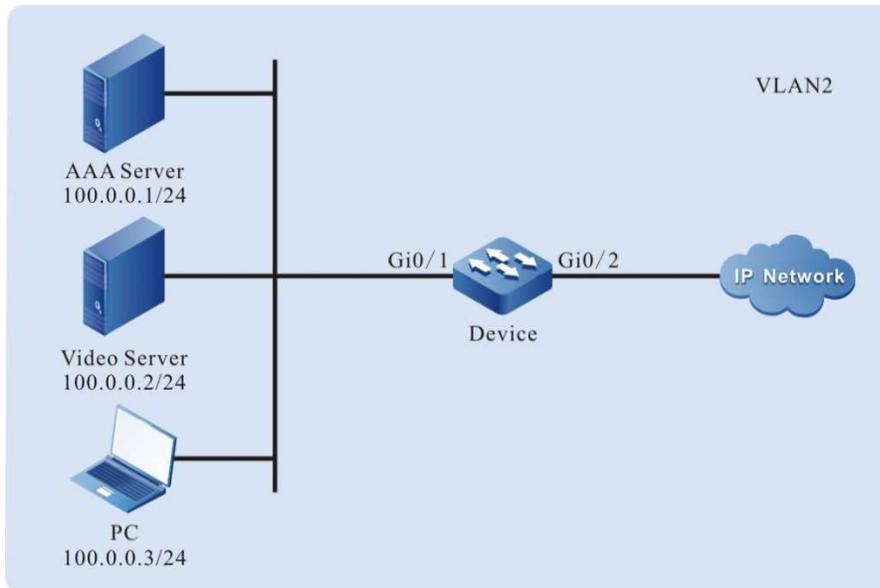

Figure 76-8 Network Topology for Configuring SP

### Configuration Steps

*Step*  
*1:*

Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
2:

Configure the L3 action group.

#Configure the L3 action group named LP7. The action is to remark the packets to queue 7.

```
Device(config)#l3-action-group LP7
Device(config-action-group)#remark l2-priority 1p 7
Device(config-action-group)#exit
```

#Configure the L3 action group named LP6. The action is to remark the packets to queue 6.

```
Device(config)#l3-action-group LP6
Device(config-action-group)#remark l2-priority 1p 6
Device(config-action-group)#exit
```

#Configure the L3 action group named LP5. The action is to remark the packets to queue 5.

```
Device(config)#l3-action-group LP5
Device(config-action-group)#remark l2-priority 1p 5
Device(config-action-group)#exit
```

*Step*  
3:

Configure the standard IP ACL.

#Configure the standard IP ACL numbered 1 on Device.

```
Device(config)#ip access-list standard 1
```

#Configure binding of rules to the L3 action group named LP7 so that the authentication traffic packets can be remarked to the queue 7.

```
Device(config-std-nacl)#permit host 100.0.0.1 l3-action-group LP7
```

#Configure binding of rules to the L3 action group named LP6 so that the video traffic packets can be remarked to the queue 6.

```
Device(config-std-nacl)#permit host 100.0.0.2 l3-action-group LP6
```

#Configure binding of rules to the L3 action group named LP5 so that the terminal traffic packets can be remarked to the queue 5.

```
Device(config-std-nacl)#permit host 100.0.0.3 l3-action-group LP5
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
```

Step  
4:

Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the ingress direction of port gigabitethernet0/1 of Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip access-group 1 in
Device(config-if-gigabitethernet0/1)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface-----Bind----Instance-----
Interface-----Direction---AclType---AclName
gi0/1             IN      IP      1
```

Step  
5:

Configure the SP function.

#Configure the SP function on port gigabitethernet0/2 to perform strict priority scheduling on packets.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#queue-schedule sp
Device(config-if-gigabitethernet0/2)#exit
```

Step  
6:

Check the result.

#When the traffic of the egress port gigabitethernet0/2 is congested, the authentication traffic is given priority to pass, the video traffic is then allowed to pass, and finally the terminal traffic is allowed to pass.

## 76.3.7 Configure WDRR

### Network Requirements

- There are authentication server (AAA Server), video server (Video Server) and one terminal device (PC) on the network;
- Configure the WDRR function to enable terminal traffic, video traffic, and

authentication traffic to pass in a specific ratio when the egress port traffic is congested.

## Network Topology

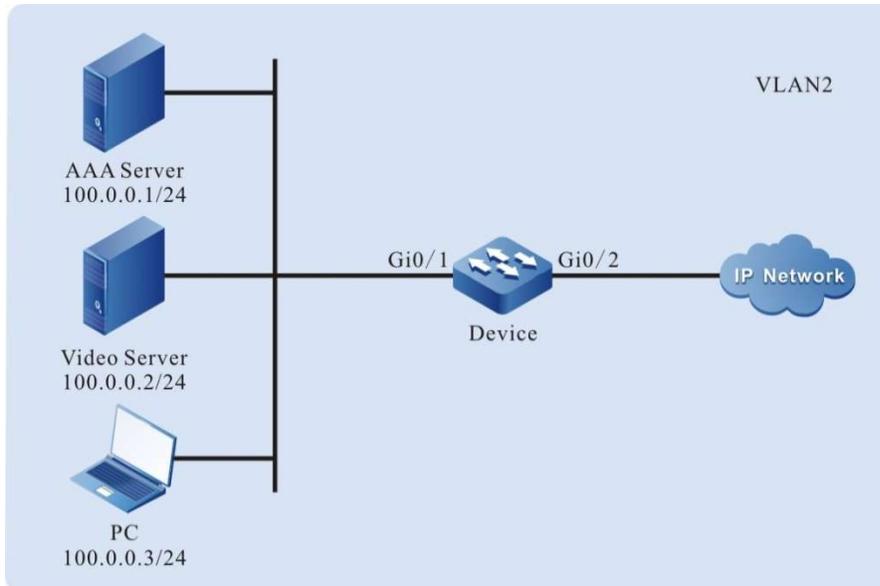

Figure 76-9 Network Topology for Configuring WDRR

## Configuration Steps

*Step*  
*1:*

Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
2:

Configure the L3 action group.

#Configure the L3 action group named LP7. The action is to remark the packets to queue 7.

```
Device(config)#l3-action-group LP7
Device(config-action-group)#remark l2-priority 1p 7
Device(config-action-group)#exit
```

#Configure the L3 action group named LP6. The action is to remark the packets to queue 6.

```
Device(config)#l3-action-group LP6
Device(config-action-group)#remark l2-priority 1p 6
Device(config-action-group)#exit
```

#Configure the L3 action group named LP5. The action is to remark the packets to queue 5.

```
Device(config)#l3-action-group LP5
Device(config-action-group)#remark l2-priority 1p 5
Device(config-action-group)#exit
```

*Step*  
3:

Configure the standard IP ACL.

#Configure the standard IP ACL numbered 1 on Device.

```
Device(config)#ip access-list standard 1
```

#Configure binding of rules to the L3 action group named LP7 so that the authentication traffic packets can be remarked to the queue 7.

```
Device(config-std-nacl)#permit host 100.0.0.1 l3-action-group LP7
```

#Configure binding of rules to the L3 action group named LP6 so that the video traffic packets can be remarked to the queue 6.

```
Device(config-std-nacl)#permit host 100.0.0.2 l3-action-group LP6
```

#Configure binding of rules to the L3 action group named LP5 so that the terminal traffic packets can be remarked to the queue 5.

```
Device(config-std-nacl)#permit host 100.0.0.3 l3-action-group LP5
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
```

Step  
4:

Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the ingress direction of port gigabitethernet0/1 of Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip access-group 1 in
Device(config-if-gigabitethernet0/1)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface-----Bind----Instance-----
Interface-----Direction----AclType----AclName
gi0/1           IN      IP      1
```

Step  
5:

Configure the WDRR function.

#Configure the WDRR function on port gigabitethernet0/2 to schedule respectively the packets in queues 5, 6, and 7 according to the ratio of 1:2:3.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#queue-schedule wdr 1 1 1 1 1 2 3
Device(config-if-gigabitethernet0/2)#exit
```

Step  
6:

Check the result.

#Terminal traffic, video traffic, and authentication traffic can pass in the specific ratio of 1:2:3 when the traffic of the egress port gigabitethernet0/2 is congested.

## 76.3.8 Configure SP+WDRR

### Network Requirements

- There are authentication server (AAA Server), video server (Video Server) and one terminal device (PC) on the network.

- Configure the SP+WDRR function to guarantee that when the traffic of the egress port is congested, all the traffic of the authentication server is given priority to pass, and the terminal traffic and video traffic can pass according to the ratio of 1:2.

## Network Topology

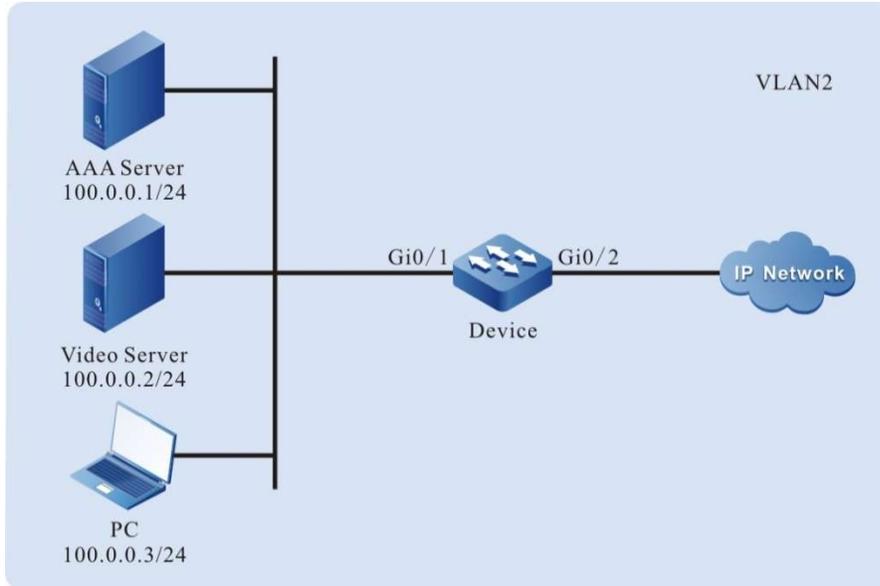

Figure 76-10 Network Topology for Configuring SP+WDRR

## Configuration Steps

*Step 1:*

Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
```

#Configure the link type of port gigabitethernet0/2 to Trunk to allow services of VLAN 2 to pass.

```
Device(config-if-gigabitethernet0/1)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
```

```
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
*2:*

Configure the L3 action group.

#Configure the L3 action group named LP7. The action is to remark the packets to queue 7.

```
Device(config)#l3-action-group LP7
Device(config-action-group)#remark l2-priority 1p 7
Device(config-action-group)#exit
```

#Configure the L3 action group named LP6. The action is to remark the packets to queue 6.

```
Device(config)#l3-action-group LP6
Device(config-action-group)#remark l2-priority 1p 6
Device(config-action-group)#exit
```

#Configure the L3 action group named LP5. The action is to remark the packets to queue 5.

```
Device(config)#l3-action-group LP5
Device(config-action-group)#remark l2-priority 1p 5
Device(config-action-group)#exit
```

*Step*  
*3:*

Configure the standard IP ACL.

#Configure the standard IP ACL numbered 1 on Device.

```
Device(config)#ip access-list standard 1
```

#Configure binding of rules to the L3 action group named LP7 so that the authentication traffic packets can be remarked to the queue 7.

```
Device(config-std-nacl)#permit host 100.0.0.1 l3-action-group LP7
```

#Configure binding of rules to the L3 action group named LP6 so that the video traffic packets can be remarked to the queue 6.

```
Device(config-std-nacl)#permit host 100.0.0.2 l3-action-group LP6
```

#Configure binding of rules to the L3 action group named LP5 so that the terminal traffic packets can be remarked to the queue 5.

```
Device(config-std-nacl)#permit host 100.0.0.3 l3-action-group LP5
```

```
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
```

*Step*  
4:

Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the ingress direction of port gigabitethernet0/1 of Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip access-group 1 in
Device(config-if-gigabitethernet0/1)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface-----Bind-----Instance-----
Interface-----Direction---AclType---AclName
gi0/1             IN      IP      1
```

*Step*  
5:

Configure the SP+WDRR function.

#Configure the SP+WDRR function on port gigabitethernet0/2 to allow all the packets in the queue 7 to pass. The packets in the queue 5 and queue 6 are scheduled according to the ratio of 1:2.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#queue-schedule wdr 1 1 1 1 1 2 0
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
6:

Check the result.

#All the authentication traffic is given priority to pass when the traffic of the egress port gigabitethernet0/2 is congested. The terminal traffic and the video traffic pass in the ratio of 1:2.

## 76.3.9 Configure Flow Mirror

### Network Requirements

- PC 1, PC 2, and PC 3 are connected to Device, and PC 1 and PC 2 communicate in VLAN 2;
- Configure the flow mirror function on Device, so that PC 3 monitors packets received by Device port gigabitethernet0/1.

### Network Topology

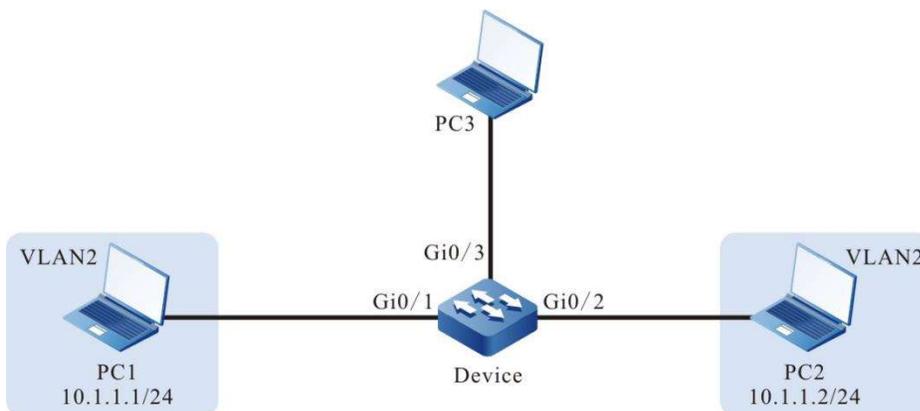

Figure 76-11 Network Topology for Configuring Flow Mirror

### Configuration Steps

*S*  
*t*  
*e*  
*p*  
*l*  
*:*

Configure VLANs and the link type of the ports.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 on Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

*S*  
*t*  
*e*  
*p*  
*2*  
*:*

Configure the flow mirror function.

#Configure the L3 action group named mirror to mirror the packets to port gigabitethernet0/3.

```
Device(config)#l3-action-group mirror
Device(config-action-group)#mirror interface gigabitethernet 0/3
Device(config-action-group)#exit
```

*S*  
*t*  
*e*  
*p*  
*3*  
*:*

Configure the standard ACL.

#Configure the standard IP ACL numbered 1 on Device.

```
Device(config)#ip access-list standard 1
```

#Configure binding of rules to the L3 action group named mirror so that all the packets can be mirrored to the port gigabitethernet0/3.

```
Device(config-std-nacl)#permit any l3-action-group mirror
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
```

*S*  
*t*  
*e*  
*p*  
*4*  
*:*

Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the ingress direction of port gigabitethernet0/1 of Device.

```
Device(config)#interface gigabitethernet 0/1
```

```
Device(config-if-gigabitethernet0/1)#ip access-group 1 in
Device(config-if-gigabitethernet0/1)#exit
```

*S*  
*t*  
*e*  
*p*  
*5*  
*:*

Check the result.

#When PC 1 and PC 2 communicate with each other, the packets received on port gigabitethernet0/1 can be captured on PC 3.

# 77 MPLS Basics

---

## 77.1 Overview

MPLS (Multiprotocol Label Switching) integrates the simplicity of Layer 2 switching with the flexibility of Layer 3 routing to provide connection-oriented features for connectionless IP networks.

MPLS has the following technical advantages over traditional IP network technologies:

- Label-based group forwarding simplifies the forwarding mechanism and improves forwarding efficiency.
- By introducing labels, service functions can be flexibly extended to achieve routing,

traffic engineering, QoS, VPN, and other functions.

- The labels themselves have no specific meaning and can map the target IP addresses, fiber channels, wavelengths or even VC channels in SDH/SONET, etc.

The following is an introduction to some important basic concepts of MPLS.

### 1. Forwarding Equivalence Class (FEC)

Forwarding Equivalence Class (FEC) refers to the set of packets that follow the same forwarding path in the network (the destination address of the packets can be different), and the packets with the same FEC are processed in the same way by the LSR during the forwarding process. The ingress LSR of the MPLS network finds the corresponding label value for IP packets entering the MPLS domain according to the FEC and encapsulates it in the packet to form a label packet, which is transmitted in the MPLS network.

### 2. Label

In an MPLS network, MPLS packets are forwarded according to the label carried by the packet, which is inserted between the headers of Layer 3 and Layer 2 and is called the MPLS label header, whose format is shown in Figure 1.

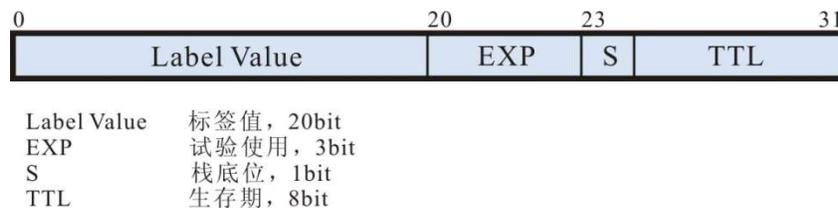

Figure 77-1 MPLS Label Structure

An MPLS packet can also carry multiple label headers in a structure called a label stack, which is organized in a "last-in, first-out" manner, with the outermost label called the top-of-stack label and the innermost label called the bottom-of-stack label, each label consisting of the following fields,

- Time to live (TTL): 8-bit, having the same function as the TTL field in the IP header.
- Bottom-of-stack (S): 1-bit, a value of 1 indicates that the corresponding label is the last label in the label stack (bottom of the stack); 0-bit indicates all other labels except for the bottom-of-stack label.
- Experimental (EXP): 3-bit, reserved, not specified in the protocol, usually used to specify Classes of Services.
- Label Value: 20-bit, used to identify the FEC. Labels 0 through 15 are reserved labels. The specific meaning of each label value is as follows.

Table 77-1 Meaning of Reserved Label Value

Label value	Meaning
-------------	---------

0	IPv4 Explicit Null label
1	Router Alert label
2	IPv6 Explicit Null label
3	Implicit Null label
4 - 15	Suspended

### 3. Label Switching Router

LSR (Label Switching Router) is a device that supports MPLS services, distributes labels, and receives and transmits packets with labels over the data link.

### 4. Label Edge Router

LER (Label Edge Router) is an LSR that is at the edge of the MPLS network and connects to other networks.

### 5. Label Switched Path

LSP (Label Switched Path) is the forwarding path of packets with the same FEC in the MPLS network.

### 6. MPLS Network Node

The MPLS network includes the following important network nodes:

- **Ingress node:** The ingress LER of the MPLS network, which encapsulates the label for the packets entering the MPLS network.
- **Transit node:** An LSR inside the MPLS network that looks up the MPLS forwarding table based on the label and performs labeling operations to send the packet along the LSP to the egress LER.
- **Egress node:** The egress LER of the MPLS network, responsible for removing the label and sending the packet to the destination network.

### 7. Label Forwarding Table

LFIB (Label Forwarding Information Base), similar to the IP FIB, is used to forward MPLS packets. It includes the following types:

- **NHLFE** (Next Hop Label Forwarding Entry): Records the MPLS forwarding operation method and forwarding information.
- **FTN** (FEC to NHLFE, FEC mapping to NHLFE): Used to look up FTN at Ingress node based on the FEC of the packet to be mapped to the NHLFE table entry.
- **ILM** (Incoming Label Map): Used to look up ILM based on incoming labels to be mapped to the NHLFE table entry.

## 77.2 MPLS Basic Function Configuration

Table 77-2 MPLS Basic Function Configuration List

Configuration Task	
Configure basic functions of MPLS.	Enable global MPLS function
	Enable interface MPLS function
	Configure label assignment ranges.
Configure MPLS forwarding control.	Configure packet load templates.
	Configure packet TTL replication method.
	Configure packet TTL timeout handling method.

### 77.2.1 Configure basic functions of MPLS.

On routers involved in MPLS forwarding, you need to enable the MPLS function globally and on the interface.

#### Configuration Condition

Before configuring the basic functions of MPLS, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.
- Configure static routes or IGP protocols to ensure that each LSR can communicate at the network layer.

#### Enable global MPLS function

Table 77-3 Enabling Global MPLS Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable global MPLS function	<b>mpls ip</b>	Mandatory By default, the MPLS function is not enabled.

### Enable interface MPLS function

Table 77-4 Enabling Interface MPLS Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface_name</i>	-
Enable interface MPLS function	<b>mpls ip</b>	Mandatory By default, the interface MPLS function is not enabled.

### Configure label assignment ranges.

Table 77-5 Configuring Label Assignment Ranges

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the range of locally assigned label.	<b>mpls label range</b> <i>min-label max-label</i>	Optional By default, the allowed range for label value assignment is 16~1048575.

---

## Caution

- Generally, you do not need to configure the range of locally distributed labels. If you configure this function after configuring the protocol for allocating label resources (such as LDP, BGP), you need to save and reboot the device to take effect.
- 

### 77.2.2 Configure MPLS forwarding control.

#### Configuration Condition

Before configuring MPLS forwarding control, do the following:

- Enable MPLS basic functions globally and on the interface to ensure that MPLS packets can be sent and received.

#### Configure packet load templates.

In the MPLS network, you can set up multipath packet load templates with a command.

Table 77-6 Configuring Packet Load Templates

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure MPLS packet load method.	<b>mpls load-balancing profile</b> <i>profile-name</i>	Optional By default, the default template is used.

#### Configure packet TTL replication method.

At the Ingress node of the MPLS network, when IP packets are encapsulated with a label, the system by default copies the TTL value of the IP packet minus one into the TTL field of the MPLS label. Users can also set the TTL field of the MPLS label to 255 through a configuration command to stop copying the TTL value of IP packets.

Table 77-7 Configuring Packet TTL Replication Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the MPLS packet TTL replication method to not replicate the TTL value in IP packets.	<b>no mpls ttl-propagate</b> [ <b>forwarded</b>   <b>local</b> ]	Optional By default, forwarded packets and locally sent packets copy the TTL value of the IP packet minus one into the TTL field of the MPLS label.

### Configure packet TTL timeout handling method.

When the LSR receives an MPLS packet with a TTL of 1, the LSR generates a TTL-expired ICMP packet. The LSR returns the ICMP packet to the sender of the packet in one of two ways:

- Forwarding ICMP packets along the original LSP, finding the route to the packet sender at the Egress node, and returning the ICMP packet to the packet sender.
- The route to the sender of the packet is queried on the LSR device where the TTL timeout is found, and the ICMP packet is returned to the sender of the packet.

The **mpls ttl-expiration** command allows you to configure the number of label layers. When the TTL timeout of an MPLS packet is found, the number of incoming label layers is compared with the configured number of label layers to determine how ICMP packets should be sent. If the number of incoming label layers does not exceed the configured number of label layers, the second method will be used to return ICMP packets to the sender, and the first method will be used vice versa.

Table 77-8 Configuring Packet TTL Timeout Handling Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the number of label layers for packet TTL timeout handling.	<b>mpls ttl-expiration</b> <i>labels-num</i>	Optional By default, the number of label layers for packet TTL timeout handling is 1.

### 77.2.3 MPLS Basic Monitoring and Maintaining

Table 77-9 MPLS Basic Monitoring and Maintaining

Command	Description
<b>clear mpls forwarding-table statistics</b>	Clear the packet count statistics of the MPLS service.
<b>show mpls forwarding-table</b> [ detail ]	Display MPLS forwarding table information.
<b>show mpls forwarding-table ilm</b> [ <i>A.B.C.D</i> [ <i>mask</i> ] ]   <b>in-label</b> <i>in-label</i>   <b>ipv4</b>   <b>sr</b>   <b>mcast</b> [ <i>in-label</i> ]   <b>vrf</b> <i>vrf-name</i> ] [ <b>detail</b> ]	Display MPLS ILM forwarding table information.
<b>show mpls forwarding-table statistics</b> { <b>packet</b>   <b>record</b> }	Display the statistics of MPLS forwarding packets and the number of each type of forwarding table.
<b>show mpls label range</b>	Show label assignment range.
<b>show mpls label used-block-data</b> [ <b>detail</b> ]	Display MPLS label block assignment information.

# 78 MPLS LDP

---

## 78.1 Overview

LDP (Label Distribution Protocol) is a basic signaling protocol for MPLS, which is used for label distribution and advertisement to dynamically establish LSP (Label Switching Path).

In addition to label distribution, LDP has a number of features:

- Support label filtering: Selectively advertise and receive labels through access control lists to achieve the purpose of saving resources and reducing network burden.
- Support loopback detection: Avoid LSP loops by loopback detection.
- Support MD5 authentication: Enhance the security of information interaction between LSRs.
- Support GR capability: Achieve uninterrupted data transmission when there is a failure at the device control level.
- Support BFD linkage: Fast convergence at LDP protocol level through BFD fast detection.

## 78.2 MPLS LDP Function Configuration

Table 1-2 LDP Function Configuration List

Configuration Task	
Configure basic functions of LDP.	Enable LDP Protocol.
Configure LDP neighbor parameters.	Configure parameters of directly connected session.
	Configure remote session parameters.
Configure LDP MD5 authentication.	Configure LDP MD5 authentication.

Configuration Task	
Configure LDP control attributes.	Configure label reception filtering.
	Configure label advertisement filtering.
	Configuration label re-advertisement.
	Configure label assignment control method.
	Configure PHP features.
	Configure loopback detection.
	Configure session reconnection.
Configure LDP GR.	Configure LDP GR.
Configure LDP to coordinate with BFD.	Configure LDP to coordinate with BFD.

### 78.2.1 Configure basic functions of LDP.

#### Configuration Condition

Before configuring the basic LDP functions, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.
- Configure static routes or IGP protocols to ensure that each LSR can communicate at the network layer.
- Enable MPLS basic functions globally and on the interface to ensure that MPLS packets can be sent and received.

#### Enable LDP Protocol.

Table 78-3 Enabling LDP Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable the LDP protocol globally.	<b>mpls ldp</b>	Mandatory By default, the LDP protocol is not enabled globally.
Exit the LDP configuration mode.	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable interface LDP protocol.	<b>mpls ldp</b>	Mandatory By default, interface LDP protocol is not enabled.

## 78.2.2 Configure LDP neighbor parameters.

### Configuration Condition

Before configuring LDP neighbor parameters, do the following:

- Configure basic functions of LDP.

### Configure parameters of directly connected session.

A session established with a directly connected peer is called a directly connected LDP session.

Table 78-4 Configuring Parameters of Directly Connected Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Configure Router ID.	<b>router-id</b> <i>ip-address</i>	Optional By default, the interface address of this device is selected, and the loopback port address is preferred.

Step	Command	Description
Enter LDP IPv4 configuration mode.	<b>address-family ipv4</b>	-
Configure transport address.	<b>transport-address</b> <i>ip-address</i>	Optional By default, the Router ID is preferred as the transport address.
Exit LDP IPv4 configuration mode.	<b>exit</b>	-
Configure Keepalive message delivery interval.	<b>keepalive interval</b> <i>value</i>	Optional The default value is 60 seconds, and the range is 1~65535 seconds.
Configure Keepalive message retention timer timeout.	<b>keepalive timeout</b> <i>value</i>	Optional The default value is 180 seconds, and the range is 1~65535 seconds.
Configure link Hello sending interval.	<b>discovery hello interval</b> <i>value</i>	Optional The default value is 5 seconds, and the range is 1~65535 seconds.
Configure link Hello retention timer timeout.	<b>discovery hello holdtime</b> <i>value</i>	Optional The default value is 15 seconds, and the range is 1~65535 seconds.
Exit the LDP configuration mode.	<b>exit</b>	-
Enter interface mode.	<b>interface</b> <i>interface-name</i>	-
Configure interface link Hello sending interval.	<b>mpls ldp discovery hello interval</b> <i>value</i>	Optional The default value is 5 seconds, and the range is 1~65535 seconds.

Step	Command	Description
Configure interface link Hello retention timer timeout.	<b>mpls ldp discovery hello holdtime</b> <i>value</i>	Optional The default value is 15 seconds, and the range is 1~65535 seconds.

## Note

- To establish an LDP session between peers, you need to ensure that the LDP protocol is enabled on both peers.
- Before establishing a session with a directly connected peer, the user needs to ensure that the transport address from the local transport address to the peer is routed reachable, otherwise the session connection cannot be established.
- Modifying the Router ID or transport address can cause a successful session to be rebuilt, so it is recommended to modify the Router ID or transport address carefully.
- The sending interval and keep-alive time of link Hello can be configured globally or on the interface. When configuration is made globally and not on the interface, the transmit interval and keep-alive time of the interface link Hello use the global configuration time; when both the global and the interface have been configured, the transmit interval and keep-alive time of the interface link Hello use the interface configuration time.

### Configure remote session parameters.

The session established with the targeted peer is called a remote LDP session.

Table 78-5 Configuring Remote Session Parameters

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Configure Router ID.	<b>router-id</b> <i>ip-address</i>	Optional By default, the interface address of this device is selected, and the loopback port address is preferred.

Step	Command	Description
Enter LDP IPv4 configuration mode.	<b>address-family ipv4</b>	-
Create targeted peers.	<b>targeted-peer</b> <i>peer-address</i>	Mandatory No targeted peer is created by default.
Configure transport address.	<b>transport-address</b> <i>ip-address</i>	Optional By default, the Router ID is preferred as the transport address.
Exit LDP IPv4 configuration mode.	<b>exit</b>	-
Configure Keepalive message delivery interval.	<b>keepalive interval</b> <i>value</i>	Optional The default value is 60 seconds, and the range is 1~65535 seconds.
Configure Keepalive message retention timer timeout.	<b>keepalive timeout</b> <i>value</i>	Optional The default value is 180 seconds, and the range is 1~65535 seconds.
Configure the targeted Hello sending interval.	<b>discovery targeted-hello interval</b> <i>value</i>	Optional The default value is 10 seconds, and the range is 1~65535 seconds.
Configure targeted Hello retention timer timeout.	<b>discovery targeted-hello holdtime</b> <i>value</i>	Optional The default value is 90 seconds, and the range is 1~65535 seconds.

---

## Note

- Configure the Keepalive packet delivery interval and the timeout of the keepalive timer is applicable for both directly connected sessions and remote sessions.

- The configured Router ID and transport address are also applied to both directly connected sessions and remote sessions.
- Before establishing a session with the targeted peer, the user needs to ensure that the address route to the peer is reachable, and also needs to make sure that the targeted peer is also created on the peer end to point to the local end, otherwise the remote session cannot be established.

### 78.2.3 Configure LDP MD5 authentication.

#### Configuration Condition

Before configuring LDP neighbor parameters, do the following:

- Configure basic functions of LDP.

#### Configure LDP MD5 Authentication

To improve the security of LDP sessions, LDP sessions based on TCP connections support configuration of MD5 authentication, and only sessions with the same password on the local end and the peer end can be established.

Table 78-6 Configuring LDP MD5 Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Enter LDP IPv4 configuration mode.	<b>address-family ipv4</b>	-
Configure LDP MD5 authentication.	<b>peer peer-address password { 0 { password-string }   7 { password-string }   password-string }</b>	Mandatory By default, MD5 authentication password is not configured.

### 78.2.4 Configure LDP control attributes.

#### Configuration Condition

Before configuring the LDP control attributes, do the following:

- Configure basic functions of LDP.

## Configure label reception filtering.

Label reception filtering is used to filter the labels received downstream from the FEC to receive only labels from FECs that pass the access control list check. This feature can reduce the size of the MPLS forwarding table. Configure label reception filtering requires configuring a standard access control list beforehand and then using the label reception filtering command reference in the LDP.

In addition, since in most MPLS networks only the labels of FECs with 32-bit mask length are required. LDP divides FECs into two categories, i.e. 32-bit mask and non-32-bit mask, and the system only receives FEC labels with 32-bit mask length by default according to the mask length.

Table 78-7 Label Reception Filtering

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Enter LDP IPv4 configuration mode.	<b>address-family ipv4</b>	-
Configure label reception filtering.	<b>accept-labels for</b> <i>prefix-accesslist-name</i>	Optional By default, label reception filtering is not configured.
Configure to receive only FEC labels with a 32-bit mask length.	<b>accept-labels for</b> <b>32bit-mask-fec-only</b>	Optional By default, only FEC labels with a 32-bit mask length are received.

---

### Note

- The *prefix-accesslist-name* parameter supports only standard access control lists.
- FEC labels not filtered by access control lists will not install the corresponding FTN, but will still save and install ILM.
- By default, only labels for 32-bit mask-length FECs are received, so it is common to use the no form to configure labels for all mask-length FECs to be received.
- **accept-labels for 32bit-mask-fec-only/no accept-labels for 32bit-mask-fec-only** command and **accept-labels for** *prefix-accesslist-name* command can be configured at the same time. If the **accept-labels for 32bit-mask-fec-only** command is configured (the system default

configuration), then only FTNs of all FECs with 32-bit mask filtered by the access control list in the **accept-labels for *prefix-accesslist-name*** command will be installed, while the FTNs of all non-32-bit mask FECs will not be installed (even if the non-32-bit mask FEC passes the access control list filtering in the **accept-labels for *prefix-accesslist-name*** command); if the **no accept-labels for 32bit-mask-fec-only** command is configured, all FTNs of FECs that pass the access control list filtering in the **accept-labels for *prefix-accesslist-name*** command will be installed.

### Configure label advertisement filtering.

Label advertisement filtering is used to filter the labels of advertisement. This feature prevents LSRs from advertising a large number of labels to reduce the burden on the network. Configure label advertisement filtering requires configuring a standard access control list beforehand and then using the label advertisement filtering command reference in the LDP.

In addition, since in most MPLS networks only the labels of FECs with 32-bit mask length are required. LDP divides FECs into two categories, i.e. 32-bit mask and non-32-bit mask, and the system only advertises FEC labels with 32-bit mask length by default according to the mask length.

Table 78-8 Label Advertisement Filtering

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Enter LDP IPv4 configuration mode.	<b>address-family ipv4</b>	-
Configure label advertisement filtering.	<b>advertise-labels for <i>prefix-accesslist-name</i> to <i>peer-accesslist-name</i></b>	Optional By default, the label advertisement filtering function is not configured.
Configure the label for announcing partial FECs to all upstream.	<b>advertise-labels for <i>prefix-accesslist-name</i> to any</b>	Optional By default, the label advertisement filtering function is not configured.
Configure not to advertise labels to any upstream devices.	<b>advertise-labels for any to none</b>	Optional By default, no configuration is done to not advertise

Step	Command	Description
		labels to any upstream devices.
Configure labels to advertise only FECs of 32-bit mask length.	<b>advertise-labels for 32bit-mask-fec-only</b>	Optional By default, only the labels of FECs with 32-bit mask length are advertised.

## Note

- The *prefix-accesslist-name* parameter and the *peer-accesslist-name* parameter support only the standard access control lists.
- Since, by default, LDP only advertises the labels of 32-bit mask-length FECs upstream, it is generally configured to advertise the labels of all mask-length FECs upstream using its no form.
- The **advertise-labels for any to none** command and the **advertise-labels for *prefix-accesslist-name* to any** command can be viewed as special forms of the **advertise-labels *prefix-accesslist-name* to *peer-accesslist-name*** command, **any** means to permit any, and **none** means to deny any. All three sets of commands can be used to enable control label advertisement via access control lists, and can be configured at the same time as the **adjustise-labels-for-32bit-mask-fec-only** command.
- If the **adverse-labels for 32bit-mask-fec-only** command is configured (system default), all non-32bit-mask FECs are denied of label advertisement, while 32bit-mask FECs will undergo lable advertisement according to the results of access control list checks. If the **no advertise-labels for 32bit-mask-fec-only** command is configured, all mask-length FECs will will undergo lable advertisement according to the result of the access control list check.

### Configuration label re-advertisement.

After label re-advertisement is configured, LDP periodically re-advertises all label images to upstream neighbors.

Table 9-10 Label Re-Advertisement

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory

Step	Command	Description
Configuration label re-advertisement.	<b>du-readvertise</b>	Mandatory By default, label mapping is not re-advertised.
Configure the re-advertisement interval.	<b>du-readvertise timer value</b>	Optional The default value is 30 seconds, the range is 1~65535 seconds.

### Configure label assignment control method.

The label assignment control method of LDP refers to the processing method used by the LSR to assign labels during the establishment of the LSP.

Independent label assignment control means that the local LSR can autonomously assign a label binding to a certain FEC and advertise it to the upstream LSR without waiting for the downstream label.

The ordered allocation label control method means that for the label mapping of a FEC on an LSR, the LSR can send the label mapping of this FEC upstream only if the LSR already has the label mapping message for the next hop of this FEC or if the LSR is the outgoing node of this FEC.

Table 11-12 Configuring the Label Assignment Control Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	-
Configure the ordered assignment control method for labels.	<b>label-distribution ordered</b>	Optional Default is independent label assignment control method.
Configure the independent assignment control method for labels.	<b>label-distribution independent</b>	Optional Default is independent label assignment control method.

### Configure PHP features.

When the device acts as an Egress node, the implicit null label is distributed to the penultimate hop device by default. After the **explicit-null** command is configured the Egress node sends the display null label to the penultimate hop device. If the Egress node distributes an implicit empty label, the label will pop up on the penultimate hop, and if the Egress node distributes a display empty label, the label will not pop up on the penultimate hop device.

Table 78-13 Configuring PHP Features

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Configure Egress nodes to display empty labels to upstream advertisement.	<b>explicit-null</b>	Optional By default, the Egress node advertises an implicit empty label to the penultimate hop.

---

### Note

- To configure or delete the **explicit-null** command, you need to reset the session with the **clear mpls ldp session** command for the command to take effect.
- 

### Configure loopback detection.

There are two ways to detect LSP loops, a maximum hop count way and a path vector way.

The maximum hop count approach is to include the hop value in the message passing the label, and add one to that value for each LSR passed. When this value reaches the maximum value detected, a loop is considered to occur and the LSP establishment process is terminated.

The path vector approach, on the other hand, records LSR ID information in the message passing the label, and each time a hop is passed, the corresponding device checks whether its own LSR ID has been recorded.

If the record does not have its own LSR ID, it adds its own LSR ID to the record; if the record already has its own LSR ID, it assumes that a loop has occurred and terminates the LSP establishment process.

Table 78-14 Configuring Loopback Detection

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Configure Loop Detection	<b>loop-detection</b>	Mandatory By default, no loop detection is configured.
Configure the maximum number of hops for loop detection.	<b>maxhops value</b>	Optional In the configuration of loopback detection after the default detection hop limit value is 255, configurable range is 1 ~ 255.

---

 **Note**

- The loop detection configuration on the LDP peer must be consistent, otherwise the LDP session cannot be established.
  - After configuring loop detection, LDP immediately detects LSP loops using both maximum hop count and path vector, where the maximum hop count is the default value of 255 hops.
- 

**Configure session reconnection.**

When a TCP connection with a peer is established unsuccessfully, LDP tries to re-establish it, a process called session reconnection.

Table 78-15 Session Reconnection Capability

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Configure not to allow increased reconnection delay time.	<b>reconnection-delay-disable</b>	Optional By default, the reconnection delay time is allowed to increase.
Configure the initial value of the reconnection interval.	<b>reconnect-interval</b> <i>value</i>	Optional The default value is 15 seconds, the value range is 1~15 seconds.

---

### Note

- The initial value of the delay time of LDP reconnect peer is 15 seconds, if allowed to increase the reconnection delay time, then the delay time will be doubled one by one after the failure of initiating TCP connection to the peer, which is 15 seconds, 30 seconds, 60 seconds, 120 seconds in order, and the maximum will not exceed 120 seconds; if the initial value of the delay time of LDP reconnect peer is 1 second, the reconnection delay time will be 1 second, 2 seconds, 4 seconds ..... in that order, and the maximum will not exceed 120 seconds. If the reconnection delay time is not enabled to increase, the reconnection interval will always be the initial value of the configured reconnection interval.
- 

## 78.2.5 Configure LDP GR.

### Configuration Condition

Before configuring LDP GR capabilities, do the following:

- Configure basic functions of LDP.
- Before configuring LDP GR capabilities, first complete the following tasks.

### Configure LDP GR

LDP GR takes advantage of the separation of MPLS forwarding plane and control plane to keep the MPLS label forwarding table entry in case of abnormality in the control plane, and LSR still forwards packets according to the table entry, thus ensuring that data transmission will not be interrupted.

During GR, the devices in the MPLS network are divided into two roles.

- GR restarter: GR restart router, refers to a device with dual master control that triggers a control level restart protocol due to user manual or failure.
- GR helper: A neighbor of the GR restarter that maintains a neighbor relationship with the restarted GR restarter and has negotiated GR capabilities with the GR restarter to assist it in restoring the pre-restart forwarding state after the GR restarter restarts.

The work process of LDP GR is as follows.

- When the session between neighbors is established at first, the time value of each GR timer is negotiated between the LSRs configured with GR capability.
- After a restart occurs in the GR restarter, the GR helper detects a session down with the GR restarter, marks all label mappings learned through this session as stale, and retains these label mappings for the GR neighbor keep-alive timer timeout.
- If the neighbor keep-alive timer times out, GR Helper removes these label mappings marked as stale. If the LDP session is successfully established within the GR neighbor preservation timer timeout, the GR restarter and GR helper update the label forwarding table and clear the stale label of the forwarding table entry by interacting the label mapping with the newly established LDP session during the LDP recovery time. After the LDP recovery timer times out, the GR helper removes the label mappings that are still marked as stale.
- The MPLS forwarding state hold timer timeout indicates the end of the GR process.

Table 78-16 Configuring LDP GR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Enabling GR capability	<b>graceful-restart</b>	Mandatory By default, no GR capability is enabled.
Configure the GR forwarding state hold timer timeout.	<b>graceful-restart timer forwarding-holding value</b>	Optional

Step	Command	Description
		The default value is 300 seconds, the value range is 30~300 seconds.
Configure the GR recovery timer timeout.	<b>graceful-restart timer max-recovery value</b>	Optional The default value is 120 seconds, the value range is 15~600 seconds.
Configure the GR Neighbor Keep Alive timer timeout.	<b>graceful-restart timer neighbor-liveness value</b>	Optional The default value is 120 seconds, the value range is 5~300 seconds.

---

## Note

- GR needs to be configured on both peers of the session before the LDP session is established in order to negotiate a successful GR capability. LDP sessions established before GR capability is enabled do not have GR capability.
- 

### 78.2.6 Configure LDP to coordinate with BFD.

#### Configuration Condition

Before configuring LDP with BFD linkage, do the following:

- Configure basic functions of LDP.
- Enable the LDP protocol on the interface that needs to be configured for LDP and BFD linkage.

#### Configure LDP to coordinate with BFD.

When there is a line failure between two neighboring devices, it takes longer for LDP to detect the neighboring line failure, and after the line failure is detected, the LDP session goes down and MPLS forwarding is interrupted. LDP and BFD linkage can quickly detect line failures of LDP neighbors and improve the performance of MPLS networks.

Table 78-17 Configuring LDP and BFD Linkage

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the LDP configuration mode.	<b>mpls ldp</b>	Mandatory
Configure globally to enable coordination between LDP and BFD.	<b>bfd all-interfaces</b>	Optional By default, the LDP and BFD linkage is not enabled globally.
Exit the LDP configuration mode.	<b>exit</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	Mandatory
Configure the interface to enable coordination between LDP and BFD.	<b>mpls ldp bfd</b>	Optional By default, LDP and BFD linkage are not enabled on the interface.
Configure the interface to disable coordination between LDP and BFD.	<b>mpls ldp bfd disable</b>	Optional By default, the interface is allowed to enable LDP with BFD linkage.

---

## Note

- For the configuration of BFD, refer to contents on BFD in the Reliability section in the User Manual.
  - The current LDP only supports single-hop detection results linked with BFD, and does not support multi-hop detection results.
  - The **mpls ldp bfd disable** command on the interface is mutually exclusive with the **mpls ldp bfd** command and has a higher priority than the **bfd all-interfaces** command in MPLS LDP mode. The impact of various combinations of configurations between them on the results of enabling the interface LDP and BFD linkage is shown in the following table.
-

bfd all-interfaces	mpls ldp bfd	mpls ldp bfd disable	Enabling LDP and BFD linkage on an interface.
18.5.2 Configuration	Not configured or no drop	Not configured or no drop	Enabled
18.5.2 Configuration	Not configured or no drop	18.5.2 Configuration	Not enabled
18.5.2 Configuration	18.5.2 Configuration	Not configured or no drop	Enabled
Not configured or no drop	Not configured or no drop	Not configured or no drop	Not enabled
Not configured or no drop	Not configured or no drop	18.5.2 Configuration	Not enabled
Not configured or no drop	18.5.2 Configuration	Not configured or no drop	Enabled

## 78.2.7 LDP Monitoring and Maintaining

Table 78-20 List of LDP Monitoring and Maintaining Commands

Command	Description
<b>clear mpls ldp adjacency</b> { <i>ip-address</i>   all }	Reset all LDP adjacencies or specify an adjacency.
<b>clear mpls ldp error-statistics</b>	Clear the error statistics of LDP.
<b>clear mpls ldp session</b> { <i>peer-address</i>   all }	Reset all LDP sessions or sessions of the specified peer.
<b>clear mpls ldp statistics</b>	Clear statistics on LDP messages sent and received.
<b>clear mpls ldp statistics advertise-labels</b> [ for <i>prefix-accesslist-name</i> [ to <i>peer-accesslist-name</i> ] ]	Clear statistics for LDP label advertisement filtering.

Command	Description
<b>show mpls ldp adjacency</b>	Display information about all LDP adjacencies.
<b>show mpls ldp advertise-labels</b>	Display statistics for LDP label advertisement filtering.
<b>show mpls ldp downstream</b> [ <i>prefix-address prefixlen</i> ]	Display all downstream information of LDP or downstream information of specified FEC.
<b>show mpls ldp error-statistics</b>	Display error statistics for LDP.
<b>show mpls ldp fec</b> [ <i>prefix-address prefixlen</i> ]	Display information about all FECs of LDP or FECs with specified prefixes.
<b>show mpls ldp fec number</b>	Display the number of FEC of LDP.
<b>show mpls ldp interface</b> [ <i>interface-name</i> ]	Show details of all LDP interfaces or specified LDP interfaces.
<b>show mpls ldp lsp</b> [ <b>advertise-list</b>   <i>prefix-address prefixlen</i> [ <b>advertise-list</b> ] ]	Display LSP details for all LSPs of LDP or FECs of the specified prefix.
<b>show mpls ldp parameter</b> [ <b>detail</b> ]	Display the parameters of LDP.
<b>show mpls ldp session</b> [ <b>statistics</b>   <i>peer-address</i> [ <b>detail</b> ] ]	Displays LDP sessions and related statistics or details of the specified session.
<b>show mpls ldp statistics message</b>	Display statistics of LDP packets sent and received.
<b>show mpls ldp statistics advertise-labels</b>	Display statistics for LDP label advertisement.
<b>show mpls ldp targeted-peers</b>	Display information about all target peers of LDP.
<b>show mpls ldp upstream</b> [ <i>prefix-address prefixlen</i> ]	Display upstream information for all LDP upstream or specified FECs.

## 78.3 MPLS LDP Typical Configuration Example

### 78.3.1 Configure basic functions of LDP.

#### Network Requirements

- The entire network uses OSPF interactive routing.
- The device enables MPLS IP and MPLS LDP, and LDP sessions are established between Device1 and Device2, Device2 and Device3.

#### Network Topology

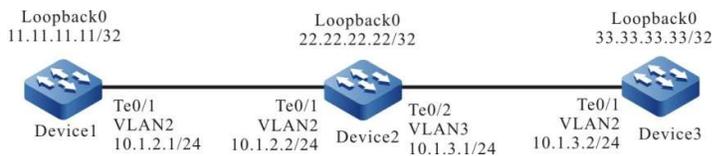

Figure 1-2 Network Topology for Configuring Basic Functions of LDP.

#### Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF.

#### #Configure OSPF on Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device1(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
Device1(config-ospf)#exit
```

#### #Configure OSPF on Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device2(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device2(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
Device2(config-ospf)#exit
```

#### #OSPF deployed on Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device3(config-ospf)#network 33.33.33.33 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#View the routing table on each device.

Here takes Device1 for example:

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.1.2.0/24 is directly connected, 06:19:07, vlan2
L 10.1.2.1/32 is directly connected, 06:19:07, vlan2
O 10.1.3.0/24 [110/2] via 10.1.2.2, 06:05:08, vlan2
LC 11.11.11.11/32 is directly connected, 06:18:54, loopback0
O 22.22.22.22/32 [110/2] via 10.1.2.2, 06:12:40, vlan2
O 33.33.33.33/32 [110/3] via 10.1.2.2, 06:02:59, vlan2
C 127.0.0.0/8 is directly connected, 102:05:13, lo0
L 127.0.0.1/32 is directly connected, 102:05:13, lo0
```

It is indicated that the routing table of Device1 has routes to the loopback0 interface of Device2 and Device3.

---

## Note

- Refer to Device1 for the checking method for Device2 and Device3.
- 

Step 4: Enable MPLS IP and MPLS LDP.

# Enable MPLS IP and MPLS LDP globally on Device1, and also enable MPLS IP and MPLS LDP on the interface.

```
Device1(config)#mpls ip
Device1(config)#mpls ldp
Device1(config-ldp)#router-id 11.11.11.11
```

```
Device1(config-ldp)#address-family ipv4
Device1(config-ldp-af4)#transport-address 11.11.11.11
Device1(config-ldp-af4)#exit
Device1(config-ldp)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#mpls ip
Device1(config-if-vlan2)#mpls ldp
Device1(config-if-vlan2)#exit
```

# Enable MPLS IP and MPLS LDP globally on Device2, and also enable MPLS IP and MPLS LDP on the interface.

```
Device2(config)#mpls ip
Device2(config)#mpls ldp
Device2(config-ldp)#router-id 22.22.22.22
Device2(config-ldp)#address-family ipv4
Device2(config-ldp-af4)#transport-address 22.22.22.22
Device2(config-ldp-af4)#exit
Device2(config-ldp)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#mpls ip
Device2(config-if-vlan2)#mpls ldp
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#mpls ip
Device2(config-if-vlan3)#mpls ldp
Device2(config-if-vlan3)#exit
```

# Enable MPLS IP and MPLS LDP globally on Device3, and also enable MPLS IP and MPLS LDP on the interface.

```
Device3(config)#mpls ip
Device3(config)#mpls ldp
Device3(config-ldp)#router-id 33.33.33.33
Device3(config-ldp)#address-family ipv4
Device3(config-ldp-af4)#transport-address 33.33.33.33
Device3(config-ldp-af4)#exit
Device3(config-ldp)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#mpls ip
Device3(config-if-vlan2)#mpls ldp
Device3(config-if-vlan2)#exit
```

---

## Note

- router-id and transport-address can be manually configured or automatically generated, and are generally configured to be the same. If router-id and transport-address are not manually configured, the device will automatically select them. Among the interfaces in the up state, the largest IP address in the Loopback interface is selected first; if the device is not configured with a Loopback interface address, the largest IP address in the normal interface is selected.
- 

Step 5: Check the result.

# View LDP session information on individual devices.

Here takes Device1 for example:

```
Device1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
22.22.22.22     Multicast  Passive  OPERATIONAL  Disabled 00:02:01

Statistics for ldp sessions:
  Multicast sessions: 1
  Targeted sessions: 0
```

The content of the State column is shown as OPERATIONAL, which shows that Device1 and Device2 successfully established an LDP session.

# View the routing label information on the device.

Here takes Device1 for example:

```
Device1#show ip route 22.22.22.22 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 22.22.22.22/32 [110/2] via 10.1.2.2, label 3, 14:29:21, vlan2
   10.1.2.2 [0], vlan2

Device1#show ip route 33.33.33.33 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 33.33.33.33/32 [110/3] via 10.1.2.2, label 17, 14:29:21, vlan2
    10.1.2.2 [0], vlan2
```

It is indicated the routing label information in Device1 to the loopback0 interface address of Device2 and Device3.

# View LSP information on individual devices.

Here takes Device1 for example:

```
Device1#show mpls ldp lsp

FEC IPV4:10.1.2.0/24 -> 0.0.0.0, vlan2
FEC IPV4:10.1.3.0/24 -> 10.1.2.2, vlan2

FEC IPV4:11.11.11.11/32 -> 0.0.0.0, loopback0
  Downstream state: Established Label: none      RequestID: 0 Peer: EGRESS Attr: None
  Upstream state: Established Label: impl-null(3) RequestID: 0 Peer: 22.22.22.22 Attr: None

FEC IPV4:22.22.22.22/32 -> 10.1.2.2, vlan2
  Downstream state: Established Label: impl-null(3) RequestID: 0 Peer: 22.22.22.22 Attr: None

FEC IPV4:33.33.33.33/32 -> 10.1.2.2, vlan2
  Downstream state: Established Label: 17      RequestID: 0 Peer: 22.22.22.22 Attr: None
```

It is indicated that the information of the loopback0 interface address of Device2 and Device3 corresponding to the LSP of FEC exists on Device1.

---

## Note

- Refer to Device1 for the checking method for Device2 and Device3.
- 

## 78.3.2 Configuring LDP remote sessions.

### Network Requirements

- The entire network uses OSPF interactive routing.

- Device1 and Device3 enable MPLS IP and MPLS LDP, and LDP remote sessions are established between Device1 and Device3.

### Network Topology

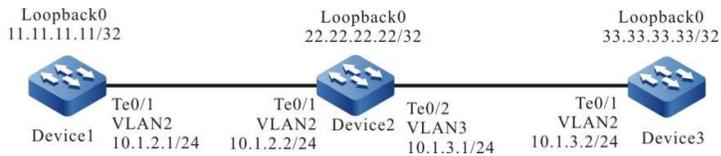

Figure 3-4 Network Topology for Configuring LDP Remote Session

### Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF.

#Configure OSPF on Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device1(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
Device1(config-ospf)#exit
```

#Configure OSPF on Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device2(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device2(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
Device2(config-ospf)#exit
```

#OSPF deployed on Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device3(config-ospf)#network 33.33.33.33 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#View the routing table on each device.

Here takes Device1 for example:

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.1.2.0/24 is directly connected, 06:19:07, vlan2
L 10.1.2.1/32 is directly connected, 06:19:07, vlan2
O 10.1.3.0/24 [110/2] via 10.1.2.2, 06:05:08, vlan2
LC 11.11.11.11/32 is directly connected, 06:18:54, loopback0
O 22.22.22.22/32 [110/2] via 10.1.2.2, 06:12:40, vlan2
O 33.33.33.33/32 [110/3] via 10.1.2.2, 06:02:59, vlan2
C 127.0.0.0/8 is directly connected, 102:05:13, lo0
L 127.0.0.1/32 is directly connected, 102:05:13, lo0
```

It is indicated that the routing table of Device1 has routes to the loopback0 interface of Device2 and Device3.

---

## Note

- Refer to Device1 for the checking method for Device2 and Device3.
- 

Step 4: Enable MPLS IP and MPLS LDP, and configure remote LDP sessions.

#Enable MPLS IP and MPLS LDP globally on Device1, and also enable MPLS IP and MPLS LDP on the interface, and configure the remote LDP peer.

```
Device1(config)#mpls ip
Device1(config)#mpls ldp
Device1(config-ldp)#router-id 11.11.11.11
Device1(config-ldp)#address-family ipv4
Device1(config-ldp-af4)#transport-address 11.11.11.11
Device1(config-ldp-af4)#targeted-peer 33.33.33.33
Device1(config-ldp-af4)#exit
Device1(config-ldp)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#mpls ip
```

```
Device1(config-if-vlan2)#mpls ldp
Device1(config-if-vlan2)#exit
```

#Enable MPLS IP and MPLS LDP globally on Device3, and also enable MPLS IP and MPLS LDP on the interface, and configure the remote LDP peer.

```
Device3(config)#mpls ip
Device3(config)#mpls ldp
Device3(config-ldp)#router-id 33.33.33.33
Device3(config-ldp)#address-family ipv4
Device3(config-ldp-af4)#transport-address 33.33.33.33
Device3(config-ldp-af4)#targeted-peer 11.11.11.11
Device3(config-ldp-af4)#exit
Device3(config-ldp)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#mpls ip
Device3(config-if-vlan2)#mpls ldp
Device3(config-if-vlan2)#exit
```

Step 5: Check the result.

# View remote LDP session information on Device1 and Device3.

Here takes Device1 for example:

```
Device1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
33.33.33.33     Targeted  Passive  OPERATIONAL  Disabled 00:02:57
Statistics for ldp sessions:
  Multicast sessions: 0
  Targeted sessions: 1
```

Device1 and Device3 successfully established a remote LDP session as shown by the content of the State column as OPERATIONAL and the content of the Peer Type column as Targeted.

# View LDP adjacencies on Device1, Device3.

Here takes Device1 for example:

```
Device1#show mpls ldp adjacency
IP Address  Interface Name  DS Cap  Deadtme  LDP-Identifier
33.33.33.33  /              Disable  00:01:20  33.33.33.33:0
```

In the LDP neighbor table of Device1, It is indicated the Targeted neighbor 33.33.33.33 with the interface name "/".

# View remote peers on Device1, Device3.

Here takes Device1 for example:

```
Device1#show mpls ldp targeted-peers
IP Address      State
33.33.33.33    Active
```

It is indicated that there is information about Device3 in the Device1 remote peer table.

---

## Note

- For Device3 check method, refer to Device1.
- 

### 78.3.3 Configure to enable coordination between MPLS LDP and BFD.

#### Network Requirements

- The whole network uses OSPF interactive routing, the device enables MPLS IP and MPLS LDP, and Device1 and Device3 is configured to enable coordination between MPLS LDP and BFD.
- When the line between Device1 and Device3 fails, the MPLS service data between Device1 and Device3 can be quickly switched.

#### Network Topology

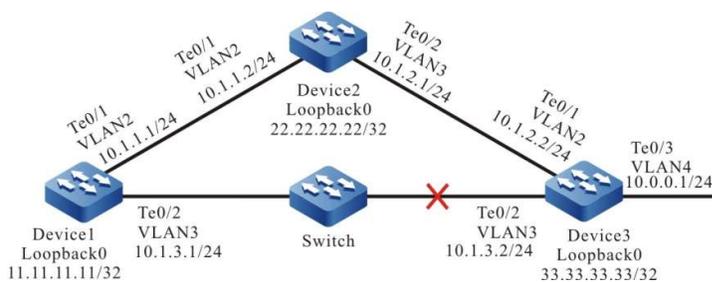

Figure 78-5 Configuring to Enable Coordination between MPLS LDP and BFD

#### Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)

### Step 3: Configure OSPF.

#### #Configure OSPF on Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device1(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
Device1(config-ospf)#exit
```

#### #Configure OSPF on Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device2(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
Device2(config-ospf)#exit
```

#### #OSPF deployed on Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
Device3(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
Device3(config-ospf)#network 33.33.33.33 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#### #View the routing table on each device.

Here takes Device1 for example:

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 10.0.0/24 [110/2] via 10.1.3.2, 00:12:57, vlan3
C 10.1.1.0/24 is directly connected, 02:22:00, vlan2
L 10.1.1.1/32 is directly connected, 02:22:00, vlan2
O 10.1.2.0/24 [110/2] via 10.1.1.2, 02:00:31, vlan2
  [110/2] via 10.1.3.2, 00:12:57, vlan2
```

```
C 10.1.3.0/24 is directly connected, 02:21:47, vlan3
L 10.1.3.1/32 is directly connected, 02:21:47, vlan3
LC 11.11.11.11/32 is directly connected, 02:16:48, loopback0
O 22.22.22.22/32 [110/2] via 10.1.1.2, 02:00:21, vlan2
O 33.33.33.33/32 [110/2] via 10.1.3.2, 00:12:57, vlan3
C 127.0.0.0/8 is directly connected, 483:17:24, lo0
L 127.0.0.1/32 is directly connected, 483:17:24, lo0
```

It is indicated that Device1's routing table has a route to Device3's directly connected segment 10.0.0.0/24, and the line between Device1 and Device3 is preferred for communication.

---

## Note

- Refer to Device1 for the inspection method of Device2 and Device3.
- 

Step 4: Enable MPLS IP and MPLS LDP.

# Enable MPLS IP and MPLS LDP globally on Device1, enable MPLS IP and MPLS LDP on the interface at the same time, and remove the 32-bit mask FEC assignment and receive labels only under the MPLS LDP process.

```
Device1(config)#mpls ip
Device1(config)#mpls ldp
Device1(config-ldp)#router-id 11.11.11.11
Device1(config-ldp)#address-family ipv4
Device1(config-ldp-af4)#transport-address 11.11.11.11
Device1(config-ldp-af4)#no advertise-labels for 32bit-mask-fec-only
Device1(config-ldp-af4)#no accept-labels for 32bit-mask-fec-only
Device1(config-ldp-af4)#exit
Device1(config-ldp)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#mpls ip
Device1(config-if-vlan2)#mpls ldp
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#mpls ip
Device1(config-if-vlan3)#mpls ldp
Device1(config-if-vlan3)#exit
```

# Enable MPLS IP and MPLS LDP globally on Device2, enable MPLS IP and MPLS LDP on the interface at the same time, and remove the 32-bit mask FEC assignment and receive labels only under the MPLS LDP process.

```
Device2(config)#mpls ip
Device2(config)#mpls ldp
Device2(config-ldp)#router-id 22.22.22.22
Device2(config-ldp)#address-family ipv4
Device2(config-ldp-af4)#transport-address 22.22.22.22
Device2(config-ldp-af4)#no advertise-labels for 32bit-mask-fec-only
Device2(config-ldp-af4)#no accept-labels for 32bit-mask-fec-only
Device2(config-ldp-af4)#exit
Device2(config-ldp)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#mpls ip
Device2(config-if-vlan2)#mpls ldp
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#mpls ip
Device2(config-if-vlan3)#mpls ldp
Device2(config-if-vlan3)#exit
```

# Enable MPLS IP and MPLS LDP globally on Device3, enable both MPLS IP and MPLS LDP on the interface, and remove the 32-bit mask FEC assignment and receive labels only under the MPLS LDP process.

```
Device3(config)#mpls ip
Device3(config)#mpls ldp
Device3(config-ldp)#router-id 33.33.33.33
Device3(config-ldp)#address-family ipv4
Device3(config-ldp-af4)#transport-address 33.33.33.33
Device3(config-ldp-af4)#no advertise-labels for 32bit-mask-fec-only
Device3(config-ldp-af4)#no accept-labels for 32bit-mask-fec-only
Device3(config-ldp-af4)#exit
Device3(config-ldp)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#mpls ip
Device3(config-if-vlan2)#mpls ldp
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#mpls ip
Device3(config-if-vlan3)#mpls ldp
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan4
```

```

Device3(config-if-vlan4)#mpls ip
Device3(config-if-vlan4)#mpls ldp
Device3(config-if-vlan4)#exit

```

# View LDP session information on individual devices.

Here takes Device1 for example:

```

Device1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
22.22.22.22     Multicast  Passive  OPERATIONAL  Disabled 00:02:54
33.33.33.33     Multicast  Passive  OPERATIONAL  Disabled 00:02:41

Statistics for ldp sessions:
  Multicast sessions: 2
  Targeted sessions: 0

```

The content of the State column is shown as OPERATIONAL, which shows that Device1 has successfully established LDP sessions with Device2 and Device3.

#View the MPLS forwarding table on each device.

Here takes Device1 for example:

```

Device1#show ip route 10.0.0.1 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 10.0.0.0/24 [110/2] via 10.1.3.2, label 3, 14:29:21, vlan3
    10.1.3.2 [0], vlan3

Device1#show mpls forwarding-table ilm 10.0.0.1 24
Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root
address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)

Pro Ident    FEC          Inlabel Outlabel Outgoing    Next hop
L global    10.0.0.0/24  20  3  vlan3      10.1.3.2

```

It is indicated that there is routing label information on Device1 to Device3 directly connected segment 10.0.0.0/24, and the line between Device1 and Device3 is preferred for communication.

---

## Note

- By default, the device is enabled under the MPLS LDP process to assign and receive labels with 32-bit mask FEC only.
  - Refer to Device1 for the inspection method of Device2 and Device3.
- 

Step 5: Configure to enable coordination between OSPF, LDP and BFD.

#Configure to enable coordination between OSPF, LDP and BFD on Device1.

```
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip ospf bfd
Device1(config-if-vlan3)#mpls ldp bfd
Device1(config-if-vlan3)#exit
```

#Configure to enable coordination between OSPF, LDP and BFD on Device3.

```
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip ospf bfd
Device3(config-if-vlan3)#mpls ldp bfd
Device3(config-if-vlan3)#exit
```

Step 6: Check the result.

#View the BFD session information of Device1 and Device3.

Here takes Device1 for example:

```
Device1#show bfd session detail
Total session number: 1
OurAddr      NeighAddr      LD/RD      State  Holddown  Interface
10.1.3.1     10.1.3.2       6/4        UP     5000     vlan3
Type:ipv4 direct
Local State:UP Remote State:UP Up for: 0h:36m:4s Number of times UP:1
Send Interval:1000ms Detection time:5000ms(1000ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
MinTxInt:1000 MinRxInt:1000 Multiplier:5
Remote MinTxInt:1000 Remote MinRxInt:1000 Remote Multiplier:5
Registered protocols:LDP OSPF
```

It is indicated that OSPF, LDP and BFD are successfully linked and the session is established normally.

# When a line failure occurs between Device1 and Device3, BFD quickly detects and notifies OSPF and LDP for fast convergence to see the route label information of each device.

Here takes Device1 for example:

```
Device1#show ip route 10.0.0.1 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 10.0.0.0/24 [110/3] via 10.1.1.2, label 21, 00:12:48, vlan2  
10.1.1.2 [0], vlan2
```

In the routing table, It is indicated that to route 10.0.0.0/24 select the line between Device1 and Device2 for communication.

---

## Note

- Refer to Device1 for the inspection method of Device3.
-

# 79 MPLS L3VPN

## 79.1 Overview

MPLS L3VPN is a network technology that allows service providers to use their IP backbones to provide Layer 3 VPN services to their subscribers. In an MPLS L3VPN network, BGP is used to publish VPN routing information in the service provider backbone and MPLS is used to forward VPN services from one VPN site to another.

VPN Routing/Forwarding Instance (VRF) is a fundamental concept in MPLS L3VPN network technology. Each VRF can be seen as a virtual router with a separate routing table, while the VRF also has a separate address space, a set of interfaces belonging to the VRF, and a set of routing protocols used only for that VRF. VRF technology can be used to isolate different VPN users and solve the problem of overlapping network addresses.

The following diagram shows the MPLS L3VPN network structure.

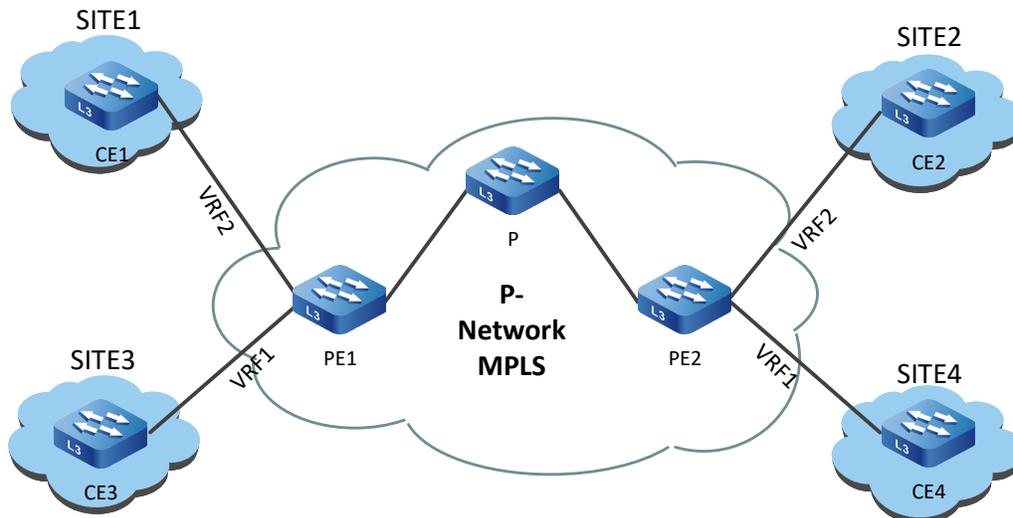

Figure 79-1 Network Topology for MPLS L3VPN

In the above figure, each PE contains two VRFs connecting 2 sites, and the 2 interfaces connecting the sites belong to each of the 2 VRFs. Site 1 and Site 2 belong to one VPN, and Site 3 and Site 4 belong to another VPN.

## 79.2 MPLS L3VPN Function Configuration

Table 79-1 MPLS L3VPN Function Configuration List

Configuration Task	
Configure basic functions of VPN.	Configure VPN instances.
	Configure PE-PE inter-route switching.
	Configure PE-CE inter-route switching.
Configure M-VRF.	Configure M-VRF.
Configure VPN route label assignment.	Configure VPN route label assignment.
Configure VPN to cross domain.	Configure Option-A to cross domain.
	Configure Option-B to cross domain.
Configure VPN users to access the Internet.	Configure CE access to the Internet.
	Configure PE access to the Internet.
Configure AS override.	Configure AS override.
Configure OSPF Pseudo-Connections	Configure OSPF Pseudo-Connections

### 79.2.1 Configure basic functions of VPN.

#### Configuration Condition

Before configuring basic VPN functions, do the following:

- Configure the MPLS backbone IGP to achieve IP reachability between PE and PE devices.
- Configure the MPLS basic capability and LDP of the MPLS backbone, and establish LSPs between PEs and PE devices.

#### Configure VPN instances.

VRF can isolate the routes between different VPNs and between VPN and public network. When configuring L3VPN, you need to configure VPN instance on PE device and associate Site (site) in VPN instance.

## 1. Configure VRF

VRFs are used to isolate different VPN users, and address overlap is allowed in different VRFs. When VRF routes are passed through the service provider network, the problem of address overlap must be solved, which requires a locally unique RD for each VRF. When the PE sends the VRF route to the remote PE, it will add RD in front of each IPv4 prefix to form a unique VPNv4 address.

Table 2-3 Configuring the VRF

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create VRF and enter VRF configuration mode	<b>ip vrf vrf-name</b>	Mandatory By default, no VRF is configured.
Configure RD for VRF.	<b>rd route-distinguisher</b>	Mandatory By default, RD for VRF is not configured.

---

### Note

- The RD must be configured at the same time after the VRF is configured for the VRF to be used.
  - After RD for VRF is configured, it cannot be deleted or modified directly, and when it must be deleted or modified, you need to delete the VRF through the **no ip vrf** command and then configure the RD, and the RD cannot be the same as the RD of other VRFs in this device.
- 

## 2. Configure to Associate VRF with Interface

The PE device is connected to the CE through a locally configured VRF, and the interface connected to the CE needs to be associated to the corresponding VRF.

Table 79-4 Configuring to Associate VRF with Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure interface to associate with an VRF.	<b>ip vrf forwarding</b> <i>vrf-name</i>	Mandatory  By default, the interface is not associated with any VRF.
Configure an IP address for an interface.	<b>ip address</b> <i>ip-address</i> { <i>network-mask</i>   <i>mask-len</i> }	Mandatory  By default, no IP address is configured for the interface.

## Note

- When the **ip vrf forwarding** command is configured under an interface, the existing IP address of the interface will be automatically deleted and needs to be reconfigured.

### 3. Configure VRF Attributes

When the local PE receives VPNv4 route information from the remote PE device, the local PE device needs to determine which local VRF to load this VPNv4 route into. To control the distribution of VPNv4 routes, each VRF requires one or more RT attributes, and there are two types of RT attributes: Export RT and Import RT. When the PE initiates a VPNv4 route carrying the Export RT attribute, the Export RT attribute carried by the route is used to match with the Import RT of the local VRF when the PE decides which VRF to import the VPNv4 route into.

In addition to the attributes of RT for VRF that controls VPNv4 route distribution, the routing policy on the VRF can also control route distribution, and there are two types of routing policies that can be configured: Import map and Export map. Import map uses route maps to control whether routes can be imported into the VRF, and Export maps use route maps to change the properties of routes originating from the VRF.

Table 5-79 Configuring VRF Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Create VRF and enter VRF configuration mode	<b>ip vrf</b> <i>vrf-name</i>	Mandatory By default, no VRF is configured.
Configuring RT for VRF	<b>route-target</b> [ <b>both</b>   <b>export</b>   <b>import</b> ] { <i>ASN:nn</i>   <i>IP-address:nn</i> }	Optional By default, no Export, Import RT attributes of VRF are configured.
Configure VRF inbound routing policies.	<b>import map</b> <i>rtmap-name</i>	Optional By default, no VRF inbound routing policy is configured.
Configure VRF outbound routing policy.	<b>export map</b> <i>rtmap-name</i>	Optional By default, no VRF outbound routing policy is configured.

---

## Note

- Import map and Export map policies are only valid for local routes.
  - Export map policy can not perform route filtering. It can only modify the properties of the VPN route published by VRF and can modify the following properties: community, extcommunity and local-preference.
  - When the PE imports VPNv4 routes into VRF, the RT matching rule has higher priority than the Import map policy, i.e., the RT rule is matched first, and then the Import map policy is matched.
- 

### Configure PE-PE inter-route switching.

In MPLS L3VPN networks, PEs interact with each other via MP-IBGP (Multiprotocol Extended BGP) for VPNv4 routes. Both ends of the PE are configured in the same way.

Table 6-7 Configuring PE-PE Inter-Route Switching

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configuring PE Neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, there are no PE neighbors configured.
Configure the source address to be used for establishing PE neighbors.	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface</i>   <i>ip-address</i> }	Mandatory By default, the outgoing interface address of the route to the PE neighbor is used as the source address.
Enter BGP VPNv4 configuration mode.	<b>address-family vpnv4</b> [ <i>unicast</i> ]	Mandatory
Activate VPNv4 address clusters for PE neighbors.	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Mandatory By default, only IPv4 unicast routes can be sent and received between BGP neighbors.
Configure to send extended group attributes to PE neighbors.	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>send-community</b> [ <b>both</b>   <b>extended</b>   <b>standard</b> ]	Optional By default, the VPNv4 address clusters of active neighbors are automatically configured to send extended group attributes.

---

## Note

- Many of the routing characteristics under BGP VPNv4 address clusters are the same as those under BGP IPv4 unicast address clusters, and these characteristics are selected according to the networking requirements, as described in the MPLS L3VPN section in the Command
-

### Configure PE-CE inter-route switching.

Routing exchange between PE and CE can use static routes, RIP, OSPF, ISIS and BGP routing protocols, depending on the actual network environment will determine which method to use. The PE is configured in the same way as the CE.

#### 1. Configure to Use Static Route between PE and CE

Table 79-8 Configuring to Use Static Route between PE and CE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure a static route to the CE.	<b>ip route vrf</b> <i>vrf-name destination-ip-address destination-mask nexthop-ip-address</i>	Mandatory By default, no static route to the CE is configured.
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory By default, in BGP IPv4 unicast configuration mode.
Configure BGP to redistribute static routes.	<b>redistribute static</b> [ <b>route-map</b> <i>map-name / metric value</i> ]	Optional By default, the BGP is not configured to redistribute static route.

#### 2. Configure to Use RIP between PE and CE

Table 79-9 Configuring to Use RIP between PE and CE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable RIP protocol and enter RIP configuration mode.	<b>router rip</b>	Mandatory By default, RIP is not enabled.
Enter the RIP VRF address family configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory By default, the VRF address cluster of the RIP protocol is not enabled.
Configure the RIP version of the RIP protocol in VRF address cluster mode.	<b>version</b> {1   2}	Mandatory By default, the version used by RIP is version 1, which should generally be modified to version 2.
Configure the RIP to override the PE and CE connection interface.	<b>network</b> [ <i>network-address</i>   <i>interface</i> ]	Mandatory By default, RIP does not cover the PE and CE connection interface.
Exit RIP protocol VRF address cluster configuration mode.	<b>exit-address-family</b>	-
Exit RIP configuration mode.	<b>exit</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory By default, in BGP IPv4 unicast configuration mode.
Configure BGP to redistribute RIP.	<b>redistribute rip</b> [ <b>route-map</b> <i>map-name</i> / <b>metric</b> <i>value</i> ]	Optional By default, there is no redistribution of RIP protocol routes.

### 3. Configure to Use OSPF between PE and CE

Table 10-11 Configuring to Use OSPF between PE and CE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create OSPF process and enter OSPF configuration mode	<b>router ospf</b> <i>process-id vrf vrf-name</i>	Mandatory  OSPF process is enabled in VRF, by default the system does not enable OSPF protocol.  When OSPF is enabled from VRF, the OSPF process belonging to a certain VRF can manage the interfaces belonging to this VRF only.
Configure OSPF to override the PE-CE connection interface.	<b>network</b> <i>ip-address wildcard-mask</i> <b>area area-id</b>	Mandatory  By default, interface doesn't belong to any OSPF process or area.  One interface can only belong to one OSPF process and area.
Exit OSPF configuration mode.	<b>exit</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory  By default, in BGP IPv4 unicast configuration mode.
Configure BGP to redistribute OSPF.	<b>redistribute ospf</b> <i>as-number</i> [ <b>route-map</b> <i>map-name</i> / <b>metric value</b> / <b>match level</b> ]	Optional  By default, there is no redistribution of RIP protocol routes.

#### 4. Configure to Use ISIS between PE-CE

Table 12-9 Configuring to Use ISIS between PE-CE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>instance-name</i> ]	-
Configure network entity title for IS-IS	<b>net</b> <i>entry-title</i>	Mandatory By default, IS-IS doesn't have network entity title.
Configure IS-IS VRF attributes	<b>vrf</b> <i>vrf-name</i>	Optional By default IS-IS processes are located in the global VRF.
Return to the global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the interface to associate a VPF instance.	<b>ip vrf forwarding</b> <i>vrf-name</i>	Mandatory By default, the interface is not associated with any VRF.
Enable IS-IS protocol for the interface	<b>ip router isis</b> [ <i>instance-name</i> ]	Mandatory IS-IS protocol is not enabled on the interface by default.
Return to the global configuration mode	<b>exit</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory

Step	Command	Description
		By default, in BGP IPv4 unicast configuration mode.
Configure BGP to redistribute ISIS.	<b>redistribute isis</b> [ <i>instance-name</i> ] [ <b>route-map</b> <i>map-name</i> / <b>metric value</b> / <b>match level</b> ]	Optional  By default, there is no redistribution of ISIS protocol routes.

## 5. Configure to Use BGP between PE and CE

Table 13-14 Configuring to Use BGP between PE and CE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory  By default, in BGP IPv4 unicast configuration mode.
Configure CE as an EBGP neighbor.	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory  By default, there are no CE neighbors configured.

### 79.2.2 Configure M-VRF.

#### Configuration Condition

Before configuring the M-VRF, do the following:

- Configure the link layer protocol for the connection interface between M-VRF device and the PE and the site, keeping them connected.

#### Configure M-VRF.

M-VRF is an inexpensive way to extend VPN functionality to CEs. When multiple services exist for customers, instead of dividing multiple services onto one CE, multiple VRFs are configured on the M-VRF device to virtualize multiple CEs, isolating each service. The following figure depicts an example of M-VRF.

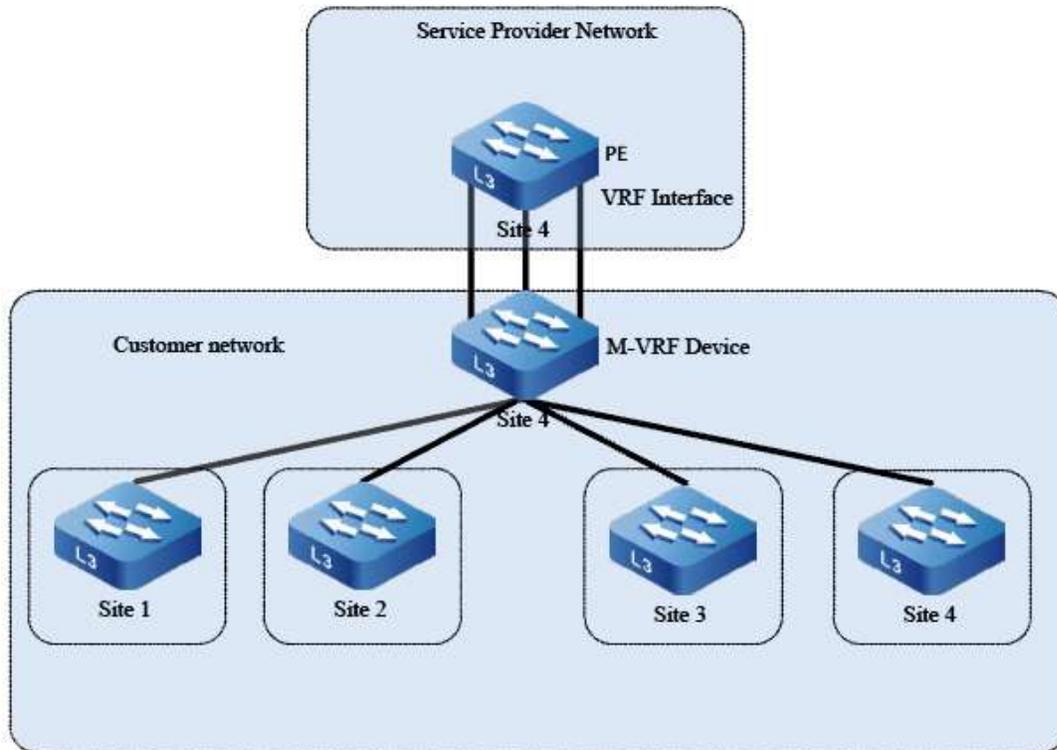

Figure 2-3 Configuring M-VRF

One interface in each VRF on the M-VRF device connects to the site and the other interface connects to the PE. In general, M-VRF devices connect to PEs using Ethernet connections, using one interface per VRF.

### 1. Configure the Routing Exchange between M-VRF Device and PE

Routing exchange between M-VRF devices and CEs can use static routes, RIP, OSPF, ISIS, and BGP routing protocols. The following is an example of routing exchange using RIP only.

Table 15-16 Configuring Routing Exchange Between M-VRF Device and PE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create VRF and enter VRF configuration mode	<b>ip vrf vrf-name</b>	Mandatory

Step	Command	Description
		By default, no VRF is configured.
Configure RD for VRF.	<b>rd</b> <i>route-distinguisher</i>	Mandatory By default, RD for VRF is not configured.
Exit VRF configuration mode.	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface_name</i>	-
Configure interface to associate with an VRF.	<b>ip vrf forwarding</b> <i>vrf-name</i>	Mandatory By default, the interface is not associated with any VRF.
Configure an IP address for an interface.	<b>ip address</b> <i>ip-address</i> { <i>network-mask</i>   <i>mask-len</i> }	Mandatory By default, no IP address is configured for the interface.
Exit interface configuration mode	<b>exit</b>	-
Enable RIP protocol and enter RIP configuration mode.	<b>router rip</b>	Mandatory By default, RIP is not enabled.
Enter the RIP VRF address family configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory By default, the RIP protocol does not enable VRF address clustering.
Configure the RIP version of the RIP protocol in VRF address cluster mode.	<b>version</b> {1   2}	Mandatory By default, the version used by RIP is version 1.
Configure RIP to override the connection interface	<b>network</b> [ <i>network-address</i>   <i>interface</i> ]	Mandatory By default, RIP does not override the interface

Step	Command	Description
between the M-VRF device and PE .		between the M-VRF device and the PE connection.

## Note

- Each VRF needs to be configured separately on the MVRF device with reference to the steps above.
- For the configuration of the PE side, refer to the "Configuring Basic Functions of VPN" section.

## 2. Configure M-VRF Devices and Inter-Site Routing Exchange

Routing exchange between M-VRF devices and sites can use static routing, RIP, OSPF, ISIS, and BGP routing protocols. The following is an example of using static routes.

Table 17-18 Configuring M-VRF and Inter-site Routing Exchange

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create VRF and enter VRF configuration mode	<b>ip vrf</b> <i>vrf-name</i>	Mandatory By default, no VRF is configured.
Configure RD for VRF.	<b>rd</b> <i>route-distinguisher</i>	Mandatory By default, RD for VRF is not configured.
Exit VRN instance configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface_name</i>	-
Configure interface to associate with an VRF.	<b>ip vrf forwarding</b> <i>vrf-name</i>	Mandatory

Step	Command	Description
		By default, the interface is not associated with any VRF.
Configure an IP address for an interface.	<b>ip address</b> <i>ip-address</i> { <i>network-mask</i>   <i>mask-len</i> }	Mandatory  By default, no IP address is configured for the interface.
Exit interface configuration mode	<b>exit</b>	-
Configure a static route to the site.	<b>ip route vrf</b> <i>vrf-name destination-ip-address destination-mask</i> <i>next-hop-ip-address</i>	Mandatory  By default, no static route to the site is configured.

---

### Note

- Each VRF needs to be configured separately on the MVRF device with reference to the steps above.
  - The site is configured in the same way as a normal static route configuration.
- 

### 79.2.3 Configure VPN route label assignment.

#### Configuration Condition

Before configuring the VPN route label assignment method, do the following:

- Configure basic VPN functions.

#### Configure VPN route label assignment.

BGP provides two ways to assign labels to VPN routes: the per-route label assignment method and the per-VRF label assignment method. With the per-route approach, BGP assigns a different label to each VPN route; with the per-VRF approach, BGP assigns the same label to VPN routes in the same VRF, and different labels to routes in different VRFs.

By default, BGP uses the per-VRF label assignment method, which can save label resources and reduce ILM table entry generation and improve performance when the amount of locally published VPN routes is large.

Table 19-20 Configuring VPN Route Label Assignment

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure per-route label assignment method.	<b>no unique-label-per-vrf</b>	Optional By default, the per-VRF label assignment method is enabled.

### 79.2.4 Configure VPN to cross domain.

#### Configuration Condition

Before configuring VPN to cross domain, do the following:

- Configure basic VPN functions.
- Configure the IP address for ASBR direct connection to achieve IP reachability between ASBRs.

#### Configure Option-A to cross domain.

Cross-domain Option-A , also known as VRF-to-VRF, is the easiest way to achieve VPN inter-access between AS. VRF-to-VRF handles inter-AS VPNv4 connectivity by simply treating another ASBR as a CE device. The following figure depicts an example of a VRF-to-VRF approach to cross domain.

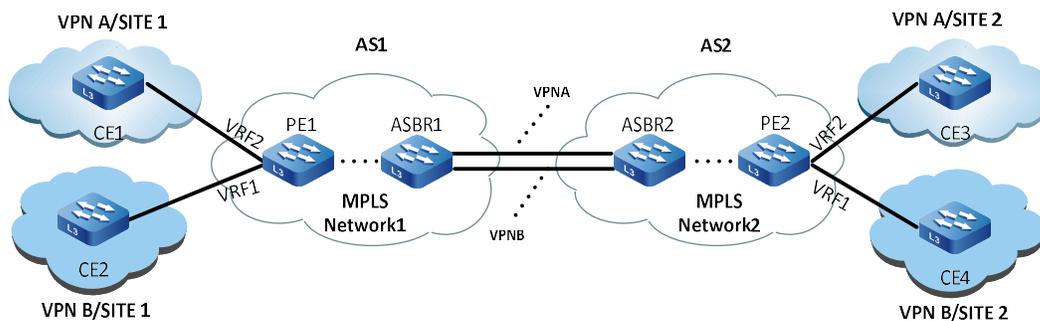

Figure 4-5 Configuring Option-A to Cross Domain (VRF-to-VRF)

In the above figure, VPN A Site 1 and Site 2 are connected to two different service providers: AS1 and AS2, and the service providers are connected to each other via ASBR. When two AS domains are configured with MPLS L3VPN networks, the VPN acrossing the AS domain requires the local ASBR to act as the PE device of the VPN and the peer ASBR to act as the CE device of the VPN. The VRF corresponding to this VPN should be configured on both ASBR devices at the same time. In this way, VPN routes are communicated within the AS via MP-IBGP for VPNv4 routes, and unicast routes are communicated between ASBRs within the corresponding VRFs of this VPN, thus achieving connectivity between Site 1 and Site 2.

The advantage of the VRF-to-VRF approach is that there is no need to run MPLS between ASBRs, and the disadvantage is that it is less scalable as the ASBR has to maintain routes for all VPNs and assign interfaces and connections to each cross-domain VPN.

See the section on "Configuring Basic Functions of VPN" for configuring method of VRF-to-VRF cross-domain.

**Configure Option-B to cross domain.**

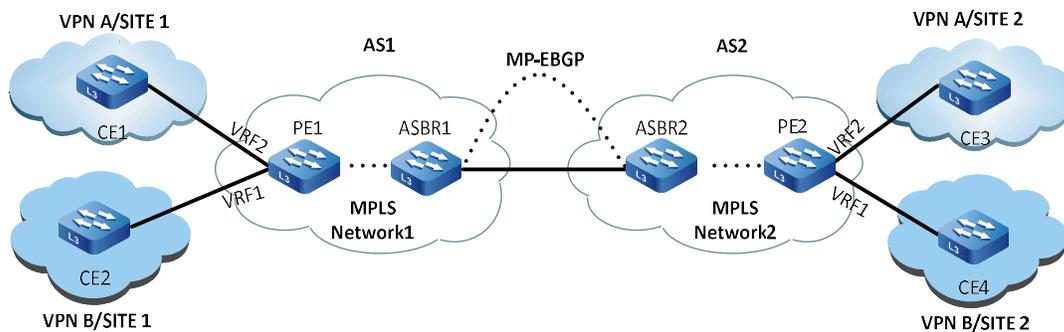

Figure 6-7 Configuring Option-B to Cross Domain (MP-EBGP Carrying VPNv4 Routes)

Option-B needs to run MP-EBGP between ASBR to cross domain. When the ASBR learns all VPN routes of the local autonomous domain PE, it re-assigns new labels to the VPN routes and then advertises the routing information and the new labels to the peer ASBR. The ASBR needs to maintain all VPN routes received from the local PE and the peer ASBR.

The method for Option-B to cross domain does not require ASBR to configure VRFs for each VPN, import VPNv4 routes, or assign interfaces to each VPN. However, ASBR still needs to maintain all VPNv4 routes and assign new labels to each label and install ILM table entries locally for old and new label conversions, so ASBR is under more pressure to carry the load.

Table 21-22 Configuring Option-B to Cross Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable MPLS forwarding globally	<b>mpls ip</b>	Mandatory By default, MPLS forwarding is not enabled
Enter the interface configuration mode	<b>interface</b> <i>interface_name</i>	-
Enable MPLS forwarding on the interface	<b>mpls ip</b>	Mandatory Configuration is done on the interconnect interface of the two ASBRs. By default, MPLS forwarding is not enabled on the interface.
Return to the global configuration mode	<b>exit</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the peer ASBR as an EBGP neighbor.	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, there are no EBGP neighbors configured.
Enter BGP VPNv4 configuration mode.	<b>address-family vpnv4</b> [ <i>unicast</i> ]	Mandatory By default, in BGP IPv4 unicast configuration mode.
Activate MP-EBGP neighbor advertisement VPN routes.	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Mandatory By default, BGP only advertises IPv4 unicast routes.
Configure to change the next hop when advertising the PE to the route.	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-</i>	Mandatory By default, the next hop is not configured to

Step	Command	Description
	<i>group-name</i> } <b>next-hop-self</b>	change when the route is advertised to the PE.

## Note

- The above only lists the basic configuration of Option-B to cross domain on ASBR. For the configuration between ASBR and PE and P devices in this AS, refer to the "Configuring Basic Functions of VPN" section.

### 79.2.5 Configure VPN users to access the Internet.

#### Configuration Condition

Before configuring VPN users to access the Internet, do the following:

- Configure basic VPN functions.

#### Configure CE access to the Internet.

In the actual application environment, customers do not want VPN users to access the Internet directly and require security devices such as firewalls to control the connection of VPN users to the Internet. Each VPN site sends its Internet data stream to the central site. VPN members forward their data streams to access the Internet to the central site by importing a default route to access the Internet (with the next hop being the central site CE). The central site forwards the data stream to the Internet to the enterprise firewall, which does the necessary access control and NAT processing according to the security policy formulated within the firewall, and finally the firewall forwards the data stream to the Internet. The following figure depicts an example of using CE access to access the Internet.

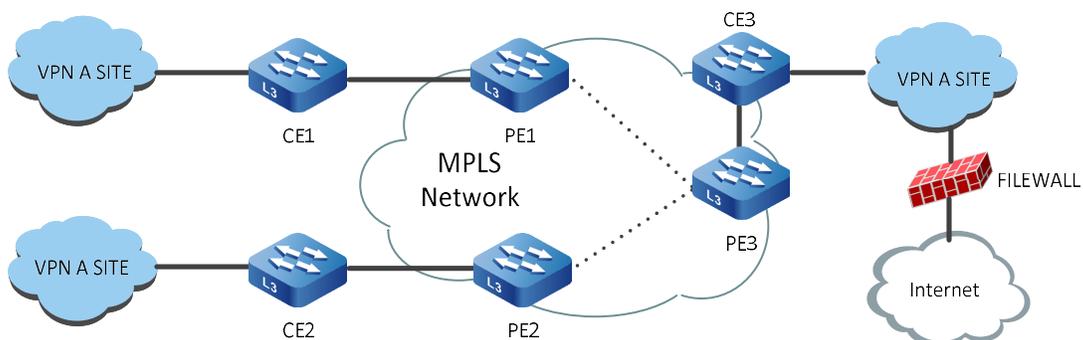

Figure 79-8 Configuring CE Access to the Internet

In the above figure, CE3 is used as the central site for customer control of Internet access, and it is only necessary to configure the default route on CE3 with the next hop as the Internet gateway, which is communicated to the PE device through the route exchange between PE and CE, and then communicated to each VPN site through MP-IBGP, so that each VPN site can access the Internet through the default route (the next hop is PE3), and the access to Internet data first arrives at CE3 through the MPLS network, and then reaches the Internet through the default route configured on CE3.

This CE access method only requires configuration and deployment within the VPN, without operator involvement, and users are free to control the security policy for internal user access to the Internet. However, this approach requires users to have strong security management capabilities, and it is not possible for operators to achieve unified management of user access to the Internet.

Table 23-24 Configuring CE Access to the Internet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the default route on the central site CE with the Internet gateway as the next hop.	<b>ip route</b> <i>destination-ip-address</i> <i>destination-mask</i> <i>nexthop-ip-address</i>	Mandatory  By default, CE is not configured with a default route to the Internet.

---

 **Note**

- For the configuration of other devices, refer to the "Configuring Basic Functions of VPN" section.
- 

**Configure PE access to the Internet.**

Internet access can be provided to VPN users by forwarding their traffic to the Internet gateway of the service provider network, which is called PE access to the Internet. To provide Internet access to the VPN, the global routing table on the PE must be able to forward VPN traffic, which is achieved by creating a static route in the PE's VRF and specifying the next hop in the global routing table. The following figure depicts an example of PE access to the Internet.

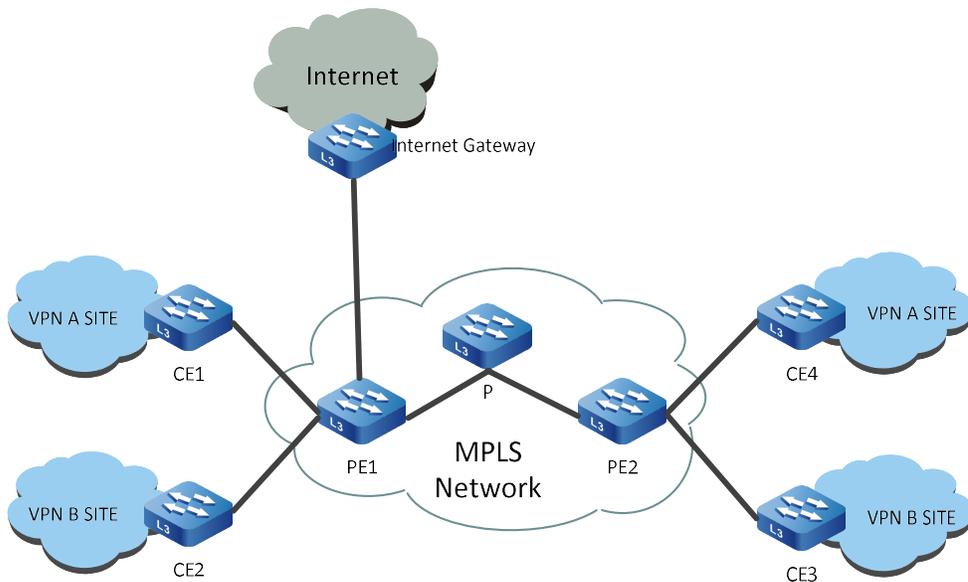

Figure 9-10 Configuring PE Access to the Internet

In the above figure, VPN A has two users, CE1 and CE4, who need to access the Internet. First, you need to configure a cross-VRF default static route to access the Internet in the VRF routing tables of PE1 and PE2 respectively, where the next hop of the cross-VRF default static route in PE1 is the Internet gateway and the next hop of the cross-VRF default static route in PE2 is PE1. In order to ensure that the packets returned from the Internet can be successfully returned to CE1 and CE4, it is also necessary to configure a cross-VRF route reaching CE1 in the global routing table of PE1, with the next hop being CE1 in the VRF; in the global routing table of PE2, it is also necessary to configure a cross-VRF route reaching CE4, with the next hop being CE4 in the VRF, and to advertise this route to the MPLS network via IGP.

Table 79-25 Configuring PE Access to the Internet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the default static route across the VRF to access the Internet in the PE's VRF routing table, with the next hop being the Internet gateway.	<b>ip route vrf vrf-name destination-ip-address destination-mask nexthop-ip-address vrf global</b>	Mandatory By default, there is no default static route configured for the PE to access the Internet.
Configure a static route across the VRF in the PE's global routing table to reach the CE, with the next hop being the CE.	<b>ip route destination-ip-address destination-mask nexthop-ip-address vrf vrf-name</b>	Mandatory By default, no static route across the VRF is

Step	Command	Description
		configured for the PE to reach the CE.

---

## Note

- The above is the key configuration for the PE connected to the Internet gateway (corresponding to PE1 in the figure). For other PEs (such as PE2 in the figure), configure a default static route across the VRF to access the Internet, and the next hop needs to point to the loopback port address of PE1 (meaning the loopback port where the BGP neighbor is established).
- 

### 79.2.6 Configure AS override.

#### Configuration Condition

Before configuring AS override, do the following:

- Configure basic VPN functions.
- Configure the PE-CE inter-route exchange to use EBGP.

#### Configure AS override.

When running BGP between PE and CE routers, the customer VPN may wish to reuse AS numbers within different sites, which inevitably produces a route from the PE that is received by the CE with an AS-PATH attribute that will contain the AS number on the CE device side, and the CE will discard the route from the PE. To resolve this situation, the PE needs to enable the BGP AS override feature. After the PE device enables the AS override function, when it advertises the route to the CE neighbor, if the AS-PATH of the route has the same AS number as the CE, the PE will replace the AS number of the CE neighbor contained in the AS-PATH attribute of the route with its own AS number and then advertise it to the CE neighbor.

Table 79-26 Configuring AS Override

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory By default, in BGP IPv4 unicast configuration mode.
Configure AS Override	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>as-override</b>	By default, the AS override function is not enabled.

## 79.2.7 Configure OSPF Pseudo-Connections

### Configuration Condition

Before configuring an OSPF pseudo-link, do the following:

- Configure basic functions of VPN and configure OSPF for routing exchange between PE and CE.

### Configure OSPF Pseudo-Connections

In an MPLS L3VPN environment, when there is a directly connected backup link (called a "backdoor link") between two CEs at different sites, the OSPF intra-domain route takes precedence over the external route redistributed from BGP, resulting in traffic between the CEs not going through the VPN, but rather through the backdoor link. In order to prioritize traffic between two CEs to pass through the VPN, an OSPF pseudo-link needs to be established between the two PEs.

The source and destination addresses of the pseudo-link are reachable within the BGP domain and cannot be overwritten and redistributed by OSPF. Routes to pseudo-link destinations can only be learned through BGP.

The OSPF pseudo-link configuration steps on the PE are as follows.

#### 1. Configure VRF Loopback Interface

Table 27-28 Configuring the VRF Loopback Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Create loopback interface and enter interface configuration mode.	<b>interface loopback</b> <i>interface-number</i>	Mandatory By default, no loopback interface is created.
Configure loopback interface to associate with VRF.	<b>ip vrf forwarding</b> <i>vrf-name</i>	Mandatory By default, the interface is not associated with any VRF.
Configure the loopback interface IP address.	<b>ip address</b> <i>ip-address</i> { <i>mask</i>   <i>mask-length</i> }	Mandatory By default, no interface IP address is configured.
Exit interface configuration mode	<b>exit</b>	-

## 2. Configure BGP to Redistribute OSPF and Directly Connected Route of Loopback Interface

Table 29-30 Configure BGP to Redistribute OSPF and Directly Connected Route of Loopback Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Mandatory By default, in BGP IPv4 unicast configuration mode.
Configure BGP to redistribute directly connected route of loopback interface.	<b>redistribute connected</b> [ <b>route-map</b> <i>map-name</i> / <b>metric</b> <i>value</i> ]	Mandatory By default, BGP does not redistribute directly connected routes
Configure BGP to redistribute OSPF.	<b>redistribute ospf</b> <i>as-number</i> [ <b>match</b> <i>route-sub-type</i> /	Mandatory By default, BGP does not redistribute OSPF routes.

Step	Command	Description
	<b>route-map</b> <i>map-name / metric value</i> ]	
Exit the BGP IPv4 VRF configuration mode	<b>exit-address-family</b>	-
Exit the BGP configuration mode	<b>exit</b>	-

### 3. Configure OSPF Pseudo-Connections

Table 31-32 Configuring OSPF Pseudo-Connections

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create OSPF process and enter OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory  Enable the OSPF process directly or from VRF. By default, the OSPF protocol is disabled in the system.  When OSPF is enabled from VRF, the OSPF process belonging to a certain VRF can manage the interfaces belonging to this VRF only.
Configure the network segment covered by OSPF area	<b>network</b> <i>ip-address wildcard-mask area area-id</i>	Mandatory  By default, interface doesn't belong to any OSPF process or area.  One interface can only belong to one OSPF process and area.
Configure OSPF Pseudo-Connections	<b>area</b> <i>area-id sham-link source-ip-address desinationt-ip-address</i> [ <b>cost</b> <i>cost</i> ]	Mandatory  <i>source-ip-address</i> should be the local loopback address, <i>desinationt-ip-</i>

Step	Command	Description
		<p><i>address</i> should be the peer loopback address.</p> <p>By default, no OSPF pseudo-link is configured.</p>

## 79.2.8 MPLS L3VPN Monitoring and Maintaining

Table 33-34 MPLS L3VPN Monitoring and Maintaining

Command	Description
<b>clear ip bgp</b> { * [vrf vrf-name]   neighbor-address [vrf vrf-name]   as-number   peer-group peer-group-name   external }	Reset BGP neighbors
<b>clear ip bgp</b> { *   neighbor-address   as-number   peer-group peer-group-name   external } [vpn4 unicast   vrf vrf-name] { [ soft ] [ in   out ] }	Softly reset neighbors
<b>show ip bgp vpnv4</b> { all   vrf vrf-name   rd route-distinguisher } [ ip-address   ip-address/mask-length ]	Display routing database information under BGP VPNv4 address clusters.
<b>show ip bgp vpnv4</b> { all   vrf vrf-name   rd route-distinguisher } dampening { dampened-paths   flap-statistics   parameters }	Show details of BGP VPNv4 route decay.
<b>show ip bgp</b> [ vpnv4 { all   vrf vrf-name   rd route-distinguisher } ] labels	Display route label information under BGP VPNv4 address clusters.
<b>show ip bgp vpnv4 all neighbors</b> [ ip-address ]	Display neighbor details under BGP VPNv4 address clusters.
<b>show ip bgp vpnv4</b> { all   vrf vrf-name   rd route-distinguisher } summary	Summary information of all neighbors under BGP VPNv4 address clusters.
<b>show ip bgp vrf</b> vrf-name	Display BGP VRF information

## 79.3 MPLS L3VPN Typical Configuration Example

### 79.3.1 Configure intra-domain MPLS L3VPN.

#### Network Requirements

- The entire MPLS network includes two VPNs, VPN1 and VPN2, and the two VPNs use different Route-Targets, thus ensuring that the two VPNs cannot inter-access each other.
- CE1 and CE3 belong to VPN1, and CE2 and CE4 belong to VPN2.
- OSPF is used for route advertisement between CE and PE.
- OSPF is used as IGP between PEs to achieve intra-PE communication, and MP-IBGP is configured to exchange VPN routing information.

#### Network Topology

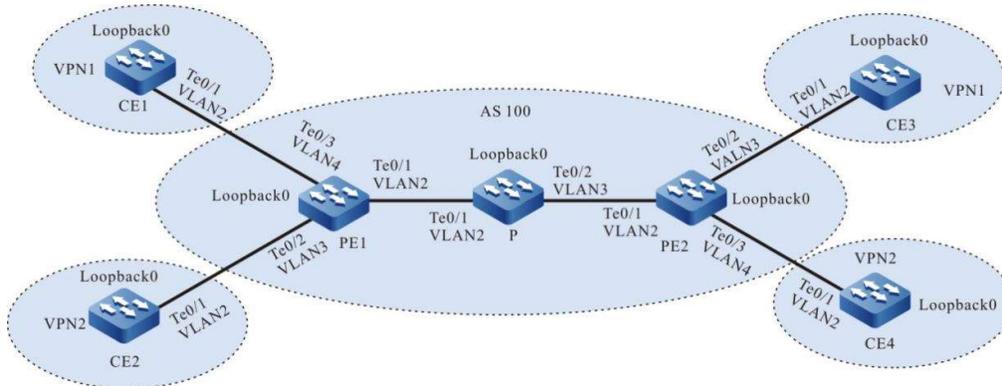

Figure 79-11 Network Topology for Configuring Intra-Domain MPLS L3VPN

Table 35-36 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	95.1.1.2/16	P	Loopback0	11.11.11.11/32
	Loopback0	5.5.5.5/32	PE2	Vlan2	92.1.1.1/16
PE1	Vlan2	93.1.1.2/16		Vlan3	90.1.1.1/16
	Vlan3	94.1.1.1/16		Vlan4	91.1.1.1/16
	Vlan4	95.1.1.1/16		Loopback0	75.75.75.75/32
	Loopback0	90.90.90.90/32	CE3	Vlan2	90.1.1.2/16

of equipment	Interface	IP address	of equipment	Interface	IP address
CE2	Vlan2	94.1.1.2/16		Loopback0	8.8.8.8/32
	Loopback0	2.2.2.2/32	CE4	Vlan2	91.1.1.2/16
P	Vlan2	93.1.1.1/16		Loopback0	3.3.3.3/32
	Vlan3	92.1.1.2/16			

### Configuration Steps

Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode.  
(Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure global OSPF to advertise global routes.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 90.90.90.90 0.0.0.0 area 0
PE1(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit
```

# Configure global OSPF on P.

```
P#configure terminal
P(config)#router ospf 100
P(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
P(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
P(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
P(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 75.75.75.75 0.0.0.0 area 0
PE2(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 11.11.11.11/32 [110/2] via 93.1.1.1, 00:05:12, vlan2
O 75.75.75.75/32 [110/3] via 93.1.1.1, 00:06:03, vlan2
C 93.1.0.0/16 is directly connected, 00:34:54, vlan2
L 93.1.1.2/32 is directly connected, 00:34:54, vlan2
O 92.1.0.0/16 [110/2] via 93.1.1.1, 00:08:12, vlan2
LC 90.90.90.90/32 is directly connected, 154:02:28, loopback0
```

It is indicated that the global routing table of PE1 has the routing information of the loopback port of P and PE2 present.

---

## Note

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 90.90.90.90
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 90.90.90.90
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#mpls ip
PE1(config-if-vlan2)#mpls ldp
PE1(config-if-vlan2)#exit
```

# Enable global MPLS IP and MPLS LDP on P. Also enable MPLS IP and MPLS LDP on the interface.

```
P(config)#mpls ip
```

```
P(config)#mpls ldp
P(config-ldp)#router-id 11.11.11.11
P(config-ldp)#address-family ipv4
P(config-ldp-af4)#transport-address 11.11.11.11
P(config-ldp-af4)#exit
P(config-ldp)#exit
P(config)#interface vlan2
P(config-if-vlan2)#mpls ip
P(config-if-vlan2)#mpls ldp
P(config-if-vlan2)#exit
P(config)#interface vlan3
P(config-if-vlan3)#mpls ip
P(config-if-vlan3)#mpls ldp
P(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```
PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 75.75.75.75
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 75.75.75.75
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit
```

---

## Note

- router-id and transport-address can be manually configured or automatically generated, and are generally configured to be the same. If router-id and transport-address are not manually configured, the device will automatically select them. Among the interfaces in the up state, the largest IP address in the Loopback interface is selected first; if the device is not configured with a Loopback interface address, the largest IP address in the normal interface is selected.
- 

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```
PE1#show mpls ldp session
```

```
Peer IP Address Peer Type My Role State DS Cap DeadTime
11.11.11.11 Multicast Active OPERATIONAL Disabled 00:02:27
```

Statistics for ldp sessions:

Multicast sessions: 1

Targeted sessions: 0

It is indicated that PE1 successfully establishes an LDP session with P.

#View the routing label table entries on the device.

Take PE1 as an example:

```
PE1#show ip route 11.11.11.11 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 11.11.11.11/32 [110/2] via 93.1.1.1, label 3, 00:29:21, vlan2
    93.1.1.1 [0], vlan2
```

```
PE1#show ip route 75.75.75.75 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 75.75.75.75/32 [110/3] via 93.1.1.1, label 16, 00:29:15, vlan2
    93.1.1.1 [0], vlan2
```

It is indicated the label information of the loopback ports to P and PE2 exist on PE1.

---

## Note

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 5: Configure the VPN instance to advertise the CE route to the PE via OSPF.

#Configure VPN instance on PE1 and OSPF under VPN1 and VPN2.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
PE1(config-vrf)#exit
PE1(config)#ip vrf 2
PE1(config-vrf)#rd 200:1
PE1(config-vrf)#route-target export 200:1
PE1(config-vrf)#route-target import 200:1
PE1(config-vrf)#exit
PE1(config)#interface vlan4
PE1(config-if-vlan4)#ip vrf forwarding 1
PE1(config-if-vlan4)#ip address 95.1.1.1 255.255.0.0
PE1(config-if-vlan4)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#ip vrf forwarding 2
PE1(config-if-vlan3)#ip address 94.1.1.1 255.255.0.0
PE1(config-if-vlan3)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#network 95.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit
PE1(config)#router ospf 300 vrf 2
PE1(config-ospf)#network 94.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit
```

#Configure OSPF on CE1.

```
CE1#configure terminal
CE1(config)#router ospf 100
CE1(config-ospf)#network 5.5.5.5 0.0.0.0 area 0
CE1(config-ospf)#network 95.1.0.0 0.0.255.255 area 0
CE1(config-ospf)#exit
```

#Configure OSPF on CE2.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 2.2.2.2 0.0.0.0 area 0
CE2(config-ospf)#network 94.1.0.0 0.0.255.255 area 0
CE2(config-ospf)#exit
```

#Configure VPN instance on PE2 and configure OSPF under VPN1 and VPN2.

```
PE2(config)#ip vrf 1
```

```

PE2(config-vrf)#rd 100:1
PE2(config-vrf)#route-target export 100:1
PE2(config-vrf)#route-target import 100:1
PE2(config-vrf)#exit
PE2(config)#ip vrf 2
PE2(config-vrf)#rd 200:1
PE2(config-vrf)#route-target export 200:1
PE2(config-vrf)#route-target import 200:1
PE2(config-vrf)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 1
PE2(config-if-vlan3)#ip address 90.1.1.1 255.255.0.0
PE2(config-if-vlan3)#exit
PE2(config)#interface vlan4
PE2(config-if-vlan4)#ip vrf forwarding 2
PE2(config-if-vlan4)#ip address 91.1.1.1 255.255.0.0
PE2(config-if-vlan4)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#network 90.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
PE2(config)#router ospf 300 vrf 2
PE2(config-ospf)#network 91.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit

```

#### #Configure OSPF on CE3.

```

CE3#configure terminal
CE3(config)#router ospf 100
CE3(config-ospf)#network 8.8.8.8 0.0.0.0 area 0
CE3(config-ospf)#network 90.1.0.0 0.0.255.255 area 0
CE3(config-ospf)#exit

```

#### #Configure OSPF on CE4.

```

CE4#configure terminal
CE4(config)#router ospf 100
CE4(config-ospf)#network 3.3.3.3 0.0.0.0 area 0
CE4(config-ospf)#network 91.1.0.0 0.0.255.255 area 0
CE4(config-ospf)#exit

```

#### #View the VPN routing table on the PE.

Take PE1 as an example:

```

PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

```

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 5.5.5.5/32 [110/2] via 95.1.1.2, 00:11:11, vlan4

C 95.1.0.0/16 is directly connected, 00:11:45, vlan4

L 95.1.1.1/32 is directly connected, 00:11:45, vlan4

PE1#show ip route vrf 2

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 2.2.2.2/32 [110/2] via 94.1.1.2, 00:22:53, vlan3

C 94.1.0.0/16 is directly connected, 00:23:25, vlan3

L 94.1.1.1/32 is directly connected, 00:23:25, vlan3

It is indicated that routes to CE1 and CE2 exist in the VPN1 and VPN2 routing tables of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

Step 6: Configure the MP-IBGP to use the loopback interface as the peer address; and redistribute routes with each other and the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE1(config)#router bgp 100
```

```
PE1(config-bgp)#neighbor 75.75.75.75 remote-as 100
```

```
PE1(config-bgp)#neighbor 75.75.75.75 update-source loopback0
```

```
PE1(config-bgp)#address-family vpnv4
```

```
PE1(config-bgp-af)#neighbor 75.75.75.75 activate
```

```

PE1(config-bgp-af)#neighbor 75.75.75.75 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute ospf 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 2
PE1(config-bgp-af)#redistribute ospf 300
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit
PE1(config)#router ospf 300 vrf 2
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit

```

#Configure the MP-IBGP on PE2 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```

PE2(config)#router bgp 100
PE2(config-bgp)#neighbor 90.90.90.90 remote-as 100
PE2(config-bgp)#neighbor 90.90.90.90 update-source loopback0
PE2(config-bgp)#address-family vpnv4
PE2(config-bgp-af)#neighbor 90.90.90.90 activate
PE2(config-bgp-af)#neighbor 90.90.90.90 send-community extended
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 2
PE2(config-bgp-af)#redistribute ospf 300
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit
PE2(config)#router ospf 300 vrf 2
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit

```

---

## Note

- In practice, if there are two or more PE devices on the same site, it is recommended not to redistribute routes directly between different routing protocols, and if you must configure them, you need to configure a routing policy to prevent routing loops from being generated.
- 

Step 7: Check the result.

# After the configuration is complete, view the BGP neighbor information on the PE.

Take PE1 as an example:

```
PE1#show ip bgp vpnv4 all summary
BGP router identifier 90.90.90.90, local AS number 100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
75.75.75.75  4  100   40   41    5   0  00:32:01   4

Total number of neighbors 1
```

The successful establishment of BGP neighbors between PE1 and PE2 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table and VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip bgp vpnv4 vrf 1
BGP table version is 43, local router ID is 90.90.90.90
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
Route Distinguisher: 100:1 (Default for VRF 1)
[O]*> 5.5.5.5/32   95.1.1.2        2     32768 ?

[B]*>i90.1.0.0/16  75.75.75.75     1    100  0 ?
[O]*> 95.1.0.0/16  0.0.0.0         1     32768 ?
```

```

PE1#show ip bgp vpnv4 vrf 2
BGP table version is 43, local router ID is 90.90.90.90
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale

```

```

Origin codes: i - IGP, e - EGP, ? - incomplete

```

```

      Network      Next Hop      Metric LocPrf Weight Path
Route Distinguisher: 200:1 (Default for VRF 2)
[O]*> 2.2.2.2/32    94.1.1.2      2     32768 ?
[B]*>i3.3.3.3/32    75.75.75.75   2    100  0 ?
[B]*>i91.1.0.0/16   75.75.75.75   1    100  0 ?
[O]*> 94.1.0.0/16   0.0.0.0       1     32768 ?

```

```

PE1#show ip route vrf 1

```

```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

```

```

      U - Per-user Static route

```

```

      O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

O  5.5.5.5/32 [110/2] via 95.1.1.2, 00:22:51, vlan4
B  8.8.8.8/32 [200/2] via 75.75.75.75, 00:01:06, vlan2
B  90.1.0.0/16 [200/1] via 75.75.75.75, 00:01:06, vlan2
C  95.1.0.0/16 is directly connected, 00:23:25, vlan4
L  95.1.1.1/32 is directly connected, 00:23:25, vlan4

```

```

PE1#show ip route vrf 2

```

```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

```

```

      U - Per-user Static route

```

```

      O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

O  2.2.2.2/32 [110/2] via 94.1.1.2, 00:22:53, vlan3
B  3.3.3.3/32 [200/2] via 75.75.75.75, 00:01:15, vlan2
B  91.1.0.0/16 [200/1] via 75.75.75.75, 00:01:15, vlan2
C  94.1.0.0/16 is directly connected, 00:23:25, vlan3
L  94.1.1.1/32 is directly connected, 00:23:25, vlan3

```

It is indicated the route information to the peer CE3 and CE4 under the BGP VPNv4 routing table, VPN1 and VPN2 routing table of PE1.

#View the routing label information on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1 8.8.8.8 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 8.8.8.8/32 [200/0] via 75.75.75.75, label 5120, 01:04:26, vlan2
```

```
93.1.1.1 [3], label 16, vlan2
```

```
PE1#show ip route vrf 2 3.3.3.3 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 3.3.3.3/32 [200/0] via 75.75.75.75, label 5121, 01:04:26, vlan2
```

```
93.1.1.1 [3], label 16, vlan2
```

```
PE1#show mpls forwarding-table
```

```
Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root  
address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)
```

```
S - Static Label
```

Pro	Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B	1	0.0.0.0/0	10240	/	/	/
B	2	0.0.0.0/0	10241	/	/	/

It is indicated that the route label information of VPN1 and VPN2 exists in the MPLS forwarding table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

#Ping the loopback port of CE3 at CE1 to see if it can ping through.

```
CE1#ping 8.8.8.8
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 8.8.8.8 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

#Ping the loopback port of CE4 on CE1 to see if it can ping through.

```
CE1#ping 3.3.3.3
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 3.3.3.3 , timeout is 2 seconds:
```

```
.....
```

```
Success rate is 0% (0/5).
```

It is indicated that devices within the same VPN can communicate normally, while devices in different VPNs cannot communicate and routes are isolated.

## 79.3.2 Configure M-VRF.

### Network Requirements

- The MCE is the device used as the VPN multi-instance switch on the client side.
- The routes of two user networks, VPN1 and VPN2, are isolated so that sites of the same VPN can communicate with each other and sites of different VPNs cannot communicate.
- CE1 and CE3 are the sites of VPN1, and CE2 and CE4 are the sites of VPN2.
- EBGP is used between PE1 and CE1, and RIP is used between PE1 and CE2.
- OSPF is used between MCE and PE2, and static routes are used between MCE and CE3 and CE4.

### Network Topology

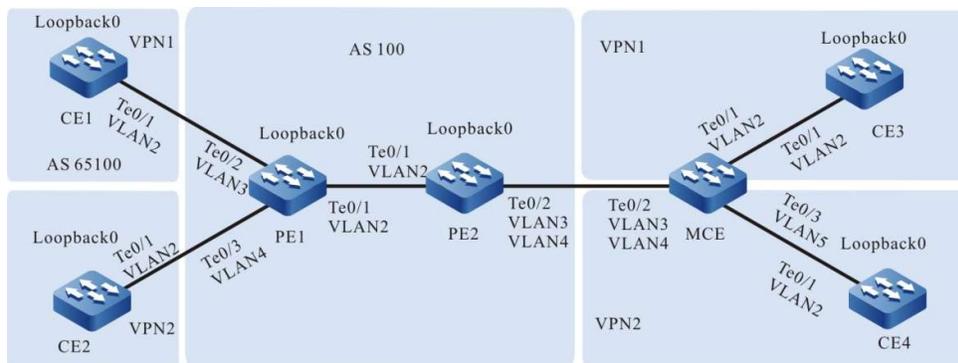

Figure 12-13 Network Topology for Configuring M-VRF

Table 37-38 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	95.1.1.2/16	PE2	Vlan4	92.1.1.2/16
	Loopback0	5.5.5.5/32		Loopback0	11.11.11.11/32
PE1	Vlan2	93.1.1.2/16	MCE	Vlan3	97.1.1.2/16
	Vlan3	95.1.1.1/16		Vlan4	92.1.1.1/16
	Vlan4	94.1.1.1/16		Vlan2	90.1.1.1/16
	Loopback0	90.90.90.90/32		Vlan5	91.1.1.1/16
CE2	Vlan2	94.1.1.2/16	CE3	Vlan2	90.1.1.2/16
	Loopback0	2.2.2.2/32		Loopback0	8.8.8.8/32
PE2	Vlan2	93.1.1.1/16	CE4	Vlan2	91.1.1.2/16
	Vlan3	97.1.1.1/16		Loopback0	3.3.3.3/32

### Configuration Steps

- Step 1: Configure Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure global OSPF to advertise global routes.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 90.90.90.0 0.0.0.0 area 0
PE1(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
```

```
PE2(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
PE2(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 11.11.11.11/32 [110/2] via 93.1.1.1, 03:19:45, vlan2
C 93.1.0.0/16 is directly connected, 03:20:31, vlan2
L 93.1.1.2/32 is directly connected, 03:20:31, vlan2
LC 90.90.90.90/32 is directly connected, 03:22:09, loopback0
```

It is indicated that the global routing table of PE1 has the routing information of the loopback port of PE2 present.

---

### Note

- Refer to PE1 for the inspection method of PE2.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 90.90.90.90
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 90.90.90.90
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#mpls ip
PE1(config-if-vlan2)#mpls ldp
```

```
PE1(config-if-vlan2)#exit
```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```
PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 11.11.11.11
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 11.11.11.11
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit
```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```
PE1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
11.11.11.11     Multicast  Active   OPERATIONAL  Disabled 00:02:19
Statistics for ldp sessions:
  Multicast sessions: 1
  Targeted sessions: 0
```

It is indicated that PE1 and PE2 successfully establish the LDP session.

#View the routing label table entries on the device.

Take PE1 as an example:

```
PE1#show ip route 11.11.11.11 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 11.11.11.11/32 [110/2] via 93.1.1.1, label 3, 03:29:21, vlan2
   93.1.1.1 [0], vlan2
```

It is indicated that the label information of the loopback port to PE2 exists in the route label table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.

Step 5: Configure the VPN instance to advertise the routes of CE1 and CE2 to PE1 via OSPF.

#Configure VPN instance on PE1 and configure EBGP under VPN1 and RIP under VPN2.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
PE1(config-vrf)#exit
PE1(config)#ip vrf 2
PE1(config-vrf)#rd 200:1
PE1(config-vrf)#route-target export 200:1
PE1(config-vrf)#route-target import 200:1
PE1(config-vrf)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#ip vrf forwarding 1
PE1(config-if-vlan3)#ip address 95.1.1.1 255.255.0.0
PE1(config-if-vlan3)#exit
PE1(config)#interface vlan4
PE1(config-if-vlan4)#ip vrf forwarding 2
PE1(config-if-vlan4)#ip address 94.1.1.1 255.255.0.0
PE1(config-if-vlan4)#exit
PE1(config)#router bgp 100
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#neighbor 95.1.1.2 remote-as 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router rip
PE1(config-rip)#address-family ipv4 vrf 2
PE1(config-rip-af)#version 2
PE1(config-rip-af)#network 94.1.0.0
PE1(config-rip-af)#exit-address-family
PE1(config-rip)#exit
```

#Configure EBGP on CE1 to advertise CE routes to the PE.

```
CE1#configure terminal
CE1(config)#router bgp 200
CE1(config-bgp)#neighbor 95.1.1.1 remote-as 100
CE1(config-bgp)#network 5.5.5.5 255.255.255.255
CE1(config-bgp)#network 95.1.0.0 255.255.0.0
```

```
CE1(config-bgp)#exit
```

#Configure RIP on CE2 to advertise CE routes to the PE.

```
CE2#configure terminal
CE2(config)#router rip
CE2(config-rip)#version 2
CE2(config-rip)#network 2.2.2.2
CE2(config-rip)#network 94.1.0.0
CE2(config-rip)#exit
```

#After the configuration is complete, check the routing table of VPN1 and VPN2 on PE1.

```
PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 5.5.5.5/32 [20/0] via 95.1.1.2, 03:22:26, vlan3
C 95.1.0.0/16 is directly connected, 03:48:37, vlan3
L 95.1.1.1/32 is directly connected, 03:48:37, vlan3
```

```
PE1#show ip route vrf 2
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
R 2.2.2.2/32 [120/1] via 94.1.1.2, 03:46:36, vlan4
C 94.1.0.0/16 is directly connected, 03:58:11, vlan4
L 94.1.1.1/32 is directly connected, 03:58:11, vlan4
```

It is indicated that routes to CE1 and CE2 exist in the VPN1 and VPN2 routing tables of PE1.

Step 6: Configure VPN instances on PE2 and MCE, and configure default routes on CE3 and CE4 to point to MCE.

#Configure VPN instance on PE2 and configure OSPF under VPN1 and VPN2.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 100:1
PE2(config-vrf)#route-target export 100:1
```

```

PE2(config-vrf)#route-target import 100:1
PE2(config-vrf)#exit
PE2(config)#ip vrf 2
PE2(config-vrf)#rd 200:1
PE2(config-vrf)#route-target export 200:1
PE2(config-vrf)#route-target import 200:1
PE2(config-vrf)#exit
PE2(config)#interface vlan4
PE2(config-if-vlan4)#ip vrf forwarding 1
PE2(config-if-vlan4)#ip address 92.1.1.1 255.255.0.0
PE2(config-if-vlan4)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 2
PE2(config-if-vlan3)#ip address 97.1.1.2 255.255.0.0
PE2(config-if-vlan3)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
PE2(config)#router ospf 300 vrf 2
PE2(config-ospf)#network 97.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit

```

**#Configure VPN instance on MCE and configure OSPF under VPN1 and VPN2, configure static route to CE loopback port and redistribute it into OSPF.**

```

MCE#configure terminal
MCE(config)#ip vrf 1
MCE(config-vrf)#rd 100:1
MCE(config-vrf)#exit
MCE(config)#ip vrf 2
MCE(config-vrf)#rd 200:1
MCE(config-vrf)#exit
MCE(config)#interface vlan4
MCE(config-if-vlan4)#ip vrf forwarding 1
MCE(config-if-vlan4)#ip address 92.1.1.2 255.255.0.0
MCE(config-if-vlan4)#exit
MCE(config)#interface vlan3
MCE(config-if-vlan3)#ip vrf forwarding 2
MCE(config-if-vlan3)#ip address 97.1.1.1 255.255.0.0
MCE(config-if-vlan3)#exit
MCE(config)#interface vlan2
MCE(config-if-vlan2)#ip vrf forwarding 1

```

```
MCE(config-if-vlan2)#ip address 90.1.1.1 255.255.0.0
MCE(config-if-vlan2)#exit
MCE(config)#interface vlan5
MCE(config-if-vlan5)#ip vrf forwarding 2
MCE(config-if-vlan5)#ip address 91.1.1.1 255.255.0.0
MCE(config-if-vlan5)#exit
MCE(config)#ip route vrf 1 8.8.8.8 255.255.255.255 90.1.1.2
MCE(config)#ip route vrf 2 3.3.3.3 255.255.255.255 91.1.1.2
MCE(config)#router ospf 100 vrf 1
MCE(config-ospf)#network 90.1.0.0 0.0.255.255 area 0
MCE(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
MCE(config-ospf)#redistribute static
MCE(config-ospf)#exit
MCE(config)#router ospf 200 vrf 2
MCE(config-ospf)#network 91.1.0.0 0.0.255.255 area 0
MCE(config-ospf)#network 97.1.0.0 0.0.255.255 area 0
MCE(config-ospf)#redistribute static
MCE(config-ospf)#exit
```

#Configure the default route on CE3 with the outgoing interface pointing to the MCE.

```
CE3#configure terminal
CE3(config)#ip route 0.0.0.0 0.0.0.0 90.1.1.1
```

#Configure the default route on CE4 with the outgoing interface pointing to the MCE.

```
CE4#configure terminal
CE4(config)#ip route 0.0.0.0 0.0.0.0 91.1.1.1
```

---

## Note

- Only one default route needs to be configured on CE3 and CE4, with the outgoing interface pointing to the MCE.
- 

#After the configuration is complete, view the routing table of VPN1 and VPN2 on the MCE.

```
MCE#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
S 8.8.8.8/32 [1/10] via 90.1.1.2, 20:18:48, vlan2
C 90.1.0.0/16 is directly connected, 22:59:50, vlan2
L 90.1.1.1/32 is directly connected, 22:59:50, vlan2
C 92.1.0.0/16 is directly connected, 01:02:01, vlan4
L 92.1.1.1/32 is directly connected, 01:02:01, vlan4
```

```
MCE#show ip route vrf 2
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
S 3.3.3.3/32 [1/10] via 91.1.1.2, 20:18:33, vlan5
C 91.1.0.0/16 is directly connected, 23:00:53, vlan5
L 91.1.1.1/32 is directly connected, 23:00:53, vlan5
C 97.1.0.0/16 is directly connected, 01:02:04, vlan3
L 97.1.1.2/32 is directly connected, 01:02:04, vlan3
```

It is indicated that static route information to CE3 and CE4 exists on the VPN1 and VPN2 routing tables of the MCE.

#View the routing table of VPN1 and VPN2 on PE2.

```
PE2#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
OE 8.8.8.8/32 [150/20] via 92.1.1.1, 00:27:44, vlan4
O 90.1.0.0/16 [110/2] via 92.1.1.1, 00:27:45, vlan4
C 92.1.0.0/16 is directly connected, 00:27:57, vlan4
L 92.1.1.2/32 is directly connected, 00:27:57, vlan4
```

```
PE2#show ip route vrf 2
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
OE 3.3.3.3/32 [150/20] via 97.1.1.2, 00:27:48, vlan3
O 91.1.0.0/16 [110/2] via 97.1.1.2, 00:27:49, vlan3
C 97.1.0.0/16 is directly connected, 00:28:00, vlan3
L 97.1.1.1/32 is directly connected, 00:28:00, vlan3
```

It is indicated that the routing information to CE3 and CE4 exists on the VPN1 and VPN2 routing tables of PE2.

**Step 7:** Configure the MP-IBGP to use the loopback interface as the peer address; and redistribute routes with each other and the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE1(config)#router bgp 100
PE1(config-bgp)#neighbor 11.11.11.11 remote-as 100
PE1(config-bgp)#neighbor 11.11.11.11 update-source loopback0
PE1(config-bgp)#address-family vpnv4
PE1(config-bgp-af)#neighbor 11.11.11.11 activate
PE1(config-bgp-af)#neighbor 11.11.11.11 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 2
PE1(config-bgp-af)#redistribute rip
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router rip
PE1(config-rip)#address-family ipv4 vrf 2
PE1(config-rip-af)#redistribute bgp 100
PE1(config-rip-af)#exit-address-family
PE1(config-rip)#exit
```

#Configure the MP-IBGP on PE2 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE2(config)#router bgp 100
PE2(config-bgp)#neighbor 90.90.90.90 remote-as 100
PE2(config-bgp)#neighbor 90.90.90.90 update-source loopback0
PE2(config-bgp)#address-family vpnv4
PE2(config-bgp-af)#neighbor 90.90.90.90 activate
PE2(config-bgp-af)#neighbor 90.90.90.90 send-community extended
PE2(config-bgp-af)#exit-address-family
```

```

PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 2
PE2(config-bgp-af)#redistribute ospf 300
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit
PE2(config)#router ospf 300 vrf 2
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit

```

Step 8: Check the result.

# After the configuration is complete, view the BGP neighbor information on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 all summary
BGP router identifier 90.90.90.90, local AS number 100
BGP table version is 4
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
11.11.11.11 4  100    11      12      4     0   00:07:25  6

Total number of neighbors 1
BGP VRF 1 Route Distinguisher:
100:1
BGP table version is 1
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
95.1.1.2    4  200     8       7      1     0   00:04:20  2

Total number of neighbors 1

```

The successful establishment of BGP neighbors by PE1 with PE2 and CE1 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table and VPN routing table on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 vrf 1
BGP table version is 33, local router ID is 90.90.90.90
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

```

Network	Next Hop	Metric	LocPrf	Weight	Path
Route Distinguisher: 100:1 (Default for VRF 1)					
[B]*> 5.5.5.5/32	95.1.1.2	0	0	200	i

[B]*>i97.1.0.0/16	11.11.11.11	1	100	0	?

PE1#show ip route vrf 1

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 5.5.5.5/32 [20/0] via 95.1.1.2, 22:47:14, vlan3  
 B 8.8.8.8/32 [200/20] via 11.11.11.11, 00:07:03, vlan2  
 B 90.1.0.0/16 [200/2] via 11.11.11.11, 00:07:03, vlan2  
 B 92.1.0.0/16 [200/1] via 11.11.11.11, 00:07:03, vlan2  
 C 95.1.0.0/16 is directly connected, 23:13:25, vlan3  
 L 95.1.1.1/32 is directly connected, 23:13:25, vlan3

PE1#show ip route vrf 2

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

R 2.2.2/32 [120/1] via 94.1.1.2, 22:59:23, vlan4
B 3.3.3/32 [200/20] via 11.11.11.11, 00:07:05, vlan2
B 91.1.0.0/16 [200/2] via 11.11.11.11, 00:07:05, vlan2
C 94.1.0.0/16 is directly connected, 23:10:58, vlan4
L 94.1.1.1/32 is directly connected, 23:10:58, vlan4
B 97.1.0.0/16 [200/1] via 11.11.11.11, 00:07:05, vlan2

```

It is indicated the route information to the peer CE3 and CE4 under the BGP VPNv4 routing table, VPN1 and VPN2 routing table of PE1.

#View the routing label information on the PE.

Take PE1 as an example:

```

PE1#show ip route vrf 1 8.8.8.8 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
        U - Per-user Static route
        O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

B 8.8.8/32 [200/0] via 11.11.11.11, label 16, 01:04:26, vlan2
    93.1.1.1 [2], label 3, vlan2

```

```

PE1#show ip route vrf 2 3.3.3.3 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
        U - Per-user Static route
        O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

B 3.3.3/32 [200/0] via 11.11.11.11, label 17, 01:04:26, vlan2
    93.1.1.1 [2], label 3, vlan2

```

```

PE1#show mpls forwarding-table
Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root
address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)
        S - Static Label

```

Pro	Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B	1	0.0.0.0/0	5120	/	/	/

It is indicated that the route label information of VPN1 and VPN2 exists in the MPLS forwarding table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

#Ping the loopback port of CE3 on CE1 to see if it can ping through.

```
CE1#ping 8.8.8.8
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 8.8.8.8 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

#Ping the loopback port of CE4 on CE1 to see if it can ping through.

```
CE1#ping 3.3.3.3
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 3.3.3.3 , timeout is 2 seconds:
```

```
.....
```

```
Success rate is 0% (0/5).
```

It is indicated that devices within the same VPN can communicate normally, while devices in different VPNs cannot communicate and routes are isolated.

### 79.3.3 Configure Cross-domain Option-A

#### Network Requirements

- The entire MPLS network includes two AS domains, and CE1 in AS 100 needs to communicate with CE2 in AS 200.
- CE1 and CE2 belong to VPN1 at the same time and use OSPF to connect to the PE.
- The ASBRs use the VRF-to-VRF method to interact with each other for VPN routes.

- The Route-Target of VPN instances of different ASes need not match.
- The ASBR uses MP-IBGP for routing interactions with the PE.

### Network Topology

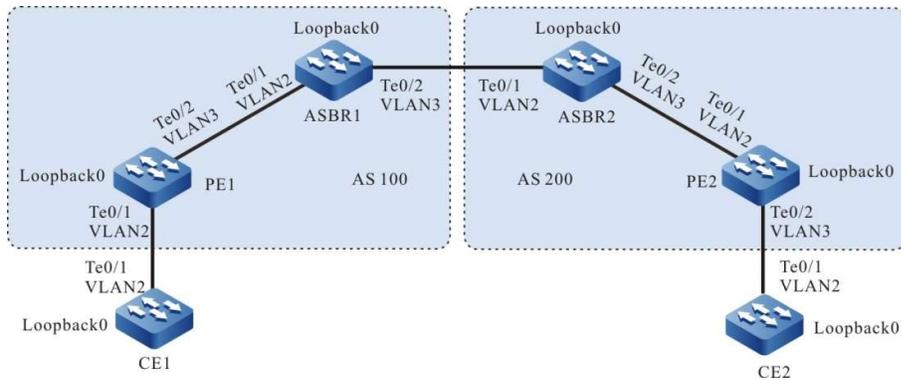

Figure 79-14 Network Topology for Configuring Cross-Domain OptionA

Table 39-40 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	10.1.1.1/24	ASBR2	Vlan2	10.1.3.2/24
	Loopback0	1.1.1.1/32		Vlan3	10.1.4.1/24
PE1	Vlan2	10.1.1.2/24		Loopback0	33.33.33.33/32
	Vlan3	10.1.2.1/24	PE2	Vlan2	10.1.4.2/24
	Loopback0	11.11.11.11/32		Vlan3	10.1.5.1/24
ASBR1	Vlan2	10.1.2.2/24		Loopback0	44.44.44.44/32
	Vlan3	10.1.3.1/24	CE2	Vlan2	10.1.5.2/24
	Loopback0	22.22.22.22/32		Loopback0	2.2.2.2/32

### Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure a global OSPF to advertise global route within the same AS domain.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
PE1(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
PE1(config-ospf)#exit
```

# Configure global OSPF on ASBR1.

```
ASBR1#configure terminal
ASBR1(config)#router ospf 100
ASBR1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
ASBR1(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
ASBR1(config-ospf)#exit
```

# Configure global OSPF on ASBR2.

```
ASBR2#configure terminal
ASBR2(config)#router ospf 100
ASBR2(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
ASBR2(config-ospf)#network 33.33.33.33 0.0.0.0 area 0
ASBR2(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
PE2(config-ospf)#network 44.44.44.44 0.0.0.0 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.1.2.0/24 is directly connected, 69:53:53, vlan3
L 10.1.2.1/32 is directly connected, 69:53:53, vlan3
LC 11.11.11.11/32 is directly connected, 69:53:37, loopback0
O 22.22.22.22/32 [110/2] via 10.1.2.2, 48:14:20, vlan3
C 127.0.0.0/8 is directly connected, 1183:09:57, lo0
```

It is indicated that the route information of ASBR1 loopback port exists in the global routing table of PE1.

---

 **Note**

- Refer to PE1 for the inspection method of PE2 and ASBR.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 11.11.11.11
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 11.11.11.11
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#mpls ldp
PE1(config-if-vlan3)#mpls ip
PE1(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on ASBR1, and also enable MPLS IP and MPLS LDP on the interface.

```
ASBR1(config)#mpls ip
ASBR1(config)#mpls ldp
ASBR1(config-ldp)#router-id 22.22.22.22
ASBR1(config-ldp)#address-family ipv4
ASBR1(config-ldp-af4)#transport-address 22.22.22.22
ASBR1(config-ldp-af4)#exit
ASBR1(config-ldp)#exit
ASBR1(config)#interface vlan2
ASBR1(config-if-vlan2)#mpls ip
ASBR1(config-if-vlan2)#mpls ldp
ASBR1(config-if-vlan2)#exit
```

# Enable global MPLS IP and MPLS LDP on ASBR2, and also enable MPLS IP and MPLS LDP on the interface.

```
ASBR2(config)#mpls ip
ASBR2(config)#mpls ldp
```

```

ASBR2(config-ldp)#router-id 33.33.33.33
ASBR2(config-ldp)#address-family ipv4
ASBR2(config-ldp-af4)#transport-address 33.33.33.33
ASBR2(config-ldp-af4)#exit
ASBR2(config-ldp)#exit
ASBR2(config)#interface vlan3
ASBR2(config-if-vlan3)#mpls ldp
ASBR2(config-if-vlan3)#mpls ip
ASBR2(config-if-vlan3)#exit

```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```

PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 44.44.44.44
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 44.44.44.44
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit

```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```

PE1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
22.22.22.22     Multicast  Passive  OPERATIONAL  Disabled 00:02:34
Statistics for ldp sessions:
  Multicast sessions: 1
  Targeted sessions: 0

```

It is indicated that PE1 has established LDP session with ASBR1 successfully.

#View the routing label table entries on the device.

Take PE1 as an example:

```

PE1#show ip route 22.22.22.22 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

O 22.22.22.22/32 [110/2] via 10.1.2.2, label 3, 14:29:21, vlan3  
10.1.2.2 [0], vlan3

It is indicated that the routing table of PE1 has the label information to the ASBR1 loopback port.

---

## Note

- Refer to PE1 for the inspection method of PE2 and ASBR.
- 

Step 5: Configure the VPN instance to advertise the CE route to the PE via OSPF.

#Configure OSPF on CE1.

```
CE1#configure terminal
CE1(config)#router ospf 100
CE1(config-ospf)#network 1.1.1.1 0.0.0.0 area 0
CE1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
CE1(config-ospf)#exit
```

#Configure VPN instance and OSPF under VPN on PE1.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
PE1(config-vrf)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#ip vrf forwarding 1
PE1(config-if-vlan2)#ip address 10.1.1.2 255.255.255.0
PE1(config-if-vlan2)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
PE1(config-ospf)#exit
```

#Configure VPN instance on ASBR1.

```
ASBR1(config)#ip vrf 1
ASBR1(config-vrf)#rd 100:1
ASBR1(config-vrf)#route-target export 100:1
ASBR1(config-vrf)#route-target import 100:1
ASBR1(config-vrf)#exit
```

```
ASBR1(config)#interface vlan3
ASBR1(config-if-vlan3)#ip vrf forwarding 1
ASBR1(config-if-vlan3)#ip address 10.1.3.1 255.255.255.0
ASBR1(config-if-vlan3)#exit
```

#Configure VPN instance on ASBR2.

```
ASBR2(config)#ip vrf 1
ASBR2(config-vrf)#rd 200:1
ASBR2(config-vrf)#route-target export 200:1
ASBR2(config-vrf)#route-target import 200:1
ASBR2(config-vrf)#exit
ASBR2(config)#interface vlan2
ASBR2(config-if-vlan2)#ip vrf forwarding 1
ASBR2(config-if-vlan2)#ip address 10.1.3.2 255.255.255.0
ASBR2(config-if-vlan2)#exit
```

#Configure VPN instance and OSPF under VPN on PE2.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 200:1
PE2(config-vrf)#route-target export 200:1
PE2(config-vrf)#route-target import 200:1
PE2(config-vrf)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 1
PE2(config-if-vlan3)#ip address 10.1.5.1 255.255.255.0
PE2(config-if-vlan3)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
PE2(config-ospf)#exit
```

#Configure OSPF on CE2.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 2.2.2.2 0.0.0.0 area 0
CE2(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
CE2(config-ospf)#exit
```

#After the configuration is complete, view the VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
```

```
O 1.1.1.1/32 [110/2] via 10.1.1.1, 70:07:57, vlan2
C 10.1.1.0/24 is directly connected, 70:09:30, vlan2
L 10.1.1.2/32 is directly connected, 70:09:30, vlan2
```

It is indicated that a route to CE1 exists in the VPN1 routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

Step 6: Configure the MP-IBGP between the PE and the ASBR, using the loopback interface as the peer address; configure EBGP between the ASBR and redistribute routes with each other and the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE1(config)#router bgp 100
PE1(config-bgp)#neighbor 22.22.22.22 remote-as 100
PE1(config-bgp)#neighbor 22.22.22.22 update-source loopback0
PE1(config-bgp)#address-family vpnv4
PE1(config-bgp-af)#neighbor 22.22.22.22 activate
PE1(config-bgp-af)#neighbor 22.22.22.22 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute ospf 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit
```

#Configure the MP-IBGP between ASBR1 and PE1 with VPNv4 address clusters enabled; and configure EBGP between ASBR2 under VRF address clusters.

```
ASBR1(config)#router bgp 100
```

```
ASBR1(config-bgp)#neighbor 11.11.11.11 remote-as 100
ASBR1(config-bgp)#neighbor 11.11.11.11 update-source loopback0
ASBR1(config-bgp)#address-family vpv4
ASBR1(config-bgp-af)#neighbor 11.11.11.11 activate
ASBR1(config-bgp-af)#neighbor 11.11.11.11 send-community extended
ASBR1(config-bgp-af)#exit-address-family
ASBR1(config-bgp)#address-family ipv4 vrf 1
ASBR1(config-bgp-af)#redistribute connected
ASBR1(config-bgp-af)#neighbor 10.1.3.2 remote-as 200
ASBR1(config-bgp-af)#exit-address-family
ASBR1(config-bgp)#exit
```

#Configure the MP-IBGP between ASBR2 and PE2 with VPNv4 address clusters enabled; and configure EBGP between ASBR1 under VRF address clusters.

```
ASBR2(config)#router bgp 200
ASBR2(config-bgp)#neighbor 44.44.44.44 remote-as 200
ASBR2(config-bgp)#neighbor 44.44.44.44 update-source loopback0
ASBR2(config-bgp)#address-family vpv4
ASBR2(config-bgp-af)#neighbor 44.44.44.44 activate
ASBR2(config-bgp-af)#neighbor 44.44.44.44 send-community extended
ASBR2(config-bgp-af)#exit-address-family
ASBR2(config-bgp)#address-family ipv4 vrf 1
ASBR2(config-bgp-af)#redistribute connected
ASBR2(config-bgp-af)#neighbor 10.1.3.1 remote-as 100
ASBR2(config-bgp-af)#exit-address-family
ASBR2(config-bgp)#exit
```

#Configure the MP-IBGP on PE2 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE2(config)#router bgp 200
PE2(config-bgp)#neighbor 33.33.33.33 remote-as 200
PE2(config-bgp)#neighbor 33.33.33.33 update-source loopback0
PE2(config-bgp)#address-family vpv4
PE2(config-bgp-af)#neighbor 33.33.33.33 activate
PE2(config-bgp-af)#neighbor 33.33.33.33 send-community extended
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 200
```

```
PE2(config-ospf)#exit
```

Step 7: Check the result.

# After the configuration is completed, check the BGP neighbor information on the PE and ASBR.

Take PE1, ASBR1 as an example.

```
PE1#show ip bgp vpnv4 all summary
```

```
BGP router identifier 11.11.11.11, local AS number 100
```

```
BGP table version is 6
```

```
1 BGP AS-PATH entries
```

```
0 BGP community entries
```

```
Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
22.22.22.22 4 100   44   43    6   0  00:34:07   3
```

```
Total number of neighbors 1
```

The successful establishment of BGP neighbors between PE1 and ASBR1 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

```
ASBR1#show ip bgp vpnv4 all summary
```

```
BGP router identifier 22.22.22.22, local AS number 100
```

```
BGP table version is 5
```

```
2 BGP AS-PATH entries
```

```
0 BGP community entries
```

```
Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd

```

```
Total number of neighbors 1
```

```
BGP VRF 1 Route Distinguisher:
```

```
100:1
```

```
BGP table version is 1
```

```
2 BGP AS-PATH entries
```

```
0 BGP community entries
```

```
Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
10.1.3.2    4 200    3    3    1   0  00:00:03   3
```

```
Total number of neighbors 1
```

The successful establishment of BGP neighbors between ASBR1 and PE1 and ASBR2 can be seen from the fact that the contents of this column of State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table on the PE and ASBR.

Take PE1, ASBR1 as an example.

```
PE1#show ip bgp vpnv4 vrf 1
BGP table version is 28, local router ID is 11.11.11.11
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale

address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)
```

```
S - Static Label
```

Pro Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B 1	0.0.0.0/0	20480 /	/	/	/

It is indicated that the route label information of VPN1 exists in the route label table entries of PE1 and ASBR1.

---

## Note

- Refer to PE1 and ASBR1 for the inspection method of PE2 and ASBR2.
- 

#View the routing table on the CE.

Take CE1 as an example.

```
CE1#show ip route
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
LC 1.1.1.1/32 is directly connected, 72:03:40, loopback0
OE 2.2.2.2/32 [150/1] via 10.1.1.2, 01:12:50, vlan2
C 10.1.1.0/24 is directly connected, 72:07:55, vlan2
L 10.1.1.1/32 is directly connected, 72:07:55, vlan2
OE 10.1.3.0/24 [150/1] via 10.1.1.2, 01:14:28, vlan2
OE 10.1.5.0/24 [150/1] via 10.1.1.2, 01:12:50, vlan2
C 127.0.0.0/8 is directly connected, 210:21:32, lo0
L 127.0.0.1/32 is directly connected, 210:21:32, lo0
```

It is indicated that the routing information to the peer CE2 exists under the routing table of CE1.

#Ping the loopback port of CE2 on CE1 to see if it can ping through properly.

```
CE1#ping 2.2.2.2
```

Press key (ctrl + shift + 6) interrupt it.

Sending 5, 76-byte ICMP Echos to 2.2.2.2 , timeout is 2 seconds:

```
!!!!
```

Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.

It is indicated that CE1 can ping through to CE2.

### 79.3.4 Configure Cross-domain OptionB

#### Network Requirements

- The entire MPLS network includes two AS domains, and CE1 in AS 100 needs to communicate with CE2 in AS 200.
- CE1 and CE2 belong to VPN1 at the same time and use OSPF to interact with PEs for routing.
- The ASBRs use MP-EBGP for routing interactions between them.
- The ASBR uses MP-IBGP for routing interactions with the PE.

#### Network Topology

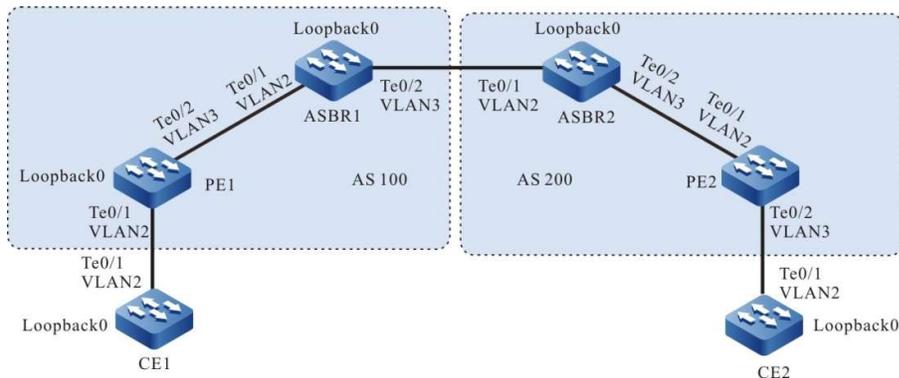

Figure 15-16 Network Topology for Configuring Cross-Domain OptionB

Table 79-41 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	10.1.1.1/24	ASBR2	Vlan2	10.1.3.2/24

of equipment	Interface	IP address	of equipment	Interface	IP address
	Loopback0	1.1.1.1/32		Vlan3	10.1.4.1/24
PE1	Vlan2	10.1.1.2/24		Loopback0	33.33.33.33/32
	Vlan3	10.1.2.1/24	PE2	Vlan2	10.1.4.2/24
	Loopback0	11.11.11.11/32		Vlan3	10.1.5.1/24
ASBR1	Vlan2	10.1.2.2/24		Loopback0	44.44.44.44/32
	Vlan3	10.1.3.1/24	CE2	Vlan2	10.1.5.2/24
	Loopback0	22.22.22.22/32		Loopback0	2.2.2.2/32

### Configuration Steps

Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode.  
(Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure a global OSPF to advertise global route within the same AS domain.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
PE1(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
PE1(config-ospf)#exit
```

# Configure global OSPF on ASBR1.

```
ASBR1#configure terminal
ASBR1(config)#router ospf 100
ASBR1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
ASBR1(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
ASBR1(config-ospf)#exit
```

# Configure global OSPF on ASBR2.

```
ASBR2#configure terminal
ASBR2(config)#router ospf 100
ASBR2(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
```

```
ASBR2(config-ospf)#network 33.33.33.33 0.0.0.0 area 0
ASBR2(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
PE2(config-ospf)#network 44.44.44.44 0.0.0.0 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.1.2.0/24 is directly connected, 04:52:00, vlan3
L 10.1.2.1/32 is directly connected, 04:52:00, vlan3
LC 11.11.11.11/32 is directly connected, 04:51:45, loopback0
O 22.22.22.22/32 [110/2] via 10.1.2.2, 01:45:41, vlan3
C 127.0.0.0/8 is directly connected, 1118:08:05, lo0
L 127.0.0.1/32 is directly connected, 1118:08:05, lo0
```

It is indicated that the routing information of the loopback port of ASBR1 exists in the global routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2 and ASBR.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
```

```
PE1(config-ldp)#router-id 11.11.11.11
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 11.11.11.11
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#mpls ldp
PE1(config-if-vlan3)#mpls ip
PE1(config-if-vlan3)#exit
```

#Enable global MPLS IP and MPLS LDP on ASBR1, and also enable MPLS IP and MPLS LDP on the interface between ASBR and PE1. The interface between ASBR only needs to enable the MPLS IP, with no need to configure the MPLS LDP.

```
ASBR1(config)#mpls ip
ASBR1(config)#mpls ldp
ASBR1(config-ldp)#router-id 22.22.22.22
ASBR1(config-ldp)#address-family ipv4
ASBR1(config-ldp-af4)#transport-address 22.22.22.22
ASBR1(config-ldp-af4)#exit
ASBR1(config-ldp)#exit
ASBR1(config)#interface vlan2
ASBR1(config-if-vlan2)#mpls ip
ASBR1(config-if-vlan2)#mpls ldp
ASBR1(config-if-vlan2)#exit
ASBR1(config)#interface vlan3
ASBR1(config-if-vlan3)#mpls ip
ASBR1(config-if-vlan3)#exit
```

#Enable global MPLS IP and MPLS LDP on ASBR2, and also enable MPLS IP and MPLS LDP on the interface between ASBR and PE2, the interface between ASBR only needs to enable MPLS IP, with no need to configure MPLS LDP.

```
ASBR2(config)#mpls ip
ASBR2(config)#mpls ldp
ASBR2(config-ldp)#router-id 33.33.33.33
ASBR2(config-ldp)#address-family ipv4
ASBR2(config-ldp-af4)#transport-address 33.33.33.33
ASBR2(config-ldp-af4)#exit
ASBR2(config-ldp)#exit
ASBR2(config)#interface vlan2
ASBR2(config-if-vlan2)#mpls ip
ASBR2(config-if-vlan2)#exit
ASBR2(config)#interface vlan3
```

```
ASBR2(config-if-vlan3)#mpls ldp
ASBR2(config-if-vlan3)#mpls ip
ASBR2(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```
PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 44.44.44.44
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 44.44.44.44
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit
```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```
PE1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
22.22.22.22     Multicast  Passive  OPERATIONAL  Disabled 00:02:34
Statistics for ldp sessions:
  Multicast sessions: 1
  Targeted sessions: 0
```

It is indicated that PE1 has established LDP session with ASBR1 successfully.

#View the routing label table entries on the device.

Take PE1 as an example:

```
PE1#show ip route 22.22.22.22 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 22.22.22.22/32 [110/2] via 10.1.2.2, label 3, 14:29:21, vlan3
    10.1.2.2 [0], vlan3
```

It is indicated that the label information to the ASBR1 loopback port exists in the route label table of PE1.

---

 **Note**

- Refer to PE1 for the inspection method of PE2 and ASBR.
- 

Step 5: Configure the VPN instance to advertise the CE route to the PE via OSPF.

#Configure VPN instance and OSPF under VPN instance on PE1.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
PE1(config-vrf)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#ip vrf forwarding 1
PE1(config-if-vlan2)#ip address 10.1.1.2 255.255.255.0
PE1(config-if-vlan2)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
PE1(config-ospf)#exit
```

#Configure OSPF on CE1.

```
CE1#configure terminal
CE1(config)#router ospf 100
CE1(config-ospf)#network 1.1.1.1 0.0.0.0 area 0
CE1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
CE1(config-ospf)#exit
```

#Configure VPN instance and OSPF under VPN instance on PE2.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 100:1
PE2(config-vrf)#route-target export 100:1
PE2(config-vrf)#route-target import 100:1
PE2(config-vrf)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 1
PE2(config-if-vlan3)#ip address 10.1.5.1 255.255.255.0
PE2(config-if-vlan3)#exit
PE2(config)#router ospf 200 vrf 1
```

```
PE2(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
PE2(config-ospf)#exit
```

#Configure OSPF on CE2.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 2.2.2.2 0.0.0.0 area 0
CE2(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
CE2(config-ospf)#exit
```

#After the configuration is complete, view the VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 1.1.1.1/32 [110/2] via 10.1.1.1, 05:58:17, vlan2
C 10.1.1.0/24 is directly connected, 05:59:50, vlan2
L 10.1.1.2/32 is directly connected, 05:59:50, vlan2
```

It is indicated that a route to CE1 exists in the VPN1 routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

**Step 6:** Configure the MP-IBGP between the PE and the ASBR, using the loopback interface as the peer address; configure the MP-EBGP between the ASBR and complete route redistribution with the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE1(config)#router bgp 100
PE1(config-bgp)#neighbor 22.22.22.22 remote-as 100
PE1(config-bgp)#neighbor 22.22.22.22 update-source loopback0
PE1(config-bgp)#address-family vpnv4
```

```
PE1(config-bgp-af)#neighbor 22.22.22.22 activate
PE1(config-bgp-af)#neighbor 22.22.22.22 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute ospf 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit
```

#Configure the MP-IBGP on ASBR1 with PE1 and MP-EBGP between ASBR1 and ASBR2 with VPNv4 address clustering enabled.

```
ASBR1(config)#router bgp 100
ASBR1(config-bgp)#neighbor 10.1.3.2 remote-as 200
ASBR1(config-bgp)#neighbor 11.11.11.11 remote-as 100
ASBR1(config-bgp)#neighbor 11.11.11.11 update-source loopback0
ASBR1(config-bgp)#address-family vpnv4
ASBR1(config-bgp-af)#neighbor 10.1.3.2 activate
ASBR1(config-bgp-af)#neighbor 10.1.3.2 send-community extended
ASBR1(config-bgp-af)#neighbor 11.11.11.11 activate
ASBR1(config-bgp-af)#neighbor 11.11.11.11 next-hop-self
ASBR1(config-bgp-af)#neighbor 11.11.11.11 send-community extended
ASBR1(config-bgp-af)#exit-address-family
ASBR1(config-bgp)#exit
```

#Configure the MP-IBGP on ASBR2 with PE2 and MP-EBGP between ASBR2 and ASBR1 with VPNv4 address clustering enabled.

```
ASBR2(config)#router bgp 200
ASBR2(config-bgp)#neighbor 10.1.3.1 remote-as 100
ASBR2(config-bgp)#neighbor 44.44.44.44 remote-as 200
ASBR2(config-bgp)#neighbor 44.44.44.44 update-source loopback0
ASBR2(config-bgp)#address-family vpnv4
ASBR2(config-bgp-af)#neighbor 10.1.3.1 activate
ASBR2(config-bgp-af)#neighbor 10.1.3.1 send-community extended
ASBR2(config-bgp-af)#neighbor 44.44.44.44 activate
ASBR2(config-bgp-af)#neighbor 44.44.44.44 next-hop-self
ASBR2(config-bgp-af)#neighbor 44.44.44.44 send-community extended
ASBR2(config-bgp-af)#exit-address-family
ASBR2(config-bgp)#exit
```

#Configure the MP-IBGP on PE2 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE2(config)#router bgp 200
PE2(config-bgp)#neighbor 33.33.33.33 remote-as 200
PE2(config-bgp)#neighbor 33.33.33.33 update-source loopback0
PE2(config-bgp)#address-family vpnv4
PE2(config-bgp-af)#neighbor 33.33.33.33 activate
PE2(config-bgp-af)#neighbor 33.33.33.33 send-community extended
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 200
PE2(config-ospf)#exit
```

Step 7: Check the result.

# After the configuration is completed, check the BGP neighbor information on the PE and ASBR.

Take PE1, ASBR1 as an example.

```
PE1#show ip bgp vpnv4 all summary
BGP router identifier 11.11.11.11, local AS number 100
BGP table version is 1
2 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
22.22.22.22  4  100    4    4    1    0   00:02:08    2

Total number of neighbors 1
```

The successful establishment of BGP neighbors between PE1 and ASBR1 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

```
ASBR1#show ip bgp vpnv4 all summary
BGP router identifier 22.22.22.22, local AS number 100
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries
```

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
11.11.11.11	4	100	2	2	1	0	0	00:00:14	2
10.1.3.2	4	200	7	8	1	0	0	00:05:28	2

Total number of neighbors 2

The successful establishment of BGP neighbors between ASBR1 and PE1 and ASBR2 can be seen from the fact that the contents of this column of State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table on the PE and ASBR.

Take PE1, ASBR1 as an example.

```
PE1#show ip bgp vpnv4 vrf 1
BGP table version is 8, local router ID is 11.11.11.11
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
Route Distinguisher: 100:1 (Default for VRF 1)
[O]*> 1.1.1.1/32   10.1.1.1         2    32768 ?
[B]*>i2.2.2.2/32   22.22.22.22      0  100  0 200 ?
[O]*> 10.1.1.0/24  0.0.0.0          1    32768 ?
[B]*>i10.1.5.0/24  22.22.22.22      0  100  0 200 ?
```

```
ASBR1#show ip bgp vpnv4 all
BGP table version is 364, local router ID is 22.22.22.22
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
Route Distinguisher: 100:1
[B]*>i1.1.1.1/32   11.11.11.11      2  100  0 ?
[B]*> 2.2.2.2/32   10.1.3.2          0    0 200 ?
[B]*>i10.1.1.0/24  11.11.11.11      1  100  0 ?
[B]*> 10.1.5.0/24  10.1.3.2          0    0 200 ?
```

It is indicated the BGP routing information to the peer CE2 exists in the BGP VPNv4 routing table of PE1 and ASBR1.

# View the route label table entries and MPLS forwarding table on PE and ASBR.

Take PE1, ASBR1 as an example.

```
PE1#show ip route vrf 1 2.2.2.2 detail
```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```
B 2.2.2.2/32 [200/0] via 22.22.22.22, label 20480, 01:04:26, vlan3
    10.1.2.2 [2], label 3, vlan3
```

PE1#show mpls forwarding-table

Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)

S - Static Label

Pro Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B 1	0.0.0.0/0	5120	/	/	/

ASBR1#show mpls forwarding-table

Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)

S - Static Label

Pro Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B global	2.2.2.2/32	20480	16	vlan3	10.1.3.2
B global	10.1.5.0/24	20481	17	vlan3	10.1.3.2
B global	1.1.1.1/32	20482	5120	vlan2	11.11.11.11
B global	10.1.1.0/24	20483	5120	vlan2	11.11.11.11

It is indicated that the route label information of VPN1 exists in the forwarding table of PE1 and ASBR1.

---

## Note

- Refer to PE1 and ASBR1 for the inspection method of PE2 and ASBR2.
- 

#View the routing table on the CE.

Take CE1 as an example.

CE1#show ip route

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```
LC 1.1.1.1/32 is directly connected, 22:18:15, loopback0
O 2.2.2.2/32 [110/2] via 10.1.1.2, 00:35:47, vlan2
C 10.1.1.0/24 is directly connected, 22:22:30, vlan2
L 10.1.1.1/24 is directly connected, 22:22:30, vlan2
O 10.1.5.0/24 [110/2] via 10.1.1.2, 00:35:47, vlan2
C 127.0.0.0/8 is directly connected, 160:36:07, lo0
L 127.0.0.1/32 is directly connected, 160:36:07, lo0
```

It is indicated that the routing information to the peer CE2 exists in the CE1 routing table.

#Ping the loopback port of CE2 on CE1 to see if it can ping through properly.

```
CE1#ping 2.2.2.2
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 2.2.2.2 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

It is indicated that CE1 can ping through to CE2.

### 79.3.5 Configure the AS replacement function of BGP.

#### Network Requirements

- Configure the MPLS L3VPN intra-domain environment.
- Both CE1 and CE2 are VPN1 devices.
- Both CE1 and CE2 belong to AS 100 and use EBGP to advertise routes to the PEs. Configure AS override to ensure that the CEs at both ends can receive routes from the other end normally.

#### Network Topology

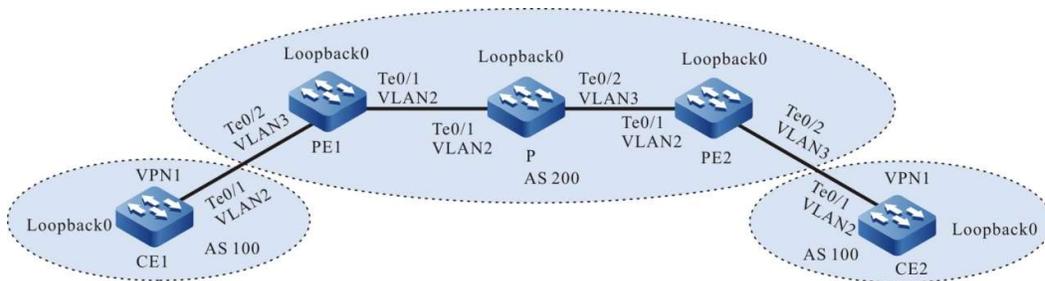

Figure 17-18 Network Topology for Configuring AS Replacement Function of BGP

Table 79-42 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	95.1.1.2/16	P	Loopback0	11.11.11.11/32
	Loopback0	5.5.5.5/32	PE2	Vlan2	92.1.1.1/16
PE1	Vlan2	93.1.1.2/16		Vlan3	90.1.1.1/16
	Vlan3	95.1.1.1/16		Loopback0	75.75.75.75/32
	Loopback0	90.90.90.90/32	CE2	Vlan2	90.1.1.2/16
P	Vlan2	93.1.1.1/16		Loopback0	8.8.8.8/32
	Vlan3	92.1.1.2/16			

### Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure global OSPF to advertise global routes.

#Configure global OSPF on PE1.

```

PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 90.90.90.90 0.0.0.0 area 0
PE1(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit

```

# Configure global OSPF on P.  
 User manual  
 Release 1.0 01/2022

```
P#configure terminal
P(config)#router ospf 100
P(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
P(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
P(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
P(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 75.75.75.75 0.0.0.0 area 0
PE2(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 11.11.11.11/32 [110/2] via 93.1.1.1, 00:05:03, vlan2
O 75.75.75.75/32 [110/3] via 93.1.1.1, 00:06:03, vlan2
LC 90.90.90.90/32 is directly connected, 154:02:28, loopback0
O 92.1.0.0/16 [110/2] via 93.1.1.1, 00:08:12, vlan2
C 93.1.0.0/16 is directly connected, 00:34:54, vlan2
L 93.1.1.2/32 is directly connected, 00:34:54, vlan2
```

It is indicated the routing information of the loopback port of P and PE2 exists in the global routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of P and PE2.
-

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 90.90.90.90
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 90.90.90.90
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#mpls ip
PE1(config-if-vlan2)#mpls ldp
PE1(config-if-vlan2)#exit
```

# Enable global MPLS IP and MPLS LDP on P. Also enable MPLS IP and MPLS LDP on the interface.

```
P(config)#mpls ip
P(config)#mpls ldp
P(config-ldp)#router-id 11.11.11.11
P(config-ldp)#address-family ipv4
P(config-ldp-af4)#transport-address 11.11.11.11
P(config-ldp-af4)#exit
P(config-ldp)#exit
P(config)#interface vlan2
P(config-if-vlan2)#mpls ip
P(config-if-vlan2)#mpls ldp
P(config-if-vlan2)#exit
P(config)#interface vlan3
P(config-if-vlan3)#mpls ip
P(config-if-vlan3)#mpls ldp
P(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```
PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 75.75.75.75
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 75.75.75.75
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
```

```
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit
```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```
PE1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
11.11.11.11     Multicast  Active   OPERATIONAL  Disabled 00:02:20
Statistics for ldp sessions:
  Multicast sessions: 1
  Targeted sessions: 0
```

It is indicated that PE1 successfully establishes an LDP session with P.

#View the routing label table entries on the device.

Take PE1 as an example:

```
PE1#show ip route 11.11.11.11 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 11.11.11.11/32 [110/2] via 93.1.1.1, label 3, 14:29:21, vlan2
    93.1.1.1 [0], vlan2
```

```
PE1#show ip route 75.75.75.75 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 75.75.75.75/32 [110/3] via 93.1.1.1, label 16, 14:30:21, vlan2
    93.1.1.1 [0], vlan2
```

It is indicated the label information of the loopback ports to P and PE2 exist on PE1.

---

 **Note**

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 5: Configure a VPN instance on the PE and configure BGP between the PE and the CE.

#Configure VPN instance on PE1 and establish EBGP neighbor with CE.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
PE1(config-vrf)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#ip vrf forwarding 1
PE1(config-if-vlan3)#ip address 95.1.1.1 255.255.0.0
PE1(config-if-vlan3)#exit
PE1(config)#router bgp 200
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#neighbor 95.1.1.2 remote-as 100
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
```

#Configure EBGP with PE on CE1.

```
CE1#configure terminal
CE1(config)#router bgp 100
CE1(config-bgp)#network 5.5.5.5 255.255.255.255
CE1(config-bgp)#network 95.1.0.0 255.255.0.0
CE1(config-bgp)#neighbor 95.1.1.1 remote-as 200
CE1(config-bgp)#exit
```

#Configure VPN instance on PE2 and establish EBGP neighbor with CE.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 100:1
PE2(config-vrf)#route-target export 100:1
PE2(config-vrf)#route-target import 100:1
PE2(config-vrf)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 1
PE2(config-if-vlan3)#ip address 90.1.1.1 255.255.0.0
```

```

PE2(config-if-vlan3)#exit
PE2(config)#router bgp 200
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#neighbor 90.1.1.2 remote-as 100
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit

```

#Configure EBGP with PE on CE2.

```

CE2#configure terminal
CE2(config)#router bgp 100
CE2(config-bgp)#network 8.8.8.8 255.255.255.255
CE2(config-bgp)#network 90.1.0.0 255.255.0.0
CE2(config-bgp)#neighbor 90.1.1.1 remote-as 200
CE2(config-bgp)#exit

```

# After the configuration is complete, check the EBGP neighbor information on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 all summary
BGP router identifier 90.90.90.90, local AS number 200BGP VRF 1 Route Distinguisher:
100:1
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries

```

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
95.1.1.2	4	100	2	2	1	0	00:00:08	2	

Total number of neighbors 1

The successful establishment of BGP neighbors between PE1 and CE1 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table and VPN routing table on the PE.

```

PE1#show ip bgp vpnv4 vrf 1
BGP table version is 18, local router ID is 90.90.90.90
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Route Distinguisher: 100:1 (Default for VRF 1)
[B]*> 5.5.5.5/32    95.1.1.2          0         0 100 i

```

```
[B]*> 95.1.0.0/16    95.1.1.2        0        0 100 i
```

```
PE1#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 5.5.5.5/32 [20/0] via 95.1.1.2, 01:13:15, vlan3 .
```

```
C 95.1.0.0/16 is directly connected, 15:40:01, vlan3
```

```
L 95.1.1.1/32 is directly connected, 15:40:01, vlan3
```

It is indicated that routes to CE1 exist in the BGP routing table and VPN routing table of PE1.

---

 **Note**

- Refer to PE1 for the inspection method of PE2.
- 

Step 6: Configure the MP-IBGP to use the loopback interface as the peer address.

#Configure MP-IBGP on PE1 and enable VPNv4 address clustering.

```
PE1(config)#router bgp 200
PE1(config-bgp)#neighbor 75.75.75.75 remote-as 200
PE1(config-bgp)#neighbor 75.75.75.75 update-source loopback0
PE1(config-bgp)#address-family vpnv4
PE1(config-bgp-af)#neighbor 75.75.75.75 activate
PE1(config-bgp-af)#neighbor 75.75.75.75 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
```

#Configure MP-IBGP on PE2 and enable VPNv4 address clustering.

```
PE2(config)#router bgp 200
PE2(config-bgp)#neighbor 90.90.90.90 remote-as 200
PE2(config-bgp)#neighbor 90.90.90.90 update-source loopback0
PE2(config-bgp)#address-family vpnv4
PE2(config-bgp-af)#neighbor 90.90.90.90 activate
PE2(config-bgp-af)#neighbor 90.90.90.90 send-community extended
```

```
PE2(config-bgp-af)#exit-address-family
```

```
PE2(config-bgp)#exit
```

# After the configuration is complete, view the BGP neighbor information on the PE.

Take PE1 as an example:

```
PE1#show ip bgp vpnv4 all summary
```

```
BGP router identifier 90.90.90.90, local AS number 200
```

```
BGP table version is 2
```

```
1 BGP AS-PATH entries
```

```
0 BGP community entries
```

```
Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
75.75.75.75 4 200    3     3    1  0  0 00:00:06    4
```

```
Total number of neighbors 1
```

```
BGP VRF 1 Route Distinguisher:
```

```
100:1
```

```
BGP table version is 1
```

```
2 BGP AS-PATH entries
```

```
0 BGP community entries
```

```
Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd

```

```
PE1#show ip bgp vpnv4 vrf 1 8.8.8.8
```

```
Route Distinguisher: 100:1 (Default for VRF 1), Prefix: 8.8.8.8/32
```

```
Not advertised to any peer
```

```
100
```

```
75.75.75.75 (metric 3) from 75.75.75.75 (75.75.75.75)
```

```
Origin IGP, metric 0, localpref 100, valid, internal, best, vrf fn installed, vrf duplicated, vrf external
```

```
Extended Community: RT:100:1
```

```
Last update: 01:38:32 ago
```

```
PE1#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 5.5.5.5/32 [20/0] via 95.1.1.2, 00:09:40, vlan3
```

```
B 8.8.8.8/32 [200/0] via 75.75.75.75, 01:46:03, vlan2
```

```
B 90.1.0.0/16 [200/0] via 75.75.75.75, 00:04:05, vlan2
```

```
C 95.1.0.0/16 is directly connected, 18:33:25, vlan3
```

```
L 95.1.1.1/32 is directly connected, 18:33:25, vlan3
```

It is indicated that the routing information to CE2 exists in the BGP VPNv4 routing table of PE1, and the AS-PATH shows 100, and the routing information to CE2 also exists in the VPN1 routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

#View the BGP routing table on the CE.

Take CE1 as an example.

```
CE1#show ip bgp
```

```
BGP table version is 1, local router ID is 5.5.5.5
```

Status codes: s suppressed, d damped, h history, \* valid, > best, i - internal,

S Stale

Origin codes: i - IGP, e - EGP, ? - incomplete

Network	Next Hop	Metric	LocPrf	Weight	Path
[B]*> 5.5.5.5/32	0.0.0.0	0	32768	i	
[B]*> 95.1.0.0/16	0.0.0.0	0	32768	i	

You can find that there is no route information to CE2 in the BGP routing table of CE1.

---

## Note

- Since CE finds that the AS PATH attribute of the received peer route contains the same AS number 100 as its own, it rejects the BGP route. Configuration is needed for AS override on the PE before the CE can learn the peer route.
- 

Step 7: Configure AS override on the PE.

#Configure AS override function for EBGP neighbors under the BGP VRF address cluster of PE1, so that the AS number same as the CE is communicated to the CE as its own local AS number.

```
PE1(config)#router bgp 200
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#neighbor 95.1.1.2 as-override
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
```

#Configure AS override for EBGP neighbors under the BGP VRF address cluster of PE2, thus overriding the AS number same as the CE as its own local AS number to pass to the CE.

```
PE2(config)#router bgp 200
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#neighbor 90.1.1.2 as-override
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
```

Step 8: Check the result.

#After the configuration is complete, view the BGP VPNv4 routing table and VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip bgp vpnv4 vrf 1
BGP table version is 27, local router ID is 90.90.90.90
```

Status codes: s suppressed, d damped, h history, \* valid, > best, i - internal,

CE1#show ip route

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

LC 5.5.5.5/32 is directly connected, 04:05:46, loopback0

B 8.8.8.8/32 [20/0] via 95.1.1.1, 00:08:51, vlan2

B 90.1.0.0/16 [20/0] via 95.1.1.1, 00:03:09, vlan2

C 95.1.0.0/16 is directly connected, 23:33:15, vlan2

L 95.1.1.2/32 is directly connected, 23:33:15, vlan2

It is indicated that the route information to CE2 exists in both the BGP routing table and the global routing table of CE1, and it is indicated that the AS-PATH of the route to CE2 is modified to 200 200 in the BGP routing table.

Ping the loopback port of CE2 on CE1 and see if it pings through.

CE1#ping 8.8.8.8

Press key (ctrl + shift + 6) interrupt it.

Sending 5, 76-byte ICMP Echos to 8.8.8.8 , timeout is 2 seconds:

!!!!

Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.

It is indicated that CE1 can ping through CE2.

### 79.3.6 Configure OSPF pseudo-Connections

#### Network Requirements

- CE1 and CE2 belong to VPN1, and OSPF for route advertisement is used between CE and PE.
- A backdoor link exists between CE1 and CE2. Configure pseudo-connections between PEs so that VPN traffic between CE1 and CE2 is forwarded globally via MPLS on a priority basis, using only the backdoor link for backup.
- Configure OSPF between PEs to achieve intra-PE communication and configure MP-IBGP to exchange VPN routing information.

#### Network Topology

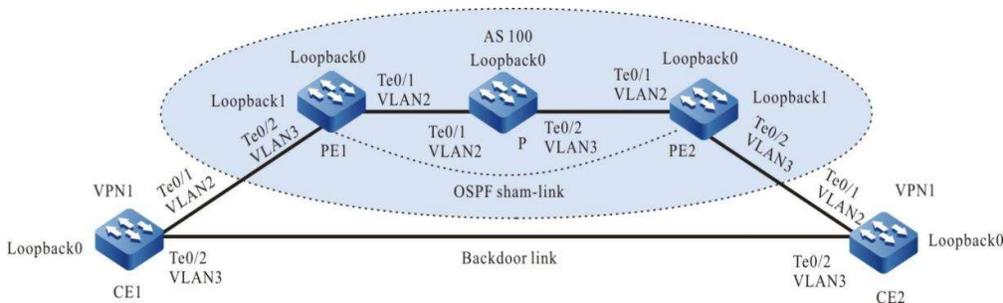

Figure 19-20 Network Topology for Configuring an OSPF Pseudo-Link

Table 43-44 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	95.1.1.2/16	P	Loopback0	11.11.11.11/32
	Vlan3	98.1.1.1/16	PE2	Vlan2	92.1.1.1/16
	Loopback0	5.5.5.5/32		Vlan3	90.1.1.1/16
PE1	Vlan2	93.1.1.2/16		Loopback0	75.75.75.75/32
	Vlan3	95.1.1.1/16		Loopback1	6.6.6.6/32
	Loopback0	90.90.90.90/32	CE2	Vlan2	90.1.1.2/16

of equipment	Interface	IP address	of equipment	Interface	IP address
	Loopback1	1.1.1.1/32		Vlan3	98.1.1.2/16
P	Vlan2	93.1.1.1/16		Loopback0	8.8.8.8/32
	Vlan3	92.1.1.2/16			

### Configuration Steps

Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode.  
(Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure global OSPF to advertise global routes.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 90.90.90.90 0.0.0.0 area 0
PE1(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit
```

# Configure global OSPF on P.

```
P#configure terminal
P(config)#router ospf 100
P(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
P(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
P(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
P(config-ospf)#exit
```

#Configure global OSPF on PE2's.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 75.75.75.75 0.0.0.0 area 0
PE2(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 11.11.11.11/32 [110/2] via 93.1.1.1, 00:05:03, vlan2

O 75.75.75.75/32 [110/3] via 93.1.1.1, 00:06:03, vlan2

LC 90.90.90.90/32 is directly connected, 00:08:28, loopback0

O 92.1.0.0/16 [110/2] via 93.1.1.1, 00:08:12, vlan2

C 93.1.0.0/16 is directly connected, 00:34:54, vlan2

L 93.1.1.2/32 is directly connected, 00:34:54, vlan2

It is indicated that the routing information of PE2 and P's loopback port exists in the global routing table of PE1.

---

 **Note**

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 90.90.90.90
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 90.90.90.90
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#mpls ip
PE1(config-if-vlan2)#mpls ldp
PE1(config-if-vlan2)#exit
```

# Enable global MPLS IP and MPLS LDP on P. Also enable MPLS IP and MPLS LDP on the interface.

```
P(config)#mpls ip
P(config)#mpls ldp
```

```

P(config-ldp)#router-id 11.11.11.11
P(config-ldp)#address-family ipv4
P(config-ldp-af4)#transport-address 11.11.11.11
P(config-ldp-af4)#exit
P(config-ldp)#exit
P(config)#interface vlan2
P(config-if-vlan2)#mpls ip
P(config-if-vlan2)#mpls ldp
P(config-if-vlan2)#exit
P(config)#interface vlan3
P(config-if-vlan3)#mpls ip
P(config-if-vlan3)#mpls ldp
P(config-if-vlan3)#exit

```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```

PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 75.75.75.75
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 75.75.75.75
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit

```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```

PE1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State      DS Cap  DeadTime
11.11.11.11     Multicast  Active   OPERATIONAL  Disabled 00:02:20
Statistics for ldp sessions:
  Multicast sessions: 1
  Targeted sessions: 0

```

It is indicated that PE1 successfully establishes an LDP session with P.

#View the routing label table entries on the device.

Take PE1 as an example:

```

PE1#show ip route 11.11.11.11 detail

```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```
O 11.11.11.11/32 [110/2] via 93.1.1.1, label 3, 14:29:21, vlan2
    93.1.1.1 [0], vlan2
```

```
PE1#show ip route 75.75.75.75 detail
```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```
O 75.75.75.75/32 [110/3] via 93.1.1.1, label 16, 14:30:21, vlan2
    93.1.1.1 [0], vlan2
```

It is indicated the label information of the loopback ports to P and PE2 exist on PE1.

---

## Note

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 5: Configure the VPN instance to advertise the CE route to the PE via OSPF.

#Configure VPN instance and OSPF under VPN instance on PE1.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
PE1(config-vrf)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#ip vrf forwarding 1
PE1(config-if-vlan3)#ip address 95.1.1.1 255.255.0.0
PE1(config-if-vlan3)#exit
```

```
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#network 95.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit
```

#Configure OSPF between CE1 and PE1 and CE2 on CE1.

```
CE1#configure terminal
CE1(config)#router ospf 100
CE1(config-ospf)#network 5.5.5.5 0.0.0.0 area 0
CE1(config-ospf)#network 95.1.0.0 0.0.255.255 area 0
CE1(config-ospf)#network 98.1.0.0 0.0.255.255 area 0
CE1(config-ospf)#exit
```

#Configure VPN instance and OSPF under VPN instance on PE2.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 100:1
PE2(config-vrf)#route-target export 100:1
PE2(config-vrf)#route-target import 100:1
PE2(config-vrf)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 1
PE2(config-if-vlan3)#ip address 90.1.1.1 255.255.0.0
PE2(config-if-vlan3)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#network 90.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
```

#Configure OSPF on CE2 with PE2 and CE1.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 8.8.8.8 0.0.0.0 area 0
CE2(config-ospf)#network 90.1.0.0 0.0.255.255 area 0
CE2(config-ospf)#network 98.1.0.0 0.0.255.255 area 0
CE2(config-ospf)#exit
```

#After the configuration is complete, view the VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

- O 5.5.5.5/32 [110/2] via 95.1.1.2, 00:11:11, vlan3
- C 95.1.0.0/16 is directly connected, 00:11:45, vlan3
- L 95.1.1.1/32 is directly connected, 00:11:45, vlan3
- O 98.1.0.0/16 [110/2] via 95.1.1.2, 00:10:11, vlan3

It is indicated the loopback port routing information to CE1 exists in the VPN routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

Step 6: Configure the MP-IBGP to use the loopback interface as the peer address; and redistribute routes with each other and the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```

PE1(config)#router bgp 100
PE1(config-bgp)#neighbor 75.75.75.75 remote-as 100
PE1(config-bgp)#neighbor 75.75.75.75 update-source loopback0
PE1(config-bgp)#address-family vpnv4
PE1(config-bgp-af)#neighbor 75.75.75.75 activate
PE1(config-bgp-af)#neighbor 75.75.75.75 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute ospf 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit

```

#Configure the MP-IBGP on PE2 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```

PE2(config)#router bgp 100
PE2(config-bgp)#neighbor 90.90.90.90 remote-as 100
PE2(config-bgp)#neighbor 90.90.90.90 update-source loopback0
PE2(config-bgp)#address-family vpnv4

```

```

PE2(config-bgp-af)#neighbor 90.90.90.90 activate
PE2(config-bgp-af)#neighbor 90.90.90.90 send-community extended
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit

```

# After the configuration is completed, check the BGP neighbor information on PE1.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 all summary
BGP router identifier 90.90.90.90, local AS number 100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
75.75.75.75 4 100   40    41     5   0  00:32:01    2

Total number of neighbors 1

```

The successful establishment of BGP neighbors between PE1 and PE2 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table and VPN routing table on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 vrf 1
BGP table version is 19, local router ID is 90.90.90.90
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric LocPrf Weight Path
Route Distinguisher: 100:1 (Default for VRF 1)
[B]* i5.5.5/32    75.75.75.75    5 100  0 ?

[O]*> 8.8.8/32    95.1.1.2       5  32768 ?
[B]* i          75.75.75.75    2 100  0 ?

```

```

[O]*> 90.1.0.0/16    95.1.1.2        5    32768 ?
[B]* i          75.75.75.75    1 100  0 ?
[B]* i95.1.0.0/16    75.75.75.75    5 100  0 ?
[O]*>          0.0.0.0        1    32768 ?
[B]* i98.1.0.0/16    75.75.75.75    4 100  0 ?
[O]*>          95.1.1.2       4    32768 ?

```

```
PE1#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```

O 5.5.5.5/32 [110/2] via 95.1.1.2, 03:00:43, vlan3
O 8.8.8.8/32 [110/5] via 95.1.1.2, 00:00:05, vlan3
O 90.1.0.0/16 [110/5] via 95.1.1.2, 00:00:05, vlan3
C 95.1.0.0/16 is directly connected, 03:01:34, vlan3
L 95.1.1.1/32 is directly connected, 03:01:34, vlan3
O 98.1.0.0/16 [110/4] via 95.1.1.2, 02:58:04, vlan3

```

It is indicated that the routes to CE2 in the BGP VPNv4 routing table and VPN routing table are through the backdoor link of CE1, not through the global MPLS network.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

Step 7: Configure OSPF pseudo-connections on the PE and configure the COST value of the interface on the CE1 backdoor link to enable communication between CEs over the global network.

#Configure OSPF pseudo-connections on PE1 and advertise the loopback port route of the OSPF pseudo-link initiation point in BGP.

```

PE1(config)#interface loopback 1
PE1(config-if-loopback1)#ip vrf forwarding 1
PE1(config-if-loopback1)#ip address 1.1.1.1 255.255.255.255
PE1(config-if-loopback1)#exit

```

```
PE1(config)#router bgp 100
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#network 1.1.1.1 255.255.255.255
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#area 0 sham-link 1.1.1.1 6.6.6.6
PE1(config-ospf)#exit
```

# Configure OSPF pseudo-connections on PE2 and advertise the loopback port route of the OSPF pseudo-link initiation point in BGP.

```
PE2(config)#interface loopback 1
PE2(config-if-loopback1)#ip vrf forwarding 1
PE2(config-if-loopback1)#ip address 6.6.6.6 255.255.255.255
PE2(config-if-loopback1)#exit
PE2(config)#router bgp 100
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#network 6.6.6.6 255.255.255.255
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#area 0 sham-link 6.6.6.6 1.1.1.1
PE2(config-ospf)#exit
```

# Modify the COST value of the backdoor routing interface on CE1 to enable communication between CEs via the global

```
CE1(config)#interface vlan3
CE1(config-if-vlan3)#ip ospf cost 4
CE1(config-if-vlan3)#exit
```

# Modify the COST value of the backdoor routing interface on CE2 to enable global communication between CEs.

```
CE2(config)#interface vlan3
CE2(config-if-vlan3)#ip ospf cost 4
CE2(config-if-vlan3)#exit
```

Step 8: Check the result.

#After the configuration is complete, view the OSPF pseudo-connection information on the PE.

```
PE1#show ip ospf sham-links
Sham Link SLINK0 to addr 6.6.6.6 is up
Area 0.0.0.0 source address 1.1.1.1
```

```

Run as demand circuit
DoNotAge LSA allowed. Cost of using 1 State Point-To-Point,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:07
Adjacency state Full(Hello suppressed)

```

```

PE2#show ip ospf sham-links
Sham Link SLINK0 to addr 1.1.1.1 is up
Area 0.0.0.0 source address 6.6.6.6
Run as demand circuit
DoNotAge LSA allowed. Cost of using 1 State Point-To-Point,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:04
Adjacency state Full(Hello suppressed)

```

# Re-view the BGP VPNv4 routing table and VPN routing table on the PE.

Take PE1 as an example:

```

PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

LC 1.1.1.1/32 is directly connected, 00:12:09, loopback1
O 5.5.5.5/32 [110/2] via 95.1.1.2, 03:21:34, vlan3

 4 8.8.8.8  16 ms  0 ms  0 ms
```

It is indicated that the path from CE1 to CE2 passes through the bone global network.

### 79.3.7 Intranet access to the Internet

#### Network Requirements

- PE1 and PE2 are connected to the CE of VPN1, and CE1 and CE2 belong to the same VPN.

- The Internet gateway is the router outside the VPN, and all sites inside the VPN are connected to the Internet through the Intranet.
- VPN members forward their access to the Internet by importing a default route to access the Internet to the CE (CE1) that connects to the Internet gateway.
- Configure OSPF between PEs to achieve intra-PE communication, and configure MP-IBGP to exchange VPN routing information.

### Network Topology

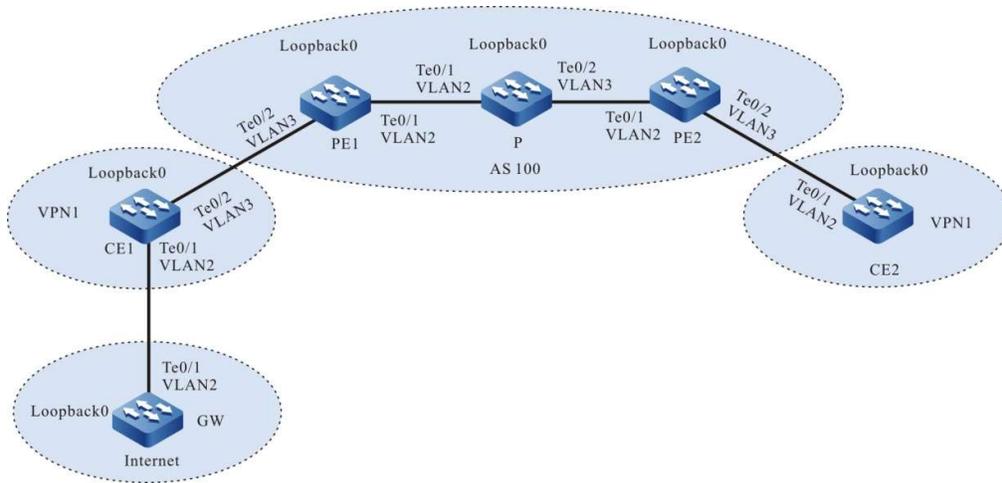

Figure 21-22 Network Topology of Intranet Access to the Internet

Table 79-45 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan3	95.1.1.2/16	P	Loopback0	11.11.11.11/32
	Vlan2	98.1.1.1/16	PE2	Vlan2	92.1.1.1/16
	Loopback0	5.5.5.5/32		Vlan3	90.1.1.1/16
PE1	Vlan2	93.1.1.2/16		Loopback0	75.75.75.75/32
	Vlan3	95.1.1.1/16	CE2	Vlan2	90.1.1.2/16
	Loopback0	90.90.90.90/32		Loopback0	8.8.8.8/32
P	Vlan2	93.1.1.1/16	GW	Vlan2	98.1.1.2/16
	Vlan3	92.1.1.2/16		Loopback0	1.1.1.1/32

## Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode.  
(Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure global OSPF to advertise global routes.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 90.90.90.0 0.0.0.0 area 0
PE1(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
PE1(config-ospf)#exit
```

# Configure global OSPF on P.

```
P#configure terminal
P(config)#router ospf 100
P(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
P(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
P(config-ospf)#network 93.1.0.0 0.0.255.255 area 0
P(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 75.75.75.75 0.0.0.0 area 0
PE2(config-ospf)#network 92.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 11.11.11.11/32 [110/2] via 93.1.1.1, 00:06:12, vlan2
O 75.75.75.75/32 [110/3] via 93.1.1.1, 00:06:03, vlan2
LC 90.90.90.90/32 is directly connected, 154:02:28, loopback0
```

```
C 93.1.0.0/16 is directly connected, 00:34:54, vlan2
L 93.1.1.2/32 is directly connected, 00:34:54, vlan2
O 92.1.0.0/16 [110/2] via 93.1.1.1, 00:08:12, vlan2
```

It is indicated that the routing information of PE2 and P's loopback port exists in the global routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 90.90.90.90
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 90.90.90.90
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#mpls ip
PE1(config-if-vlan2)#mpls ldp
PE1(config-if-vlan2)#exit
```

# Enable global MPLS IP and MPLS LDP on P. Also enable MPLS IP and MPLS LDP on the interface.

```
P(config)#mpls ip
P(config)#mpls ldp
P(config-ldp)#router-id 11.11.11.11
P(config-ldp)#address-family ipv4
P(config-ldp-af4)#transport-address 11.11.11.11
P(config-ldp-af4)#exit
P(config-ldp)#exit
P(config)#interface vlan2
P(config-if-vlan2)#mpls ip
P(config-if-vlan2)#mpls ldp
P(config-if-vlan2)#exit
```

```
P(config)#interface vlan3
P(config-if-vlan3)#mpls ip
P(config-if-vlan3)#mpls ldp
P(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```
PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 75.75.75.75
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 75.75.75.75
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit
```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```
PE1#show mpls ldp session
Peer IP Address  Peer Type  My Role  State    DS Cap  DeadTime
11.11.11.11     Multicast  Active   OPERATIONAL  Disabled 00:02:20
Statistics for ldp sessions:
  Multicast sessions: 1
  Targeted sessions: 0
```

It is indicated that PE1 successfully establishes an LDP session with P.

#View the routing label table entries on the device.

Take PE1 as an example:

```
PE1#show ip route 11.11.11.11 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 11.11.11.11/32 [110/2] via 93.1.1.1, label 3, 14:29:21, vlan2
    93.1.1.1 [0], vlan2
```

```
PE1#show ip route 75.75.75.75 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 75.75.75.75/32 [110/3] via 93.1.1.1, label 16, 14:30:21, vlan2  
93.1.1.1 [0], vlan2
```

It is indicated the label information of the loopback ports to P and PE2 exist on PE1.

---

## Note

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 5: Configure the VPN instance to advertise the CE route to the PE via OSPF.

#Configure VPN instance and OSPF under VPN instance on PE1.

```
PE1(config)#ip vrf 1  
PE1(config-vrf)#rd 100:1  
PE1(config-vrf)#route-target export 100:1  
PE1(config-vrf)#route-target import 100:1  
PE1(config-vrf)#exit  
PE1(config)#interface vlan3  
PE1(config-if-vlan3)#ip vrf forwarding 1  
PE1(config-if-vlan3)#ip address 95.1.1.1 255.255.0.0  
PE1(config-if-vlan3)#exit  
PE1(config)#router ospf 200 vrf 1  
PE1(config-ospf)#network 95.1.0.0 0.0.255.255 area 0  
PE1(config-ospf)#exit
```

#Configure OSPF on CE1.

```
CE1#configure terminal  
CE1(config)#router ospf 100  
CE1(config-ospf)#network 5.5.5.5 0.0.0.0 area 0  
CE1(config-ospf)#network 95.1.0.0 0.0.255.255 area 0  
CE1(config-ospf)#exit
```

#Configure VPN instance and OSPF under VPN instance on PE2.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 100:1
PE2(config-vrf)#route-target export 100:1
PE2(config-vrf)#route-target import 100:1
PE2(config-vrf)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 1
PE2(config-if-vlan3)#ip address 90.1.1.1 255.255.0.0
PE2(config-if-vlan3)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#network 90.1.0.0 0.0.255.255 area 0
PE2(config-ospf)#exit
```

#Configure OSPF on CE2.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 8.8.8.8 0.0.0.0 area 0
CE2(config-ospf)#network 90.1.0.0 0.0.255.255 area 0
CE2(config-ospf)#exit
```

#After the configuration is complete, view the VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 5.5.5/32 [110/2] via 95.1.1.2, 00:11:11, vlan3
C 95.1.0.0/16 is directly connected, 00:11:45, vlan3
L 95.1.1.1/32 is directly connected, 00:11:45, vlan3
```

It is indicated the loopback port routing information to CE1 exists in the VPN routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.

Step 6: Configure the MP-IBGP to use the loopback interface as the peer address; and redistribute routes with each other and the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE1(config)#router bgp 100
PE1(config-bgp)#neighbor 75.75.75.75 remote-as 100
PE1(config-bgp)#neighbor 75.75.75.75 update-source loopback0
PE1(config-bgp)#address-family vpnv4
PE1(config-bgp-af)#neighbor 75.75.75.75 activate
PE1(config-bgp-af)#neighbor 75.75.75.75 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute ospf 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit
```

#Configure the MP-IBGP on PE2 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE2(config)#router bgp 100
PE2(config-bgp)#neighbor 90.90.90.90 remote-as 100
PE2(config-bgp)#neighbor 90.90.90.90 update-source loopback0
PE2(config-bgp)#address-family vpnv4
PE2(config-bgp-af)#neighbor 90.90.90.90 activate
PE2(config-bgp-af)#neighbor 90.90.90.90 send-community extended
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit
```

# After the configuration is complete, view the BGP neighbor information on the PE.

Take PE1 as an example:

```
PE1#show ip bgp vpnv4 all summary
```

BGP router identifier 90.90.90.90, local AS number 100

BGP table version is 6

1 BGP AS-PATH entries

0 BGP community entries

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
75.75.75.75	4	100	40	41	5	0	0	00:32:01	4

Total number of neighbors 1

The successful establishment of BGP neighbors between PE1 and PE2 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table and the routing table of VPN1 on the PE.

Take PE1 as an example:

```
PE1#show ip bgp vpnv4 vrf 1
```

BGP table version is 39, local router ID is 90.90.90.90

Status codes: s suppressed, d damped, h history, \* valid, > best, i - internal,

S Stale

Origin codes: i - IGP, e - EGP, ? - incomplete

Network	Next Hop	Metric	LocPrf	Weight	Path
---------	----------	--------	--------	--------	------

Route Distinguisher: 100:1 (Default for VRF 1)

[O]*> 5.5.5.5/32	95.1.1.2	2			32768 ?
[B]*>i8.8.8.8/32	75.75.75.75	2	100		0 ?
[B]*>i90.1.0.0/16	75.75.75.75	1	100		0 ?
[O]*> 95.1.0.0/16	0.0.0.0	1			32768 ?

```
PE1#show ip route vrf 1
```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 5.5.5.5/32 [110/2] via 95.1.1.2, 00:50:39, vlan3

B 8.8.8.8/32 [200/2] via 75.75.75.75, 00:20:04, vlan2

B 90.1.0.0/16 [200/1] via 75.75.75.75, 00:20:04, vlan2

C 95.1.0.0/16 is directly connected, 00:51:28, vlan3

L 95.1.1.1/32 is directly connected, 00:51:28, vlan3

It is indicated that routing information to CE2 exists in both the BGP VPNv4 routing table of PE1 and the routing table of VPN1.

#View the routing label table entries and MPLS forwarding table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1 8.8.8.8 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 8.8.8.8/32 [200/0] via 75.75.75.75, label 5120, 01:04:26, vlan2
    93.1.1.1 [3], label 16, vlan2
```

```
PE1#show mpls forwarding-table
```

```
Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root
address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)
```

```
S - Static Label
```

Pro Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B 1	0.0.0.0/0	5120	/	/	/

It is indicated that the route label information of VPN1 exists in the forwarding table of PE1.

---

## Note

- The inspection method on PE2 is the same as PE1.
- 

Step 7: Configure static routes to enable VPN members to access the Internet.

#Configure the default route to the Internet on CE1.

```
CE1(config)#ip route 0.0.0.0 0.0.0.0 98.1.1.2
```

#Configure the default route to the Internet on PE1, redistribute this default route to BGP, and thus advertise the route to the Internet to the peer PE and CE.

```
PE1(config)#ip route vrf 1 0.0.0.0 0.0.0.0 95.1.1.2
```

```
PE1(config)#router bgp 100
```

```

PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute static
PE1(config-bgp-af)#default-information originate
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit

```

#Enable the default route introduction feature under OSPF in PE2 to receive routes coming from redistribution.

```

PE2(config)#router ospf 200
PE2(config-ospf)#default-information originate
PE2(config-ospf)#exit

```

#Configure the default route on the Internet gateway.

```

GW#configure terminal
GW(config)#ip route 0.0.0.0 0.0.0.0 98.1.1.1

```

---

## Caution

- For BGP to redistribute default routes, it requires the configuration of **default-information originate**.
- 

Step 8: Check the result.

#After the configuration is complete, view the BGP VPNv4 routing table and the routing table of VPN1 on the device.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 vrf 1
BGP table version is 39, local router ID is 90.90.90.90
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
Route Distinguisher: 100:1 (Default for VRF 1)
[S]*> 0.0.0.0/0    95.1.1.2         0   32768 ?
[B]*>i8.8.8/32    75.75.75.75      2  100   0 ?
[O]*> 5.5.5/32    95.1.1.2         2   32768 ?
[B]*>i90.1.0.0/16 75.75.75.75      1  100   0 ?
[O]*> 95.1.0.0/16 0.0.0.0          1   32768 ?

```

```
PE1#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
S 0.0.0.0 [1/10] via 95.1.1.2, 01:12:43, vlan3
O 5.5.5.5/32 [110/2] via 95.1.1.2, 01:11:55, vlan3
B 8.8.8.8/32 [200/2] via 75.75.75.75, 00:41:19, vlan2
B 90.1.0.0/16 [200/1] via 75.75.75.75, 00:41:19, vlan2
C 95.1.0.0/16 is directly connected, 01:12:43, vlan3
L 95.1.1.1/32 is directly connected, 01:12:43, vlan3
```

It is indicated that CE1 cannot ping through the loopback port of CE2.

# Check the accessibility of the device to the Internet.

```
PE1#ping vrf 1 1.1.1.1
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 98.1.1.2 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

```
PE2#ping vrf 1 1.1.1.1
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 98.1.1.2 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

```
CE2#ping 1.1.1.1
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 98.1.1.2 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/3/16 ms.
```

It is indicated that PE1, PE2 and CE2 can all ping through the loopback port of the Internet gateway.

### 79.3.8 Service provider network access to the Internet way

#### Network Requirements

- PE1 and PE2 are connected to the CE of VPN1, and CE1 and CE2 belong to the same VPN.
- The Internet gateway is the router outside the VPN, and all sites inside the VPN are connected to the Internet through the service provider network.
- VPN members forward their access to the Internet by importing a default route to access the Internet to the PE (PE1) that connects to the Internet gateway.
- Configure OSPF between PEs to achieve intra-PE communication, and configure MP-IBGP to exchange VPN routing information.

#### Network Topology

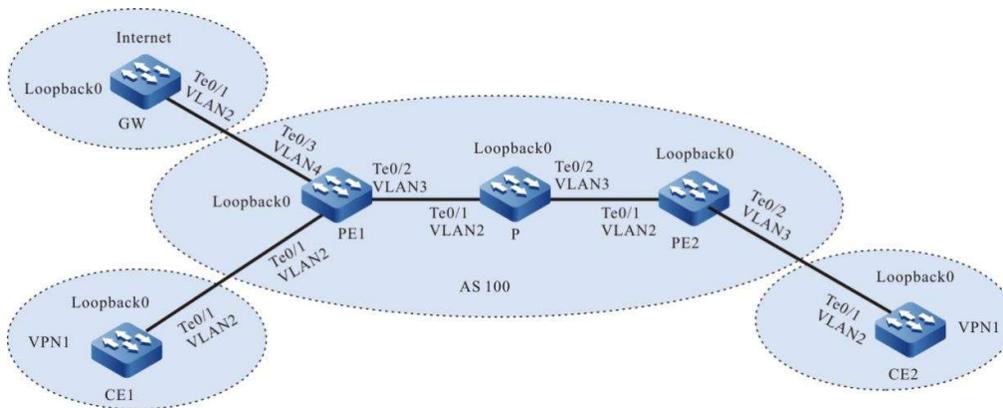

Figure 79-23 Network Topology of Ways of Service Provider Network Access to the Internet

Table 46-47 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	10.1.1.1/24	P	Loopback0	22.22.22.22/32
	Loopback0	1.1.1.1/32	PE2	Vlan2	10.1.3.2/24
PE1	Vlan2	10.1.1.2/24		Vlan3	10.1.4.1/24
	Vlan3	10.1.2.1/24		Loopback0	33.33.33.33/32
	Vlan4	10.1.5.1/24	CE2	Vlan2	10.1.4.2/24

of equipment	Interface	IP address	of equipment	Interface	IP address
	Loopback0	11.11.11.11/32		Loopback0	2.2.2.2/32
P	Vlan2	10.1.2.2/24	GW	Vlan2	10.1.5.2/24
	Vlan3	10.1.3.1/24		Loopback0	3.3.3.3/32

### Configuration Steps

Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode.  
(Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure global OSPF to advertise global routes.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
PE1(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
PE1(config-ospf)#exit
```

# Configure global OSPF on P.

```
P#configure terminal
P(config)#router ospf 100
P(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
P(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
P(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
P(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
PE2(config-ospf)#network 33.33.33.33 0.0.0.0 area 0
PE2(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```
C 10.1.2.0/24 is directly connected, 65:47:37, vlan3
L 10.1.2.1/32 is directly connected, 65:47:37, vlan3
O 10.1.3.0/24 [110/2] via 10.1.2.2, 01:18:39, vlan3
C 10.1.5.0/24 is directly connected, 00:22:25, vlan4
L 10.1.5.1/32 is directly connected, 00:22:25, vlan4
LC 11.11.11.11/32 is directly connected, 65:47:37, loopback0
O 22.22.22.22/32 [110/2] via 10.1.2.2, 65:11:53, vlan3
O 33.33.33.33/32 [110/3] via 10.1.2.2, 01:18:34, vlan3
C 127.0.0.0/8 is directly connected, 65:47:57, lo0
L 127.0.0.1/32 is directly connected, 65:47:57, lo0
```

It is indicated that the routing information of PE2 and P's loopback port exists in the global routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of P and PE2.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 11.11.11.11
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 11.11.11.11
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#mpls ip
PE1(config-if-vlan3)#mpls ldp
```

```
PE1(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on P. Also enable MPLS IP and MPLS LDP on the interface.

```
P(config)#mpls ip
P(config)#mpls ldp
P(config-ldp)#router-id 22.22.22.22
P(config-ldp)#address-family ipv4
P(config-ldp-af4)#transport-address 22.22.22.22
P(config-ldp-af4)#exit
P(config-ldp)#exit
P(config)#interface vlan2
P(config-if-vlan2)#mpls ip
P(config-if-vlan2)#mpls ldp
P(config-if-vlan2)#exit
P(config)#interface vlan3
P(config-if-vlan3)#mpls ip
P(config-if-vlan3)#mpls ldp
P(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```
PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 33.33.33.33
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 33.33.33.33
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#mpls ip
PE2(config-if-vlan2)#mpls ldp
PE2(config-if-vlan2)#exit
```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```
PE1#show mpls ldp session
Peer IP Address Peer Type My Role State DS Cap DeadTime
22.22.22.22 Multicast Passive OPERATIONAL Disabled 00:02:34
Statistics for ldp sessions:
Multicast sessions: 1
Targeted sessions: 0
```

It is indicated that PE1 successfully establishes an LDP session with P.

#View the routing label table entries on the device.

Take PE1 as an example:

```
PE1#show ip route 22.22.22.22 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 22.22.22.22/32 [110/2] via 10.1.2.2, label 3, 14:29:21, vlan3
    10.1.2.2 [0], vlan3
```

```
PE1#show ip route 33.33.33.33 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 33.33.33.33/32 [110/3] via 10.1.2.2, label 17, 14:30:21, vlan3
    10.1.2.2 [0], vlan3
```

It is indicated the label information of the loopback ports to P and PE2 exist on PE1.

---

## Note

- Refer to PE1 equipment for the inspection method of P and PE2.
- 

Step 5: Configure the VPN instance to advertise the CE route to the PE via OSPF.

#Configure VPN instance and OSPF under VPN instance on PE1.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
```

```
PE1(config-vrf)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#ip vrf forwarding 1
PE1(config-if-vlan2)#ip address 10.1.1.2 255.255.255.0
PE1(config-if-vlan2)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#network 10.1.1.0 0.255.255.255 area 0
PE1(config-ospf)#exit
```

#### #Configure OSPF on CE1.

```
CE1#configure terminal
CE1(config)#router ospf 100
CE1(config-ospf)#network 1.1.1.1 0.0.0.0 area 0
CE1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
CE1(config-ospf)#exit
```

#### #Configure VPN instance and OSPF under VPN instance on PE2.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 100:1
PE2(config-vrf)#route-target export 100:1
PE2(config-vrf)#route-target import 100:1
PE2(config-vrf)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#ip vrf forwarding 1
PE2(config-if-vlan3)#ip address 10.1.4.1 255.255.255.0
PE2(config)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
PE2(config-ospf)#exit
```

#### #Configure OSPF on CE2.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 2.2.2.2 0.0.0.0 area 0
CE2(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
CE2(config-ospf)#exit
```

#After the configuration is complete, view the VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
```

```
O 1.1.1.1/32 [110/2] via 10.1.1.1, 00:00:12, vlan2
C 10.1.1.0/24 is directly connected, 00:00:23, vlan2
L 10.1.1.2/32 is directly connected, 00:00:23, vlan2
```

It is indicated the loopback port routing information to CE1 exists in the VPN routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2.
- 

Step 6: Configure the MP-IBGP to use the loopback interface as the peer address; and redistribute routes with each other and the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE1(config)#router bgp 100
PE1(config-bgp)#neighbor 33.33.33.33 remote-as 100
PE1(config-bgp)#neighbor 33.33.33.33 update-source loopback0
PE1(config-bgp)#address-family vpnv4
PE1(config-bgp-af)#neighbor 33.33.33.33 activate
PE1(config-bgp-af)#neighbor 33.33.33.33 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute ospf 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit
```

#Configure the MP-IBGP on PE2 to enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE2(config)#router bgp 100
PE2(config-bgp)#neighbor 11.11.11.11 remote-as 100
```

```

PE2(config-bgp)#neighbor 11.11.11.11 update-source loopback0
PE2(config-bgp)#address-family vpnv4
PE2(config-bgp-af)#neighbor 11.11.11.11 activate
PE2(config-bgp-af)#neighbor 11.11.11.11 send-community extended
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit

```

# After the configuration is complete, view the BGP neighbor information on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 all summary
BGP router identifier 11.11.11.11, local AS number 100
BGP table version is 3
1 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
33.33.33.33   4 100    8    9    3    0  00:04:26  2

Total number of neighbors 1

```

The successful establishment of BGP neighbors between PE1 and PE2 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table and the routing table of VPN1 on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 vrf 1
BGP table version is 3, local router ID is 11.11.11.11
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network        Next Hop        Metric LocPrf Weight Path
Route Distinguisher: 100:1 (Default for VRF 1)
[O]*> 1.1.1.1/32  10.1.1.1        2    32768 ?
[B]*>i2.2.2.2/32  33.33.33.33     2  100  0 ?

```

```
[O]*> 10.1.1.0/24 0.0.0.0 1 32768 ?
[B]*>i10.1.4.0/24 33.33.33.33 1 100 0 ?
```

```
PE1#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 1.1.1.1/32 [110/2] via 10.1.1.1, 00:20:31, vlan2
B 2.2.2.2/32 [200/2] via 33.33.33.33, 00:08:17, vlan3
C 10.1.1.0/24 is directly connected, 00:20:42, vlan2
L 10.1.1.2/32 is directly connected, 00:20:42, vlan2
B 10.1.4.0/24 [200/1] via 33.33.33.33, 00:09:33, vlan3
```

It is indicated that routing information to CE2 exists in both the BGP VPNv4 routing table of PE1 and the routing table of VPN1.

#View the routing label table entries and MPLS forwarding table on the PE.

```
PE1#show ip route vrf 1 2.2.2.2 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 2.2.2.2/32 [200/0] via 33.33.33.33, label 16, 01:04:26, vlan3
    10.1.2.2 [3], label 17, vlan3
```

```
PE1#show ip route vrf 1 10.1.4.0 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 10.1.4.0/24 [200/0] via 33.33.33.33, label 16, 01:04:26, vlan3
    10.1.2.2 [3], label 17, vlan3
```

```
PE1#show mpls forwarding-table
```

```
Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root  
address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)
```

```
S - Static Label
```

Pro Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B 1	0.0.0.0/0	16 / /	/ /	/	

It is indicated that the route label information of VPN1 exists in the forwarding table of PE.

---

## Note

- The inspection method on PE2 is the same as PE1.
- 

Step 7: Configure static routes on PEs and CEs to enable VPN members to access the Internet.

#Configure the default route to the Internet on CE1.

```
CE1(config)#ip route 0.0.0.0 0.0.0.0 10.1.1.2
```

#Configure the default route to the Internet and the route to CE1 globally on PE1, configure the default route to the Internet across VPNs under VPN, and cancel configuration of sole assignment and reception of labels for 32-bit mask within the MPLS LDP process.

```
PE1(config)#ip route 0.0.0.0 0.0.0.0 10.1.5.2  
PE1(config)#ip route vrf global 1.1.1.1 255.255.255.255 10.1.1.1 vrf 1  
PE1(config)#ip route vrf global 10.1.1.0 255.255.255.0 10.1.1.1 vrf 1  
PE1(config)#ip route vrf 1 0.0.0.0 0.0.0.0 10.1.5.2 vrf global  
PE1(config)#router bgp 100  
PE1(config-bgp)#address-family ipv4 vrf 1  
PE1(config-bgp-af)#redistribute connected  
PE1(config-bgp-af)#exit-address-family  
PE1(config-bgp)#exit  
PE1(config)#mpls ldp  
PE1(config-ldp)#address-family ipv4  
PE1(config-ldp-af4)#no advertise-labels for 32bit-mask-fec-only  
PE1(config-ldp-af4)#no accept-labels for 32bit-mask-fec-only  
PE1(config-ldp-af4)#exit  
PE1(config-ldp)#exit
```

#Configure the route to CE2 globally on PE2, configure the cross-VPN default route to the Internet under VPN with the next hop as PE2's BGP neighbor address, and redistribute the global static route under global OSPF to redistribute the route to the private network to PE1, and remove the 32-bit mask assignment and receive labels only under the MPLS LDP process.

```
PE2(config)#ip route vrf global 2.2.2.2 255.255.255.255 10.1.4.2 vrf 1
PE2(config)#ip route vrf global 10.1.4.0 255.255.255.0 10.1.4.2 vrf 1
PE2(config)#ip route vrf 1 0.0.0.0 0.0.0.0 11.11.11.11 vrf global
PE2(config)#router ospf 100
PE2(config-ospf)#redistribute static
PE2(config-ospf)#exit
PE2(config)#mpls ldp
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#no advertise-labels for 32bit-mask-fec-only
PE2(config-ldp-af4)#no accept-labels for 32bit-mask-fec-only
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
```

#Configure on CE2 the default route to the Internet.

```
CE2(config)#ip route 0.0.0.0 0.0.0.0 10.1.4.1
```

#Configure the default route on the Internet gateway.

```
GW#configure terminal
GW(config)#ip route 0.0.0.0 0.0.0.0 10.1.5.1
```

Step 8: Check the result.

#After the configuration is complete, view the global routing table on the PE.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

S 0.0.0.0 [1/10] via 10.1.5.2, 00:11:42, vlan4
S 1.1.1.1/32 [1/10] via 10.1.1.1, 95:27:42, vlan2
OE 2.2.2.2/32 [150/20] via 10.1.2.2, 00:13:22, vlan3
S 10.1.1.0/24 [1/10] via 10.1.1.1, 95:27:49, vlan2
C 10.1.2.0/24 is directly connected, 96:57:55, vlan3
L 10.1.2.1/32 is directly connected, 96:57:55, vlan3
O 10.1.3.0/24 [110/2] via 10.1.2.2, 72:44:34, vlan3
```

```
OE 10.1.4.0/24 [150/20] via 10.1.2.2, 00:13:22, vlan3
C 10.1.5.0/24 is directly connected, 96:57:41, vlan4
L 10.1.5.1/32 is directly connected, 96:57:41, vlan4
LC 11.11.11.11/32 is directly connected, 96:47:46, loopback0
O 22.22.22.22/32 [110/2] via 10.1.2.2, 72:44:34, vlan3
O 33.33.33.33/32 [110/3] via 10.1.2.2, 00:14:28, vlan3
C 127.0.0.0/8 is directly connected, 458:41:50, lo0
L 127.0.0.1/32 is directly connected, 458:41:50, lo0
```

```
PE1#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
S 0.0.0.0/0 [1/10] via 10.1.5.2, 95:27:24, vlan4
O 1.1.1.1/32 [110/2] via 10.1.1.1, 95:57:17, vlan2
B 2.2.2.2/32 [200/2] via 33.33.33.33, 00:13:44, vlan3
C 10.1.1.0/24 is directly connected, 95:57:28, vlan2
L 10.1.1.2/32 is directly connected, 95:57:28, vlan2
B 10.1.4.0/24 [200/0] via 33.33.33.33, 00:14:12, vlan3
```

It is indicated that both the global routing table and the VPN routing table on PE1 have a default route pointing to the Internet.

---

## Note

- Refer to PE1 device for the inspection method of PE2.
- 

# View the device's reachability to the Internet.

```
CE1#ping 3.3.3.3
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 3.3.3.3 , timeout is 2 seconds:
```

```
!!!!
```

Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.

CE2#ping 3.3.3.3

Press key (ctrl + shift + 6) interrupt it.

Sending 5, 76-byte ICMP Echos to 3.3.3.3 , timeout is 2 seconds:

!!!!

Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.

It is indicated that both CE1 and CE2 can ping through the Internet route.

### 79.3.9 Configure a Shared VPN.

#### Network Requirements

- The entire MPLS network includes three VPNs, VPN1, VPN2 and VPN-Share.
- CE1 belongs to the user network of VPN1 and CE2 belongs to the user network of VPN2. The Import Target attribute of any PE connected to a non-shared VPN is not the same as the Export Target attribute of other PEs connected to a non-shared VPN, thus making it impossible to inter-access between non-shared VPNs.
- CE3 belongs to the user network of shared VPN. The shared VPN can accept routes from all non-shared VPN sites, and the routes published by the shared VPN sites can be received by all non-shared VPN sites.
- Shared VPN sites are able to communicate with any non-shared VPN site, and non-shared VPN sites cannot communicate with each other.

#### Network Topology

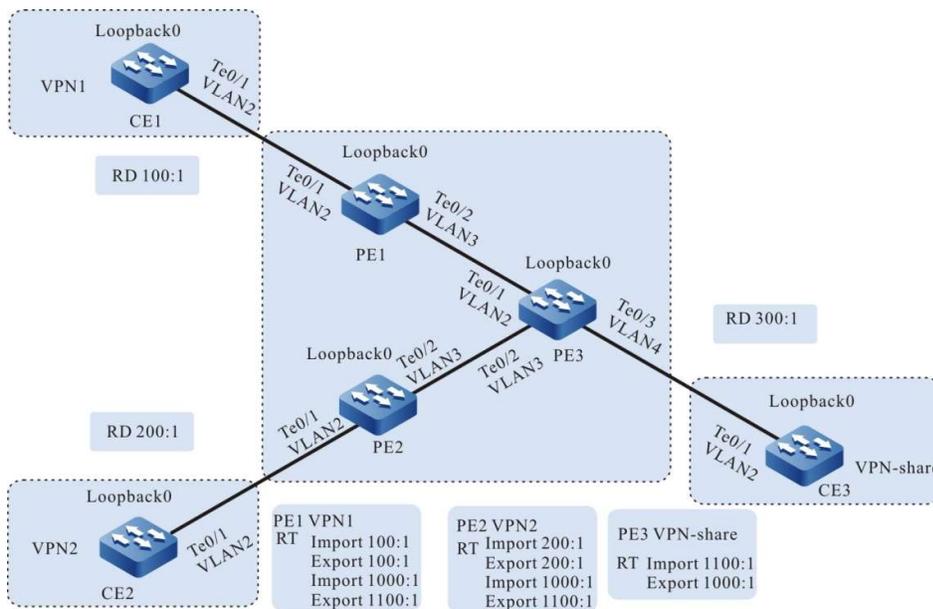

Figure 24-25 Network Topology for Configuring a Shared VPN

Table 48-49 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	10.1.1.1/24	PE2	Vlan3	10.1.4.1/24
	Loopback0	1.1.1.1/32		Loopback0	22.22.22.22/32
PE1	Vlan2	10.1.1.2/24	PE3	Vlan2	10.1.2.2/24
	Vlan3	10.1.2.1/24		Vlan3	10.1.4.2/24
	Loopback0	11.11.11.11/32		Vlan4	10.1.3.1/24
CE2	Vlan2	10.1.5.1/24		Loopback0	33.33.33.33/32
	Loopback0	2.2.2.2/32	CE3	Vlan2	10.1.3.2/24
PE2	Vlan2	10.1.5.2/24		Loopback0	3.3.3.3/32

### Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure global OSPF to advertise global routes.

#Configure global OSPF on PE1.

```
PE1#configure terminal
PE1(config)#router ospf 100
PE1(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
PE1(config-ospf)#network 11.11.11.11 0.0.0.0 area 0
PE1(config-ospf)#exit
```

#Configure global OSPF on PE2.

```
PE2#configure terminal
PE2(config)#router ospf 100
PE2(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
PE2(config-ospf)#network 22.22.22.22 0.0.0.0 area 0
PE2(config-ospf)#exit
```

#Configure global OSPF on PE3.

```
PE3#configure terminal
PE3(config)#router ospf 100
PE3(config-ospf)#network 10.1.2.0 0.0.0.255 area 0
PE3(config-ospf)#network 10.1.4.0 0.0.0.255 area 0
PE3(config-ospf)#network 33.33.33.33 0.0.0.0 area 0
PE3(config-ospf)#exit
```

#After the configuration is complete, view the global routing table on the device.

Take PE1 as an example:

```
PE1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.1.2.0/24 is directly connected, 04:39:17, vlan3
L 10.1.2.1/32 is directly connected, 04:39:17, vlan3
O 10.1.4.0/24 [110/2] via 10.1.2.2, 03:46:04, vlan3
LC 11.11.11.11/32 is directly connected, 04:39:05, loopback0
O 22.22.22.22/32 [110/3] via 10.1.2.2, 03:46:04, vlan3
O 33.33.33.33/32 [110/2] via 10.1.2.2, 03:45:25, vlan3
C 127.0.0.0/8 is directly connected, 1579:41:11, lo0
L 127.0.0.1/32 is directly connected, 1579:41:11, lo0
```

It is indicated that the routing information of the loopback ports of PE2 and PE3 exists in the global routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE3 and PE2.
- 

Step 4: Enable MPLS IP and MPLS LDP.

#Enable global MPLS IP and MPLS LDP on PE1, and also enable MPLS IP and MPLS LDP on the interface.

```
PE1(config)#mpls ip
```

```
PE1(config)#mpls ldp
PE1(config-ldp)#router-id 11.11.11.11
PE1(config-ldp)#address-family ipv4
PE1(config-ldp-af4)#transport-address 11.11.11.11
PE1(config-ldp-af4)#exit
PE1(config-ldp)#exit
PE1(config)#interface vlan3
PE1(config-if-vlan3)#mpls ip
PE1(config-if-vlan3)#mpls ldp
PE1(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on PE2, and also enable MPLS IP and MPLS LDP on the interface.

```
PE2(config)#mpls ip
PE2(config)#mpls ldp
PE2(config-ldp)#router-id 22.22.22.22
PE2(config-ldp)#address-family ipv4
PE2(config-ldp-af4)#transport-address 22.22.22.22
PE2(config-ldp-af4)#exit
PE2(config-ldp)#exit
PE2(config)#interface vlan3
PE2(config-if-vlan3)#mpls ip
PE2(config-if-vlan3)#mpls ldp
PE2(config-if-vlan3)#exit
```

# Enable global MPLS IP and MPLS LDP on PE3, and also enable MPLS IP and MPLS LDP on the interface.

```
PE3(config)#mpls ip
PE3(config)#mpls ldp
PE3(config-ldp)#router-id 33.33.33.33
PE3(config-ldp)#address-family ipv4
PE3(config-ldp-af4)#transport-address 33.33.33.33
PE3(config-ldp-af4)#exit
PE3(config-ldp)#exit
PE3(config)#interface vlan2
PE3(config-if-vlan2)#mpls ip
PE3(config-if-vlan2)#mpls ldp
PE3(config-if-vlan2)#exit
PE3(config)#interface vlan3
PE3(config-if-vlan3)#mpls ip
PE3(config-if-vlan3)#mpls ldp
PE3(config-if-vlan3)#exit
```

# After the configuration is complete, view the LDP session information on the device.

Take PE1 as an example:

```
PE1#show mpls ldp session
Peer IP Address Peer Type My Role State DS Cap DeadTime
33.33.33.33 Multicast Passive OPERATIONAL Disabled 00:02:48
Statistics for ldp sessions:
Multicast sessions: 1
Targeted sessions: 0
```

It is indicated that PE1 and PE3 successfully establish the LDP session.

#View the MPLS forwarding table on the device.

Take PE1 as an example:

```
PE1#show ip route 22.22.22.22 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 22.22.22.22/32 [110/3] via 10.1.2.2, label 17, 14:29:21, vlan3
10.1.2.2 [0], vlan3
```

```
PE1#show ip route 33.33.33.33 detail
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 33.33.33.33/32 [110/2] via 10.1.2.2, label 3, 14:30:21, vlan3
10.1.2.2 [0], vlan3
```

It is indicated the label information of the loopback ports to PE2 and PE3 exist on PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2 and PE3.
-

Step 5: Configure the VPN instance to advertise the CE route to the PE via OSPF.

#Configure VPN instance and OSPF under VPN instance on PE1.

```
PE1(config)#ip vrf 1
PE1(config-vrf)#rd 100:1
PE1(config-vrf)#route-target export 100:1
PE1(config-vrf)#route-target import 100:1
PE1(config-vrf)#route-target export 1100:1
PE1(config-vrf)#route-target import 1000:1
PE1(config-vrf)#exit
PE1(config)#interface vlan2
PE1(config-if-vlan2)#ip vrf forwarding 1
PE1(config-if-vlan2)#ip address 10.1.1.2 255.255.255.0
PE1(config-if-vlan2)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
PE1(config-ospf)#exit
```

---

## Note

- The import-target and export-target of 100:1 in the Rt attribute of PE1 are for importing and exporting internal VPN routes, the export-target of 1100:1 is for exporting internal VPN routes to the shared VPN, and the import-target of 1000:1 is for importing routes passed by the shared VPN.
- 

#Configure OSPF on CE1.

```
CE1#configure terminal
CE1(config)#router ospf 100
CE1(config-ospf)#network 1.1.1.1 0.0.0.0 area 0
CE1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
CE1(config-ospf)#exit
```

#Configure VPN instance and OSPF under VPN instance on PE2.

```
PE2(config)#ip vrf 1
PE2(config-vrf)#rd 200:1
PE2(config-vrf)#route-target export 200:1
PE2(config-vrf)#route-target import 200:1
```

```
PE2(config-vrf)#route-target export 1100:1
PE2(config-vrf)#route-target import 1000:1
PE2(config-vrf)#exit
PE2(config)#interface vlan2
PE2(config-if-vlan2)#ip vrf forwarding 1
PE2(config-if-vlan2)#ip address 10.1.5.2 255.255.255.0
PE2(config-if-vlan2)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
PE2(config-ospf)#exit
```

---

## Note

- The import-target and export-target of 200:1 in the Rt attribute of PE2 are for importing and exporting internal VPN routes, the export-target of 1100:1 is for exporting internal VPN routes to the shared VPN, and the import-target of 1000:1 is for importing routes passed by the shared VPN.
- 

### #Configure OSPF on CE2.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 2.2.2.2 0.0.0.0 area 0
CE2(config-ospf)#network 10.1.5.0 0.0.0.255 area 0
CE2(config-ospf)#exit
```

### #Configure VPN instance and OSPF under VPN instance on PE3.

```
PE3(config)#ip vrf vpn-share
PE3(config-vrf)#rd 300:1
PE3(config-vrf)#route-target export 1000:1
PE3(config-vrf)#route-target import 1100:1
PE3(config-vrf)#exit
PE3(config)#interface vlan4
PE3(config-if-vlan4)#ip vrf forwarding vpn-share
PE3(config-if-vlan4)#ip address 10.1.3.1 255.255.255.0
PE3(config-if-vlan4)#exit
PE3(config)#router ospf 200 vrf vpn-share
PE3(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
PE3(config-ospf)#exit
```

---

## Note

- The export-target of 1000:1 in the Rt attribute of PE3 is used to export routes from the local VPN to other VPNs, and the import-target of 1100:1 is used to import routes coming from other VPNs.
- 

#Configure OSPF on CE3.

```
CE2#configure terminal
CE2(config)#router ospf 100
CE2(config-ospf)#network 3.3.3.3 0.0.0.0 area 0
CE2(config-ospf)#network 10.1.3.0 0.0.0.255 area 0
CE2(config-ospf)#exit
```

#After the configuration is complete, view the VPN routing table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 1.1.1.1/32 [110/2] via 10.1.1.1, 04:09:32, vlan2
C 10.1.1.0/24 is directly connected, 04:19:47, vlan2
L 10.1.1.2/32 is directly connected, 04:19:47, vlan2
```

It is indicated the loopback port routing information to CE1 exists in the VPN routing table of PE1.

---

## Note

- Refer to PE1 for the inspection method of PE2 and PE3.
- 

Step 6: Configure the MP-IBGP to use the loopback interface as the peer address; and redistribute routes with each other and the IGP protocol under the VPN instance.

#Configure the MP-IBGP on PE1 to establish BGP neighbors with PE3, enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE1(config)#router bgp 100
PE1(config-bgp)#neighbor 33.33.33.33 remote-as 100
PE1(config-bgp)#neighbor 33.33.33.33 update-source loopback0
PE1(config-bgp)#address-family vpnv4
PE1(config-bgp-af)#neighbor 33.33.33.33 activate
PE1(config-bgp-af)#neighbor 33.33.33.33 send-community extended
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#address-family ipv4 vrf 1
PE1(config-bgp-af)#redistribute ospf 200
PE1(config-bgp-af)#exit-address-family
PE1(config-bgp)#exit
PE1(config)#router ospf 200 vrf 1
PE1(config-ospf)#redistribute bgp 100
PE1(config-ospf)#exit
```

#Configure the MP-IBGP on PE2, establish BGP neighbors with PE3, enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE2(config)#router bgp 100
PE2(config-bgp)#neighbor 33.33.33.33 remote-as 100
PE2(config-bgp)#address-family vpnv4
PE2(config-bgp-af)#neighbor 33.33.33.33 activate
PE2(config-bgp-af)#neighbor 33.33.33.33 send-community extended
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#address-family ipv4 vrf 1
PE2(config-bgp-af)#redistribute ospf 200
PE2(config-bgp-af)#exit-address-family
PE2(config-bgp)#exit
PE2(config)#router ospf 200 vrf 1
PE2(config-ospf)#redistribute bgp 100
PE2(config-ospf)#exit
```

#Configure the MP-IBGP on PE3, establish BGP neighbors with PE1 and PE2, and enable VPNv4 address clustering; and redistribute routes with each other and the IGP protocol under the VPN instance.

```
PE3(config)#router bgp 100
PE3(config-bgp)#neighbor 11.11.11.11 remote-as 100
PE3(config-bgp)#neighbor 11.11.11.11 update-source loopback0
PE3(config-bgp)#neighbor 22.22.22.22 remote-as 100
PE3(config-bgp)#neighbor 22.22.22.22 update-source loopback0
PE3(config-bgp)#address-family vpnv4
```

```

PE3(config-bgp-af)#neighbor 11.11.11.11 activate
PE3(config-bgp-af)#neighbor 11.11.11.11 send-community extended
PE3(config-bgp-af)#neighbor 22.22.22.22 activate
PE3(config-bgp-af)#neighbor 22.22.22.22 send-community extended
PE3(config-bgp-af)#exit-address-family
PE3(config-bgp)#address-family ipv4 vrf vpn-share
PE3(config-bgp-af)#redistribute ospf 200
PE3(config-bgp-af)#exit-address-family
PE3(config-bgp)#exit
PE3(config)#router ospf 200 vrf vpn-share
PE3(config-ospf)#redistribute bgp 100
PE3(config-ospf)#exit

```

Step 7: Check the result.

# View BGP neighbor information on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 all summary
BGP router identifier 11.11.11.11, local AS number 100
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
33.33.33.33   4  100   305   302    2   0  0 04:16:40    2

Total number of neighbors 1

```

The successful establishment of BGP neighbors between PE1 and PE3 can be seen from the fact that the contents of the column State/PfxRcd are shown as numbers (the number of received route prefixes from neighbors).

#View the BGP VPNv4 routing table and the routing table of VPN1 on the PE.

Take PE1 as an example:

```

PE1#show ip bgp vpnv4 vrf 1
BGP table version is 2, local router ID is 11.11.11.11
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
                S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric LocPrf Weight Path
Route Distinguisher: 100:1 (Default for VRF 1)

```

```
[O]*> 1.1.1.1/32    10.1.1.1        2    32768 ?
[B]*>i3.3.3.3/32    33.33.33.33     2    100   0 ?
[O]*> 10.1.1.0/24   0.0.0.0         1    32768 ?
[B]*>i10.1.3.0/24   33.33.33.33     1    100   0 ?
```

```
PE1#show ip route vrf 1
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 1.1.1.1/32 [110/2] via 10.1.1.1, 04:48:39, vlan2
B 3.3.3.3/32 [200/2] via 33.33.33.33, 04:46:00, vlan3
C 10.1.1.0/24 is directly connected, 04:58:53, vlan2
L 10.1.1.2/32 is directly connected, 04:58:53, vlan2
B 10.1.3.0/24 [200/1] via 33.33.33.33, 04:46:00, vlan3
```

It is indicated that there is routing information to CE3 in both the BGP VPNv4 routing table of PE1 and the routing table of VPN1, and there is no routing information to CE2.

#View the routing label table entries and MPLS forwarding table on the PE.

Take PE1 as an example:

```
PE1#show ip route vrf 1 3.3.3.3 detail
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 3.3.3.3/32 [200/0] via 33.33.33.33, label 5120, 01:04:26, vlan3
    10.1.2.2 [2], label 3, vlan3
```

```
PE1#show mpls forwarding-table
```

```
Pro: L - LDP, B - MP-BGP, R - RSVP, M - Mapped-Route, ML - mLDP (ML FEC: Root
address/OT/OV), RM - RSVP P2MP (RM FEC: P2MP ID/TID)
```

```
S - Static Label
```

Pro	Ident	FEC	Inlabel	Outlabel	Outgoing	Next hop
B	1	0.0.0.0/0	5120	/	/	/

It is indicated that the route label information of VPN1 exists in the forwarding table of PE1.

---

 **Note**

- The inspection method on PE2 and PE3 is the same as PE1.
- 

#Ping the loopback ports of CE1 and CE2 on CE3.

```
CE3#ping 1.1.1.1
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 1.1.1.1 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/3/16 ms.
```

```
CE3#ping 2.2.2.2
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 2.2.2.2 , timeout is 2 seconds:
```

```
!!!!
```

```
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

It is indicated that CE3 is able to ping through the loopback ports of CE1 and CE2.

#Ping the loopback port of CE2 on CE1.

```
CE1#ping 2.2.2.2
```

```
Press key (ctrl + shift + 6) interrupt it.
```

```
Sending 5, 76-byte ICMP Echos to 2.2.2.2 , timeout is 2 seconds:
```

```
.....
```

```
Success rate is 0% (0/5).
```

It is indicated that CE1 cannot ping through the loopback port of CE2.

# 80 MPLS OAM

---

## 80.1 MPLS OAM Introduction

The MPLS OAM function is used to implement fault detection and maintenance in MPLS networks, where MPLS LSP Ping/Traceroute are two common means to detect end-to-end LSP connectivity and control plane and data plane consistency.

## 80.2 MPLS OAM Function Configuration

Table 1-2 MPLS OAM Function Configuration List

Configuration Task	
Configure the MPLS OAM Function.	Enable the MPLS OAM Function
Check LSP	MPLS LSP Ping Function
	MPLS LSP Ping Function
	Interactive mode MPLS LSP Ping function
	Interaction Mode MPLS LSP Traceroute Feature

### 80.2.1 Configure the MPLS OAM Function.

#### Configuration Condition

Before configuring the MPLSOAM feature, do the following:

- Configure basic functions of MPLS to ensure that MPLS packets can be sent and received normally.

### Enable the MPLS OAM Function

Table 3-4 Enable the MPLS OAM Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the MPLS OAM Function	<b>mpls oam</b>	Mandatory By default, the MPLS OAM function is not enabled

## 80.2.2 Check LSP

### Configuration Condition

To ensure the validity of the test results, the following tasks need to be completed prior to testing the LSP:

- When using MPLS LSP Ping detection, the MPLS OAM feature needs to be enabled on the Ingress node and Egress node of the LSP.
- When using MPLS LSP Traceroute detection, the MPLS OAM feature needs to be enabled on all nodes on the LSP path.

### MPLS LSP Ping Function

MPLS LSP Ping detects the connectivity of LSPs by sending and receiving Echo Request and Echo Reply packets. The Echo Request packet sent by the Ingress node carries the label corresponding to the arrival of the specified FEC, and the packet is sent to the Egress node through the detected LSP, which processes and returns the Echo Reply packet. If the Ingress node receives an Echo Reply packet without error information, the detected LSP is reachable; if no corresponding Echo Reply packet is received or an Echo Reply packet carrying an error TLV is received, the detected LSP is not reachable.

Table 5-6 MPLS LSP Ping Function

Step	Command	Description
Ping detection of LSP connectivity	<b>ping mpls</b> [ { <b>ipv4</b> <i>prefix-address prefix-mask-length</i> [ <b>destination</b> <i>address-start address-end address-increment</i> ]   <b>vrf</b> <i>vrf-name</i> <b>ipv4</b> <i>prefix-address prefix-mask-length</i> [ <b>destination</b> <i>address-start address-end address-increment</i> ] } [ <b>ttl</b> <i>time-to-live</i> / <b>source</b> <i>source-address</i> / <b>repeat</b> <i>count</i> / <b>timeout</b> <i>seconds</i> / <b>size</b> <i>packet-size</i> / <b>sweep</b> <i>minimum-size maximum-size size-increment</i> / <b>pad</b> <i>pattern</i> / <b>reply-pad-tlv</b> / <b>reply-mode</b> { <b>ipv4</b>   <b>router-alert</b> } / <b>interval</b> <i>msec</i> / <b>exp</b> <i>exp-bits</i> / <b>verbose</b> ] ]	Mandatory

### MPLS LSP Traceroute Function

MPLS LSP Traceroute is used to check the reachability and label consistency of each hop on the LSP path. The Ingress node sends Echo Request packets by increasing the TTL one by one and receives Echo Reply packets returned by each hop on the LSP path, thus discovering the information of each hop on the LSP path until it reaches Egress.

Table 7-8 MPLS LSP Traceroute Function

Step	Command	Description
Detection of reachability and label consistency for each hop on the LSP path	<b>traceroute mpls</b> [ { <b>ipv4</b> <i>prefix-address prefix-mask-length</i> [ <b>destination</b> <i>address-start address-end address-increment</i> ]   <b>vrf</b> <i>vrf-name</i> <b>ipv4</b> <i>prefix-address prefix-mask-length</i> [ <b>destination</b> <i>address-start address-end</i>	Mandatory

Step	Command	Description
	<i>adderss-increment</i> } } [ <b>ttl</b> <i>max-hop-count</i> / <b>source</b> <i>source-address</i> / <b>timeout</b> <i>seconds</i> / <b>reply-pad-tlv</b> / <b>reply-mode</b> { <b>ipv4</b>   <b>router-alert</b> } / <b>exp</b> <i>exp-</i> <i>bits</i> ] ]	

### Interactive mode MPLS LSP Ping function

Table 9-10 Interactive Mode MPLS LSP Ping Function

Step	Command	Description
Enter ping mpls interactive mode	<b>ping mpls</b>	Mandatory
Specify the type of FEC being detected	<b>Target ipv4 or vrf [ipv4]:</b> [ <b>ipv4</b>   <b>vrf</b> ]	Mandatory By default, the FEC type is ipv4
Specify the IPv4 address of the FEC being detected	<b>Target IPv4 address:</b> { <i>prefix-address</i> }	Mandatory
Specify the IPv4 mask length of the FEC being detected	<b>Target mask length [32]:</b> [ <i>prefix-mask-length</i> ]	Optional By default, the IPv4 mask length is 32
Specify the number of times the same MPLS echo request packet is sent repeatedly.	<b>Repeat count [5]:</b> [ <i>count</i> ]	Optional By default, the packet is sent 5 times repeatedly.
Specify the length of the MPLS echo request packet.	<b>Datagram size [120]:</b> [ <i>packet-size</i> ]	Optional By default, the packet length is 120 bytes.

Step	Command	Description
Specify the timeout for MPLS echo request packets.	<b>Timeout in seconds [2]:</b> [ <i>seconds</i> ]	Optional By default, the timeout time is 2 seconds
Specify the interval for sending MPLS echo request packets.	<b>Send interval in msec [0]:</b> [ <i>msec</i> ]	Optional By default, the sending interval of MPLS echo request packet is 0 milliseconds.
Select whether to enable the MPLS OAM function extension option.	<b>Extended command? [no]:</b> [ <i>yes   no</i> ]	Optional By default, the extension option is not enabled.
Specify the starting address for sending MPLS echo request packets with an incremental destination IPv4 address.	<b>Destination address or destination start address [127.0.0.1]:</b> [ <i>address-start</i> ]	Optional By default, the destination address for sending MPLS echo request packets is not incremental and is fixed at 127.0.0.1.
Specify the end address of the MPLS echo request packet sent with an incremental destination IPv4 address.	<b>Destination end address:</b> [ <i>address-end</i> ]	Optional
Specify the address increment value for sending MPLS echo request packets with incremental destination IPv4 addresses.	<b>Destination address increment [0.0.0.1]:</b> [ <i>address-increment</i> ]	Optional By default, the incremental value is 0.0.0.1.
Specify the IPv4 source address of the MPLS echo request packet.	<b>Source address:</b> [ <i>source-address</i> ]	Optional

Step	Command	Description
Specify the value of the EXP field in the MPLS label of the MPLS echo request packet.	<b>EXP bits in mpls header</b> [0]: [ <i>exp-bits</i> ]	Optional By default, the value of the EXP field in the label is 0.
Specify the padding value in the pad TLV of the MPLS echo request packet.	<b>Pad TLV pattern</b> [0xABCD]: [ <i>pattern</i> ]	Optional By default, the padding value in the pad TLV is 0xABCD.
Specifies whether the pad TLV is included in the MPLS echo reply packet.	<b>Reply Pad TLV?</b> [no]: [ <b>yes</b>   <b>no</b> ]	Optional By default, no pad TLV is included in the MPLS echo reply packet.
Set the TTL value of the outermost label of the MPLS echo request packet.	<b>Time To Live</b> [255]: [ <i>time-to-live</i> ]	Optional By default, the TTL value of the outermost label is 255.
Specify the reply mode of the MPLS echo reply packet.	<b>Reply mode (2-ipv4 via udp, 3-ipv4 via udp with router alert))</b> [2]:	Optional By default, the reply mode is 2, i.e., returned as IPv4 UDP packets.
Select whether to display the results of MPLS LSP Ping operations in detail mode.	<b>Verbose mode?</b> [no]: [ <b>yes</b>   <b>no</b> ]	Optional By default, the result of MPLS LSP Ping operation is displayed in abbreviated mode
Select whether to send MPLS echo request packets in incremental length	<b>Sweep range of sizes?</b> [no]: [ <b>yes</b>   <b>no</b> ]	Optional By default, MPLS echo request packets are sent in a fixed packet length

Step	Command	Description
Specify the starting value for sending the length of MPLS echo request packets.	<b>Sweep min size [120]:</b> [ <i>minimum-size</i> ]	Optional By default, the starting value of packet length is 120 bytes
Specify the maximum length of the transmitted MPLS echo request packet.	<b>Sweep max size [18024]:</b> [ <i>maximum-size</i> ]	Optional By default, the maximum value of incremental packet length is 18024 bytes.
Specify the incremental length of the MPLS echo request packet to be sent.	<b>Sweep interval [100]:</b> [ <i>size-increment</i> ]	Optional By default, the length increment value is 100 bytes

#### Interaction Mode MPLS LSP Traceroute Feature

Table 11-12 Interaction Mode MPLS LSP Traceroute Feature

Step	Command	Description
Enter traceroute mpls interactive mode	<b>traceroute mpls</b>	Mandatory
Specify the type of FEC being detected	<b>Target ipv4 or vrf [ipv4]:</b> [ <i>ipv4</i>   <i>vrf</i> ]	Mandatory By default, the FEC type is ipv4
Specify the IPv4 address of the FEC being detected	<b>Target IPv4 address:</b> { <i>prefix-address</i> }	Mandatory
Specify the IPv4 mask length of the FEC being detected	<b>Target mask length [32]:</b> [ <i>prefix-mask-length</i> ]	Optional By default, the IPv4 mask length is 32

Step	Command	Description
Specify the timeout for MPLS echo request packets.	<b>Timeout in seconds [2]:</b> [ <i>seconds</i> ]	Optional By default, the timeout time is 2 seconds
Select whether to enable the MPLS OAM function extension option.	<b>Extended command? [no]:</b> [ <i>yes</i>   <i>no</i> ]	Optional By default, the extension option is not enabled.
Specify the starting address for sending MPLS echo request packets with an incremental destination IPv4 address.	<b>Destination address or destination start address [127.0.0.1]:</b> [ <i>address-start</i> ]	Optional By default, the destination address for sending MPLS echo request packets is not incremental and is fixed at 127.0.0.1.
Specify the end address of the MPLS echo request packet sent with an incremental destination IPv4 address.	<b>Destination end address:</b> [ <i>address-end</i> ]	Optional
Specify the address increment value for sending MPLS echo request packets with incremental destination IPv4 addresses.	<b>Destination address increment [0.0.0.1]:</b> [ <i>address-increment</i> ]	Optional By default, the incremental value is 0.0.0.1.
Specify the IPv4 source address of the MPLS echo request packet.	<b>Source address:</b> [ <i>source-address</i> ]	Optional
Specify the value of the EXP field in the MPLS label of the MPLS echo request packet.	<b>EXP bits in mpls header [0]:</b> [ <i>exp-bits</i> ]	Optional By default, the value of the EXP field in the label is 0.

Step	Command	Description
Specifies whether the pad TLV is included in the MPLS echo reply packet.	<b>Reply Pad TLV? [no]: [ yes   no ]</b>	Optional By default, no pad TLV is included in the MPLS echo reply packet.
Set the TTL value of the outermost label of the MPLS echo request packet.	<b>Time To Live [30]: [ max-hop-count ]</b>	Optional By default, the maximum value of TTL increment for the outermost label is 30.
Specify the reply mode of the MPLS echo reply packet.	<b>Reply mode (2-ipv4 via udp) [2]:</b>	Optional

## 80.3 MPLS OAM Typical Configuration Example

### 80.3.1 Configure LSP Ping

#### Network Requirements

- In MPLS L3VPN networks, the reachability of MPLS LSPs is checked by using LSP Ping.

#### Network Topology

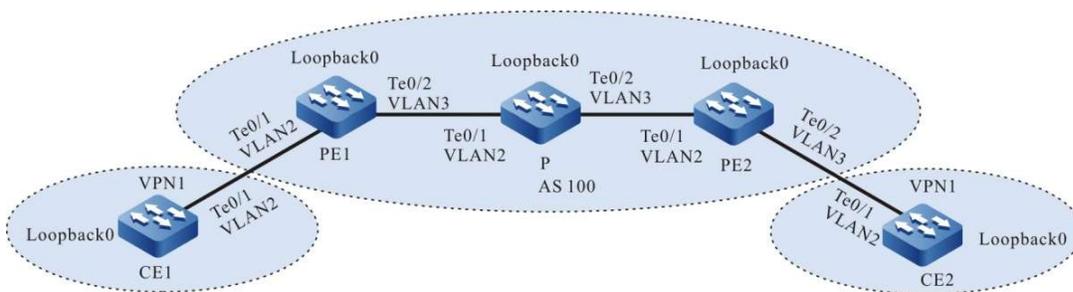

Figure 80-1 Network Topology for Configuring the LSP Ping

Table 13-14 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	10.1.1.1/24	P	Loopback0	22.22.22.22/32
	Loopback0	1.1.1.1/32	PE2	Vlan2	10.1.3.2/24
PE1	Vlan2	10.1.1.2/24		Vlan3	10.1.4.1/24
	Vlan3	10.1.2.1/24		Loopback0	33.33.33.33/32
	Loopback0	11.11.11.11/32	CE2	Vlan2	10.1.4.2/24
P	Vlan2	10.1.2.2/24		Loopback0	2.2.2.2/32
	Vlan3	10.1.3.1/24			

### Configuration Steps

Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode.  
(Omitted)

Step 2: Configure the IP address of each interface, CE1, PE1, P and PE2, CE2 form an MPLS L3VPN network, CE1 and CE2 can interoperate, and the VRF on PE1 is 1. (Omitted. Refer to the relevant section on MPLS L3VPN in the Configuration manual).

Step 3: Configure MPLS OAM on the Ingress node and Egress node of the LSP being detected.

#Configure MPLS OAM on PE1.

```
PE1#configure terminal
PE1(config)#mpls oam
```

#Configure MPLS OAM on PE1.

```
PE2#configure terminal
PE2(config)#mpls oam
```

Step 4: Check the result.

# LSP Ping operation on PE.

Take PE1 as an example:

```
PE1#ping mpls ipv4 33.33.33.33 32
```

Sending 5, 120-byte MPLS Echos to 33.33.33.33/32, TTL is 255, timeout is 2 seconds:

Codes: '!' - success, 'Q' - request not transmitted,  
'.' - timeout, 'U' - unreachable,  
'R' - downstream router but not destination,  
'M' - malformed request,  
'MR' - malformed reply

Press key (ctrl + shift + 6) to abort.

!!!!

Success rate is 100% (5/5), round-trip min/avg/max = 0/0/0 ms.

It is indicated that when PE1 pings PE2's loopback0 interface, PE1 continuously sends five echo request packets to the egress LSR PE2 and successfully receives the echo reply packets from PE2.

```
PE1#ping mpls vrf 1 ipv4 2.2.2.2 32
```

Sending 5, 120-byte MPLS Echos to vrf 1 2.2.2.2/32, TTL is 255, timeout is 2 seconds:

Codes: '!' - success, 'Q' - request not transmitted,  
'.' - timeout, 'U' - unreachable,  
'R' - downstream router but not destination,  
'M' - malformed request,  
'MR' - malformed reply

Press key (ctrl + shift + 6) to abort.

!!!!

Success rate is 100% (5/5), round-trip min/avg/max = 0/3/16 ms.

It is indicated that when PE1 pings CE2's loopback0 interface, PE1 continuously sends five echo request packets to CE2 and successfully receives the echo reply packets from CE2.

---

## Note

- Refer to PE1 for the inspection method on PE2.
-

## 80.3.2 Configure LSP Traceroute

### Network Requirements

- In MPLS L3VPN networks, MPLS LSP reachability is detected and each hop on the LSP path is discovered by using LSP Traceroute.

### Network Topology

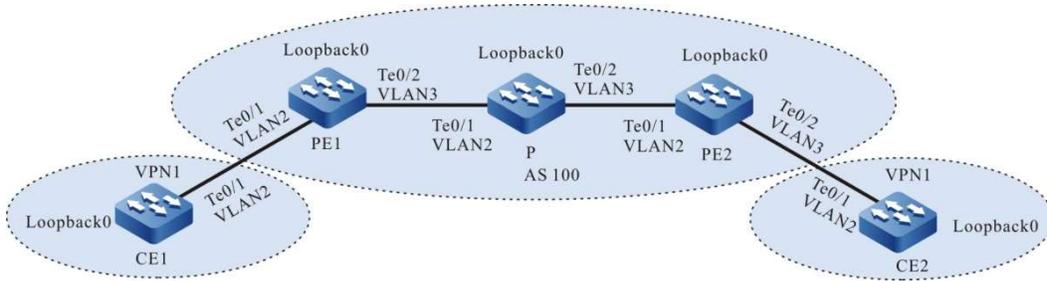

Figure 80-2 Network Topology for Configuring LSP Traceroute

Table 15-16 Interface Mapping Relationships

of equipment	Interface	IP address	of equipment	Interface	IP address
CE1	Vlan2	10.1.1.1/24	P	Loopback0	22.22.22.22/32
	Loopback0	1.1.1.1/32	PE2	Vlan2	10.1.3.2/24
PE1	Vlan2	10.1.1.2/24		Vlan3	10.1.4.1/24
	Vlan3	10.1.2.1/24		Loopback0	33.33.33.33/32
	Loopback0	11.11.11.11/32	CE2	Vlan2	10.1.4.2/24
P	Vlan2	10.1.2.2/24		Loopback0	2.2.2.2/32
	Vlan3	10.1.3.1/24			

### Configuration Steps

- Step 1: Configure the VLAN and add the port to the corresponding VLAN in access mode.  
(Omitted)

Step 2: Configure the IP address of each interface, CE1, PE1, P and PE2, CE1 and CE2 form an MPLS L3VPN network, CE1 and CE2 can interoperate, and the VRF on PE1 is 1. (Omitted. Refer to the relevant section on MPLS L3VPN in the Configuration manual).

Step 3: Configure MPLS OAM on all nodes through which the LSP being detected passes.

#Configure MPLS OAM on PE1.

```
PE1#configure terminal
PE1(config)#mpls oam
```

#Configure MPLS OAM on P.

```
P#configure terminal
P(config)#mpls oam
```

#Configure MPLS OAM on PE2.

```
PE2#configure terminal
PE2(config)#mpls oam
```

Step 4: Check the result.

#LSP Traceroute operation on each PE, CE.

Take PE1 as an example:

```
PE1#traceroute mpls ipv4 33.33.33.33 32
```

```
Tracing MPLS Label Switched Path to 33.33.33.33/32, timeout is 2 seconds:
```

```
Codes: '!' - success, 'Q' - request not transmitted,
        '!' - timeout, 'U' - unreachable,
        'R' - downstream router but not destination,
        'M' - malformed request,
        'MR' - malformed reply
```

```
Press key (ctrl + shift + 6) to abort.
```

```
0 10.1.2.1 mtu 1500 [Labels: 17 EXP: 0]
R 1 10.1.2.2 mtu 1500 [Labels: 3 EXP: 0] 0 ms
! 2 10.1.3.2 0 ms
```

It is indicated the path of the packet forwarded from PE1 to PE2 Loopback0 address and the label information of each hop.

```
PE1#traceroute mpls vrf 1 ipv4 2.2.2.2 32
```

Tracing MPLS Label Switched Path to vrf 1 2.2.2.2/32, timeout is 2 seconds:

Codes: '!' - success, 'Q' - request not transmitted,  
'.' - timeout, 'U' - unreachable,  
'R' - downstream router but not destination,  
'M' - malformed request,  
'MR' - malformed reply

Press key (ctrl + shift + 6) to abort.

```
0 10.1.2.1 mtu 1500 [Labels: 17/5120 EXP: 0/0]
R 1 10.1.2.2 mtu 1500 [Labels: 3/5120 EXP: 0/0] 0 ms
! 2 10.1.3.2 0 ms
```

It is indicated the path of the packet forwarded from PE1 to CE2 Loopback0 address and the label information of each hop.

---

## Note

- Refer to PE1 for the inspection method on PE2.
- 

# 81 ARP Check

---

## 81.1 Overview

ARP Check is used to check the legality of ARP packets so as to prevent illegal ARP packets from passing and improve network security.

The legality of ARP packets is checked according to the entries bound to the port, including the two types below:

Static binding entries manually configured;

Dynamic binding entries, dynamically generated by the valid entries of DHCP Snooping function and 802.1 function.

The specific detection principle of ARP Check is shown below:

For the ARP packets received by the port, if the IP address of sending end and source MAC address fully match the entries bound to the ARP Check of the port upon check, these ARP packets are legal and forwarded; otherwise, they are illegal and discarded.

## 81.2 ARP Check Function Configuration

Table 81-1 ARP Check Function Configuration List

Configuration Task	
Enable ARP Check Function of the Port	Enable ARP Check Function of the Port
Configure Binding Static Entries of ARP Check	Configure Binding Static Entries of ARP Check
Configure to Reinstall the Entries Failed in Writing Hardware	Configure to Reinstall the Entries Failed in Writing Hardware

### 81.2.1 Enable ARP Check Function of the Port

#### Configuration Condition

None

#### Enable ARP Check Function of the Port

After enabling the ARP Check function of the port, ARP Check will dynamically obtain entries from the DHCP Snooping database and write ACL hardware.

Table 1 Configuring Enabling ARP Check Function of the Port

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable ARP check function of the port	<b>arp-check enable</b>	Mandatory  By default, the ARP Check function of the port is disabled.

## 81.2.2 Configure Binding Static Entries of ARP Check

### Configuration Condition

None

### Configure Binding Static Entries of ARP Check

Table 81-3 Configuring Binding Static Entries of ARP Check

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Binding Static Entries of ARP Check	<b>arp-check binding</b> <i>mac-address ip-address</i> <b>rate limit-value</b>	Mandatory  By default, no static binding entry of ARP Check is configured.

### 81.2.3 Configure to Reinstall the ARP Check Entries Failed in Writing Hardware

#### Configuration Condition

None

#### Configure to Reinstall the ARP Check Entries Failed in Writing Hardware

Table 81-4 Configuring to Reinstall ARP Check Entries Failed in Writing Hardware

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
Configure to reinstall the entries failed in writing hardware.	<b>arp-check install</b>	Mandatory By default, the port doesn't automatically install the hardware entries failed in writing.

## 81.2.4 ARP Check Monitoring and Maintaining

Table 81-5 ARP Check Monitoring and Maintaining

Command	Description
<b>show arp-check</b> [ <b>active</b>   <b>brief</b>   <b>inactive</b>   <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	A command used to show the information in ARP Check entries

## 81.3 Typical Configuration Example of ARP Check

### 81.3.1 Configure Basic Functions of ARP Check

#### Network Requirements

- PC1 and PC2 access IP network through the Device;
- Configure the basic functions of ARP Check so that PC1 instead of PC2 can normally access the IP Network.

#### Network Topology

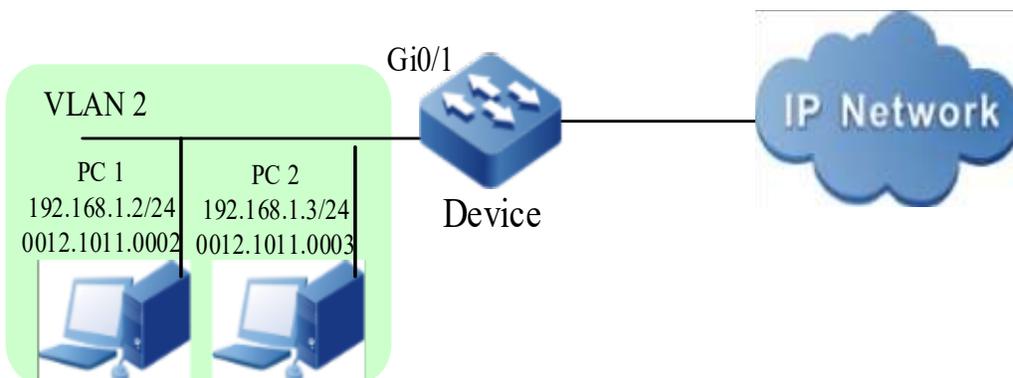

Figure 1 Network Topology for Configuring Basic Functions of ARP Check

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 2: Configure ARP Check function on Device.

#Enable the ARP Check function on port gigabitethernet0/1, and configure ARP Check binding entries with MAC address of 0012.1011.0002 and IP address of 192.168.1.2.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#arp-check enable
Device(config-if-gigabitethernet0/1)#arp-check binding 0012.1011.0002 192.168.1.2 rate 10
Device(config-if-gigabitethernet0/1)#exit
```

Step 3: Check the result.

#View ARP Check-related configuration information.

```
Device#show arp-check brief
-----
Interface Name  Status  Binding Table
-----
gi0/1          Enable  Yes
```

It is indicated that the port gigabitethernet0/1 has enabled the ARP Check function and has ARP Check entries.

# View ARP Check binding entries of the port.

```
Device#show arp-check interface gigabitethernet0/1
-----ARP Check Table-----
Interface-Name Status MAC-Address IP-Address Rate PolicySource SetHardware
-----
gi0/1          enable 0012.1011.0002 192.168.1.2 10 STATIC active
total number: 1
```

#PC1 instead of PC2 can normally access the IP Network.

### 81.3.2 Combination of ARP Check with DHCP Snooping

#### Network Requirements

- PC1 which uses static IP address and PC2 which obtains IP address through DHCP access the IP Network through the Device;
- Configure DHCP Snooping and ARP Check function for the Device so that PC2 instead of PC1 can normally access the IP Network.

#### Network Topology

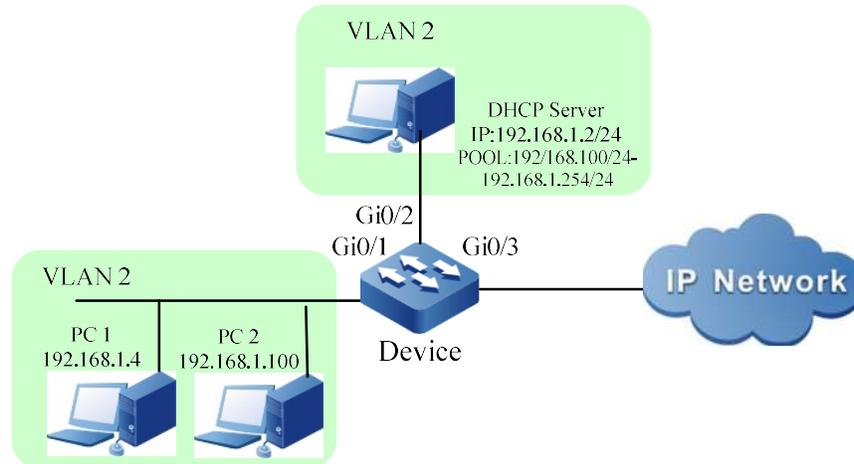

Figure 2 Network Topology for Combination of ARP Check and DHCP Snooping

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of the ports gigabitethernet0/1, gigabitethernet0/2 and gigabitethernet0/3 as Access, permitting the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/3
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

Step 2: Configure DHCP Snooping function on Device.

#Enable the DHCP Snooping function and configure gigabitethernet0/2 as a trusted port.

```
Device(config)#dhcp-snooping
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dhcp-snooping trust
Device(config-if-gigabitethernet0/2)#exit
```

Step 3: Configure ARP Check function on Device.

#Enable the ARP Check function on the port gigabitethernet0/1.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#arp-check enable
Device(config-if-gigabitethernet0/1)#exit
```

Step  
4: Check the result.

#After PC2 successfully obtains the IP address, view the dynamic entries of DHCP Snooping on the Device.

```
Device#show dhcp-snooping database
dhcp-snooping database:
database entries count:1
database entries delete time :300
-----
macAddr      ipAddr      transtion-id  vlan  interface      leaseTime(s)  status
0013.0100.0001 192.168.1.100 2          2    gi0/1          107990        active
-----
```

#View ARP Check binding entries of the port gigabitethernet0/1.

```
Device#show arp-check interface gigabitethernet0/1
-----ARP Check Table-----
Interface-Name  Status  MAC-Address  IP-Address  Rate  PolicySource  SetHardware
-----
gi0/1          enable  0013.0100.0001 192.168.1.100 16  DHCPSP      active
total number: 1
```

#PC2 instead of PC1 can normally access the IP Network.

### 81.3.3 Combination of ARP Check with 802.1X

#### Network Requirements

- PC1 accesses IP network through the Device which uses 802.1X access control;
- RADIUS authentication is used as an authentication method;
- PC1 cannot access network without successful authentication. It is permitted to access the IP Network once it passes the authentication;
- After the successful authentication, users can generate ARP Check entries to check the legality of their ARP packets.

#### Network Topology

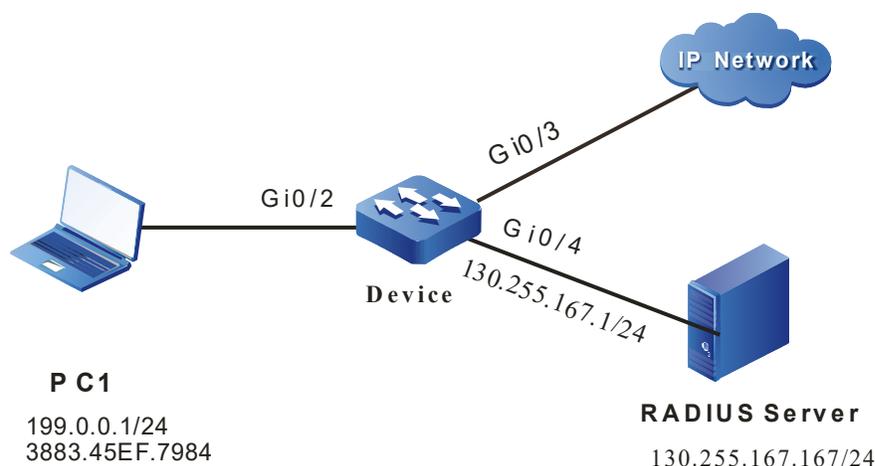

Figure 3 Network Topology for Combination of ARP Check and 802.1X

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN2~VLAN4 on Device.

```
Device#configure terminal
Device(config)#vlan 2-4
Device(config)#exit
```

#Configure the link type of the port gigabitethernet 0/2 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport access vlan 2
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of the ports gigabitethernet 0/3~gigabitethernet 0/4 on the Device as Access, allowing the services of VLAN3~VLAN4 to pass. (Omitted)

Step 2: Configure interface IP address for Device.

#Configure the IP address of VLAN4 as 130.255.167.1/24.

```
Device(config)#interface vlan 4
Device(config-if-vlan4)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan4)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on Device, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
```

User manual

Release 1.0 01/2022

```
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure 802.1X authentication.

#Enable 802.1X authentication on the port and configure the authentication mode as Macbased.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x port-control enable
Device(config-if-gigabitethernet0/2)# authentication port-method macbased

Device(config-if-gigabitethernet0/2)#exit
```

Step 6: Configure ARP Check function on the Device.

#Enable the ARP Check function on the port gigabitethernet0/2.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#arp-check enable
Device(config-if-gigabitethernet0/2)#exit
```

Step 7: Authentication succeeds.

#Before passing the authentication, PC1 cannot access the network.

#After PC1 users initiate authentication and the authentication succeeds, PC1 can access the IP network.

```
Device#show dot1x user
-----
NO 1 : MAC_ADDRESS= 3883.45ef.7984 STATUS= Authorized USER_NAME= admin
      VLAN= 2 INTERFACE= gi0/2 USER_TYPE= DOT1X
      AUTH_STATE= AUTHENTICATED BACK_STATE= IDLE IP_ADDRESS= 199.0.0.1
      IPV6_ADDRESS= Unknown

      Online time: 0 week 0 day 0 hours 0 minute 51 seconds

Total: 1 Authorized: 1 Unauthorized/guest/critical: 0/0/0 Unknown: 0
```

Step 8: Check the result.

```

Device#show arp-check interface gigabitethernet0/2
-----ARP Check Table-----
Interface-Name Status MAC-Address IP-Address Rate PolicySource SetHardware
-----
gi0/2          enable 3883.45ef.7984 199.0.0.1 16 DOT1X active

total number: 1

```

#If the APR packets and entries sent by PC1 can be fully matched, they can be normally forwarded and limited in speed; otherwise, they will be directly discarded.

# 82 CPU Protection

---

## 82.1 Overview

There are lots of protocol packets in the device that need to be sent to CPU for processing and we need to specify the queue for each kind of protocol packets. The CPU protection function classifies the protocol packets sent to CPU and the packets enter different CPU queues according to the different protocol priorities. We can set the rate limitation of each queue.

The device totally has eight queues, numbering from 0 to 7. They adopt the strict priorities. The smaller the number is, the lower the priority is. That is to say, the priority of queue 0 is the lowest and the priority of queue 7 is the highest. The packets in the queue with the high priority are earlier sent to the CPU for processing than the packets in the queue with low priority. We can specify them to different priorities of queues according to the importance of each kind of packets, ensuring that the important packets are first sent to the CPU for processing.

Meanwhile, the device can perform the rate limitation for the packets entering each CPU queue, preventing the vicious protocol packet attack in the network from causing the too high CPU utilization of the device and resulting in the abnormal running of the device.

## 82.2 Configure CPU protection function

Table 82 CPU Protection Function Configuration List

Configuration Task	
Configure CPU Queue of Protocol Packets	Configure CPU Queue of Protocol Packets
Configure Rate Limitation of CPU Queue	Configure Total Rate Limitation of All CPU Queues
	Configure Rate Limitation of Each CPU Queue
Make Users' Custom Protocol Packets Delivered to CPU for Processing	Configure the Match Rules of Delivering Users' Custom Protocol Packets to CPU for Processing
	Configure the Method of Delivering Users' Custom Protocol Packets to CPU for Processing

### 82.2.1 Configure CPU Queue of Protocol Packets

#### Configuration Condition

None

#### Configure CPU Queue of Protocol Packets

The device has 8 CPU queues. Users can configure to make different protocol packets enter different queues. The device can deliver protocol packets to CPU for processing by the priority of queues from high to low according to user's configuration. The protocol packets in the queue with a high priority will be first delivered to CUP for processing. Users can specify important packets to enter the queue with a high priority so that they can be first delivered to CUP for processing. By default, different protocol packets enter default CPU queues or the specified CPU queue through a command.

Table 1 Configuring CPU Queue of Protocol Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure CPU Queue of Protocol Packets	<b>cpu-packet protocol cos</b> <i>cos-value</i>	Mandatory By default, different protocol packets enter their default CPU queue.

## 82.2.2 Configure the Traffic rate Limitation of Protocol Packets

### Configuration Condition

None

### Configure the Committed Information Rate and Committed Burst Size of Protocol Packets

The device can monitor and control the traffic of vbrp, vrrp, and vrrp3 protocol packets. Users can limit the traffic size of specific protocol packets by configuring committed information rate and committed burst size. This can prevent a large number of continuous bursts of business data which will make the network more congested, or even network congestion to cause abnormal business.

Table 2 Configuring Committed Information Rate and Committed Burst Size of Protocol Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the committed information rate and committed burst size of protocol packets	<b>cpu-packet { vbrp   vrrp   vrrp3 } cir cir-value cbs</b> <i>cbs-value</i>	Mandatory By default, default committed information rate and committed burst size are configured for different protocol packets.

## 82.2.3 Configure Total Rate Limitation of All CPU Queues

### Configuration Condition

None

### Configure Total Rate Limitation of All CPU Queues

Malicious network attack will make the device unable to operate due to a very high CPU utilization rate. In order to prevent this, users can configure the total rate limitation of all CPU queues. If any attack occurs, and the total packet rate of all the queues exceeds the total rate limitation, the packets will be discarded to avoid a very high CPU utilization rate.

Table 3 Configuring Total Rate Limitation of All CPU Queues

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Total Rate Limitation of All CPU Queues	<b>cpu-packet cos global pps</b> <i>pps-value</i>	Mandatory By default, the total rate limit of all queues is 2000PPS.

### 82.2.4 Configure Rate Limitation of Each CPU Queue

#### Configuration Condition

None

#### Configure Rate Limitation of Each CPU Queue

Malicious network attack will make the device unable to operate due to a very high CPU utilization rate. In order to prevent this, users can configure the rate limitation of each CPU queue. If any attack occurs, and the packet rate in the queue exceeds the rate limit of this queue, the packets will be discarded to avoid a very high CPU utilization rate. By default, different rate limits are set for different CPU queues. Users may modify the rate limit as needed.

Table 4 Configuring Rate Limitation of Each CPU Queue

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure Rate Limitation of Each CPU Queue	<b>cpu-packet cos</b> <i>cos-value</i> <b>pps</b> <i>pps-value</i>	Mandatory By default, each queue has a unique rate limit.

## 82.2.5 Make Users' Custom Protocol Packets Delivered to CPU for Processing

### Configuration Condition

None

### Configure the Match Rules of Delivering Users' Custom Protocol Packets to CPU for Processing

The match rules of delivering users' custom protocol packets to CPU for processing must be used with the method of delivering users' custom protocol packets to CPU for processing. It will conduct corresponding action processing for the packets meeting the match rules. The match rules include `dst-mac` (destination MAC address), `ingress` (interface), `vlan-id` (VLAN number), `ether-type` (ether type), IP (IPV4), IPV6, 0x0000 (custom Ethernet type), `ip-protocol` (IP protocol, such as IGMP and TCP), `dst-ip` (destination IP), `src-port` (source port), and `dst-port` (destination port). Users can combine the match rules mentioned above as needed.

Table 5 Configuring the Match Rules of Delivering Users' Custom Protocol Packets to CPU

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the rules of matching users' custom protocol packets	<b>cpu-packet user-define</b> <i>user-id match</i> { <b>dst-mac</b> <i>dst-mac</i>   <b>ether-type</b> { <i>ether-type-value</i>   <b>ip</b> [ <b>dst-ip</b> <i>dst-ip-address</i>   <b>dst-mac</b> <i>dst-mac</i>   <b>ingress</b> <i>ingress-interface</i>   <b>ip-</b> <b>protocol</b> <i>protocol-type</i>   <b>vlan-id</b> <i>vlan-id</i> [ <b>dst-ip</b> <i>dst-</i> <i>ip-address</i>   <b>ingress</b> <i>ingress-interface</i>   <b>ip-</b>	Mandatory By default, there are no match rules.

Step	Command	Description
	<pre> <b>protocol</b> <i>protocol-type</i> ] ]   <b>ipv6</b> [ <b>dst-ip6</b> <i>dst-ipv6-</i> <i>address</i>   <b>dst-mac</b> <i>dst-mac</i> / <b>ingress</b> <i>ingress-interface</i>   <b>ip-protocol</b> <i>protocol-</i> <i>type</i>   <b>vlan-id</b> <i>vlan-id</i> [ <b>dst-</b> <b>ip</b> <i>dst-ip-address</i>   <b>ingress</b> <i>ingress-interface</i>   <b>ip-</b> <b>protocol</b> <i>protocol-type</i> ] ] }   <b>ingress</b> <i>ingress-interface</i>   <b>vlan-id</b> <i>vlan-id</i> [ <b>ingress</b> <i>ingress-interface</i> ] }</pre>	

### Configure the Method of Delivering Users' Custom Protocol Packets to CPU for Processing

The match rules of delivering users' custom protocol packets to CPU for processing must be used with the method of delivering users' custom protocol packets to CPU for processing. It will conduct corresponding action processing for the packets meeting the match rules. For example, if the configuration method is copy, the original forwarding process of the packets will not be changed. Instead, the packets will be delivered to CPU for processing by copying. If the configuration method is drop, the packets are not permitted to be delivered to CPU for processing, but discarded. If the configuration method is remark, the priority of delivering packets to CPU for processing is modified. If the configuration method is trap, the original forwarding process of packets is changed. The packets are delivered to CPU for processing instead of being forwarded.

Table 6 Configuring Method of Delivering Users' Custom Protocol Packets to CPU

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Method of Delivering Users' Custom Protocol Packets to CPU for Processing	<pre> <b>cpu-packet user-define</b> <i>user-id</i> <b>action</b> { <b>drop</b>   { <b>copy</b>   <b>remark</b>   <b>trap</b> } <b>cos</b> <i>cos-value</i> }</pre>	<p>Mandatory</p> <p>By default, no action processing is conducted for the packets meeting the match rules.</p> <p>When the method of delivering users' custom</p>

Step	Command	Description
		protocol packets to CUP for processing is copy, remark or trap, the cos value can be specified.

## 82.2.6 CPU Protection Monitoring and Maintaining

Table 7 CPU Protection Monitoring and Maintaining

Command	Description
<b>show cpu-packet protocol-config-table</b>	Show the configuration information of delivering all protocol packets to CPU
<b>show cpu-packet cos</b>	Show current and default queue information of delivering protocol packets to CPU for processing
<b>show cpu-packet pps</b>	Show the rate limitation information of each CPU queue
<b>show cpu-packet udf-table</b>	Show the information of users' all custom ACL entries set through CPU protection module

## 82.3 Typical Configuration Example of CPU Protection

### 82.3.1 Configure Basic Functions of CPU Protection

#### Network Requirements

- PC can access IP Network through the Device.
- Make DHCP packets enter queue 5 on the Device so that the DHCP protocol packets can be first processed by CPU.
- Limit the rate of the ARP queue on the Device so that the packets with a low priority

can be normally processed even if the Device has a very high CPU utilization rate.

## Network Topology

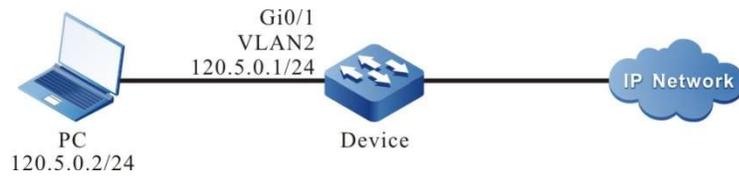

Figure 82 Network Topology for Configuring Basic Functions of CPU Protection

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure CPU queue of DHCP packets.

#Make DHCP packets enter queue 5 on the Device.

```
Device#configure terminal
Device(config)#cpu-packet dhcp cos 5
```

Step 4: Configure rate limitation of CPU queue.

#Configure the rate limit of CPU queue as 100pps on the Device.

```
Device(config)#cpu-packet cos 1 pps 100
```

Step 5: Check the result.

#View the CPU queue of each protocol packet on the Device.

```
Device#show cpu-packet cos
Type          Current-CoS  [Default-CoS]
-----
random        0            [0]
ipv6-all     0            [0]

7    100          [100]
TOTAL 2000      [2000]

```

It is indicated that the rate limit of queue 1 where ARP is located on the Device is changed from the default 250pps to 100pps.

### 82.3.2 Configure Custom Rules of CPU Protection

#### Network Requirements

- Device is directly connected to PC1 and PC2 respectively.
- Configure the custom rules of CPU protection on the Device, and make the packets meeting the match conditions delivered to CPU for processing through trap and enter corresponding queue.

#### Network Topology

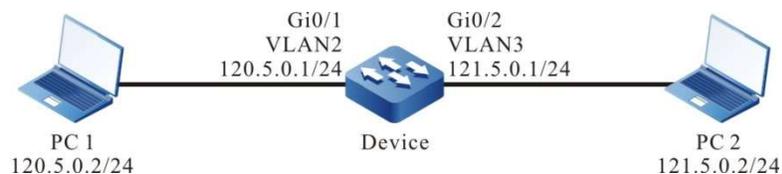

Figure 1 Network Topology for Configuring Custom Rules of CPU Protection

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure custom rules of CPU protection.

#Configure the custom rules of CPU protection, and make the packets with a destination address of 121.5.0.2 delivered to CPU for processing in trap mode and set the COS value as 5.

```
Device#configure terminal
Device(config)#cpu-packet user-define 1 match ether-type ip dst-ip host 121.5.0.2
Device(config)#cpu-packet user-define 1 action trap cos 5
```

Step 4: Check the result.

#View custom rules on the Device.

```
Device#show cpu-packet udf-table
user-define 1
ether-type: 0x0800(IPv4)
dst-ip: host 121.5.0.2
location: global
valid: yes
action: trap
CoS: 5
```

#When PC1 accesses PC2, the custom rules of CPU protection take effect. The packets with a destination address of 121.5.0.2 on the Device are delivered to CPU for processing in trap mode and enter queue 5.

---

### Note

- Please see this configuration when the custom rules match other conditions and execute other methods.
-

# 83 Port Security

---

## 83.1 Overview

### 83.1.1 Introduction

Port security is a security mechanism used to control the device assessed to the network. Generally applied in the access layer, it can limit the host using device ports and permits some specific hosts to access the network only.

The port security function flexibly binds four elements of the user, i.e. MAC address, IP address, VLAN ID, and port number, to prevent illegal users from accessing the network. This can ensure the network data are secure and valid users have enough bandwidth.

### 83.1.2 Port Security Rules

Port security rules can be classified into four types:

**MAC rules:** They control whether the host can communicate according to its MAC address. Their binding methods include MAC binding, MAC+VLAN binding, MAC+IP binding, and MAC+IPv6 binding;

**IP rules:** They control whether the host can communicate according to its IP address. IP rules can be bound to a single IP address or an IP address segment;

**IPv6 rules:** They control whether the host can communicate according to its IPv6 address. IPv6 rules can be bound to a single IPv6 address or an IPv6 address segment;

**MAX rules:** They control the communication of the host by limiting the number of MAC address entries that the port can freely learn. They don't include the legal MAC address entries generated by MAC rules, IP rules and IPv6 binding;

**STICKY rules:** They control whether the host can communicate according to its MAC address. Their binding methods include MAC binding, MAC+VLAN binding, MAC+IP binding, and MAC+IPv6 binding. STICKY rules can be both automatically learned and manually configured. They are saved in running configuration. If the running configuration is saved prior to restarting the device, these STICKY rules can take effect automatically after the device is restarted. When the STICKY function is enabled under the port and the

STICKY learning mode is MAC, the dynamic MAC entries learned by the MAX rules will be transformed into STICKY rules and saved in the running configuration;

VOICE VLAN rules: They control the communication of the host by identifying whether the MAC address belongs to the OUI configured by VOICE-VLAN. They don't include the legal MAC address entries generated by MAC rules, IP rules and IPv6 binding.

### 83.1.3 Working Principle of Port Security

If only port security is enabled, the port security will discard all the packets received on the port. The port security rules are triggered by the ARP packets and IP packets of the terminal device. When the device receives the ARP packets and IP packets, the port security extracts packet information from them, and matches them with the configured rules. The matching order is shown below: MAC rules, STICKY rules, IP rules, and MAX rules. It controls the layer-2 forwarding table of the port according to the matching result so as to control the port's behavior of forwarding packets. If the packets that match MAX rules or STICKY rules are legal, they will be forwarded. For the packets that match MAC rules or IP rules, if the action performed by the rule on the packet is permit, then the packet is legal and will be forwarded; otherwise, the packet is illegal and will be discarded.

For the MAC rules and IP rules with the action of permit, after they take effect, their corresponding MAC address is written into the layer-2 forwarding table so that the packets matching the rules can be forwarded in layer 2. For the MAC rules and IP rules with the action of reject, their corresponding MAC is not written into the layer-2 forwarding table, and the packets need to be discarded through port security.

After MAX rules and STICKY rules take effect, they are written into the MAC address entries to form valid entries so that the packets can be forwarded in layer 2. IPv6 packets are processed in similar ways.

## 83.2 Port Security Function Configuration

Table 83 Basic Function Configuration List of Port Security

Configuration Task	
Configure Basic Functions of Port Security	Enable Port Security Function
Configure Port Security Rules	Configure MAC Rules
	Configure IP Rules
	Configure IPv6 Rules
	Configure MAX Rules
	Configure STICKY Rules

Configuration Task	
	Configure VOICE VLAN Rules
Configure STICKY Rules Learning Mode	Configure STICKY Rules Learning Mode
Configure Static MAC Address Aging Function	Enable Static MAC Address Aging Function
	Configure Static MAC Address Aging Time
Configure Processing Mode After Receiving Illegal Packets	Configure Processing Mode After Receiving Illegal Packets
Configure Log Sending Interval After Receiving Illegal Packets	Configure Log Sending Interval After Receiving Illegal Packets
Configure Port Security to Use ACL Function	Configure Port Security to Use ACL Function

### 83.2.1 Configure Basic Functions of Port Security

In the various configuration tasks of port security, you must first enable port security so that the configuration of the other function features can take effect.

#### Configuration Condition

None

#### Enable Port Security Function

After port security is enabled, if no port security rule is configured, the port cannot learn MAC address.

Table 83 Configuring Basic Functions Port Security

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable Port Security Function	<b>port-security enable</b>	Mandatory  By default, the port security function is not enabled.

---

### Note

- The IP rules and MAX rules of port security cannot be used with 802.1x on the same port.
  - The IP rules and MAX rules of port security cannot be used with MAC address authentication on the same port.
  - Port security cannot be used with the secure channel authentication function on the same port.
  - Port security cannot be used with DAI (Dynamic ARP Inspection) on the same port.
- 

## 83.2.2 Configure Port Security Rules

### Configuration Condition

Before configuring port security rules, ensure that:

- Enable the port security function.

### Configure MAC Rules

To control the communication of a terminal with MAC address, users may use MAC rules. The packets of the rules matching the action of permit can be forwarded, while those of the rules matching the action of reject will be discarded.

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure MAC rules with the action of permit	<b>port-security permit mac-address</b> <i>mac-address-value</i> [ <b>desc</b> <i>security-rule-description</i>   <b>ip-address</b> <i>ip-address-value</i> [ <b>desc</b> <i>security-rule-description</i> ]   <b>ipv6-address</b> <i>ipv6-address-value</i> [ <b>desc</b> <i>security-rule-description</i> ]   <b>vlan-id</b> <i>vlan-id</i> [ <b>desc</b> <i>security-rule-description</i> ] ]	At least one option must be selected.  By default, MAC rules are not configured under the port.
Configure MAC rules with the action of reject	<b>port-security deny mac-address</b> <i>mac-address-value</i> [ <b>ip-address</b> <i>ip-address-value</i>   <b>ipv6-address</b> <i>ipv6-address-value</i>   <b>vlan-id</b> <i>vlan-id</i> ]	

## Configure IP Rules

To control the communication of a terminal with IP address, users may use IP rules. The packets of the rules matching the action of permit can be forwarded, while those of the rules matching the action of reject will be discarded.

Table 2 Configuring IP Rules

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure IP rules with the action of permit	<b>port-security permit ip-address</b> <i>ip-address-value</i> [ <b>to</b> <i>ip-address-value</i> ]	At least one option must be selected.
Configure IP rules with the action of reject	<b>port-security deny ip-address</b> <i>ip-address-value</i> [ <b>to</b> <i>ip-address-value</i> ]	By default, IP rules are not configured under the port.

### Configure IPv6 Rules

To control the communication of a terminal with IPv6 address, users may use IP rules. The packets of the rules matching the action of permit can be forwarded, while those of the rules matching the action of reject will be discarded.

Table 3 Configuring IPv6 Rules

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure IPv6 rules with the action of permit	<b>port-security permit ipv6-address</b> <i>ipv6-address-value</i> [ <b>to</b> <i>ipv6-address-value</i> ]	At least one option must be selected.  By default, IPv6 rules are not configured under the port.
Configure IPv6 rules with the action of reject	<b>port-security deny ipv6-address</b> <i>ipv6-address-value</i> [ <b>to</b> <i>ipv6-address-value</i> ]	

### Note

Port security provides secure access in the data link layer. For the IPv6 rules currently supported like MAC+IPv6 and IPv6, once corresponding valid entries are generated, subsequent packets can be normally forwarded only if they match the MAC+VLAN entries that have been generated. Their IPv6 addresses are not checked.

### Configure MAX Rules

Under the port where port security function has been enabled, if users hope the terminal accessed can communicate event if it doesn't match the MAC rules and IP rules, they can configure MAX rules which will limit the number of terminals permitted to be access.

Table 4 Configuring MAX Rules

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure MAX Rules	<b>port-security maximum</b> <i>maximum-number</i>	Mandatory  By default, MAX rules permit the number of MAC addresses learned to be 0.

---

### Note

- The actual number of dynamic addresses learned by the MAX rules is limited by the number of ports, VLANs, and system MAC addresses.
- 

### Configure STICKY Rules

If users wish the MAC address and VLAN information corresponding to the terminal permitted by MAX rules are saved in the configuration, they can enable the STICKY function on the device so that the entries learned by the device through MAX rules can be transformed into STICKY rules. Upon completion of the transformation, the number of MAX rules can be adjusted by the number of current STICKY rules so that only the terminals that match STICKY rules can communicate. Then, the device can automatically learn the MAC address of the terminal accessed, transform it into STICKY rules, and save them in the configuration without manually configuring MAC rules.

Table 5 Configuring STICKY Rules

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure MAX Rules	<b>port-security maximum</b> <i>maximum-number</i>	Mandatory  By default, the number of dynamic MAC addresses that MAX rules permit to learn is 0. STICKY rules can be configured only after the number of MAX rules is configured.
Enable the STICKY function	<b>port-security permit mac-address sticky</b>	Mandatory  By default, the STICKY function is not enabled. STICKY rules can be configured only after the STICKY function is enabled.
Configure STICKY Rules	<b>port-security permit mac-address sticky</b> [ <i>mac-address-value</i> [ <b>desc</b> <i>security-rule-description</i> / <b>vlan-id</b> <i>vlan-id</i> [ <b>desc</b> <i>security-rule-description</i> ] ]   <b>ip-address</b> <i>ip-address-value</i> [ <b>desc</b> <i>security-rule-description</i> ]   <b>ipv6-address</b>	Mandatory  By default, STICKY rules are not configured under the port.

Step	Command	Description
	<code>ipv6-address-value [ desc security-rule-description ] ] ]</code>	

### Configure VOICE VLAN Rules

Under the port where port security function has been enabled, if users hope that the terminal accessed can communicate event if it doesn't match the VOICE-VLAN packets of MAC rules and IP rules, and that it is not limited by the number of addresses of MAX rules, they can configure VOICE VLAN rules which will permit all the packets of OUI configured for VOICE-VLAN by OUI to pass.

Table 83 Configuring VOICE VLAN Rules

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure VOICE VLAN Rules	<b>port-security permit voice vlan</b>	Mandatory  By default, VOICE VLAN rules are not configured under the port.

### Note

- The source MAC permitted by voice vlan rules comes from the OUI configured by

---

VOICE-VLAN.

- After MAX rules are enabled, voice vlan rules will not take effect.
- 

### 83.2.3 Configure STICKY Rules Learning Mode

#### Configuration Condition

Before configuring STICKY rules learning mode, ensure that:

- Enable the port security function.

#### Configure STICKY Rules Learning Mode

If users wish the STICKY rules learning is conducted by MAC or AC+VLAN, the STICKY rules learning mode can be configured as MAC; if users wish the STICKY rules learning is conducted by MAC+IP, the STICKY rules learning mode can be configured as MAC+IP.

Table 83 Configuring STICKY Rules Learning Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure STICKY Rules Learning Mode	<b>port-security permit mac-address sticky mode { mac   mac-ip }</b>	Mandatory By default, the STICKY rules learning mode is MAC.

## 83.2.4 Configure Static MAC Address Aging Function

### Configuration Condition

Before configuring the static MAC address aging function, ensure that:

- Enable the port security function.

### Enable Static MAC Address Aging Function

In order to detect whether the terminal corresponding to the valid entries of MAC rules or IP rules is online, the static MAC address aging function can be enabled. After the static MAC address aging function is enabled, if the terminal is checked offline, the valid entries corresponding to this terminal will be deleted so that the chip resources can be released.

Table 6 Enabling Static MAC Address Aging Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable Static MAC Address Aging Function	<b>port-security aging static</b>	Mandatory By default, the static MAC address aging function is closed.

### Configure Static MAC Address Aging Time

Users can configure a reasonable aging time based on the actual network environment. In general applications, keep the default value.

Table 7 Configuring Static MAC Address Aging Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Static MAC Address Aging Time	<b>port-security aging time</b> <i>time-value</i>	Mandatory  By default, the static MAC address aging time is 1 minute.

### 83.2.5 Configure Processing Mode After Receiving Illegal Packets

#### Configuration Condition

Before configuring the processing mode when illegal packets are received, ensure that:

- Enable the port security function.

#### Configure Processing Mode After Receiving Illegal Packets

Port security provides three processing modes for illegal packets, i.e. protect, restrict, and shutdown. Users can select them according to their requirements for security. The specific functions of these three processing modes are shown below:

- **Protect:** Discard the illegal packets after receiving them;

- **Restrict:** Discard the packets and trap the information to network management after receiving them;
- **Shutdown:** Discard the packets, close the port which receives them, and trap the information to network management after receiving them.

Table 8 Configuring Processing Mode After Receiving Illegal Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the processing mode of illegal packets	<b>port-security violation</b> { <b>protect</b>   <b>restrict</b>   <b>shutdown</b> }	Mandatory By default, the processing mode of port security after receiving illegal packets is <b>protect</b> .

### 83.2.6 Configure Log Sending Interval After Receiving Illegal Packets

#### Configuration Condition

Before configuring the log sending interval after receiving illegal packets, ensure that:

- Enable the port security function.

#### Configure Log Sending Interval After Receiving Illegal Packets

Users may configure the log sending interval after receiving illegal packets as needed. In general applications, keep the default value.

Table 9 Configuring Processing Mode After Receiving Illegal Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Log Sending Interval After Receiving Illegal Packets	<b>port-security violation log-interval</b> <i>log-interval-value</i>	Mandatory By default, the log sending interval is 5 seconds when the port security receives illegal packets.

### 83.2.7 Configure Port Security to Use ACL Function

#### Configuration Condition

Before configuring port security to use ACL function, do the following:

- Enable the port security function.

#### Configure Port Security to Use ACL Function

Users may configure port security to use ACL or not as needed. When using ACL, MAC+IP, MAC+IPv6, STICKY MAC+IP, and STICKY MAC+IPv6 rules can accurately match users' source MAC address and source IP/IPv6 address to prevent the illegal users with matched source MAC address and unmatched source IP/IPv6 address from accessing.

Table 10 Configuring Processing Mode After Receiving Illegal Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent

Step	Command	Description
		configuration takes effect only within the aggregation group.
Configure port security to use ACL function	<b>port-security use-acl</b>	Mandatory By default, port security doesn't use ACL.

### 83.2.8 Port Security Monitoring and Maintaining

Table 11 Port Security Monitoring and Maintaining

Command	Description
<b>clear port-security statistics</b>	Clear statistics of sending and receiving packets
<b>show port-security</b>	Show port summary with port security configuration
<b>show port-security ip-address</b>	Show the IP rules configured
<b>show port-security ipv6-address</b>	Show the IPv6 rules configured
<b>show port-security mac-address</b>	Show the MAC rules and STICKY rules configured
<b>show port-security active-address</b>	Show the information of all valid entries
<b>show port-security detect-mac</b>	Show the new MAC entries currently detected
<b>show port-security violation log-interval</b>	Show the log printing cycle when any illegal MAC entry is detected
<b>show port-security violation-mac</b>	Show the illegal MAC entries currently detected
<b>show port-security statistics</b>	Show statistics of sending and receiving packets

## 83.3 Typical Configuration Example of Port Security

### 83.3.1 Configure MAC and IP Rules for Port Security

#### Network Requirements

- PC1, PC2 and network printer access the server through the Device.
- Configure port security function on the Device. Allow PC1 to pass, reject PC2, and permit the network printer to perform the printing task assigned by the server and PC1 users.

#### Network Topology

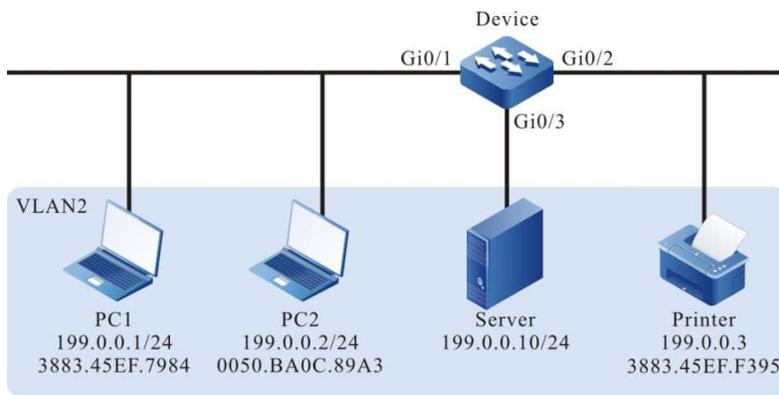

Figure 83 Network Topology for Configuring MAC and IP Rules for Port Security

#### Configuration Steps

Step 1: Configure VLAN.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1~gigabitethernet0/3 on the Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/3
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

Step 2: Configure the port security function.

#Configure MAC+IP rules on gigabitethernet0/1 of the Device to permit PC1 to pass, and configure IP rules to reject PC2.

```

Device#config terminal
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#port-security enable
Device(config-if-gigabitethernet0/1)#port-security permit mac-address 3883.45ef.7984 ip-address 199.0.0.1
Device(config-if-gigabitethernet0/1)#port-security deny ip-address 199.0.0.2
Device(config-if-gigabitethernet0/1)#exit

```

#Configure MAC rules on gigabitethernet0/2 of the Device, permitting the network printer to access the network.

```

Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#port-security enable
Device(config-if-gigabitethernet0/2)#port-security permit mac-address 3883.45ef.f395
Device(config-if-gigabitethernet0/2)#exit

```

Step 3: Check the result.

#View valid entries of port security on the Device. It is indicated that the MAC of PC1 and network printer has been written into the valid entries of port security.

```

Device#show port-security active-address
-----
Entry Interface      MAC address      VID IP/IPv6 Addr  Derivation  Age(Sec)
-----
1   gi0/1              38:83:45:EF:79:84 2   199.0.0.1      MAC+HP      0
2   gi0/2              38:83:45:EF:F3:95 2   199.0.0.3      MAC         0

```

#Through verification, it is indicated that PC1 can access the server and the network printer can perform the printing task assigned by PC1 and the server.

#Through verification, it is indicated that PC2 cannot ping the server and network printer.

### 83.3.2 Configure MAX Rules for Port Security

#### Network Requirements

- PC1, PC2, and PC3 simultaneously access the server through the Device. The PC and the server are in the same LAN.
- Configure port security rules on the Device to permit PC1 and PC2 instead of PC3 to access the server.

#### Network Topology

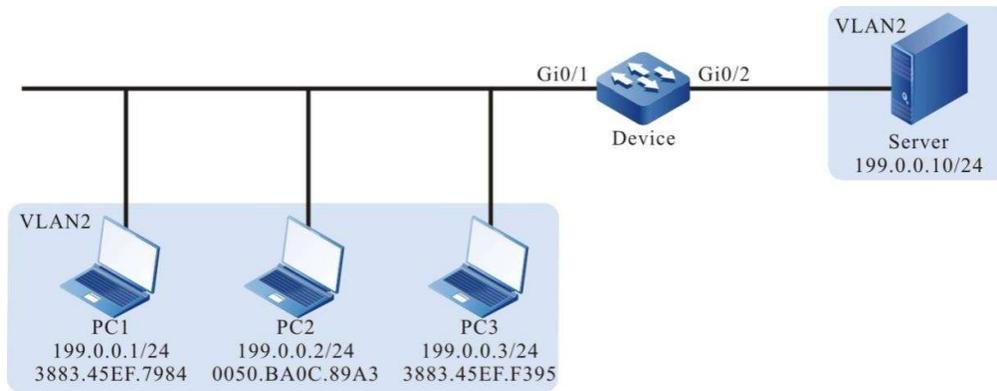

Figure 83 Network Topology for Configuring MAC Rules for Port Security

### Configuration Steps

Step 1: Configure VLAN.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 on the Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

Step 2: Configure port security rules on the Device.

#Configure MAX rules on gigabitethernet0/1 of the Device, 3 at most.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#port-security enable
Device(config-if-gigabitethernet0/1)#port-security maximum 3
Device(config-if-gigabitethernet0/1)#exit
```

#Reject PC3 to access the server on giabitethernet0/1 of the Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#port-security deny mac-address 3883.45ef.f395
Device(config-if-gigabitethernet0/1)#exit
```

Step 3: Check the result.

#Three PCs try to communicate with the server. It is indicated that PC1 and PC2 can access the server, but PC3 cannot do so. #View valid entries of port security on gigabitethernet0/1 of the Device. It is indicated that the MAC addresses of PC1 and PC2 have been written into the valid entries of port security.

```
Device#show port-security active-address
```

Entry	Interface	MAC address	VID	IP/IPv6 Addr	Derivation	Age(Sec)
1	gi0/1	00:50:ba:0c:89:a3	2	---	FREE	0
2	gi0/1	38:83:45:EF:79:84	2	---	FREE	0

Total Mac Addresses for this criterion: 2

### 83.3.3 Configure STICKY Rules for Port Security

#### Network Requirements

- PC1, PC2, and PC3 access the server through the Device. The PC and the server are in the same LAN.
- Configure port security rules on the Device, permitting two PCs to pass.
- After saving the configuration and restarting the Device, the STICKY rules before restarting can take effect immediately.

#### Network Topology

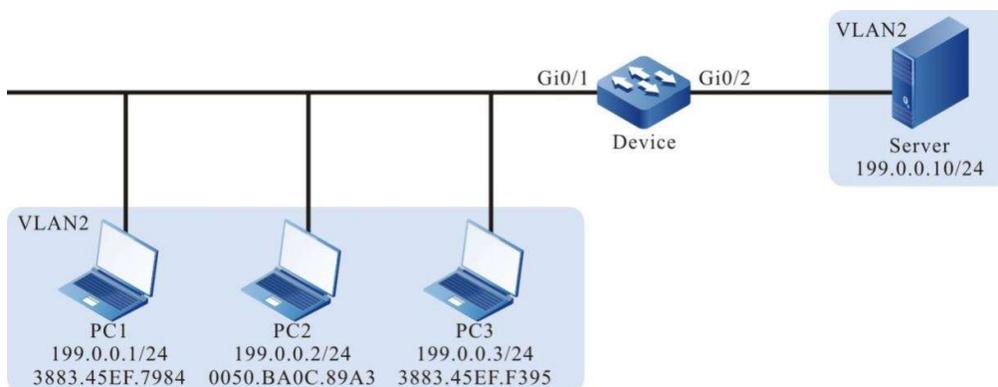

Figure 1 Network Topology for Configuring STICKY Rules for Port Security

#### Configuration Steps

Step 1: Configure VLAN.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 on the Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

Step 2: Configure MAX rules for port security on the Device.

#Configure MAX rules on gigabitethernet0/1 of the Device, 2 at most.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#port-security enable
Device(config-if-gigabitethernet0/1)#port-security maximum 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 3: Configure STICKY rules for port security on the Device.

#On gigabitethernet0/1 of the Device, enable the STICKY function.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#port-security permit mac-address sticky
Device(config-if-gigabitethernet0/1)#exit
```

Step 4: #Check the configuration result.

#PC1, PC2 and PC3 try to communicate with the server. By checking the valid entries of port security on gigabitethernet0/1 of the Device, it is indicated that the rules on gigabitethernet0/1 are STICKY rules.

```
Device#show port-security active-address
-----
Entry Interface      MAC address      VID IP/IPv6 Addr  Derivation  Age(Sec)
-----
1   gi0/1             38:83:45:EF:79:84 2  199.0.0.1        STICKY      0
2   gi0/1             38:83:45:EF:F3:95 2  199.0.0.3        STICKY      0
Total Mac Addresses for this criterion: 2
```

#After saving the configuration and restarting the Device, the STICKY rules before restarting exist and take effect.

```
Device#show port-security active-address
-----
Entry Interface      MAC address      VID IP/IPv6 Addr  Derivation  Age(Sec)
-----
1   gi0/1             38:83:45:EF:79:84 2  199.0.0.1        STICKY      0
2   gi0/1             38:83:45:EF:F3:95 2  199.0.0.3        STICKY      0
Total Mac Addresses for this criterion: 2
```

# 84 IP Source Guard

---

## 84.1 Overview

IP Source Guard is a packet filtering function. It can filter and control the packets forwarded by the port to prevent illegal packets from passing through the port and improve the security of the port. This function has two types:

1. Port IP Source Guard, i.e. filter the IP packets received by the specified port. The filtering methods include IP, MAC, and IP+MAC. For the specific processing method, see the content below:

- IP: If the source IP address and VLAN ID in the packets are the same as the IP address and VLAN ID recorded in the binding entries, the port will forward the packets; otherwise, it will discard them;
- MAC: If the source MAC address in the packets is the same as the MAC address and VLAN ID recorded in the binding entries, the port will forward the packets; otherwise, it will discard them;
- IP+MAC: If the source IP address, source MAC address and VLAN ID in the packets are the same as the IP address, MAC address and VLAN ID recorded in the binding entries, the port will forward the packets; otherwise, it will discard them.
- The setting of filtration type is valid for dynamic binding entries instead of static ones.
- The binding entries of port IP Source Guard have two types:
- Static binding entries, manually configured static binding entries of port IP Source Guard;
- Dynamic binding entries, dynamically generated by the valid entries of DHCP Snooping function.

2. Global IP Source Guard, i.e. filter the packets received by all the ports, including ARP (Address Resolution Protocol) and IP packets. The filtering methods are shown below:

- If the source IP address in the IP packets is the same as the IP address in the binding entries of global IP Source Guard yet the source MAC address is different, and the source MAC address in the IP packets is the same as the MAC address in the binding entries of global IP Source Guard yet the source IP address is different, the packets will be discarded;

- If the IP address of sending end in the ARP packets is the same as the IP address in the binding entries yet the source MAC address is different, the source MAC address in the ARP packets is the same as the MAC address in the binding entries yet the IP address of sending end is different, the packets will be discarded.

## 84.2 IP Source Guard Function Configuration

Table 84 IP Source Guard Function Configuration List

Configuration Task	
Configure static binding entries for port IP Source Guard	Configure static binding entries for port IP Source Guard
Configure the port IP Source Guard function	Configure the port IP Source Guard function
	Configure port IP Source Guard to filter packet type
Configure global IP Source Guard function	Configure global IP Source Guard function

### 84.2.1 Configure Static Binding Entries for Port IP Source Guard

#### Configuration Condition

Before configuring the static binding entries for port IP Source Guard, do the following:

- Enable the port IP Source Guard function or port Dynamic ARP Inspection function.

#### Configure Static Binding Entries for Port IP Source Guard

The static binding entries of port IP Source Guard serve as the basis of filtering the IP packets received by the specified port.

When the port Dynamic ARP Inspection function is enabled, the static binding entries of the port IP Source Guard can serve as the basis of checking the legality of ARP packets only when the static entries of mac, ip and vlan are configured.

Table 84 Configure Static Binding Entries for Port IP Source Guard

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure static binding entries for port IP Source Guard	<b>ip source binding</b> { <b>ip-address</b> <i>ip-address</i> [ <b>mac-address</b> <i>mac-address</i> [ <b>vlan</b> <i>vlan-id</i> ]   <b>vlan</b> <i>vlan-id</i> ]   <b>mac-address</b> <i>mac-address</i> [ <b>vlan</b> <i>vlan-id</i> ] }	Mandatory  By default, there are no static binding entries of port IP Source Guard.

---

## Note

- For the port Dynamic ARP Inspection function, see the Dynamic ARP Inspection-related chapter in the User Manual.
- 

## 84.2.2 Configure the Port IP Source Guard Function

### Configuration Condition

None

### Configure the Port IP Source Guard Function

After the port IP Source Guard function is enabled, first write the binding entries of port into the chip, including static binding entries with a higher priority and dynamic binding entries. Then, control security of the IP packets received by the port according to the entries written into the chip to prove security.

Table 1 Configure Port IP Source Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable the port IP Source Guard function	<b>ip verify source</b>	Mandatory  By default, the port IP Source Guard function is disabled.

## Note

- After the port IP Source Guard function is enabled, the binding entries of port IP Source Guard are written into the chip, the number of which depends on the available sources of chip entries. If the sources of chip entries are not available, and it's necessary to add binding entries or enable the port IP Source Guard function on other ports, then the binding entries related to the sources of chip entries need to be deleted.
- If some binding entries of the port IP Source Guard fail to be written into the chip due to inadequate sources of chip entries, the system will automatically try to rewrite these binding entries into the chip every 60 seconds until all the binding entries that fail to be written into the chip are written into the chip or deleted.
- If both port IP Source Guard and global IP Source Guard are enabled, the IP packets received by the port can be forwarded only when they match the binding entries of port IP Source Guard and global IP Source Guard; otherwise, they will be discarded.
- Before enabling the port IP Source Guard function, if the terminal device connected to this port is a non-DHCP (Dynamic Host Configuration) client, or if the terminal device is a DHCP client, but it doesn't enable the DHCP Snooping function, the MAC address, IP address and corresponding VLAN number of the terminal device need to be configured as the static binding entries of port IP Source Guard to ensure that after this function is enabled, the

---

terminal device can normally communicate. For the DHCP Snooping function, refer to the DHCP Snooping-related chapters in the User Manual.

---

### 84.2.3 Configure Port IP Source Guard to Filter Packet Type

#### Configuration Condition

Before configuring the port IP Source Guard to filter packet type, do the following:

- Enable the port IP Source Guard function

#### Configure Port IP Source Guard to Filter Packet Type

After enabling the port IP Source Guard function, filter the IP packets in ip mode. When the source IP address and VLAN number in the IPv4 packets received by the port are both the same as those in the binding entries of port IP Source Guard, this port will forward these packets; otherwise, it will discard them.

After the IP Source Guard function of the port is enabled, filter the IP packets in ip-mac mode. When the source MAC address, source IP address and VLAN number in the IP packets received by the port are all the same as the MAC address, IP address and VLAN number in the binding entries of port IP Source Guard, the port will forward these packets; otherwise, it will discard them.

After enabling the IP Source Guard function of the port, filter the IP packets in mac mode. When the source MAC address and VLAN number in the IP packets received by the port are both the same as the MAC address and VLAN number in the binding entries of port IP Source Guard, this port will forward these packets; otherwise, it will discard them.

Table 2 Configuring Port IP Source Guard to Filter Packet Type

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect

Step	Command	Description
		only within the aggregation group.
Configure port IP Source Guard to filter packet type	<b>ip verify source type { ip   ip-mac   mac }</b>	Mandatory  By default, the filtering method is ip, which takes effect for dynamic entries only.

## 84.2.4 Configure the Function of Binding Static Entries of Port MAC

### Configuration Condition

#### The Function of Binding Static Entries of Port MAC Is not Configured

After configuring the function of binding static entries of port MAC, corresponding mac address, vlan number and port number are obtained to distribute corresponding static MAC entries from the static entries of IP Source Guard configured and the dynamic entries obtained on the port.

Table 3 Configuring Function of Binding Static MAC Entries

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.

Step	Command	Description
Configure the function of binding static entries of port MAC	<b>ip source sticky-mac</b>	Mandatory  By default, the function of binding static entries of port MAC is disabled.

## 84.2.5 Configure Global IP Source Guard Function

### Configuration Condition

None

### Configure Global IP Source Guard Function

In order to protect the security of users' IP address and prevent other users from embezzling their IP address, the IP Source Guard function can be configured to bind users' IP address and MAC address. The binding entries of global IP Source Guard of users' IP address and MAC address configured will be directly written into the chip to realize the filtration of illegal IP and ARP packets.

When the global Dynamic ARP Inspection function is enabled, the binding entries of the global IP Source Guard configured can serve as the basis of checking the legality of ARP packets by the global Dynamic ARP Inspection function.

Table 4 Configuring Global IP Source Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure global IP Source Guard function	<b>source binding mac-address ip-address</b>	Mandatory  By default, there are no binding entries of global IP Source Guard. This function is disabled.  This command enables the global IP Source Guard function, and configures a binding entry of global IP Source Guard.

---

## Note

- At most 40 binding entries of global IP Source Guard are supported. The configuration will fail once the number exceeds 40.
  - The binding entries of global IP Source Guard configured are directly written into the chip, the number of which depends on the available sources of chip entries. If the sources of chip entries are not available, and it's necessary to add the binding entries of global IP Source Guard, then the binding entries related to the sources of chip entries need to be deleted.
  - If both port IP Source Guard and global IP Source Guard are enabled, the IP packets received by the port can be forwarded only when they match the binding entries of port IP Source Guard and global IP Source Guard; otherwise, they will be discarded.
- 

---

## Note

- For the global Dynamic ARP Inspection function, see the Dynamic ARP Inspection-related chapter in the User Manual.
- 

### 84.2.6 IP Source Guard Monitoring and Maintaining

Table 84 IP Source Guard Monitoring and Maintenance

Command	Description
<b>show ip binding table</b> [ <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i>   <b>slot</b>   <b>summary</b> ]	Show the binding entries of port IP Source Guard and the statistics of the number of binding entries
<b>show ip source guard</b> [ <b>interface</b> { <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> } ]	Show the configuration of port IP Source Guard function
<b>show source binding</b>	Show the binding entries of global IP Source Guard and the statistics of the number of entries

## 84.3 Typical Configuration Example of IP Source Guard

### 84.3.1 Configure Valid Port IP Source Guard Function Based on Dynamic Entries of DHCP Snooping

#### Snooping

#### Network Requirements

- PC1 and PC2 access IP network through the Device.
- Configure the DHCP Snooping function.
- Configure the port IP Source Guard function so that PC1 instead of PC2 can normally access the IP Network.

#### Network Topology

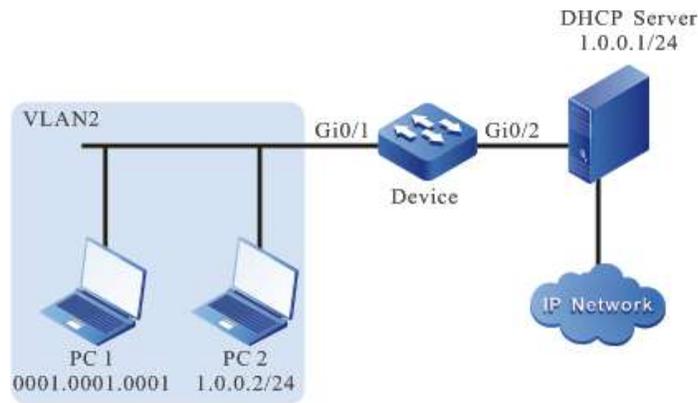

Figure 84-1 Network Topology for Configuring Valid Port IP Source Guard Function Based on Dynamic Entries of DHCP Snooping

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 2: On the Device, enable the global DHCP Snooping function, and configure the gigabitethernet0/2 connected to DHCP Server as a trusted port.

```
Device(config)#dhcp snooping enable
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dhcp snooping trust
Device(config-if-gigabitethernet0/2)#exit
```

Step 3: Configure the address pool of DHCP Server as 1.0.0.0/24. (omitted)

Step 4: On the Device, configure the port IP Source Guard function.

#On the port gigabitethernet0/1, enable the port IP Source Guard function.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip verify source
Device(config-if-gigabitethernet0/1)#exit
```

Step 5: Check the result.

#View DHCP Snooping-related configuration information.

```
Device#show dhcp-snooping
dhcp-snooping configuration information:
dhcp-snooping status:enable
dhcp-snooping option82 information status:disable
dhcp-snooping option82 information policy:replace

.....
```

It is indicated that the port gigabitethernet0/1 has enabled the IP Source Guard function, and the Verify Type is ip. Therefore, in the example mentioned above, dynamic entries will take effect based on ip+vlan.

#View the binding entries of port IP Source Guard.

```
Device#show ip binding table
-----
IP Source Guard binding table on slot 0
    Total binding entries   : 1
    Static binding entries  : 0
    Dynamic binding entries : 1
    Dynamic not write entries : 0
    PCE writing entries      : 1
-----
Interface-Name  MAC-Address  IP-Address  VLAN-ID  Type-Flag  Writing-Flag  L2-Flag
-----
gi0/1           0001.0001.0001  1.0.0.2    2        dynamic    Write         Not Write
```

#PC1 instead of PC2 can normally access the IP Network.

### 84.3.2 Configure the Port IP Source Guard Function Which Takes Effect Based on Static Entries

#### Network Requirements

- PC1 and PC2 access IP network through the Device.
- Configure the port IP Source Guard function which takes effect based on static entries

so that PC1 instead of PC2 can normally access the IP Network.

## Network Topology

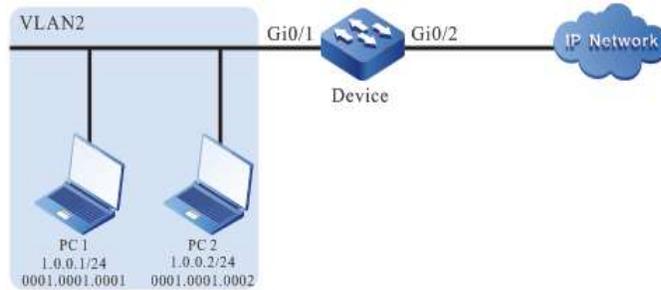

Figure 84-2 Network Topology for Configuring Valid Port IP Source Guard Function Based on Static Entries

## Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 2: On the Device, configure the port IP Source Guard function.

#Enable the port IP Source Guard function based on MAC+VLAN filtering method on port gigabitethernet0/1, and configure the binding entries of port IP Source Guard with IP address of 1.0.0.1 and VLAN 2.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip verify source
Device(config-if-gigabitethernet0/1)#ip source binding ip-address 1.0.0.1 vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 3: Check the result.

#View IP Source Guard-related configuration information.

```
Device#show ip source guard
-----
IP source guard interfaces on slot 0 :
```

Total number of enabled interfaces : 1

Interface Name	Status	Verify Type	L2 Status
gi0/1	Enabled	IP	Disabled
gi0/2	Disabled	IP	Disabled
gi0/3	Disabled	IP	Disabled
gi0/4	Disabled	IP	Disabled
.....			

It is indicated that the port gigabitethernet0/1 has enabled the IP Source Guard function. The static IP Source Guard entries that take effect according to the IP+VLAN entries configured have nothing to do with Verify Type value. Therefore, the example mentioned above takes effect based on IP+VLAN.

#View the binding entries of port IP Source Guard.

```
Device #show ip binding table
-----
IP Source Guard binding table on slot 0
Total binding entries   : 1
Static binding entries  : 1
Dynamic binding entries : 0
Dynamic not write entries : 0
PCE writing entries     : 1
-----
Interface-Name  MAC-Address  IP-Address  VLAN-ID  Type-Flag  Writing-Flag  L2-Flag
-----
gi0/1          ---         1.0.0.1    2        Static    Write        Not Write
```

#PC1 instead of PC2 can normally access the IP Network.

# 85 IPv6 Source Guard

---

## 85.1 Overview

IPv6 Source Guard is a packet filtering function. It can filter and control the packets forwarded by the port to prevent illegal packets from passing through the port and improve the security of the port. This function has two types:

1. Port IPv6 Source Guard, i.e. filter the IPv6 packets received by the specified port. The filtering methods include IP, IP+MAC and MAC. For the specific processing method, see the content below:

- IP: If the source IPv6 address and VLAN ID in the packets are the same as the IPv6 address and VLAN ID recorded in the binding entries, the port will forward the packets; otherwise, it will discard them;
- IP+MAC+VLAN: If the source IPv6 address, source MAC address and VLAN ID in the packets are the same as the IPv6 address, MAC address and VLAN ID recorded in the binding entries, the port will forward the packets; otherwise, it will discard them.
- MAC+VLAN: If the source MAC address and VLAN ID in the packets are the same as the MAC address and VLAN ID recorded in the binding entries, the port will forward the packets; otherwise, it will discard them.
- The setting of filtration type is valid for dynamic binding entries instead of static ones.

The binding entries of port IPv6 Source Guard have two types:

- Static binding entries, manually configured static binding entries of port IPv6 Source Guard;
- Dynamic binding entries, dynamically generated by the valid entries of DHCPv6 Snooping function.

2. Global IPv6 Source Guard, i.e. filter the packets received by all the ports. The filtering methods are shown below:

- If the source IPv6 address and MAC address in IPv6 packets are different from any one of the IPv6 address and source MAC address in the binding entries of global IPv6 Source Guard, the packets will be discarded.

## 85.2 IPv6 Source Guard Function Configuration

Table 85 IPv6 Source Guard Function Configuration List

Configuration Task	
Configure Basic Functions of Port IPv6 Source Guard	Enable Port IPv6 Source Guard Function
	Configure Number of Binding Entries of Port IPv6 Source Guard
Configure Port IPv6 Source Guard to Filter Packet Type	Configure Port IPv6 Source Guard to Filter Packet Type
Configuring Static Binding Entries for Port IPv6 Source Guard	Configuring Static Binding Entries for Port IPv6 Source Guard
Configure the function of binding static entries of port MAC	Configure the function of binding static entries of port MAC
Configure Global IPv6 Source Guard Function	Configure Global IPv6 Source Guard Function

### 85.2.1 Enable Port IPv6 Source Guard Function

#### Configuration Condition

- None

#### Enable Port IPv6 Source Guard Function

After the port IPv6 Source Guard function is enabled, the binding entries (static and dynamic entries) on the port will be written into the hardware. Only the packets that completely match the characteristics of the binding entries can be forwarded. Others will be discarded. This can achieve the purpose of security protection. After IPv6 Source Guard is enabled, the DHCPv6 packets and ND packets under this port are permitted to pass by default.

Table 85 Enabling Port IPv6 Source Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration

Step	Command	Description
		takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable Port IPv6 Source Guard Function	<b>ipv6 verify source</b>	Mandatory  By default, the IPv6 Source Guard function is disabled on the port.

## 85.2.2 Configure Number of Binding Entries of Port IPv6 Source Guard

### Configuration Condition

Before configuring the number of binding entries for port IPv6 Source Guard, do the following:

- Enable port IPv6 Source Guard function.

### Configure Number of Binding Entries of Port IPv6 Source Guard

The upper limit of the number of binding entries (including static and dynamic binding entries) supported by the port, to prevent a single port from being attached and occupying device resources.

Table 1 Configuring Number of Binding Entries of Port IPv6 Source Guard

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent

Step	Command	Description
		configuration takes effect only within the aggregation group.
Configure Number of Binding Entries of Port IPv6 Source Guard	<b>ipv6 verify source max-entries</b> <i>number</i>	Mandatory  By default, 536 binding entries can be configured for each port.

### 85.2.3 Configure Port IPv6 Source Guard to Filter Packet Type

#### Configuration Condition

Before configuring the port IPv6 Source Guard to filter packet type, do the following:

- Enable port IPv6 Source Guard function.

#### Configure Port IPv6 Source Guard to Filter Packet Type

After enabling the port IPv6 Source Guard function, filter the IPv6 packets in ip mode. When the source IPv6 address and VLAN number in the IPv6 packets received by the port are both the same as those in the binding entries of port IPv6 Source Guard, this port will forward these packets; otherwise, it will discard them.

After the port IPv6 Source Guard function is enabled, filter the IPv6 packets in ip-mac mode. When the source MAC address, source IPv6 address and VLAN number in the IPv6 packets received by the port are all the same as the MAC address, IPv6 address and VLAN number in the binding entries of port IPv6 Source Guard, the port will forward these packets; otherwise, it will discard them.

After enabling the port IPv6 Source Guard function, filter the IPv6 packets in mac mode. When the source MAC address and VLAN number in the IPv6 packets received by the port are both the same as the MAC address and VLAN number in the binding entries of port IPv6 Source Guard, this port will forward these packets; otherwise, it will discard them.

Table 2 Configure Port IPv6 Source Guard to Filter Packet Type

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Port IPv6 Source Guard to Filter Packet Type	<b>ipv6 verify source type {ip   ip-mac   mac}</b>	Mandatory  By default, the port filters packets in ip-only mode.

---

### Note

- After the port IPv6 Source Guard function is enabled, the binding entries of port IPv6 Source Guard are written into the chip, the number of which depends on the available sources of chip entries. If the sources of chip entries are not available, and it's necessary to add binding entries or enable the port IPv6 Source Guard function on other ports, then the binding entries related to the sources of chip entries need to be deleted.
  - If some binding entries of the port IPv6 Source Guard fail to be written into the chip due to inadequate sources of chip entries, the system will automatically try to rewrite these binding entries into the chip every 60 seconds until all the binding entries that fail to be written into the chip are written into the chip or deleted.
  - Configure port IPv6 Source Guard to filter packet type and make it take effect for the dynamic entries generated by DHCPv6 Snooping only
- 

## 85.2.4 Configuring Static Binding Entries for Port IPv6 Source Guard

### Configuration Condition

Before configuring static binding entries for port IPv6 Source Guard, do the following:

- Enable port IPv6 Source Guard function.

### Configure Static Binding Entries for Port IP Source Guard

The static binding entries of port IPv6 Source Guard serve as the basis of filtering the IPv6 packets received by the specified port.

Table 85 Configuring Static Binding Entries of Port IPv6 Source Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configuring Static Binding Entries for Port IPv6 Source Guard	<b>ipv6 source binding</b> { <b>ipv6-address</b> <i>ipv6-address</i> [ <b>mac-address</b> <i>mac-address</i> [ <b>vlan</b> <i>vlan-id</i> ]   <b>vlan</b> <i>vlan-id</i> ]   <b>mac-address</b> <i>mac-address</i> [ <b>vlan</b> <i>vlan-id</i> ] }	Mandatory  By default, there are no static binding entries of port IPv6 Source Guard.

### 85.2.5 Configure the Function of Binding Static Entries of Port MAC

#### Configuration Condition

The function of binding static entries of port MAC is not configured

After configuring the function of binding static entries of port MAC, corresponding mac address, vlan number and port number are obtained to distribute corresponding static MAC entries from the static entries of IPv6 Source Guard configured and the dynamic entries obtained on the port.

Table 3 Configure Function of Binding Static MAC Entries

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the function of binding static entries of port MAC	<b>ipv6 source sticky-mac</b>	Mandatory  By default, the function of binding static entries of port MAC is disabled.

## 85.2.6 Configure Global IPv6 Source Guard Function

### Configuration Condition

None

### Configure Global IPv6 Source Guard Function

In order to protect the security of users' IPv6 address and prevent other users from embezzling their own IPv6 address, you can configure the global IPv6 Source Guard function to bind users' IPv6 address and MAC address. The binding entries of global IPv6 Source Guard of users' IPv6 address and MAC address configured will be directly written into the chip to realize the filtration of illegal IPv6 packets.

Table 85 Configuring Global IPv6 Source Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Configure Global IPv6 Source Guard Function	<b>ipv6 source binding mac-address <i>mac-address</i> ipv6-address <i>ipv6_address</i></b>	Mandatory  By default, there are no binding entries of global IPv6 Source Guard. This function is disabled.

## Note

- At most 40 binding entries of global IPv6 Source Guard are supported. The configuration will fail once the number exceeds 40.
- The binding entries of global IPv6 Source Guard configured are directly written into the chip, the number of which depends on the available sources of chip entries. If the sources of chip entries are not available, and it's necessary to add the binding entries of global IPv6 Source Guard, then the binding entries related to the sources of chip entries need to be deleted.
- If both port IPv6 Source Guard and global IPv6 Source Guard are enabled, the IPv6 packets received by the port can be forwarded only when they match the binding entries of port IPv6 Source Guard and global IPv6 Source Guard; otherwise, they will be discarded.

## 85.2.7 IPv6 Source Guard Monitoring and Maintaining

Table 4 IPv6 Source Guard Monitoring and Maintenance

Command	Description
<b>show ipv6 binding table [ dynamic   static   interface <i>interface-name</i>   slot   summary ]</b>	Show the binding entries of port IPv6 Source Guard and the statistics of the number of binding entries
<b>show ipv6 source guard [ interface <i>interface-name</i>]</b>	Show the configuration of port IPv6 Source Guard function

## 85.3 Typical Configuration Example of IPv6 Source Guard

### 85.3.1 Configure Valid Port IPv6 Source Guard Function Based on Dynamic Entries of DHCPv6 Snooping

#### Network Requirements

- PC1 and PC2 access IPv6 network through the Device.

- Configure the global DHCPv6 Snooping function.
- Configure the port IPv6 Source Guard function so that PC1 instead of PC2 can normally access the IPv6 Network.

## Network Topology

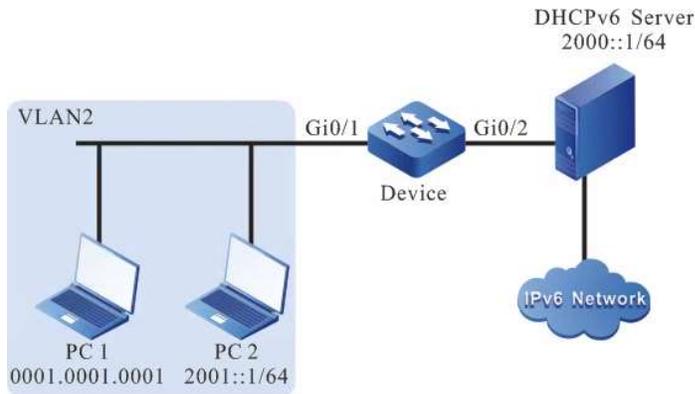

Figure 85 Network Topology for Configuring Valid Port IPv6 Source Guard Function Based on Dynamic Entries of DHCPv6 Snooping

## Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 2: On the Device, enable the global DHCPv6 Snooping function, and configure the gigabitethernet0/2 connected to DHCPv6 Server as a trusted port.

```
Device(config)#ipv6 dhcp snooping enable
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#ipv6 dhcp snooping trust
Device(config-if-gigabitethernet0/2)#exit
```

Step 3: Configure the address pool of DHCPv6 Server as 2000::2/64. (omitted)

Step 4: Configure port IPv6 Source Guard function on the Device.

#On the port gigabitethernet0/1, enable the port IPv6 Source Guard function.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ipv6 verify source
Device(config-if-gigabitethernet0/1)#exit
```

Step 5: Check the result.

#View DHCPV6 Snooping-related configuration information.

```
Device#show ipv6 dhcp snooping
dhcpv6-snooping configuration information:
dhcpv6-snooping status:enable
dhcpv6-snooping entry aged time:300
dhcpv6-snooping binding agent save delay time:1800

dhcpv6-snooping binding agent save file :dhcpv6sp_binding.db
dhcpv6-snooping binding agent save pool time:30
dhcpv6-snooping interface information :
-----
interface      trust-status  max-learning-num option-policy  option18-status  option37-status
gi0/1          untrust      1024          keep          disable          disable
              gi0/2        trust         1024          keep          disable          disable
gi0/3          untrust      1024          keep          disable          disable
gi0/4          untrust      1024          keep          disable          disable
gi0/5          untrust      1024          keep          disable          disable
.....
```

#View IPv6 Source Guard-related configuration information.

```
Device#show ipv6 source guard
-----
IPv6 source guard interfaces on slot 0 :
  Total number of enabled interfaces : 1
-----
Interface Name    Status    Verify Type  L2 Status  Max Entry
-----
gi0/1             Enabled   ip           Disabled   536
gi0/2             Disabled ip           Disabled   536
gi0/3             Disabled ip           Disabled   536
gi0/4             Disabled ip           Disabled   536
gi0/5             Disabled ip           Disabled   536
.....
```

It is indicated that the port gigabitethernet0/1 has enabled the IPv6 Source Guard function, and the Verify Type is ip. Therefore, in the example mentioned above, dynamic entries will take effect based on ip+vlan.

#View the binding entries of port IPv6 Source Guard.

```
Device#show ipv6 binding table
-----global Ipv6 and mac binding entry -----
total :0
-----
IPv6 Source Guard binding table on slot 0
Total binding entries   : 1
Static binding entries  : 0
Static not write entries : 0
Dynamic binding entries : 1
Dynamic not write entries : 0
PCE writing entries      : 1
-----
```

gi0/1	0001.0001.0001	2	dynamic	Write	Not Write	2000::2

#PC1 instead of PC2 can normally access the IPv6 Network.

## 85.3.2 Configure the Port IPv6 Source Guard Function Which Takes Effect Based on Static Entries

### Network Requirements

- PC1 and PC2 access IPv6 network through the Device.
- Configure the port IPv6 Source Guard function which takes effect based on static entries so that PC1 instead of PC2 can normally access the IPv6 Network.

### Network Topology

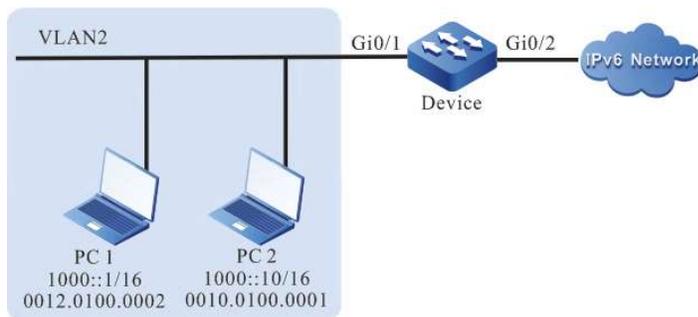

Figure 1 Network Topology for Configuring Valid Port IPv6 Source Guard Function Based on Static Entries

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 2: Configure port IPv6 Source Guard function on the Device.

#Enable the port IPv6 Source Guard function based on MAC+VLAN filtering method on port gigabitethernet0/1, and configure the binding entries of port IPv6 Source Guard with IP address of 1000::1 and VLAN 2.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ipv6 verify source
Device(config-if-gigabitethernet0/1)#ipv6 source binding ipv6-address 1000::1 vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 3: Check the result.

#View IPv6 Source Guard-related configuration information.

```
Device#show ipv6 source guard
-----
IPv6 source guard interfaces on slot 0 :
  Total number of enabled interfaces : 1
-----
Interface Name      Status   Verify Type  L2 Status  Max Entry
-----
gi0/1               Enable   ip           Disabled   536
gi0/2               Disabled ip           Disabled   536
gi0/3               Disabled ip           Disabled   536
gi0/4               Disabled ip           Disabled   536
.....
```

It is indicated that the port gigabitethernet0/1 has enabled the IPv6 Source Guard function. The static IPv6 Source Guard entries that take effect according to the IP+VLAN entries configured have nothing to do with Verify Type value. Therefore, the example mentioned above takes effect based on IP+VLAN.

#View the binding entries of port IPv6 Source Guard.

```
Device #show ipv6 binding table
-----global Ipv6 and mac binding entry -----
total :0
-----

  Dynamic binding entries : 0
  Dynamic not write entries : 0
  PCE writing entries     : 1
-----

Interface-Name  MAC-Address  VLAN-ID  Type-Flag  Writing-Flag  L2-Flag  IP-Address
```

---

```
gi0/1      ---  2    Static  Write   Not Write  1000::1
```

#PC1 can normally access the IP Network. PC2 cannot access the IPv6 Network.

# 86 ND Snooping

---

## 86.1 Overview

### ND Snooping

ND Snooping is a security feature of IPv6 ND (Neighbor Discovery), used in layer-2 switching network environment. It builds ND Snooping dynamic binding table by snooping the NS (Neighbor Solicitation) packets of DAD (Duplicate Address Detection) to record the source IPv6 address, source MAC address, VLAN, ingress port, etc. of packets so as to prevent from being attacked by the ND packets of subsequent fake users and gateways.

### Trusted Interface/Untrusted Interface of ND Snooping

**Trusted interface of ND Snooping:** This type of interface is used to connect trusted IPv6 nodes. The ND packets received from this type of interface will be normally forwarded by the device.

**Untrusted interface of ND Snooping:** This type of interface is used to connect untrusted IPv6 nodes. For the RA packets and redirected packets received from this type of interface, the device considers them to be illegal and directly discards them; for the NA/NS/RS packets received, if the interface or the VLAN where the interface is located enables the ND packet legality check function, the device will check the binding table matching of NA/NS/RS packets according to the dynamic binding table of ND Snooping. When the packets fail to comply with the binding table relationship, they will be considered as illegal users' packets and directly discarded; for other types of ND packets received, the device forwards them normally.

### ND Snooping binding table

After the ND Snooping function is configured, the device builds a dynamic binding table of ND Snooping by snooping users' NS packets for DAD. The entries include the requested IPv6 address, source MAC address, VLAN and ingress interface in DAD packets. The dynamic binding table of ND Snooping can be used for the device to check the binding table matching of NA/NS/RS packets received from untrusted interface so as to filter illegal NA/NS/RS packets.

## 86.2 ND Snooping Function Configuration

Table 86-1 ND Snooping Function Configuration List

Configuration Task	
Configure Enabling the ND Snooping Function	Configure Enabling the ND Snooping Function

Configuration Task

## 86.2.1 Configure Enabling the ND Snooping Function

### Configuration Condition

None

### Configure Enabling the ND Snooping Function

Table 1 Configuring Enabling ND Snooping Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enable the global ND Snooping function	<b>nd snooping enable</b>	Mandatory By default, the global ND Snooping function is disabled.
Enter the layer-2 VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	Mandatory After entering the Layer-2 VLAN configuration mode, subsequent configurations only take effect on current VLAN.
Configure to enable the ND Snooping function under vlan	<b>nd snooping enable</b>	Mandatory By default, the ND Snooping function under VLAN is disabled.

## 86.2.2 Configure Specifying Trusted Interface of ND Snooping

### Configuration Condition

None

### Configure Specifying Trusted Interface of ND Snooping

Table 86-3 Configuring Specifying Trusted Interface of ND Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enable the global ND Snooping function	<b>nd snooping enable</b>	Mandatory By default, the global ND Snooping function is disabled.
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	Mandatory The subsequent configuration takes effect only on the current port after you enter the Layer-2 Ethernet interface configuration mode.
Configure to specify trusted interface	<b>nd snooping trusted</b>	Mandatory By default, the interface is an untrusted interface.

## 86.2.3 Configure Static Binding Entries for ND Snooping

### Configuration Condition

None

### Configure Static Binding Entries for ND Snooping

Table 86-4 Configuring Static Binding Entries of ND Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enable the global ND Snooping function	<b>nd snooping enable</b>	Mandatory By default, the global ND Snooping function is disabled.
Configure Static Binding Entries for ND Snooping	<b>nd snooping user-bind</b> <i>ipv6-address mac-address</i> <b>vlan</b> <i>vlan-id</i> <b>interface</b> <i>interface-name</i>	Optional By default, no static binding entry of ND Snooping is configured.  When there is a static binding entry, match this static binding entry first; when static binding entry is not configured, use dynamic binding entry directly.

#### 86.2.4 Configure Dynamic Binding Table Detection Function for ND Snooping

##### Configuration Condition

None

##### Configure Dynamic Binding Table Detection Function for ND Snooping

Table 86-5 Configuring Dynamic Binding Table Detection Function of ND Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enable the global ND Snooping function	<b>nd snooping enable</b>	Mandatory By default, the global ND Snooping function is disabled.
Configure Dynamic Binding Table Detection Function for ND Snooping	<b>nd snooping detect</b> <b>retransmit</b> <i>retransmits-times</i> <b>interval</b> <i>time</i>	Mandatory By default, the dynamic binding table detection function of ND Snooping is disabled.

## 86.2.5 Configure Enabling ND Snooping Attack Detection Log Function

### Configuration Condition

None

### Configure Enabling ND Snooping Attack Detection Log Function

Table 86-6 Configuring Enabling ND Snooping Attack Detection Log Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enable the global ND Snooping function	<b>nd snooping enable</b>	Mandatory By default, the global ND Snooping function is disabled.
Configure Enabling ND Snooping Attack Detection Log Function	<b>nd snooping attack-log enable</b>	Mandatory By default, the ND Snooping attack detection log function is disabled.

## 86.2.6 ND Monitoring and Maintaining

Table 86-7 ND Monitoring and Maintaining

Command	Description
<b>clear nd fast-response statistics</b>	The command is used to clear the ND fast response statistics.
<b>clear nd snooping dynamic-user-bind</b>	The command is used to delete dynamic binding entries of ND Snooping.
<b>clear nd snooping prefix</b>	The command is used to delete prefix entries of ND Snooping.
<b>clear nd snooping statistics</b>	The command is used to clear the statistics of ND Snooping.

Command	Description
<b>show nd fast-response statistics</b>	The command is used to display the ND fast response statistics.
<b>show nd proxy address</b>	The command is used to show nd as the address of external module pickup.
<b>show nd snooping prefix</b>	The command is used to show prefix entries of ND Snooping.
<b>show nd snooping user-bind</b>	The command is used to show binding entries of ND Snooping.
<b>show nd snooping statistics</b>	The command is used to show the statistics of ND Snooping.

## 86.3 Typical Configuration Example of ND Snooping

### 86.3.1 Configure the Basic Functions of ND Snooping

#### Network Requirements

- Device1 connects the gateway device Device2 through gigabitethernet0/3.
- Enable RA service on Device2 (enable RA packet sending function).
- Enable ND Snooping function on Device1. When an attacker sends illegal NS/NA/ RS /RA packets in the network, Device1 will discard these illegal ND packets to guarantee the communication between legal users and gateway.

#### Network Topology

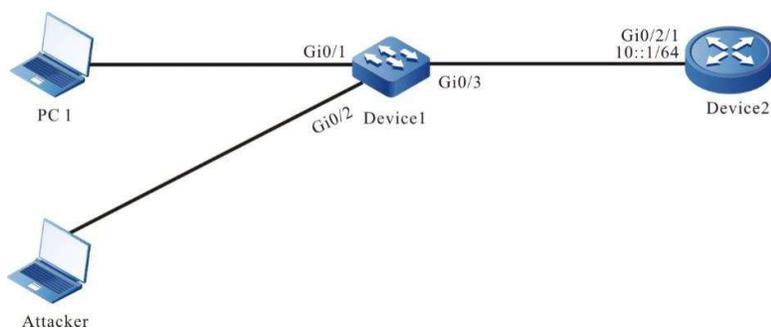

Figure 86 Network Topology for Configuring Basic Functions of ND Snooping

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device1.

#Create VLAN 2.

```
Device1#configure terminal
Device1(config)#vlan 2
Device1(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1~gigabitethernet0/3 as Access, allowing the services of VLAN2 to pass.

```
Device1(config)#interface gigabitethernet 0/1-0/3
Device1(config-if-range)#switchport mode access
Device1(config-if-range)#switchport access vlan 2
Device1(config-if-range)#exit
```

Step 2: Configure IPv6 address on the layer-3 interface gigabitethernet0/2/1 of the gateway device Device 2.

```
Device2(config)#interface gigabitethernet 0/2/1
Device2 (config-if-gigabitethernet0/2/1)#ipv6 address 10::1/64
Device2 (config-if-gigabitethernet0/2/1)#exit
```

Step 3: Enable RA service on the gateway device Device2 (enable RA packet sending function).

```
Device2(config)#interface gigabitethernet 0/2/1
Device2 (config-if-gigabitethernet0/2/1)#no ipv6 nd suppress-ra period
Device2 (config-if-gigabitethernet0/2/1)#no ipv6 nd suppress-ra response
Device2 (config-if-gigabitethernet0/2/1)#exit
```

Step 4: Configure ND Snooping function on Device1.

#Globally enable the ND Snooping function.

```
Device1(config)#nd snooping enable
```

#Enable ND Snooping function on VLAN 2.

```
Device1(config)#vlan 2
Device1(config-vlan2)#nd snooping enable
Device1(config-vlan2)#exit
```

#Configure the port gigabitethernet0/3 as a trusted interface.

```
Device1(config)#interface gigabitethernet 0/3
Device1(config-if-gigabitethernet0/3)#nd snooping trusted
Device1(config-if-gigabitethernet0/3)#exit
```

Step 5: Check the result.

#View the prefix information obtained by Device1 from the gateway device Device2.

```
Device1#show nd snooping prefix
```

prefix	length	valid-time	preferred-time
10::	64	2592000	604800

```
Total number: 1
```

#After the Ipv6 address 10::3 within the prefix 10::/64 administration scope is configured on PC1, view ND Snooping entries on the Device.

```
Device1#show nd snooping user-bind dynamic
ipv6-address  mac-address  vlan  interface  type
10::3         0857.00da.4715  2    gi0/1      dynamic
```

The ND Snooping entries of the IP, MAC, VLAN, and access port information of PC1 are generated on Device1.

#Attacker simulates the IP of PC1 to send NS, NA and RS packets to the gateway. The Device receives the Attacker's NS, NA, and RS packets, discards them if they are found inconsistent with the recorded ND Snooping entries, and makes relevant records in the statistics of ND Snooping.

```
Device1#show nd snooping statistics
```

Statistics for lpu 0 nd snooping:

```
lladdrInvalid:    0
dadPacketDeal:    0
nsPacketPass:     0

sendDtPktOk:     0
```

# 87 DHCP Snooping

---

## 87.1 Overview

### 87.1.1 Basic Functions of DHCP Snooping

DHCP snooping is a security feature of DHCP (Dynamic Host Configuration Protocol). It has the following two functions:

1. Record the corresponding relation between MAC address and IP address of DHCP client:

For the sake of security, the network administrator may need to record the IP address used when users surf the Internet, and confirm the corresponding relation between the MAC address of users' host and the IP address obtained from the DHCP server.

DHCP snooping records the MAC address of DHCP client and the IP address obtained by snooping the DHCP request packets and the DHCP response packets received by the trusted port. The administrator can view the IP address information obtained by the DHCP client through the binding entries recorded by DHCP snooping.

2. Guarantee the client obtains IP address from a legal server:

If there is DHCP server set up in the network without permission, the DHCP client is likely to obtain incorrect IP address, causing abnormal communication or safety hazard. To ensure that the DHCP client can obtain an IP address through a legal DHCP server, the DHCP snooping function permits to configure the port as a trusted port or an untrusted port:

- Trusted port is directly or indirectly connected to a legitimate DHCP server. Trusted port normally forwards the DHCP response packets received so as to ensure that the DHCP client can obtain a correct IP address;
- An untrusted port is not directly or indirectly connected to a legitimate DHCP server. If a DHCP response packet sent by the DHCP server is received from an untrusted port, it will be discarded to prevent the DHCP client from obtaining incorrect IP address.

### 87.1.2 DHCP Snooping Option82

DHCP snooping supports the addition, forwarding and management of Option82. Option82 is a DHCP packet option used to record the location of DHCP client. The administrator can locate DHCP client according to this option for security control, e.g. limit the number of IP addresses that can be assigned by a port or VLAN. Depending on the type of DHCP packets, Option82 can be processed by the following ways:

1. When the device receives a DHCP request packet, it will process the packet according to whether it contains Option82, the processing policy and fill format configured by the user, and forward the processed packet to the DHCP server;

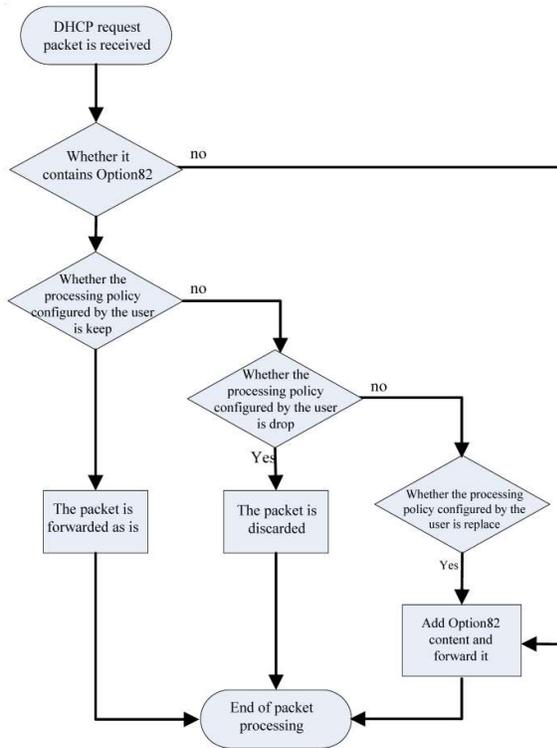

Figure 1 Processing Flow of Option82

2. When the device receives a response packet from the DHCP server, if the packet contains Option82, Option 82 is deleted and the packet is forwarded to the DHCP client. If the packet does not contain Option 82, it is directly forwarded to the DHCP client.

## 87.2 DHCP Snooping Function Configuration

Table 87 DHCP Snooping Function Configuration List

Configuration Task	
Configure Basic Functions of DHCP snooping	Configure DHCP Snooping Function
	Configure Trust Status of Port
	Configure Rate Limiting Function for DHCP Snooping

Configuration Task	
Configure DHCP snooping Option82	Configure Processing Policy of Option82
	Configure Content of Remote ID
	Configure Content of Circuit ID
	Configure Fill Format of Option82
	Configure Packet Processing Policy of Option82
Configure Binding Entries Storage for ND Snooping	Configure Automatic Storage of Binding Entries for DHCP Snooping
	Configure Manual Storage of Binding Entries for DHCP Snooping

### 87.2.1 Configure Basic Functions of DHCP snooping

The basic functions of DHCP snooping include enabling DHCP snooping, configuring trust status of port, and limiting DHCP packet rate.

#### Configuration Condition

None

#### Configure DHCP Snooping Function

After the DHCP snooping function is enabled, the DHCP packets received by all ports of the device will be monitored:

- For the request packets received, corresponding binding entries will be generated according to the information in the packets;
- For the response packets received from the trusted port, the status and lease time of corresponding binding entries will be updated;
- The response packets received from the untrusted port will be directly discarded.

Table 1 Configure DHCP Snooping Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the DHCP snooping function	<b>dhcp-snooping</b>	Mandatory  By default, the DHCP snooping function is disabled.

### Configure Trust Status of Port

To prevent the DHCP client from obtaining addresses from illegal DHCP server, you can configure the port directly or indirectly connected to legitimate server as a trusted one.

When the port is configured as a trusted one, the DHCP response packets are permitted to be normally forwarded; otherwise, they will be discarded.

Table 2 Configure Trust Status of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Trust Status of Port	<b>dhcp-snooping trust</b>	Mandatory  By default, all ports are untrusted ones.

---

 **Note**

- The port connected to DHCP server must be configured as a trusted one; otherwise, the DHCP client cannot obtain any address.
  - After the port is configured as a trusted one, it will not limit the rate of the DHCP packets that pass through this port.
  - After the port status is changed to untrusted from trusted, the upper limit of the port rate is 40 by default.
- 

### Configure Rate Limiting Function for DHCP Snooping

Configuring rate limiting function for DHCP Snooping can limit the number of DHCP packets processed per second. This can avoid the following circumstance: other protocol packets cannot be processed in a timely manner due to the processing of DHCP packets in long term.

When the number of DHCP packets received in one second exceeds the upper limit of rate, subsequent DHCP packets will be discarded. If the DHCP packets continuously received by the port in 20 seconds all exceed the rate limit, corresponding port will be closed to isolate the source of packet impact.

Table 3 Configuring Rate Limiting Function of DHCP Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.

Step	Command	Description
Configure Rate Limiting Function for DHCP Snooping	<b>dhcp-snooping rate-limit</b> <i>limit-value</i>	Mandatory  By default, the upper limit of the rate of DHCP packet is 40pps.

---

### Note

- After configuring the upper limit of the rate of DHCP packet in aggregation group configuration mode, it is applicable to each member port of the aggregation group.
  - The DHCP packet rate limiting function is effective for untrusted port only.
  - After the port is automatically closed, it can be automatically enabled by configuring Error-Disable. By default, the port auto closing function is enabled; if the DHCP packets received by the port exceed the rate limit for 20 consecutive seconds, and corresponding port cannot be automatically closed, you need to check the Error-Disable configuration. For the Error-Disable function, refer to the Error-Disable-related chapters in the User Manual.
- 

## 87.2.2 Configure DHCP snooping Option82

The DHCP snooping function supports Option82 which can contain 255 sub-options at most. Our company's devices support two sub-options, i.e. Circuit ID and Remote ID.

### Configuration Condition

Before configuring the DHCP snooping Option82, do the following:

- Enable the DHCP snooping function.

### Configure Processing Policy of Option82

When disabling information is configured on the port, all the option packets received by the port will be forwarded as is.

Table 4 Configuring Processing Policy of Option82

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable Option82 of DHCP Snooping	<b>dhcp-snooping information enable</b>	Mandatory  By default, Option82 of DHCP Snooping function is disabled.
Enter the layer-2 Ethernet interface configuration mode.	<b>interface <i>interface-name</i></b>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation <i>link-aggregation-id</i></b>	
Configure Processing Policy of Option82	<b>dhcp-snooping information disable</b>	Optional  By default, the processing policy for the DHCP request packets containing Option82 is replace, i.e. replace prior to forwarding.

### Configure Content of Remote ID

The content of Remote ID has two types, i.e. default and non-default. The default fill format of Remote ID is shown as follows:

#### Remote ID Suboption Frame Format

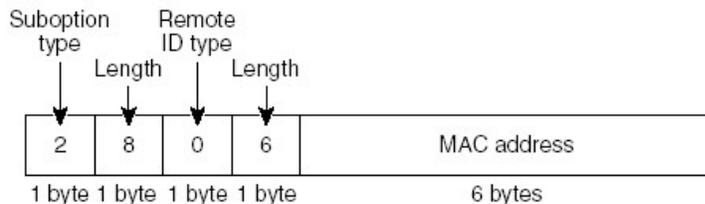

Figure 2 Fill Format of Default Remote ID Content

Non-default content has two types, i.e. custom character string and device name. It is required to be configured in the fill format to take effect under user configuration format. The fill format of the non-default Remote ID content is shown as follows:

**Remote ID Suboption Frame Format (for user-configured string):**

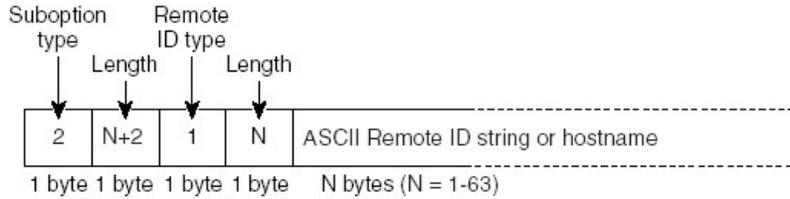

Figure 3 Fill Format of Non-default Remote ID Content

Table 5 Configure Content of Remote ID

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Content of Remote ID	<b>dhcp-snooping information format remote-id { string   default   hostname }</b>	Mandatory By default, the content of Remote ID is default content, i.e. the MAC address of device port.

**Configure Content of Circuit ID**

The content of Circuit ID has two types, i.e. default and non-default. The fill format of the default Circuit ID content is shown as follows:

**Circuit ID Suboption Frame Format**

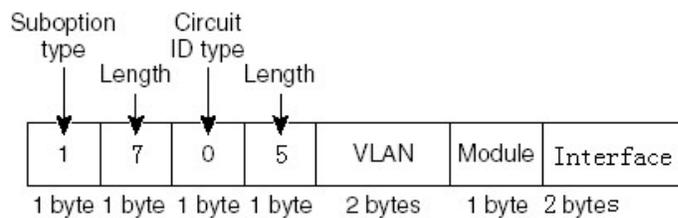

Figure 4 Fill Format of Default Circuit ID Content

Non-default content needs to be configured in the fill format to take effect under user configuration format. The fill format of the non-default Circuit ID content is shown as follows:

**Circuit ID Suboption Frame Format (for user-configured string):**

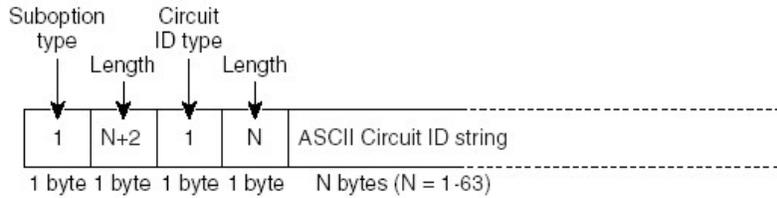

Figure 5 Fill Format of Non-default Circuit ID Content

Table 6 Configure Content of Circuit ID

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Content of Circuit ID	<b>dhcp-snooping information format circuit-id</b> { <i>string</i>   <b>default</b> }	Mandatory By default, the content of Circuit ID is default content.

**Configure Fill Format of Option82**

The fill format of Option82 has two types, default format and user configuration format.

When the fill format is default format, the content of both Remote ID and Circuit ID is default content; only when the fill format is configured as user configuration format will the non-default content of Remote ID and Circuit ID take effect.

Table 7 Configuring Fill Format of Option82

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Fill Format of Option82	<b>dhcp-snooping information format { default   user-config }</b>	Mandatory By default, the fill format is default format.

### Configure Packet Processing Policy of Option82

Configure the packet processing policy of Option82. You may take different forwarding policies for the DHCP request packets containing Option82.

Table 8 Configuring Packet Processing Policy of Option82

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Packet Processing Policy of Option82	<b>dhcp-snooping information policy { drop   keep   replace }</b>	Mandatory By default, the processing policy is replace.

### 87.2.3 Configure Binding Entries Storage for ND Snooping

The DHCP snooping function supports automatic or manual storage of binding entries in the specified path. If the device restarts, the stored binding entries can be restored to prevent the communication from being affected due to the loss of binding entries.

The specified path can be device FLASH, FTP server or TFTP server.

#### Configuration Condition

Before configuring the binding entries storage path as FTP/TFTP server, do the following:

- Normally, the FTP/TFTP server function is enabled on the FTP/TFTP server;
- The device can ping the IP address of FTP/TFTP server.

#### Configure Automatic Storage of Binding Entries for DHCP Snooping

The binding entries of DHCP snooping can be configured as auto storage mode, i.e. the system stores the binding entries by timing.

The system periodically refreshes the binding entries to detect whether the binding entries have been updated. If yes, the updated entries will be stored in the specified path only after the storage delay expires. Storage delay can prevent and control frequent system storage due to the continuous updating of entries.

Table 9 Configure Auto Storage of Binding Entries of DHCP Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Automatic Storage of Binding Entries for DHCP Snooping	<b>dhcp-snooping database savetype auto</b> { <b>flash</b> <i>file-name</i>   <b>ftp</b> <i>dest-ip-address ftp-username ftp-password file-name</i>   <b>tftp</b> <i>dest-ip-address file-name</i> }	Mandatory  By default, the binding entries storage mode is auto mode, storage path flash, and storage file name "dhcsp_binding.db".
Configure binding entries storage delay	<b>dhcp-snooping database savedelay</b> <i>seconds</i>	Optional  By default, the binding entries storage delay is 1800 seconds.
Configure binding entries refresh interval	<b>dhcp-snooping database savepool</b> <i>seconds</i>	Optional  By default, the binding entries refresh interval is 30 seconds.

### Configure Manual Storage of Binding Entries for DHCP Snooping

The binding entries of DHCP snooping can be configured as manual storage mode, i.e. the binding entries are stored by executing a storage command.

Table 10 Configure Manual Storage of Binding Entries of DHCP Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure Manual Storage of Binding Entries for DHCP Snooping	<b>dhcp-snooping database savetype manual</b> { <b>flash</b> <i>file-name</i>   <b>ftp</b> <i>dest-ip-address ftp-username ftp-password file-name</i>   <b>tftp</b> <i>dest-ip-address file-name</i> }	Mandatory  By default, the binding entries storage mode is auto mode, storage path flash, and storage file name "dhcsp_binding.db".
Configure storage binding files	<b>dhcp-snooping database save</b>	Mandatory  Store binding entries in the specified path  By default, the binding entries are not stored in the specified path.

## 87.2.4 DHCP Snooping Monitoring and Maintaining

Table 11 DHCP Snooping Monitoring and Maintaining

Command	Description
<b>clear dhcp-snooping database</b> { <b>interface</b> { <i>interface-list</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> }   <b>ip-address</b> <i>ip-address</i>   <b>mac-address</b> <i>mac-address</i>   <b>vlan</b> <i>vlan-id</i>   <b>all</b> }	Clear binding entries
<b>clear dhcp-snooping packet statistics</b> [ <b>interface</b> { <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> } ]	Clear statistics of receiving and sending DHCP packets
<b>show dhcp-snooping</b> [ <b>interface</b> { <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> }   <b>save</b>   <b>detail</b> ]	#Show the configuration information of DHCP Snooping
<b>show dhcp-snooping database</b> [   { { <b>begin</b>   <b>exclude</b>   <b>include</b> } <i>expression</i>   <b>redirect</b> { <b>file</b> <i>file-name</i>   <b>ftp</b> [ <b>vrf</b> <i>vrf-name</i> ] { <i>hostname</i>   <i>dest-ip-address</i> } <i>ftp-username ftp-password file-name</i> } } ] [ <b>interface</b> { <i>interface-name</i>   <b>link-</b>	Show the information about binding entries of DHCP Snooping

Command	Description
<b>aggregation</b> <i>link-aggregation-id</i> }   <b>ip-address</b> <i>ip-address</i>   <b>vlan</b> <i>vlan-id</i>   <b>mac-address</b> <i>mac-address</i> [   { <b>begin</b>   <b>exclude</b>   <b>include</b> } <i>expression</i>   <b>redirect</b> { <b>file</b> <i>file-name</i>   <b>ftp</b> [ <b>vrf</b> <i>vrf-name</i> ] { <i>hostname</i>   <i>dest-ip-address</i> } <i>ftp-username</i> <i>ftp-password</i> <i>file-name</i> } } ]   <b>detail</b> ]	
<b>show dhcp-snooping packet statistics</b> [ <b>interface</b> { <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> } ]	Show the statistics of receiving and sending DHCP packets

## 87.3 Typical Configuration Example of DHCP Snooping

### 87.3.1 Configure Basic Functions of DHCP Snooping

#### Network Requirements

- DHCP Server1 is a legal DHCP server, and DHCP Server2 is an illegal DHCP server.
- After the DHCP snooping function is configured, both PC1 and PC2 can obtain addresses from DHCP Server1 only.

#### Network Topology

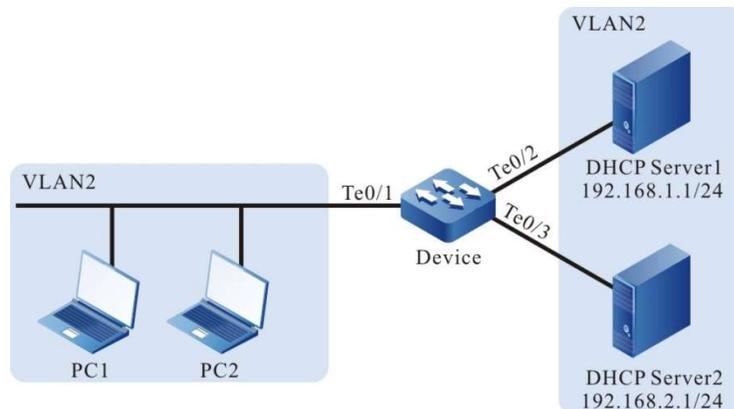

Figure 6 Network Topology for Configuring Basic Functions of DHCP Snooping

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports tengigabitethernet0/1~tengigabitethernet0/3 as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface tengigabitethernet 0/1-0/3
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

Step 2: Configure the address pool of DHCP Server1 as 192.168.1.100~192.168.1.199 and that of DHCP Server2 as 192.168.2.100~192.168.2.199. (omitted)

Step 3: Configure DHCP Snooping function on the Device.

#Enable the DHCP snooping function.

```
Device(config)#dhcp-snooping
```

#Configure the port tengigabitethernet0/2 as a trusted port.

```
Device(config)#interface tengigabitethernet 0/2
Device(config-if-tengigabitethernet0/2)#dhcp-snooping trust
Device(config-if-tengigabitethernet0/2)#exit
```

Step 4: Check the result.

#After both PC1 and PC2 successfully obtain the address, view the entries of DHCP Snooping on the Device.

```
Device#show dhcp-snooping database
dhcp-snooping database:
database entries count:2
database entries delete time :300
-----
 macAddr    ipAddr    transtion-id  vlan  interface  leaseTime(s)  status
-----
0013.0100.0002  192.168.1.101  1    2    te0/1    107990    active
-----
0013.0100.0001  192.168.1.100  0    2    te0/1    107989    active
-----
Total valid DHCP Client binding table for this criterion: 2
```

Both PC1 and PC2 can obtain addresses from DHCP Server1 only.

# 88 DHCPv6 Snooping

---

## 88.1 Overview

### 88.1.1 Basic Functions of DHCPv6 Snooping

DHCPv6 snooping is a security feature of DHCPv6 (Dynamic Host Configuration Protocol for IPv6). It has the following two functions:

1. Record the corresponding relation between MAC address and IPv6 address of DHCPv6 client:

For the sake of security, the network administrator may need to record the IPv6 address used when users surf the Internet, and confirm the corresponding relation between the MAC address of users' host and the IPv6 address obtained from the DHCPv6 server.

DHCPv6 snooping records the MAC address of DHCPv6 client and the IPv6 address obtained by snooping DHCPv6 request packets and the DHCPv6 response packets received by the trusted port. The administrator may view the IPv6 address information obtained by the DHCPv6 client through the binding entries recorded by DHCPv6 snooping.

2. Guarantee the client obtains IPv6 address from a legitimate server:

If there is DHCPv6 server set up in the network without permission, the DHCPv6 client is likely to obtain incorrect IPv6 address, causing abnormal communication or safety hazard. In order to ensure that the DHCPv6 client can obtain IPv6 address through a legitimate DHCPv6 server, the DHCPv6 snooping function permits the port to be configured as a trusted or an untrusted one:

- Trusted port is directly or indirectly connected to a legitimate DHCPv6 server. Trusted port normally forwards the DHCPv6 response packets received so as to ensure that the DHCPv6 client can obtain a correct IPv6 address;
- An untrusted port is not directly or indirectly connected to a legitimate DHCPv6 server. If a DHCPv6 response packet sent by the DHCPv6 server is received from an untrusted port, it will be discarded to prevent the DHCPv6 client from obtaining incorrect IPv6 address.

### 88.1.2 DHCPv6 Snooping Option18/37

In order that the DHCPv6 Server can obtain the physical location of DHCPv6 client, Option18 and Option37 can be added to the DHCPv6 request packet.

When the device is snooping DHCPv6 packets, some user-related device information can be added to the DHCPv6 request packet in DHCPv6 Option mode. In particular, Option18 which records the interface information of the client is called Interface ID option. Option37 recording the MAC address information of the client is called Remote ID option.

When Option18/37 is enabled, after the device receives the DHCPv6 request packets, it may process them by the following manners according to the processing policy and fill method of Option18/37 configured by users:

Table 88-1 DHCPv6 Request Packet Processing Policy

DHCPv6 request packet	Processing policy	Fill method	Packet processing principle
Without Option18/37	Add	Default fill format	Fill and forward in default format
	Add	Extend fill format	Fill and forward in the user-defined format
With Option18/37	maintained	Not filled	No processing or forwarding of Option18/37
	Replacements	Default fill format	Replace the original Option18/37 in default format and forward
		Extend fill format	Replace the original Option18/37 in the user-defined format and forward

## 88.2 DHCPv6 Snooping Function Configuration

Table 1 DHCPv6 Snooping Function Configuration List

Configuration Task	
Configure Basic Functions of DHCPv6 Snooping	Enable DHCPv6 Snooping
	Configure Trust Status of Port
	Configure Number of Binding Entries of Port
Configure DHCPv6 Snooping Option18/37	Configure Option18

Configuration Task	
	Configure Option37
	Configure Packet Processing Policy of Option18/37
Configure Delay Time of Deleting Invalid Entries of DHCPv6 Snooping	Configure Delay Time of Deleting Invalid Entries of DHCPv6 Snooping
Configure Storage of Binding Entries of DHCPv6 Snooping	Configure Storage of Binding Entries of DHCPv6 Snooping

### 88.2.1 Configure Basic Functions of DHCPv6 Snooping

The basic functions of DHCPv6 snooping include enabling DHCPv6 snooping, configuring trust status of port, and configuring the number of DHCPv6 snooping entries bound to the port.

#### Configuration Condition

None

#### Enable DHCPv6 Snooping

After the DHCPv6 snooping function is enabled, the DHCPv6 packets received by all ports of the device will be monitored:

- For the DHCPv6 request packets received, corresponding binding entries will be generated according to the information in the packets;
- For the response packets received from the trusted port, the status and lease time of corresponding binding entries will be updated;
- The response packets received from the untrusted port will be directly discarded.

Table 2 Enabling DHCPv6 Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable DHCPv6 snooping	<b>ipv6 dhcp snooping enable</b>	At least one option must be selected.

Step	Command	Description
Enable the DHCPv6 snooping function of the specified VLAN	<b>ipv6 dhcp snooping</b> <b>vlan <i>vlanlist</i></b>	By default, the DHCPv6 snooping function is disabled.

### Configure Trust Status of Port

To prevent the DHCPv6 client from obtaining addresses from illegal DHCPv6 server, you can configure the port directly or indirectly connected to legitimate server as a trusted one.

When the port is configured as a trusted one, the DHCPv6 response packets are permitted to be normally forwarded; otherwise, they will be discarded.

Table 3 Configuring Trust Status of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface <i>interface-name</i></b>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <b><i>link-aggregation-id</i></b>	
Configure Trust Status of Port	<b>ipv6 dhcp snooping trust</b>	Mandatory  By default, all ports are untrusted ones.

**Note**

- The port connected to DHCPv6 server must be configured as a trusted one; otherwise, the DHCPv6 client cannot obtain any address.

### Configure the Number of Binding Entries of Port DHCPv6 Snooping

Configure the number of binding entries of DHCPv6 snooping. You can limit the maximum number of dynamic entries to be learned by the port to prevent them from occupying too many resources.

Table 4 Configuring Number of Binding Entries of Port DHCPv6 Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the number of binding entries of DHCPv6 snooping	<b>ipv6 dhcp snooping max-learning-num</b> <i>number</i>	Mandatory  By default, 1024 binding entries can be learned by the port.

### 88.2.2 Configure DHCPv6 Snooping Option18/37

The DHCPv6 snooping function supports Option18 and Option37, both of which support the default and extended fill format.

#### Configuration Condition

Before configuring the DHCP snooping Option18 and Option37, do the following:

- Enable the DHCPv6 snooping function.

## Configure Option18

The content of Interface ID has two types of fill format, i.e. default and extended. The fill format of the default Interface ID content is shown as follows:

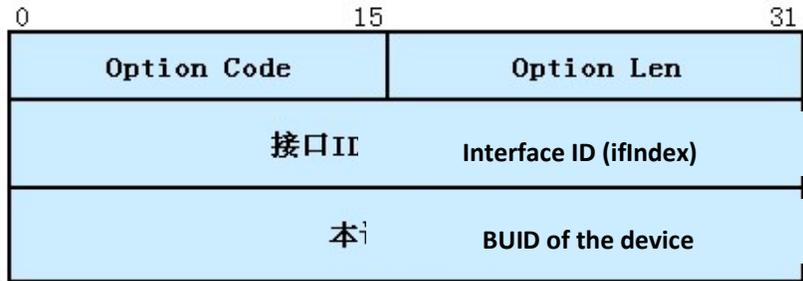

Figure 88 Fill Format of Default Interface ID Content

For the extended fill format, the fill format needs to be configured to take effect under user configuration format. The extended fill format of the Interface ID content is shown as follows:

Figure 88 Extended Fill Format of Interface ID

Table 5 Configuring Option18

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect

Step	Command	Description
		only within the aggregation group.
Enable the Option18 function	<b>ipv6 dhcp snooping option interface-id enable</b>	Mandatory By default, the Option18 function is disabled.
Configure the content of Interface ID option	<b>ipv6 dhcp snooping option format interface-id <i>string</i></b>	Optional By default, the content of Interface ID in Option18 is in interface id - duid format.

### Configure Option37

The content of Remote ID has two types of fill format, i.e. default and extended. The default fill format of Remote ID is shown as follows:

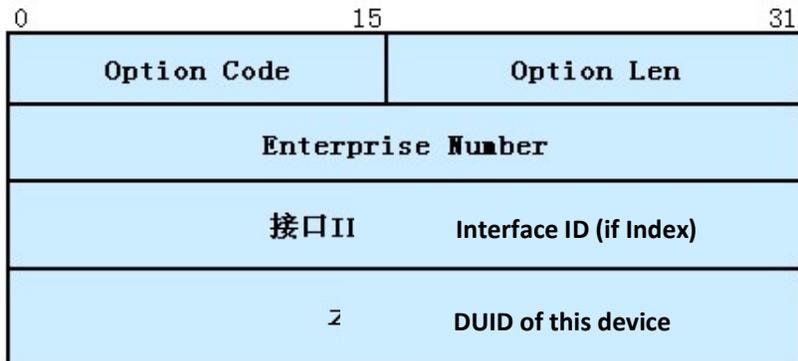

Figure 88 Fill Format of Default Remote ID Content

For the extended fill format, the fill format needs to be configured to take effect under user configuration format. The extended fill format of the Remote ID content is shown as follows:

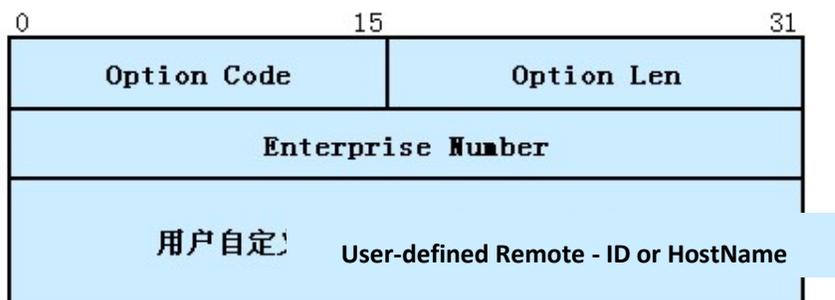

Figure 1 Fill Format of Non-default Remote ID Content

Table 6 Configuring Option37

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable the Option37 function	<b>ipv6 dhcp snooping option remote-id enable</b>	Mandatory By default, the Option37 function is disabled.
Configure Content of Remote ID	<b>ipv6 dhcp snooping option format remote-id</b> { <i>string</i>   <b>hostname</b> }	Mandatory By default, the content of Remote ID in Option37 is in enterprise num - interface id-duid format.

Configure the packet processing policy of Option18/37. You may take different processing policies for the DHCPv6 request packets containing Option18/37.

Table 7 Configuring Packet Processing Policy of Option18/37

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Packet Processing Policy of Option18/37	<b>ipv6 dhcp snooping option policy replace</b>	Mandatory  By default, the content of Option18/37 in DHCPv6 request packets is not replaced.

### 88.2.3 Configure Delay Time of Deleting Invalid Entries of DHCPv6 Snooping

#### Configuration Condition

Before configuring the delay time of deleting invalid binding entries for DHCPv6 snooping, do the following:

- Enable the DHCPv6 snooping function.

#### Configure Delay Time of Deleting Invalid Entries of DHCPv6 Snooping

After the binding relation is cancelled, the binding entries are updated as invalid. These invalid entries will not be deleted until the delay time expires. During this period of time, if the client renews the lease, they can be reactivated without reestablishing binding entries.

Table 8 Configuring Delay Time of Deleting Invalid Entries of DHCP Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Delay Time of Deleting Invalid Entries of DHCPv6 Snooping	<b>ipv6 dhcp snooping database timeout</b> <i>seconds</i>	Mandatory By default, the delay time of deleting invalid binding entries is 300 seconds.

## 88.2.4 Configure Storage of Binding Entries of DHCPv6 Snooping

The DHCPv6 snooping function supports automatic storage of binding entries in FLASH. If the device restarts, the stored binding entries can be restored to prevent the communication from being affected due to the loss of binding entries.

### Configuration Condition

Before configuring the storage of binding entries of DHCPv6 snooping, do the following:

- Enable the DHCPv6 snooping function.

### Configure Storage of Binding Entries of DHCPv6 Snooping

The system periodically refreshes the binding entries of DHCPv6 snooping to detect whether the binding entries have been updated. If yes, the updated entries will be automatically stored in the specified path after the storage delay expires. At the same time, the binding entries may also be stored in FLASH immediately.

Table 9 Configuring Storage of Binding Entries of DHCPv6 Snooping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the refresh interval of binding entries of DHCPv6 snooping	<b>ipv6 dhcp snooping database save pool</b> <i>seconds</i>	Optional By default, the refresh interval of binding entries is 30 seconds.
Configure the storage delay of binding entries of DHCPv6 snooping	<b>ipv6 dhcp snooping database save interval</b> <i>seconds</i>	Optional By default, the binding entries storage delay is 1800 seconds.

Step	Command	Description
Configure to perform storage of binding entries immediately	<b>ipv6 dhcp snooping database save now</b>	Optional By default, the storage delay of binding entries is 1800 seconds.
Configure the storage of binding entries of DHCPv6 snooping in the specified file	<b>ipv6 dhcp snooping database save filename</b> <i>string</i>	Mandatory By default, the name of the storage file is "/flash/dhcpv6sp_binding.db".

## 88.2.5 DHCPv6 snooping monitoring and maintaining

Table 10 DHCPv6 Snooping Monitoring and Maintaining

Command	Description
<b>clear ipv6 dhcp snooping database</b> [ <b>interface</b> { <i>interface-list</i> }   <b>ipv6-address</b> <i>ipv6-address</i>   <i>mac-address</i>   <b>vlan</b> <i>vlan-id</i> ]	Clear binding entries of DHCPv6 Snooping
<b>clear ipv6 dhcp snooping statistics</b> [ <b>interface</b> { <i>interface-name</i> } ]	Clear the statistics of receiving and sending DHCPv6 packets
<b>show ipv6 dhcp snooping</b> [ <b>interface</b> { <i>interface-name</i> } ]	#Show DHCPv6 Snooping-related configuration information on the specified interface
<b>show ipv6 dhcp snooping database</b> [   { <b>begin</b>   <b>exclude</b>   <b>include</b> } <i>expression</i>   <b>redirect</b> { <b>file</b> <i>file-name</i>   <b>ftp</b> [ <b>vrf</b> <i>vrf-name</i> ] { <i>hostname</i>   <i>dest-ip-address</i> } <i>ftp-username</i> <i>ftp-password</i> <i>file-name</i> } } ] [ <b>interface</b> { <i>interface-name</i> }   <b>ipv6-address</b> <i>ipv6-address</i>   <b>mac-address</b> <i>mac-address</i>   <b>vlan</b> <i>vlan-id</i> ] [   { <b>begin</b>   <b>exclude</b>   <b>include</b> } <i>expression</i>   <b>redirect</b> { <b>file</b> <i>file-name</i>   <b>ftp</b> [ <b>vrf</b> <i>vrf-name</i> ] { <i>hostname</i>   <i>dest-ip-address</i> } <i>ftp-username</i> <i>ftp-password</i> <i>file-name</i> } } ] ]	Show the information of binding entries of DHCPv6 Snooping
<b>show ipv6 dhcp snooping statistics</b> [ <b>interface</b> { <i>interface-name</i> } ]	Show the statistics of receiving and sending DHCPv6 packets

## 88.3 Typical configuration example of DHCPv6 Snooping

### 88.3.1 Configure Basic Functions of DHCPv6 Snooping

#### Network Requirements

- DHCPv6 Server1 is a legitimate DHCPv6 server, and DHCPv6 Server2 is an illegal DHCPv6 server.
- After the DHCPv6 snooping function is configured, both PC1 and PC2 can obtain addresses from DHCPv6 Server1 only.

#### Network Topology

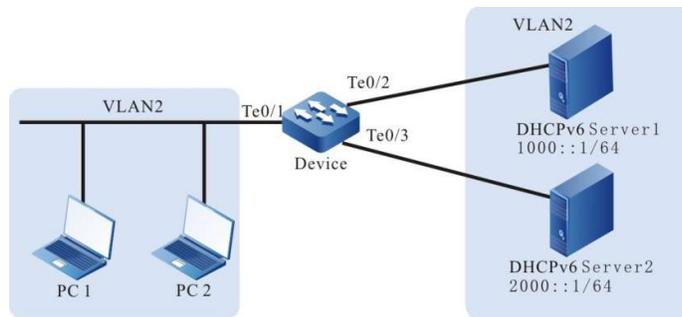

Figure 2 Network Topology for Configuring Basic Functions of DHCPv6 Snooping

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

```
#Create VLAN 2.  
Device#configure terminal  
Device(config)#vlan 2  
Device(config-vlan2)#exit
```

#Configure the link type of ports tengigabitethernet0/1~tengigabitethernet0/3 as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface tengigabitethernet 0/1-0/3  
Device(config-if-range)#switchport mode access  
Device(config-if-range)#switchport access vlan 2  
Device(config-if-range)#exit
```

Step 2: Configure the address pool of DHCPv6 Server1 as 1000::2/64 and that of DHCP Server2 as 2000::2/64. (omitted)

Step 3: Configure the DHCPv6 Snooping function on the Device.

#Enable the DHCPv6 snooping function.

```
Device(config)#ipv6 dhcp snooping enable
```

#Configure the port tengigabitethernet0/2 as a trusted port.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-tengigabitethernet0/2)#ipv6 dhcp snooping trust
Device(config-if-tengigabitethernet0/2)#exit
```

Step 4: Check the result.

#After both PC1 and PC2 successfully obtain the address, view the entries of DHCPv6 Snooping on the Device.

```
Device#show ipv6 dhcp snooping database
Interface-Name  MAC-Address  VLAN-ID  ValidTime  AgedTime  IP-Address
te0/1          0001.0001.0008  2       120       0       1000::2
te0/1          0001.0001.0007  2       120       0       1000::3
```

Both PC1 and PC2 can obtain addresses from DHCPv6 Server1 only.

# 89 Dynamic ARP Inspection

---

## 89.1 Overview

Dynamic ARP Inspection is called DAI function for short. It can increase network security by detecting the legality of ARP (Address Resolution Protocol) packets to discover and prevent ARP spoofing attack. The DAI function has two types:

- Port DAI: Detect the legality of the ARP packets received by the specified port to discover and prevent ARP spoofing attack;

The legality of ARP packets is checked according to the binding entries of port IP Source Guard. The specific principle is shown below:

For the ARP packets received, if the IP address of sending end, source MAC address and VLAN ID fully match the entries bound to the ARP Check of the port, these ARP packets are legal and forwarded; otherwise, they are illegal and discarded, and the log information is recorded.

- Global DAI: Detect the legality of all ARP packets received by the port to prevent fake users from sending fake ARP packets so that the device establishes incorrect ARP entries.

The legality of ARP packets is checked according to the binding entries of global IP Source Guard. The specific principle is shown below:

For the ARP packets received, if the IP address of sending end is the same as that in the binding entries of global IP Source Guard yet the MAC address is different, these ARP packets are considered fake and discarded, and the log information is not recorded.

The port DAI and global DAI function can also check the legality of ARP packets. The specific principle is shown below:

If the source MAC address in the ARP packets received is different from the MAC address of the sending end, these packets are invalid ones and discarded, and the log information is not recorded.

- Detection of port ARP attack: record the log information instead of detecting the legality of the ARP packets received by the specified to look for ARP attack.

## 89.2 Dynamic ARP Inspection function configuration

Table 89-1 Dynamic ARP Inspection Function Configuration List

Configuration Task	
Configure Dynamic ARP Inspection Function of Port	Configure Dynamic ARP Inspection Function of Port
Configure Global Dynamic ARP Inspection Function	Configure Global Dynamic ARP Inspection Function

### 89.2.1 Configure Dynamic ARP Inspection Function of Port

#### Configuration Condition

Before configuring Dynamic ARP Inspection function of port, the following tasks should be completed:

- Configure binding entries for port IP Source Guard.

#### Configure Dynamic ARP Inspection Function of Port

After the port DAI function is enabled, the system will check the legality of the ARP packets received by this port according to the binding entries of port IP Source Guard. Illegal packets will be discarded and recorded in the log.

The content recorded in the log includes VLAN ID, receiving port, IP address of sending end, destination IP address, MAC address of sending end, destination MAC address, and the number of identical ARP packets. Users may make further analysis according to the log information recorded, such as locating the host initiating ARP attack.

By default, log information is output on a periodic basis. The recording, output and aging of packets can be controlled by configuring log output interval. Log output interval serves as the basic value of the following log-related parameter:

- Log refresh cycle: Identify whether the log needs to be output or has been aged. If the log output interval configured is less than 5 seconds, the log refresh cycle is 1 second; otherwise, the log refresh cycle is one fifth of the log output interval;
- Log aging time: After the aging time expires, the log will be deleted. The log aging time is twice the log output interval;
- Log token: During the log refresh cycle, the allowable maximum number of logs. The number of log tokens is 15 times the value of log refresh cycle.

After the port DAI function is enabled, you can also configure rate limiting function for port ARP, i.e., limiting the number of ARP packets processed per second to prevent the system from processing a large number of ARP packets for a long time so that other protocol packets cannot be processed in a timely manner.

---

 **Note**

- The rate limiting function of port ARP, i.e. limiting the number of ARP packets processed per second to prevent the system from processing a large number of ARP packets for a long time so that other protocol packets cannot be processed in a timely manner. When the number of ARP packets received in one second exceeds the upper limit of rate, subsequent ARP packets received will be discarded. If the ARP packets continuously received by the port in 20 seconds all exceed the rate limit, corresponding port will be closed to isolate the source of packet impact.
- 

Table 89 Configuring Dynamic ARP Inspection of the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable the DAI function of the port	<b>ip arp inspection</b>	Mandatory  By default, the DAI function of the port is disabled.

Step	Command	Description
Configure the upper limit of processing ARP packets by the port	<b>ip arp inspection rate-limit</b> <i>limit-value</i>	Optional By default, the upper limit of processing ARP packets by the port is 15pps.
Return to the global configuration mode	<b>exit</b>	-
Configure the number of cache logs	<b>ip arp inspection log-buffer</b> <i>buffer-size</i>	Optional By default, the system can cache 32 logs. If it is configured as 0, no log is cached, i.e. the log is directly output to the terminal after an illegal ARP packet is detected.
Configure the log output interval	<b>ip arp inspection log-interval</b> <i>seconds</i>	Optional By default, the log output interval is 20 seconds. If it is configured as 0, the log is output immediately, i.e. the log is directly output to the terminal after an illegal ARP packet is detected.
Configure the log output level	<b>ip arp inspection log-level</b> <i>log-level</i>	Optional By default, the log output level is 6.

## Note

- After the DAI function is enabled, all the ARP packets (broadcast and unicast ARP) received by corresponding port are redirected to CPU for detection, software forwarding and log recording. When there are a large number of ARP packets, they will consume a lot of CPU resources. Therefore, when the device communication is normal, enabling the DAI function of the port is not recommended. Only when you suspect ARP spoofing attack occurs in the network will the DAI function of the port be enabled for detection and locating.
- Under the same port, the port DAI function cannot be enabled simultaneously with the port

---

security function.

- After configuring the upper limit of the rate of APR packet processed by the port in aggregation group configuration mode, it is applicable to each member port of the aggregation group.
  - If the ARP packets received by the port in 20 consecutive seconds exceed the upper limit, and the port is not closed automatically, you should refer to Error-Disable-related chapters in the User Manual.
- 

## 89.2.2 Configure Global Dynamic ARP Inspection Function

### Configuration Condition

Before configuring global Dynamic ARP Inspection function, the following tasks should be completed:

- Configure the binding entries of global IP Source Guard.

### Configure Global Dynamic ARP Inspection Function

After the global DAI function is enabled, the system will check the legality of the ARP packets received by this port according to the binding entries of global IP Source Guard. Illegal packets will be discarded directly without being recorded in the log.

Table 1 Configuring Global Dynamic ARP Inspection Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable global DAI function	<b>arp-security</b>	Mandatory By default, the global DAI function is disabled.

## 89.2.3 Configure Dynamic ARP Inspection to Detect ARP Attack

### Configuration Condition

None

### Configure Dynamic ARP Inspection to detect ARP attack

After ARP attack detection is enabled, the system will record log instead of checking the legality of ARP packets received.

Table 89-4 Configuring Dynamic ARP Inspection to Detect ARP Attack

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable ARP attack detection of the port	<b>ip arp inspection attack</b>	Mandatory  By default, ARP attack detection is disabled on the port.

## 89.2.4 Dynamic ARP Inspection Monitoring and Maintaining

Table 89-5 Dynamic ARP Inspection Monitoring and Maintaining

Command	Description
<b>clear ip arp inspection</b> { <b>log-information</b>   <b>log-statistics</b>   <b>pkt-statistics</b> [ <b>interface</b> { <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> } ] }	Delete the statistics of DIA function record
<b>show arp-security</b>	Show the status of global DAI function
<b>show ip arp inspection</b> [ <b>interface</b> { <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> } ]	Show the configuration information of port DAI function

Command	Description
<b>show ip arp inspection log-information</b>	Show the log information of port DIA function record
<b>show ip arp inspection log-statistics</b>	Show the statistics of the number of logs
<b>show ip arp inspection pkt-statistics</b> [ <b>interface</b> { <i>interface-name</i>   <i>link-aggregation link-aggregation-id</i> } ]	Show the statistics of ARP packets

## 89.3 Typical Configuration Example of DAI

### 89.3.1 Configure Basic Functions of DAI

#### Network Requirements

- PC1 and PC2 access IP network through the Device.
- On the Device, configure the port DAI function to prevent from ARP attack and spoofing.

#### Network Topology

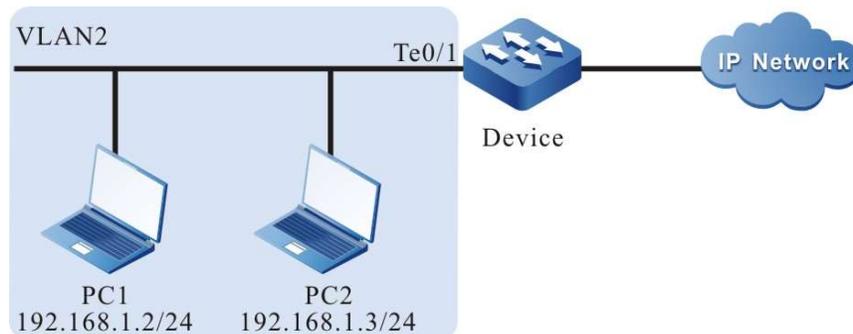

Figure 89 Network Topology for Configuring Basic Functions of DAI

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port tengigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```

Device(config)#interface tengigabitethernet 0/1
Device(config-if-tengigabitethernet0/1)#switchport mode access
Device(config-if-tengigabitethernet0/1)#switchport access vlan 2
Device(config-if-tengigabitethernet0/1)#exit

```

Step 2: Configure port DAI function on the Device.

#Enable the port DAI function on the port tengigabitethernet0/1, and configure the upper limit of processing ARP packets by this port as 30pps.

```

Device(config)#interface tengigabitethernet 0/1
Device(config-if-tengigabitethernet0/1)#ip arp inspection
Device(config-if-tengigabitethernet0/1)#ip arp inspection rate-limit 30
Device(config-if-tengigabitethernet0/1)#exit

```

Step 3: Configure binding entries on the Device.

#On the port gigabitethernet0/1, configure the binding entries of port IP Source Guard with MAC address of 0012.0100.0001, IP address of 192.168.1.2, and VLAN of 2.

```

Device(config)#interface tengigabitethernet 0/1
Device(config-if-tengigabitethernet0/1)#ip source binding ip-address 192.168.1.2 mac-address 0012.0100.0001 vlan 2
Device(config-if-tengigabitethernet0/1)#exit

```

Step 4: Check the result.

#View DHCP-related configuration information.

```

Device#show ip arp inspection
Dynamic ARP Inspection information:
Dynamic ARP Inspection log buffer size: 30
Dynamic ARP Inspection log Interval: 20
Dynamic ARP Inspection log Level: 6
Dynamic ARP Inspection interface information :
-----
interface      status  rate-limit(pps)  attack
te0/1          enable  30                OFF
te0/2          disable 15                OFF
.....

```

#When the port tengigabitethernet0/1 receives ARP packets at a rate which is more than 30pps, the Device will discard the packets that exceed the rate and output the following prompt messages.

```

Jan 1 02:21:06: The rate on interface tengigabitethernet0/1 too fast ,the arp packet drop!

```

#When the port tengigabitethernet0/1 receives ARP packets at a rate which is more than 30pps for 20 seconds, the Device will close this port and output the following prompt messages.

```

Jan 1 02:21:26: %LINK-INTERFACE_DOWN-4: interface tengigabitethernet0/1, changed state to down
Jan 1 02:21:26: The rate of arp packet is too fast,dynamic arp inspection shut down the tengigabitethernet0/1 !

```

#Whe the ARP packets received by the port tengigabitethernet0/1 are inconsistent with the binding entries, the Device records the illegal information in the following format in the DAI log and output it periodically.

Jan 1 07:19:49: SEC-7-DARPLOG: sender IP address: 192.168.1.3 sender MAC address:0011.0100.0001 target IP address: 0.0.0.0 target MAC address:0000.0000.0000 vlan ID:2 interface ID: tengigabitethernet0/1 record packet :32 packet(s)

#View DAI log.

```
Device#show ip arp inspection log-information
LogCountInBuffer:1
```

```
SEC-7-DARPLOG: sender IP address: 192.168.1.3 sender MAC address:0011.0100.0001 target IP address: 0.0.0.0 target MAC
address:0000.0000.0000 vlan ID:2 interface ID: tengigabitethernet0/1 record packet :0 packet(s)
```

## 89.3.2 Combination of DAI with DHCP Snooping

### Network Requirements

- PC1 and PC2 access the IP Network through Device1, with PC2 being a DHCP client and Device2 being a DHCP relay.
- On Device1, configure DHCP Snooping and port DAI function so that PC2 instead of PC1 can normally access the IP Network.

### Network Topology

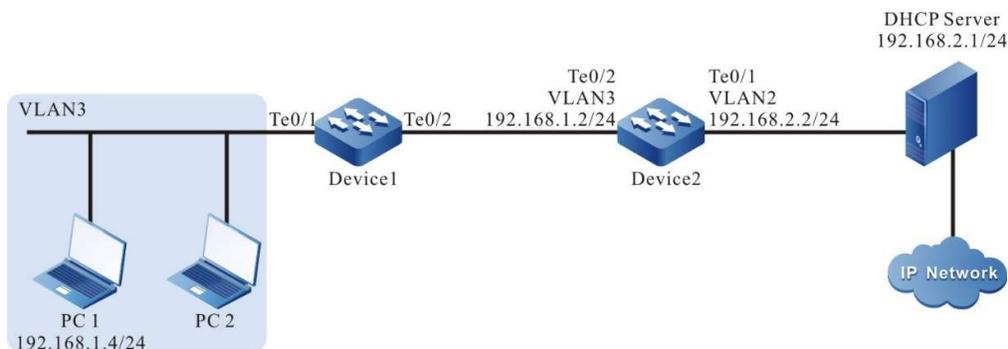

Figure 89 Network Topology for Combination of DAI and DHCP Snooping

### Configuration Steps

Step 1: Configure VLAN and port link type on Device1.

#Create VLAN3.

```
Device1#configure terminal
Device1(config)#vlan 3
Device1(config-vlan3)#exit
```

#Configure the link type of both tengigabitethernet0/1 and tengigabitethernet0/2 as Access, permitting the services of VLAN3 to pass.

```
Device1(config)#interface tengigabitethernet 0/1-0/2
Device1(config-if-range)#switchport access vlan 3
Device1(config-if-range)#exit
```

Step 2: Configure VLAN and port link type on Device2.

#Create VLAN2 and VLAN3.

```
Device2#configure terminal
Device2(config)#vlan 2-3
```

#Configure the link type of port tengigabitethernet0/1 and tengigabitethernet0/2 as Access. Port tengigabitethernet0/1 allows the services of VLAN2 to pass and tengigabitethernet0/2 allows the services of VLAN3 to pass.

```
Device2(config)#interface tengigabitethernet 0/1
Device2(config-if-tengigabitethernet0/1)#switchport mode access
Device2(config-if-tengigabitethernet0/1)#switchport access vlan 2
Device2(config-if-tengigabitethernet0/1)#exit
Device2(config)#interface tengigabitethernet 0/2
Device2(config-if-tengigabitethernet0/2)#switchport mode access
Device2(config-if-tengigabitethernet0/2)#switchport access vlan 3
Device2(config-if-tengigabitethernet0/2)#exit
```

Step 3: Configure corresponding VLAN interface and IP address on Device1 and Device2. (Omitted)

Step 4: Configure DHCP Snooping function on Device1.

#Enable the DHCP Snooping function and configure gigabitethernet0/2 as a trusted port.

```
Device1(config)#dhcp-snooping
Device1(config)#interface tengigabitethernet 0/2
Device1(config-if-tengigabitethernet0/2)#dhcp-snooping trust
Device1(config-if-tengigabitethernet0/2)#exit
```

Step 5: Configure port DAI function on Device1.

#On the port tengigabitethernet0/1, enable the port DAI function.

```
Device1(config)#interface tengigabitethernet 0/1
Device1(config-if-tengigabitethernet0/1)#ip arp inspection
Device1(config-if-tengigabitethernet0/1)#exit
```

Step 6: Configure the IP address of DHCP relay server on Device2.

#Configure the IP address of DHCP relay server as 198.168.2.1.

```
Device2(config-if-vlan3)ip dhcp relay
Device2(config-if-vlan3)ip dhcp relay server-address 192.168.2.1
```

Step 7: Check the result.

#After PC2 successfully obtains the address, view the dynamic entries of DHCP Snooping on Device1.

```
Device1#show dhcp-snooping database
dhcp-snooping database:
database entries count:1
database entries delete time :300
-----
macAddr    ipAddr    transion-id  vlan  interface  leaseTime(s)  status
0013.0100.0001 192.168.1.100  2      2    te0/1      107990        active
-----
```

#PC2 instead of PC1 can normally access the IP Network.

# 90 Host Guard

---

## 90.1 Overview

Host Guard is mainly used for the device in the access layer to prevent the ARP (Address Resolution Protocol) packets counterfeited by the attacker from damaging the ARP table on the terminal device. The host IP address protected by Host Guard generally corresponds to the IP address of the gateway device and important server in the network.

For the Host Guard function, there are two concepts:

- Host protection group: It is composed of a series of host protection group rules, i.e. the set of protected host IP address;
- Host protection group rule: A protected host IP address.

The working principle of Host Guard function is shown below:

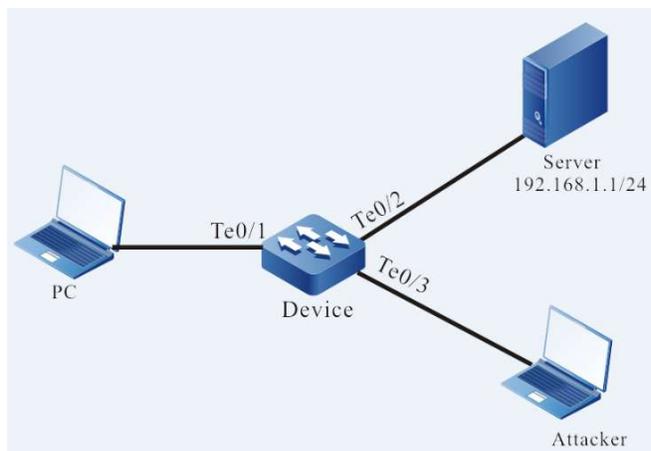

Figure 90 Functions of Host Guard

As shown in the figure above, the Attacker can use the IP address 192.168.1.1 of the Server to counterfeit ARP packets that will be forwarded to PC through the Device and damage the ARP table on the PC so that it cannot normally access the Server.

On the Device, after applying the IP address 192.168.1.1 of the Server to the port te0/2 as a host protection group rule, when among the ARP packets received by the Device, the IP address at the sending end is the same as that in the Server, if the receiving port is te0/2, the packets can be processed with normal methods; if not, they will be discarded. That is to say, the ARP packets sent by the Server can be forwarded through the port te0/2 only, and those counterfeited by the Attacker will be discarded.

## 90.2 Host Guard Function Configuration

Table 90-1 Host Guard Function Configuration List

Configuration Task	
Configure Host Guard Function	Configure Host Protection Group
	Configure Application of Host Protection Group

### 90.2.1 Configure Host Guard Function

#### Configuration Condition

None

#### Configure Host Protection Group

The host protection group is composed of a series of host protection group rules. The IP address of gateway and important server in the network can be configured as a rule in the host protection group.

Table 90-2 Configure Host Protection Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create host protection group	<b>host-guard group <i>group-name</i></b>	Mandatory By default, no host protection group is created.
Configure host protection group rules	<b>permit host <i>ip-address</i></b>	Mandatory

Step	Command	Description
		By default, the host protection group rules are not configured.

## Note

- Each host protection can support 128 rules at most.

### Configure Application of Host Protection Group

Apply the host protection group to the port to monitor the ARP packets received and protect the ARP table.

Table 90 Configuring Application of Host Protection Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Application of Host Protection Group	<b>host-guard binding</b> <i>group-name</i>	Mandatory  By default, there is no host protection group applied on the port or aggregation group.

## 90.2.2 Host Guard Monitoring and Maintaining

Table 90 Host Guard Monitoring and Maintaining

Command	Description
<b>show host-guard binding</b> [ <b>interface</b> <i>interface-id</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> ]	Show the application information of host protection group
<b>show host-guard group</b> [ <i>group-name</i> ]	Show the configuration information of host protection group and its rules

# 91 AAA

---

## 91.1 Overview

AAA means Authentication, Authorization, and Accounting. Since the birth of network, Authentication, Authorization and Accounting system has become the foundation of its operation. The use of various resources in the network needs to be managed by Authentication, Authorization and Accounting. Generally, AAA adopts the client/server structure. The client is running on NAS (Network Access Server), and the server is used for centralized management of user information. NAS is a server for users and a client for the server.

In particular, Authentication means to confirm the identity of users when they use the resources in the network system. During this process, the identity information obtained through interaction with users is submitted to the authentication server; the latter checks the identity information with the user information in the database, and then confirm whether users' identities are correct according to the processing result. Authorization means the network system authorizes users to use its resources in a specific way. This process specifies the services and permissions that the authenticated user can use and own after accessing the network, such as the IP address assigned. Accounting means the network system collects and records users' use of the network resources so as to charge fees from users for their use of the resources or use it for the purpose of auditing.

RADIUS (Remote Authentication Dial-In User Service) is a C/S-structured protocol. Its client was a NAS server at the beginning. RADIUS protocol authentication mechanism is flexible. It can use PAP, CHAP or Unix login. RADIUS is an extensible protocol, and all of its work is based on the vector of Attribute-Length-Value. The basic working principle of RADIUS is as follows: after users access the NAS, the NAS submits user information to the RADIUS server using data packet Access-Require, including user name, password and other related information. In particular, the user password is MD5 encrypted. The two parties use a shared key which is not propagated through network. The RADIUS server checks the legality of the user name and password, and when necessary, it can put forward a challenge to request further user authentication or similar authentication for the NAS. If it is legal, return the data packet Access-Accept to the NAS, allowing the user to proceed to the next step. Otherwise, it will return the data packet Access-Reject and deny user access. If the access is allowed, the NAS will request Account-Require to the RADIUS server which will give a response of Account-Accept prior to user statistics. At the same time, users can perform their own operations.

TACACS (Terminal Access Controller Access Control System) is an old authentication protocol for Unix network. It allows remote access server to send user login password to the authentication server which determines whether the user can log in to the system. As an encryption protocol, TACACS has a lower security than the later TACACS+ and RADIUS. In fact, TACACS+ is a new protocol. It has superseded previous protocols with RADIUS in existing network. TACACS+ uses Transmission Control Protocol (TCP), and RADIUS applies User Datagram Protocol (UDP). RADIUS combines authentication and authorization from the perspective of users, while TACACS+ separates them.

## 91.2 AAA Function Configuration

Table 91-1 AAA Function Configuration List

Configuration Task	
Configure AAA Domain	Configure ISP Domain
Configure Authentication Function under AAA Domain	Configure Default, Login and Dot1x Authentication Method under ISP Domain
Configure Authorization Function under AAA Domain	Configure Default, Login and Commands Authorization Method under ISP Domain
Configure Accounting Function under AAA Domain	Configure Default, Login, Dot1x and Commands Accounting Method under ISP Domain
Configure Authentication Method of Entering Privileged Mode	Configure Authentication Method of Entering Privileged Mode
Configure to Enable Command Line Authorization	Configure to Use Command Line Authorization
	Configure to Use Console Authorization
Configure System Accounting Function	Configure System Event Accounting Method
Configure Statistics-related Properties	Configure to Close Accounting of Empty User Name
	Configure Sending of Accounting Update Packet
	Configure Method of Sending Accounting Failure for Processing
Configure RADIUS Program	Configure RADIUS Server
	Configure RADIUS-related Properties

Configuration Task	
	Configure to Send Source Address of RADIUS Packet
Configure TACACS Program	Configure TACACS Server
	Configure to Send Source Address of TACACS Packet

### 91.2.1 Configure AAA Domain

**Domain:** NAS manages users based on ISP (Internet Service Provider) domain. Each user belongs to an ISP domain. Generally, the ISP domain to which the user belongs is determined by the user name provided by the user at the time of login. By default, the system has a system domain. You can configure the authentication, authorization and charging method of each type of access user under the domain.

The solution for user and AAA management based on domain is described as follows:

NAS device manages users based on ISP domain. Generally, the ISP domain to which the user belongs is determined by the user name provided by the user at the time of login.

"User name input by user" = "user name understood by user" + "domain name"

During user authentication, the device identifies its domain by the following order, and then performs the AAA policy in the domain:

- 1) [Optional] Log in/access the authentication domain specified by module configuration;
- 2) ISP domain specified in the user name;
- 3) Default ISP domain of the system.

#### Configuration Condition

None

#### Configure ISP Domain

Table 91-2 Configuring AAA Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the view of ISP domain	<b>domain</b> <i>isp-name</i>	Optional. By default, the system has an ISP domain named system.
Exit the global configuration mode	<b>exit</b>	-
Configure the default ISP domain	<b>domain default enable</b> <i>isp-name</i>	Optional. By default, the default ISP domain of the system is system domain.

### 91.2.2 Configure Authentication Function under AAA Domain

AAA provides a series of authentication method to guarantee the security of device and network service. For example, prohibit illegal users from operating the device by authenticating user login; authenticate users' entering into the privileged mode and limit users' permission of using the device; authenticate PPP session connection and limit the establishment of illegal connection.

#### Configuration Condition

None

#### Configure the Authentication Method Under ISP Domain

When a user try to log in to a specific ISP domain, AAA can authenticate this user and prohibit the user from logging in to the ISP domain if it fails to pass the authentication.

Table 91 Configuring List of Authentication Methods under ISP Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the view of ISP domain	<b>domain</b> <i>isp-name</i>	Mandatory. By default, the system has an ISP domain named system.

Step	Command	Description
Configure the default authentication method under ISP domain	<b>aaa authentication default { none / local / radius-group <i>group-name</i> / tacacs-group <i>group-name</i> }</b>	Optional. By default, the default authentication method under ISP domain is local.
Configure the user login authentication method under ISP domain	<b>aaa authentication login { none / enable / local / radius-group <i>group-name</i> / tacacs-group <i>group-name</i> }</b>	Optional. By default, the login authentication method is not configured. The default authentication method under the domain is used.
Configure the dot1x authentication method under ISP domain	<b>aaa authentication dot1x { none / local / radius-group <i>group-name</i> / tacacs -group <i>group-name</i> }</b>	Optional. By default, the dot1x authentication method is not configured. The default authentication method under the domain is used.

### 91.2.3 Configure Authorization Function Under AAA Domain

After the successful authentication, the authorization function of AAA can control the administrator's permission of using device resources and the access of users to network resources, limit the administrator's execution of unauthorized command, and limit the access of users to unauthorized network resources.

#### Configuration Condition

For the command line authorization under the configuration domain, please enable command line authorization first to enable that configured under the domain to take effect.

#### Configure the Authorization Method under ISP Domain

When a user executes an authorized item under a specific ISP domain, AAA can authorize this user, grant permissions to it, and prohibit it from executing the authorized item under the domain if it fails to pass the authorization.

Table 91 Configuring List of Authorization Methods under ISP Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the view of ISP domain	<b>domain</b> <i>isp-name</i>	Mandatory.  By default, the system has an ISP domain named system.
Configure the default authorization method under ISP domain	<b>aaa authorization default</b> { <b>if-authenticated</b> / <b>local</b> / <b>none</b> / <b>radius-group</b> <i>group-name</i> / <b>tacacs-group</b> <i>group-name</i> }	Optional.  By default, the authorization method under ISP domain is none.
Configure the authorization method of commands under ISP domain	<b>aaa authorization commands</b> <i>cmd-lvl</i> { <b>if-authenticated</b> / <b>none</b> / <b>radius-group</b> <i>group-name</i> / <b>tacacs-group</b> <i>group-name</i> }	Optional.  By default, the authorization method of commands under ISP domain is not configured. The authorization method under the domain is none.  To enable this configuration to take effect, you must enable the command authorization function.
Configure the user login authorization method under ISP domain	<b>aaa authorization login</b> { <b>if-authenticated</b> / <b>local</b> / <b>none</b> / <b>radius-group</b> <i>group-name</i> / <b>tacacs-group</b> <i>group-name</i> }	Optional.  By default, the login authorization method under ISP domain is not configured. The default authorization method under the domain is used.

---

 **Note**

- aaa authorization commands and aaa authorization config-commands can be configured in any order.
- 

### 91.2.4 Configure Accounting Function under AAA Domain

Users' use of commands on the device, login of sessions, network service conditions and system events can be summarized with the user-defined method. The result provides a basis for charging users.

#### Configuration Condition

None

#### Configure the Accounting Method Under ISP Domain

When a user successfully logs in to a certain ISP domain, AAA can account for this user, including start login time, end login time, and the commands input.

Table 91 Configuring Accounting Methods under ISP Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the view of ISP domain	<b>domain</b> <i>isp-name</i>	Mandatory. By default, the system has an ISP domain named system.
Configure the accounting method of command lines under ISP domain	<b>aaa accounting commands</b> <i>cmd-lvl</i> { [ <b>broadcast</b> ] <b>tacacs-group</b> <i>group-name</i> }	Optional. By default, the command accounting method is not configured, and command accounting is not conducted.
Configure the default accounting	<b>aaa accounting default</b> { <b>none</b>   { <b>start-stop</b>   <b>stop-only</b>   <b>wait-start</b> [ <b>broadcast</b> ] }	Optional. By default, the accounting

Step	Command	Description
method under ISP domain	<b>{ radius-group group-name / tacacs-group group-name }}</b>	method under ISP domain is none.
Configure the user login accounting method under ISP domain	<b>aaa accounting login{ none   { start-stop   stop-only   wait-start [ broadcast ] { radius-group group-name / tacacs-group group-name } } }</b>	Optional. By default, the login accounting method under ISP domain is not configured. The default accounting method under ISP domain is used.
Configure the dot1x accounting method under ISP domain	<b>aaa accounting dot1x { none   { start-stop   stop-only   wait-start [ broadcast ] { radius-group group-name / tacacs-group group-name } } }</b>	Optional. By default, the dot1x accounting method under ISP domain is not configured. The default accounting method under ISP domain is used.

### 91.2.5 Configure the Authentication Method of Entering Privileged Mode

After the user successfully logs in to the device, AAA can input enable command for the user to enter the privileged mode for authentication and prohibit the user who fails to pass the authentication from entering the privileged mode.

#### Configuration Condition

None

#### Configure the Privileged Mode Authentication Method

Table 91 Configuring Privileged Mode Authentication Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the privileged mode	<b>aaa authentication enable-method { none / enable / radius-</b>	Optional.

Step	Command	Description
authentication method	<b>group</b> <i>group-name</i> / <b>tacacs-group</b> <i>group-name</i> }	By default, the privileged mode authentication method is enable.

---

### Note

- When using the RADIUS authentication method, the password of the user name in the format of \$enableLEVEL\$ is used as the authentication password. In particular, LEVEL means the user level entered by current user. Its value ranges from 0 to 15, with level 15 being the highest.
- 

## 91.2.6 Configure to Enable Command Line Authorization

### Configuration Condition

None

### Configure to Use Command Line Authorization

The device has commands with levels from 0 to 15. Command authorization is used to determine the level of command used by the user through the authorization method, and restrict the user from using the command higher than current level.

Table 91 Enabling Command Authorization in Global Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable command line authorization	<b>aaa authorization config-commands</b>	Mandatory. By default, the command line authorization function is closed.

### Configure to Use CONSOLE Authorization

To restrict access to the CONSOLE port, you can enable CONSOLE port authorization and activate the command authorization function. After that, the device will authorize the commands executed by the CONSOLE port.

Table 91 Configuring to Use Console Authorization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to Use Console Authorization	<b>aaa authorization console</b>	Mandatory. By default, the Console authorization is disabled.

### 91.2.7 Configure the System Event Accounting Function

Users may send the events like system start and restart to the server for accounting by configuring the system event accounting method.

#### Configuration Condition

None

#### Configure System Event Accounting Method

Table 91 Configuring List of System Event Accounting Methods

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure System Event Accounting Method	<b>aaa accounting system { none   { start-stop [broadcast] { tacacs-group group-name } } }</b>	Mandatory By default, the accounting of system event is not conducted.

---

 **Note**

- System event account supports TACACS protocol instead of RADIUS protocol.
- 

## 91.2.8 Configure Statistics-related Properties

### Configuration Condition

None

### Configure to Close Accounting of Empty User Name

Users may close the AAA's accounting of empty user names by configuring the command **aaa accounting suppress null-username**. By default, AAA's accounting of empty user names is enabled.

Table 1 Configuring to Close Accounting of Empty User Names

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to Close Accounting of Empty User Name	<b>aaa accounting suppress null-username</b>	Mandatory. By default, the accounting of empty user names is enabled.

### Configure Sending of Accounting Update Packet

Users can configure the method of sending accounting update packets, including real-time sending and periodic sending.

Table 91 Configuring Sending of Accounting Update Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure Sending of Accounting Update Packet	<b>aaa accounting update periodic interval</b>	Mandatory.  By default, the accounting update packets are not sent.

### Configure Method of Sending Accounting Failure for Processing

Table 91 Configuring Method of Sending Accounting Failure for Processing

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the method of sending accounting failure for processing	<b>aaa accounting start-fail {online   offline}</b>	Optional.  By default, users who fail to start the accounting cannot go online.

### 91.2.9 Configure RADIUS Program

To configure RADIUS program, you must first configure key parameters of the server.

#### Configuration Condition

None

#### Configure RADIUS Server

If AAA needs to use RADIUS for authentication, authorization and accounting, you are required to configure RADIUS server-related parameters, including server IP address, authentication/authorization port, accounting port, and shared key.

Before entering the RADIUS server, you need to configure a RADIUS server group. When quoting the server group name to configure the method list, you can use the RADIUS server group for authentication, authorization and accounting of users.

Table 2 Configuring RADIUS Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the RADIUS server group name (this command can also lead to the RADIUS server group configuration mode)	<b>aaa server group radius <i>group-name</i></b>	Mandatory. By default, the RADIUS server group name is not configured.
Configure RADIUS Server	<b>server {<i>ip-address</i> <i>ipv6 ip-address</i>} [ <b>acc-port</b> <i>acc-port-num</i> ] [ <b>auth-port</b> <i>auth-port-num</i> ] [ <b>priority</b> <i>priority</i> ] { <b>key</b> [ <b>0</b>   <b>7</b> ] <i>key</i> }</b>	Mandatory. By default, the RADIUS server is not configured.
Configure quiet period of RADIUS	<b>dead-time <i>dead-time</i></b>	Optional. By default, the quiet period of RADIUS server is 0, i.e. no quiet period.
Configure the maximum times of RADIUS retransmission	<b>retransmit <i>retries</i></b>	Optional. By default, the maximum times of retransmission by RADIUS server are 3.
Configure the response timeout time of RADIUS server	<b>timeout <i>timeout</i></b>	Optional. By default, the timeout time of waiting for the RADIUS server to respond is 5 seconds.
Configure not to check the TAG tag when resolving the tunnel attributes	<b>tunnel without-tag</b>	Optional. By default, TAG tag is required when resolving the tunnel attributes

Step	Command	Description
issued by the RADIUS server		issued by the RADIUS server
Configure the VRF to which the RADIUS server group belongs	<b>ip vrf forwarding</b> <i>vrf-name</i>	Optional. By default, the RADIUS server group belongs to the global VRF.

### Note

- The device selects the order of using the **RADIUS** server according to the **priority** value configured.
- Quiet period means that the device marks the **RADIUS** servers which give no response to the authentication request unavailable, and no longer gives request to these servers during the **dead time**.
- The shared keys configured on the device and the **RADIUS** server must be consistent.

## Configure RADIUS-related Properties

Table 91 Configuring Relevant Attributes of RADIUS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the value of service-type in the RADIUS packets for login authentication	<b>radius login service-type</b> <i>attr-value</i>	Optional By default, the value of service-type in RADIUS packet is 7.
Configure the maximum number of concurrent packets of NAS device and RADIUS server	<b>radius control-speed</b> <i>pck-num</i>	Optional By default, the maximum number of concurrent packets of NAS

Step	Command	Description
		device and RADIUS server is 100.

### Configure to Send Source Address of RADIUS Packet

Table 91 Configuring Source Address of Sending RADIUS Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the interface selected by the RADIUS source address	<b>ip radius source-interface</b> <i>interface-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	Optional By default, the device automatically selects source interface.

### Configure the Accounting-on Function Which Can Send RADIUS

The accounting-on function is mainly used to make all the online users on the specified RADIUS server offline when the AAA process is pulled up for the first time. By default, the accounting-on function is disabled; when the account-on function is enabled, the default retransmission interval is 6 seconds, and the maximum times of retransmission are 50; since the SPU of high-end device starts slow, it is recommended that the retransmission times and interval be no less than the default values.

Table 3 Configuring Accounting-on Function of RADIUS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RADIUS server group mode	<b>aaa server group radius</b> <i>group-name</i>	-
Configure the accounting-on function of RADIUS	<b>accounting-on enable</b> [ <i>interval seconds</i>   <b>send</b> <i>send-times</i> ]	Optional.

Step	Command	Description
		By default, the accounting-on function is disabled.

## 91.2.10 Configure TACACS Program

To configure TACACS program, you must first configure key parameters of the server.

### Configuration Condition

None

### Configure TACACS Server

After the TACACS server is configured, if AAA needs to use TACACS for authentication, authorization and accounting, you are required to configure TACACS server-related parameters, including server IP address, shared key, and server port number.

When quoting the server group name to configure the method, you can use the TACACS server group for authentication, authorization and accounting of users.

Table 4 Configuring TACACS Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the TACACS server group name (this command can also lead to the TACACS server group configuration mode)	<b>aaa server group tacacs <i>group-name</i></b>	Mandatory. By default, the TACACS server group name is not configured.
Configure TACACS Server	<b>server {<i>ip-address</i>   <b>ipv6</b> <i>ip-address</i>} [ <b>port</b> <i>port-num</i> ] [ <b>priority</b> <i>priority</i> ] { <b>key</b> [ <b>0</b>   <b>7</b> ] <i>key</i>}</b>	Mandatory. By default, the member server of TACACS server group is not configured.

Step	Command	Description
Configure the response timeout time of TACACS server	<b>timeout</b> <i>timeout</i>	Optional. By default, the timeout time of waiting for the TACACS server to respond is 5 seconds.
Configure the VRF attribute of TACACS server group	<b>ip vrf forwarding</b> <i>vrf-name</i>	Optional. By default, the TACACS server group belongs to the global VRF.

### Note

- You can execute `server {ip-address|ipv6 ip-address} [port port-num] [priority priority] {key [0 | 7] key}` multiple times to configure the multiple TACACS servers under the TACACS server group. The device will select servers by the configuring order for authentication. When a server fails, the device will automatically select the next one.
- The shared keys configured on the device and the TACACS server must be consistent.

### Configure to Send Source Address of TACACS Packet

Table 91 Configuring Source Address of Sending TACACS Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the interface selected by the TACACS source address	<b>ip tacacs source-interface</b> <i>interface-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	Optional. By default, the device automatically selects source interface.

## 91.2.11AAA Monitoring and Maintaining

Table 5 AAA Monitoring and Maintaining

Command	Description
<b>debug aaa { authentication   authorization   accounting   event   error   all }</b>	Turn on the AAA debugging information switch
<b>debug radius [details]</b>	Turn on the TACACS debugging information switch
<b>debug tacacs</b>	Turn on the TACACS debugging information switch
<b>show aaa configuration</b>	Show the information of AAA configuration
<b>show aaa module [dot1x   shell   shell-cmd   shell-web ]</b>	Show the function module of AAA and the result of operating AAA last time by this module
<b>show aaa server [ radius   tacacs ]</b>	Show the RADIUS/TACACS server configuration and status of AAA
<b>show aaa session [dot1x   shell   shell-web ]</b>	Show AAA statistics session
<b>show aaa source-address</b>	Show the source address used by AAA

## 91.3 Typical Configuration Example of AAA

### 91.3.1 Configure Telnet User Login for Local Authentication

#### Network Requirements

- Enable the Device to conduct local authentication for Telnet user login

#### Network Topology

Figure 91 Network Topology for Configuring Local Authentication for Telnet User Login

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure the Device.

#Configure both user name and password as admin1.

```
Device#configure terminal
Device(config)#local-user admin1 class manager
Device(config-user-manager-admin1)#service-type telnet
Device(config-user-manager-admin1)#password 0 admin1
Device(config-user-manager-admin1)#exit
```

#Configure the AAA authentication mode to local authentication.

```
Device(config)#domain system
Device(config-isp-system)#aaa authentication login local
Device(config-isp-system)#exit
```

#Configure Telnet session and enable AAA local authentication.

```
Device(config)#line vty 0 15
Device(config-line)#login aaa
Device(config-line)#exit
```

Step 4: Check the result.

When the client logs in to the Device through telnet, it can successfully go to the Shell user interface of the Device by inputting user name and password admin1.

## 91.3.2 Configure Telnet User Login for RADIUS Authentication, Authorization and

### Accounting

#### Network Requirements

- The Device is connected to the Telnet client and RADIUS server, and the IP route is reachable.
- The IP address of the RADIUS server is 2.0.0.2/24; the authentication and authorization port is 1812; the accounting port is 1813; the shared key is admin.
- When the Telnet user logs in to the Device, it needs to perform authentication, authorization, and accounting through the RADIUS server.

- When the RADIUS server fails, local authentication and authorization apply.

## Network Topology

Figure 911 Network Topology for Configuring RADIUS Authentication, Authorization and Accounting for Telnet User Login

## Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure the Device.

#Configure AAA to use RADIUS authentication/authorization and accounting.

---

### Note

- For authentication and authorization, first use the first method in the list of methods, and use the second method when the server fails.
- 

```
Device#configure terminal
Device(config)#domain system
Device(config-isp-system)#aaa authentication login radius-group radius-group local
Device(config-isp-system)#aaa authorization login radius-group radius-group local
Device(config-isp-system)#aaa accounting login start-stop radius-group radius-group
Device(config-isp-system)#exit
```

#Configure the RADIUS server: the authentication port is 1812; the accounting port is 1813; the shared key is admin.

```
Device(config)#aaa server group radius radius-group
Device(config-sg-radius-radius-group)#server 2.0.0.2 auth-port 1812 acct-port 1813 key admin
Device(config-sg-radius-radius-group)#exit
```

#Configure Telnet session and enable RADIUS authentication, authorization and accounting.

```
Device(config)#line vty 0 15
Device(config-line)#login aaa
Device(config-line)#exit
```

- Step 4: Configure the RADIUS server.

For the interface setting of RADIUS server, please see the help document of the server. The specific steps are shown below.

#Add user admin on the RADIUS server, set the password as admin, and configure the user level as 15.

#Set the IP address of the server as 2.0.0.2, shared key as admin, authentication port as 1812, and accounting port as 1813.

#Set the IP address of the client as 2.0.0.1 and shared key as admin.

Step 5: #Check the result, and verify authentication, authorization and accounting.

#After the Telnet user logs into the Device for successful authorization, show privilege to view the user priority, i.e. 15.

#Check the login and disconnection information on the RADIUS server.

### 91.3.3 Configure Telnet User Level Switch for RADIUS Authentication

#### Network Requirements

- The Device is connected to the Telnet client and RADIUS server, and the IP route is reachable.
- The IP address of the RADIUS server is 2.0.0.2/24; the authentication/authorization port is 1812; the shared key is admin.
- When the Telnet user logs in to the Device and the user level switches to 3 from 1, it needs to perform authentication through the RADIUS server.

#### Network Topology

Figure 91 Network Topology for Configuring RADIUS Authentication for Telnet User Level Switch

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure the Device.

#Configure user level switch for RADIUS authentication.

```
Device#configure terminal
Device(config)#aaa authentication enable-method radius-group radius-group
Device(config)#domain system
Device(config-isp-system)#aaa authentication login radius-group radius-group local
```

```
Device(config-isp-system)#exit
```

#Configure the RADIUS server: the authentication port is 1812; the shared key is admin.

```
Device(config)#aaa server group radius radius-group
Device(config-sg-radius-radius-group)#server 2.0.0.2 auth-port 1812 acct-port 1813 key admin
Device(config-sg-radius-radius-group)#exit
Device(config)#line vty 0 15
Device(config-line)#login aaa
Device(config-line)#exit
```

Step 4: Configure the RADIUS server.

For the interface setting of RADIUS server, please see the help document of the server. The specific steps are shown below.

#Add user name \$enab3\$ (user level 3), and set the password as admin.

---

### Note

- User level switch uses the user name authentication in the format of \$enabLEVEL\$. In particular, the uppercase LEVEL is the level to which the user intends to switch.
  - No authentication is required when the user level decreases.
- 

Step 5: Check the result.

Telnet users input user name and password according to the prompt. After login, the user level is 1 by default. After executing the command enable 3, input the password admin. After successful authentication by the RADIUS server, the user level switches to 3.

## 91.3.4 Configure TACACS Authorization and Accounting of SHELL Command

### Network Requirements

- Device and TACACS server are interconnected, and the route is reachable.
- The IP address of the TACACS server is 2.0.0.2/24; the service port is 49; the shared key is admin.
- After the Telnet client logs in to the Device, the SHELL command with a user level of 15 is required to be authorized by the TACACS server and recorded on the TACACS server.

### Network Topology

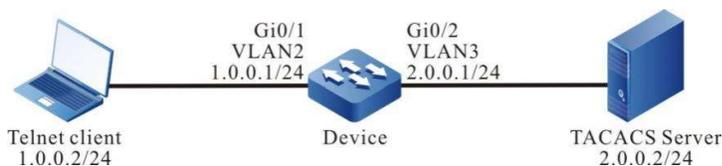

Figure 91 Network Topology for Configuring TACACS Authorization and Accounting for SHELL Command

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure the Device.

#Configure authorization and accounting of TACACS command.

---

 **Note**

- The authentication must succeed prior to authorization and accounting.
- 

```
Device#configure terminal
Device(config)#domain system
Device(config-isp-system)#aaa authentication login tacacs-group tacacs-group local
Device(config-isp-system)#aaa authorization commands 15 tacacs-group tacacs-group
Device(config-isp-system)#aaa accounting commands 15 tacacs-group tacacs-group
Device(config-isp-system)#exit
Device(config)#aaa authorization config-commands
```

#Configure the TACACS server: the service port is 49; the shared key is admin.

```
Device(config)#aaa server group tacacs tacacs-group
Device(config-sg-tacacs-tacacs-group)#server 2.0.0.2 port 49 key admin
Device(config-sg-tacacs-tacacs-group)#exit
```

#Configure Telnet session and enable TACACS authorization and accounting.

```
Device(config)#line vty 0 15
Device(config-line)#login aaa
Device(config-line)#exit
```

Step 4: Configure TACACS server.

For the interface setting of TACACS server, please see the help document of the server. The specific steps are shown below.

#Add the client 2.0.0.1 on the server; the shared key is admin; select "TACACS+(Cisco IOS)" authentication.

#Set SHELL command authorization for the admin of Telnet user. Permit commands configure terminal, router ospf and router rip, and deny other commands.

Step 5: Check the result.

#After logging in to the Device, the Telnet user can execute corresponding SHELL command. The command which is successfully authorized can be successfully executed, while the command which fails to be authorized cannot be executed.

```
Device#configure terminal
% Enter configuration commands, one per line. End with CNTL+Z.
Device(config)#router ospf 100
Device(config-ospf)#exit
Device(config)#router rip
Device(config-rip)#exit
Device(config)#interface gigabitethernet 0/1
Command authorization failed
Device(config)#router bgp 100
Command authorization failed
```

#View the statistics of SHELL command.

#Check the statistics of SHELL command on the TACACS server.

# 92 802.1X

---

## 92.1 Overview

### 92.1.1 802.1X

802.1X is a broadband access authentication program proposed by IEEE in June 2001. It defines a Port-Based Network Access Control protocol. By utilizing the physical access features of IEEE 802 architecture LAN, 802.1X provides the method of connecting the device on LAN port in point-to-point mode for authentication, charging and authorization.

802.1X system is a typical client/server structure, as shown in the figure below. It includes three entities, i.e. Supplicant system, Authentication system, and Authentication server system.

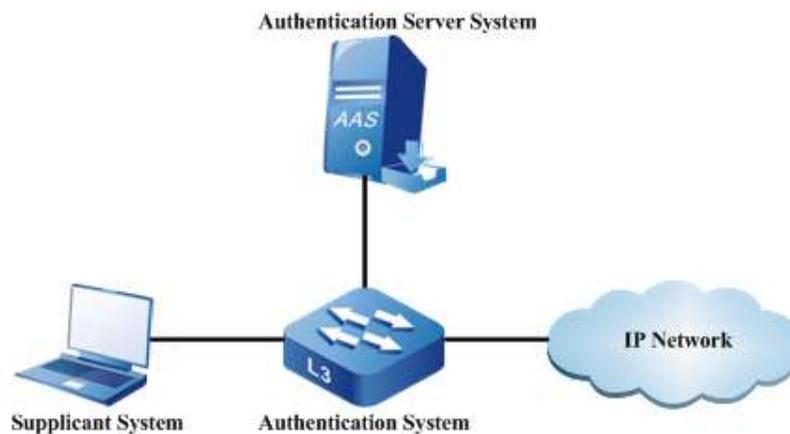

Figure 92 802.1X System Structure

- Install software that supports 802.1X authentication on the client and sends an authentication request to the authentication device. After the authentication succeeds, it can normally access the network.
- Located between the client and the authentication server, the authentication device controls network access of the client through server interaction.
- Generally, the authentication server is RADIUS (Remote Authentication Dial-In User

Service) server. It is used to verify the legality of the client and notify the authentication result to the authentication device which controls network access of the client according to the authentication result.

The EAP (Extensible Authentication Protocol) used in 802.1X authentication is a general protocol for PPP authentication. It is used to realize the interaction of authentication information between the client, authentication device, and authentication server. The 802.1X protocol uses the EAPOL (EAP Over LAN) frame encapsulation format to encapsulate EAP packets to realize the interaction between client and authentication device. Depending on the application scenarios, the 802.1X protocol will encapsulate EAP packets in different frame formats to realize the interaction between authentication device and authentication server. In relay authentication, the EAP packets are encapsulated in EAPOR (EAP Over RADIUS) frame format; in termination authentication, EAP packets are encapsulated in standard RADIUS frame format.

802.1X authentication has two types, i.e. relay and termination.

The following figure shows relay authentication mode:

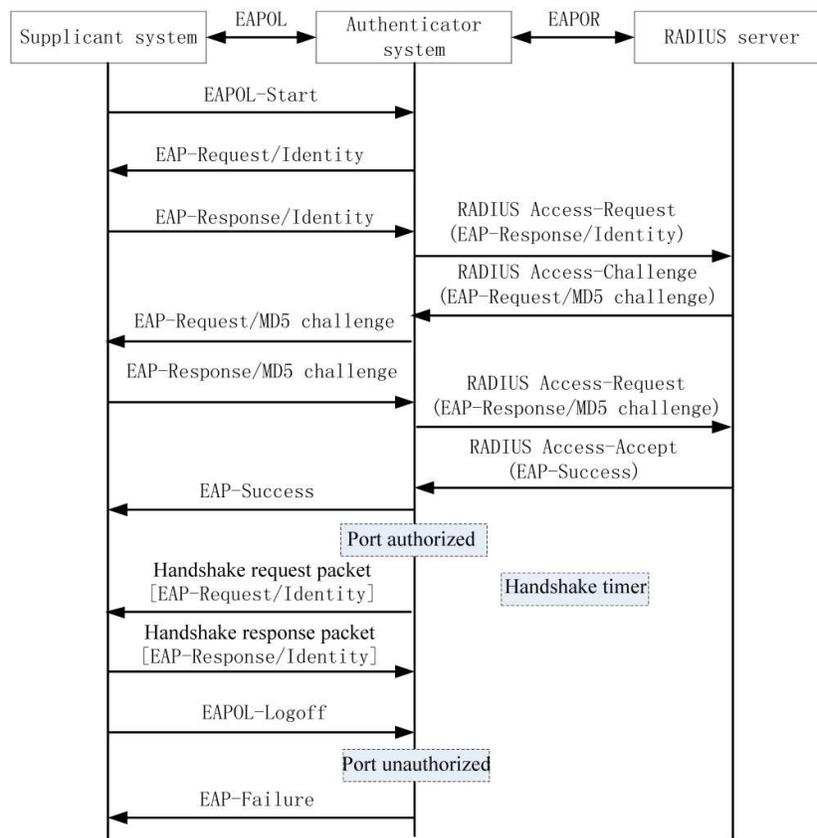

Figure 92 802.1X Relay Authentication Process

The relay authentication process is as follows:

- When the users intend to access the network, they can open the program on the 802.1X client, input the legal user name registered on the authentication server and password,

and initiate an authentication request (EAPOL-Start packet). At this time, the client program will send the packet requesting authentication to the authentication device, and start an authentication process;

- After the authentication device receives the data frame of requesting authentication, it will send a user name which the request frame (EAP-Request/Identity packet) requires the client program of the user to send;
- The client program responds to the request sent by the authentication device and sends the user name to the authentication device through a data frame (EAP-Response/Identity packet). The authentication device encapsulates the data frame sent by the client in a packet (RADIUS Access-Request packet) and sends it to the authentication server for processing;
- After the RADIUS server receives the user name forwarded by the authentication device, it compares the information with the user name table in the database, finds the password corresponding to the user name, encrypts it with an encrypted character randomly generated, and sends this character through the RADIUS Access-Challenge packet to the authentication device which then forwards it to the client program;
- After the client program receives the encrypted character (EAP-Request/MD5 Challenge packet) from the authentication device, it uses the encrypted character to encrypt the password part (this kind of encryption algorithm is usually irreversible, and it will generate EAP-Response/MD5 Challenge packet), and passes it to the authentication server through the authentication device;
- The RADIUS authentication server compares the encrypted password received (RADIUS Access-Request packet) with the local password after encryption operation. If they are the same, it is believed that this user is legal and it will give the message that authentication succeeds (RADIUS Access-Accept packet and EAP-Success packet);
- The authentication device changes the port to authorized after receiving the message that authentication succeeds, allowing the user to access the network through the port;
- The client can also send an EAPOL-Logoff packet to the authentication device to request to go offline. The authentication device changes the port status from authorized to unauthorized, and sends an EAP-Failure packet to the client.

This requires both the authentication device and the authentication server support EAP.

The following figure shows termination authentication mode:

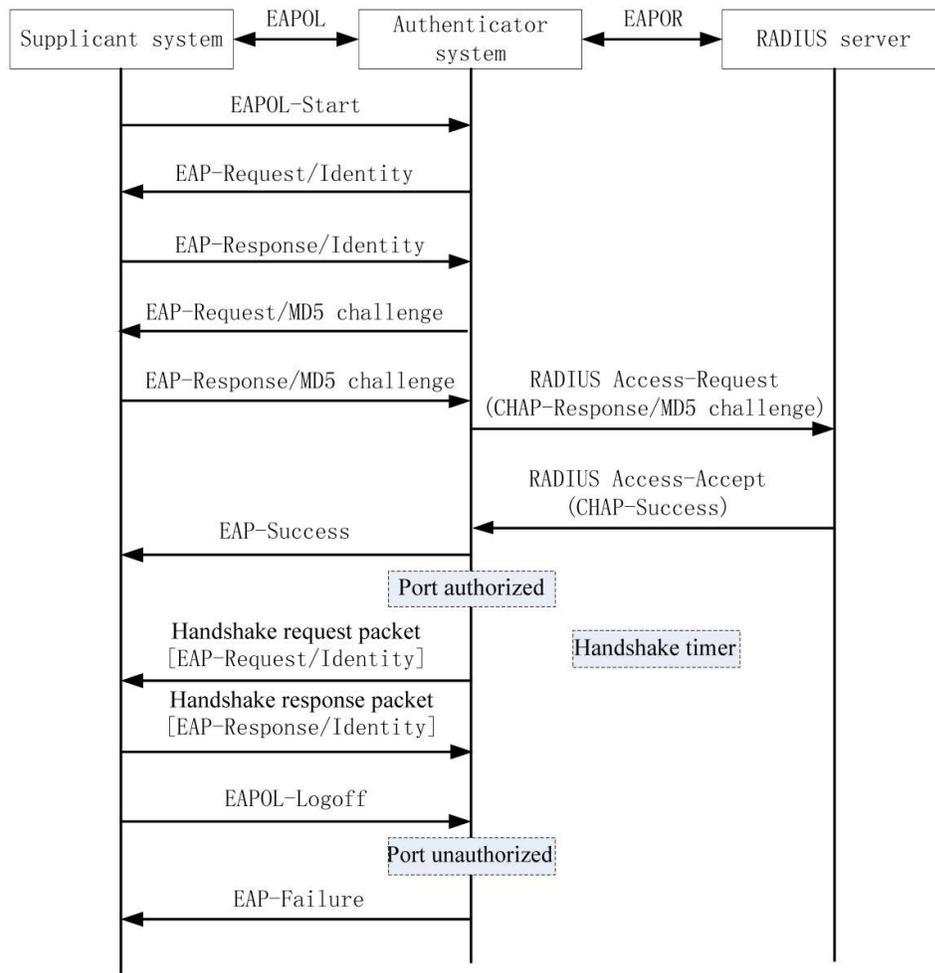

Figure 92802.1X Termination Authentication Process

- The process of termination authentication is different from that of relay authentication in that the randomly encrypted character for encryption of user password is generated by the authentication device which then sends the user name, randomly encrypted character and client encryption password to the RADIUS server for relevant authentication processing.

Termination authentication is used for the authentication server which is deployed earlier and doesn't support EAP protocol.

The authentication device supports two types of access control:

- Port-based access control: After the first user under the port is successfully authenticated, other users can access the network without authentication. But when the first user goes offline, other users are not allowed to access the network;
- Macbased access control: All access users under the port need to be individually authenticated. After a user goes offline, it cannot access the network any longer. Yet this

does not affect other users' access to the network.

Sometimes Auto VLAN is also called Assigned VLAN. When the client passes the server authentication, the server will send the authorized VLAN information to the authentication device. If this VLAN exists and is legal in the authentication device, the authentication port will be added to it. After the client goes offline, the port becomes unauthenticated again and is deleted from this Auto VLAN, and the default VLAN of the port recovers to the previous one.

When the Guest VLAN function is enabled, the user can only access the resources in the VLAN without authentication; after the successful user authentication, the port leaves the Guest VLAN and the user can access other network resources. Generally, the user can obtain 802.1X client software from the Guest VLAN to upgrade the client, or execute other application (e.g. anti-virus software and OS patches) upgrading. After enabling 802.1X authentication and correctly configuring the Guest VLAN, the port will be added to the Guest VLAN in Untagged mode. At this time, the user under the port in the Guest VLAN initiates authentication. If the authentication fails, the port is still in the Guest VLAN; if it succeeds, one of the following two circumstances applies:

- If the authentication server issues a VLAN, the port moves from the Guest VLAN to the issued VLAN. After the user goes offline, the port will go back to the Guest VLAN;
- If the authentication server does not issue any VLAN, the port moves from the Guest VLAN to the Config VLAN that has been configured in the authentication device. After the user goes offline, the port will go back to the Guest VLAN.

### 92.1.2 Secure Channel Authentication

The secure channel authentication function is based on the 802.1X authentication function. In addition to 802.1X authentication, it can open a secure channel for specific terminal users so that they can access the resources in the specified network when they are not authenticated, or specify specific terminal users to access network resources without authentication.

### 92.1.3 MAC Address Authentication

In the actual network, in addition to plenty of terminal users, there may be some network terminals (e.g. network printers). These terminals do not have their own or cannot be installed with 802.1X authentication client software. In this case, you can access the network without client authentication. With this authentication method, users don't have to install any 802.1X authentication client software. After detecting the MAC address of the user for the first time, the authentication device sends the configured user name and password or the MAC address of the user as user name and password to the authentication server for authentication.

Generally, the MAC address uses the following two formats of user name and password:

MAC address: Use the MAC address of the authenticated user as user name and password;

Fixed user name and password: Use the user name and password that have been configured on the authentication device.

## 92.2 802.1X Function Configuration

Table 92-1 802.1X Function Configuration List

Configuration Task	
Configure 802.1X Authentication	Enable 802.1X Authentication
Configure Secure Channel Authentication	Enable Secure Channel Authentication Function
	Configure and Apply Secure Channel
Configure 802.1X Authentication and Secure Channel Authentication Attributes	Configure Port Authentication Method
	Configure Multicast Trigger
	Configure Reauthentication Function
	Configure the Maximum Number of Port Authentication Failures
	Configure Function of Omitting IP Field in User Name
	Configure Function of Transparent Transmission of Packets
	Configure Keepalive Function
	Configure Function of Not Waiting for Response of Server
Configure MAC Address Authentication	Enable MAC Address Authentication Function
	Configure MAC Address Authentication User Name Format
	Configure Domain Name Used in Global MAC Authentication
Configure Common Attributes	Configure Control Direction

## Configuration Task

Configure Authenticable Host List
Configure IP Authorization Function
Configure the Maximum Times of Transmitting Authentication Request Packets
Configure the Maximum Times of Transmitting Authentication Packets
Configure Function of Data Logging
Configure ARP Keepalive Function
Configure the Maximum Number of Users on Port
Configure IP ACL Prefix Name
Configure Default Valid VLAN
Configure Function of Permitting Unauthenticated Users to Communicate in the VLAN of PVID
Configure Port Access Control Method
Configure Guest VLAN
Configure Guest ACL
Configure Critical VLAN
Configure User Authentication Migration Function
Configure Timer Parameters
Restore Default Configurations of Port
Configure Step Size of Log Record

## 92.2.1 Configure 802.1X Authentication Function

Permit to configure both 802.1X authentication and MAC address authentication under the same port.

- When MAC address authentication is first conducted for terminal users, if the authentication succeeds, the 802.1X authentication initiated by these terminal users will not be processed. Otherwise, the 802.1X authentication initiated by these terminal users will be processed.
- If 802.1X authentication is first conducted for the terminal users, no MAC address authentication is required.

### Configuration Condition

None

### Enable 802.1X Authentication

To enable the 802.1X authentication function, the terminal user has to install the client software with 802.1X authentication.

Table 92-2 Enabling 802.1X

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable global 802.1X authentication	<b>dot1x { enable   disable }</b>	Optional By default, the global 802.1X authentication function is enabled.
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.

Step	Command	Description
Enable 802.1X Authentication	<b>dot1x port-control { enable   disable }</b>	Mandatory  By default, the 802.1X authentication function under the port is disabled.

## Note

- The 802.1X authentication and secure channel authentication functions cannot be both enabled under the same port.
- The 802.1X authentication and port security functions can be both enabled under the same port, but port security IP rules and MAX rules are not allowed to configure.
- When both 802.1X authentication and port security functions are used, if the port security is configured with relevant MAC rules, 802.1X doesn't process the sending packets and authentication request of this terminal. Instead, they will be processed by port security.

### Configure the Function of Triggering the Generation of 802.1X Users Through ARP/IP Packets

After the 802.1X authentication function is enabled under the port, if the terminal user intends to view its information on the authentication device when it does not initiate authentication, you need to configure function of triggering the generation of 802.1X users through ARP/IP packets.

If the functions of 802.1X authentication and triggering the generation of 802.1X users through ARP/IP packets are both enabled under the same port, when the authentication device receives the ARP or IP packets of the terminal user under the port, 802.1X user can be generated.

Table 92-3 Enabling Function of Triggering Generation of 802.1X Users Through ARP/IP Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration

Step	Command	Description
		takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the function of triggering the generation of 802.1X users through ARP/IP packets	<b>dot1x arp-ip-auth { enable   disable }</b>	Mandatory  By default, the function of triggering the generation of 802.1X users through ARP/IP packets under the port is disabled.
Configure the timeout value of triggering the generation of 802.1X users through ARP/IP packets	<b>dot1x arp-ip-auth timeout <i>timeout-value</i></b>	Optional  By default, the timeout value of triggering the generation of 802.1X users through ARP/IP packets under the port is 5 minutes.

## 92.2.2 Configure Secure Channel Authentication

### Configuration Condition

None

### Enable Secure Channel Authentication

The secure channel authentication function is based on the 802.1X authentication function. In addition to 802.1X authentication, it can open a secure channel for specific terminal users so that they can access the resources in the specified network when they are not authenticated, or specify specific terminal users to access network resources without authentication.

Table 92-4 Enabling Secure Channel Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable secure channel authentication	<b>dot1x free-ip</b>	Mandatory  By default, the secure channel authentication function under the port is disabled.

---

### Note

The secure channel authentication and port security functions cannot be both enabled under the same port.

The 802.1X authentication and secure channel authentication functions cannot be both enabled under the same port.

The MAC address authentication and secure channel authentication functions cannot be both enabled under the same port.

When the secure channel authentication function is enabled under the port, yet no secure channel is applied or no secure channel rule is configured, the secure channel authentication function is the same as 802.1X authentication function.

In case of secure channel authentication, after the user passes the authentication, it will occupy chip resources. Insufficient chip resources will lead to failure of user authentication.

---

After enabling the secure channel authentication function under the port, to permit terminal users to access the resources in the specified network when they are not authenticated, or specify specific terminal users to access network resources without authentication, you need to configure and apply secure channel.

Secure channel rules can be configured as follows.

- Permit terminal users to access specified network resources.
- Permit specified terminal users to access network resources.

Table 92 Applying Secure Channel

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure secure channel	<b>hybrid access-list advanced</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no secure channel is configured in the device.
Configure secure channel rules	[ <i>sequence</i> ] <b>permit [ether- ipv6] protocol</b> { <b>any</b>   <i>source-ip-addr source- wildcard</i>   <b>host</b> <i>source-ip- addr</i> } { <b>any</b>   <i>source-mac- addr source-wildcard</i>   <b>host</b> <i>source-mac-addr</i> } { <b>any</b>   <i>destination-ip-addr</i> <i>destination-wildcard</i>   <b>host</b> <i>destination-ip-addr</i> } { <b>any</b>   <i>destination-mac-addr</i> <i>destination-wildcard</i>   <b>host</b> <i>destination-mac-addr</i> }	Mandatory  By default, there are no secure channel rules under the secure channel.
Apply secure channel	<b>global security access- group</b> { <i>access-group- number</i>   <i>access-group- name</i> }	Mandatory  By default, no secure channel is applied in the system.

**Note**

A device can be configured with multiple secure channels, and a secure channel may have multiple secure channel rules.

The type of secure channel can be mixed advanced ACL only, and only one secure channel can be applied in the device.

### Configure the Function of URL Redirection

When URL redirection is configured on the authentication device, the authentication device will redirect the URL address the user visits to the configured redirected URL address when the user accesses a non-authentication-free network segment where it is not authenticated or fails to pass the authentication. In the specified URL page, users can download/upgrade the authentication client, or update software.

Table 92 Configuring URL Redirection Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure secure channel	<b>hybrid access-list advanced</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no secure channel is configured in the device.
Configure secure channel rules	[ <i>sequence</i> ] <b>permit [ether-ipv6] protocol</b> { <b>any</b>   <i>source-ip-addr source-wildcard</i>   <b>host</b> <i>source-ip-addr</i> } { <b>any</b>   <i>source-mac-addr source-wildcard</i>   <b>host</b> <i>source-mac-addr</i> } { <b>any</b>   <i>destination-ip-addr destination-wildcard</i>   <b>host</b> <i>destination-ip-addr</i> } { <b>any</b>   <i>destination-mac-addr destination-wildcard</i>   <b>host</b> <i>destination-mac-addr</i> }	Mandatory  By default, there are no secure channel rules under the secure channel.
Apply secure channel	<b>global security access-group</b> { <i>access-group-number</i>   <i>access-group-name</i> }	Mandatory  By default, no secure channel is applied in the system.

Step	Command	Description
Configure the function of URL redirection	<b>dot1x url <i>url-redirect-string</i></b>	Mandatory  By default, redirected URL address is not configured on the device.

---

### Note

The authentication-free network segment should have the IP address of DNS server and the IP address of redirected URL link.

The client is required to apply for an address from the DHCP server. When the authentication device itself is not a DHCP server, the DHCP RELAY function should be enabled to ensure that the client can normally obtain IP address.

---

### 92.2.3 Configure 802.1X Authentication and Secure Channel Authentication Attributes

If the 802.1X authentication function or secure channel authentication function is not enabled under the port, relevant attributes configured cannot take effect.

#### Configuration Condition

None

#### Configure Port Authentication Method

802.1X authentication has two types, i.e. relay and termination.

The 802.1X authentication is composed of three parts, i.e. client, authentication device, and authentication server. According to the standard 802.1X protocol, the client interacts with the authentication server through EAP packets. The authentication device, as a "relay" in the interaction, encapsulates the EAP data sent by the client in other protocols, e.g. RADIUS protocol, and sends them to the authentication server. Likewise, the authentication device encapsulates the EAP data sent by the authentication server in an EAPOL packet and forwards them to the client. This way of interaction is called relay authentication. It requires the authentication server to support EAP protocol. The specific authentication mechanism supported by EAP relay authentication depends on the client and the authentication server.

The authentication server deployed earlier may not support EAP protocol. It needs to be configured with termination authentication. The EAP packets of the client will not be directly sent to the authentication

server. Instead, the authentication device will complete the EAP packet interaction with the client. After the authentication device obtains enough information about user authentication, the authentication information is sent to the authentication server for authentication.

EAP termination authentication supports PAP (Password Authentication Protocol) authentication and CHAP (Challenge Handshake Authentication Protocol) authentication.

Table 92 Configuring Port Authentication Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure port authentication mode	<b>dot1x eap-relay { enable   disable }</b>	Mandatory By default, the port authentication mode is termination authentication.

---

 **Note**

Configure termination authentication. Currently, only the EAP authentication based on MD5 (Message Digest Algorithm Version 5) is supported. The 802.1X authentication and secure channel authentication functions support both relay and termination authentication.

When the client uses certificate authentication, the authentication port needs to be configured as relay authentication.

MAC address authentication supports termination authentication only.

## Configure Multicast Trigger

Some terminals have 802.1X authentication client, but the client cannot initiate authentication. The authentication process can only be triggered by the authentication device. The authentication device will periodically send a multicast packet requesting user name to the port configured with multicast trigger. After receiving this packet, the client responds to the authentication request of the authentication device and begins the authentication process.

Table 92 Configuring Multicast Trigger

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable multicast trigger	<b>dot1x multicast-trigger</b>	Mandatory By default, the multicast trigger under the port is disabled.
Configure multicast trigger period	<b>dot1x multicast-period</b> <i>multicast-period-value</i>	Optional By default, the multicast trigger time under the port is 15 seconds.

---

If the client doesn't support multicast trigger, its network card may display abnormally and cause failure of reauthentication.

---

### Configure Reauthentication Function

In order to detect whether the client is online, prevent abnormal client crashes from affecting the accuracy of charging, and prevent the client from being illegally used by others, the authentication device will periodically initiate a reauthentication request to the client. During this process, users are not required to input user name and password again.

Table 92 Configuring Reauthentication Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Reauthentication Function	<b>dot1x reauthentication</b>	Mandatory  By default, the reauthentication function is enabled under the port.

### Configure the Maximum Number of Authentication Failures

When the number of authentication failures on the client reaches the upper limit, the client becomes quiet, during which period, the authentication device gives no response to the authentication request initiated by this client.

Table 92 Configuring Maximum Number of Authentication Failures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the upper limit of the maximum number of port authentication failures	<b>dot1x max-authfail</b> <i>max-authfail-value</i>	Mandatory  By default, the maximum number of authentication failures under the port is 1.

### Configure Function of Transparent Transmission of Packets

In the actual application environment, there may be intermediate devices between the terminal to be authenticated and the authentication device. If these intermediate devices cannot transparently transmit EAPOL packets, a normal authentication process is impossible. In order to enable a normal authentication process, you are required to enable the transparent transmission of EAPOL packet on the port of the intermediate device which receives EAPOL packet, and configure an uplink port for this port. If the port where the function of EAPOL packet transparent transmission is enabled receives an EAPOL packet, it will send it out from the configured uplink port. If the device directly connected to the uplink port is an authentication device, the authentication device will process the EAPOL packet after receiving it.

Table 1 Configuring Function of Packet Transparent Transmission

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Function of Transparent Transmission of Packets	<b>dot1x eapol-relay</b> { <b>enable</b>   <b>disable</b> }	Mandatory  By default, the function of packet transparent transmission under the port is disabled.
Configure uplink port for packet transparent transmission	<b>dot1x eapol-relay uplink</b> { <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> }	Mandatory  By default, uplink port is not configured under the port.

### Configure Keepalive Function

In order to check whether the client is online, the authentication device will periodically send EAP-Request/Identity packet to the client. After receiving the EAP-Response/Identity packet from the client, it will send EAP-Request/MD5 Challenge packet to the client. If the authentication system receives the EAP-Response/MD5 Challenge packet, it confirms that the client is online normally, and sends an EAP-Success packet to notify the client of the successful keepalive.

Table 92 Configuring Keepalive Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Keepalive Function	<b>dot1x keepalive { enable   disable }</b>	Mandatory  By default, the keepalive function under the port is disabled.
Configure keepalive time	<b>dot1x keepalive period</b> <i>period-value</i>	Optional  By default, the keepalive period under the port is 60 seconds.
Configure the times of keepalive packets retransmission	<b>dot1x keepalive retries</b> <i>retries-value</i>	Optional  By default, the maximum keepalive times is 3.
Configure keepalive type	<b>dot1x keepalive type</b> <b>{ request-identity   request-md5 }</b>	Optional  By default, the keepalive type under the port is standard keepalive.

## Note

The keepalive function needs the support of 802.1X authentication client software (the TC client of our company). If the client doesn't support this function, the keepalive will fail and the user will go offline.

## Configure Function of Not Waiting for Response of Server

Under relay authentication, the client may send some packets to which the server will not respond. These packets will make the session channels of authentication device and authentication server occupied so that subsequent client authentication fails. To avoid this, you can enable the function of not waiting for response of server under the port.

Table 92 Configuring Function of not Waiting for Response of Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Function of Not Waiting for Response of Server	<b>dot1x nowait-result</b>	Mandatory By default, the function of not waiting for response of server under the port is disabled.

### 92.2.4 Configure MAC Address Authentication

Permit to configure both 802.1X authentication and MAC address authentication under the same port.

- When MAC address authentication is first conducted for terminal users, if the authentication succeeds, the 802.1X authentication initiated by these terminal users will not be processed. Otherwise, the 802.1X authentication initiated by these terminal users will be processed.
- If 802.1X authentication is first conducted for the terminal users, no MAC address

authentication is required.

### Configuration Condition

None

### Enable MAC Address Authentication Function

MAC address authentication is also called client-free authentication. This authentication method applies to both the terminals where client software cannot be installed for authentication, and the terminal users who do not have client software and can authenticate without inputting user name and password.

When configuring the parameters related to MAC address authentication under the port of authentication device, if the MAC address authentication function is not enabled on the port, relevant functions configured cannot take effect.

Table 92 Enabling MAC Address Authentication Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable MAC Address Authentication Function	<b>dot1x mac-authentication</b> { <b>enable</b>   <b>disable</b> }	Mandatory By default, the MAC address authentication function under the port is disabled.

The MAC address authentication and port security functions can be both enabled under the same port, but port security IP rules and MAX rules are not allowed to configure.

The MAC address authentication and secure channel authentication functions cannot be both enabled under the same port.

### Configure MAC Address Authentication User Name Format

There are two types of user name and password formats for MAC address authentication: fixed and MAC address.

Fixed user name and password: When the authentication device receives the data packet of the terminal user, it will send the user name and password configured to the authentication server for authentication.

MAC address user name and password: The authentication will use the MAC address of the terminal user as user name and password. The MAC address format may either contain hyphen (e.g. 00-01-7a-00-00-01) or not contain hyphen (e.g. 00017a000001).

Table 2 Configuring Format of User Name for MAC Address Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure MAC Address Authentication User Name Format	<b>dot1x mac-authentication user-name-format { fixed account <i>account-value</i> password <i>password-value</i>  </b>	Mandatory  By default, the MAC address with hyphen is used as user name and

Step	Command	Description
	<b>mac-address [ with-hyphen   without-hyphen ] }</b>	password for MAC address authentication.

### Configure the Domain Name Used in Global MAC Authentication

This function can be enabled when the MAC authentication users connected to all ports on the device are required to be assigned to a specified domain for authentication.

By default, the domain name used in MAC authentication is not specified in the global mode. The domain used for user authentication should be the mandatory authentication domain configured on the port. If no such domain is configured on the port, use the domain contained in the user name. If the user name does not contain any domain, use the default domain of the aaa module.

After configuring on the port, the priority of the domain used by users who access mac authentication under the port is as follows: mandatory authentication domain configured on the port > domain contained in the fixed user name configured on the port > domain globally specified to be used for mac authentication > default domain of aaa module; the priority of the domain used by the 1x authentication users accessed under the port is as follows: mandatory authentication domain configured on the port > domain contained in the user name > default domain of the aaa module.

Table 92-16 Configuring Domain Name Used in Global MAC Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the domain name used in global MAC authentication	<b>dot1x mac-authentication domain <i>domain-name</i></b>	Mandatory By default, the domain name used in global MAC authentication is not configured under the port.

### Configure Domain Name Separator

The authentication device can manage users based on domains. If the authentication user name contains a domain name, the device uses the server in the corresponding AAA server group to authenticate, authorize and charge the user. If the authentication user name does not contain any domain name, it will use the default authentication server in the system for authentication. Therefore, the authentication device should be able to accurately resolve the user name and domain name in the user name. This is very critical in providing authentication services for users. Different clients support different user name and domain name

separators. In order to better manage and control the user access with different user name formats, it is required to specify the supported domain name separators on the authentication device.

At present, the domain name separators supported include @, \, and /.

When the domain name separator is '@', the format of authentication user name is username@domain.

When the domain name separator is '/', the format of authentication user name is username/domain.

When the domain name separator is '\', the format of authentication user name is domain\username.

In particular, username means a pure user name, and domain denotes a domain name. If the user name contains multiple domain name separators, the authentication device will identify the first one as the actual domain name separator, and all others will be considered as part of the domain name.

Table 3 Configuring Domain Name Separator

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure domain name separator	<b>dot1x domain-delimiter</b> <i>domain-delimiter-type</i>	Mandatory By default, the domain name separator under the port is '@'.

**Note**

---

When using the user name with a domain name for authentication, corresponding authentication server group needs to be configured on the authentication device.

---

### Configure the Format of Authentication User Name

The authentication user is named in the format of 'username@domain', and the content following the separator '@' is a domain name. The authentication device determines which authentication server group is used to authenticate the user by resolving the domain name. Some earlier servers cannot accept user names that contain domain names. In this case, the authentication device needs to remove the domain names from the user names and only send the authentication user names to the server. Whether the authentication user name sent to the authentication device contains a domain name can be selected by configuring the format of authentication user name.

At present, the domain name separators supported include @, \, and /.

Table 92-18 Configuring Format of Authentication User Name

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the format of authentication user name	<b>dot1x user-name-format</b> { with-domain   without-domain }	Mandatory  By default, the authentication user name with domain name is sent to the authentication server.

---

 **Note**

Configure the port that sends the authentication user name without domain name to the authentication server. Certificate authentication is not supported.

---

### Configure Authentication Packet Interaction Mode

In actual application scenarios, after most clients initiate authentication, the unicast/multicast authentication interaction mode is supported between the authentication device and the client. However, some authentication clients only recognize multicast authentication packets, i.e. those with a destination MAC address of 0180.C200.0003. In this case, the multicast authentication interaction mode can be configured under the port.

For most authentication clients, after the authentication device receives the EAP packet from the server for the first time, subsequent interactions with the client and the authentication server are all subject to the identifier contained in the server packet. Very few authentication clients are subject to the identifier generated by the authentication device during authentication. In this case, it is required to configure the function of caring about the identifier in EAP authentication packet under the port.

Table 92-19 Configuring Authentication Packet Interaction Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure authentication interaction mode	<b>dot1x auth-mac { multicast   unicast }</b>	Mandatory By default, the unicast authentication packet

Step	Command	Description
		interaction mode is used under the port.
Function of caring about the identifier in EAP authentication packet	<b>dot1x identifier { match   ignore }</b>	Optional By default, the identifier in EAP authentication packet is not cared about.

---

### Note

Very few clients need to care about the identifier in EAP authentication interaction packet. Unless explicitly required, do not configure this function as far as possible.

---

## 92.2.5 Configure Common Attributes

When configuring the parameters of common attributes, if the 802.1X authentication function, secure channel authentication function or MAC address authentication function is not enabled on the port, relevant functions configured cannot take effect.

### Configuration Condition

When configuring the IP authorization function under the port, you are also required to configure the ARP keepalive function.

### Configure Control Direction

Port control direction has two types, i.e. two-way control and one-way control.

- Two-way control means the port cannot receive or forward packets.
- One-way control means the port cannot receive the packets from the client, though it can forward packets to the client.

It is used with the WOL (Wake On Lan) function. For some terminals, although they are dormant, their network card can process some special packets, such as WOL packets. After receiving the WOL packet, the network card will start the terminal device and begin working.

When the authentication function is enabled on the access port of the dormant terminal, you can configure the port as one-way control to ensure that WOL packets can be forwarded to the terminal normally. After the terminal is started, authentication activity can be initiated. It can normally access network resources after passing the authentication.

When sending WOL packets across network segments, it is required to configure ARP forwarding entries on the authentication device.

Table 92-20 Configuring Control Direction

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Control Direction	<b>dot1x control-direction</b> { <b>both</b>   <b>in</b> }	Mandatory  By default, the port is controlled in both directions.

### Configure Authenticable Host List

After the function of authenticable host list is enabled, only the user whose MAC address is in the authenticable host list is permitted to conduct authentication activity. The authentications initiated by other users will be denied.

Table 92-21 Configure Authenticable Host List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Authenticable Host List	<b>dot1x auth-address</b> { <b>enable</b>   <b>disable</b>   <i>mac-address</i> }	Mandatory  By default, the authenticable host list under the port is disabled.

### Configure IP Authorization Function

Enable the IP authorization function under the port. If any change of the IP address of the authentication user is detected, the user will become offline. There are several modes:

**disable:** Disable mode. Under this mode, the IP address of user is not detected.

**dhcp-server:** DHCP Server mode. When configuring this mode, you are required to configure the DHCP Snooping function on the device. After the authentication user obtains IP address from the DHCP server, the device will record the binding relationship between authentication user and IP address. If any change of the IP address of the authentication user is detected, the user will become offline.

**radius-server:** RADIUS Server mode. RADIUS Server encapsulates in the RADIUS packet the IP address that the authentication user should use in the Frame-IP-Address field. The authentication device records the binding relationship between the user and this IP address. If it finds that the IP address of the user has changed, the user will become offline.

**Supplicant:** client mode. After the user passes the authentication for the first time, the binding relationship between the authentication user and the IP address is recorded on the device. If any change of the IP address of the user is detected, the user will become offline.

bind-mac-ip: MAC+IP binding mode. After the user passes the authentication for the first time, MAC+IP binding entries will be generated and saved. Then, only the IP address in the binding entries generated by the first authentication is permitted to access the network.

Table 92-22 Configuring IP Authorization Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure IP Authorization Function	<b>dot1x authorization ip-auth-mode { disable   dhcp-server   radius-server   supplicant   bind-mac-ip }</b>	Mandatory  By default, the IP authorization function under the port is disabled.

### Configure the Maximum Times of Transmitting Authentication Request Packets

After receiving the EAPOL-Start packet sent by the client, the authentication device will send an authentication request EAP-Request/Identity packet to the client. If the authentication device fails to receive the response packet, the packet will be retransmitted. This function is used to configure the maximum times of sending EAP-Request/Identity packets. If the times of sending exceed the configured upper limit, the authentication device will consider the client has disconnected and end the authentication activity.

For the process of retransmitting EAP-Request/Identity packet, see the figure below:

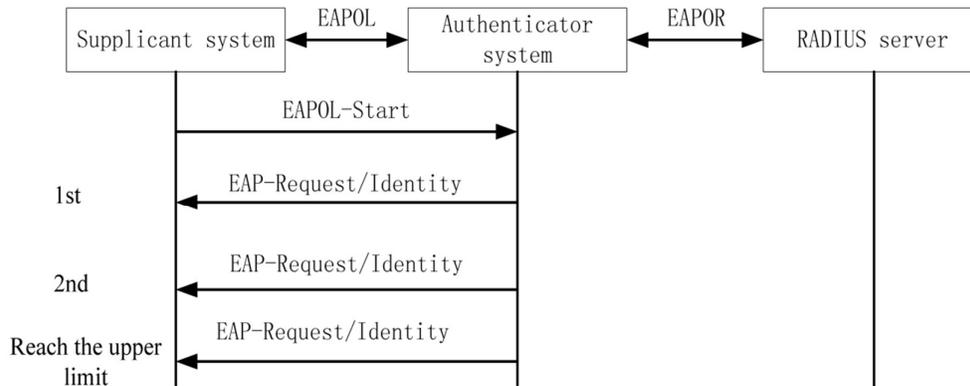

Figure 12-4 Retransmission of EAP-Request/Identity Packet

Table 92-23 Configuring the Maximum Times of Transmitting Authentication Request Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Maximum Times of Transmitting Authentication Request Packets	<b>dot1x max-reauth</b> <i>count</i>	Mandatory  By default, the maximum times of transmitting authentication request packets under the port are 3.

### Configure the Maximum Times of Transmitting Authentication Packets

During the process of authentication, the authentication device sends other EAP-Request packets than EAP-Request/Identity packet to the client, such as EAP-Request/MD5 challenge packet. If the authentication device fails to receive the response packet, the packet will be retransmitted. This function is used to configure the maximum times of sending these packets. If the times of sending exceed the configured upper limit, the authentication device will consider the client authentication fails.

For the process of retransmitting EAP-Request packet, see the figure below:

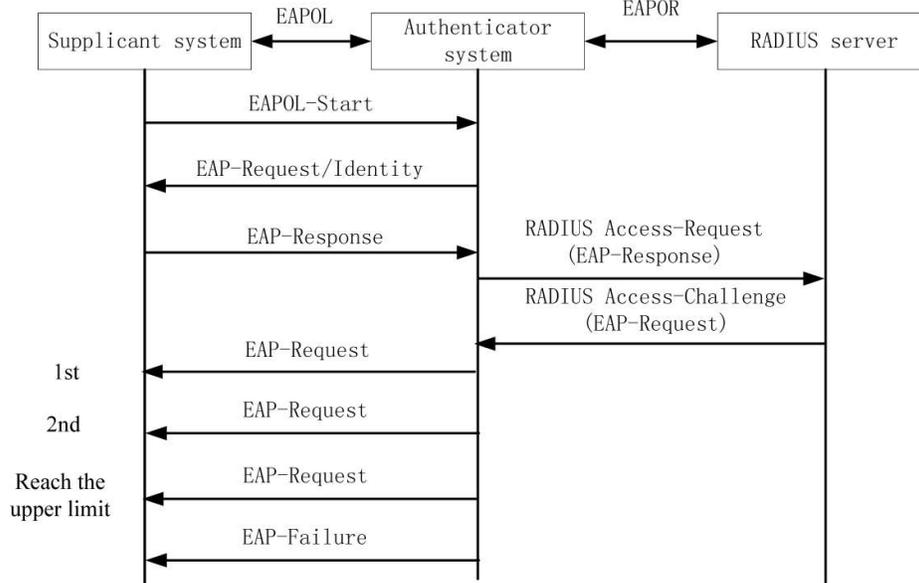

Figure 1 Retransmission of EAP-Request Packet

Table 92-24 Configuring the Maximum Times of Transmitting Authentication Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter

Step	Command	Description
		the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Maximum Times of Transmitting Authentication Packets	<b>dot1x max-req count</b>	Mandatory By default, the maximum times of transmitting authentication packets under the port are 2.

### Configure Function of Data Logging

After the data logging function is enabled, the authentication device will record the information about the user's going online and offline and the change of user information for the convenience of troubleshooting.

Table 92-25 Configuring Data Logging Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.

Step	Command	Description
Configure Function of Data Logging	<b>dot1x logging security-data {abnormal-logout   failed-login   normal-logout   successful-login   information}*</b>	Mandatory  By default, the data logging function is not enabled under the port.

### Configure ARP Keepalive Function

After the terminal user authentication succeeds, to check whether the user is online, the authentication device can send ARP request packet to the authenticated user. It identifies whether the user is online through the ARP response packet it can receive or not from the user.

Table 92-26 Configuring ARP Keepalive Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure ARP Keepalive Function	<b>dot1x client-probe</b> { <b>enable</b>   <b>disable</b> }	Mandatory  By default, the ARP keepalive function under the port is disabled.

---

 **Note**

To normally trigger the ARP keep-alive function, the authentication device has to obtain the IP address of the authenticated user. If the ARP response packet fails to be received from the authentication device during the protection period, the user will become offline.

---

### Configure the Maximum Number of Users on Port

After the number of users authenticated under the port reaches the upper limit configured, the authentication system no longer responds to the authentication request initiated by the new user.

Table 92-27 Configuring Maximum Number of Users on Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Maximum Number of Users on Port	<b>authentication max-user-num</b> <i>max-uer-num-value</i>	Mandatory  By default, at most 256 users are permitted to access under the port.

---

 **Note**

---

Under the port, configure as Macbased access control. Otherwise, the configured number of users permitted to access cannot take effect.

---

### Configure IP ACL Prefix Name

After the terminal user authentication succeeds, when the number of the IP ACL issued by the server is greater than 2000, the IP ACL named "IP ACL prefix name" + "ACL number" needs to be configured in the device. For example, if the server issues ACL 2001, the IP ACL named "assignacl-2001" should be configured on the device.

Table 92-28 Configuring IP ACL Prefix Name

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IP ACL Prefix Name	<b>dot1x number-acl-prefix</b> <i>number-acl-prefix-name</i>	Mandatory By default, the IP ACL prefix name is "assignacl-".

---

### Note

When the access control method is configured as portbased host-mode multi-hosts, the function of issuing ACL is not valid.

---

### Configure Default Valid VLAN

When the server issues no VLAN (Auto VLAN), to make the users who pass authentication communicate within the specified VLAN, you can use this configuration to specify a VLAN.

Table 92-29 Configuring Default Valid VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Default Valid VLAN	<b>dot1x default-active-vlan</b> <i>default-active-vlan-id</i>	Mandatory

Step	Command	Description
		By default, no default valid VLAN is configured under the port.

### Note

After the user authentication succeeds, the priority of binding with VLAN is as follows: VLAN issued by the server, default valid VLAN, and VLAN to which the port PVID belongs.

When Macbased access control is configured under the port, the default valid VLAN will take effect only when the port meets the following conditions: VLAN mode is hybrid and MAC VLAN is enabled.

### Configure Function of Permitting Unauthenticated Users to Communicate in the VLAN of PVID

When multiple terminals access the port, each of them should have access control. This command can be enabled for the network resources which some terminals intend to access even if they cannot initiate 802.1X authentication. After this function is enabled, the unauthenticated terminal user can normally communicate in the VLAN of PVID.

This function can be normally used only when it meets the following conditions:

- 802.1X authentication or MAC address authentication is enabled on the port.
- The port access control is Macbased.
- The port VLAN mode is Hybrid.
- The function of receiving Untag packets only is enabled under the port.

Table 92-30 Configuring Function of Permitting Unauthenticated Users to Communicate in the VLAN of PVID

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Function of Permitting Unauthenticated Users to Communicate in the VLAN of PVID	<b>dot1x native-vlan-free</b>	Mandatory By default, the function of permitting unauthenticated users to communicate in

Step	Command	Description
		the VLAN of PVID is disabled under the port.

## Note

After this function is enabled on the port, the function of receiving Untag packets only should also be enabled (configure the following command under the port: `switchport accept frame-type untag`) to guarantee the packets sent by the users who fail to pass the authentication are forwarded within the VLAN of PVID only.

It is recommended that this function be used with the VLAN issued by the server or the default valid VLAN configured.

This function does not support secure channel authentication.

### Configure Port Access Control Method

There are two types of port access control: Portbased and Macbased.

Portbased access control: Only one user is permitted to pass authentication under the port.

Macbased access control: Multiple users are permitted to pass authentication under the port. They cannot access the network without passing authentication.

The Portbased access control also has two modes: Multi-hosts and Single-host.

Multi-hosts: After one user passes authentication, other users under the port can access the network without authentication.

Single-host: Under the port, only one user is permitted to pass authentication and access the network. Other users cannot access the network or pass authentication.

Table 92-31 Configuring Port Access Control Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure access control method	<b>authentication port-method { macbased   portbased }</b>	Mandatory  By default, user authentication method is enabled under the port.
Portbased access control method	<b>authentication port-method portbased host-mode { multi-hosts   single-host }</b>	Optional  By default, Multi-hosts authentication is enabled under the port.

### Note

When configuring the host mode under portbased access control, you should guarantee that the access control method has been configured as Portbased.

## Configure Guest VLAN

The user can obtain 802.1X client software from the Guest VLAN to upgrade the client, or execute other application (e.g. anti-virus software and OS patches) upgrading.

Table 92-32 Configuring Guest VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Guest VLAN	<b>authentication guest-vlan</b> <i>guest-vlan-id</i>	Mandatory  By default, no Guest VLAN is configured under the port, and the value range is 1~4094.

---

### Note

The Guest VLAN of the port cannot be applied to the dynamic VLAN. If the VLAN ID specified by the Guest VLAN is automatically created by GVRP, then the Guest VLAN can be successfully configured, but it will not take effect.

To ensure various functions can be normally used, please assign different VLAN IDs to Voice VLAN, Private VLAN and Guest VLAN.

---

### Configure Guest ACL

If the user fails to pass authentication, you can restrict it from accessing resources in the Guest VLAN by configuring Guest ACL under the port.

Table 92-33 Configuring Guest ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Guest ACL	<b>authentication guest-acl</b> <i>guest-acl-name</i>	Mandatory  By default, Guest ACL rules are not configured under the port.

---

### Note

If no Guest VLAN is configured under the port, the configuration of Guest ACL will not take effect.

Guest ACL only takes effect under the Macbased port access control method.

Corresponding ACL rules have been configured in the authentication device.

---

### Configure Critical VLAN

When the user uses RADIUS authentication, if the authentication fails due to the unreachable authentication server, this user can access resources in the specified VLAN. This VLAN is called a Critical VLAN.

When the port is configured with portbased access control method, and there is user authentication on the port, yet all authentication servers are unreachable, the port will be added to the Critical VLAN, and all users under the port can access resources in the Critical VLAN.

When the port is configured with Macbased access control method, and there is user authentication on the port, yet all authentication servers are unreachable, the user can only access resources in the Critical VLAN.

When the port is configured with Macbased access control method, it can be normally used only when it meets the following conditions:

- The port VLAN mode is Hybrid.
- Enable the MAC VLAN function on the port. When the user in the Critical VLAN initiates an authentication activity, if the authentication server is still unreachable, the user maintains in the Critical VLAN. If the authentication server is reachable, the user exits the Critical VLAN with the authentication result.

After the port is added to the critical VLAN and the authentication device is configured with the AAA detection function, when the authentication server is found reachable, if the critical-vlan recovery reinitialize function is configured, then:

- If the port is configured with Macbased access control method, the port added to the Critical VLAN will actively send unicast packets to all users in the Critical VLAN, triggering user reauthentication.
- If the port is configured with Portbased access control method, the port added to the Critical VLAN will actively send multicast packets to trigger user reauthentication.

Table 4 Configuring Critical VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Critical VLAN	<b>authentication critical-vlan</b> <i>critical-vlan-id</i>	Mandatory  By default, no Critical VLAN is configured under the

Step	Command	Description
		port, and the value range is 1~4094.
Configure port recovery and trigger authentication	<b>authentication critical-vlan recovery-action reinitialize</b>	Optional By default, after the authentication server is found reachable, the port leaves the Critical VLAN only.

---

## Note

- This function supports RADIUS authentication only.
  - If the device is configured with radius and escape functions, i.e., aaa authentication dot1x radius none and critical vlan, when the user is authenticated and the authentication server is unreachable, the user will not enter the critical VLAN but escape directly; if only the escape function, i.e. aaa authentication dot1x none, and critical vlan are configured, when the user is authenticated, the escape function takes effect.
  - When only Guest VLAN is configured under the port, the users who fail to pass the authentication are within the Guest VLAN. When both Guest VLAN and Critical VLAN functions are configured under the port, the user will enter the Critical VLAN if the authentication fails due to the unreachable authentication server, or the Guest VLAN if the authentication fails due to other reasons.
  - For details of the AAA detection function, see the AAA configuration-related section.
- 

### Configure User Authentication Migration Function

The user authentication migration function applies to the scenarios where the same user (depending on the terminal MAC address) migrates from one authentication port to another in the same device. When the user authentication migration function is disabled, after a user is authenticated on one port of the device, it is not permitted to initiate authentication on another authentication port of the device; when the user authentication migration function is enabled, after the user is authenticated on one port, and the device finds that the user has migrated to another authentication port, the device deletes the authentication information on the original port and then permits the user to initiate authentication on a new authentication port.

No matter whether the user authentication migration function is enabled, the device will record a log once it finds user migration between authentication ports.

Table 5 Configuring User Authentication Migration Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure User Authentication Migration Function	<b>authentication station-move { enable   disable }</b>	Mandatory By default, the user authentication migration function is disabled.

### Configure Timer Parameters

The timer parameters under the port include re-authperiod, quiet-period, server-timeout, supp-timeout, and MAC address authentication user offline-detect.

**Re-authperiod:** After the reauthentication function is configured under the port, the authentication device periodically initiates reauthentication requests to the client, which applies to 802.1X authentication.

**Quiet-period:** When the client reaches the maximum number of authentication failures, the authentication device will respond to the authentication request from the client again after the quiet period expires. This applies to 802.1X authentication and MAC address authentication.

**Server-timeout:** If the authentication device fails to receive the server response packet within the specified time, it is considered that it has disconnected with the server. This applies to 802.1X authentication and MAC address authentication.

**Supp-timeout:** If the authentication device fails to receive response packet from the 802.1X client within the specified time, it is considered that it has disconnected with the user. This applies to 802.1X authentication.

MAC address authentication user offline-detect: After MAC address authentication is enabled, the port periodically checks whether the user is online. This applies to MAC address authentication.

Table 92-36 Configuring Timer Parameters

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Timer Parameters	<b>dot1x timeout { re-authperiod</b> <i>re-authperiod-value</i> <b>  quiet-period</b> <i>quiet-period-value</i> <b>  server-timeout</b> <i>server-timeout-value</i> <b>  supp-timeout</b> <i>supp-timeout-value</i> <b>  offline-detect</b> <i>offline-detect-value</i> <b>}</b>	Mandatory  By default,  the reauthentication time under the port is 3600 seconds, and the value range is 5~65535;  the quiet period is 60 seconds, and the value range is 1~65535;  the timeout time of the server is 30 seconds, and the value range is 5~3600;  the timeout time of the client is 30 seconds, and the value range is 5~3600;  the client offline detection time is 300 seconds, and the value range is 5~3600.

**Configure MAB function**

After the terminal passes the MAC address authentication, when it's necessary to use higher access rights through client authentication, you can enable this function.

Table 92-37 Enabling MAB Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable 802.1X Authentication	<b>dot1x port-control { enable   disable }</b>	Mandatory  By default, the 802.1X authentication function under the port is disabled.
Enable MAC Address Authentication Function	<b>dot1x mac-authentication { enable   disable }</b>	Mandatory  By default, the MAC address authentication function under the port is disabled.
Enable MAB function	<b>dot1x after-mac-auth { enable   disable }</b>	Mandatory  By default, the MAB function under the port is disabled.

### Restore Default Configurations of Port

Recover the default configuration of 802.1X authentication and MAC address authentication under the port.

Table 92-38 Recovering Default Configuration of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Restore Default Configurations of Port	<b>dot1x default</b>	Mandatory  The 802.1X authentication and MAC address authentication functions under the port are disabled, related configuration parameters are recovered to default values, and the default configuration parameters do not take effect.

---

 **Note**

The command `show dot1x` is used to view detailed default authentication configuration parameters.

---

**Configure mandatory authentication domain for port**

This function can be enabled when the users to be authenticated on the port are required to be assigned to a specified domain for authentication.

By default, no mandatory authentication domain is configured for the port. The domain used for user authentication should be that carried by the user. If there is no domain in the user name, use the default domain of the aaa module.

After configuration on the port, the user can use the domains by the following priority: domain configured under the port > domain carried by the user > default domain of aaa module.

Table 92-39 Enabling Mandatory Authentication Domain Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable 802.1X mandatory authentication domain function	<b>dot1x authentication domain</b> <i>domain-name</i>	Mandatory By default, no mandatory authentication domain is configured under the port.

## 92.2.6 802.1X monitoring and maintaining

Table 92-40 802.1X Monitoring and Maintaining

Command	Description
<b>clear dot1x statistic</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>mac</b> { <i>mac-address</i>   <b>all</b> } ]	Clear authentication statistics
<b>clear dot1x auth-fail-user history</b> [ <b>mac</b> <i>mac-address</i> ]	Clear record of failed authentication
<b>show authentication user</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>mac</b> <i>mac-address</i>   <b>summary</b> ]	Show the information of authentication management users
<b>show authentication intf-status</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Show the information of authentication status
<b>show dot1x</b>	Show default configurations of authentication
<b>show dot1x auth-fail-user history</b> [ <b>recent</b>   <b>mac</b> <i>mac-address</i> ]	Show the information of authentication failure
<b>show dot1x auth-address</b> [ <i>mac-address</i>   <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Show the information of authenticable host list
<b>show dot1x config</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Show configurations of authentication
<b>show dot1x free-ip</b>	Show configuration information of secure channel.
<b>show dot1x global config</b>	Show the information of global configuration
<b>show dot1x statistic</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>mac</b> { <i>mac-address</i>   <b>all</b> } ]	Show authentication statistics
<b>show dot1x user</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>summary</b> ]	Show user information

## 92.3 Typical Configuration Example of 802.1X Function

### 92.3.1 Configure Portbased Authentication of 802.1X

#### Network Requirements

- PC1 and PC2 on the same LAN access the IP network through the Device where 802.1X access control is enabled;
- RADIUS authentication is used as an authentication method;
- Users can access the Update Server only when they fail to pass authentication. They are permitted to access the IP Network once it passes the authentication;
- After one user on the LAN passes authentication, other users on this LAN can access the IP Network without authentication.

#### Network Topology

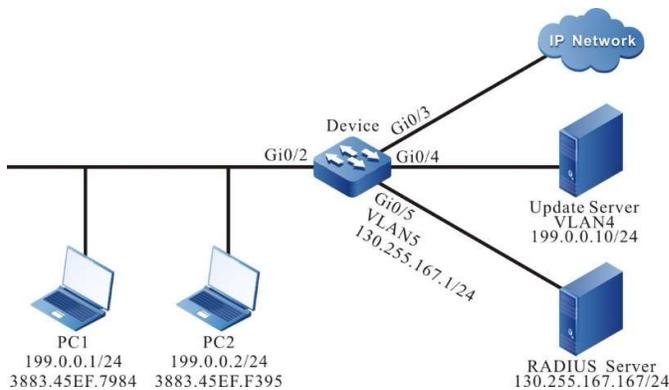

Figure 2 Network Topology for Configuring Portbased Authentication of 802.1X

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN2~VLAN5 on the Device.

```
Device#configure terminal
Device(config)# vlan 2-5
Device(config)#exit
#Configure the link type of port gigabitethernet0/2 to Access to allow services of VLAN 2 to pass.
```

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 2
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of the ports gigabitethernet 0/3~gigabitethernet 0/5 on the Device as Access, allowing the services of VLAN3~VLAN5 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN5 as 130.255.167.1/24.

```
Device(config)#interface vlan 5
Device(config-if-vlan5)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan5)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA on the Device and use RADIUS authentication. The server key is admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

#On the AAA server, configure three attributes for the Auto VLAN issued by RADIUS: 64 as VLAN, 65 as 802, and 81 as VLAN3. (Omitted)

Step 5: Configure 802.1X authentication for the port.

#Enable 802.1X authentication on the port and configure Portbased mode.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x port-control enable
Device(config-if-gigabitethernet0/2)#authentication port-method portbased
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the Guest VLAN of the port as VLAN4.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#authentication guest-vlan 4
Device(config-if-gigabitethernet0/2)#exit
```

Step 6: Check the result.

#Before passing authentication, gigabitethernet0/2 is added to the Guest VLAN. At this moment, both PC1 and PC2 users are within VLAN4 and permitted to access the Update Server.

```
Device#show vlan 4
```

NO.	VID	VLAN-Name	Owner	Mode	Interface
1	4	VLAN0004	static	Untagged	gi0/2 gi0/4

#Verify that PC1 can pass the authentication, and the authentication server issues VLAN3. At this moment, both PC1 and PC2 users are within VLAN3 and can access the IP Network.

Device#show dot1x user

```
-----
NO 1 : MAC_ADDRESS= 3883.45ef.7984 STATUS=   Authorized   USER_NAME=  admin
      VLAN=          3      INTERFACE=  gi0/2      USER_TYPE=  DOT1X
      AUTH_STATE=  AUTHENTICATED  BACK_STATE=  IDLE      IP_ADDRESS=  Unknown
      IPV6_ADDRESS= Unknown
```

Online time: 0 week 0 day 0 hours 0 minute 51 seconds

Total: 1 Authorized: 1 GetIP: 0 Unauthorized/guest/critical: 0/0/0 Unknown: 0

### 92.3.2 Configure Macbased Authentication of 802.1X

#### Network Requirements

- Both PC1 and PC2 access the IP network through the Device which uses 802.1X access control;
- RADIUS authentication is used as an authentication method;
- PC can access the Update Server only when it fails to pass authentication. It permitted to access the IP Network once it passes the authentication;
- After one user on the LAN passes authentication, other users on this LAN still need to pass the authentication prior to accessing the IP Network.

#### Network Topology

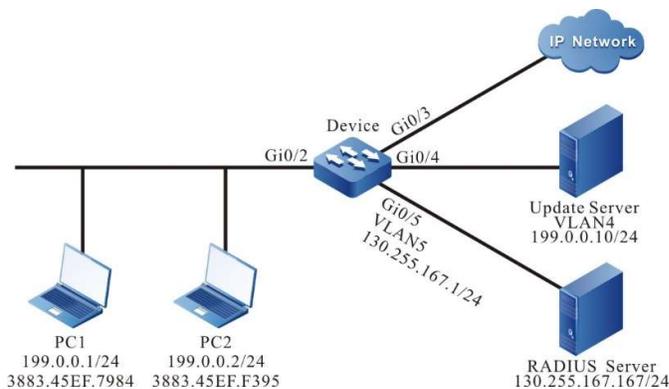

Figure 92 Network Topology for Configuring Macbased Authentication of 802.1X

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN2~VLAN5 on the Device.

```
Device#configure terminal
Device(config)#vlan 2-5
Device(config)#exit
```

#Configure the link type of port gigabitethernet 0/2 to Hybrid to allow services of VLAN2 to pass, and configure PVID to 2.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport hybrid untagged vlan 2
Device(config-if-gigabitethernet0/2)#switchport hybrid pvid vlan 2

Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of the ports gigabitethernet 0/3~gigabitethernet 0/5 on the Device as Access, allowing the services of VLAN3~VLAN5 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN5 as 130.255.167.1/24.

```
Device(config)#interface vlan 5
Device(config-if-vlan5)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan5)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

#On the AAA server, configure three attributes for the Auto VLAN issued by RADIUS: 64 as VLAN, 65 as 802, and 81 as VLAN3. (Omitted)

Step 5: Configure 802.1X authentication.

#Enable 802.1X authentication on the port and configure the authentication mode as Macbased.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x port-control enable
Device(config-if-gigabitethernet0/2)#authentication port-method macbased
Device(config-if-gigabitethernet0/2)#exit
```

#Enable the MAC VLAN of gigabitethernet0/2.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#mac-vlan enable
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the Guest VLAN of the port as VLAN4.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#authentication guest-vlan 4
Device(config-if-gigabitethernet0/2)#exit
```

Step 6: Check the result.

#Before passing authentication, gigabitethernet0/2 is added to the Guest VLAN. At this moment, both PC1 and PC2 users are within VLAN4 and can access the Update Server.

```
Device#show vlan 4
-----
NO. VID VLAN-Name          Owner Mode  Interface
-----
1  4  VLAN0004                static Untagged gi0/2 gi0/4
```

#After PC1 users initiate authentication and successfully pass the authentication, they are within Auto VLAN3 and can access the IP Network. At this moment, PC2 still needs to pass the authentication prior to accessing the IP Network.

```
Device#show dot1x user
-----
NO 1 : MAC_ADDRESS= 3883.45ef.7984 STATUS=   Authorized   USER_NAME=  admin
      VLAN=      3      INTERFACE=  gi0/2      USER_TYPE=  DOT1X
      AUTH_STATE= AUTHENTICATED BACK_STATE=  IDLE       IP_ADDRESS=  Unknown
      IPV6_ADDRESS= Unknown
```

Online time: 0 week 0 day 0 hours 0 minute 51 seconds

Total: 1 Authorized: 1 GetIP: 0 Unauthorized/guest/critical: 0/0/0 Unknown: 0

#After PC2 users input incorrect user name or password authentication fails, PC2 users are within Guest VLAN4 and can access the Update Server.

```
Device#show dot1x user
-----
NO 1 : MAC_ADDRESS= 3883.45ef.f395 STATUS=   Unauth(guest) USER_NAME=  admin
      VLAN=      4      INTERFACE=  gi0/2      USER_TYPE=  DOT1X
      AUTH_STATE= GUEST_HELD  BACK_STATE=  IDLE       IP_ADDRESS=  Unknown
      IPV6_ADDRESS= Unknown
```

Total:1 Authorized: 0 Unauthorized/guest/critical: 0/1/0 Unknown: 0

### 92.3.3 Configure Transparent Transmission Mode of 802.1X

#### Network Requirements

- PC connects to Device2 where 802.1X access control is enabled through Device1 to access the IP Network.
- Device1 enables the function of transparent transmission, and Device 2 uses RADIUS

authentication.

- PC can access the IP Network once it passes authentication.

## Network Topology

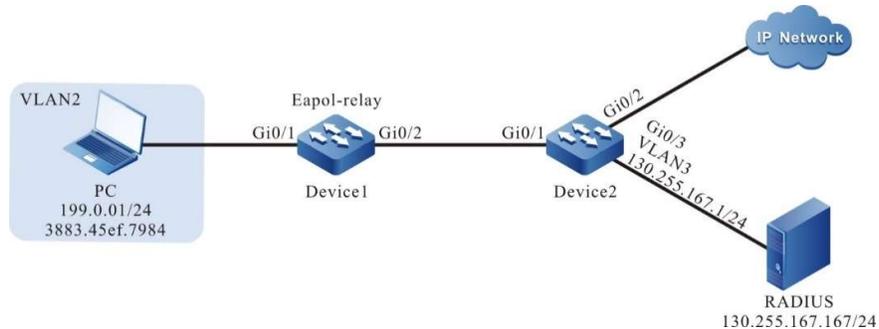

Figure 92 Network Topology for Configuring Transparent Transmission Mode of 802.1X

## Configuration Steps

Step 1: Configure VLAN and port link type on Device2.

#Create VLAN2-VLAN3 on Device2.

```
Device2#configure terminal
Device2(config)#vlan 2-3
Device2(config)#exit
```

#Configure the link type of port gigabitethernet 0/1 to Access to allow services of VLAN 2 to pass.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode access
Device2(config-if-gigabitethernet0/1)#switchport access vlan 2
Device2(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of the ports gigabitethernet 0/2~ gigabitethernet 0/3 on Device2 as Access, allowing the services of VLAN2~VLAN3 to pass. (Omitted)

Step 2: Configure the interface IP address of Device2.

#Configure the IP address of VLAN3 as 130.255.167.1/24.

```
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ip address 130.255.167.1 255.255.255.0
Device2(config-if-vlan3)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on Device2, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
```

```
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin (omitted).

Step 5: Configure the port VLAN of Device1.

#Configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 on Device1 as Access, allowing the services of VLAN2 to pass. (Omitted)

Step 6: On Device1, enable the function of 802.1X transparent transmission.

#Configure 802.1X transparent transmission mode on the port gigabitethernet0/1 of Device1, with the uplink port being gigabitethernet0/2.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#dot1x eapol-relay enable
Device1(config-if-gigabitethernet0/1)#dot1x eapol-relay uplink interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/1)#exit
```

Step 7: Configure 802.1X authentication mode on Device2.

#Enable 802.1X authentication on gigabitethernet0/1 and configure the port authentication mode as Portbased.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#dot1x port-control enable
Device2(config-if-gigabitethernet0/1)#authentication port-method portbased
Device2(config-if-gigabitethernet0/1)#exit
```

Step 8: Check the result.

#PC users can successfully pass the authentication and access the IP Network.

```
Device2#show dot1x user
```

```
-----
```

```
NO 1 : MAC_ADDRESS= 3883.45ef.7984 STATUS=   Authorized   USER_NAME=  admin
      VLAN=      2      INTERFACE=  g10/1      USER_TYPE=  DOT1X
      AUTH_STATE= AUTHENTICATED BACK_STATE=  IDLE      IP_ADDRESS=  Unknown
      IPV6_ADDRESS= Unknown
```

Online time: 0 week 0 day 0 hours 0 minute 51 seconds

Total: 1 Authorized: 1 GetIP: 0 Unauthorized/guest/critical: 0/0/0 Unknown: 0

## 92.3.4 Configure 802.1X Free-Client Authentication

### Network Requirements

- The network printer accesses IP network through the Device which uses 802.1X access control.
- The Device periodically conducts offline detection over the network printer.
- Use RADIUS authentication.
- After passing authentication, the network printer can perform the printing tasks from IP network.

### Network Topology

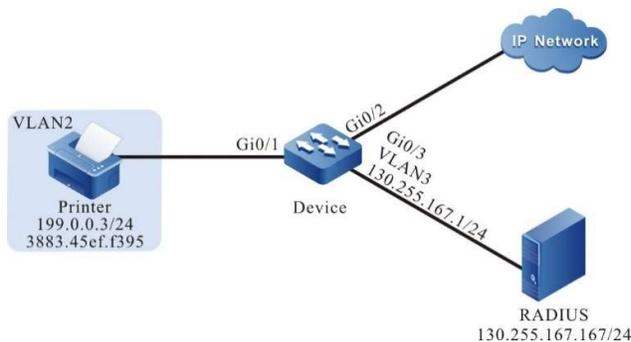

Figure 92 Network Topology for Configuring 802.1X Free-client Authentication

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN2-VLAN3 on the Device.

```
Device#configure terminal
Device(config)#vlan 2-3
Device(config)#exit
```

#Configure the link type of port as Access on gigabitethernet 0/1, permitting the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of port as Access on gigabitethernet 0/2~ gigabitethernet 0/3 of the Device, allowing the services of VLAN2~VLAN3 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN3 as 130.255.167.1/24.

```
Device(config)#interface vlan 3
Device(config-if-vlan3)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan3)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure 802.1X authentication.

#Configure 802.1X free-client authentication mode, and use the MAC address of the network printer as user name and password.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#dot1x mac-authentication enable
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the Device to periodically conduct offline detection over the printer every 120 seconds.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#dot1x timeout offline-detect 120
Device(config-if-gigabitethernet0/1)#exit
```

Step 6: Check the result.

#The network printer can pass authentication and perform the printing tasks from IP network.

```
Device#show dot1x user
```

```
-----
NO 1 : MAC_ADDRESS= 3883.45ef.f395 STATUS= Authorized USER_NAME= 38-83-45-ef-f3-95
      VLAN= 2 INTERFACE= gi0/1 USER_TYPE= DOT1X
      AUTH_STATE= AUTHENTICATED BACK_STATE= IDLE IP_ADDRESS= 199.0.0.3
      IPV6_ADDRESS= Unknown
```

```
Online time: 0 week 0 day 0 hours 1 minutes 6 seconds
Total: 1 Authorized: 1 GetIP: 0 Unauthorized/guest/critical: 0/0/0 Unknown: 0
```

## 92.3.5 Configure Secure Channel

### Network Requirements

- PC1 and PC2 on the same LAN access the IP network through the Device where secure channel access control is enabled;
- RADIUS authentication is used as an authentication method;
- PC1 can access the Update Server prior to passing authentication. It is permitted to access the Update Server once it passes the authentication;
- PC2 can access the Update Server and IP Network without authentication.

### Network Topology

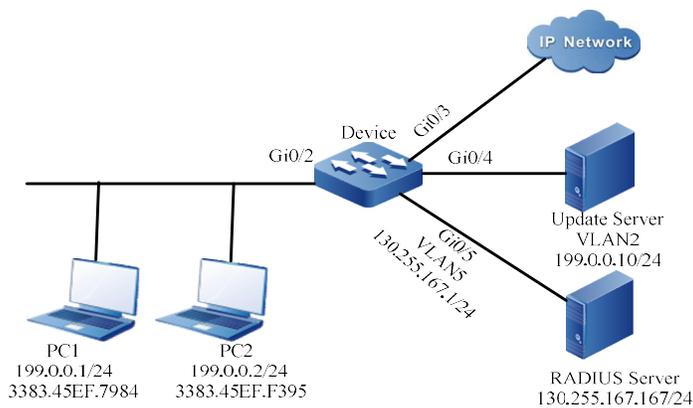

Figure 92 Network Topology for Configuring Secure Channel

### Configuration Steps

Step 1: Configure VLAN and link type on the port.

#Create VLAN2 and VLAN5 on the Device.

```
Device#configure terminal
Device(config)#vlan 2,5
Device(config)#exit
```

#Configure the link type of gigabitethernet0/2 to Access to allow services of VLAN 2 to pass.

```
Device#configure terminal
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)# switchport mode access
```

```
Device(config-if-gigabitethernet0/2)# switchport access vlan 2
Device(config-if-gigabitethernet0/2)#end
```

#Configure the link type of port as Access on gigabitethernet 0/3~gigabitethernet 0/4 of the Device to allow services of VLAN 2 to pass, and as Trunk on gigabitethernet 0/5 to allow services of VLAN5 to pass.

(Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN5 as 130.255.167.1/24.

```
Device#configure terminal
Device(config)#interface vlan 5
Device(config-if-vlan5)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan5)#end
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-rg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure secure channel.

#Enable secure channel access control on the port gigabitethernet 0/2.

```
Device#configure terminal
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x free-ip
Device(config-if-gigabitethernet0/2)#exit
```

#Configure a secure channel named channel, and configure to permit PC1 to access the Update Server, and PC2 to access both Update Server and IP Network.

```
Device#configure terminal
Device(config)#hybrid access-list advanced channel
Device (config-adv-hybrid-nacl)#permit ip any any host 199.0.0.10 any
Device(config-adv-hybrid-nacl)#permit ip host 199.0.0.2 any any any
```

#Apply the secure channel named channel.

```
Device#configure terminal
```

```
Device(config)#global security access-group channel
Device(config)#exit
```

Step 6: Check the result.

#View the configuration information of secure channel

```
Device#show dot1x free-ip
802.1X free-ip Enable Interface (num:1): gi0/2
global security access-group channel
Total free-ip user number : 0
```

```
Device#show hybrid access-list channel
hybrid access-list advanced channel
10 permit ip any any host 199.0.0.10 any
20 permit ip host 199.0.0.2 any any any
```

It is indicated that secure channel is enabled on gigabitethernet 0/2, and the secure channel rules of channel are bound.

#Before passing authentication, PC1 can access the Update Server instead of other network resources.

#After PC1 users initiate authentication and the authentication succeeds, view the information of user authentication.

```
Device#show dot1x user
```

```
-----
NO 1 : MAC_ADDRESS= 3883.45ef.7984 STATUS= Authorized USER_NAME= admin
      VLAN= 2 INTERFACE= gi0/2 USER_TYPE= DOT1X
      AUTH_STATE= AUTHENTICATED BACK_STATE= IDLE IP_ADDRESS= 199.0.0.1
      IPV6_ADDRESS= Unknown
```

```
Online time: 0 week 0 day 0 hours 0 minute 51 seconds
```

```
Total: 1 Authorized: 1 GetIP: 0 Unauthorized/guest/critical: 0/0/0 Unknown: 0
```

It is indicated that the PC1 user has passed authentication and can access the Update Server and IP Network.

#PC2 can access the Update Server and IP Network without authentication.

### 92.3.6 Configure IP Authorization as DHCP Server Mode

#### Network Requirements

- PC accesses IP network through the Device which enables 802.1X access control;
- RADIUS authentication is used as an authentication method;
- PC1 can access the IP Network after obtaining IP address through the specified DHCP Server;
- PC2 cannot access the IP Network after being configured with static IP address authentication.

## Network Topology

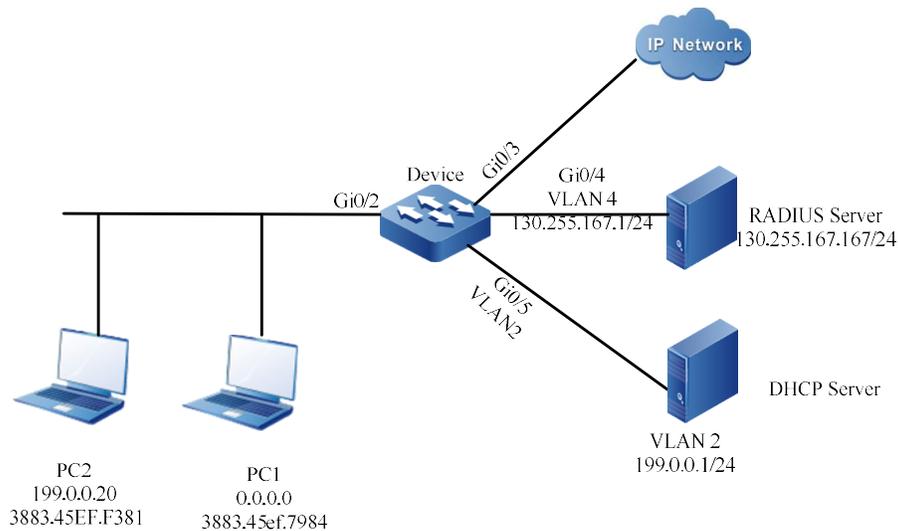

Figure 92 Network Topology for Configuring 802.1X IP Authorization as DHCP Server Mode

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#On the Device, create VLAN2 and VLAN4, configure the link type of port as Hybrid on gigabitethernet0/2, permitting the services of VLAN2 to pass, and configure PVID as 2.

```
Device#configure terminal
Device(config)#vlan 2,4
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode hybrid
Device(config-if-gigabitethernet0/2)#switchport hybrid untagged vlan 2
Device(config-if-gigabitethernet0/2)#switchport hybrid pvid vlan 2
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of port as Access on gigabitethernet0/5 of the Device, allowing the services of VLAN2 to pass. (Omitted)

#Configure the link type of port as Access on gigabitethernet0/4 of the Device, allowing the services of VLAN4 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN4 as 130.255.167.1/24.

```
Device(config)#intergice vlan 4
Device(config-if-vlan4)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan4)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure the DHCP server.

#Configure the segment of assigning IP address on the DHCP server as 199.0.0.2-199.0.0.10, and the subnet mask as 255.255.255.0. (omitted)

Step 6: On the Device, enable the DHCP Snooping function and configure gigabitethernet0/5 as a trusted port.

```
Device(config)#dhcp-snooping
Device(config)#intergice gigabitethernet 0/5
Device(config-if-gigabitethernet0/5)#dhcp-snooping trust
Device(config-if-gigabitethernet0/5)#exit
```

Step 7: Configure 802.1X authentication on the Device.

#Enable 802.1X authentication of gigabitethernet0/2.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x port-control enable
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the IP authorization of gigabitethernet0/2 as DHCP Server mode.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x authorization ip-auth-mode dhcp-server
Device(config-if-gigabitethernet0/2)#exit
```

#Enable the ARP keepalive of gigabitethernet0/2.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x client-probe enable
Device(config-if-gigabitethernet0/2)#exit
```

Step 8: Check the result.

#PC1 users can successfully pass the authentication and obtain IP address from DHCP server and access the IP Network.

```
Device#show dot1x user
```

User manual

#PC2 cannot access the IP Network even if it has passed authentication.

### 92.3.7 Configure 802.1X Critical VLAN

#### Network Requirements

- PC accesses IP network through the Device which enables 802.1X access control;
- RADIUS authentication is used as an authentication method;
- PC2 can access the Update Server only when it fails to pass authentication due to the unreachable server.

#### Network Topology

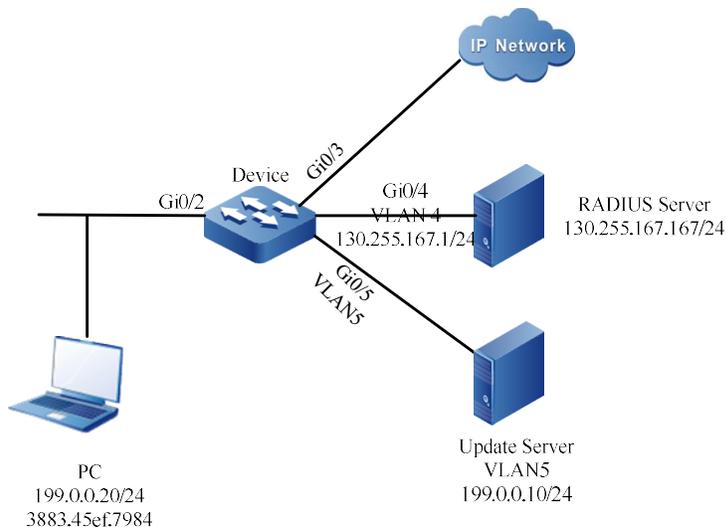

Figure 92 Network Topology for Configuring 802.1X Critical VLAN

## Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#On the Device, create VLAN2, VLAN4 and VLAN5, configure the link type of port as Hybrid on gigabitethernet0/2, permitting the services of VLAN2 to pass, and configure PVID as 2.

```
Device#configure terminal
Device(config)#vlan 2,4,5
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode hybrid
Device(config-if-gigabitethernet0/2)#switchport hybrid untagged vlan 2
Device(config-if-gigabitethernet0/2)#switchport hybrid pvid vlan 2
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of port as Access on gigabitethernet0/5 of the Device, allowing the services of VLAN5 to pass. (Omitted)

#Configure the link type of port as Access on gigabitethernet0/4 of the Device, allowing the services of VLAN4 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN4 as 130.255.167.1/24.

```
Device(config)#interface vlan 4
Device(config-if-vlan4)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan4)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure 802.1X authentication on the Device.

#Enable 802.1X authentication of gigabitethernet 0/2.

```
Device(config)#interface gigabitethernet 0/2
User manual
Release 1.0 01/2022
```

```
Device(config-if-gigabitethernet0/2)#dot1x port-control enable
Device(config-if-gigabitethernet0/2)#exit
```

#Enable the MAC VLAN of gigabitethernet0/2.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#mac-vlan enable
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the Critical VLAN of the port as VLAN5.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#authentication critical-vlan 5
Device(config-if-gigabitethernet0/2)#exit
```

Step 6: Check the result.

#The Device cannot ping the server when the server is abnormal. As a result, the user fails to pass authentication due to the unreachable server. The PC user is in the Critical VLAN and can access the Update Server.

Device#show dot1x user

```
-----

```

## 92.3.8 Configure Combined Use of 802.1x and Port Security

### Network Requirements

- PC accesses IP network through the Device which enables 802.1X access control and port security;
- RADIUS authentication is used as an authentication method;
- Configure port security rules that fail to match the MAC address of PC1, and PC1 can access the IP Network through authentication;
- Configure port security deny rules that fail to match the MAC address of PC2, and PC2 cannot pass authentication.

### Network Topology

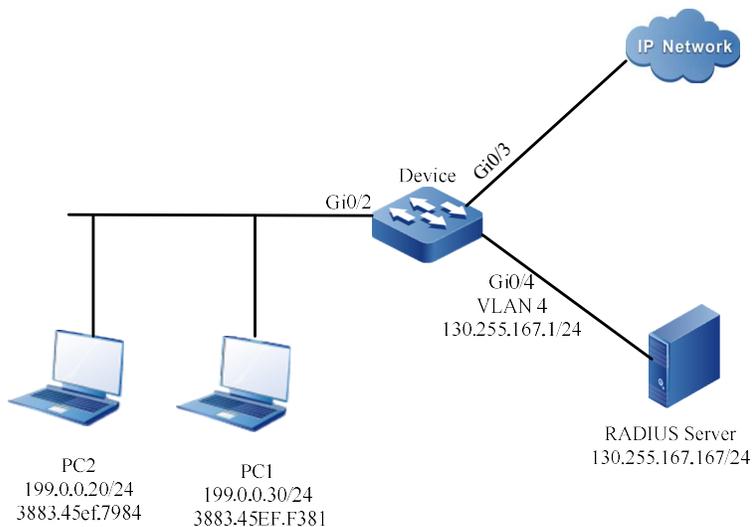

Figure 3 Network Topology for Configuring Combined Use of 802.1X and Port Security

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#On the Device, create VLAN2 and VLAN4, configure the link type of port as Hybrid on gigabitethernet0/2, permitting the services of VLAN2 to pass, and configure PVID as 2.

```
Device#configure terminal
Device(config)#vlan 2,4
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode hybrid
Device(config-if-gigabitethernet0/2)#switchport hybrid untagged vlan 2
Device(config-if-gigabitethernet0/2)#switchport hybrid pvid vlan 2
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of port as Access on gigabitethernet0/4 of the Device, allowing the services of VLAN4 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN4 as 130.255.167.1/24.

```
Device(config)#interface vlan 4
Device(config-if-vlan4)#ip address 130.255.167.1 255.255.255.0
Device(config-if-vlan4)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device(config)#domain system
User manual
Release 1.0 01/2022
```

```
Device(config-isp-system)# aaa authentication dot1x radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 130.255.167.167 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure 802.1X authentication on the Device.

#Enable 802.1X authentication of gigabitethernet0/2.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#dot1x port-control enable
Device(config-if-gigabitethernet0/2)#exit
```

Step 6: Configure port security on the Device.

#On port gigabitethernet0/2, enable port security.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#port-security enable
Device(config-if-gigabitethernet0/2)exit
```

#Configure port security rules on port gigabitethernet0/2.

```
Device(config)#intergice gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#port-security deny mac-address 3883.45EF.7984
Device(config-if-gigabitethernet0/2)exit
```

Step 7: Check the result.

#PC1 users can successfully pass the authentication and then access the IP Network.

```
Device#show dot1x user
```

-----

```
NO 1 : MAC_ADDRESS= 3883.45ef.f381 STATUS=   Authorized   USER_NAME=  admin
      VLAN=      2      INTERFACE=  gi0/2      USER_TYPE=  DOT1X
      AUTH_STATE= AUTHENTICATED  BACK_STATE= IDLE      IP_ADDRESS=  Unknown
      IPV6_ADDRESS= Unknown
```

```
Online time: 0 week 0 day 0 hour 0 minute 1 second
```

```
Total: 1  Authorized: 1  GetIP: 0  Unauthorized/guest/critical: 0/0/0  Unknown: 0
```

#PC2 users cannot successfully pass the authentication, so they cannot access the network.

# 93 PORTAL

---

## 93.1 Overview

### 93.1.1 Introduction

Portal authentication is often called Web authentication, i.e. accept the user name and password input by the user through Web pages to authenticate the user. Portal authentication technology offers a flexible access control method. It can realize access control in the access layer and key data entries that need to be protected without installing a client. Generally, Portal authentication website is called portal website.

When an unauthenticated user surfs on the Internet, the device forces the user to visit a specific site, i.e., the Portal server. The user can access the services therein for free without authentication, such as application (e.g. antivirus software and OS patches) upgrading. When the user needs to access other resources on the Internet, it must authenticate its identity on the Portal authentication page provided by the Portal server. It can access the network resources only when it passes authentication.

In addition to flexible authentication, Portal can provide convenient management function, and there is advertising, notification and other personalized services on the Portal authentication page.

### 93.1.2 System Composition of Portal

The typical networking method of Portal is shown in the figure below. It comprises four elements: Portal Client, Authentication Device, Portal Server and AAA Server (Authentication/Authorization/Accounting Server).

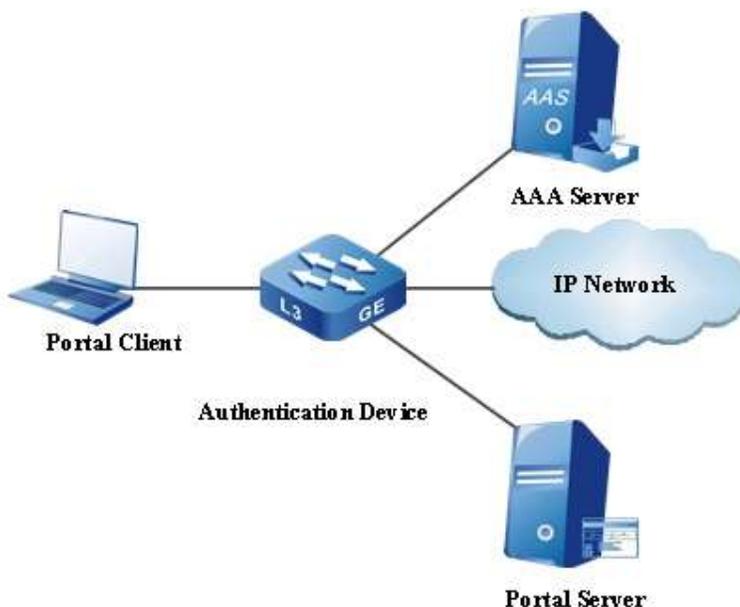

Figure 93 System Composition of Portal

- Portal Client: Generally the browser which runs HTTP or the proprietary Portal client software.
- Authentication Device: Located between the client and the authentication server, it controls network access of the client through interactions with Portal server and AAA server.
- Portal Server: The server system which receives authentication requests from the authentication client, and provides free portal service and Web authentication-based interface. After accepting the authentication requests from the authentication client and extracting authentication information therefrom, it interacts with the authentication device through the Portal protocol and notifies the authentication client of the authentication result.
- AAA Server: Generally, it is RADIUS (Remote Authentication Dial-In User Service) server. It is used to verify the legality of the client and notify the authentication result to the authentication device which controls network access of the client according to the authentication result.

### 93.1.3 Authentication Method of Portal

The Portal authentication method that can be used varies with networking mode. According to the network layer where Portal authentication is implemented in the network, Portal authentication method has two types, i.e. layer-2 authentication and layer-3 authentication.

#### 1. Layer-2 authentication

Support enabling the Portal authentication function on the layer-2 interface through which the authentication device connects with the user. Before authentication, the user obtains an IP address through manual configuration or DHCP, and can only access the Portal server; after passing the authentication, it can access network resources. Layer-2 authentication, based on source MAC control, permits the packets with legal source MAC address to pass after passing the authentication.

#### 2. Layer-3 authentication

Support enabling the Portal authentication function on the layer-3 interface through which the authentication device connects with the user. Layer-3 authentication has two types, i.e. general layer-3 authentication and secondary address allocation authentication.

##### (1) General layer-3 authentication

Before authentication, the user obtains an IP address through manual configuration or DHCP, and can only access the Portal server and the free access address set; after passing the authentication, it can access network resources. General layer-3 authentication realizes control in two ways:

- Based on source IP control, permitting the packets with legal source IP to

pass after passing the authentication.

- Based on source IP + source MAC control, permits the packets with legal source IP and source MAC address to pass after passing the authentication.

### 93.1.4 Authentication Process of Portal

There are two ways of authentication interaction between Portal server and authentication device:

- CHAP (Challenge Handshake Authentication Protocol): It is very secure as both user name and password are encrypted during transmission.
- PAP (Password Authentication Protocol): It has low security as both user name and password are transmitted in plaintext.

Portal server completes challenge handshake authentication through CHAP authentication interaction. Challenge is randomly generated by the authentication device when receiving Challenge request packets. With 16 bytes, it will be issued to the Portal server with Challenge response packets.

Layer-2 Portal authentication has the same process as general layer-3 Portal authentication.

#### 1. Process of layer-2 Portal and general layer-3 Portal authentication

The flow chart is shown below:

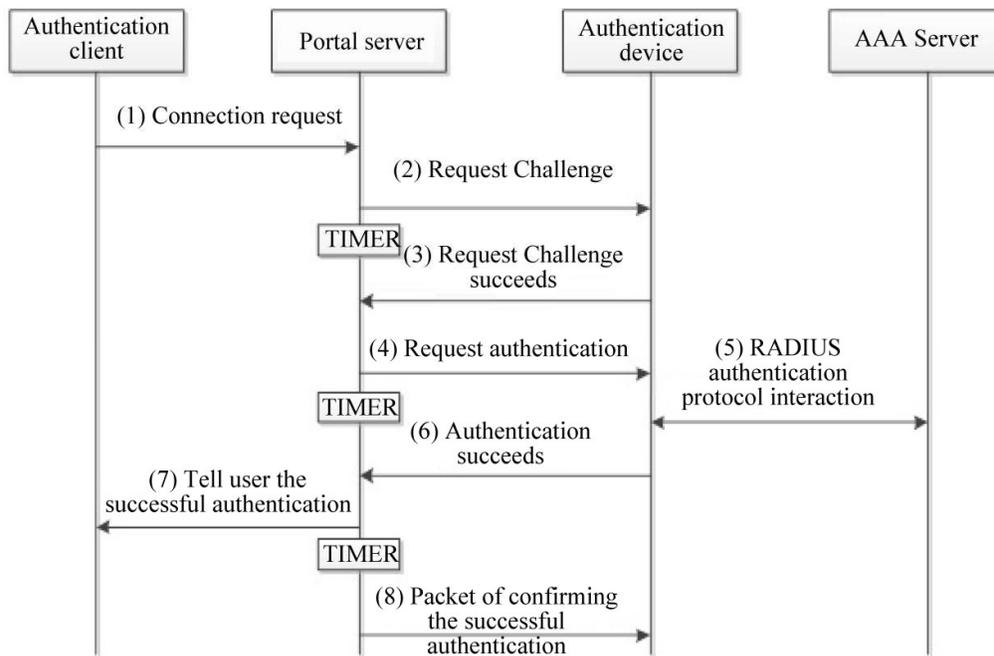

Figure 93 CHAP Flow Chart of Layer-2/General Layer-3 Portal Authentication

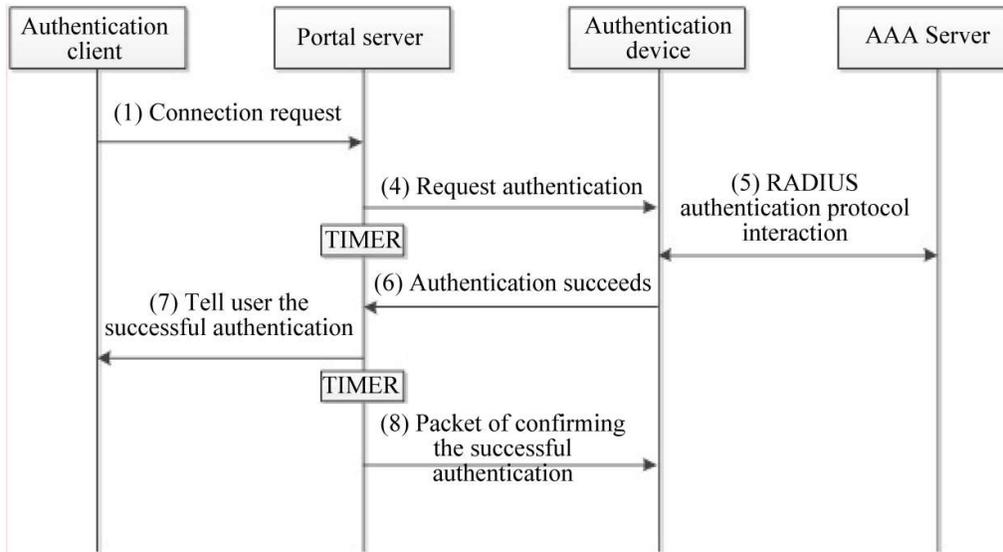

Figure 93 PAP Flow Chart of Layer-2/General Layer-3 Portal Authentication

Process of layer-2 Portal and general layer-3 Portal authentication:

- 1) Portal users have to initiate authentication requests when they need to access the network. When HTTP packets pass through the authentication device, the authentication device allows those accessing the Portal server or the free access address set to pass, and intercepts and redirects those accessing other addresses to the Portal server. The Portal server begins an authentication process by providing a Web page for users to input the legal user name and password that have been registered on the authentication server.
- 2) The Portal server uses CHAP authentication interaction to perform challenge handshake authentication. It will send a Challenge request to the authentication device. Use PAP authentication interaction to go to step (4).
- 3) The authentication device randomly generates a Challenge when receiving a Challenge request packet, and sends a successful challenge request packet to issue the Challenge to the Portal server. Use PAP authentication interaction to go to step (4).
- 4) The Portal server packets the user name and password input by the user into an authentication request packet and then sends it to the authentication device for authentication. At the same time, it enables the timer to wait for the authentication response.
- 5) The interaction of RADIUS protocol packets is conducted between the authentication device and the RADIUS server.
- 6) The authentication device sends a packet of successful authentication to the Portal server.
- 7) The Portal server sends the packet of successful authentication to the authentication

client to notify the user of the successful authentication.

- 8) The Portal server sends the packet of confirming successful authentication to the authentication device.

### 93.1.5 Support Issuing ACL

ACL (Access Control List) offers the function of controlling users' access to network resources and restricting users' access permission. When users go online, if an authorized ACL is configured on the server, the device will control the data flow of the port where the user is located according to the authorized ACL issued by the server; before configuring the authorized ACL on the server, it is required to configure corresponding rules on the device. Layer-2 Portal authentication supports issuing standard IP ACLs and extended IP ACLs; layer-3 Portal authentication supports issuing extended IP ACLs, and the matching items of the ACL rules configured support adding "source IP + source MAC".

## 93.2 Portal Function Configuration

Table 93 Portal Function Configuration List

Configuration Task	
Configure Portal Server and Attributes	Create Portal Server
	Configure Type of Portal Server
	Configure Detection Function for Portal Server
	Configure Source Interface for Sending Portal Packet
	Configure Destination UDP Port Number for Sending Packet of Forcing Users to Go Offline
Configure Layer-2 Portal Authentication Function	Enable Layer-2 Portal Authentication Function
Configure Layer-2 Portal Authentication Attributes	Configure Port Access Control Method
Configure Layer-3 Portal Authentication Function	Enable General Layer-3 Portal Authentication Function
	Configure and Apply Secure Channel

Configuration Task	
Configure Common Attributes	Configure the Maximum Number of Users on Interface
	Configure User Authentication Migration Function
	Configure the Function of Removing Domain Name
	Configure Timer Parameters
	Configure Authentication Method List
	Configure Accounting Method List

### 93.2.1 Configure Portal Server and Attributes

#### Configuration Condition

None

#### Create Portal Server

Create a Portal server and specify relevant parameters of the Portal server, including server IP address, shared encryption key, server port number, and server URL (authentication page address of the server).

Table 93 Creating Portal Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create Portal Server	<b>portal server</b> <i>server-name</i> <b>ip</b> <i>ip-address</i> <b>key</b> [ <b>0</b>   <b>7</b> ] <i>key-string</i> [ <b>port</b> <i>udp-port-num</i>   <b>url</b> <i>url-string</i> ]	Optional By default, the Portal server is not created.

**Note**

- Portal authentication supports IPV4 protocol only.
- At most 5 Portal servers can be created on the authentication device.
- The parameters of the Portal server configured can be deleted or modified only when this Portal server is not referenced by interface.
- The shared keys configured on the authentication device and Portal server must be consistent.

### Configure Type of Portal Server

Configuring the type of Portal server is useful in two aspects:

- Different Portal servers extend the standard Portal protocol specifications.
- When no server URL is configured on the Portal server, it uses the default server URL of corresponding type for redirection.

The server types that can be specified include:

aas: AAS server, default server URL: `http://IP-ADDRESS/portal/Login.do`

imc: IMC server, default server URL: `http://IP-ADDRES:8080/portal`

user-defined: user-defined server, the default server URL format complies with the protocol specification "PORTAL Protocol Specification v2.0.2 for WLAN Service of China Mobile".

Table 93 Configuring Type of Portal Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Type of Portal Server	<b>portal server <i>server-name</i> type { aas   imc   user-defined }</b>	Optional By default, the server type is AAS.

### Configure Detection Function for Portal Server

During the process of Portal authentication, if the communication between authentication device and Portal server is interrupted, new users cannot go online, and the Portal users who are already online cannot go offline normally. To solve this problem, the authentication device should be able to timely detect the changes of the reachable state of the Portal server, and trigger the performance of corresponding operation to respond to the influence of these changes. For example, when the specified Portal server is

unreachable, all users who use the Portal server for authentication will be forced to pass the authentication to access network resources, i.e. the Portal escape function.

Configure detection function so that the authentication device can detect the reachable state of the Portal server. The specific configurations are shown below:

- (1) Time interval of detecting reachability of server
- (2) Action performed when the reachable state of server changes
  - Log record: When the reachable state of Portal server changes, the log information is recorded.
  - Enable user restriction: When the reachable state of the Portal server changes, the log information is recorded; when the specified Portal server is unreachable, all users who use the Portal server for authentication will be forced to pass the authentication; when the Portal server is reachable again, the users who use this Portal server for forced authentication will be forced to go offline.

Table 93 Configuring Detection Function for Portal Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the time interval of detecting Portal server	<b>portal server</b> <i>server-name</i> <b>detect-interval</b> <i>detect-interval-value</i>	Optional By default, the time interval of detecting Portal server is 60 seconds, and the value range is 20~600 seconds or 0; when it is configured as 0, the Portal server cannot be detected.
Configure the action performed when the reachable state of the Portal server changes	<b>portal server</b> <i>server-name</i> <b>failover { log   permit }</b>	Optional By default, when the reachable state of Portal server changes, the log information is recorded.

### Configure Source Interface for Sending Portal Packet

Specify the source interface for sending Portal packet. The master IP address configured under the source interface is the source address used by the authentication device to send Portal packets to this Portal server. If there is no master IP address under the source interface, the communication will fail.

Table 93 Configuring Source Interface for Sending Portal Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Source Interface for Sending Portal Packet	<b>portal server</b> <i>server-name</i> <b>source-interface</b> <i>interface-name</i>	Optional By default, the source interface for sending Portal packet is not specified, and the user access interface is the source interface for sending Portal packet.

### Configure the Destination UDP Port Number for Sending Packet of Forcing Users to Go Offline

The port number of some servers for receiving the packet of forcing users to go offline is the specific UDP port number. Therefore, it's necessary to configure the destination UDP port number for sending packet of forcing users to go offline.

Table 93 Configuring Destination UDP Port Number for Sending Packet of Forcing Users to Go Offline

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the destination UDP port number for sending packet of forcing users to go offline	<b>portal server</b> <i>server-name</i> <b>ntf-logout-port</b> <i>udp-port-num</i>	Optional By default, the destination UDP port number for sending packet of forcing users to go offline is not specified. Instead, the port number of server is used.

## 93.2.2 Configure Layer-2 Portal Authentication Function

### Configuration Condition

To enable the layer-2 Portal authentication function, the following conditions should be met:

- This Portal server has been created on the authentication device

### Enable Layer-2 Portal Authentication Function

Enable layer-2 Portal authentication on the port of the authentication device connecting the user. The layer-2 authentication, based on source MAC control, permits the packets with legal source MAC address to pass after passing the authentication.

Table 93 Enabling Layer-2 Portal Authentication Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on current port.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the interface of current aggregation group.
Enable Layer-2 Portal Authentication Function	<b>portal server</b> <i>server-name</i> <b>method layer2</b>	Mandatory  By default, the layer-2 Portal authentication function under the port is disabled.

### Note

- The layer-2 Portal authentication doesn't support the issuance of VLAN.
- Layer-2 Portal authentication and Free-IP of 802.1X cannot be both configured for the same port.
- When layer-2 Portal authentication is enabled on the port, layer-3 Portal authentication cannot be enabled on corresponding VLAN interface. Otherwise, the configuration will fail.

- When the port where layer-2 Portal authentication is enabled is added to the VLAN interface where layer-3 Portal authentication is enabled, the configuration related to layer-2 Portal authentication of the port will be automatically cleared, and the log automatically cleared will be recorded.

### 93.2.3 Configure Layer-2 Portal Authentication Attributes

#### Configuration Condition

None

#### Configure Port Access Control Method

There are two types of port access control: Portbased and Macbased.

Portbased access control: Only one user is permitted to pass authentication under the port.

Macbased access control: Multiple users are permitted to pass authentication under the port. They cannot access the network without passing authentication.

The Portbased access control also has two modes: Multi-hosts and Single-host.

Multi-hosts: After one user passes authentication, other users under the port can access the network without authentication.

Single-host: Under the port, only one user is permitted to pass authentication and access the network. Other users cannot access the network or pass authentication.

Table 93-8 Configuring Port Access Control Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only on the

Step	Command	Description
		interface of current aggregation group.
Configure access control method	<b>authentication port-method { macbased   portbased }</b>	Mandatory By default, user authentication method is enabled under the port.
Portbased access control method	<b>authentication port-method portbased host-mode { multi-hosts   single-host }</b>	Optional By default, Multi-hosts authentication is enabled under the port.

---

### Note

- When configuring the host mode under portbased access control, you should guarantee that the access control method has been configured as Portbased.
- 

## 93.2.4 Configure Layer-3 Portal Authentication Function

### Configuration Condition

To enable the layer-3 Portal authentication function, the following conditions should be met:

- This Portal server has been created on the authentication device

### Enable General Layer-3 Portal Authentication Function

Enable the general layer-3 Portal authentication function on the layer-3 interface of the authentication device connecting to the user. The general layer-3 authentication has two control methods:

- Based on source IP control, permitting the packets with legal source IP to pass after passing the authentication.
- Based on source IP + source MAC control, permits the packets with legal source IP and source MAC address to pass after passing the authentication.

Table 93 Enabling General Layer-3 Portal Authentication Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable General Layer-3 Portal Authentication Function	<b>portal server</b> <i>server-name</i> <b>method layer3</b> [ <b>ip</b>   <b>ip-mac</b> ]	Mandatory  By default, the general layer-3 Portal authentication function of the interface is disabled.

---

### Note

- After the port under the general layer-3 Portal authentication interface is enabled, both 802.1X authentication and MAC authentication cannot be enabled.
  - After the port under the general layer-3 Portal authentication interface is enabled, the layer-2 Portal authentication function cannot be enabled.
  - When the port where layer-2 Portal authentication is enabled is added to the VLAN interface where the general layer-3 Portal authentication has been enabled, the enabling status of layer-2 Portal authentication is cleared.
- 

### Configure and Apply Secure Channel

After enabling the layer-3 authentication function under the layer-3 interface, to permit terminal users to access the resources in the specified network when they are not authenticated, or specify specific terminal users to access network resources without authentication, you need to configure and apply secure channel.

Secure channel rules can be configured as follows.

- Permit terminal users to access specified network resources.
- Permit specified terminal users to access network resources.

Table 1 Applying Secure Channel

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure secure channel	<b>hybrid access-list advanced</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no secure channel is configured in the device.
Configure secure channel rules	[ <i>sequence</i> ] <b>permit</b> <i>protocol</i> { <b>any</b>   <i>source-ip-addr</i> <i>source-wildcard</i>   <b>host</b> <i>source-ip-addr</i> } { <b>any</b>   <i>source-mac-addr</i> <i>source-wildcard</i>   <b>host</b> <i>source-mac-addr</i> } { <b>any</b>   <i>destination-ip-addr</i> <i>destination-wildcard</i>   <b>host</b> <i>destination-ip-addr</i> } { <b>any</b>   <i>destination-mac-addr</i> <i>destination-wildcard</i>   <b>host</b> <i>destination-mac-addr</i> }	Mandatory  By default, there are no secure channel rules under the secure channel.
Apply secure channel	<b>global security access-group</b> { <i>access-group-number</i>   <i>access-group-name</i> }	Mandatory  By default, no secure channel is applied in the system.

---

### Note

- A device can be configured with multiple secure channels, and a secure channel may have multiple secure channel rules.
  - The type of secure channel can be mixed advanced ACL only, and only one secure channel can be applied in the device.
- 

## 93.2.5 Configure Common Attributes

### Configuration Condition

None

2008

User manual  
Release 1.0 01/2022

## Configure the Maximum Number of Users on Interface

After the number of users authenticated under the interface reaches the upper limit configured, the authentication system no longer responds to the authentication request initiated by the new user.

The maximum number of users on layer-2 interface ranges from 1 to 4096, and that on layer-3 interface from 1 to 500.

Table 93 Configuring Maximum Number of Users on Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	The subsequent configuration takes effect only on current interface after you enter the layer-2
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Ethernet interface configuration mode, only on the interface of current aggregation group after you enter the aggregation group configuration mode, and only on current interface after you enter the interface configuration mode
Configure the Maximum Number of Users on Interface	<b>authentication max-user-num</b> <i>max-user-num-value</i>	Mandatory By default, at most 256 users are permitted to access under the interface.

---

### Note

- Under the layer-2 interface, configure as Macbased access control. Otherwise, the configured number of users permitted to access cannot take effect.
- 

## Configure User Authentication Migration Function

The user authentication migration function applies to the scenarios where the same user migrates from one authentication interface to another in the same device. When the user authentication migration function is disabled, after a user is authenticated on one interface of the device, it is not permitted to initiate authentication on another authentication interface of the device; when the user authentication migration function is enabled, after the user is authenticated on one interface, and the device finds that the user has migrated to another authentication interface, the device deletes the authentication information on the original interface and then permits the user to initiate authentication on a new authentication interface.

No matter whether the user authentication migration function is enabled, the device will record a log once it finds user migration between authentication interfaces.

Table 93 Configuring User Authentication Migration Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on current interface after you enter the layer-2 Ethernet interface configuration mode, only on the interface of current aggregation group after you enter the aggregation group configuration mode, and only on current interface after you enter the interface configuration mode
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	
Configure User Authentication Migration Function	<b>authentication station-move { enable   disable }</b>	Mandatory  By default, the user authentication migration function is disabled.

### Configure the Function of Removing Domain Name

In some scenarios, the username automatically contains the domain name when the client initiates authentication, and the user carrying the domain name cannot pass the authentication on the

authentication server. In order to avoid this, whether the authenticated user name sent to the authentication device contains a domain name can be configured for the authentication device.

Table 2 Configuring Function of Removing Domain Name

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on current interface after you enter the layer-2
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	Ethernet interface configuration mode, only on the interface of aggregation group after you enter the aggregation group configuration mode, and only on current interface after you enter the interface configuration mode
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	
Configure the Function of Removing Domain Name	<b>portal user-name-format</b> { <b>with-domain</b>   <b>without-domain</b> }	Mandatory  By default, the function of removing domain name is not configured.

### Configure Timer Parameters

The timer parameters under the interface include authenticating-period, authenticated-period, idle-period, and idle-period.

**Authenticating-period:** When any client packet is detected, the authenticating-period timer is enabled. After time-out of the timer, if no authentication result has been obtained, the client will be deleted.

**Authenticated-period:** After the client passes the authentication, this timer is enabled. After time-out of the timer, the information of the client which passes the authentication is deleted.

**Idle-period:** After the client passes the authentication, this timer is enabled. When the client is found offline, the information of the client which passes the authentication is deleted.

Quiet-period: When the client fails to pass the authentication, this timer is enabled. After time-out of the timer, the authentication device will respond to the authentication request from the client again.

The timer newly configure is valid for the authenticated users who later go online instead of those who have been online.

Table 3 Configuring Timer Parameters

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on current interface after you enter the layer-2 Ethernet interface configuration mode, only on the interface of current aggregation group after you enter the aggregation group configuration mode, and only on current interface after you enter the interface configuration mode
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	
Configure Timer Parameters	<b>portal timeout</b> { <b>authenticating-period</b> <i>authenticating-period-value</i>   <b>authenticated-period</b> <i>authenticated-period-value</i>   <b>idle-period</b> <i>idle-period-value</i>   <b>quiet-period</b> <i>quiet-period-value</i> }	Mandatory  By default,  the authenticating-period is 120 seconds, and the value range is 15~300;  the authenticated-period is 36000 seconds, and the value range is 0 or 300~864000;  the idle-period is 300 seconds, and the value range is 0 or 180~1800;  the quiet period is 60 seconds, and the value range is 15~3600.

### Configure Authentication Method List

Configure the authentication method list used by Portal users. When the user name of a Portal user contains a domain name, the authentication method list specified by the domain name is used; when there is no domain name in the Portal user name, the authentication method list configured is used.

Table 93 Configure Authentication Method List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to connect the authentication method list	<b>portal authentication method-list</b> { <b>default</b>   <i>list-name</i> }	Optional By default, the authentication method list of default is used.

### Configure Accounting Method List

The accounting method list used by Portal users. When the user name of a Portal user contains a domain name, the accounting method list specified by the domain name is used; when there is no domain name in the Portal user name, the accounting method list configured is used.

Table 4 Configuring Accounting Method List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to connect the accounting method list	<b>portal accounting method-list</b> { <b>default</b>   <i>list-name</i> }	Optional By default, the accounting method list of default is used.

## 93.2.6 Portal Monitoring and Maintaining

Table 93 Portal Monitoring and Maintaining

Command	Description
<b>clear portal user</b> { <b>ip</b> <i>ip-address</i>   <b>mac</b> <i>mac-address</i>   <b>all</b>   <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> }	Force the Portal user to go offline
<b>clear portal auth-fail-user history</b> [ <b>ip</b> <i>ip-address</i> ]	Clear record of failed authentication
<b>clear portal statistic</b> [ <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> ]	Clear authentication statistics
<b>show authentication user</b> [ <b>ip</b> <i>ip-address</i>   <b>mac</b> <i>mac-address</i>   <b>all</b>   <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i>   <b>summary</b> ]	Show the information of authentication management users
<b>show authentication intf-status</b> [ <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> ]	Show the information of authentication status
<b>show portal</b>	Show default configurations of authentication
<b>show portal auth-fail-user history</b> [ <b>ip</b> <i>ip-address</i>   <b>recent</b> ]	Show the information of authentication failure
<b>show portal config</b> [ <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> ]	Show configurations of authentication
<b>show portal global config</b>	Show the information of global configuration
<b>show portal server</b>	Show the information of Portal server
<b>show portal statistic</b> [ <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> ]	Show authentication statistics
<b>show portal user</b> [ <b>ip</b> <i>ip-address</i>   <b>mac</b> <i>mac-address</i>   <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i>   <b>summary</b> ]	Show user information

## 93.3 Typical Configuration Example of Portal

### 93.3.1 Configure Portbased Layer-2 Portal Authentication

#### Network Requirements

- PC1 and PC2 on the same LAN access the IP network through the Device where the layer-2 Portal authentication function is enabled and configured as Portbased.
- RADIUS authentication is used as an authentication method.
- Users can access the Portal Server only when they fail to pass authentication. They are permitted to access the IP Network once it passes the authentication.
- After one user on the LAN passes authentication, other users on this LAN can access the IP Network without authentication.

#### Network Topology

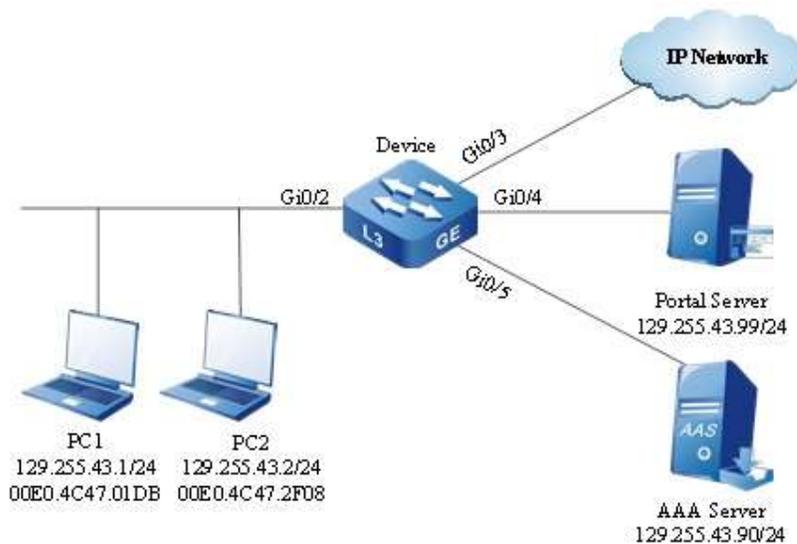

Figure 93 Network Topology for Configuring Portbased Layer-2 Portal Authentication

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN129 on the Device.

```
Device#configure terminal
Device(config)#vlan 129
Device(config)#exit
```

#Configure the link type of port gigabitethernet0/2 as Access, allowing the services of VLAN129 to pass.

```
Device(config)#interface gigabitethernet 0/2
```

```
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 129
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of the ports gigabitethernet 0/3~gigabitethernet 0/5 on the Device as Access, allowing the services of VLAN129 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN129 as 129.255.43.10/24.

```
Device(config)#interface vlan 129
Device(config-if-vlan129)#ip address 129.255.43.10 255.255.255.0
Device(config-if-vlan129)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, RADIUS server address 129.255.43.90/24, server key admin, and priority 1.

```
Device#configure terminal
Device(config)#domain system
Device(config-isp-system)# aaa authentication portal radius-group radius
Device(config-isp-system)#exit
Device(config)#aaa server group radius radius
Device(config-sg-radius-radius)#server 129.255.43.90 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure layer-2 Portal authentication.

#On the Device, configure the Portal server of server1.

```
Device(config)# portal server server1 ip 129.255.43.99 key admin url http://129.255.43.99:8080/portal
```

#Enable layer-2 portal authentication on the Device and configure Portbased mode.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#portal server server1 method layer2
Device(config-if-gigabitethernet0/2)#authentication port-method portbased
Device(config-if-gigabitethernet0/2)#exit
```

Step 6: Configure Portal server.

#On Portal server, configure IP address of PC1, address of the Device and key value as admin. (Omitted)

Step 7: Check the result.

#Before passing the authentication, PC1 and PC2 can access the Portal Server only.

#Verify that PC1 can pass the authentication. At this moment, both PC1 and PC2 can access the IP Network.

Device#show portal user

```
-----  
NO 1 : IP_ADDRESS= 129.255.43.1 STATUS= Authorized USER_NAME= admin  
      INTERFACE= gi0/2 CTRL_METHOD= L2_MAC AUTH_STATE= AUTHENTICATED  
      BACK_STATE= AAA_SM_IDLE VLAN= 129 MAC_ADDRESS= 00E0.4C47.01DB  
  
Total: 1 Authorized: 1 Unauthorized/Guest/Critical: 0/0/0
```

### 93.3.2 Configure Macbased Layer-2 Portal Authentication

#### Network Requirements

- PC1 and PC2 on the same LAN access the IP network through the Device where the layer-2 Portal authentication function is enabled and configured as Macbased.
- RADIUS authentication is used as an authentication method.
- Users can access the Portal Server only when they fail to pass authentication. They are permitted to access the IP Network once it passes the authentication.
- After one user on the LAN passes authentication, it can access the IP Network. Other users on this LAN can access the IP Network only when they pass authentication.

#### Network Topology

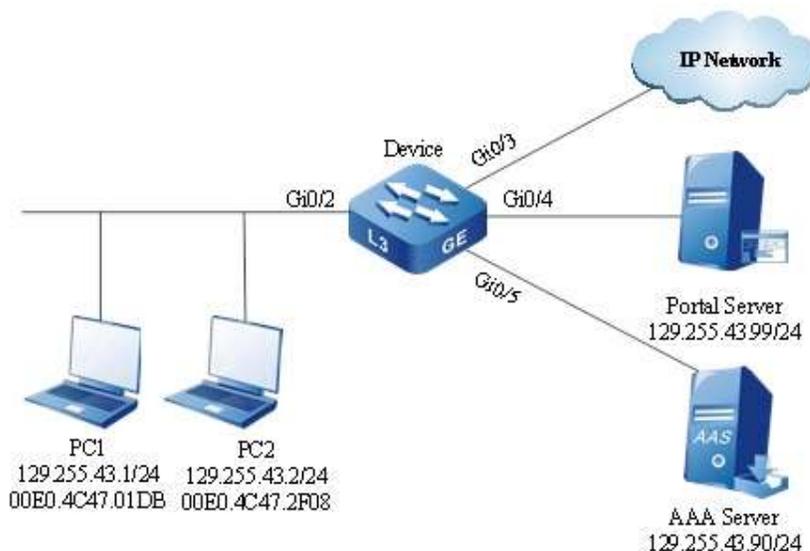

Figure 93 Network Topology for Configuring Macbased Layer-2 Portal Authentication

## Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN129 on the Device.

```
Device#configure terminal
```

```
Device(config)#vlan 129
```

```
Device(config)#exit
```

#Configure the link type of port gigabitethernet0/2 as Access, allowing the services of VLAN129 to pass.

```
Device(config)#interface gigabitethernet 0/2
```

```
Device(config-if-gigabitethernet0/2)#switchport mode access
```

```
Device(config-if-gigabitethernet0/2)#switchport access vlan 129
```

```
Device(config-if-gigabitethernet0/2)#exit
```

#Configure the link type of the ports gigabitethernet 0/3~gigabitethernet 0/5 on the Device as Access, allowing the services of VLAN129 to pass. (Omitted)

Step 2: Configure interface IP address for the Device.

#Configure the IP address of VLAN129 as 129.255.43.10/24.

```
Device(config)#interface vlan 129
```

```
Device(config-if-vlan129)#ip address 129.255.43.10 255.255.255.0
```

```
Device(config-if-vlan129)#exit
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, RADIUS server address 129.255.43.90/24, server key admin, and priority 1.

```
Device#configure terminal
```

```
Device(config)#domain system
```

```
Device(config-isp-system)# aaa authentication portal radius-group radius
```

```
Device(config-isp-system)#exit
```

```
Device(config)#aaa server group radius radius
```

```
Device(config-rg-radius-radius)#server 129.255.43.90 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure layer-2 Portal Authentication.

#On the Device, configure the Portal server of server1.

```
Device(config)# portal server server1 ip 129.255.43.99 key admin url http://129.255.43.99:8080/portal
```

#Enable layer-2 portal authentication on the Device and configure Macbased mode.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#portal server server1 method layer2
Device(config-if-gigabitethernet0/2)#authentication port-method macbased
Device(config-if-gigabitethernet0/2)#exit
```

Step 6: Configure Portal server.

#On Portal server, configure IP address of PC1, address of the Device and key value as admin. (Omitted)

Step 7: Check the result.

#Before passing the authentication, PC1 and PC2 can access the Portal Server only.

#Verify that PC1 can pass the authentication. At this moment, PC1 instead of PC2 can access the IP Network.

```
Device#show portal user
```

```
-----
NO 1 : IP_ADDRESS= 129.255.43.1 STATUS= Authorized USER_NAME= admin
      INTERFACE= gi0/2 CTRL_METHOD= L2_MAC AUTH_STATE= AUTHENTICATED
      BACK_STATE= AAA_SM_IDLE VLAN= 129 MAC_ADDRESS= 00E0.4C47.01DB
      Total: 1 Authorized: 1 Unauthorized/Guest/Critical: 0/0/0
```

### 93.3.3 Configure General Layer-3 Portal Authentication

#### Network Requirements

- PC1 and PC2 on the same LAN access the IP network through the Device where the general layer-3 Portal authentication is enabled.
- RADIUS authentication is used as an authentication method.
- PC1 can access the Update Server only prior to passing authentication. It is permitted to access the IP Network once it passes the authentication.
- PC2 is permitted to access the Update Server.

#### Network Topology

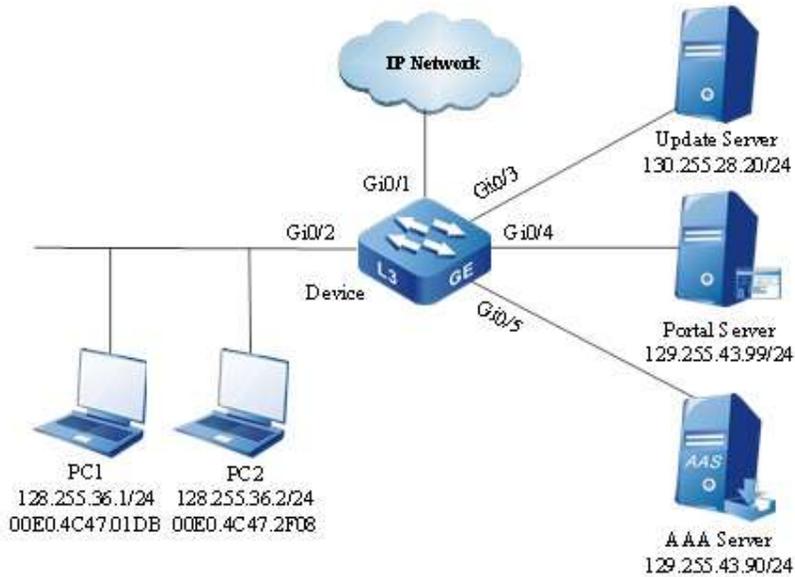

Figure 93 Network Topology for Configuring General Layer-3 Portal Authentication

### Configuration Steps

Step 1: Configure VLAN and link type on the port.

#Create VLAN128, VLAN129, VLAN130 and VLAN131 on the Device.

```
Device#configure terminal
Device(config)#vlan 128,129,130,131
Device(config)#exit
```

#Configure the link type of gigabitethernet0/2 to Access to allow services of VLAN128 to pass.

```
Device#configure terminal
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 128
Device(config-if-gigabitethernet0/2)#end
```

#Configure the link type of port as Access on gigabitethernet 0/1 of the Device, allowing the services of VLAN131 to pass. Configure the link type of port as Access on gigabitethernet 0/3 of the Device to allow services of VLAN130 to pass, and as Access on gigabitethernet 0/4~gigabitethernet 0/5 to allow services of VLAN129 to pass. (Omitted)

Step 2: Configure interface IP address of the Device so that network routes are reachable.

#Configure the IP address of VLAN128 as 128.255.36.10/24.

```
Device#configure terminal
Device(config)#interface vlan 128
Device(config-if-vlan128)#ip address 128.255.36.10 255.255.255.0
```

```
Device(config-if-vlan128)#end
```

#Configure the IP address of VLAN129 as 129.255.43.10/24.

```
Device#configure terminal
```

```
Device(config)#interface vlan 129
```

```
Device(config-if-vlan129)#ip address 129.255.43.10 255.255.255.0
```

```
Device(config-if-vlan129)#end
```

#Configure the IP address of VLAN130 as 130.255.28.10/24.

```
Device#configure terminal
```

```
Device(config)#interface vlan 130
```

```
Device(config-if-vlan130)#ip address 130.255.28.10 255.255.255.0
```

```
Device(config-if-vlan130)#end
```

#Configure the IP address of VLAN131 as 131.255.28.10/24.

```
Device#configure terminal
```

```
Device(config)#interface vlan 131
```

```
Device(config-if-vlan131)#ip address 131.255.28.10 255.255.255.0
```

```
Device(config-if-vlan131)#end
```

Step 3: Configure AAA authentication.

#Enable AAA authentication on the Device, authentication method RADIUS, RADIUS server address 129.255.43.90/24, server key admin, and priority 1.

```
Device#configure terminal
```

```
Device(config)#domain system
```

```
Device(config-isp-system)# aaa authentication portal radius-group radius
```

```
Device(config-isp-system)#exit
```

```
Device(config)#aaa server group radius radius
```

```
Device(config-rg-radius-radius)#server 129.255.43.90 priority 1 key admin
```

Step 4: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 5: Configure general layer-3 Portal authentication.

#On the Device, configure the Portal server of server1.

```
Device(config)# portal server server1 ip 129.255.43.99 key admin url http://129.255.43.99:8080/portal
```

#Enable layer-3 Portal authentication on the Device.

```
Device#configure terminal
```

```
Device(config)#interface vlan 128
```

```
Device(config-if-vlan128)#portal server server1 method layer3 ip
```

```
Device(config-if-vlan128)#exit
```

```
User manual
```

```
Release 1.0 01/2022
```

#Configure a secure channel named channel, and permit both PC1 and PC2 to access the Update Serve.

```
Device#configure terminal
Device(config)#hybrid access-list advanced channel
Device(config-adv-hybrid-nacl)#permit ip any any host 130.255.28.20 any
```

#Apply the secure channel named channel.

```
Device#configure terminal
Device(config)#global security access-group channel
Device(config)#exit
```

Step 6: Configure Portal server.

#On Portal server, configure IP address of PC1, address of the Device and key value as admin. (Omitted)

Step 7: Check the result.

#View the configuration information of secure channel

```
Device#show portal global config
```

```
portal global configuration information:
authentication method list : default
accounting method list    : default
```

```

# 94 Trusted Device Access

---

## 94.1 Overview

In order to prevent unauthorized access to the core network, the edge devices of core network must have high security. Therefore, other network devices that access these edge devices must be trusted ones. The trusted device access function implements the scheme of prohibiting unauthorized devices from accessing the core network based on the mature 802.1X protocol. Its basic network topology is shown in Figure 7-1. It includes three entities, i.e. Access Device, Authentication System and Authentication Server System.

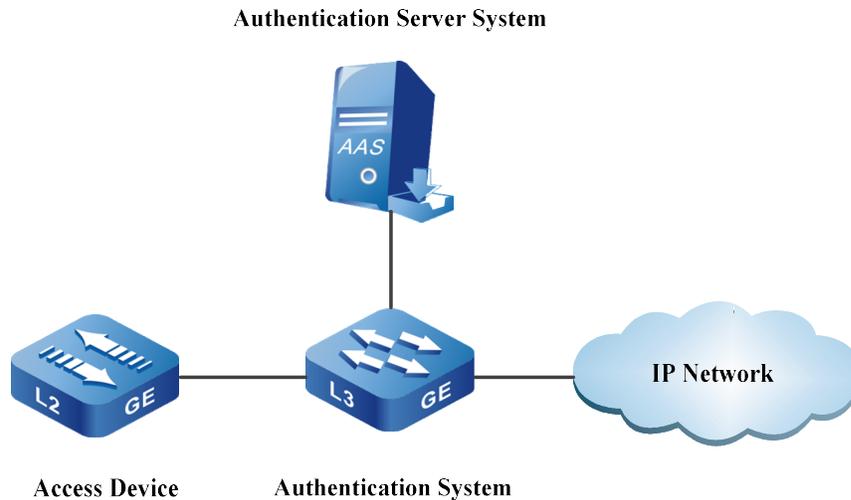

Figure 94 Topology for Trusted Device Access

The specific methods of accessing trusted device are shown below:

- Enable the trusted device access function on the access device, and configure the identity credential and relevant parameters required for device access on the access device and authentication server.
- Enable the authentication function of 802.1X device on the authentication device and make the port accessing to the access device become a controlled port for access of device.
- After the access device accesses the authentication device, it automatically initiates 802.1X authentication. After passing the 802.1X authentication, the authentication device turns on the controlled port to enable the access device to successfully access the network.
- The access device periodically conducts keepalive authentication according to the keepalive period set on the authentication device.

## 94.2 Configuration of Trusted Device Access

Table 94 Trusted Device Access Function Configuration List

Configuration Task	
Configure Trusted Device Access	Configure User Name and Password of Trusted Device Access
	Configure the User Name Format of Trusted Device Access
	Configure Trigger Period of Trusted Device Access
	Enable Trusted Device Access
Configure 802.1X Device Authentication	Enable 802.1X Device Authentication Function
	Configure Authentication Keepalive Period of 802.1X Device

## 94.2.1 Configure Trusted Device Access

### Configuration Condition

None

### Configure User Name and Password of Trusted Device Access

To successfully make the access device access the network, you are required to configure the user name and password of trusted device access on the port connecting the authentication device. The user name and password configured will be sent as the authentication credential of the access device to the authentication device for authentication through 802.1X protocol (MD5-Challenge mode).

Table 94 Configuring User Name and Password of Trusted Device Access

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the

Step	Command	Description
		current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure User Name and Password of Trusted Device Access	<b>dot1x client user</b> <i>username</i> <i>password 0 password</i>	Mandatory  By default, the user name and password of trusted device access are not configured under the port.

### Note

- Only one user name and password for device access can be configured under one port. The newly configured user name and password under the same port will overwrite the original ones under this port.

### Configure the User Name Format of Trusted Device Access

802.1X authentication identifies whether the peer end initiating authentication is device or terminal according to the device ID in the protocol packet EAP-Response/Identity. When the user name of the trusted device access under the port contains device ID, the authentication initiated by this port is 802.1X device authentication. When there is no device ID in the user name of the trusted device access under the port, the authentication initiated by this port is 802.1X terminal authentication.

Table 94 Configuring User Name Format of Trusted Device Access

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the User Name Format of Trusted Device Access	<b>dot1x client user-name-format { with-dev-flag   without-dev-flag }</b>	Mandatory  By default, the user name of trusted device access under the port contains device ID.

### Configure Trigger Period of Trusted Device Access

Before the access device passes the authentication, it actively sends an EAPoL-Start packet for 802.1X device authentication according to the access trigger period configured to ensure that the access device can quickly access the network.

Table 94 Configuring Trigger Period of Trusted Device Access

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
Configure Trigger Period of Trusted Device Access	<b>dot1x client auth-interval</b> <i>interval-value</i>	Mandatory  By default, the trigger period of trusted device access under the port is 15 seconds.

### Enable Trusted Device Access

After the device access function is enabled, the access device will actively conduct 802.1X device authentication prior to passing authentication. After passing the 802.1X authentication, the authentication device turns on the controlled port to enable the access device to successfully access the network.

Table 94 Enabling Trusted Device Access Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable Trusted Device Access	<b>dot1x client { enable   disable }</b>	Mandatory  By default, the trusted device access function under the port is disabled.

---

 **Note**

- The trusted device access and 802.1X authentication functions cannot be both enabled on the same port.
  - The trusted device access and MAC address authentication functions cannot be both enabled on the same port.
  - The trusted device access and secure channel authentication functions cannot be both enabled on the same port.
- 

## 94.2.2 Configure 802.1X Device Authentication

### Configuration Condition

None

### Enable 802.1X Device Authentication Function

To enable the 802.1X device authentication function to take effect on the authentication device, you are required to enable both 802.1X authentication and 802.1X device authentication function. After the authentication device takes effect, the port connecting authentication device and access device becomes a controlled one; after passing the authentication, the authentication device turns on the controlled port to enable the access device to successfully access the network.

Table 94 Enabling 802.1X Device Authentication Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect

Step	Command	Description
		only within the aggregation group.
Enable 802.1X Authentication	<b>dot1x port-control { enable   disable }</b>	Mandatory By default, the 802.1X authentication function under the port is disabled.
Enable 802.1X device authentication	<b>dot1x device-auth { enable   disable }</b>	Mandatory By default, the 802.1X device authentication function under the port is disabled.

### Note

- The 802.1X device authentication and MAC address authentication functions cannot be both enabled on the same port.
- The 802.1X device authentication and secure channel authentication functions cannot be both enabled on the same port.

### Configure Authentication Keepalive Period of 802.1X Device

In order to check whether the access device is online, after passing the authentication, the authentication device sends the 802.1X device authentication keepalive period configured to the access device which initiates keepalive authentication with this keepalive period. If the authentication device fails to receive the keepalive authentication from the access device during a period which is three times the keepalive period, the access device is considered offline, and the port status is changed to controlled.

Table 94 Configuring Keepalive Period of 802.1X Device Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface <i>interface-name</i></b>	At least one option must be selected.

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Authentication Keepalive Period of 802.1X Device	<b>dot1x device-auth</b> <b>keepalive</b> <i>period-value</i>	Mandatory  By default, the keepalive period of 802.1X device authentication under the port is 600 seconds.

### 94.2.3 Trusted Device Access Monitoring and Maintaining

Table 94 Trusted Device Access Monitoring and Maintaining

Command	Description
<b>show dot1x client config</b> { <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> }	Show configuration information
<b>show dot1x client user</b> { <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i> }	Shown access information
<b>show dot1x user</b> [ <i>mac-address</i>   <b>auth-type</b> { <b>device</b>   <b>user</b> }   <b>interface</b> <i>interface-name</i>   <b>link-aggregation</b> <i>link-aggregation-id</i>   <b>summary</b> ]	Show user information

## 94.3 Typical Configuration Example of Trusted Device Access

### Network Requirements

- The access device Device1 accesses the IP Network through the authentication device Device2 which uses device authentication access control.
- Device1 periodically initiates keepalive authentication.
- Use RADIUS authentication.
- After the access device passes authentication, PC can access the network.

### Network Topology

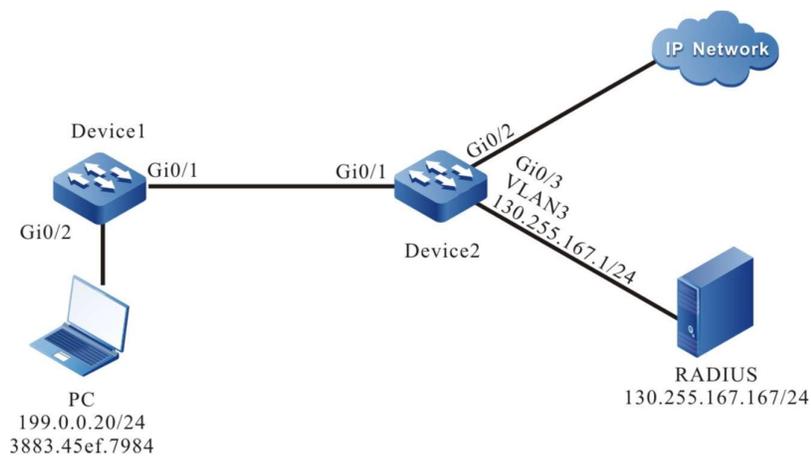

Figure 94 Network Topology for Configuring Trusted Device Access

### Configuration Steps

Step 1: Configure VLAN and port link type on Device1.

#Configure the link type of port as Access on gigabitethernet 0/2 of Device1, allowing the services of VLAN2 to pass.

```
Device1(config)#interface gigabitethernet 0/2
Device1(config-if-range)#switchport mode access
Device1(config-if-range)#switchport access vlan 2
Device1(config-if-range)#exit
```

#Configure the link type of port as Hybrid on gigabitethernet 0/1 of Device1, and add the port to VLAN2 in Tagged mode.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-range)#switchport mode hybrid
Device1(config-if-range)#switchport hybrid tagged vlan 2
Device1(config-if-range)#exit
```

Step 2: Configure VLAN and port link type on Device2.

#Create VLAN2-VLAN3 on Device2.

```
Device2#configure terminal
Device2(config)#vlan 2-3
Device2(config)#exit
```

#Configure the link type of port as Hybrid on gigabitethernet 0/1 of Device2, and add the port to VLAN2 in Tagged mode.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-range)#switchport mode hybrid
Device2(config-if-range)# switchport hybrid tagged vlan 2
Device2(config-if-range)#exit
```

#Configure the link type of port as Access on gigabitethernet 0/2~ gigabitethernet 0/3 of the Device2, allowing the services of VLAN2~VLAN3 to pass. (Omitted)

Step 3: Configure the interface IP address of Device2.

#Configure the IP address of VLAN3 as 130.255.167.1/24 on Device2.

```
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ip address 130.255.167.1 255.255.255.0
Device2(config-if-vlan3)#exit
```

Step 4: Configure AAA authentication on Device2.

#Enable AAA authentication on Device2, authentication method RADIUS, server key admin, priority 1, and RADIUS server address 130.255.167.167/24.

```
Device2(config)#aaa new-model
Device2(config)#aaa authentication connection default radius
Device2(config)#radius-server host 130.255.167.167 priority 1 key admin
```

Step 5: Configure AAA server.

#On AAA server, configure user name, password and key value as admin. (Omitted)

Step 6: Configure trusted device access on Device1.

#On Device1, configure the user name and password for trusted device access authentication.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#dot1x client user admin password 0 admin
Device1(config-if-gigabitethernet0/1)#exit
```

#Configure to initiate eapol-start packet for 802.1X device authentication every 10 seconds.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#dot1x client auth-interval 10
Device1(config-if-gigabitethernet0/1)#exit
```

#On Device1, enable the trusted device access function

```
Device1(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#dot1x client enable
Device2(config-if-gigabitethernet0/1)#exit
```

Step 7: Configure 802.1X device authentication on Device2.

#Enable 802.1X authentication on Device2.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#dot1x port-control enable
Device2(config-if-gigabitethernet0/1)#exit
```

#Enable 802.1X device authentication on Device2

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#dot1x device-auth enable
Device2(config-if-gigabitethernet0/1)#exit
```

#On Device2, configure the keepalive period of 802.1X device authentication as 120 seconds.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#dot1x device-auth keepalive 120
Device2(config-if-gigabitethernet0/1)#exit
```

Step 8: Check the result.

#Before the access device passes the authentication, PC cannot access the network. After passing authentication, PC can normally access the network.

```
Device1#show dot1x client user
Interface      : gi0/1
Status        : Authorized
State Machine State : AUTHENTICATED
Keep Alive Interval : 120 sec (802.1X Server)
```

```
Device2#show dot1x user auth-type device
```

```
-----
NO 1 : MAC_ADDRESS= 3883.45ef.7984  STATUS=  Authorized  USER_NAME=  admin
      VLAN=      2      INTERFACE=  gi0/1      USER_TYPE=  DOT1X
      AUTH_STATE= AUTHENTICATED  BACK_STATE= IDLE   IP_ADDRESS=  Unknown

```

# 95 ACL Configuration

---

## 95.1 Overview

### 95.1.1 Overview

ACL (Access Control List) is composed of a series of rules. Each rule is a statement of permit, deny or comment, stating corresponding matching conditions and behaviors. ACL rules filter packets by matching some fields in the packets.

ACL can be composed of multiple rules. The matching content specified by each rule is not completely the same, and they may overlap or conflict. ACL rules match by numbers from small to large, and those with a small sequence number take effect first. Sequence means the sequence number of rules in the entire ACL.

Following the last ACL rule, there is a rule which denies all packets. Its sequence is larger than all the other rules. With invisible rule, it will discard the packet which doesn't match all the prior rules. That is to say, when the packet doesn't match all the previous rules, the default rules will be matched and the packet will be discarded.

Depending on the application purpose, ACL can be divided into seven types, standard IP ACL, extended IP ACL, standard MAC ACL, extended MAC ACL, extended Hybrid ACL, standard IPv6 ACL, and extended IPv6 ACL. ACL name comprises figures or user-defined character strings. When figures are used as ACL name, corresponding ACL category and value range are shown below:

- Standard IP ACL: 1 ~ 1000;
- Extended IP ACL: 1001 ~ 2000;
- Standard MAC ACL: 2001 ~ 3000;
- Extended MAC ACL: 3001 ~ 4000;
- Extended hybrid ACL: 5001 ~ 6000;
- Standard IPv6 ACL: 6001 ~ 7000;
- Extended IPv6 ACL: 7001 ~ 8000;

When user-defined character strings are used as ACL name, all ACLs share the same space. That is to say, if standard IP ACL uses a certain name, other types of ACL cannot use this name again.

ACL can also perform corresponding action group according to the matching result. For details, see the chapters on "QOS Configuration" in the User Manual.

### 95.1.2 Time Domain

Time domain is a set of time periods. A time domain can contain multiple time periods, and the time scope of time domain is the union of all time periods.

Time period has two types:

- Periodic time period means one or several days from Monday to Sunday and the period from start time to end time are selected as time periods, which can repeatedly take effect per week;
- Absolute time period takes effect in the specified date and time scope.

Users often have the following requirements:

The PC in a certain network segment can access the server during the office hours of working days (except for all holidays); all PCs are permitted to communicate with external networks on Saturday afternoon;

These time-based communication control requirements can be satisfied by binding time domains in ACL or ACL rules.

### 95.2.1 Configure Standard IP ACL

The standard IP ACL only filters packets according to the rules set by source IP address.

#### Configuration Condition

None

#### Configure Standard IP ACL

The standard IP ACL name comprises figures or user-defined character strings. When figures are used as standard IP ACL name, the maximum number of ACLs can be enabled; if user-defined character strings are used as standard IP ACL name, the maximum number of ACLs can be disabled. Users can choose an appropriate ACL name according to the actual situation.

Table 95 Configuring Standard IP ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Standard IP ACL	<b>ip access-list standard</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, no standard IP ACL is configured. Value range of standard IP ACL: 1 ~ 1000
Configure ACL permit rules	[ <i>sequence</i> ] <b>permit</b> { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ]	Optional By default, no ACL permit rule is configured.

Step	Command	Description
	<pre>[ <b>pbr-action-group</b> pbr- action-group-name ]  [ <b>l3-action-group</b> l3-action- group-name ] [ <b>egr-action- group</b> egr-action-group- name ] [ <b>vfp-action-group</b> vfp-action-group-name ]</pre>	
Configure ACL deny rules	<pre>[ <i>sequence</i> ] <b>deny</b> { <b>any</b>   source-addr source- wildcard   <b>host</b> source- addr } [ <b>time-range</b> time- range-name ] [<b>log</b>]  [ <b>pbr-action-group</b> pbr- action-group-name ]  [ <b>l3-action-group</b> l3-action- group-name ] [ <b>egr-action- group</b> egr-action-group- name ] [ <b>vfp-action-group</b> vfp-action-group-name ]</pre>	Optional  By default, no ACL deny rule is configured.
Configure ACL comment	<pre>[ <i>sequence</i> ] <b>remark</b> comment</pre>	Optional  By default, no comment of ACL rules is configured.

---

## Note

- To create standard IP ACL with the command `ip access-list standard`, rules must be configured under the standard IP ACL configuration mode.
  - Sequence means the sequence number of rules in the entire ACL. ACLs match and filter packets by numbers from small to large, and those with a small sequence number take effect first. When the packet doesn't match any of the rules, the default discarding action will be performed, i.e. all the packets that have not been permitted to pass will be discarded.
- 

### Configure Standard IP ACL Named with Figures

The standard IP ACL rules named with figures allow users to quickly identify the type of ACL. But they have some limitations, such as limited number of access lists and complicated process for users to identify ACL rules.

Table 95 Configuring Standard IP ACL Named with Figures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Standard IP ACL Named with Figures	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ] [ <b>pbr-action-group</b> <i>pbr-action-group-name</i> ] [ <b>l3-action-group</b> <i>l3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	Mandatory  By default, no standard IP ACL named with figures is configured.  Value range of standard IP ACL: 1 ~ 1000
Configure comment for standard IP ACL named with figures	<b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>comment</i>	Optional  By default, no comment for standard IP ACL rules named with figures is configured.

### Note

- If the ACL with a specified number doesn't exist, create a new ACL and add new rules. If the ACL with a specified number exists, add new rules only.

## 95.2.2 Configure Extended IP ACL

The extended IP ACL can set classification rules according to IP protocol number, source IP address, destination IP address, source TCP/UDP port number, destination TCP/UDP port number, packet priority, TCP flag, and fragment flag to filter the packets.

### Configuration Condition

None

## Configure Extended IP ACL

The extended ACL name comprises figures or user-defined character strings. When figures are used as extended IP ACL name, the maximum number of ACLs can be enabled; if user-defined character strings are used as extended IP ACL name, the maximum number of ACLs can be disabled. Users can choose an appropriate ACL name according to the actual situation. The extended IP ACL has more abundant, accurate and flexible content than standard IP ACL.

Table 95 Configuring Extended IP ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended IP ACL	<b>ip access-list extended</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no extended IP ACL is configured.  Value range of extended IP ACL: 1001 ~ 2000
Configure ACL permit rules	[ <i>sequence</i> ] <b>permit</b> <i>protocol</i> { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host source-addr</b> } [ <i>operator source-port</i> ] { <b>any</b> / <i>destination-addr destination-wildcard</i>   <b>host destination-addr</b> } [ <i>operator destination-port</i> ] [ <b>ack</b>   <b>fin</b>   <b>psh</b>   <b>rst</b>   <b>syn</b>   <b>urg</b> ] [ <b>precedence precedence</b> ] [ <b>tos tos</b> ] [ <b>dscp dscp</b> ] [ <b>fragments</b> ] [ <b>log</b> ] [ <b>time-range time-range-name</b> ]  [ <b>pbr-action-group pbr-action-group-name</b> ]  [ <b>l3-action-group l3-action-group-name</b> ] [ <b>egr-action-group egr-action-group-name</b> ] [ <b>vfp-action-group vfp-action-group-name</b> ]	Optional  By default, no ACL permit rule is configured.

Step	Command	Description
Configure ACL deny rules	<pre>[ sequence ] deny protocol { any   source-addr source- wildcard   host source- addr } [ operator source- port ] { any   destination- addr destination-wildcard   host destination-addr } [ operator destination- port ] [ ack   fin   psh   rst   syn   urg ] [ precedence precedence ] [ tos tos ] [ dscp dscp ] [fragments] [log] [ time-range time- range-name ]  [ pbr-action-group pbr- action-group-name ]  [ l3-action-group l3-action- group-name ] [ egr-action- group egr-action-group- name ] [ vfp-action-group vfp-action-group-name ]</pre>	<p>Optional</p> <p>By default, no ACL deny rule is configured.</p>
Configure ACL comment	<pre>[ sequence ] remark comment</pre>	<p>Optional</p> <p>By default, no comment of ACL rules is configured.</p>

---

## Note

- To create extended IP ACL with the command **ip access-list extended**, rules must be configured under the extended IP ACL configuration mode.
  - Sequence means the sequence number of rules in the entire ACL. ACLs match and filter packets by numbers from small to large, and those with a small sequence number take effect first. When the packet doesn't match any of the rules, the default discarding action will be performed, i.e. all the packets that have not been permitted to pass will be denied.
- 

### Configure Extended IP ACL Named with Figures

The extended IP ACL rules named with figures allow users to quickly identify the type of ACL. But they have some limitations, such as limited number of access lists and complicated process for users to identify ACL rules. The extended IP ACL has more abundant, accurate and flexible content than standard IP ACL.

Table 95 Configuring Extended IP ACL Named with Figures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended IP ACL Named with Figures	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } <i>protocol</i> { <b>any</b>   <i>source-addr</i> <i>source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <i>operator</i> <i>source-port</i> ] { <b>any</b> / <i>destination-addr</i> <i>destination-wildcard</i>   <b>host</b> <i>destination-addr</i> } [ <i>operator</i> <i>destination-port</i> ] [ <b>ack</b>   <b>fin</b>   <b>psh</b>   <b>rst</b>   <b>syn</b>   <b>urg</b> ] [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>dscp</b> <i>dscp</i> ] [ <b>fragments</b> ] [ <b>log</b> ] [ <b>time-range</b> <i>time-range-name</i> ]  [ <b>pbr-action-group</b> <i>pbr-action-group-name</i> ]  [ <b>l3-action-group</b> <i>l3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	Mandatory  By default, no extended IP ACL named with figures is configured.  Value range of extended IP ACL: 1001 ~ 2000
Configure comment for extended IP ACL named with figures	<b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>comment</i>	Optional  By default, no comment for extended IP ACL rules named with figures is configured.

 **Note**

- If the ACL with a specified number doesn't exist, create a new ACL and add new rules. If the ACL with a specified number exists, add new rules only.

### 95.2.3 Configure Standard MAC ACL

The standard MAC ACL only filters packets according to the rules set by source MAC address.

#### Configuration Condition

None

#### Configure Standard MAC ACL

The standard MAC ACL name comprises figures or user-defined character strings. When figures are used as standard MAC ACL name, the maximum number of ACLs can be enabled; if user-defined character strings are used as standard MAC ACL name, the maximum number of ACLs can be disabled. Users can choose an appropriate ACL name according to the actual situation.

Table 95 Configuring Standard MAC ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Standard MAC ACL	<b>mac access-list standard</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no standard MAC ACL is configured.  Value range of standard MAC ACL: 2001 ~ 3000
Configure ACL permit rules	[ <i>sequence</i> ] <b>permit</b> { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ] [ <b>I2-action-group</b> <i>I2-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	Optional  By default, no ACL permit rule is configured.
Configure ACL deny rules	[ <i>sequence</i> ] <b>deny</b> { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ] [ <b>I2-action-group</b> <i>I2-action-group-name</i> ] [ <b>egr-action-</b>	Optional  By default, no ACL deny rule is configured.

Step	Command	Description
	<b>group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	
Configure ACL comment	[ <i>sequence</i> ] <b>remark</b> <i>comment</i>	Optional By default, no comment of ACL rules is configured.

## Note

- To create standard MAC ACL with the command **mac access-list standard**, rules must be configured under the standard MAC ACL configuration mode.
- Sequence means the sequence number of rules in the entire ACL. ACLs match and filter packets by numbers from small to large, and those with a small sequence number take effect first. When the packet doesn't match any of the rules, the default discarding action will be performed, i.e. all the packets that have not been permitted to pass will be discarded.

### Configure Standard MAC ACL Named with Figures

The standard MAC ACL rules named with figures allow users to quickly identify the type of ACL. But they have some limitations, such as limited number of access lists and complicated process for users to identify ACL rules.

Table 95 Configuring Standard MAC ACL Named with Figures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Standard MAC ACL Named with Figures	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ] [ <b>I2-action-group</b> <i>I2-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	Mandatory By default, no standard MAC ACL named with figures is configured. Value range of standard MAC ACL: 2001 ~ 3000

Step	Command	Description
Configure comment for standard MAC ACL named with figures	<b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>comment</i>	Optional By default, no comment for standard MAC ACL rules named with figures is configured.

### Note

- If the ACL with a specified number doesn't exist, create a new ACL and add new rules. If the ACL with a specified number exists, add new rules only.

## 95.2.4 Configure Extended MAC ACL

The extended MAC ACL can set classification rules according to Ethernet protocol type, source MAC address, destination MAC address, VLAN ID, and 802.1p priority to filter the packets.

### Configuration Condition

None

### Configure Extended MAC ACL

The extended MAC ACL name comprises figures or user-defined character strings. When figures are used as extended MAC ACL name, the maximum number of ACLs can be enabled; if user-defined character strings are used as extended MAC ACL name, the maximum number of ACLs can be disabled. Users can choose an appropriate ACL name according to the actual situation. The extended MAC ACL has more abundant, accurate and flexible content than standard MAC ACL.

Table 95 Configuring Extended MAC ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended MAC ACL	<b>mac access-list extended</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, no extended MAC ACL is configured.

Step	Command	Description
		Value range of extended MAC ACL: 3001 ~ 4000
Configure ACL permit rules	[ <i>sequence</i> ] <b>permit</b> { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } { <b>any</b>   <i>destination-addr destination-wildcard</i>   <b>host</b> <i>destination-addr</i> } [ <b>ether-type</b> <i>type</i> ] [ <b>cos</b> <i>cos</i> ] [ <b>vlan-id</b> <i>vlan</i> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ] [ <b>l2-action-group</b> <i>l2-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	Optional  By default, no ACL permit rule is configured.
Configure ACL deny rules	[ <i>sequence</i> ] <b>deny</b> { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } { <b>any</b>   <i>destination-addr destination-wildcard</i>   <b>host</b> <i>destination-addr</i> } [ <b>ether-type</b> <i>type</i> ] [ <b>cos</b> <i>cos</i> ] [ <b>vlan-id</b> <i>vlan</i> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ] [ <b>l2-action-group</b> <i>l2-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	Optional  By default, no ACL deny rule is configured.
Configure ACL comment	[ <i>sequence</i> ] <b>remark</b> <i>comment</i>	Optional  By default, no comment of ACL rules is configured.

## Note

- To create extended MAC ACL with the command **mac access-list extended**, rules must be configured under the extended MAC ACL configuration mode.

- Sequence means the sequence number of rules in the entire ACL. ACLs match and filter packets by numbers from small to large, and those with a small sequence number take effect first. When the packet doesn't match any of the rules, the default discarding action will be performed, i.e. all the packets that have not been permitted to pass will be discarded.

### Configure Extended MAC ACL Named with Figures

The extended MAC ACL rules named with figures allow users to quickly identify the type of ACL. But they have some limitations, such as limited number of access lists and complicated process for users to identify ACL rules. The extended MAC ACL has more abundant, accurate and flexible content than standard MAC ACL.

Table 95 Configuring Extended MAC ACL Named with Figures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended MAC ACL Named with Figures	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } { <b>any</b>   <i>source-addr source-wildcard</i>   <b>host</b> <i>source-addr</i> } { <b>any</b>   <i>destination-addr destination-wildcard</i>   <b>host</b> <i>destination-addr</i> } [ <b>ether-type</b> <i>type</i> ] [ <b>cos</b> <i>cos</i> ] [ <b>vlan-id</b> <i>vlan</i> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>log</b> ] [ <b>l2-action-group</b> <i>l2-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>vfp-action-group</b> <i>vfp-action-group-name</i> ]	Mandatory  By default, no extended MAC ACL named with figures is configured.  Value range of extended MAC ACL: 3001 ~ 4000
Configure the comment for extended MAC ACL named with figures	<b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>comment</i>	Optional  By default, no comment for extended MAC ACL rules named with figures is configured.

**Note**

- If the ACL with a specified number doesn't exist, create a new ACL and add new rules. If the ACL with a specified number exists, add new rules only.

### 95.2.5 Configure Extended Hybrid ACL

The extended Hybrid ACL can set classification rules according to source MAC address, destination MAC address, Ethernet Type, IP protocol number, source IP address, destination IP address, packet priority, VLAN ID and 802.1p priority to filter the packets.

#### Configuration Condition

None

#### Configure Extended Hybrid ACL

The extended Hybrid ACL name comprises figures or user-defined character strings. When figures are used as extended Hybrid ACL name, the maximum number of ACLs can be enabled; if user-defined character strings are used as extended Hybrid ACL name, the maximum number of ACLs can be disabled. Users can choose an appropriate ACL name according to the actual situation. The extended Hybrid ACL is more abundant, accurate and flexible content than that separately defined using IP ACL and MAC ACL.

Table 95 Configuring Extended Hybrid ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended Hybrid ACL	<b>hybrid access-list extended</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no extended Hybrid ACL is configured.  Value range of extended Hybrid ACL: 5001 ~ 6000
Configure ACL permit rules	[ <i>sequence</i> ] <b>permit</b> { <b>any</b>   <i>source-mac -addr source-wildcard</i>   <b>host</b> <i>source-mac-addr</i> } { <b>any</b>   <i>destination-mac-addr destination-wildcard</i>   <b>host</b> <i>destination-mac-addr</i> } [ <b>cos</b> <i>cos</i> ] [ <b>vlan-id</b> <i>vlan</i> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>egr-action-</b>	Optional  By default, no ACL permit rule is configured.

Step	Command	Description
	<pre> <b>group</b> <i>egr-action-group-name</i> [ <b>I3-action-group</b> <i>I3-action-group-name</i> ] [<b>ether-type</b>] { <i>etherne-type</i>   <i>ipv4 protocol</i> } { <b>any</b>   <i>source-ip-addr source-wildcard</i>   <b>host</b> <i>source-ip-addr</i> } { <b>any</b>   <i>destination-ip-addr destination-wildcard</i>   <b>host</b> <i>destination-ip-addr</i> } [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>dscp</b> <i>dscp</i> ] [ <b>fragments</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [<b>egr-action-group</b> <i>egr-action-group-name</i>] [ <b>I3-action-group</b> <i>I3-action-group-name</i> ] </pre>	
Configure ACL deny rules	<pre> [ <i>sequence</i> ] <b>deny</b> { <b>any</b>   <i>source-mac -addr source-wildcard</i>   <b>host</b> <i>source-mac-addr</i> } { <b>any</b>   <i>destination-mac-addr destination-wildcard</i>   <b>host</b> <i>destination-mac-addr</i> } [ <b>cos</b> <i>cos</i> ] [ <b>vlan-id</b> <i>vlan</i> ] [ <b>time-range</b> <i>time-range-name</i> ] [<b>egr-action-group</b> <i>egr-action-group-name</i>] [ <b>I3-action-group</b> <i>I3-action-group-name</i> ] [<b>ether-type</b>] { <i>etherne-type</i>   <i>ipv4 protocol</i> } { <b>any</b>   <i>source-ip-addr source-wildcard</i>   <b>host</b> <i>source-ip-addr</i> } { <b>any</b>   <i>destination-ip-addr destination-wildcard</i>   <b>host</b> <i>destination-ip-addr</i> } [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>dscp</b> <i>dscp</i> ] [ <b>fragments</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [<b>egr-action-group</b> <i>egr-action-group-name</i>] [ <b>I3-action-group</b> <i>I3-action-group-name</i> ] </pre>	Optional By default, no ACL deny rule is configured.

Step	Command	Description
Configure ACL comment	[ <i>sequence</i> ] <b>remark</b> <i>comment</i>	Optional By default, no comment of ACL rules is configured.

## Note

- To create extended Hybrid ACL with the command **hybrid access-list extended**, rules must be configured under the extended Hybrid ACL configuration mode.
- Sequence means the sequence number of rules in the entire ACL. ACLs match and filter packets by numbers from small to large, and those with a small sequence number take effect first. When the packet doesn't match any of the rules, the default discarding action will be performed, i.e. all the packets that have not been permitted to pass will be discarded.

### Configure Extended Hybrid ACL Named with Figures

The extended Hybrid ACL rules named with figures allow users to quickly identify the type of ACL. But they have some limitations, such as limited number of access lists and complicated process for users to identify ACL rules.

Table 95 Configuring Extended Hybrid ACL Named with Figures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended Hybrid ACL Named with Figures	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } { <b>any</b>   <i>source-mac -addr source-wildcard</i>   <b>host</b> <i>source-mac-addr</i> } { <b>any</b>   <i>destination-mac-addr destination-wildcard</i>   <b>host</b> <i>destination-mac-addr</i> } [ <b>cos</b> <i>cos</i> ] [ <b>vlan-id</b> <i>vlan</i> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>l3-action-group</b> <i>l3-action-group-name</i> ] [ <b>ether-type</b> { <i>etherne-type</i>   <i>ipv4</i> }	Mandatory By default, no extended Hybrid ACL named with figures is configured. Value range of extended Hybrid ACL: 5001 ~ 6000

Step	Command	Description
	<pre>protocol } { any   source-ip-addr source-wildcard   host source-ip-addr } { any   destination -ip-addr destination -wildcard   host destination-ip-addr } [ precedence precedence ] [ tos tos ] [ dscp dscp ] [ fragments ] [ time-range time-range-name ] [ egr-action-group egr-action-group-name ] [ l3-action-group l3-action-group-name ]</pre>	
Configure the comment for extended Hybrid ACL named with figures	<pre>access-list access-list-number remark comment</pre>	Optional By default, no comment for extended Hybrid ACL rules named with figures is configured.

### Note

- If the ACL with a specified number doesn't exist, create a new ACL and add new rules. If the ACL with a specified number exists, add new rules only.

## 95.2.6 Configure Standard IPv6 ACL

The standard IPv6 ACL can set classification rules according to the source IPv6 address field to filter the packets.

### Configuration Condition

None

### Configure Standard IPv6 ACL

The standard IPv6 ACL name comprises figures or user-defined character strings. When figures are used as standard IPv6 ACL name, the maximum number of ACLs can be enabled; if user-defined character strings are used as standard IPv6 ACL name, the maximum number of ACLs can be disabled. Users can choose an appropriate ACL name according to the actual situation.

Table 95 Configuring Standard IPv6 ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Standard IPv6 ACL	<b>ipv6 access-list standard</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no standard IPv6 ACL is configured.
Configure ACL permit rules	[ <i>sequence</i> ] <b>permit</b> { <b>any</b>   <i>source-addr/source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ]  [ <b>pbr-action-group</b> <i>pbr-action-group-name</i> ]  [ <b>I3-action-group</b> <i>I3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ]	Optional  By default, no ACL permit rule is configured.
Configure ACL deny rules	[ <i>sequence</i> ] <b>deny</b> { <b>any</b>   <i>source-addr/source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>I3-action-group</b> <i>I3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>pbr-action-group</b> <i>pbr-action-group-name</i> ]	Optional  By default, no ACL deny rule is configured.
Configure ACL comment	[ <i>sequence</i> ] <b>remark</b> <i>comment</i>	Optional  By default, no comment of ACL rules is configured.

**Note**

- To create standard IPv6 ACL with the command **ipv6 access-list standard**, rules must be configured under the standard IPv6 ACL configuration mode.
- Sequence means the sequence number of rules in the entire ACL. ACLs match and filter packets by numbers from small to large, and those with a small sequence number take effect first. When the packet doesn't match any of the rules, the default discarding action will be performed, i.e. all the packets that have not been permitted to pass will be denied.

### Configure Standard IPv6 ACL Named with Figures

The standard IPv6 ACL rules named with figures allow users to quickly identify the type of ACL. But they have some limitations, such as limited number of access lists and complicated process for users to identify ACL rules.

Table 95 Configuring Standard IPv6 ACL Named with Figures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Standard IPv6 ACL Named with Figures	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } { <b>any</b>   <i>source-addr/source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <b>time-range</b> <i>time-range-name</i> ] [ <b>l3-action-group</b> <i>l3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ] [ <b>pbr-action-group</b> <i>pbr-action-group-name</i> ]	Mandatory  By default, no standard IPv6 ACL named with figures is configured.  Value range of standard IPv6 ACL: 6001 ~ 7000
Configure the comment for standard IPv6 ACL named with figures	<b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>comment</i>	Optional  By default, no comment for standard IPv6 ACL rules named with figures is configured.

### Note

- If the ACL with a specified number doesn't exist, create a new ACL and add new rules. If the

---

ACL with a specified number exists, add new rules only.

---

## 95.2.7 Configure Extended IPv6 ACL

The extended IPv6 ACL can set classification rules according to IPv6 protocol number, source IPv6 address, destination IPv6 address, source TCP/UDP port number, destination TCP/UDP port number, packet priority, and TCP flag to filter the packets.

### Configuration Condition

None

### Configure Extended IPv6 ACL

The extended IPv6 ACL name comprises figures or user-defined character strings. When figures are used as extended IPv6 ACL name, the maximum number of ACLs can be enabled; if user-defined character strings are used as extended IPv6 ACL name, the maximum number of ACLs can be disabled. Users can choose an appropriate ACL name according to the actual situation.

Table 1 Configuring Extended IPv6 ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended IPv6 ACL	<b>ipv6 access-list extended</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, no extended IPv6 ACL is configured.
Configure ACL permit rules	[ <i>sequence</i> ] <b>permit protocol</b> { <b>any</b>   <i>source-addr/source-wildcard</i>   <b>host source-addr</b> } [ <i>operator source-port</i> ] { <b>any</b>   <i>destination-addr/destination-wildcard</i>   <b>host destination-addr</b> } [ <i>operator destination-port</i> ] [ <b>ack / fin / psh / rst / syn / urg</b> ] [ <b>precedence precedence</b> ] [ <b>tos tos</b> ] [ <b>dscp dscp</b> ] [ <b>fragments</b> ] [ <b>time-range time-range-name</b> ] [ <b>pbr-action-group pbr-action-group-name</b> ]	Optional By default, no ACL permit rule is configured.

Step	Command	Description
	[ <b>l3-action-group</b> <i>l3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ]	
Configure ACL deny rules	[ <i>sequence</i> ] <b>deny protocol</b> { <b>any</b>   <i>source-addr/source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <i>operator source-port</i> ] { <b>any</b>   <i>destination-addr/destination-wildcard</i>   <b>host</b> <i>destination-addr</i> } [ <i>operator destination-port</i> ] [ <b>ack</b> / <b>fin</b> / <b>psh</b> / <b>rst</b> / <b>syn</b> / <b>urg</b> ] [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>dscp</b> <i>dscp</i> ] [ <b>fragments</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>pbr-action-group</b> <i>pbr-action-group-name</i> ]  [ <b>l3-action-group</b> <i>l3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ]	Optional  By default, no ACL deny rule is configured.
Configure ACL comment	[ <i>sequence</i> ] <b>remark</b> <i>comment</i>	Optional  By default, no comment of ACL rules is configured.

## Note

- To create extended IPv6 ACL with the command **ipv6 access-list extended**, rules must be configured under the extended IPv6 ACL configuration mode.
- Sequence means the sequence number of rules in the entire ACL. ACLs match and filter packets by numbers from small to large, and those with a small sequence number take effect first. When the packet doesn't match any of the rules, the default discarding action will be performed, i.e. all the packets that have not been permitted to pass will be denied.

### Configure Extended IPv6 ACL Named with Figures

The extended IPv6 ACL rules named with figures allow users to quickly identify the type of ACL. But they have some limitations, such as limited number of access lists and complicated process for users to identify ACL rules.

Table 2 Configuring Extended IPv6 ACL Named with Figures

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Extended IPv6 ACL Named with Figures	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } <i>protocol</i> { <b>any</b>   <i>source-addr/source-wildcard</i>   <b>host</b> <i>source-addr</i> } [ <i>operator source-port</i> ] { <b>any</b>   <i>destination-addr/destination-wildcard</i>   <b>host</b> <i>destination-addr</i> } [ <i>operator destination-port</i> ] [ <b>ack</b> / <b>fin</b> / <b>psh</b> / <b>rst</b> / <b>syn</b> / <b>urg</b> ] [ <b>precedence</b> <i>precedence</i> ] [ <b>tos</b> <i>tos</i> ] [ <b>dscp</b> <i>dscp</i> ] [ <b>fragments</b> ] [ <b>time-range</b> <i>time-range-name</i> ] [ <b>pbr-action-group</b> <i>pbr-action-group-name</i> ] [ <b>l3-action-group</b> <i>l3-action-group-name</i> ] [ <b>egr-action-group</b> <i>egr-action-group-name</i> ]	Mandatory  By default, no extended IPv6 ACL named with figures is configured.  Value range of extended IPv6 ACL: 7001 ~ 8000
Configure the comment for extended IPv6 ACL named with figures	<b>access-list</b> <i>access-list-number</i> <b>remark</b> <i>comment</i>	Optional  By default, no comment for extended IPv6 ACL rules named with figures is configured.

## Note

- If the ACL with a specified number doesn't exist, create a new ACL and add new rules. If the ACL with a specified number exists, add new rules only.

### 95.2.8 Configure Commit operation

Commit operating command is used to confirm the ACL rules configured, including whether the rules added or deleted take effect. After an ACL rule is added or deleted, Commit operation must be performed. Otherwise, the rule added or deleted will not take effect. When the configuration is saved, the added rule without Committing will not be saved to the Startup file.

#### Configuration Condition

## Configure ACL

### Configure Commit operation

After an ACL rule is configured, it is required to perform Commit operation to commit current ACL rule added or deleted.

Table 95 Configuring Commit Operation for ACL Rules

Step	Command	Description
Enter the ACL configuration mode	<b>ip access-list standard</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory  By default, no standard IP ACL is configured.  Value range of standard IP ACL: 1 ~ 1000  The ACL configuration mode is not limited to standard IP ACL. Commit operation supports all the ACL configuration modes.
Commit ACL rules	<b>commit</b>	Mandatory  By default, the rule added or deleted is not Committed.

### 95.2.9 Configure Limit of ACL Rule Entries

#### Configuration Condition

None

#### Configure Limit of ACL Rule Entries

After it is enabled, at most 1024 rule entries can be configured in a single ACL.

Table 95 Configuring Limit of ACL Rule Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Disable/enable the limit of ACL rule entries	<b>access-list rule-limit</b> { <b>enable</b>   <b>disable</b> }	Mandatory  By default, this function is disabled, i.e. the number of rule entries configured in each ACL is not limited by the maximum number 1024.

### 95.2.10 Configure Time Domain

Time domain is a set of time periods. A time domain can contain multiple time periods, and the time scope of time domain is the union of all time periods. Time domain can be bound to ACL or ACL rule as a precondition for the ACL or ACL rule to take effect or not.

#### Configuration Condition

Before configuring the time domain function, do the following:

- Configure the ACL.

#### Configure Time Domain

Configure whether the application object of time domain is limited by the time domain. When it is enabled, all application objects are limited by time domain. Otherwise, they are not limited by time domain.

Table 3 Configuring Time Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enable/disable time domain	<b>set time-range</b> { <b>disable</b>   <b>enable</b> }	Mandatory  It is enabled by default.

#### Configure Periodic Time Period

Periodic time period means one or several days from Monday to Sunday and the period from start time to end time are selected as time periods, which can repeatedly take effect per week.

Table 4 Configuring Periodic Time Period

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Time Domain	<b>time-range</b> <i>time-range-name</i>	Mandatory By default, time domain is not configured.
Configure Periodic Time Period	[ <i>sequence</i> ] <b>periodic</b> [ <i>day-of-the-week</i> ] [ <i>hh: mm</i> [ : <i>ss</i> ] ] <b>to</b> [ <i>day-of-the-week</i> ] [ <i>hh: mm</i> [ : <i>ss</i> ] ]	At least one option must be selected. By default, no periodic time period is configured.
	[ <i>sequence</i> ] <b>periodic</b> { <b>weekdays</b>   <b>weekend</b>   <b>daily</b> } [ <i>hh: mm</i> [ : <i>ss</i> ] ] <b>to</b> [ <i>hh: mm</i> [ : <i>ss</i> ] ]	The previous command can specify the time scope as a single day (e.g. Monday) or several days (Monday, Friday). The latter command can specify the time scope as every day, weekend, or working days.

### Configure Absolute Time Period

Absolute time period takes effect in the specified date and time scope.

Table 95 Configuring Absolute Time Period

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Time Domain	<b>time-range</b> <i>time-range-name</i>	Mandatory By default, time domain is not configured.
Configure absolute time period of time domain	[ <i>sequence</i> ] <b>absolute start</b> <i>hh: mm</i> [ : <i>ss</i> ] [ <i>day</i> [ <i>month</i> [ <i>year</i> ] ] ] <b>end</b> <i>hh: mm</i> [ : <i>ss</i> ] [ <i>day</i> [ <i>month</i> [ <i>year</i> ] ] ]	Mandatory By default, the absolute time period of time domain is not configured.

## Configure Refresh Period

Time domain has two statuses, i.e. valid and invalid. By default, it automatically refreshes every 1 minute according to current system time. Therefore, the status refresh may have 0-60 seconds of time delay compared to the system time.

Table 95 Configuring Refresh Period

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure time domain refresh period	<b>set time-range frequency</b> { <i>frequency-min</i>   <b>seconds</b> <i>frequency-sec</i> }	Mandatory  The default value is 1 minute.  The refresh period is the interval between two refreshes, in minute or second.

## Configure the Maximum Time Deviation

The maximum time deviation means the maximum deviation between the accumulated time of the counter and the system time. Once the time statistics exceed the deviation value, the status of each time domain will be judged and updated at the time of next refreshing so as to get increasingly accurate time statistics.

Table 5 Configuring Maximum Time Deviation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum time deviation of time domain	<b>set time-range max-offset</b> <i>max-offset-number</i>	Mandatory  The default value is 100.  The time deviation, in seconds, has a value range of 1~300.

## Configure Binding of Time Domain to ACL Rules

When it's necessary to make a user access network resources during a specified period of time, you can set the time domain-based ACL rules to filter packets. Whether the time domain takes effect has a direct impact on the ACL rules associated with it.

Table 6 Configuring Binding of Time Domain to ACL Rules

Step	Command	Description
Configure to bind with standard IP ACL rules	Please see "Configure Standard IP ACL"	-
Configure to bind with extended IP ACL rules	Please see "Configure Extended IP ACL"	-
Configure to bind with standard MAC ACL rules	Please see "Configure Standard MAC ACL"	-
Configure to bind with extended MAC ACL rules	Please see "Configure Extended MAC ACL"	-
Configure to bind with extended Hybrid ACL rules	Please see "Configure Extended Hybrid ACL"	-
Configure to bind with standard IPv6 ACL rules	Please see "Configure Standard IPv6 ACL"	-
Configure to bind with extended IPv6 ACL rules	Please see "Configure Extended IPv6 ACL"	-

---

### Note

- When the time domain to which ACL rules are bound doesn't exist, the ACL rules take effect.
- 

## Configure Binding of Time Domain to ACL

When it's necessary to make some users access network resources during the same period of time, you can set the time domain-based ACL to filter packets. Whether the time domain takes effect has a direct impact on the rules contained in the entire ACL.

Table 7 Configuring Binding of Time Domain to ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure binding of time domain to IP ACL	<b>ip time-range</b> <i>time-range-name</i> <b>access-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, the time domain is not bound to IP ACL.
Configure binding of time domain to MAC ACL	<b>mac time-range</b> <i>time-range-name</i> <b>access-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, the time domain is not bound to MAC ACL.
Configure binding of time domain to Hybrid ACL	<b>hybrid time-range</b> <i>time-range-name</i> <b>access-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, the time domain is not bound to Hybrid ACL.
Configure binding of time domain to IPv6 ACL	<b>ipv6 time-range</b> <i>time-range-name</i> <b>access-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, the time domain is not bound to IPv6 ACL.

---

## Note

- When the time domain to which ACL is bound doesn't exist, the ACL takes effect.
- 

### 95.2.11 Configure ACL Application

ACL can be applied globally, in VLAN, VLAN RANGE, port and interface. MAC ACL, IP ACL and IPV6 ACL can all be applied to VLAN, VLAN RANGE, port and interface in both incoming and outgoing directions; Hybrid ACL can be applied to global, port and interface in both incoming and outgoing directions; IP ACL can be applied to global in the incoming direction;

When ACL is applied globally, it will filter all packets in the incoming direction of the device port; when ACL is applied to VLAN, it will filter all packets in the incoming direction and the forwarded packets in the outgoing direction of the port in the VLAN; when ACL is applied to VLAN RANGE, it will take effect for VLANs within the VLAN RANGE; when ACL is applied to a port, all packets in the incoming direction and the

forwarded packets in the outgoing direction of the port will be filtered; when ACL is applied to an interface, the layer-3 forwarded packets will be filtered.

ACL matches by priority from high to low: apply to port, apply to VLAN, and apply globally.

If the packets simultaneously match the ACL rules of applying to port, applying to VLAN and applying globally, the permitted packet with a high priority is matched first, and the packet with a filtering result of deny is directly discarded.

### Configuration Condition

Before configuring ACL application, do the following:

- Configure the ACL.

### Configure Application of IP ACL to Port

Apply IP ACL to the port to analyze and process the packets passing through this port according to the IP ACL.

Table 95 Configuring Application of IP ACL to Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure to apply IP ACL to port	<b>ip access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b>   <b>vfp</b> }	Mandatory  By default, no IP ACL is applied to the port.

---

 **Note**

- If the ACL applied to port doesn't exist, all the packets passing through this port will be permitted.
- 

### Configure Application of IPv6 ACL to Port

Apply IPv6 ACL to the port to analyze and process the packets passing through this port according to the IPv6 ACL.

Table 8 Configuring Application of IPv6 ACL to Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	
Configure to apply IPv6 ACL to port	<b>ipv6 access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, no IPv6 ACL is applied to the port.

---

 **Note**

- If the ACL applied to port doesn't exist, all the packets passing through this port will be permitted.
-

## Configure Application of MAC ACL to Port

Apply MAC ACL to the port to analyze and process the packets passing through this port according to the MAC ACL.

Table 9 Configuring Application of MAC ACL to Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure to apply MAC ACL to port	<b>mac access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b>   <b>vfp</b> }	Mandatory By default, no MAC ACL is applied to the port.

---

### Note

- If the ACL applied to port doesn't exist, all the packets passing through this port will be permitted.
- 

## Configure Application of HYBRID ACL to Port

Apply HYBRID ACL to the port to analyze and process the packets passing through this port according to the HYBRID ACL.

Table 10 Configuring Application of HYBRID ACL to Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure to apply HYBRID ACL to port	<b>hybrid access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, no HYBRID ACL is applied to the port.

### Configure Application of IP ACL to VLAN

Apply IP ACL to VLAN to analyze and process the packets passing through this VLAN according to the IP ACL.

Table 11 Configuring Application of IP ACL to VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan</b> <i>vlan-id</i>	-
Configure to apply IP ACL to VLAN	<b>ip access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b>   <b>vfp</b> }	Mandatory  By default, no IP ACL is applied to VLAN.

---

 **Note**

- If the ACL applied to VLAN doesn't exist, all the packets passing through this VLAN will be permitted.
- 

### Configure Application of MAC ACL to VLAN

Apply MAC ACL to VLAN to analyze and process the packets passing through this VLAN according to the MAC ACL.

Table 12 Configuring Application of MAC ACL to VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure to apply MAC ACL to VLAN	<b>mac access-group { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }</b>	Mandatory By default, no MAC ACL is applied to VLAN.

---

 **Note**

- If the ACL applied to VLAN doesn't exist, all the packets passing through this VLAN will be permitted.
- 

### Configure Application of IPv6 ACL to VLAN

Apply IPv6 ACL to VLAN to analyze and process the packets passing through this VLAN according to the IPv6 ACL.

Table 13 Configuring Application of IPv6 ACL to VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the VLAN configuration mode	<b>vlan</b> <i>vlan-id</i>	-
Configure to apply IPv6 ACL to VLAN	<b>ipv6 access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory By default, no IPv6 ACL is applied to VLAN.

### Note

- If the ACL applied to VLAN doesn't exist, all the packets passing through this VLAN will be permitted.

### Configure Application of MAC ACL to VLAN RANGE

Apply MAC ACL to VLAN RANGE to analyze and process the packets passing within this VLAN RANGE according to the MAC ACL.

Table 14 Configuring Application of MAC ACL to VLAN RANGE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to apply MAC ACL to VLAN RANGE	<b>mac access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> } <b>vlan range</b> <1-4094>	Mandatory By default, no MAC ACL is applied to VLAN RANGE.

### Note

- If the ACL applied to VLAN RANGE doesn't exist, all the packets passing through this VLAN RANGE will be permitted.

### Configure Application of IP ACL to VLAN RANGE

Apply IP ACL to VLAN RANGE to analyze and process the packets passing within this VLAN RANGE according to the IP ACL.

Table 15 Configuring Application of IP ACL to VLAN RANGE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to apply IP ACL to VLAN RANGE	<b>ip access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> } <b>vlan range</b> <1-4094>	Mandatory By default, no IP ACL is applied to VLAN RANGE.

### Note

- If the ACL applied to VLAN RANGE doesn't exist, all the packets passing through this VLAN RANGE will be permitted.

### Configure Application of IPv6 ACL to VLAN RANGE

Apply IPv6 ACL to VLAN RANGE to analyze and process the packets passing within this VLAN RANGE according to the IPv6 ACL.

Table 16 Configuring Application of IPv6 ACL to VLAN RANGE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to apply IPv6 ACL to VLAN RANGE	<b>ipv6 access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> } <b>vlan range</b> <1-4094>	Mandatory By default, no IPv6 ACL is applied to VLAN RANGE.

### Note

- If the ACL applied to VLAN RANGE doesn't exist, all the packets passing through this VLAN RANGE will be permitted.

### Configure Application of MAC ACL to VLAN RANGE of layer-3 interface

Apply MAC ACL to VLAN RANGE of layer-3 interface to analyze and process the packets passing within this VLAN RANGE of layer-3 interface according to the MAC ACL.

Table 17 Configuring Application of MAC ACL to VLAN RANGE of Layer-3 Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure application of MAC ACL to VLAN RANGE of layer-3 interface	<b>mac access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> } <b>interface</b> <b>vlan range</b> <1-4094>	Mandatory By default, no MAC ACL is applied to VLAN RANGE of layer-3 interface.

### Note

- If the ACL applied to VLAN RANGE of layer-3 interface doesn't exist, all the packets passing through this VLAN RANGE will be permitted.

### Configure Application of IP ACL to VLAN RANGE of layer-3 interface

Apply IP ACL to VLAN RANGE of layer-3 interface to analyze and process the packets passing within this VLAN RANGE of layer-3 interface according to the IP ACL.

Table 18 Configuring Application of IP ACL to VLAN RANGE of Layer-3 Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure application of IP ACL to VLAN RANGE of layer-3 interface	<b>ip access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> } <b>interface</b> <b>vlan range</b> <1-4094>	Mandatory By default, no IP ACL is applied to VLAN RANGE of layer-3 interface.

### Note

- If the ACL applied to VLAN RANGE of layer-3 interface doesn't exist, all the packets passing through this VLAN RANGE will be permitted.

### Configure Application of IPv6 ACL to VLAN RANGE of layer-3 interface

Apply IPv6 ACL to VLAN RANGE of layer-3 interface to analyze and process the packets passing within this VLAN RANGE of layer-3 interface according to the IPv6 ACL.

Table 19 Configuring Application of IPv6 ACL to VLAN RANGE of Layer-3 Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure application of IPv6 ACL to VLAN RANGE of layer-3 interface	<b>ipv6 access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> } <b>interface vlan range</b> <1-4094>	Mandatory By default, no IPv6 ACL is applied to VLAN RANGE of layer-3 interface.

#### Note

- If the ACL applied to VLAN RANGE of layer-3 interface doesn't exist, all the packets passing through this VLAN RANGE will be permitted.

### Configure Application of IP ACL to Global

Apply IP ACL globally to analyze and process the packets passing through all ports according to the IP ACL.

Table 20 Configuring Global Application of IP ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to apply IP ACL globally	<b>global ip access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } <b>in</b>	Mandatory By default, no IP ACL is applied globally.

#### Note

- If the ACL applied globally doesn't exist, and no ACL is set on all ports, all the packets

---

passing through the port will be permitted.

---

### Configure Global Application of Hybrid ACL

Apply Hybrid ACL globally to analyze and process the packets passing through all ports according to the Hybrid ACL.

Table 21 Configuring Global Application of Hybrid ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to apply Hybrid ACL globally	<b>global hybrid access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, no Hybrid ACL is applied globally.

---

### Note

- If the ACL applied globally doesn't exist, and no ACL is set on all ports, all the packets passing through all ports will be permitted.
- 

### Configure Application of IP ACL to Interface

Apply IP ACL to interface to analyze and process the packets passing through this interface according to the IP ACL.

Table 22 Configuring Application of IP ACL to Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure to apply IP ACL to interface	<b>ip access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, no IP ACL is applied to the interface.

### Note

- If the ACL applied to interface doesn't exist, all the packets passing through this interface will be permitted.

### Configure Application of MAC ACL to Interface

Apply MAC ACL to interface to analyze and process the packets passing through this interface according to the MAC ACL.

Table 23 Configuring Application of MAC ACL to Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure to apply MAC ACL to interface	<b>mac access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, no MAC ACL is applied to interface.

### Note

- If the ACL applied to interface doesn't exist, all the packets passing through this interface will be permitted.

### Configure Application of HYBRID ACL to interface

Apply HYBRID ACL to interface to analyze and process the packets passing through this interface according to the HYBRID ACL.

Table 24 Configure Application of HYBRID ACL to Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure to apply HYBRID ACL to interface	<b>hybrid access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, no HYBRID ACL is applied to interface.

### Note

- If the ACL applied to interface doesn't exist, all the packets passing through this interface will be permitted.

### Configure Application of IPv6 ACL to Interface

Apply IPv6 ACL to interface to analyze and process the packets passing through this interface according to the IPv6 ACL.

Table 25 Configuring Application of IPv6 ACL to Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure to apply IPv6 ACL to interface	<b>ipv6 access-group</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, no IPv6 ACL is applied to the interface.

---

 **Note**

- If the ACL applied to interface doesn't exist, all the packets passing through this interface will be permitted.
- 

### 95.2.12 Configure ACL mode

When the same ACL is applied on different ports, there are two modes. The first one is Port mode. In this mode, the same ACL uses different ACL resources on different ports, and the traffic on different ports uses different resources for matching. The other one is BitMap mode. In this mode, the same ACL uses the same ACL resources on different ports. Port matches through bitmaps. The traffic of different ports uses related resources for matching. Therefore, this mode can save resources. By default, the ACL is in Port mode.

#### Configuration Condition

None

#### Configure ACL mode

When the same ACL is used on different ports, mode can be utilized to adjust whether ACL will separately issues resources on the port or share resources through BitMap.

Table 26 Configuring ACL Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure ACL mode	<b>acl mode { port   bitmap }</b>	Mandatory By default, ACL is in Port mode.

### 95.2.13 ACL Monitoring and Maintaining

Table 27 ACL Monitoring and Maintaining

Command	Description
<b>show access-list</b> [ <i>access-list-number</i>   <i>access-list-name</i> ]	Show the ACL configuration information
<b>show acl-object</b> [ <i>global</i>   <i>interface</i> [ <i>vlan</i> [ <i>in</i>   <i>out</i> ] ]   <i>switchport</i> [ <i>in</i>   <i>out</i>   <i>vfp</i> ] ]	Show the information of VLAN, port, global application of ACL, interface

Command	Description
<b>  vlan [ in   out ]   vlan-range [ in   out ] ]</b>	VLAN, VLAN RANGE, and interface VLAN RANGE
<b>show hybrid access-list</b> [ <i>access-list-number</i>   <i>access-list-name</i> ]	Show the configuration information of Hybrid extension and advanced ACL
<b>show ip access-list</b> [ <i>access-list-number</i>   <i>access-list-name</i> ]	Show the IP ACL configuration information
<b>show ip interface list</b>	Show the information of IP ACL applied to interface
<b>show ipv6 access-list</b> [ <i>access-list-number</i>   <i>access-list-name</i> ]	Show the configuration information of IPv6 ACL
<b>show mac access-list</b> [ <i>access-list-number</i>   <i>access-list-name</i> ]	Show the MAC ACL configuration information
<b>show mac interface list</b>	Show the information of MAC ACL applied to interface
<b>show time-range</b> [ <i>time-range-name</i> ]	Show the configuration of time domain and status information
<b>show time-range-state</b> [ <i>time-range-name</i> ]	Show status information of time domain
<b>show acl mode</b>	Show the information of ACL mode

## 95.3 Typical Configuration Example of ACL

### 95.3.1 Configure Standard IP ACL

#### Network Requirements

- PC1, PC2 and PC3 access IP network through the Device.
- Configure standard IP ACL rules so that PC1 instead of PC2 and PC3 can access the IP Network.

#### Network Topology

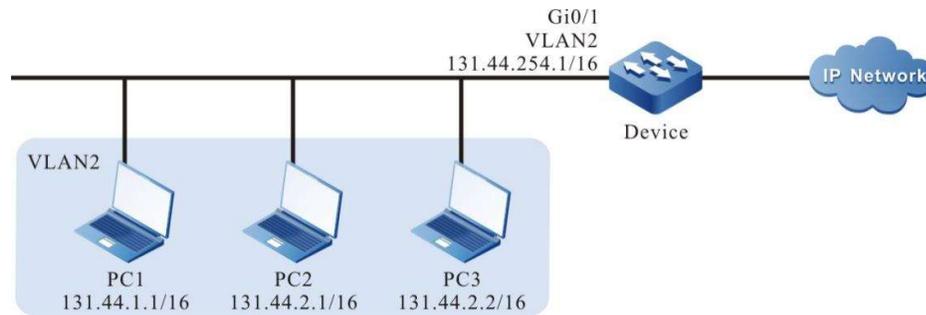

Figure 95 Network Topology for Configuring Standard IP ACL

## Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 2: Configure corresponding VLAN interface and IP address on the Device. (Omitted)

Step 3: Configure the standard IP ACL.

#Configure the standard IP ACL numbered 1 on Device.

```
Device(config)#ip access-list standard 1
```

#Configure rules to permit PC1 to access the IP Network.

```
Device(config-std-nacl)#permit host 131.44.1.1
```

#Configure rules to prevent the network segment 131.44.2.0/24 from accessing the IP Network.

```
Device(config-std-nacl)#deny 131.44.2.0 0.0.0.255
```

#Commit the rules configured

```
Device(config-std-nacl)#commit
Device(config-std-nacl)#exit
```

#View the information of ACL 1 on the Device.

```
Device#show ip access-list 1
ip access-list standard 1
10 permit host 131.44.1.1
20 deny 131.44.2.0 0.0.0.255
```

Step 4: Configure applying of the standard IP ACL.

#Apply the standard IP ACL numbered 1 to the ingress direction of port gigabitethernet0/1 of Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip access-group 1 in
Device(config-if-gigabitethernet0/1)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface-----Bind-----Instance-----
Interface-----Direction----AclType----AclName
gi0/1          IN      IP      1
-----Interface-----Bind-----Instance-----
Interface VlanId-----Direction----AclType----AclName
Device#
```

Step 5: Check the result.

#PC1 instead of PC2 and PC3 can access the IP Network.

### 95.3.2 Configure Extended IP ACL with Time Domain

#### Network Requirements

- PC1, PC2 and PC3 access IP network through the Device.
- Configure extended IP ACL rules so that PC1 can access the IP Network within the specified time, PC2 can access the FTP services in the IP Network, and PC3 cannot access the IP Network.

#### Network Topology

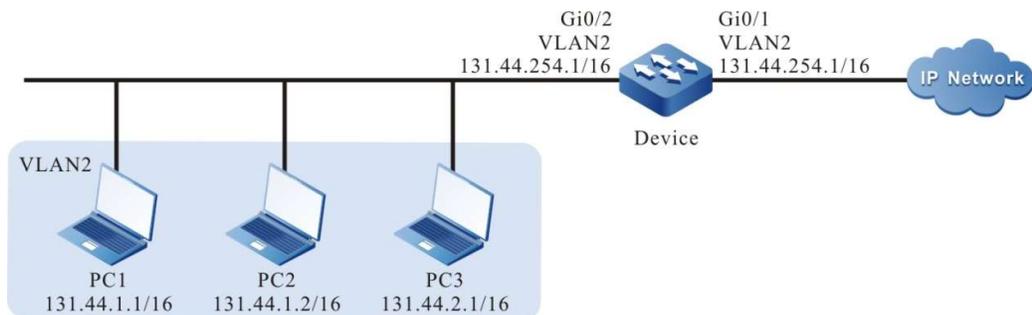

Figure 95 Network Topology for Configuring Extended IP ACL with Time Domain

#### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of the ports gigabitethernet0/1 and gigabitethernet0/2 as Access, permitting the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1,0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

Step 2: Configure corresponding VLAN interface and IP address on the Device. (Omitted)

Step 3: Configure time domain.

#Configure time domain "time-range-work" on the Device, from 08:00:00 to 18:00:00 per day.

```
Device(config)#time-range time-range-work
Device(config-time-range)#periodic daily 08:00:00 to 18:00:00
Device(config-time-range)#exit
```

#View current system time on the Device.

```
Device#show clock

UTC FRI APR 05 15:26:31 2013
```

#View the information of defined time domain "time-range-work" on the Device.

```
Device#show time-range time-range-work
Timerange name:time-range-work (STATE:active)
10 periodic daily 08:00:00 to 18:00:00 (active)
```

Step 4: Configure extended IP ACL.

#Configure the extended IP ACL numbered 1001 on the Device.

```
Device(config)#ip access-list extended 1001
```

#Configure rules to prevent the network segment 131.44.2.0/24 from accessing the IP Network.

```
Device(config-ext-nacl)#deny ip 131.44.2.0 0.0.0.255 any
```

#Configure rules to permit PC2 to access the FTP services of IP Network.

```
Device(config-ext-nacl)#permit tcp host 131.44.1.2 any eq ftp
Device(config-ext-nacl)#permit tcp host 131.44.1.2 any eq ftp-data
```

#Configure rules to permit PC1 to access the IP Network within the scope of the defined time domain "time-range-work".

```
Device(config-ext-nacl)#permit ip host 131.44.1.1 any time-range time-range-work
```

#Commit the rules configured

```
Device(config-ext-nacl)#commit
Device(config-ext-nacl)#exit
```

#View the information of ACL 1001 on the Device.

```
Device#show ip access-list 1001
ip access-list extended 1001
10 deny ip 131.44.2.0 0.0.0.255 any
20 permit tcp host 131.44.1.2 any eq ftp
30 permit tcp host 131.44.1.2 any eq ftp-data
40 permit ip host 131.44.1.1 any time-range time-range-work (active)
```

Step 5: Configure to apply extended IP ACL.

#Apply the extended IP ACL numbered 1001 in the outgoing direction of port gigabitethernet0/1 of the Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip access-group 1001 out
Device(config-if-gigabitethernet0/1)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface-----Bind-----Instance-----
Interface-----Direction----AclType----AclName
gi0/1          OUT      IP      1001
-----Interface-----Bind-----Instance-----
Interface VlanId-----Direction----AclType----AclName
```

Step 6: Check the result.

#PC1 can access the IP Network from 08:00 to 18:00 per day; PC2 can access the FTP server in the IP Network, and PC3 cannot access the IP Network.

### 95.3.3 Configure Standard MAC ACL

#### Network Requirements

- PC1, PC2 and PC3 access IP network through the Device.
- Configure standard MAC ACL rules so that PC1 instead of PC2 and PC3 can access the IP Network.

#### Network Topology

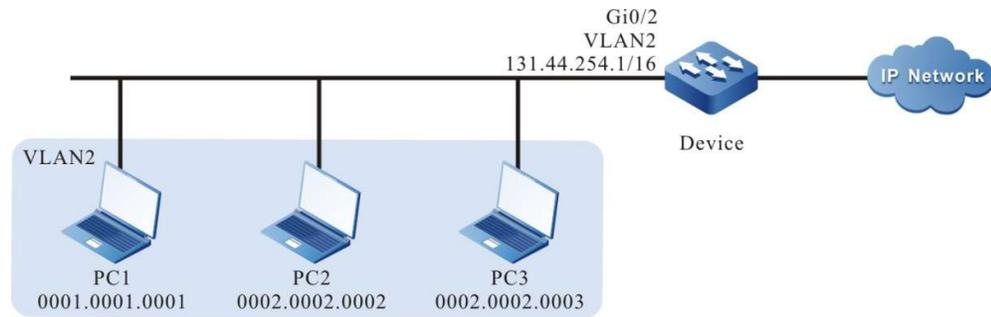

Figure 95 Network Topology for Configuring Standard MAC ACL

## Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/2 to Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 2
Device(config-if-gigabitethernet0/2)#exit
```

Step 2: Configure corresponding VLAN interface and IP address on the Device. (Omitted)

Step 3: Configure standard MAC ACL.

#Configure the standard MAC ACL numbered 2001 on the Device.

```
Device(config)#mac access-list standard 2001
```

#Configure rules to permit PC1 to access the IP Network.

```
Device(config-std-mac-nacl)#permit host 0001.0001.0001
```

#Configure rules to prevent the network segment with MAC address of 0002.0002.0000 and mask of ffff.ffff.0000 from accessing the IP Network.

```
Device(config-std-mac-nacl)#deny 0002.0002.0000 0000.0000.ffff
```

#Commit the rules configured

```
Device(config-std-mac-nacl)#commit
```

#View the information of ACL 2001 on the Device.

```
Device#show mac access-list 2001
mac access-list standard 2001
10 permit host 0001.0001.0001
20 deny 0002.0002.0000 0000.0000.ffff
```

Step 4: Configure to apply standard MAC ACL.

#Apply the standard MAC ACL numbered 2001 in the incoming direction of port gigabitethernet0/1 of the Device.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#mac access-group 2001 in
Device(config-if-gigabitethernet0/2)#exit
```

#View on Device, the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface-----Bind-----Instance-----
Interface-----Direction----AclType----AclName
gi0/2             IN      MAC      2001
-----Interface-----Bind-----Instance-----
Interface VlanId-----Direction----AclType----AclName
```

Step 5: Check the result.

#PC1 instead of PC2 and PC3 can access the IP Network.

### 95.3.4 Configure Extended MAC ACL

#### Network Requirements

- PC1, PC2 and IP Phone access the IP network through Device1.
- Configure extended MAC ACL rules on Device2 so that VLAN2 users cannot access the IP Network, and VLAN3 users others than voice users can access it.

#### Network Topology

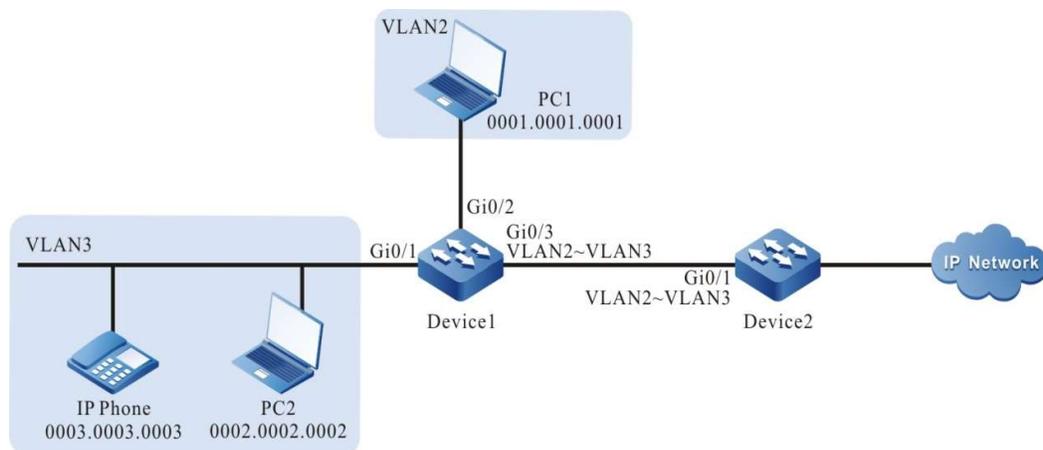

Figure 95 Network Topology for Configuring Extended MAC ACL

### Configuration Steps

Step 1: Configure VLAN and port link type on Device2.

#Create VLAN2 and VLAN3.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit

Device2#configure terminal
Device2(config)#vlan 3
Device2(config-vlan3)#exit
```

#Configure the link type of port gigabitethernet0/1 as Trunk, and allow services of VLAN2 and VLAN3 to pass.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#switchport trunk vlan 2-3
Device2(config-if-gigabitethernet0/1)#exit
```

Step 2: Configure corresponding VLAN interface and IP address on Device1 and Device2. (Omitted)

Step 3: Configure Voice-VLAN on Device1 and set the cos value of IP Phone packet as 7. (omitted)

Step 4: Configure extended MAC ACL.

#Configure the extended MAC ACL numbered 3001 on Device2.

```
Device2(config)#mac access-list extended 3001
```

#Configure rules to prevent the users in VLAN2 from accessing the IP Network.

```
Device2(config-ext-mac-nacl)#deny any any vlan-id 2
```

#Configure rules to prevent the voice users in VLAN3 from accessing the IP Network.

```
Device2(config-ext-mac-nacl)#deny any any cos 7 vlan-id 3
```

#Configure rules to prevent other users in VLAN3 from accessing the IP Network.

```
Device2(config-ext-mac-nacl)#permit any any vlan-id 3
```

#Commit the rules configured

```
Device2(config-ext-mac-nacl)#commit
```

#View the information of ACL 3001 on Device2.

```
Device2#show access-list 3001
mac access-list extended 3001
10 deny any any vlan-id 2
20 deny any any cos 7 vlan-id 3
30 permit any any vlan-id 3
```

Step 5: Configure to apply extended MAC ACL.

#Apply the extended MAC ACL numbered 3001 in the incoming direction of port gigabitethernet0/1 of Device2.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#mac access-group 3001 in
Device2(config-if-gigabitethernet0/1)#exit
```

#View on Device2 the information of the ACL applied to the port.

```
Device#show acl-object interface
-----Interface----Bind----Instance-----
Interface-----Direction----AclType----AclName
gi0/1             IN          MAC       3001
-----Interface----Bind----Instance-----
Interface VlanId-----Direction----AclType----AclName
```

Step 6: Check the result.

#PC2 instead of PC1 and IP Phone can access the IP Network.

---

### Note

- For configurations related to Voice-VLAN, refer to the Voice-VLAN-related chapter in the User Manual.
- 

## 95.3.5 Configure Extended Hybrid ACL

### Network Requirements

- PC1, PC2 and PC3 access IP network through the Device.
- Configure extended Hybrid ACL rules so that PC1 instead of PC2 and PC3 can access the

IP Network within the specified time range.

## Network Topology

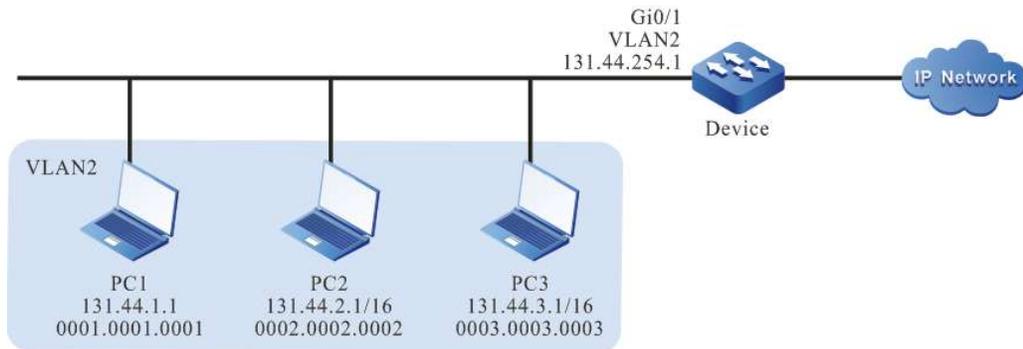

Figure 95 Network Topology for Configuring Extended Hybrid ACL

## Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 as Access to allow services of VLAN 2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

Step 2: Configure corresponding VLAN interface and IP address on the Device. (Omitted)

Step 3: Configure time domain.

#Configure time domain "time-range-work" on the Device, from 08:00 to 18:00 per day.

```
Device(config)#time-range time-range-work
Device(config-time-range)#periodic daily 08:00 to 18:00
Device(config-time-range)#exit
```

#View current system time on the Device.

```
Device#show clock
UTC FRI APR 05 15:26:31 2013
```

#View the information of defined time domain "time-range-work" on the Device.

```
Device#show time-range time-range-work
Timerange name:time-range-work (STATE:active)
10 periodic daily 08:00 to 18:00 (active)
```

Step 4: Configure extended Hybrid ACL.

#Configure the extended Hybrid ACL numbered 5001 on the Device.

```
Device(config)#hybrid access-list extended 5001
```

#Configure rules to permit PC1 to access the IP Network within the scope of the defined time domain "time-range-work".

```
Device(config-hybrid-nacl)# permit host 0001.0001.0001 any ether-type ipv4 ip any any time-range time-range-workwork
```

#Configure rules to prevent the network segment 131.44.0.0/16 from accessing the IP Network.

```
Device(config-hybrid-nacl)# deny any any ether-type ipv4 ip 131.44.0.0 0.0.255.255 any
```

#Configure rules to permit all the packets from IP Network to pass through the Device.

```
Device(config-hybrid-nacl)# permit any any ether-type ipv4 ip any any
```

#Commit the rules configured

```
Device(config-hybrid-nacl)#commit  
Device(config-hybrid-nacl)#exit
```

#View the information of ACL 5001 on the Device.

```
Device#show hybrid access-list 5001  
hybrid access-list extended 5001  
  
10 permit host 0001.0001.0001 any ether-type ipv4 ip any any time-range time-range-work (active)  
20 deny any any ether-type ipv4 ip 131.44.0.0 0.0.255.255 any  
30 permit any any ether-type ipv4 ip any any
```

Step 5: Configure to apply extended Hybrid ACL.

#Apply the extended Hybrid ACL numbered 5001 in the incoming direction of global.

```
Device(config)#global hybrid access-group 5001 in
```

#View on Device the information of the ACL applied globally.

```
Device#show acl-object global  
  
-----Global----Bind----Instance-----  
Global-----Direction----AclType----AclName  
global          IN      HYBRID   5001
```

Step 6: Check the result.

#PC1 can access the IP Network from 08:00 to 18:00 per day; PC2 and PC3 cannot access the IP Network.

# 96 Attack Detection

## 96.1 Overview

Attack defense is an important function for the maintenance of network security. It analyzes the content of packets passing through the device to determine whether they have the characteristics of attack, and takes some preventive measures for those with attack characteristics according to the configuration, such as intercepting attack packet, recording attack packet log, and adding attack source to blacklist. By configuring the device with attack defense function, on one hand, you can prevent the device from becoming abnormal due to network attack to improve the device's anti-attack ability; on the other hand, the attack traffic forwarded by the device can be intercepted to prevent other devices on the network from working abnormally due to the attack.

## 96.2 Attack Defense Function Configuration

Table 96 Attack Defense Function Configuration List

Configuration Task	
Configure single-packet attack defense function	<p>1) Hardware detection supports the configuration of intercepting the following attack packets: frag-icmp, icmp-large, icmpv6-large, ping-of-death, smurf, src-dst-mac-equal, src-dst-ip-equal, src-dst-port-equal, tcp-flag-seq-zero, tcp-hdr-incomplete, tcp-invalid-flag, tcp-syn-fin, smac-zero, and invalid-ttl. The actual results are subject to the capability set of each chip.</p> <p>2) Configure to intercept the following attack packets for software: fraggle, fragment, tcp-land, REDIRECT, UNREACH, ECHOREPLY, SOURCEQUENCH, ECHO, ROUTERADVERT, ROUTERSOLICIT, TIMXCEED, PARAMPROB, TSTAMP, TSTAMPREPLY, IREQ, IREQREPLY, MASKREQ, MASKREPLY, small-packet, and icmp code none-zero.</p>
Configure flood defense function	Configure to intercept the following types of flood attack packets: tcp syn, tcp syn-ack, tcp

	ack, tcp fin, tcp rst, tcp port, udp, udp port, icmp, icmpv6, dns, http, and ip.
Configure scanning attack defense function	Configure to intercept ip scanning and port scanning attack packets
Configure URPF attack defense function	Configure URPF check function
Configure blacklist function	Configure blacklist function and discard the packets of corresponding source address

Note: The packet interception configured on software of the switch is applicable to the packet of local device only.

### 96.2.1 Configure Single-packet Attack Defense Function

Single-packet attack defense can determine whether the packets passing through the device are offensive by analyzing their characteristics. Generally, it is only valid for the packets applied with attack defense policies in the incoming direction. After the single-packet attack defense function is configured, if the device finds that a packet is offensive, it will output an alarm log, discard the packet, and perform statistics of discarded packets.

#### Configuration Condition

None

#### Configure Different Types of Single-packet Attack Defense Function

When the attack packet configured is detected, it will be discarded, and statistics of discarded packets will be performed.

Table 96 Configuring Single-packet Attack List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to intercept specified type of single-packet attack packet	<b>anti-attack detect { fraggle   frag-icmp   icmp-large   icmpv6-large   ping-of-death   src-dst-ip-equal   src-dst-mac-equal   src-dst-port-equal   smurf   tcp-flag-seq-zero   tcp-hdr-incomplete   tcp-invalid-</b>	Mandatory By default, the default value of <i>max-off</i> is 65535.

<b>flags   tcp-land   tcp-syn-fin   smac-zero   invalid-ttl}</b>  <b>anti-attack drop { fragment [ max-off max-off ]   small-packet [ mini-length ]   icmp { type { REDIRECT   UNREACH   ECHOREPLY   SOURCEQUENCH   ECHO   ROUTERADVERT   ROUTERSOLICIT   TIMXCEED   PARAMPROB   TSTAMP   TSTAMPREPLY   IREQ   IREQREPLY   MASKREQ   MASKREPLY}   code none-zero }}</b>  <b>anti-attack subnet-broadcast masklen length</b>	<p>By default, the default value of <i>mini-length</i> is 64.</p> <p>By default, the default value of <i>length</i> is 0.</p> <p>For single-packet attack defense, the detection of packets with such characteristics is disabled.</p>
---	--

### Configure Single-packet Attack Defense Logging

When the device finds single-packet attack, it discards the packet while logging.

Table 96 Configuring Single-packet Attack Log Output

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure single-packet attack type of log output	<b>attack-defense action logging detect</b>	Mandatory By default, the single-packet attack defense log is not enabled.

## 96.2.2 Configure Flood Defense Function

Flood attack is mainly used to protect servers from the impact of large-traffic packets. Generally, it is applied to the interface of the device connecting external network, and valid for the packets in the incoming direction of the interface where the attack defense policy is applied. After the flood defense policy is applied to the interface, the interface begins to detect attack. When it finds that the rate of a certain type of keeps exceeding the specified trigger threshold value, it considers that the interface has been flooded and enters the attack defense status. Then, it starts corresponding defense policy according to the configuration (output alarm logs, discard packets, and add attack source to the dynamic blacklist which takes effect after traceability function is configured). When the device finds the traffic of this type of

packet is less than the threshold value for 5 seconds in succession, the attack status is cancelled, and attack defense measures stop.

### Configuration Condition

Configure attack defense policy, and flood defense in the policy configuration mode.

Apply attack defense policy, and enable the flood defense detection in the policy.

### Configure Different Types of Flood Defense Function

When the packet configured with flood detection exceeds the threshold value, corresponding defense measures should be taken.

Table 96 Configuring Flood Defense List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the policy configuration mode	<b>attack-defense policy <i>policy</i></b>	Mandatory The defense policy is differentiated according to policy name
Configure flood detection type and defense action	<b>detect { tcp-syn   tcp-ack   tcp-syn-ack   tcp-fin   tcp-rst   tcp { port [ <i>port-number</i>   bgp   ftp   ldp   ssh   syslog   telnet ] }   udp { port [ <i>port-number</i>   snmp   syslog   tftp ] }   icmp   icmpv6   dns   http   ip } flood threshold <i>threshold-value</i> action { drop   blacklist }*</b>	<b>threshold-value:</b> Configure the threshold value of flood detection  By default, corresponding type of flood detection is not enabled.  When the policy is applied, corresponding flood detection function takes effect.

### Configure the Function of Tracing Attack Source in Flood Detection

Trace the packet configured with flood defense, and summarize the number of packets based on each source address.

Table 96 Configuring Flood Defense and Tracing Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the policy configuration mode	<b>attack-defense policy <i>policy</i></b>	Mandatory The defense policy is differentiated according to policy name
Configure flood defense and tracing function	<b>trace-type {source-ip   source-mac} max-count <i>max-source-number</i></b>	<i>max-source-number</i> : Configure the number of packets for flood detection and tracing. For the node of the source address where tracing number is exceeded, tracing operation is not performed.  By default, the detection of unisource threshold value is not performed according to the source address.

**Configure Global Application of Attack Defense Policy**

Flood attack is configured based on policy, and the configuration takes effect when the policy is applied.

Table 96 Configuring Global Application of Flood Defense Policy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Configure application of attack defense policy	<b>attack-defense global apply policy</b> <i>policy-name</i>	By default, all flood defense functions are invalid.  <i>policy-name</i> : Enable specific defense policy
--	---	---

### Configure Application of Attack Defense Policy Under the Port

Flood attack is configured based on policy, and the configuration takes effect when the policy is applied. The policy can be separately applied based on interface. If there is both global application policy and configuration under interface, the latter takes valid first.

Table 96 Configure Application of Attack Defense Policy Under Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure application of attack defense policy	<b>attack-defense apply policy</b> <i>policy-name</i>	By default, the policy is not separately applied under interface.  <i>policy-name</i> : Enable specific defense policy

### Configure Flood Defense Logging

When the device finds flood attack, it takes defense policies while logging.

Table 96 Configuring Flood Attack Log Output

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure flood attack log output	<b>attack-defense action logging flood</b>	By default, the flood defense log is not enabled.

### 96.2.3 Configure Scanning Attack Defense Function

Scanning attack defense mainly detects the detection behavior by monitoring the rate of initiating connections to the target system by network users to prevent them from detecting network status. Generally, it is applied to the interface of the device connecting external network, and valid for the packets in the incoming direction of the interface where the attack defense policy is applied.

After the scanning attack defense is configured, when the number of IPs accessed in the network or the number of ports accessed on a certain device exceeds the threshold value, it is considered that a scanning attack has happened in the network, and the attack source is automatically detected and added to the dynamic blacklist. At the same time, a scanning attack defense log will be output according to the configuration.

#### Configuration Condition

Configure attack defense policy, and scanning attack defense in the policy configuration mode.

Apply attack defense policy, and enable the scanning attack defense detection in the policy.

#### Configure Scanning Attack Defense Function

After the scanning attack defense level is configured, and the number of destination addresses accessed in the network or the number of ports accessed on a certain destination address exceeds the threshold value, a scanning attack log will be output according to the configuration and the attack source will be added to the blacklist.

High means high-level defense. The number of destination IP addresses permitted for simultaneous access at this level is 16, and 4 ports are permitted for simultaneous access under the same destination address. Medium means medium-level defense. This level allows 32 destination IP addresses to be accessed at the same time and 8 ports to be accessed simultaneously under the same destination address. Low means low-level defense. The number of destination IP addresses permitted for simultaneous access at this level is 64, and 16 ports can be accessed simultaneously under the same destination address.

Table 96 Configure Scanning Attack Defense Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the policy configuration mode	<b>attack-defense policy <i>policy</i></b>	Mandatory The defense policy is differentiated according to policy name
Configure scanning attack defense function	<b>detect scan level {high   medium   low} action blacklist</b>	By default, the scanning attack defense function is not enabled.  When the policy is applied, corresponding scanning attack detection function takes effect.

### Configure Global Application of Attack Defense Policy

Scanning attack is configured based on policy, and the configuration takes effect when the policy is applied.

Table 1 Configuring Global Application of Attack Defense Policy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure application of attack defense policy	<b>attack-defense global apply policy <i>policy-name</i></b>	By default, the scanning attack defense function is invalid.  <i>policy-name</i> : Enable specific defense policy

### Configure Application of Attack Defense Policy Under the Port

Scanning attack is configured based on policy, and the configuration takes effect when the policy is applied. The policy can be separately applied based on interface. If there is both global application policy and configuration under interface, the latter takes valid first.

Table 2 Configure Application of Attack Defense Policy Under Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure application of attack defense policy	<b>attack-defense apply policy</b> <i>policy-name</i>	By default, the policy is not separately applied under interface.  <i>policy-name</i> : Enable specific defense policy

### Configure Scanning Attack Defense Logging

When the device finds any scanning attack, it begins logging.

Table 96 Configuring Scanning Attack Log Output

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure scanning	<b>attack-defense action logging scan</b>	By default, the scanning attack

attack log output		defense log is not enabled.
-------------------	--	-----------------------------

## 96.2.4 Configure URPF Attack Defense Function

URPF, a unicast reverse routing lookup technology, is used to prevent the attacks based on source address spoofing, such as DoS (Denial of Service) and DDoS (Distributed Denial of Service) attacks.

### Configuration Condition

To make the URPF detection take effect, you are required to globally enable the URPF function.

### Configure Global URPF Function

The URPF function on the interface takes effect only after the URPF function is globally enabled.

Table 3 Configuring Global URPF Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure global URPF function	<b>ip urpf</b>	Mandatory Enable the global URPF function

### Configure the Function of Looking up Default Route via URPF

When looking up the source route via URPF, permit the packet to pass if its source route is found to be the default route by enabling the default route function. Table 4 Configuring Permission of Default Route via URPF

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Configure permission of default route via URPF	<b>ip urpf allow-default-route</b>	Enable permission of default route via URPF  It is not enabled by default.
--	------------------------------------	--

### Configure URPF Function Under Interface

When looking up the source route via URPF, permit the packet to pass if its source route is found to be the default route by enabling the default route function.

In the loose mode, only whether the source address is in the routing table will be checked; in the strict mode, whether the source address is in the routing table and whether the incoming port of the packet is correct will be checked.

Table 96 Configuring Permission of Default Route via URPF

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	<i>interface-name</i> : Configure the interface of URPF function
Configure the URPF detection function on interface	<b>ip urpf { loose   strict }</b>	Enable the URPF detection function on interface. The URPF function is not enabled by default.

## 96.2.5 Configure Blacklist Function

The blacklist function is an attack defense feature which filters packets according to the source IP or IPv6 address of packets. Compared to the packet filtering function based on ACL (Access Control List), blacklist uses a simple way to match packets. It can rapidly filter and effectively shield packets. Blacklist can be added or deleted by the device dynamically or the user manually.

### Configuration Condition

None

## Configure Static Blacklist

Dynamic blacklist is dynamically added by functions like flood defense and scanning attack defense, while static blacklist is manually configured by the user.

The blacklist on the switching device is implemented through ACL resources, and that on the routing device is implemented through software.

Table 5 Configuring Static Blacklist

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure static blacklist	<b>blacklist {ip <i>ip-address</i>   ipv6 <i>ipv6-address</i> }</b>	<i>ip-address</i> and <i>ipv6-address</i> are used to configure the blacklist function of specified source address.

## 96.2.6 Attack Defense Monitoring and Maintaining

Table 6 Attack Defense Monitoring and Maintaining List

Step	Command	Description
Clear statistics of NULL SCAN on all members	<b>clear attack-defense nullscan stastics</b>	-
Show statistics of single-packet attack	<b>show anti-attack detect statistic lpu <i>lpu-ID</i></b>	-
Show the attack defense policy	<b>show attack-defense applied policy</b>	-

applied at present		
Show the configuration of attack defense policy	<b>show attack-defense policy</b> [ <i>policy-name</i> ]	-
Show flood defense status	<b>show attack-defense flood lpu</b> <i>lpu-ID</i> [ <b>interface</b> <i>interface-name</i> ]	-
Show scanning attack defense status	<b>show attack-defense scan</b> { <b>ip-scan</b>   <b>ipv6-scan</b>   <b>port-scan</b>   <b>ipv6-port-scan</b> } <b>lpu</b> <i>lpu-ID</i>	-
Show the scanning attack defense status on the specified interface	<b>show attack-defense scan</b> { <b>statistic</b>   <b>ipv6-statistic</b> } <b>lpu</b> <i>lpu-ID</i> <b>interface</b> <i>interface-name</i>	-
Show attack tracing status	<b>show attack-defense trace lpu</b> <i>lpu-ID</i> [ <b>interface</b> <i>interface-name</i> ]	-
Show the information of blacklist	<b>show blacklist</b> { <b>ip</b>   <b>ipv6</b>   <b>config</b>   <b>mac</b> } <b>lpu</b> <i>lpu-ID</i>	-
Show the statistics of NULL SCAN	<b>show attack-defense nullscan stastics</b> <b>lpu</b> <i>lpu-ID</i>	When the flood defense function is enabled, the nullscan (the packet with the flag of 0 in TCP packet) detection function will be automatically enabled.

## 96.3 Typical Configuration Example of Attack Defense

### 96.3.1 Configure Single-packet Attack Detection

#### Network Requirements

- The attacker and PC access the Device through interface.
- The single-packet attack detection function is configured for the Device so that it can give an alarm when an attack packet is detected and discards it. Take common Fraggle and Land attacks as examples.

#### Network Topology

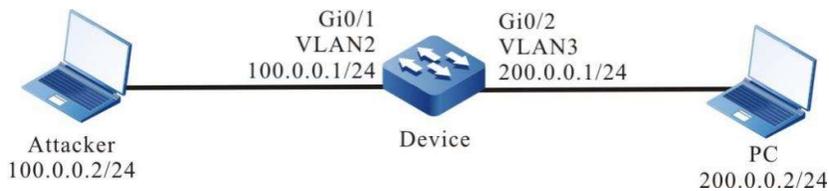

Figure 96 Network Topology for Configuring Single-packet Attack Detection

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP address and route of each interface, and require PC to access the Network through the Device. (Omitted)
- Step 3: Configure Fraggle and Land attack detection function on the Device and turn on the single-packet attack log switch.

#Configure Fraggle attack detection.

```
Device#configure terminal
Device(config)#anti-attack detect fraggle
```

#Configure Land attack detection.

```
Device(config)#anti-attack detect tcp-land
```

#Turn on the single-packet attack log switch on the Device.

```
Device(config)#attack-defense action logging detect
```

- Step 4: Check the result.

#When the attacker launches Fraggle and Land attacks on the PC, if this function is not configured, the attack packets can be captured on the PC; if this function is configured, the attack packets cannot be captured on the PC, in which case, you need to check log and statistical information on the Device.

#When there is a Fraggle attack on the Device, it will output the following log information:

```
%ANTIATTACK-DETECT_ATTACK-4: vlan2 detect attack, type fraggle
```

#When there is a Land attack on the Device, it will output the following log information:

```
%ANTIATTACK-DETECT_ATTACK-4: vlan2 detect attack, type tcp-land
```

#Execute the command show anti-attack detect statistic on the Device to view the statistical information of discarded packets.

```
Device#show anti-attack detect statistic
```

detect-type	DropCount
-----	
fraggle	87
fragment	0
frag-icmp	0
tcp-land	456
REDIRECT	0
UNREACH	0
ECHOREPLY	0
SOURCEQUENCH	0
ECHO	0
ROUTERADVERT	0
ROUTERSOLICIT	0
TIMXCEED	0

TSTAMPREPLY	0
IREQ	0
IREQREPLY	0
MASKREQ	0
MASKREPLY	0
small-packet	0
none-zero	0
invalid-ttl	0

---

### Note

- The hardware processing of single-packet attack detection on the switch is valid for both forwarded and local packets, and no log or statistical information will be generated; the software processing of single-packet attack detection is only valid for local packets, and log and statistical information will be generated.
-

## 96.3.2 Configure Flood Attack Detection

### Network Requirements

- The Device accesses the IP Network through gigabitethernet0/1.
- The flood attack detection function is configured for the Device so that it can give an alarm log when an attack packet of corresponding type is detected and discards it. Take common tcp syn flood and icmp flood attacks as examples.

### Network Topology

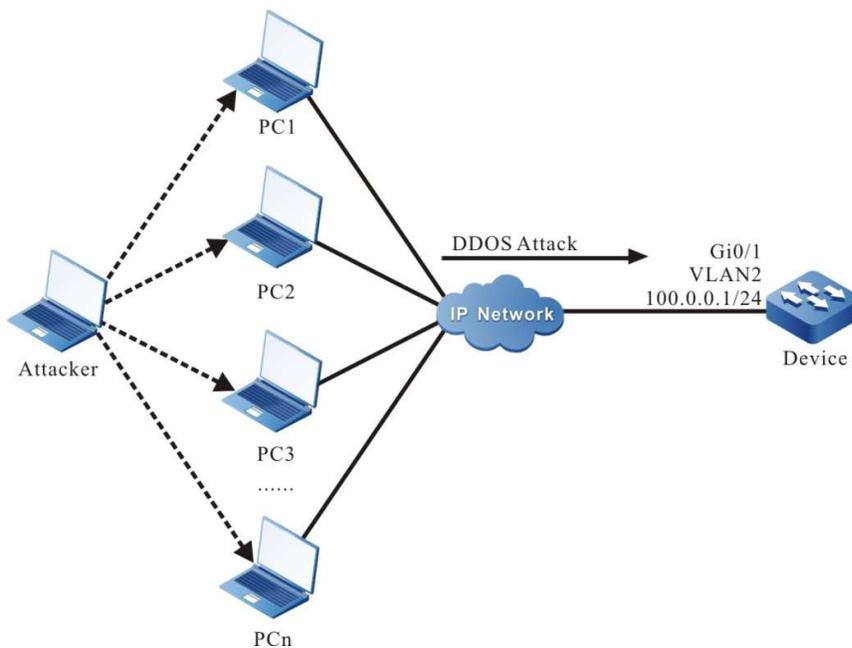

Figure 96 Network Topology for Configuring Flood Attack Detection

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP address and route of each interface, and require PC to access the IP Network through the Device. (Omitted)
- Step 3: Configure attack defense policy a on the Device, add tcp syn flood and icmp flood attack detection function to the policy, and configure IP address-based attack traceability.

```
Device(config)#attack-defense policy a
Device(config-anti-policy-a)#detect tcp-syn flood threshold 500 action drop
Device(config-anti-policy-a)#detect icmp flood threshold 500 action blacklist
Device(config-anti-policy-a)#trace-type source-ip max-count 5
Device(config-anti-policy-a)#exit
```

#Configure global application of attack defense policy a on the Device.

```
Device(config)#attack-defense global apply policy a
```

#Turn on the flood attack log switch on the Device.

```
Device(config)#attack-defense action logging flood
```

Step 4: Check the result.

#View current attack defense policy on the Device.

```
Device#show attack-defense applied policy
attack-defense policy a
detect tcp-syn flood threshold 500 action drop
detect icmp flood threshold 500 action blacklist
trace-type source-ip max-count 5
```

#When an attacker launches tcp syn flood and icmp flood attacks on the Device, view the flood attack log output on the Device.

```
%ANTIATTACK-FLOOD_ATTACK-4: vlan2 detect attack, type tcp-syn.
%ANTIATTACK-FLOOD_IP_ATTACK-4: vlan2 detect attack, type icmp, ipaddr 100.0.0.2.
```

#View attack tracing entries on the Device.

```
Device#show attack-defense trace lpu 0

### 96.3.3 Configure Scanning Attack Detection

#### Network Requirements

- The Device accesses the IP Network through gigabitethernet0/1.
- Scanning attack detection function is configured on the Device. When IP scanning or Port scanning is detected, output an alarm log, add the attack source to the blacklist, and intercept all packets of the attack source before aging of the blacklist.

#### Network Topology

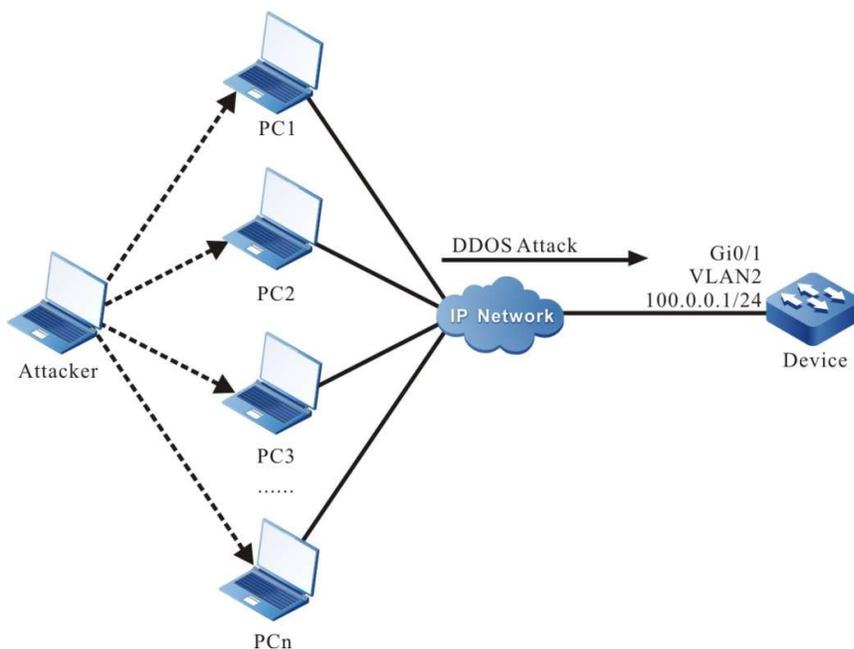

Figure 96 Network Topology for Configuring Scanning Attack Detection

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure the IP address and route of each interface, and require PC to access the IP Network through the Device. (Omitted)

Step 3: Configure attack defense policy a on the Device, and the scanning attack detection function in the policy, with the scanning level being high.

```
Device(config)#attack-defense policy a
Device(config-anti-policy-a)#detect scan level high action blacklist
Device(config-anti-policy-a)#exit
```

#Configure global application of attack defense policy a on the Device.

```
Device(config)#attack-defense global apply policy a
```

#Turn on the scanning attack log switch on the Device.

```
Device(config)#attack-defense action logging scan
```

Step 4: Check the result.

#View current attack defense policy on the Device.

```
Device#show attack-defense applied policy
attack-defense policy a
detect scan level high action blacklist
```

#When an attacker launches a scanning attack on the Device, view the scanning attack log output on the Device.

```

### Note

- Both flood attack and scanning attack detection functions are only valid for local packets of the switch.
  - After specific attack source is identified for flood attack source tracing or scanning attack, it will be added to a dynamic blacklist with an aging time of 2 minutes. Before the blacklist ages, all packets of the attack source will be intercepted.
- 

## 96.3.4 Configure URPF Strict Mode

### Network Requirements

- PC accesses the IP Network through the Device. Configure URPF strict mode on the Device.
- PC simulates an attacker to send an illegal packet with a fake source address to access the IP Network, and the URPF function of the Device makes this packet discarded.

## Network Topology

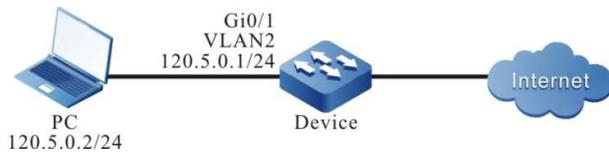

Figure 96 Network Topology for Configuring URPF Strict Mode

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure the IP address and route of each interface, and require PC to access the IP Network through the Device. (Omitted)

Step 3: Configure URPF strict mode.

#Enable the URPF function on the Device, and configure URPF strict mode on the interface vlan2.

```
Device#configure terminal
Device(config)#ip urpf
Device(config)#interface vlan2
Device(config-if- vlan2)#ip urpf strict
Device(config-if- vlan2)#exit
```

Step 4: Check the result.

#PC accesses the IP Network through the Device. The source address is 120.5.0.2.

There is a route leading to 120.5.0.2 on the Device, and the output interface of the route is VLAN 2. The output interface of the route leading to the source address and the interface where the packet is received are the same interface VLAN2. After the URPF strict mode check, the packet is forwarded by the Device, and the PC can access the IP Network.

#PC simulates an attacker to send an illegal packet with a fake source address to access the IP Network through the Device. The source address is 120.10.0.2.

There is no route leading to 120.10.0.2 on the Device. URPF discards the packet, and PC cannot access the IP Network.

## 96.3.5 Configure URPF Loose Mode

### Network Requirements

- In the network environment, PC1 accesses PC2 through Device1, Device2 and Device3, and the response packets of PC2 reach PC1 through Device3 and Device1.
- Configure URPF loose mode on Device3.
- PC1 simulates an attacker to send an illegal packet with a fake source address to access PC2, and the URPF function of Device3 makes this packet discarded.

## Network Topology

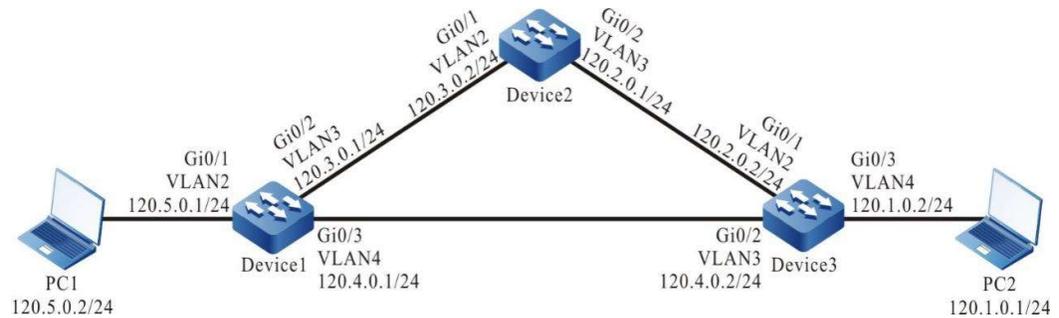

Figure 96 Network Topology for Configuring URPF Loose Mode

## Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure static route in the network so that PC1 accesses PC2 through Device1, Device2 and Device3, and the response packets of PC2 reach PC1 through Device3 and Device1.

#Configure static route of Device1, Device2 and Device3, and build a network environment according to the network requirements.

```
Device1#configure terminal
Device1(config)#ip route 120.1.0.0 255.255.255.0 120.3.0.2
Device1(config)#ip route 120.2.0.0 255.255.255.0 120.3.0.2

Device2#configure terminal
Device2(config)#ip route 120.1.0.0 255.255.255.0 120.2.0.2

Device3#configure terminal
Device3(config)#ip route 120.5.0.0 255.255.255.0 120.4.0.1
```

#View the routing table of Device1, Device2 and Device3.

```
Device1#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS
```

Gateway of last resort is not set

```
S 120.1.0.0/24 [1/10] via 120.3.0.2, 00:10:49, vlan3
S 120.2.0.0/24 [1/10] via 120.3.0.2, 00:11:19, vlan3
C 120.3.0.0/24 is directly connected, 00:19:15, vlan3
C 120.4.0.0/24 is directly connected, 00:15:00, vlan4
C 120.5.0.0/24 is directly connected, 00:07:36, vlan2
C 127.0.0.0/8 is directly connected, 357:23:02, lo0
```

Device2#show ip route

Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management  
D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

```
S 120.1.0.0/24 [1/10] via 120.2.0.2, 00:15:37, vlan3
C 120.2.0.0/24 is directly connected, 00:17:17, vlan3
C 120.3.0.0/24 is directly connected, 00:25:21, vlan2
C 127.0.0.0/8 is directly connected, 00:38:29, lo0
```

Device3#show ip route

Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management  
D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

```
C 120.1.0.0/24 is directly connected, 00:17:01, vlan4
C 120.2.0.0/24 is directly connected, 00:19:13, vlan2
C 120.4.0.0/24 is directly connected, 00:18:50, vlan3
S 120.5.0.0/24 [1/10] via 120.4.0.1, 00:17:19, vlan3
C 127.0.0.0/8 is directly connected, 00:26:16, lo0
```

**Step 4: Configure URPF loose mode on Device3.**

**#Enable the URPF function on Device3, and configure URPF loose mode on the vlan interface 2.**

```
Device3#configure terminal
Device3(config)#ip urpf
Device3(config)#interface vlan 2
Device3(config-if-vlan2)#ip urpf loose
```

Device3(config-if-vlan2)#exit

Step 5: Check the result.

#PC1 ping PC2

The ping request packet of PC1 reaches PC2 through Device1, Device2 and Device3; the response packets of PC2 reach PC1 through Device3 and Device1.

#PC1 accesses PC2. The source address is 120.5.0.2.

There is a route leading to 120.5.0.2 on Device3, and the output interface of the route is VLAN3. Although the output interface VLAN 3 of the route leading to the source address and the interface VLAN 2 where the packet is received are different, after the URPF loose mode check, the packet is forwarded by Device3, PC1 can access PC2, and the response packet of PC2 reaches PC1 through Device3 and Device1.

#PC1 simulates an attacker to send an illegal packet with a fake source address to access PC2. The source address is 120.10.0.2.

There is no route leading to 120.10.0.2 on Device3. URPF discards the packet, and PC1 cannot access PC2.

---

### Note

- The packet discarding as a result of this detection will not generate any log or statistical information.
  - The URPF strict and loose modes are different in the following aspect: in loose mode, URPF searches routing table for the source IP address which receives packet, and permits this packet to pass if it is found; in strict mode, the packet is permitted to pass only when the route is found and its output interface is the same as the packet receiving interface.
  - Generally, the strict mode is applied. Loose mode is applied to the network environment with "inconsistent incoming and outgoing paths" in similar cases.
-

# 97 AARF

---

## 97.1 Overview

Anti Attack Resilient Framework is called AARF for short.

## 97.2 Introduction

In the network environment, switches are often attacked by malicious packets (e.g. ARP and ICMP). These attacks cause a heavy burden on the switch system, bring it to stop. Generally, too many packets will consume the CPU utilization, memory, entries or other resources of the switch so that the system cannot process other normal protocol and management packets. Sometimes, they may even cause suspended operation of the entire network.

AARF can effectively identify attacks and prevent the switch from being attacked. When the switch is attacked, it can ensure the normal operation of the system and protect the CPU from excessive load so that the entire network can operate normally.

## 97.3 Principle

Generally, it prevents the attack of protocol packets by counting the packets sent to CPU, calculating their sending rates, and compare them with the attack threshold value set. If the rate has reached the threshold value, it is considered that the packet is offensive, and the host with such offensive behavior will be limited, such as discarding CPU, limiting speed and filter, so as to protect the CPU.

As a matter of fact, different anti-attack functions for protocol packets use the same way to implement packet counting, identification and attack policy application. We can build an AARF by abstracting the same processing methods. AARF is used to implement some common processing mechanisms of the

anti-attack module to improve the extensibility of this module and reduce the workload in developing new module.

Currently, AARF supports arp-guard.

## 97.4 ARP-guard

ARP-guard is used to monitor the ARP packets on CUP in real time so as to prevent too many ARP packets from impacting the CPU and improve device security.

ARP-guard has three functions, i.e. ARP-guard based on host, ARP-guard based on port, and ARP scanning and identification.

The ARP-guard based on host counts the number of ARP packets received and compares the value with the threshold value set. If it exceeds the threshold value, they are identified as overspeed or offensive. Statistics and identification are based on either source IP address/VLAN ID/port or link layer source MAC address/VLAN ID/port.

The ARP-guard based on port counts the number of ARP packets that are received by the port and don't attack the host. If the value exceeds the threshold value set on the port, they are identified as overspeed or offensive. Port statistics exclude the ARP packets that have been identified as offensive for the host (host entries are generated and attack protection policy is applied).

ARP scanning and identification can identify ARP scanning with fixed MAC address yet constantly changing source IP, or that with fixed IP yet constantly changing destination IP.

### 97.4.1 ARP-guard Function Configuration

Table 97 ARP-guard Function Configuration List

Configuration Task	
Configure Basic Functions of ARP-guard	Enable Global ARP-guard Function
	Enable ARP-guard Function of the Port
Configure ARP-guard Monitoring Policy	Configure Global Monitoring Policy
	Configure Port Monitoring Policy

## 97.4.2 Configure Basic Functions of ARP-guard

The ARP-guard function based on port can take effect only after the global ARP-guard function is enabled.

### Configuration Condition

None

### Enable Global ARP-guard Function

Table 97 Enabling Global ARP-guard Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the AARF configuration mode	<b>aarf</b>	-
Enable Global ARP-guard Function	<b>arp-guard enable</b>	Mandatory By default, the ARP-guard function is disabled globally.

### Enable ARP-guard Function of the Port

Table 97 Enabling ARP-guard Function of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		subsequent configuration takes effect only within the aggregation group.
Enable ARP-guard Function of the Port	<b>aarf arp-guard enable</b>	Mandatory By default, the ARP-guard function is disabled on the port.

### 97.4.3 Configure ARP-guard Monitoring Policy

#### Configuration Condition

No.

#### Configure Global ARP-guard Monitoring Policy

Table 97 Configuring Global ARP-guard Monitoring Policy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the AARF configuration mode	<b>aarf</b>	-
Configure global ARP-guard monitoring policy	<b>arp-guard policy { filter   monitor   punish macbased}</b>	By default, the global ARP-guard monitoring policy is monitor.

#### Configure ARP-guard Monitoring Policy for Port

Table 97 Configuring ARP-guard Monitoring Policy for Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	
Configure ARP-guard monitoring policy for port	<b>aarf arp-guard policy</b> <b>{ filter   monitor  </b> <b>punish macbased}</b>	By default, the ARP-guard monitoring policy for port is not configured. The global ARP-guard monitoring policy is considered as the valid value.

The command **aarf arp-guard policy filter** is the host filtering protection policy under the port applied to the host or port with ARP attack behavior. After the filtering policy is configured, the host with ARP overspeed or attack behavior under the port will generate attack alarm. If the host sends ARP at a rate between the speed limit and attack threshold value, the rate of sending ARP packet to CUP will be limited to the speed limit, and the ARP packet in the forwarding direction will be forwarded at a host sending rate; if the rate of sending ARP by the host exceeds the attack threshold value, the ARP packet sent to CUP and forwarded will be discarded. If any overspeed or attack behavior is detected on the port (i.e. the total rate of receiving ARP packets that do not attack the host by the port is no less than the port rate limit or attack threshold value), an attack alarm will be generated. If the total rate of such ARP packets received by the port is between the port rate limit and the attack threshold value, it will limit the speed of the ARP packets sent to CPU according to the port rate limit, and the ARP packets to be forwarded will be forwarded at the original rate; If the total rate of such ARP packets received by the port is no less than the port attack threshold value, all ARP packets received by the port will be discarded in the forwarding direction and will not be sent to CPU.

The command **aarf arp-guard policy monitor** is the host monitoring protection policy under the port applied to the host or port with ARP attack behavior. After the monitoring policy is configured, if any host packets or port with ARP overspeed or attack behavior are detected under the port, an attack alarm will be generated, and the packets will be sent to CPU at the rate limit, with the ARP packets that exceed the rate limit being discarded by CPU; the ARP packets to be forwarded will be forwarded at the original rate.

The command **aarf arp-guard policy punish macbased** is the punishment-based rate limit protection policy under the port applied to the MAC host with ARP attack behavior. After the punishment-based rate limit policy is configured, when the MAC host packets with ARP overspeed or attack behavior are detected under the port, an attack alarm will be generated. If the rate of packets sent by the MAC host is between the rate limit and the attack threshold value, it will take effect according to the monitor policy. If the ARP packet rate is no less than the attack threshold value, the MAC packets attacking the host will be sent to CPU and forwarded at the rate which is half of the MAC rate limit. If the attack stops or the rate drops below the MAC rate limit, the host protection policy will be cancelled when the aging period expires. In addition, under this policy mode, both the port and IP host use the monitor policy.

#### 97.4.4 ARP-guard Monitoring and Maintaining

Table 97 ARP-guard Monitoring and Maintaining

Command	Description
<b>show aarf arp-guard configure</b>	Show the configuration of ARP-guard.
<b>show aarf arp-guard hosts</b>	Show the information of the monitored host.
<b>show aarf arp-guard ports</b>	Show the information of the monitored port.
<b>show aarf arp-guard scan</b>	Show the information of the scanning host.

### 97.5 Typical Configuration Example of AARF ARP-GUARD

#### 97.5.1 Configure Basic Functions of AARF ARP-GUARD

##### Network Requirements

- PC1, PC2 and PC3 access IP network through the Device.
- PC1 sends ARP packets to attack the Device which turns on AARF ARP-Guard and normally identifies ARP overspeed, ARP attack, ARP MAC scanning and ARP MAC-IP scanning so that the anti-attack policy takes effect.

##### Network Topology

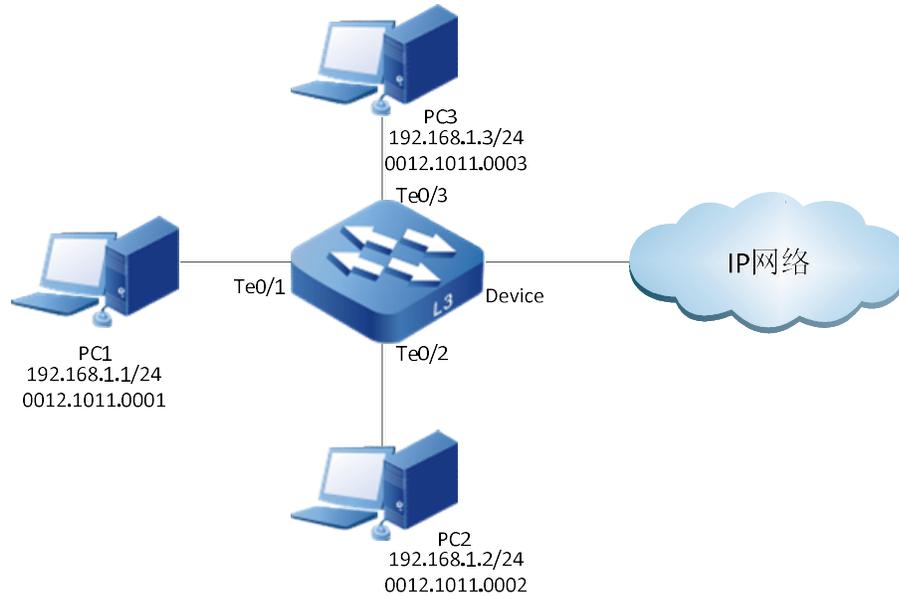

Figure 97-1 Network Topology for Configuring ARP-guard Function

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN 2.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports tengigabitethernet0/1, tengigabitethernet0/2 and tengigabitethernet0/3 as Access to allow services of VLAN2 to pass.

```
Device(config)#interface tengigabitethernet 0/1-0/3
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
```

Step 2: Configure the gateway of PC1, PC2 and PC3 on the Device.

#Configure VLAN interface 2 as the gateway of PC1, PC2 and PC3

```
Device(config)#interface vlan 2
Device(config-if-vlan2)#ip address 192.168.1.254 24
```

Step 3: Configure AARF ARP-Guard on the Device.

#Globally enable AARF ARP-Guard

```
Device(config)#aarf
Device(config-aarf)#arp-guard enable
```

#Enable AARF ARP-Guard on the port tengigabitethernet0/1, relevant threshold value is default configuration, and the configuration policy is filter.

```
Device(config-if-tengigabitethernet0/1)# aarf arp-guard enable
Device(config-if-tengigabitethernet0/1)# aarf arp-guard policy filter
```

Step 4: Check the result.

#View AARF ARP-Guard-related configuration information

```
Device#show aarf arp-guard configure interface tengigabitethernet 0/1
(Format of column Rate-limit and Attack-threshold is per-src-ip/per-src-mac/per-interface.)
```

Interface/Global	Status	Rate-limit	Attack-threshold	Scan-threshold	Attack-policy
te0/1	Enabled	4/4/100	8/8/200	15	filter

#When the rate of ARP Request packets sent by PC1 to request the gateway IP address of the Device is no less than the host-based rate limit 4pps and less than the host-based attack threshold value 8pps, related entries will be formed and log information will be output, and the Device can identify the overspeed host-based ARP packets.

```
Device#show aarf arp-guard hosts
```

# 98 PPPoE+

---

## 98.1 Introduction to Basic Functions of PPPoE+

PPPoE+ (Point-Point Protocol over Ethernet Plus) is also called PPPoE Intermediate Agent. Similar to DHCP option82, this function extends the PPPoE protocol packet. The access device identifies the client by intercepting the protocol packets in the PPPoE discovery phase, inserting the physical information of the client in the up direction, and peeling off the physical information of the client in the down direction.

## 98.2 Principle

- 1) The access device where the PPPoE+ function is enabled obtains the PADI packet sent by the PPPoE client. Then it adds the Vendor-Specific Tag to the load

- information field of the packet and sends it to the PPPoE server;
- 2) After receiving the PADI packet containing Vendor-Specific Tag, the PPPoE server will give the client PADO packet;
  - 3) The PPPoE client sends PADR packet upon receipt of PADO packet;
  - 4) When obtaining the PADR packet, the access device will add the Vendor-Specific Tag to the load information field of the packet and then send it to the PPPoE server;
  - 5) After receiving a PADR packet containing Vendor-Specific Tag, the PPPoE server will randomly generate a session-id, add it to the PADS packet field, and then send it to the PPPoE client. This can achieve the point-to-point PPP negotiation and PPPoE packet interaction with the client.

### 98.3 Vendor-Specific Tag for PPPoE Packet

This Tag is used to transmit the information defined by the manufacturer. In order that the PPPoE server can obtain the physical information of PPPoE client, Vendor-Specific Tag can be added to the PPPoE request packet.

When PPPoE packet interaction happens on the device, some user-related device information can be added to the PPPoE request packet through Vendor-Specific Tag. The Vendor-Specific Tag records the physical information of the client. Circuit-id is circuit ID, and remote-id is remote ID.

When the PPPoE+ function is enabled, after the device receives the PPPoE request packets, it may process them by the following manners according to the processing policy and fill method of Vendor-Specific Tag of PPPoE packet configured by users:

Table 98-1 PPPoE Request Packet Processing Policy

PPPoE request packet	Processing policy	Fill method	Packet processing principle
Without Vendor-Specific Tag	Add	Default fill format	Fill and forward in default format
	Add	Extend fill format	Fill and forward in the user-defined format
With Vendor-Specific Tag	maintained	Not filled	No processing or forwarding of PPPoE packet
	Filter	Discard the packet	Discard the packet

	Replacements	Default fill format	Replace the original Vendor-Specific Tag content in default format and forward
		Extend fill format	Replace the original Vendor-Specific Tag in the user-defined format and forward

## 98.4 Configure Basic Functions of PPPoE+

Table 98 PPPoE+ Function Configuration List

Configuration Task	
Configure to Enable/Disable PPPoE+ Function	Configure to Enable/Disable PPPoE+ Function of Port
Configure Processing Policy of PPPoE+ Function for PPPoE Packet with Vendor-Specific Tag	Configure Processing Policy of PPPoE+ Function for PPPoE Packet with Vendor-Specific Tag
Configure Content of Circuit-id in Vendor-Specific Tag	Configure Content of Circuit-id in Vendor-Specific Tag
Configure Content of Remote-id in Vendor-Specific Tag	Configure Content of Remote-id in Vendor-Specific Tag
Configure Fill Policy of PPPoE+ Function for Vendor-Specific Tag Contained in PPPoE Packet	Configure Fill Policy of PPPoE+ Function for Vendor-Specific Tag Contained in PPPoE Packet
Configure to Fill Value of Vendor-id in Vendor-Specific Tag	Configure to Fill Value of Vendor-id in Vendor-Specific Tag

### 98.4.1 Configure to Enable/Disable PPPoE+ Function

#### Configuration Condition

None

### Enable/disable PPPoE+ function

Table 98 Configuring to Enable/Disable PPPoE+ Function

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter layer-2 Ethernet interface mode	interface <i>interface name</i>	Enable/disable PPPoE+ under the mode
Enter the port aggregation group	interface link-aggregation <i>link-aggregation-id</i>	Enable/disable PPPoE+ function under the aggregation group mode
Enable/disable PPPoE+ function	pppoe relay enable/no pppoe relay enable	By default, the PPPoE+ function is disabled.

## 98.4.2 Configure Processing Policy of PPPoE+ Function for PPPoE Packet with Vendor-Specific Tag

### Configuration Condition

None

### Configure Processing Policy of PPPoE+ Function for PPPoE Packet with Vendor-Specific Tag

Table 98 Configuring Processing Policy of PPPoE+ Function for PPPoE Packet with Vendor-Specific Tag

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter layer-2 Ethernet interface mode	interface <i>interface name</i>	The configuration takes effect under the port mode only

Enter the port aggregation group	interface link-aggregation <i>link-aggregation-id</i>	The configuration takes effect under the aggregation group mode only
Configure the processing policy for PPPoE packet with Vendor-Specific Tag	pppoe relay information policy {keep drop replace}	By default, it is replace, i.e. replace and forward the packet field containing Vendor-Specific Tag.

### Note

- The command `pppoe relay information policy keep` is used to forward the PPPoE packet containing Vendor-Specific Tag as is under the port/aggregation group mode.
- The command `pppoe relay information policy drop` is used to discard the PPPoE packet containing Vendor-Specific Tag under the port/aggregation group mode.
  - The command `pppoe relay information policy replace` is used to replace and forward the Vendor-Specific Tag of PPPoE packet under the port/aggregation group mode.

## 98.4.3 Configure Content of Circuit-id in Vendor-Specific Tag

### Configuration Condition

None

### Configure Content of Circuit-id in Vendor-Specific Tag

Table 98 Configuring Content of Circuit-id in Vendor-Specific Tag

Step	Command	Description
Enter the global configuration mode.	<code>configure terminal</code>	-
Enter layer-2 Ethernet interface mode	interface <i>interface name</i>	The configuration takes effect under the port mode only.

Enter the port aggregation group	Interface link-aggregation <i>link-aggregation-id</i>	The configuration takes effect under the aggregation group mode only.
Configure the content of circuit-id	pppoe relay information format circuit-id{ <i>LINE</i>  default}	By default, fill vlan-interface in the packet.

### Note

- The command pppoe relay information format circuit-id *LINE* is used to allow users to configure the content of circuit-id.
  - The command pppoe relay information format circuit-id default is used to configure circuit-id to be filled with vlan-interface.

## 98.4.4 Configure Content of Remote-id in Vendor-Specific Tag

### Configuration Condition

None

### Configure Content of Remote-id in Vendor-Specific Tag

Table 98 Configuring Content of Remote-id in Vendor-Specific Tag

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter layer-2 Ethernet interface mode	interface <i>interface name</i>	The configuration takes effect under the port mode only.
Enter the port aggregation group	interface link-aggregation <i>link-aggregation-id</i>	The configuration takes effect under the aggregation group mode only.

Configure the content of remote-id	pppoe relay information format remote-id{ <i>LINE</i>  default }	By default, the mac address of the device port is filled in the packet.
------------------------------------	--	---

### Note

- The command pppoe relay information format remote-id *LINE* is used to allow users to configure the content of remote-id.
- The command pppoe relay information format remote-id default is used to configure circuit-id to be filled with switch-mac.

## 98.4.5 Configure Fill Policy of PPPoE+ Function for Vendor-Specific Tag Contained in PPPoE Packet

### Configuration Condition

None

### Configure Fill Policy of PPPoE+ Function for Vendor-Specific Tag Contained in PPPoE Packet

Table 98 Configuring Fill Policy of PPPoE+ Function for Vendor-Specific Tag Contained in PPPoE Packet

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter layer-2 Ethernet interface mode	interface <i>interface name</i>	The configuration takes effect under the port mode only
Enter the port aggregation group	interface link-aggregation <i>link-aggregation-id</i>	The configuration takes effect under the aggregation group mode only

Configure Fill Policy for Vendor-Specific Tag Contained in PPPoE Packet	pppoe relay information encapsulation {circuit-id remote-id both}	By default, circuit-id and remote-id are filled with default values.
---	---	--

#### 98.4.6 Configure to Fill Value of Vendor-id in Vendor-Specific Tag

##### Configuration Condition

None

##### Configure to Fill Value of Vendor-id in Vendor-Specific Tag

Table 98 Configuring Value of Circuit-id in Vendor-Specific Tag

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter layer-2 Ethernet interface mode	Interface <i>interface name</i>	The configuration takes effect under the port mode only
Enter the port aggregation group	interface link-aggregation <i>link-aggregation-id</i>	The configuration takes effect under the aggregation group mode only
Configure value of vendor-id	pppoe relay information vendor-id <i>vendor-id</i>	The value range is 0-4294967295. By default, the value of vendor-id is 2011.

# 99 HA

---

## 99.1 Overview

HA (High Availability) is one high availability management platform on the device, and it provides the regular detection for some system faults, ensuring that the services are not interrupted.

## 99.2 HA Function Configuration

### 99.2.1 HA Monitoring and Maintaining

Table 99 HA Monitoring and Maintaining

Command	Description
<b>show ham job</b>	Show current HA task processing table of local device

# 100 ULFD

---

## 100.1 Overview

In the traditional Ethernet, we usually use the fiber and other physical medium to connect the devices. In the actual networking, the fiber crossover connection (Figure 2-1), or one fiber not connected or disconnected (Figure 2-2) may result in the uni-directional communication. This kind of faulty link is called uni-directional link. The uni-directional link causes a series of problems. For example, the spanning tree detection failure results in the topology calculation error.

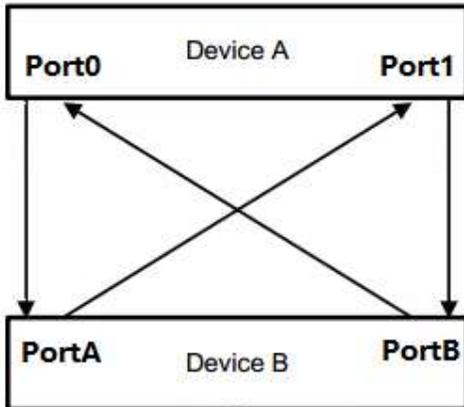

Figure 100 Fiber Cross-Connect

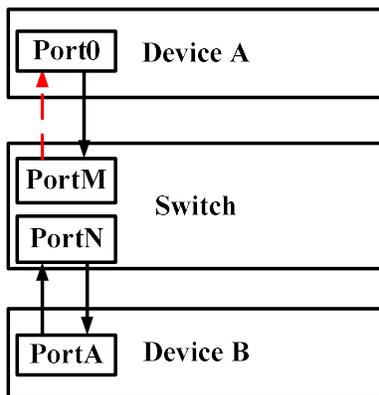

Figure 1 A Fiber not Connected or Disconnected

ULFD (Unidirectional Link Fault Detection) can monitor whether the fiber or twisted-pair has the uni-directional link. When ULFD detects the uni-directional link, it is responsible for closing the physical and logical uni-directional connection, sending the alarm information to the user and blocking the failure of other protocols.

## 100.2 ULFD Function Configuration

Table 100 ULFD Function Configuration List

Configuration Task	
Configure ULFD Basic Functions	Enable global ULFD function
	Enable the port ULFD function
Configure ULFD Parameters	Configure Sending Period of ULFD Detection Packet
	Reset Port Disabled by ULFD

### 100.2.1 Configure ULFD Basic Functions

#### Configuration Condition

Before configuring the ULFD basic functions, complete the following task:

- Ensure that the ULFD detection port is connected normally

#### Enable Global ULFD Function

ULFD has two work modes, that is, normal and aggressive. For the two modes, the basis of judging the uni-directional link is different. The normal mode is often used to check the uni-direction caused by the crossover connection. The aggressive mode is used to check the uni-directional connection caused by the crossover connection or disconnection.

Table 100 Enabling Global ULFD Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable global ULFD function	<b>ulfd { aggressive   enable }</b>	Mandatory  By default, the global ULFD function is disabled.

### Enable the Port ULFD Function

ULFD detection needs to enable the global ULFD detection function and the port ULFD detection function. If the ULFD function is not enabled globally, but just enabled on the port, the ULFD function cannot take effect.

If the global enabled ULFD detection mode and port enabled ULFD detection mode are inconsistent, the port ULFD detection mode takes effect first.

Table 1 Enabling Ethernet ULFD Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2/3 Ethernet interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable the port ULFD function	<b>ulfd port [ aggressive ]</b>	Mandatory  By default, the Ethernet ULFD function is disabled.

### Note

- To switch over the ULFD work mode on the port, first cancel the previous work mode and then configure the new mode.
- When enabling the ULFD function on the port, ensure that the neighbor port is also configured with the ULFD function and works in the same detection mode.

## 100.2.2 Configure ULFD Parameters

### Configuration Condition

Before configuring the ULFD parameters, first complete the following task:

- Enable the ULFD function

### Configure Sending Period of ULFD Detection Packet

ULFD periodically sends the detection packets to detect whether the network has the uni-directional link. We can modify the sending period of the detection packets according to the actuality of the network. The sending period of the detection packets is 7-90s. By default, it is 15s.

Table 100 Configuring Sending Period of ULFD Detection Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the sending period of ULFD packet	<b>ulfd message time</b> <i>time-value</i>	Optional By default, the sending period of uni-directional detection packets is sent is 15 seconds.

### Reset Port Disabled by ULFD

If ULFD detects the uni-direction and disables the port and we want to re-enable the ULFD detection function of the port, the user needs to perform the reset operation manually. The operation sets the port to UP and re-enables the ULFD detection.

Table 2 Resetting Port Disabled by ULFD

Step	Command	Description
Reset Port Disabled by ULFD	<b>ulfd reset</b> [ <b>interface</b> <i>interface-name</i> ]	Optional By default, the Ethernet port cannot automatically reset after it is disabled.

## 100.2.3 ULFD Monitoring and Maintaining

Table 3 ULFD Monitoring and Maintaining

Command	Description
<code>show ulfd [ all   interface <i>interface-name</i> [ detail ] ]</code>	Show the global configuration information of ULFD and ULFD configuration of all/specified Ethernet ports

## 100.3 Typical Configuration Example of ULFD

### 100.3.1 Configure ULFD Basic Functions

#### Network Requirements

- Device1 is connected to Device2 through fiber.
- Configure aggressive ULFD to disable the port when a uni-directional link is detected.

#### Network Topology

Figure 2 Network Topology for Configuring Basic Functions of ULFD

#### Configuration Steps

Step 1: Configure ULFD functions.

#Enable ULFD functions on Device1, and configure ULFD mode as aggressive on the port gigabitethernet0/1.

```
Device1#configure terminal
Device1(config)#ulfd aggressive
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#ulfd port aggressive
Device1(config-if-gigabitethernet0/1)#exit
```

#Enable ULFD functions on Device2, and configure ULFD mode as aggressive on port gigabitethernet0/1.

```
Device2#configure terminal
Device2(config)#ulfd aggressive
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#ulfd port aggressive
Device2(config-if-gigabitethernet0/1)#exit
```

#View the ULFD information of port gigabitethernet0/1 on Device1.

```
Device1#show ulfd interface gigabitethernet 0/1
Interface name   : gigabitethernet0/1
ULFD config mode : Aggressive
ULFD running mode : Aggressive
Link status      : Link Up

Time to Die      : 36
-----
```

## Note

- The ULFD information of port on Device2 is viewed the same way as that on Device1. (Omitted)
- 

Step 2: Check the result.

#In the actual networking environment, as shown in Figure 2-1 and 2-2, when the fibers have crossover connection or a fiber is not connected or disconnected, uni-directional communication will happen. After the ULFD function is configured, when uni-directional communication is detected on Device1, port gigabitethernet0/1 will be closed and the following log information will be output:

```
%ULFD_LOG_WARN: gigabitethernet0/1: detected Unidirectional neighbor: device ID[00017a787878], device name[Device2], interface name[gigabitethernet0/1]!
```

```
%LINK-INTERFACE_DOWN-3: interface gigabitethernet0/1, changed state to down
```

```
%ULFD-UNDIR_LINK_ERR_V3-4: ULFD shutdown interface gigabitethernet0/1 successful
```

#It is indicated that port gigabitethernet0/1 is disabled.

```
Device1#show interface gigabitethernet 0/1
```

```
gigabitethernet0/1 configuration information
```

```

---

## Note

- When configuring the ULFD function, ensure that the ULFDs at both ends of the link are working in the same detection mode.
  - For normal ULFD, please refer to this configuration method. Normal mode only supports the detection of uni-directional communication caused by fiber cross connect.
-

# 101 EIPS

---

## 101.1 Overview

In the layer-2 Ethernet, STP protocol is generally used for network reliability. As a standard ring protection protocol developed by IEEE, it has been widely applied. However, this protocol has been restricted by network size, and the convergence time is affected by network topology. Generally, STP has a second-level convergence time which increases with the growth of network diameter.

In order to reduce the convergence time and eliminate the influence of network size, EIPS (Ethernet Intelligent Protection Switching) technology is born. EIPS is a link layer protocol dedicated for Ethernet ring. It can prevent the broadcast storm caused by data loop in the Ethernet ring; when a link on the Ethernet ring is disconnected, the backup link can be quickly enabled to restore the communication between nodes on the ring network. Compared to STP protocol, EIPS is characterized by fast topological convergence (less than 50ms) and no relation between convergence time and the number of nodes on the ring network.

EIPS technology supports two modes, i.e. subring and hierarchy segment. In subring mode, two crossed rings are broken up into a main ring and a subring, and there is a common link between them; in the mode of hierarchy segment, when processing two crossed rings, one of them is selected as a main ring, and the ring on the main ring with the common link part shared with the main ring removed becomes a low-level link. Simply put, the subring mode splits the crossed rings into a main ring and a subring, while the hierarchy segment mode splits the crossed rings into a main ring and a low-level link. There is only one main ring, yet multiple subrings or low-level links.

### 101.1.1 Basic Concepts

To better understand the basic concepts mentioned in this section, please refer to the typical topologies of subring mode and hierarchy segment mode below.

#### EIPS Domain

The interconnected devices with the same domain ID and same control VLAN constitute an EIPS domain. An EIPS domain may contain multiple EIPS rings, one main ring and the others subrings. The EIPS domain is composed of the following elements: EIPS ring, EIPS control VLAN, master node, transmission node, edge control node, and assistant edge node.

#### EIPS Ring

EIPS ring is identified by integer IDs. It physically corresponds to a ring-shaped Ethernet topology. There is only one main ring and multiple subrings. Subrings intersect with the main ring through edge nodes, and subrings intersect with each other through the main ring. The main ring is level 0, lower than subrings.

### **EIPS Mode**

The switches on the EIPS ring are called nodes, each of which is a unique domain ID and ring ID. Each node is connected to the ring via two ports. The master port and slave port are specified by the user.

**Master port:** It serves as both the initiator of ring network status polling and the decision maker of operation performance after the status of network topology is changed. There is only one master node on each ring.

**Transmission node:** All except master node on the master ring of EIPS are transmission nodes. Transmission nodes are responsible for monitoring the status of the link directly connected to them, and reporting the status change through EIPS protocol packet to the master node which makes decisions on how to process it.

The two nodes where subring and master ring intersect are called edge nodes (called transmission nodes on the master ring) that include edge control nodes and assistant edge nodes. These two types of nodes must be used in pair to detect the integrity or failure status of subring.

### **EIPS Control VLAN**

Control VLAN is used to transmit EIPS protocol packets. The port on the EIPS ring must be added to the control VLAN, and no IP address is permitted to configure on the control VLAN interface. In the subring mode, the port on master ring should be added to the control VLAN of both master ring and subring, and that on subring is required to be added to the control VLAN of subring only. In the hierarchy segment mode, the same VLAN on master ring and low-level segment can be used as control VLAN.

### **EIPS Port**

EIPS port is an abstract concept, which corresponds to a link makes up an EIPS ring. This link can be either a single physical link or an aggregation port composed of multiple physical links. Each EIPS node has two ports connected to EIPS ring. Since there are EIPS rings intersecting, an EIPS port may belong to multiple EIPS nodes.

**Master and secondary EIPS port:** There is master port and slave port on the master node and transmission nodes. The master port on the master node sends hello packet, and the slave port receives this packet. This can ensure the integrity of the loop. When the loop is complete, it is required to obstruct the data VLAN of the slave port on the master node. For transmission nodes, neither master port nor slave port has special meanings.

### **Topology Level**

Topology level means the ring hierarchical division of EIPS domain. EIPS domain is composed of one ring or several rings intersecting with each other. When there is a single ring in the domain, it is a major-level ring, numbered 0; when there are multiple rings intersecting with each other in the domain, one of them is

selected as a major-level ring, numbered 0, and the ring connected to this major-level ring with the common part shared with the major-level ring removed becomes a link in low-level segment.

Low-level link is the set of links with the common part connected to the upper layer removed.

The major-level ring has the highest level number (0). The lower the level, the larger the level number.

### **Topology Segment**

In EIPS, segment number is used to differentiate different low-level links in the same level. Multiple low-level links can appear in the same level of the domain. The multiple low-level links in the same level are defined with different segment numbers. In particular, the segment number of the major-level ring is 0.

After dividing levels and segments in the EIPS domain, corresponding ring or low-level ring in each level and segment has unique level and segment numbers, called level segment. The low-level link where level and segment numbers are defined are called low-level segments.

## **101.1.2 Operating Mechanism**

### **Polling Mechanism**

With the polling mechanism, the master node of EIPS ring actively detects the integrity of the ring network.

The master node periodically sends from its master port Hello packet which passes every transmission node and spread on the ring. If the loop is healthy, the slave port of the master node will receive Hello packet before time-out of the timer, and the master node will maintain the slave port obstructed. If the loop is broken so that the slave port of the master node cannot receive Hello packet before time-out of the timer, the master node will cancel the obstruction status of data VLAN on the slave port and send COMM-FLUSH-FDB packet to notify all transmission nodes so that they can update their forwarding entries.

### **Link Down Alarm Mechanism**

When the transmission node or edge node finds any of its port which belongs to EIPS ring becomes down, it will immediately send a Link-Down packet to the master node. After receiving the Link-Down packet, the master node will immediately cancel the obstruction status of data VLAN on the slave port and send COMM-FLUSH-FDB packet to notify all transmission and edge nodes so that they can update their forwarding entries. After the nodes update their entries, the data flow switch to the normal link.

### **Loop Recovery Mechanism**

When the port which belongs to EIPS ring on transmission node or edge node is up again, the master node may find loop recovery after a period of time. For data VLAN, there may be a temporary loop in the network and then broadcast storm during this period of time.

In order to avoid temporary loop, non-master node immediately obstructs the port connecting to the ring network (only permitting the packet of control VLAN to pass) once it finds this port is up again until it believes no loop will be generated.

## Load Balancing Mechanism

Load balancing is achieved by configuring multiple EIPS domains on the same ring network and permitting different EIPS domains to send traffic of different data VLANs, i.e. traffic of different VLANs is forwarded along different paths.

## Backup Master Node Mechanism

The transmission node directly connected to the slave port of the master node is considered as the backup master node. When the master node is normal, the backup master node works as a transmission node; when the master node crashes, the backup master node will continue to work on behalf of the master node.

### 101.1.3 Typical Topology of Subring Mode

#### Single Ring

Domain1 of EIPS domain has an EIPS ring Ring1, a master node Master, three transmission nodes Transit1, Transit2 and Transit3, as shown in the figure below.

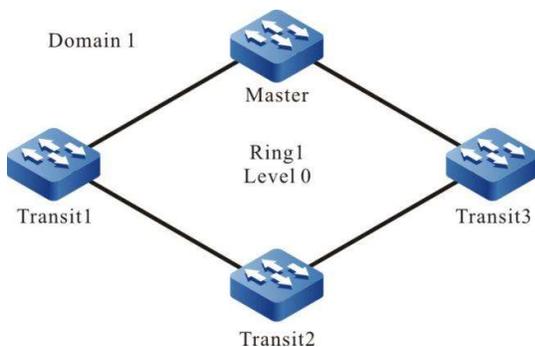

Figure 101 Topology of Single Ring

This networking is characterized by rapid response and short convergence time in case of topology change.

#### Typical Networking of Intersecting Rings

Domain1 of EIPS domain contains two EIPS rings, i.e. Ring1 and Ring2. In particular, Ring1 is the main ring, and Ring2 is the subring. The main ring Ring1 has a master node Master and two transmission nodes Transit1 and Transit2; the sub-ring Ring2 includes the edge control node Edge control (i.e. Transit3), assistant edge node Edge assistant (i.e. Transit4), transmission nodes Sub Transit1 and Sub Transit2, and edge nodes Edge control and Edge assistant that are also the transmission nodes of Ring1. This is shown in the image below.

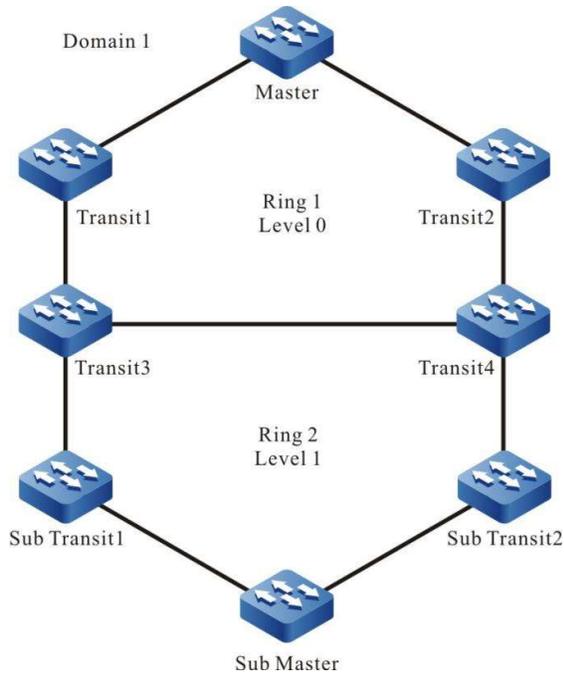

Figure 101 Typical Network Topology of Intersecting Rings

In this typical application of networking, subrings can be dual-homed to uplink with two edge nodes to provide uplink backup.

### 101.1.4 Typical Topology of Hierarchy Segment Mode

#### Single Ring

Domain1 of EIPS domain has an EIPS ring Ring1, a master node Master, and three transmission nodes Transit1, Transit2 and Transit3. Master port Primary and slave port Slave are configured on the master node. There is only one ring in Domain1. This single ring is defined as the major-level ring, the level as 0, and the segment as 0. When there is no fault in the major-level ring, EIPS blocks the data VLAN of the slave port Slave. This is shown in the image below.

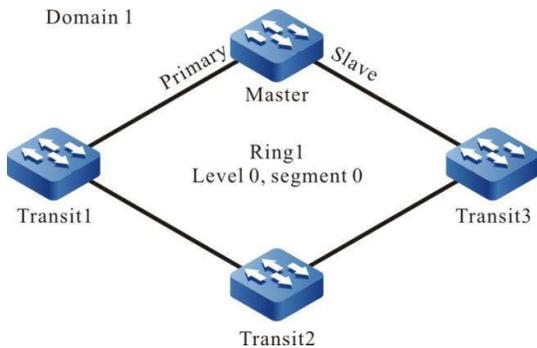

Figure 101 Topology of Single Ring in Hierarchy Segment Mode

## Topology of Intersecting Rings

There are rings intersecting in Domain1 which is decomposed into a hierarchical structure containing a major-level ring and a low-level segment. Both level and segment of main ring Ring1 are defined as 0; the ring intersecting with Ring1 becomes a low-level segment after removing the common part connected to Transit2 and Transit3, which is assigned level and segment numbers of 1.

The major-level ring (level 0, segment 0) contains a master node Master and four transmission nodes Transit1, Transit2, Transit3 and Transit4. It is a single ring. The low-level segment (Level 1, segment 1) has edge control node Edge control (i.e. Transit2) and assistant edge node Edge assistant (i.e. Transit3), and transmission nodes Transit5 and Transit6, as shown below.

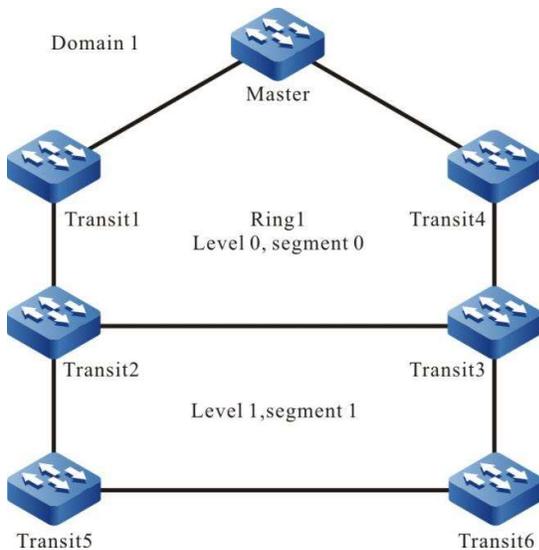

Figure 1 Topology of Intersecting in Hierarchy Segment Mode

## 101.2 EIPS Function Configuration

Table 101 EIPS Function Configuration List

Configuration Task	
Configure EIPS Ring	Configure EIPS Master Node
	Configure Transmission Node of EIPS
	Configure Edge Control Node of EIPS

	Configure Assistant Edge Node of EIPS
	Configure EIPS Domain
	Configure EIPS Control VLAN
	Configure EIPS Level Number
	Configure EIPS Segment Number
	Configure EIPS Data Instance
Configure EIPS Reliability	Configure EIPS Backup Master Node
	Configure EIPS uni-directional detection
Configure EIPS Timer	Configure EIPS Timer

## Note

- EIPS technology supports two modes, i.e. subring and hierarchy segment.
- Hierarchy segment mode is recommended.
- There is little difference between hierarchy segment mode and subring mode in configuration. In hierarchy segment mode, parameter **segment** must be used in creating various EIPS nodes, and EIPS segment number needs to be configured.

### 101.2.1 Configure EIPS Ring

When configuring EIPS ring, you are required to configure the ports that will access EIPS ring on each node and the nodes on the ring.

#### Configuration Condition

Before configuring EIPS ring, do the following:

- Configure the type of the ports to be added to each node as nni;
- Close the spanning tree protocol of the ports to be added to each node;
- Configure the ports to be added to each node as trunk mode;
- Add the ports to be added to each node to the control VLAN to which the node belongs.

#### Configure EIPS Master Node

Please configure the device to be configured as a master node as follows.

Table 1 Configuring EIPS Master Node

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create EIPS master node	<b>eips ring <i>ring-id</i> master [ <i>segment</i> ]</b>	Mandatory  By default, no EIPS master node is created.  Parameter <i>segment</i> is recommended to specify the EIPS ring network as hierarchy <i>segment</i> mode. Otherwise, it is subring mode.
Configure master port of the master node	<b>primary interface <i>interface-name</i></b>	Mandatory  By default, master port of the master node is not configured.
Configure slave port of the master node	<b>secondary interface <i>interface-name</i></b>	Mandatory  By default, slave port of the master node is not configured.
Configure data instance of the master node	<b>instance <i>instance-id</i></b>	Mandatory  By default, data instance of the master node is not configured.  The data VLAN permitted by the EIPS port should be included in the EIPS data instance, and all nodes of the same EIPS domain should be configured with the same data instance.

---

 **Note**

- In subring mode, all ports on the main ring need to be added to the control VLAN of the subring.
- 

### Configure Transmission Node of EIPS

Please configure the device to be configured as a transmission node as follows.

Table 2 Configuring Transmission Node of EIPS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create transmission node of EIPS	<b>eips ring <i>ring-id</i> transit [ <i>segment</i> ]</b>	Mandatory By default, no transmission node of EIPS is created. Parameter <i>segment</i> is recommended to specify the EIPS ring network as hierarchy segment mode. Otherwise, it is subring mode.
Configure master port of the transmission node	<b>primary interface <i>interface-name</i></b>	Mandatory By default, master port of the transmission node is not configured.
Configure slave port of the transmission node	<b>secondary interface <i>interface-name</i></b>	Mandatory By default, slave port of the transmission node is not configured.
Configure data instance of the transmission node	<b>instance <i>instance-id</i></b>	Mandatory By default, data instance of the transmission node is not configured. The data VLAN permitted by the EIPS port should be

		included in the EIPS data instance, and all nodes of the same EIPS domain should be configured with the same data instance.
--	--	---

### Configure Edge Control Node of EIPS

Please configure the device to be configured as an edge control node as follows.

Table 3 Configuring Edge Control Node of EIPS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure edge control node	<b>eips ring <i>ring-id</i> edge [ segment ]</b>	Mandatory By default, no edge control node is configured. Parameter segment is recommended to specify the EIPS ring network as hierarchy segment mode. Otherwise, it is subring mode.
Associate edge control node with transmission node	<b>transit ring <i>ring-id</i></b>	Mandatory By default, edge control node is not associated with transmission node. Only when the edge control node is associated with the transmission node, low-level segments or sub-rings can work together with the main ring
Configure edge port of edge control node	<b>edge interface <i>interface-name</i></b>	Mandatory By default, no edge port is designated for edge control node.

		Edge port is used to connect low-level segment or subring with main ring
Configure data instance of edge control node	<b>instance</b> <i>instance-id</i>	<p>Mandatory</p> <p>By default, no data instance is configured for edge control node.</p> <p>The data VLAN permitted by the EIPS port should be included in the EIPS data instance, and all nodes of the same EIPS domain should be configured with the same data instance.</p>

### Configure Assistant Edge Node of EIPS

Please configure the device to be configured as an assistant edge node as follows.

Table 4 Configuring Assistant Edge Node of EIPS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure assistant edge node	<b>eips ring</b> <i>ring-id</i> <b>assistant</b> [ <b>segment</b> ]	<p>Mandatory</p> <p>By default, no assistant edge node is configured.</p> <p>Parameter segment is recommended to specify the EIPS ring network as hierarchy segment mode. Otherwise, it is subring mode.</p>
Associate assistant edge node with transmission node	<b>transit ring</b> <i>ring-id</i>	<p>Mandatory</p> <p>By default, assistant edge node is not associated with transmission node.</p> <p>Only when the assistant edge node is associated with the transmission node,</p>

		low-level segments or sub-rings can work together with the main ring
Configure edge port of assistant edge node	<b>edge interface</b> <i>interface-name</i>	Mandatory  By default, edge port of the assistant edge node node is not configured.  Edge port is used to connect low-level segment or subring with main ring
Configure data instance of assistant edge node	<b>instance</b> <i>instance-id</i>	Mandatory  By default, no data instance is configured for assistant edge node.  The data VLAN permitted by the EIPS port should be included in the EIPS data instance, and all nodes of the same EIPS domain should be configured with the same data instance.

### Configure EIPS Domain

Specify the domain to which the EIPS ring or hierarchy segment belongs, and configure all nodes in the same EIPS domain with the same domain ID.

Table 101 Configuring EIPS Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EIPS configuration mode	<b>eips ring</b> <i>ring-id</i> { <b>master</b>   <b>transit</b>   <b>edge</b>   <b>assistant</b> } [ <b>segment</b> ]	-
Configure EIPS Domain	<b>domain id</b> <i>domain-id</i>	Mandatory  By default, EIPS domain is not configured.

### Configure EIPS Control VLAN

Configure the control VLAN of EIPS ring or hierarchy segment; configure the control VLAN prior to enabling EIPS protocol; configure all nodes in the same EIPS ring with the same control VLAN. Therefore, when configuring control VLAN, please select a VLAN that has been created yet has not been used by other layer-2 protocols. Otherwise, the configuration cannot succeed.

EIPS control VLAN is used to transmit EIPS protocol packets. Data packets are not permitted to enter the control VLAN.

Table 101 Configuring EIPS Control VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EIPS configuration mode	<b>eips ring <i>ring-id</i> { master   transit   edge   assistant } [ segment ]</b>	-
Configure EIPS Control VLAN	<b>control vlan <i>vlan-id</i></b>	Mandatory  By default, no EIPS control VLAN is configured.

### Configure EIPS Level Number

EIPS level number is an important sign to distinguish main ring from subring or low-level segment. The level numbers of all main rings are 0, those of first-level subrings or hierarchy segments are 1, and so on. Node of subring must be configured, and the level numbers of subrings or hierarchy numbers at the same level must be the same.

Table 101 Configuring EIPS Level Number

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EIPS configuration mode	<b>eips ring <i>ring-id</i> { master   transit   edge   assistant } [ segment ]</b>	-

Configure the level number of subring or hierarchy segment	<b>level</b> <i>level-id</i>	Mandatory  By default, level number is not configured for subring or hierarchy segment.
--	------------------------------	---

### Configure EIPS Segment Number

Segment number is an important sign in the hierarchy segment mode. The segment number of main ring is 0, and that of low-level segment is defined by users. The hierarchy segment with a level number greater than 0 must be configured with a segment number, and all nodes on the same hierarchy segment must have the same segment numbers.

Table 5 Configuring EIPS Number

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EIPS configuration mode	<b>eips ring</b> <i>ring-id</i> { <b>master</b>   <b>transit</b>   <b>edge</b>   <b>assistant</b> } [ <b>segment</b> ]	-
Configure EIPS Segment Number	<b>segment</b> <i>segment-id</i>	Mandatory  By default, segment number is not configured for the hierarchy segment.  This command is exclusive for EIPS-level segment. The subring mode doesn't have this command. Segment number is configured on the edge control node, assistant edge node and transmission node of low-level segment.

### Configure EIPS Data Instance

Data instance is configured prior to configuring EIPS ring or hierarchy segment; the data VLAN permitted by the EIPS port should be included in the EIPS data instance; all nodes of the same EIPS domain should be configured with the same data instance.

Data instance is configured by referencing MSTP (Multiple Spanning Tree Protocol Instance). Therefore, before configuring EIPS ring or hierarchy segment, the mapping relationship between the MSTP instance and the VLAN to be included should be configured.

Table 6 Configuring EIPS Data Instance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the MSTP configuration mode	<b>spanning-tree mst configuration</b>	-
Configure MSTP instance	<b>instance</b> <i>instance-id</i> <b>vlan</b> <i>vlan-range</i>	Mandatory  By default, MSTP creates instance 0 which contains all VLANs.  Configure MSTP and map to corresponding data VLAN
Activate MST domain parameter configuration.	<b>active configuration pending</b>	Mandatory  By default, MST domain parameters do not take effect immediately after modification unless this command is executed.
Enter the global configuration mode.	<b>exit</b>	-
Enter the EIPS configuration mode	<b>eips ring</b> <i>ring-id</i> { <b>master</b>   <b>transit</b>   <b>edge</b>   <b>assistant</b> } [ <b>segment</b> ]	-
Configure EIPS Data Instance	<b>instance</b> <i>instance-id</i>	Mandatory  By default, EIPS data instance is not configured.

### Enable EIPS Protocol

Upon completion of the configuration mentioned above, use this command to enable EIPS protocol.

Table 7 Enabling Protocol on EIPS Node

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EIPS configuration mode	<b>eips ring <i>ring-id</i> { master   transit   edge   assistant } [ segment ]</b>	-
Enable EIPS protocol	<b>eips start</b>	Mandatory  By default, EIPS protocol is not enabled on the node.

### 101.2.2 Configure EIPS Reliability

#### Configuration Condition

None

#### Configure EIPS Backup Master Node

In order to improve the reliability of EIPS ring network, the backup master node will replace the master node to perform its functions when the master node crashes.

The backup master node needs to be configured on the transmission node directly connected to the master node.

Table 8 Configuring EIPS Backup Master Node

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EIPS configuration mode	<b>eips ring <i>ring-id</i> { master   transit   edge   assistant } [ segment ]</b>	-
Configure the specified transmission node as a backup master node	<b>backup master</b>	Mandatory  By default, backup master node is not configured.

## Configure EIPS Uni-directional Detection

Enable the uni-directional function under the port or port group.

Table 9 Configuring EIPS Uni-directional Detection of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure EIPS uni-directional detection of port	<b>eips udd interval</b> [ <i>value</i> ]	Mandatory  By default, the uni-directional detection function is not disabled on the port.

## 101.2.3 Configure EIPS Timer

### Configuration Condition

Before configuring EIPS timer, do the following:

- Configure basic EIPS functions.

### Configure EIPS Timer

The master node and the edge control node in hierarchy segment mode use timer to control the frequency of sending hello packet and the timeout period of receiving hello packet, and the transmission node uses blocking timer to control the time taken for node to transform to complete state when the failure of transmission node recovers.

Table 10 Configuring EIPS Timer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EIPS configuration mode	<b>eips ring</b> <i>ring-id</i> { <b>master</b>   <b>transit</b>   <b>edge</b>   <b>assistant</b> } [ <b>segment</b> ]	-

Configure timer of EIPS node	<b>timer</b> { <b>hello</b>   <b>receive</b>   <b>block</b> } <i>timer-value</i>	Mandatory  By default, the timeout period of hello timer is 1 second, that of receive timer is 5 seconds, and that of block timer is 10 seconds.
------------------------------	--	--

## Note

- The timer for sending hello packet can be configured on the master node or edge control node only, and the blocking timer on the transmission node only.

## Caution

- If backup master node is configured, the timeout period of hello timer on master node cannot be configured as 0.

## 101.2.4 EIPS Monitoring and Maintaining

Table 11 EIPS Monitoring and Maintaining

Command	Description
<b>clear eips</b> { <b>interface</b> [ <i>interface-name</i> ]   <b>interface link-aggregation</b> [ <i>link-aggregation-number</i> ]   <b>ring</b> [ <i>ring-id</i> ]   <b>udld</b> }	Clear EIPS-related statistics
<b>show eips</b> { <b>config</b> [ <i>ring-id</i> ]   <b>interface</b> [ <i>interface-name</i> ]   <b>interface link-aggregation</b> [ <i>link-aggregation-number</i> ]   <b>mac-control-table</b>   <b>ring</b> [ <i>ring-id</i> ]   <b>ticktimer</b> [ <i>ticktime-name</i> ]   <b>topology</b> [ <i>ring ring-id</i> ]   <b>topology-summary</b> [ <i>ring ring-id</i> ]   <b>udld</b> [ <b>interface</b> <i>interface-name</i> ] }	Show the configuration, status and statistical information of EIPS. This includes EIPS port, aggregation port, address table, node, topology, timer-related information, and information related to UDLD uni-directional communication.

## 101.3 Typical Configuration Example of EIPS

### 101.3.1 Configure Single Ring in EIPS Hierarchy Segment Mode

#### Network Requirements

- There are four devices in Ring 1 of EIPS within LAN. Configure EIPS hierarchy segment mode, and protect the ring network by blocking the slave port gigabitethernet0/2 of Master node.
- When the link between transmission nodes Transit1 and Transit2 is disconnected, it can cancel the spanning tree blocking state of the Master node's slave port gigabitethernet0/2 so that data switch and the communication within the LAN are not affected.

#### Network Topology

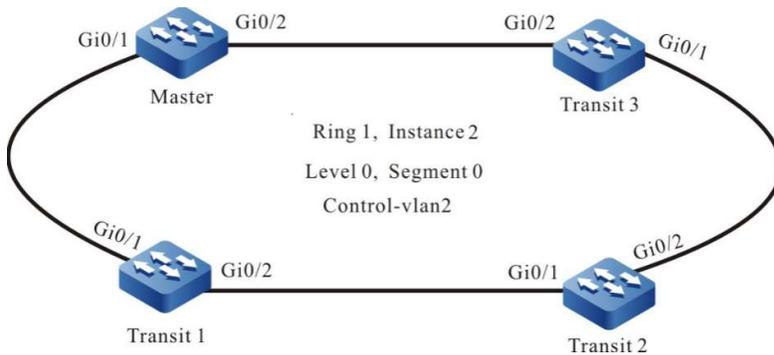

Figure 2 Network Topology for Configuring Single Ring in EIPS Hierarchy Segment Mode

#### Configuration Steps

Step 1: Configure VLANs, and configure the link type of the ports.

#On Master, create VLAN2 and VLAN3, and configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN3 to pass. Configure PVID as 1.

```
Master#configure terminal
Master(config)#vlan 2-3
Master(config)#interface gigabitethernet 0/1-0/2
Master(config-if-range)#switchport mode trunk
Master(config-if-range)#switchport trunk allowed vlan add 2-3
Master(config-if-range)#switchport trunk pvid vlan 1
```

#On Master, map VLAN3 to the spanning tree instance 2, and close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2.

```

Master (config)#spanning-tree mst configuration
%Alert: Commands configured under the mode would not take effect immediately, you should activate them explicitly!
Master (config-mst)#instance 2 vlan 3
Master (config-mst)#active configuration pending
Master(config-if-range)#exit
Master(config)#interface gigabitethernet 0/1-0/2
Master(config-if-range)#no spanning-tree enable
Master(config-if-range)#no storm-control multicast
Master(config-if-range)#no storm-control unicast
Master(config-if-range)#no storm-control broadcast
Master(config-if-range)#exit

```

#On the transmission node Transit1, create VLAN2 and VLAN3, map VLAN3 to the spanning tree instance 2, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN3 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

#On Transit2, create VLAN2 and VLAN3, map VLAN3 to the spanning tree instance 2, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN3 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

#On the transmission node Transit3, create VLAN2 and VLAN3, map VLAN3 to the spanning tree instance 2, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN3 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

---

## Note

- VLAN2 is a control VLAN used to transmit EIPS protocol packets, and VLAN3 is a data VLAN used to forward services.
  - To use the EIPS function, you must map the EIPS data VLAN to corresponding spanning tree instance, and disable the spanning tree function on the port.
- 

Step 2: Configure the EIPS hierarchy segment mode.

#On the master node Master, create master node Ring1 of the major ring in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```

Master(config)#eips ring 1 master segment

```

```
Master(config-eips)#control vlan 2
Master(config-eips)#level 0
Master(config-eips)#segment 0
Master(config-eips)#instance 2
Master(config-eips)#primary interface gigabitethernet 0/1
Master(config-eips)#secondary interface gigabitethernet 0/2
Master(config-eips)#eips start
Master(config-eips)#exit
```

#On the transmission node Transit1, create transmission node Ring1 in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Transit1(config)#eips ring 1 transit segment
Transit1(config-eips)#control vlan 2
Transit1(config-eips)#level 0
Transit1(config-eips)#segment 0
Transit1(config-eips)#instance 2
Transit1(config-eips)#primary interface gigabitethernet 0/1
Transit1(config-eips)#secondary interface gigabitethernet 0/2
Transit1(config-eips)#eips start
Transit1(config-eips)#exit
```

#On the transmission node Transit2, create transmission node Ring1 in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Transit2(config)#eips ring 1 transit segment
Transit2(config-eips)#control vlan 2
Transit2(config-eips)#level 0
Transit2(config-eips)#segment 0
Transit2(config-eips)#instance 2
Transit2(config-eips)#primary interface gigabitethernet 0/1
Transit2(config-eips)#secondary interface gigabitethernet 0/2
Transit2(config-eips)#eips start
Transit2(config-eips)#exit
```

#On the transmission node Transit3, create transmission node Ring1 in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Transit3(config)#eips ring 1 transit segment
Transit3(config-eips)#control vlan 2
Transit3(config-eips)#level 0
Transit3(config-eips)#segment 0
Transit3(config-eips)#instance 2
```

```

Transit3(config-eips)#primary interface gigabitethernet 0/1
Transit3(config-eips)#secondary interface gigabitethernet 0/2
Transit3(config-eips)#eips start
Transit3(config-eips)#exit

```

Step 3: Check the result.

#By executing show eips topology-summary on the four devices, you can see that the EIPS ring status is round, and the topology content is consistent.

```

Master#show eips topology-summary
ring ID : 1
topo status : round
seq host-name mac type interface1 link interface2 link isBorder
-----
1 Transit3 0000.0000.008b transit gi0/2 UP gi0/1 UP NO
2 Transit2 0001.7a22.2224 transit gi0/2 UP gi0/1 UP YES
3 Transit1 0000.0010.0017 transit gi0/2 UP gi0/1 UP YES
4 Master 0001.7a54.5d71 master gi0/1 UP gi0/2 UP NO

```

```

Transit3#show eips topology-summary
ring ID : 1
topo status : round
seq host-name mac type interface1 link interface2 link isBorder
-----
1 Master 0001.7a54.5d71 master gi0/2 UP gi0/1 UP NO
2 Transit1 0000.0010.0017 transit gi0/1 UP gi0/2 UP YES
3 Transit2 0001.7a22.2224 transit gi0/1 UP gi0/2 UP YES
4 Transit3 0000.0000.008b transit gi0/1 UP gi0/2 UP NO

```

```

Transit1#show eips topology-summary
ring ID : 1
topo status : round
seq host-name mac type interface1 link interface2 link isBorder

### 101.3.2 Configure the Intersecting Rings in EIPS Hierarchy Segment Mode

#### Network Requirements

- There are six devices within the LAN, which make up two levels of intersecting rings. Protect the ring network by configuring EIPS hierarchy segment mode to block the slave port gigabitethernet0/2 of master node Master and the edge port gigabitethernet0/3 of edge node Transit1.
- When the link between the edge node Transit1 and the assistant edge node Transit2 is disconnected, it can cancel the spanning tree blocking state of the slave port gigabitethernet0/2 of the main ring's master node Master so that data switch and the communication in the main ring Ring1 are not affected.
- When the link between transmission nodes sTransit1 and sTransit2 is disconnected, it can cancel the spanning tree blocking state of the edge node Transit1's edge port gigabitethernet0/3 so that data switch and the communication in the first level of subring Ring2 are not affected.

#### Network Topology

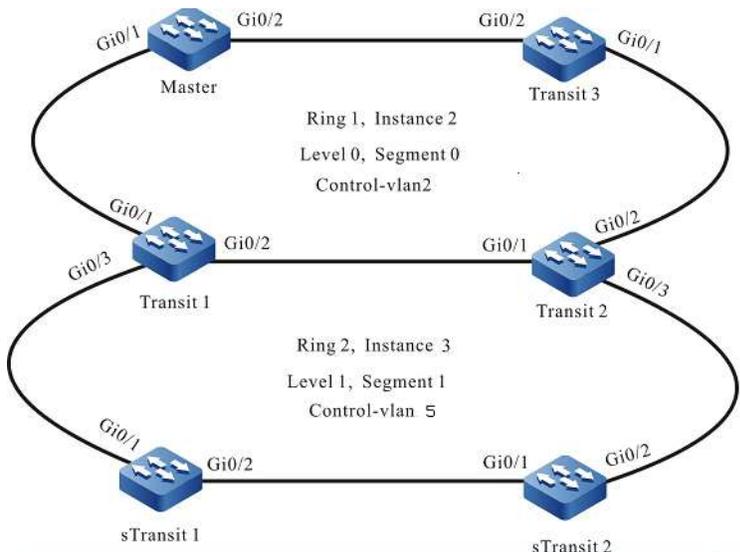

Figure 3 Network Topology for Configuring Intersecting Rings in EIPS Hierarchy Segment Mode

#### Configuration Steps

Step 1: Configure VLANs, and configure the link type of the ports.

#On Master, create VLAN2 and VLAN3, and configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN3 to pass. Configure PVID as 1.

```

Master#configure terminal
Master(config)#vlan 2-3
Master(config)#interface gigabitethernet 0/1-0/2
Master(config-if-range)#switchport mode trunk
Master(config-if-range)#switchport trunk allowed vlan add 2-3
Master(config-if-range)#switchport trunk pvid vlan 1

```

#On Master, map VLAN3 to the spanning tree instance 2, and close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2.

```

Master (config)#spanning-tree mst configuration
%Alert: Commands configured under the mode would not take effect immediately, you should active them explicitly!
Master (config-mst)#instance 2 vlan 3
Master (config-mst)#active configuration pending
Master(config-if-range)#exit
Master(config)#interface gigabitethernet 0/1-0/2
Master(config-if-range)#no spanning-tree enable
Master(config-if-range)#no storm-control multicast
Master(config-if-range)#no storm-control unicast
Master(config-if-range)#no storm-control broadcast
Master(config-if-range)#exit

```

#On the transmission node Transit1 of the main ring, create VLAN2-5, map VLAN3 to the spanning tree instance 2 and VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk to permit services of VLAN2-3 to pass and that of ports gigabitethernet0/2~gigabitethernet0/3 as Trunk to permit services of VLAN4-5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/3. (Omitted)

#On the transmission node Transit2 of the main ring, create VLAN2-5, map VLAN3 to the spanning tree instance 2 and VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk to permit services of VLAN2-3 to pass and that of ports gigabitethernet0/2~gigabitethernet0/3 as Trunk to permit services of VLAN4-5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/3. (Omitted)

#On the transmission node Transit3 of the main ring, create VLAN2 and VLAN3, map VLAN3 to the spanning tree instance 2, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN3 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

#On the transmission node sTransit1 of the first level of subring, create VLAN4 and VLAN5, map VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN4 and VLAN5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

#On the transmission node Transit2 of the first level of subring, create VLAN4 and VLAN5, map VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN4 and VLAN5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

---

## Note

- VLAN5 is a control VLAN used to transmit EIPS protocol packets, and VLAN4 is a data VLAN used to forward services.
  - To use the EIPS function, you must map the EIPS data VLAN to corresponding spanning tree instance, and disable spanning tree and storm suppression functions on the port.
- 

Step 2: Configure the main ring Ring1.

#On the master node Master, create master node Ring1 in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Master(config)#eips ring 1 master segment
Master(config-eips)#control vlan 2
Master(config-eips)#level 0
Master(config-eips)#segment 0
Master(config-eips)#instance 2
Master(config-eips)#primary interface gigabitethernet 0/1
Master(config-eips)#secondary interface gigabitethernet 0/2
Master(config-eips)#eips start
Master(config-eips)#exit
```

#On the transmission node Transit1 of the main ring, create transmission node Ring1 in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS. (Omitted)

#On the transmission node Transit2 of the main ring, create transmission node Ring1 in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS. (Omitted)

#On the transmission node Transit3 of the main ring, create transmission node Ring1 in hierarchy segment mode, configure the level and segment number of EIPS ring as 0, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS. (Omitted)

Step 3: Configure the first-level subring Ring2.

#On the edge node of the first-level subring (transmission node of the main ring), create edge node Ring2 of hierarchy segment mode on Transit1, configure the level and segment number of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, edge port as gigabitethernet0/3 and Ring1 as its associated transmission node, and enable EIPS.

```
Transit1(config)#eips ring 2 edge segment
Transit1(config-eips)#control vlan 5
Transit1(config-eips)#level 1
Transit1(config-eips)#segment 1
Transit1(config-eips)#instance 3
Transit1(config-eips)#transit ring 1
Transit1(config-eips)#edge interface gigabitethernet0/3
Transit1(config-eips)#eips start
Transit1(config-eips)#exit
```

#On the assistant edge node of the first-level subring (transmission node of the main ring), create assistant edge node Ring2 of hierarchy segment mode on Transit2, configure the level and segment number of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, edge port as gigabitethernet0/3 and Ring1 as its associated transmission node, and enable EIPS.

```
Transit2(config)#eips ring 2 assistant segment
Transit2(config-eips)#control vlan 5
Transit2(config-eips)#level 1
Transit2(config-eips)#segment 1
Transit2(config-eips)#instance 3
Transit2(config-eips)#transit ring 1
Transit2(config-eips)#edge interface gigabitethernet0/3
Transit2(config-eips)#eips start
Transit2(config-eips)#exit
```

#On the transmission node sTransit1 of the first-level subring, create transmission node Ring2 in hierarchy segment mode, configure the level and segment number of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
sTransit1(config)#eips ring 2 transit segment
sTransit1(config-eips)#control vlan 5
sTransit1(config-eips)#level 1
sTransit1(config-eips)#segment 1
sTransit1(config-eips)#instance 3
sTransit1(config-eips)#primary interface gigabitethernet 0/1
sTransit1(config-eips)#secondary interface gigabitethernet 0/2
sTransit1(config-eips)#eips start
sTransit1(config-eips)#exit
```

#On the transmission node Transit2 of the first-level subring, create transmission node Ring2 in hierarchy segment mode, configure the level and segment number of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
sTransit2(config)#eips ring 2 transit segment
sTransit2(config-eips)#control vlan 5
sTransit2(config-eips)#level 1
sTransit2(config-eips)#segment 1
sTransit2(config-eips)#instance 3
sTransit2(config-eips)#primary interface gigabitethernet 0/1
sTransit2(config-eips)#secondary interface gigabitethernet 0/2
sTransit2(config-eips)#eips start
sTransit2(config-eips)#exit
```

Step 4: Check the result.

#By executing show eips topology-summary on edge node and assistant edge node, you can see that the status of both EIPS main ring and subring is round, and the topology content is consistent.

```

### 101.3.3 Configure the Intersecting Rings in EIPS Subring Mode

#### Network Requirements

- There are six devices within the LAN, which make up two levels of intersecting rings. Protect the ring network by configuring EIPS subring mode to block the slave port

gigabitethernet0/2 of main ring's master node Master and the slave port gigabitethernet0/2 of subring's master node sMaster.

- When the link between the main ring's transmission nodes Transit1 and Transit2 is disconnected, it can cancel the spanning tree blocking state of the slave port gigabitethernet0/2 of the main ring's master node Master so that data switch and the communication in the main ring Ring1 are not affected.
- When the link between subring's transmission node sTransit1 and main ring's transmission node Transit2 is disconnected, it can cancel the spanning tree blocking state of the slave port of subring's master node of sMaster gigabitethernet0/2 so that data switch and the communication in subring Ring2 are not affected.

### Network Topology

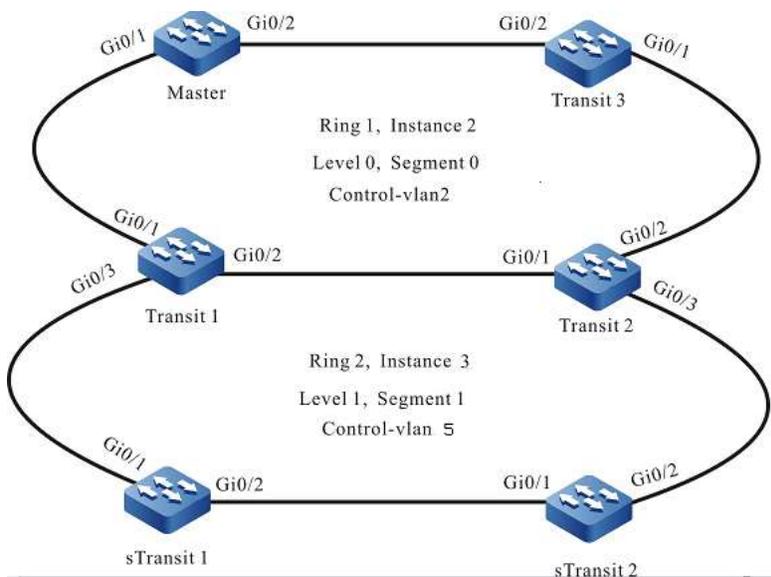

Figure 4 Network Topology for Configuring Intersecting Rings in EIPS Subring Mode

### Configuration Steps

Step 1: Configure VLANs, and configure the link type of the ports.

#On Master, create VLAN2~VLAN3, and configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2-VLAN3 to pass. Configure PVID as 1.

```
Master#configure terminal
Master(config)#vlan 2-4
Master(config)#interface gigabitethernet 0/1-0/2
Master(config-if-range)#switchport mode trunk
Master(config-if-range)#switchport trunk allowed vlan add 2-3
Master(config-if-range)#switchport trunk pvid vlan 1
```

#On Master, map VLAN3 to the spanning tree instance 2, and close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2.

```
Master (config)#spanning-tree mst configuration
%Alert: Commands configured under the mode would not take effect immediately, you should active them explicitly!
Master (config-mst)#instance 2 vlan 3
Master (config-mst)#active configuration pending
Master(config-if-range)#exit
Master(config)#interface gigabitethernet 0/1-0/2
Master(config-if-range)#no spanning-tree enable
Master(config-if-range)#no storm-control multicast
Master(config-if-range)#no storm-control unicast
Master(config-if-range)#no storm-control broadcast
Master(config-if-range)#exit
```

#On the transmission node Transit1 of the main ring, create VLAN2-5, map VLAN3 to the spanning tree instance 2 and VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk to permit services of VLAN2-3 to pass and that of ports gigabitethernet0/2~gigabitethernet0/3 as Trunk to permit services of VLAN4-5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/3. (Omitted)

#On the transmission node Transit2 of the main ring, create VLAN2-5, map VLAN3 to the spanning tree instance 2 and VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk to permit services of VLAN2-3 to pass and that of ports gigabitethernet0/2~gigabitethernet0/3 as Trunk to permit services of VLAN4-5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/3. (Omitted)

#On the transmission node Transit3 of the main ring, create VLAN2 and VLAN3, map VLAN3 to the spanning tree instance 2, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN3 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

#On the transmission node sTransit1 of the first level of subring, create VLAN4 and VLAN5, map VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN4 and VLAN5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

#On the transmission node Transit2 of the first level of subring, create VLAN4 and VLAN5, map VLAN4 to the spanning tree instance 3, configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, permitting services of VLAN4 and VLAN5 to pass, and configure PVID as 1. Close spanning tree and storm suppression functions on ports gigabitethernet0/1~gigabitethernet0/2. (Omitted)

---

 **Note**

- VLAN2 is a control VLAN of main ring and VLAN5 is a control VLAN of subring, used to transmit EIPS protocol packets; VLAN3-4 are data VLANs used to forward services.
  - To use the EIPS function, you must map the EIPS data VLAN to corresponding spanning tree instance, and disable spanning tree and storm suppression functions on the port.
- 

Step 2: Configure the main ring Ring1.

#On the master node Master, create master node Ring1 in subring mode, configure the level of EIPS ring as 0, domain of EIPS ring as 1, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Master(config)#eips ring 1 master
Master(config-eips)#control vlan 2
Master(config-eips)#level 0
Master(config-eips)#domain id 1
Master(config-eips)#instance 2
Master(config-eips)#primary interface gigabitethernet 0/1
Master(config-eips)#secondary interface gigabitethernet 0/2
Master(config-eips)#eips start
Master(config-eips)#exit
```

#On the transmission node Transit1 of the main ring, create transmission node Ring1 in subring mode, configure the level of EIPS ring as 0, domain of EIPS ring as 1, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Transit1(config)#eips ring 1 transit
Transit1(config-eips)#instance 2
Transit1(config-eips)#control vlan 2
Transit1(config-eips)#domain id 1
Transit1(config-eips)#level 0
Transit1(config-eips)#primary interface gigabitethernet0/1
Transit1(config-eips)#secondary interface gigabitethernet0/2
Transit1(config-eips)#eips start
Transit1(config-eips)#exit
```

#On the transmission node Transit2 of the main ring, create transmission node Ring1 in subring mode, configure the level of EIPS ring as 0, domain of EIPS ring as 1, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Transit2(config)#eips ring 1 transit
Transit2(config-eips)#instance 2
```

```
Transit2(config-eips)#domain id 1
Transit2(config-eips)#control vlan 2
Transit2(config-eips)#level 0
Transit2(config-eips)#primary interface gigabitethernet0/1
Transit2(config-eips)#secondary interface gigabitethernet0/2
Transit2(config-eips)#eips start
Transit2(config-eips)#exit
```

#On the transmission node Transit3 of the main ring, create transmission node Ring1 in subring mode, configure the level of EIPS ring as 0, domain of EIPS ring as 1, instance of EIPS ring as 2, control VLAN as VLAN2, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```
Transit3(config)#eips ring 1 transit
Transit3(config-eips)#control vlan 2
Transit3(config-eips)#level 0
Transit3(config-eips)#domain id 1
Transit3(config-eips)#instance 2
Transit3(config-eips)#primary interface gigabitethernet 0/1
Transit3(config-eips)#secondary interface gigabitethernet 0/2
Transit3(config-eips)#eips start
Transit3(config-eips)#exit
```

### Step 3: Configure the subring Ring2.

#On the edge node of the subring (transmission node of the main ring), create edge node Ring2 of subring mode on Transit1, configure the level and domain of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, edge port as gigabitethernet0/3 and Ring1 as its associated transmission node, and enable EIPS.

```
Transit1(config)#eips ring 2 edge
Transit1(config-eips)#control vlan 5
Transit1(config-eips)#level 1
Transit1(config-eips)#domain id 1
Transit1(config-eips)#instance 3
Transit1(config-eips)#transit ring 1
Transit1(config-eips)#edge interface gigabitethernet0/3
Transit1(config-eips)#eips start
Transit1(config-eips)#exit
```

#On the assistant edge node of the subring (transmission node of the main ring), create assistant edge node Ring2 of subring mode on Transit2, configure the level and domain of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, edge port as gigabitethernet0/3 and Ring1 as its associated transmission node, and enable EIPS.

```
Transit2(config)#eips ring 2 assistant
```

```

Transit2(config-eips)#control vlan 5
Transit2(config-eips)#level 1
Transit2(config-eips)#domain id 1
Transit2(config-eips)#instance 3
Transit2(config-eips)#transit ring 1
Transit2(config-eips)#edge interface gigabitethernet0/3
Transit2(config-eips)#eips start
Transit2(config-eips)#exit

```

#On the master node sMaster of the subring, create master node Ring2 in subring mode, configure the level and domain of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```

sMaster(config)#eips ring 2 master
sMaster(config-eips)#level 1
sMaster(config-eips)#domain id 1
sMaster(config-eips)#instance 3
sMaster(config-eips)#control vlan 5
sMaster(config-eips)#primary interface gigabitethernet 0/1
sMaster(config-eips)#secondary interface gigabitethernet 0/2
sMaster(config-eips)#eips start
sMaster(config-eips)#exit

```

#On the transmission node sTransit1 of the subring, create transmission node Ring2 in subring mode, configure the level and domain of EIPS ring as 1, instance of EIPS ring as 3, control VLAN as VLAN5, master port as gigabitethernet0/1 and slave port as gigabitethernet0/2, and enable EIPS.

```

sTransit1(config)#eips ring 2 transit
sTransit1(config-eips)#control vlan 5
sTransit1(config-eips)#level 1
sTransit1(config-eips)#domain id 1
sTransit1(config-eips)#instance 3
sTransit1(config-eips)#primary interface gigabitethernet 0/1
sTransit1(config-eips)#secondary interface gigabitethernet 0/2
sTransit1(config-eips)#eips start
sTransit1(config-eips)#exit

```

Step  
4:

Check the result.

#By executing show eips topology-summary on edge node and assistant edge node, you can see that the status of both EIPS main ring and subring is round, and the topology content is consistent.

```

Transit1#show eips topology-summary

```

# 102 ULPP and Monitor Link

---

## 102.1 Overview

Dual-uplink networking mode is one of the frequently-used networking modes in core networks. This networking mode improves network reliability through redundant link. Generally, STP is used to remove redundant links. However, the convergence time of STP cannot meet the requirement of carrier Ethernet. In this circumstance, ULPP (UpLink Protect Protocol) was born.

ULPP means UpLink Protect Protocol. In addition to satisfying users' requirement for fast convergence of link, it achieves redundant backup of host and backup links and rapid switch of traffic, and effectively simplifies the configuration, making both deployment and maintenance more convenient and improving the working efficiency of deployment and maintenance staff.

Monitor Link provides coordination management technology for changes of link status. There are multiple uplink ports and multiple downlink ports in Monitor Link group. The uplink ports are monitored in real time. When their status changes, the downlink ports are coordinated to quickly notify the status of uplink device port to downlink device. This can help STP, ULPP and other modules rapidly respond to network changes and traffic switch.

## 102.2 ULPP Function Configuration

Table 102 ULPP Function Configuration List

Configuration Task	
Configure Basic Functions of ULPP	Configure ULPP Group
	Configure Uplink Port of ULPP
Configure ULPP Compatible Mode	Configure Compatible Mode of ULPP Group

Configuration Task	
	Configure Compatible Mode of ULPP Uplink Port
Configure Basic Functions of Monitor Link	Configure Monitor Link Group

### 102.2.1 Configure Basic Functions of ULPP

#### Configuration Condition

Before configuring the basic functions of ULPP, first complete the following tasks:

- Configure the spanning tree instance mapping relationship of ULPP group;
- This VLAN has been created when the control VLAN of ULPP group is configured;
- The member ports in ULPP group must be added to the VLAN.

#### Configure ULPP Group

There are two ports in ULPP group, i.e. master port and backup port. The ULPP group has two working modes: link backup and load sharing. In link backup mode, either master or backup port in the ULPP group can be in forwarding status, and the other is blocked, in standby state. When the port in normal forwarding status has any link failure, the ULPP group will automatically block this port, and switch the status of the originally blocked standby port to forwarding. In the load sharing mechanism, the ULPP group carries spanning tree instance traffic in different VLANs according to the binding relationship between the spanning tree instance configured on the master/backup port and the port.

Table 102 Configuring ULPP Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create ULPP group and enter the ULPP configuration mode	<b>ulpp-group</b> <i>group-id</i>	Mandatory By default, ULPP group is not created.
Configure the master port of ULPP group	<b>master { interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> }	Mandatory

Step	Command	Description
		By default, master port of the ULPP group is not configured.
Configure backup port of ULPP group	<b>slave</b> { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> }	Mandatory By default, backup port of the ULPP group is not configured.
Configure the stance carried by ULPP group	<b>instance group</b> <i>instance-number</i> { <b>master</b>   <b>slave</b> }	Mandatory By default, the stance carried by ULPP group is not configured.  The spanning tree instances carried by master port and backup port shall not intersect with each other.
Configure the control VLAN of ULPP group	<b>control-vlan</b> <i>vlan-id</i>	Mandatory By default, control VLAN of the ULPP group is not configured.
Configure ULPP group enablement	<b>enable</b>	Mandatory By default, ULPP group enablement is not configured.
Enable the FLUSH packet sending function of ULPP group	<b>flush enable</b>	Optional By default, the FLUSH packet sending function of ULPP group is not enabled.
Configure the working mode of ULPP group	<b>mode</b> { <b>load-balance</b>   <b>backup</b> }	Optional By default, the ULPP group is in master/backup mode.
Configure role preemption	<b>preemption mode role</b>	Optional

Step	Command	Description
function for ULPP group		By default, the role preemption of ULPP group is not configured.  Only when the working mode of ULPP group is link backup will the role preemption function be configured.

## Note

- EIPS, STP and loopback detection functions must be disabled on the member ports of ULPP group.
- The member ports of ULPP group shall not be those of the ULPP group and Monitor Link group that have existed.
- The control VLAN in ULPP group shall not be used to forward service data.
- One ULPP group has one control VLAN only, and one control VLAN belongs to one ULPP group only.
- After the ULPP group is disabled, member ports are all blocked in all spanning tree instances.

### Configure Uplink Port of ULPP

When the ULPP group has link switch, the ULPP group notifies other devices to refresh their address tables by sending FLUSH packet to them so as to ensure the rapid switch of service traffic in the network. In addition to receiving FLUSH packet, the uplink port forwards FLUSH packet within the control VLAN of the device.

Table 102 Configuring Control VLAN for Uplink Port of ULPP Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the port configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation link-aggregation-id</b>	subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure control VLAN for uplink port of ULPP group	<b>ulpp flush control-vlan vlan-list</b>	Mandatory  By default, the control VLAN for uplink port of ULPP group is not configured.

## 102.2.2 Configure ULPP Compatible Mode

### Configuration Condition

Before configuring ULPP compatible mode, ensure that:

- To configure ULPP compatible mode, basic functions of ULPP group need to be configured;
- To configure the compatible mode of ULPP uplink mode, the control VLAN of ULPP uplink port needs to be configured first.

### Configure Compatible Mode of ULPP Group

ULPP group has three compatible modes, i.e. flexlink, smartlink, and smartlink multicast-mode.

Table 1 Configuring Compatible Mode of ULPP Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the ULPP configuration mode	<b>ulpp-group group-id</b>	-
Configure Compatible Mode of ULPP Group	<b>compatible { flexlink   smartlink   smartlink multicast-mode }</b>	Mandatory  By default, the compatible mode of ULPP group is not configured.

## Configure Compatible Mode of ULPP Uplink Port

ULPP uplink port has three compatible modes, i.e. flexlink, smartlink, and smartlink multicast-mode.

Table 2 Configuring Compatible Mode of ULPP Uplink Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure compatible mode of ULPP uplink port	<b>ulpp compatible { flexlink   smartlink   smartlink multicast-mode }</b>	Mandatory  By default, the compatible mode for uplink port of ULPP group is not configured.

---

### Note

- Compatible mode can be configured only when the spanning tree of uplink port in ULPP group is closed.
- 

## 102.2.3 Configure Basic Functions of Monitor Link Group

### Configuration Condition

None

### Configure Monitor Link Group

The Monitor Link group may have multiple uplink ports, such as general port, member port of aggregation group, aggregation group, VSL port or ULPP group. The Monitor Link group may have multiple downlink ports, such as general port, member port of aggregation group, and aggregation group. But ULPP group cannot serve as a downlink port.

Table 3 Configuring Creation of Monitor Link

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create Monitor Link group and enter the Monitor Link configuration mode	<b>mtlk-group</b> <i>group-id</i>	Mandatory By default, Monitor Link group is not created.
Configure the uplink port of Monitor Link group	<b>uplink</b> { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>ulpp-group</b> <i>group-id</i> }	Optional By default, uplink port of Monitor Link group is not configured.
Configure the downlink port of Monitor Link group	<b>downlink</b> { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> }	Optional By default, downlink port of Monitor Link group is not configured.

### 102.2.4 ULPP Monitoring and Maintaining

Table 102 ULPP Monitoring and Maintaining

Command	Description
<b>clear ulpp message flush</b> { <b>receive</b>   <b>send group</b> <i>group-id</i>   <b>transmit</b> }	Clear the statistics of FLUSH packets of ULPP group
<b>show ulpp group</b> <i>group-id</i>	Show the configurations of ULPP group
<b>show ulpp instance group</b> <i>group-id</i>	Show the status of the spanning tree carried by master/backup member port in ULPP group

Command	Description
<b>show ulpp message flush</b> { send group <i>group-id</i>   receive   transmit }	Show the statistics of FLUSH packets processed by ULPP group
<b>show ulpp assi</b>	Show the configurations of uplink port of ULPP group
<b>show mtlk group</b> <i>group-id</i>	Show the configurations of Monitor Link group

## 102.3 Typical Configuration Example of ULPP and Monitor Link

### 102.3.1 Configure ULPP

#### Network Requirements

- Four devices constitute a dual-uplink network. In particular, uplink devices include Device1, Device2, and Device3, and Device4 is a downlink device.
- ULPP function is configured for the downlink device so that the port can normally carry or switch the services in associated spanning tree instance.

#### Network Topology

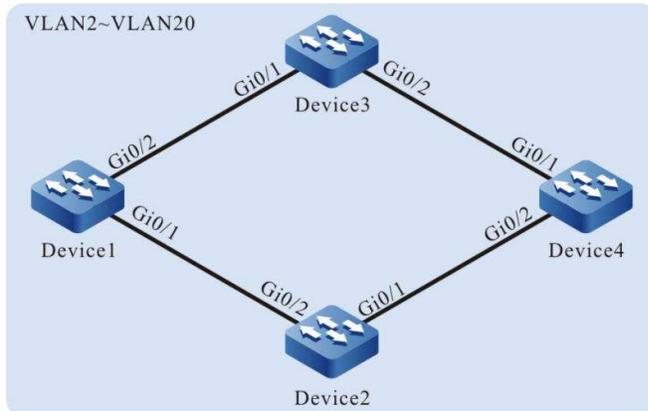

Figure 102 Configuring Network Topology of ULPP

#### Configuration Steps

Step 1: Configure VLANs and the link type of the ports.

#On Device1, create VLAN2-VLAN20, and configure the link type of ports gigabitEthernet0/1 and gigabitEthernet0/2 as Trunk to allow services of VLAN2-VLAN20 to pass.

```
Device1#configure terminal
Device1(config)#vlan 2-20
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#switchport mode trunk
Device1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2-20
Device1(config-if-gigabitethernet0/1)#exit
Device1(config)#interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/2)#switchport mode trunk
Device1(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2-20
Device1(config-if-gigabitethernet0/2)#exit
```

---

## Note

- The VLAN and configuration of port link type on Device2, Device3, and Device 4 are the same as those on Device1. (Omitted)
- 

Step 2: #Configure spanning tree instance on Device4.

#Configure spanning tree instance. Map instance 1 to VLAN3~VLAN10 and instance 2 to VLAN11~VLAN20.

```
Device4(config)#spanning-tree mst configuration
Device4(config-mst)#region-name admin
Device4(config-mst)#revision-level 1
Device4(config-mst)#instance 1 vlan 3-10
Device4(config-mst)#instance 2 vlan 11-20
```

#Enable the spanning tree instance.

```
Device4(config-mst)#active configuration pending
Device4(config-mst)#exit
```

Step 3: #Configure ULPP function on Device4.

#Create ULPP group.

```
Device4(config)#ulpp-group 1
```

#Configure the master port gigabitethernet0/1 and slave port gigabitethernet0/2 of ULPP group.

```
Device4(config-ulpp-1)#master interface gigabitethernet 0/1
Device4(config-ulpp-1)#slave interface gigabitethernet 0/2
```

#Configure associated spanning tree instance 1 of master port gigabitethernet0/1 and associated spanning tree instance 2 of slave port gigabitethernet0/2.

```
Device4(config-ulpp-1)#instance group 1 master
Device4(config-ulpp-1)#instance group 2 slave
```

#Configure the working mode of ULPP group as link backup.

```
Device4(config-ulpp-1)#mode backup
```

#Configure the control VLAN of ULPP group as VLAN2.

```
Device4(config-ulpp-1)#control-vlan 2
```

#Enable the Flush packet sending mechanism of ULPP.

```
Device4(config-ulpp-1)#flush enable
```

#Enable ULPP group.

```
Device4(config-ulpp-1)#enable  
Device4(config-ulpp-1)#exit
```

---

## Note

- After VLAN2 is configured as a control VLAN, it only permits Flush packet to pass.
- 

Step 4: Configure uplink devices Device1, Device2, and Device3.

#Configure Flush packet receiving and forwarding mechanism on Device1.

```
Device1(config)#interface gigabitethernet 0/1-0/2  
Device1(config-if-range)#ulpp flush control-vlan 2  
Device1(config-if-range)#exit
```

---

## Note

- The packet receiving and sending mechanism of Device2 and Device3, is the same as that of Device1. (Omitted)
- 

Step 5: Check the results.

#View the status of ULPP group on Device4.

```
Device4#show ulpp group 1  
-----  
ulpp-group 1 configuration information  
-----  
Current status      : MASS  
Work type           : Backup  
Control vlan        : 2  
Flush function       : Enable  
Preemption mode     : Disable  
Master interface name : gi0/1  
Slave interface name  : gi0/2  
Master interface status : Active  
Slave interface status : Standby  
Master interface instance : 1  
Slave interface instance : 2  
Flexlink compatible  : Disable  
Smartlink compatible  : Disable
```

```
Smartlink mcast compatible : Disable
Enable status              : Enable
```

#On Device4, view the status of associated spanning tree instances of master and slave ports.

```
Device4#show ulpp instance group 1
-----
ulpp-group 1 instance status
-----
Master forwarding instance : 1-2
Master block instance     : None
Slave forwarding instance  : None
Slave block instance      : 1-2
```

#When the port gigabitethernet0/1 of Device4 fails, the status of ULPP group will be switched. View the status of ULPP group on Device4.

```
Device4#show ulpp group 1
-----
ulpp-group 1 configuration information
-----
Current status      : MNSA
Work type           : Backup
Control vlan        : 2
Flush function      : Enable
Preemption mode     : Disable
Master interface name : gi0/1
Slave interface name : gi0/2
Master interface status : Down
Slave interface status : Active
Master interface instance : 1
Slave interface instance : 2
Flexlink compatible : Disable
Smartlink compatible : Disable
Smartlink mcast compatible : Disable
Enable status       : Enable
```

The master port gigabitethernet0/1 changes from Active to Down, and the slave port gigabitethernet0/2 changes from Standby to Active. The services in spanning tree instance are normally forwarded through gigabitethernet0/2.

#The uplink devices Device1 and Device2 will print the following information.

```
19:26:10: [tUpp]%ULPP-ASSI: Receive flush message from gigabitethernet0/2 success, the receive sequence number is 1, vlan id is 2
```

This is the information of Flush packet received by uplink devices Device1 and Device2 when the status of ULPP group changes.

## 102.3.2 Configure Monitor Link

### Network Requirements

- Four devices constitute a dual-uplink network. In particular, uplink devices include Device1, Device2, and Device3, and Device4 is a downlink device.
- Configure the Monitor Link function on Device3 to achieve link status monitoring.
- When the uplink port of Monitor Link group fails, the downlink port is closed, which

causes the ULPP group to switch between active and standby links to ensure network connectivity.

### Network Topology

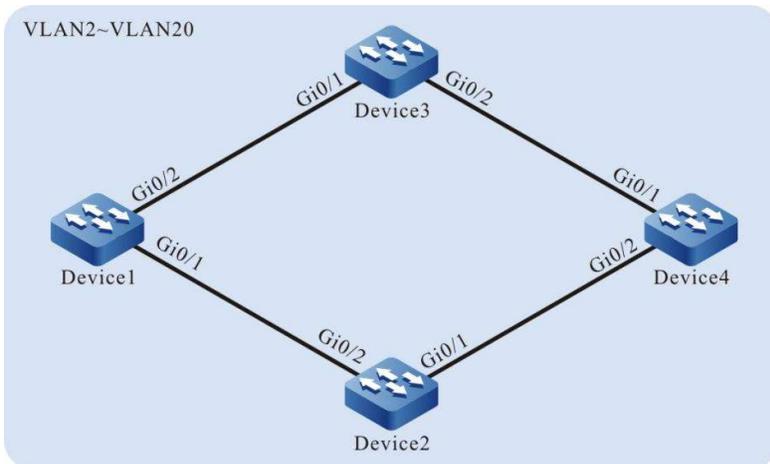

Figure 102 Configuring Network Topology of Monitor Link

### Configuration Steps

Step 1: Configure VLANs and the link type of the ports.

#On Device1, create VLAN2-VLAN20, and configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk to allow services of VLAN2-VLAN20 to pass.

```
Device1#configure terminal
Device1(config)#vlan 2-20
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#switchport mode trunk
Device1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2-20
Device1(config-if-gigabitethernet0/1)#exit
Device1(config)#interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/2)#switchport mode trunk
Device1(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2-20
Device1(config-if-gigabitethernet0/2)#exit
```

---

### Note

- The configuration of port and link type on Device2, Device3, and Device 4 is the same as that on Device1. (Omitted)
- 

Step 2: #Configure spanning tree instance on Device4.

#Configure spanning tree instance. Map instance 1 to VLAN3~VLAN10 and instance 2 to VLAN11~VLAN20.

```
Device4(config)#spanning-tree mst configuration
```

```
Device4(config-mst)#region-name admin
Device4(config-mst)#revision-level 1
Device4(config-mst)#instance 1 vlan 3-10
Device4(config-mst)#instance 2 vlan 11-20
```

#Enable the spanning tree instance.

```
Device4(config-mst)#active configuration pending
Device4(config-mst)#exit
```

Step 3: #Configure ULPP function on Device4.

```
Device4(config)#ulpp-group 1
Device4(config-ulpp-1)#master interface gigabitethernet 0/1
Device4(config-ulpp-1)#slave interface gigabitethernet 0/2
Device4(config-ulpp-1)#instance group 1 master
Device4(config-ulpp-1)#instance group 2 slave
Device4(config-ulpp-1)#mode backup
Device4(config-ulpp-1)#control-vlan 2
Device4(config-ulpp-1)#flush enable
Device4(config-ulpp-1)#enable
Device4(config-ulpp-1)#exit
```

---

## Note

- After VLAN2 is configured as a control VLAN, it only permits Flush packet to pass.
- 

Step 4: Configure uplink devices Device1, Device2, and Device3.

#Configure Flush packet receiving and forwarding mechanism on Device1.

```
Device1(config)#interface gigabitethernet 0/1-0/2
Device1(config-if-range)#ulpp flush control-vlan 2
Device1(config-if-range)#exit
```

---

## Note

- The packet receiving and sending mechanism of Device2 and Device3, is the same as that of Device1. (Omitted)
- 

Step 5: Configure Monitor Link group.

#Configure Monitor Link group on Device3.

```
Device3(config)#mtlk-group 1
```

#On Device3, configure gigabitethernet0/1 as the uplink port of Monitor Link.

```
Device3(config-mtlk-1)#uplink interface gigabitethernet 0/1
```

#On Device3, configure gigabitethernet0/2 as the downlink port of Monitor Link.

```
Device3(config-mtlk-1)#downlink interface gigabitethernet 0/2
```

#View Monitor Link group.

```
Device3#show mtlk group 1
-----
mtlk-group 1 configuration information
-----
Uplink interface      : gi0/1
Uplink type          : no-ulpp
Uplink status        : up
Downlink interface    : gi0/2
```

Step 6: Check the result.

#When the uplink port gigabitethernet0/1 of the uplink device Device3 fails, the status of downlink port gigabitethernet0/2 coordinates with that of uplink port gigabitethernet 0/1, and the downlink port is forced to be closed.

#View the status of the downlink port gigabitethernet0/2.

```
Device3#show interface gigabitethernet 0/2
gigabitethernet0/2 configuration information
  Description      : downlink
  Status           : Enabled
  Link             : Down (Err-disabled)
  Set Speed        : Auto
  Act Speed        : Unknown
  Set Duplex       : Auto
  Act Duplex       : Unknown
  Set Flow Control : Off
  Act Flow Control : Off
  Mdx              : Auto
  Mtu              : 1824
  Port mode        : LAN
  Port ability     : 10M HD,10M FD,100M HD,100M FD,1000M FD
  Link Delay       : No Delay
  Storm Control    : Unicast Disabled
  Storm Control    : Broadcast Disabled
  Storm Control    : Multicast Disabled
  Storm Action     : None
  Port Type        : Nni
  Pvid             : 1
  Set Medium       : Copper
  Act Medium       : Copper
  Mac Address      : 0001.7a58.000b
```

After the downlink port gigabitethernet0/2 is closed, the ULPP group of Device4 switches between active and standby links to ensure network connectivity

# 103 VRRP

---

## 103.1 Overview

VRRP is the short name for Virtual Router Redundancy Protocol. In short, VRRP is a fault tolerance protocol. It can ensure when the next-hop device of the host fails, it can be timely replaced by another device to ensure the continuity and reliability of communication. To enable the VRRP to work, first you need to create a virtual IP address and MAC address to add a virtual device to this network. The host on this network can communicate with the virtual device without knowing any information of the physical device on this network.

- A virtual device is composed of a master device and several backup devices. The master device can implements forwarding function. When the master device fails, the backup device becomes a new master device to continue to perform its task. The master and backup devices are hereinafter referred to as "Master" and "Backup" respectively.

## 103.2 VRRP Function Configuration

Table 103-1 VRRP Function Configuration List

Configuration Task	
Configure Basic Functions of VRRP	Enable VRRP Protocol
	Configure VRRP Priority
	Configure VRRP Preemption Mode
	Configure Real MAC Address of VRRP
Configure VRRP Coordination Group	Configure VRRP Coordination Group

Configuration Task	
Configure VRRP Network Authentication	Configure Simple Text Authentication for VRRP
Configure VRRP Delay Downgrading	Configure VRRP Delay Downgrading
Configure VRRP Packet Dispersion	Configure VRRP Packet Dispersion
Configure VRRP Delayed Recovery	Configure VRRP Delayed Recovery
Configure Virtual MAC Address of VRRP dual-holding	Configure Virtual MAC Address of VRRP dual-holding
Configure Static VRRP Function	Configure Static VRRP
Configure Association of VRRP with Track	Configure Coordination of VRRP with Track to Monitor Uplink of Master
	Configure Coordination of VRRP with Track to Monitor Interconnecting Lines of Master and Backup

### 103.2.1 Configure Basic Functions of VRRP

Among various configuration tasks of VRRP, VRRP must be enabled first. Other functional performance configured cannot take effect until the virtual IP address of VRRP group is in the same network segment with the interface IP address.

#### Configuration Condition

Before configuring the basic VRRP functions, do the following:

- Configure interface IP address.

#### Enable VRRP Protocol

To enable VRRP functions, you are required to create a VRRP group under the interface and configure virtual IP address.

Table 103-2 Enabling VRRP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VRRP group	<b>vrrp vrid ip</b> <i>ip-address</i>	Mandatory Enable VRRP. In particular, vrid is the VRRP group number, and ip-address is the virtual IP address.

### Configure VRRP Priority

After VRRP is configured, if no priority is set, the default priority 100 will be used; the device with a higher priority will be elected as the Master responsible for forwarding packets, and others will become Backups; if all devices have the same priority, the election will be conducted according to the size of the interface IP address of each device, and the device with a larger interface IP address becomes the Master. You can set the priority of VRRP as needed. The larger the value, the higher the priority.

Table 103-3 Configuring VRRP Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure the priority of VRRP group	<b>vrrp vrid priority</b> <i>priority</i>	Mandatory Configure VRRP priority. The default priority is 100.

### Note

- In virtual MAC mode, when the interface IP address is the same as the virtual IP address, it becomes Init immediately, and the priority remains unchanged. If the user wants the virtual IP address to be the same as the interface IP address, it needs to change the virtual

---

MAC mode to real MAC mode.

---

### Configure VRRP Preemption Mode

Configure VRRP. In preemption mode, once other devices in VRRP group finds their priority is higher than that of current Master, they will become the Master; in non-preemption mode, if the Master doesn't fail, other devices cannot become a Master even if they are configured with higher priority.

Table 103-4 Configuring VRRP Preemption Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VRRP group as preemption mode	<b>vrrp vrid preempt</b>	Mandatory By default, the preemption mode is enabled.

### Configure Real MAC Address of VRRP

The virtual device in a VRRP group has one virtual MAC address. According to RFC2338, the format of the virtual MAC address is as follows: 00-00-5E-00-01-{vrid}. When the virtual device responds to an ARP request, it provides a virtual MAC address instead of a real MAC address of the interface. It is noteworthy that virtual MAC address of interface is used by default.

Table 2 Configuring Real MAC Address of VRRP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure real MAC address for VRRP	<b>vrrp vrid use-bia</b>	Mandatory By default, virtual MAC address is used.

---

 **Note**

- By default, virtual MAC address is used after VRRP configuration. When the commands mentioned in this section are configured, real MAC address is used by the host to forward packets; after deleting these commands, the virtual MAC address is used by the host to forward packets.
- 

### 103.2.2 Configure VRRP Coordination Group

VRRP coordination group can reduce the interaction between VRRP protocol packets, alleviate network load, and reach millisecond switch. When multiple common VRRP groups are added to a VRRP coordination group, they play different roles in this coordination group, such as Active or non-Active. The Active group instead of non-Active group sends protocol packets. The non-Active group has the same status as the Active group, i.e. the former switches with the latter, in order to reduce interaction of protocol packets. Millisecond sending period of VRRP packets can be configured for the coordination group to meet the purpose of rapid switch.

#### Configuration Condition

Before configuring the VRRP coordination group, do the following:

- Configure multiple VRRP groups.

#### Configure VRRP Coordination Group

To configure a VRRP coordination group, first create one, and then add the common VRRP group configured to the coordination group created. The common VRRP group can be added to the coordination group as an Active group or a non-Active group. But one coordination group must have only one Active group.

Table 103-6 Configuring VRRP Coordination Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure coordination group	<b>vrrp linkgroup</b> <i>lgid</i> [ <b>interval</b> <i>Interval-time</i> ]	Mandatory The default value of interval-time is 1000ms.
Enter interface mode.	<b>interface</b> <i>interface-name</i>	Mandatory

Step	Command	Description
Add the common VRRP group to the coordination group as an Active group	<b>vrrp vrid linkgroup lgid</b> [ <b>active</b> ]	Mandatory  If [active] is not selected, it will be added as a non-Active group.

## Note

- In addition to coordination group, multiple VRRP groups can be used to achieve load balancing. For details, see the chapter "Configure VRRP Load Balancing" in "VRRP Typical Configuration Example".
- In coordination group, when common VRRP group is added, the common group timer will fail. That is to day, the sending period of VRRP packet in common group is subject to the timer of the coordination group.

### 103.2.3 Configure VRRP Network Authentication

VRRP supports simple text authentication which requires no more than 8 digits of authentication key.

#### Configuration Condition

Before configuring VRRP network authentication, ensure that:

- Configure a VRRP group.

#### Configure Simple Text Authentication for VRRP

Table 103-7 Configuring VRRP Simple Text Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure Simple Text Authentication for VRRP	<b>vrrp vrid authentication text</b> <i>string</i>	Mandatory

Step	Command	Description
		By default, the simple text authentication function is disabled.  The authentication key should have no more than 8 characters.

### 103.2.4 Configure VRRP Delay Downgrading

In order to meet the requirements of high reliability scenario, delay downgrading function can be configured for VRRP. When the device status of VRRP switches from Master to Backup, it can forward service traffic within the time of delay downgrading so as to effectively avoid losing service traffic due to the slow traffic switch of downstream switch equipment. The Backup device still under delay degradation can forward the service traffic with destination MAC address being a virtual MAC address. Therefore, the Backup device will also forward traffic packets when the delay downgrading timer takes effect, causing double traffic to be sent. This function is not recommended if there is a low requirement for reliability to prevent double traffic from affecting the network.

#### Configuration Condition

Before configuring the VRRP delay downgrading function, ensure that:

- Configure a VRRP group.

#### Configure VRRP Delay Downgrading

Table 103-8 Configuring VRRP Delay Downgrading

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VRRP Delay Downgrading	<b>vrrp vrid degrade-delay</b> <i>delay-time</i>	Mandatory  Configure VRRP delay downgrading. In particular, vrid is the VRRP group number, and delay-time is

Step	Command	Description
		the delay downgrading time.

### 103.2.5 Configure VRRP Packet Dispersion

In order to meet the requirements of high reliability scenario, the VRRP packet dispersion function can be configured when a large number of VRRP groups are configured. When VRRP bursts, the VRRP packet sending time is discretized to ensure balanced sending of VRRP packets.

#### Configuration Condition

No.

#### Configure VRRP Packet Dispersion

Table 103-9 Configuring VRRP Packet Dispersion

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure VRRP Packet Dispersion	<b>vrrp disperse- skew skew-time</b>	Mandatory Configure VRRP packet dispersion. Skew-time is the packet dispersion interval.

### 103.2.6 Configure VRRP Delayed Recovery

In order to meet the requirements of high reliability scenario, the VRRP delayed recovery function can be configured. When the interface status of VRRP device switches from down to up, VRRP switches status after delayed recovery in INIT status.

#### Configuration Condition

Before configuring VRRP delayed recovery function, do the following:

- Configure a VRRP group.

Configure VRRP Packet Dispersion

Table 103-10 Configuring VRRP Delayed Recovery

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure VRRP Delayed Recovery	<b>vrp restore-delay</b> <i>delay-time</i>	Mandatory Configure VRRP delayed recovery. Delay-time is the VRRP recovery delay time.

### 103.2.7 Configure Virtual MAC Address of VRRP dual-holding

In order to meet the requirements of high reliability scenario, virtual MAC dual-holding function can be configured for VRRP. When the Master fails, and the device status of VRRP has not switched from Backup to Master yet, the Backup device can rapidly start the forwarding of service traffic to effectively reduce the time of gateway blackhole. However, under normal conditions, if the downstream switch device has flooding of service traffic, the Backup device with mac dual-holding enabled will also forward traffic packets, causing double traffic to be sent. This function is not recommended if there is a low requirement for reliability to prevent double traffic from affecting the network.

#### Configuration Condition

Before configuring VRRP virtual MAC dual-holding function, do the following:

- Configure a VRRP group.
- This VRRP group uses virtual MAC address.

Configure VRRP Packet Dispersion

Table 103-11 Configuring VRRP Virtual MAC Dual-holding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure Virtual MAC Address of VRRP dual-holding	<b>vrp vrid</b> <i>svlm</i>	Mandatory Configure VRRP virtual MAC dual-holding. In particular,

Step	Command	Description
		vrid is the VRRP group number.

### 103.2.8 Configure Static VRRP Function

After the static VRRP function is enabled, VRRP doesn't perform protocol interaction, the status will ultimately remain at master, and ARP responses can be given normally. This applies to single-device virtual gateways and MLAG scenarios.

#### Configuration Condition

Before configuring static VRRP function, do the following:

- Configure a VRRP group.

#### Configure Static VRRP Function

Table 103-12 Configuring Static VRRP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure Static VRRP	<b>vrrp</b> <i>vrid</i> <b>static</b>	Mandatory Configure static VRRP. In particular, vrid is the VRRP group number.

### 103.2.9 Configure Coordination of VRRP with Track

VRRP can monitor the status of uplink and the line connecting Master and Backup to improve the reliability of VRRP.

#### Configuration Condition

Before configuring the coordination of VRRP with Track, do the following:

- Configure a VRRP group.

### Configure Coordination of VRRP with Track to Monitor Uplink of Master

Configure coordination with Track on the Master. By associating the interface or BFD and RTR through Track, you can make it focus on the status of uplink interface. If the uplink interface is down, VRRP can reduce the priority of the Master with the consumption value configured. At this time, upon receipt, the Backup will automatically switch to Master (it is worth noting that the priority of Master is lower than that of Backup at this time). If it's necessary to switch to Backup quickly, you can configure the command of fast switch upon receipt of low-priority packet on the Backup. For details, see the figure below.

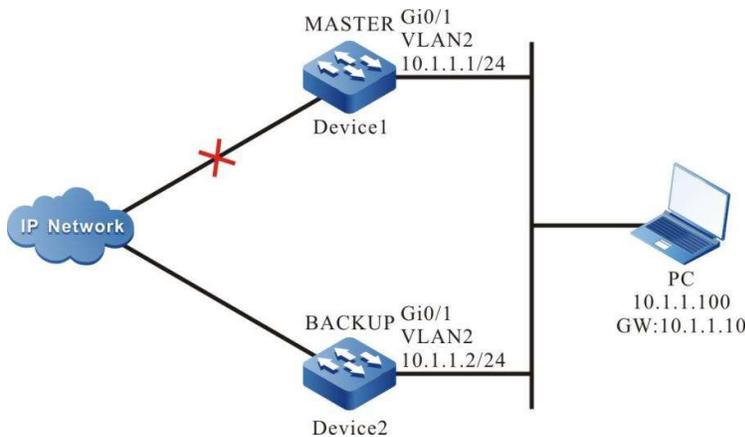

Figure 103-1 Configuring Coordination of VRRP with Track to Monitor Uplink of Master

### Configure Coordination of VRRP with Track to Associate Uplink Interface

Associate VRRP with the uplink interface to be cared about through Track. When the uplink interface is down, the Master will automatically lower its priority and the Backup will receive the VRRP packet with a low priority and switch to Master; if the user has configured "fast switch upon receipt of low-priority packet", i.e. "low-pri-master" function, the Backup will quickly switch to Master.

Table 3 Configuring Coordination of VRRP with Track to Associate with Uplink Interface (Configured on Master)

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter interface mode.	<b>interface</b> <i>interface-name</i>	Mandatory
Configure association of VRRP with uplink interface	<b>vrrp vrid track</b> <i>interface-name</i> [ <i>decrement</i> ]	Mandatory By default, the priority consumption value is 10.
Configure the function of fast switch after VRRP	<b>vrrp vrid switchover low-pri-master</b>	Optional

Step	Command	Description
receives low-priority packet		This command is configured on the Backup for fast switch after the priority of Master decreases.

### Configure Coordination of VRRP with Track (Associate Track with BFD and RTR)

If Track is associated with BFD and RTR, the Master can directly associate with this Track to monitor the lines. When any failure occurs on the lines, the Master decreases its priority. At this moment, the Backup switches to Master after receiving the VRRP packet with a low priority. If the user configures the "fast switch upon receipt of low-priority packet", i.e. "low-pri-master" function, the Backup will quickly switch to Master.

Table 103-14 Configuring Coordination of Master with Track (Associate Track with BFD and RTR)

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter interface mode.	<b>interface</b> <i>interface-name</i>	Mandatory
Configure association of VRRP with uplink interface	<b>vrrp vrid track track-id</b> [ <i>decrement</i> ]	Mandatory By default, the priority consumption value is 10.
Configure the function of fast switch after VRRP receives low-priority packet	<b>vrrp vrid switchover low-pri-master</b>	Optional This command is configured on the Backup for fast switch after the priority of Master decreases.

### Note

- For the creation of Track and the configurations of Association of Track with BFD or RTR, see Track-related chapter in the User Manual.
- The low-pri-master function enables the Backup to switch quickly when receiving low-priority packets, even if it is in non-preemption mode. If this function is not configured,

when low-priority packets are received, the Backup will switch after the next timeout period. When the switch time is not strictly required, it's unnecessary to configure the low-pri-master function. However, when the switch time is strictly required, this function can make the switch time reach millisecond level.

### Configure Coordination of VRRP with Track to Monitor Interconnecting Lines of Master and Backup

After coordination of VRRP with Track to monitor interconnecting lines of Master and Backup is configured, when the line between Master and Backup is down, the Backup will quickly switch to Master. For details, see the figure below.

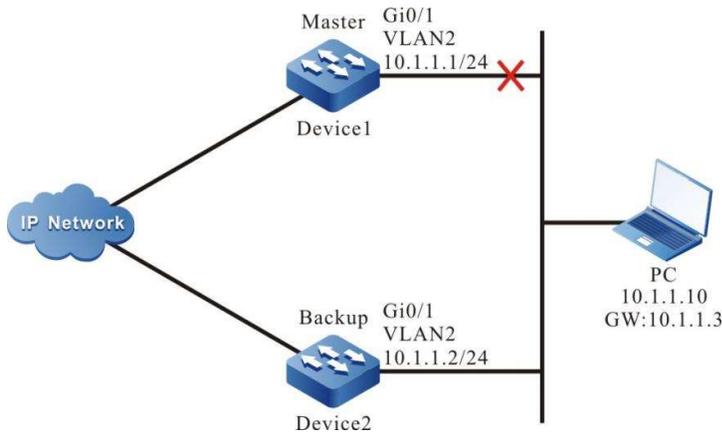

Figure 103-2 Configuring Coordination of VRRP with Track to Monitor Interconnecting Lines of Master and Backup

Table 103-15 Configuring Coordination of VRRP with Track to Monitor Interconnecting Lines of Master and Backup

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter interface mode.	<b>interface <i>interface-name</i></b>	Mandatory
Configure the function of fast switch when the Backup VRRP device finds the line between Master and Backup becomes down	<b>vrrp vrid track track-id switchover</b>	Mandatory

---

## Note

- For the configurations of associating Track with BFD and RTR, see Track-related chapter in the User Manual.
  - Track can be associated with BFD to monitor the interconnecting lines between Master and Backup.
- 

### 103.2.10 VRRP Monitoring and Maintaining

Table 103-16 VRRP Monitoring and Maintaining

Command	Description
<b>show vrrp</b> [ <b>brief</b> ]   [ <b>interface</b> <i>interface-name</i> ]   [ <b>group</b> [ <i>linkgroup-number</i> ]]	Show the VRRP configuration information, including virtual IP address, virtual MAC address, device status, device priority, dependent device interface address, and coordination group.

## 103.3 Typical Configuration Example of VRRP

### 103.3.1 Configure the Priority of Single VRRP Backup Group

#### Network Requirements

- On Device1 and Device2, create a single VRRP backup group so that Device1 and Device2 can share a virtual IP address to back up the default gateway of the user's host, reducing the time of network disconnection.

#### Network Topology

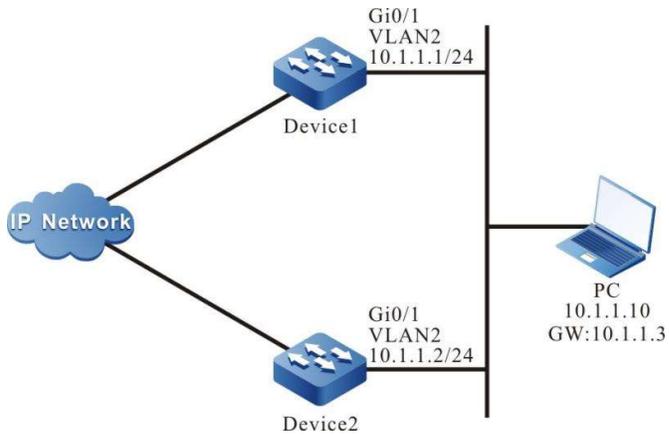

Figure 103-3 Network Topology for Configuring Single VRRP Backup Group

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure a VRRP group.

#On Device1, configure VRRP group 1, with virtual IP address of 10.1.1.3 and priority configured of 110.

```
Device1#configure terminal
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device1(config-if-vlan2)#vrrp 1 priority 110
Device1(config-if-vlan2)#exit
```

#On Device2, configure VRRP group 1, with virtual IP address of 10.1.1.3.

```
Device2#configure terminal
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device2(config-if-vlan2)#exit
```

Step 4: Check the result.

#View the VRRP status of Device1.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.1
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:10.1.1.1/24
State : Master
Normal priority : 110
Currnet priority : 110
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
```

Authentication Mode : None

#View the VRRP status of Device2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.2
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:10.1.1.2/24
State : Backup
Master addr : 10.1.1.1
Normal priority : 100
Current priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

It can be seen that the VRRP status of Device1 is Master, and that of Device2 is Backup. Device1 shares a virtual IP address with Device2. The host communicates with the network through this address. When Device1 fails, Device2 immediately switches to Master for data forwarding.

---

## Note

- For VRRP status, the device with a higher priority is the Master. When they have the same priority, the device with a larger interface IP address is the Master.
  - By default, VRRP works in preemption mode, and the default priority is 100.
- 

### 103.3.2 Configure VRRP Coordination Group

#### Network Requirements

- Enable VRRP on Device1 and Device2 interfaces, and add it to the coordination group. Only the Active group in the coordination group exchanges protocol packets.
- The VRRP status in non-Active group maintains the same as that of Active group, i.e. the status of Active group switches with the change of non-Active group.

#### Network Topology

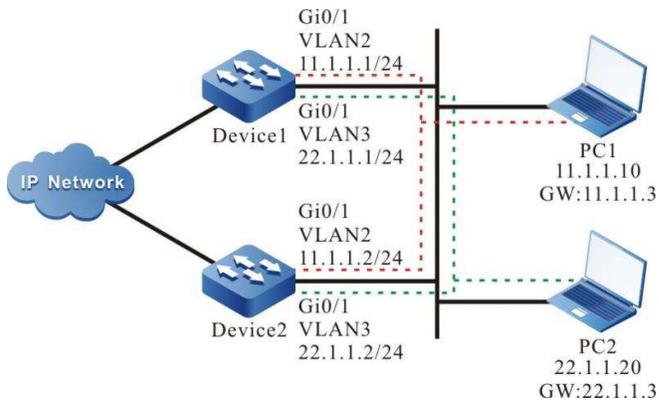

Figure 103 Network Topology for Configuring Multiple VRRP Backup Groups

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure a VRRP coordination group.

#Configure a VRRP coordination group on Device1.

```
Device1#configure terminal
Device1(config)#vrrp linkgroup 1
```

#On Device2, configure VRRP coordination group 1.

```
Device2#configure terminal
Device2(config)#vrrp linkgroup 1
```

Step 4: Configure a VRRP Group.

#On the interface of Device1, configure the virtual IP address of VRRP group 1 as 11.1.1.3.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 ip 11.1.1.3
Device1(config-if-vlan2)#exit
```

#On the interface of Device1, configure the virtual IP address of VRRP group 2 as 22.1.1.3.

```
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#vrrp 2 ip 22.1.1.3
Device1(config-if-vlan3)#exit
```

#On the interface of Device2, configure the virtual IP address of VRRP group 1 as 11.1.1.3.

```
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 1 ip 11.1.1.3
Device2(config-if-vlan2)#exit
```

#On the interface of Device2, configure the virtual IP address of VRRP group 2 as 22.1.1.3.

```
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#vrrp 2 ip 22.1.1.3
```

```
Device2(config-if-vlan3)#exit
```

Step 5: Add VRRP to the coordination group.

#On Device1, add VRRP group 1 to the coordination group as an Active group.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 linkgroup 1 active
Device1(config-if-vlan2)#exit
```

#On Device1, add VRRP group 2 to the coordination group as a non-Active group.

```
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#vrrp 2 linkgroup 1
Device1(config-if-vlan3)#exit
```

#On Device2, add VRRP group 1 to the coordination group as an Active group.

```
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 1 linkgroup 1 active
Device2(config-if-vlan2)#exit
```

#On Device2, add VRRP group 2 to the coordination group as a non-Active group.

```
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#vrrp 2 linkgroup 1
Device2(config-if-vlan3)#exit
```

Step 6: Check the result.

#View the VRRP status on Device1.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 11.1.1.1
Vrf : 0
Virtual router : 1
Linkgroup : 1
Active : TRUE
Virtual IP address : 11.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:11.1.1.1/24
State : Backup
Master addr : 11.1.1.2
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None

Interface vlan3 (Flags 0x1)
Pri-addr : 22.1.1.1
Vrf : 0
Virtual router : 2
Linkgroup : 1
Active : FALSE
Virtual IP address : 22.1.1.3
Virtual MAC address : 00-00-5e-00-01-02
Depend prefix:22.1.1.1/24
State : Backup
Master addr : 0.0.0.0
```

```
Normal priority : 100
Currnet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

#View the VRRP status on Device2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 11.1.1.2
Vrf : 0
Virtual router : 1
Linkgroup : 1
Active : TRUE
Virtual IP address : 11.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:11.1.1.2/24
State : Master
Normal priority : 100
Currnet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None

Interface vlan3 (Flags 0x1)
Pri-addr : 22.1.1.2
Vrf : 0
Virtual router : 2
Linkgroup : 1
Active : FALSE
Virtual IP address : 22.1.1.3
Virtual MAC address : 00-00-5e-00-01-02 , installed into HW
Depend prefix:22.1.1.2/24
State : Master
Normal priority : 100
Currnet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

It is indicated that the VRRP status of non-Active group is consistent with that of Active group.

Step 7: Configure the priority of VLAN2 on Device1 as 110 for status switch.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 priority 110
Device1(config-if-vlan2)#exit
```

#View the VRRP status on Device1.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 11.1.1.1
Vrf : 0
Virtual router : 1
Linkgroup : 1
Active : TRUE
Virtual IP address : 11.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:11.1.1.1/24
State : Master
Normal priority : 110
Currnet priority : 110
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
```

Authentication Mode : None

```
Interface vlan3 (Flags 0x1)
Pri-addr : 22.1.1.1
Vrf : 0
Virtual router : 2
Linkgroup : 1
Active : FALSE
Virtual IP address : 22.1.1.3
Virtual MAC address : 00-00-5e-00-01-02 , installed into HW
Depend prefix:22.1.1.1/24
State : Master
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

#View the VRRP status on Device2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 11.1.1.2
Vrf : 0
Virtual router : 1
Linkgroup : 1
Active : TRUE
Virtual IP address : 11.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:11.1.1.2/24
State : Backup
Master addr : 11.1.1.1
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

```
Interface vlan3 (Flags 0x1)
Pri-addr : 22.1.1.2
Vrf : 0
Virtual router : 2
Linkgroup : 1
Active : FALSE
Virtual IP address : 22.1.1.3
Virtual MAC address : 00-00-5e-00-01-02
Depend prefix:22.1.1.2/24
State : Backup
Master addr : 0.0.0.0
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

It can be seen that the status of non-Active group changes with that of Active group. The Active group instead of non-Active group in the coordination group is responsible for sending protocol packets. This can significantly reduce the interactions between VRRP protocol packets and the network load.

- 
- The sending interval of the coordination group can be as short as millisecond level to meet the purpose of rapid switch.
- 

### 103.3.3 Configure Coordination of VRRP with Track

#### Network Requirements

- VRRP is enabled between Device1 and Device2 so that Device1 and Device2 can share a virtual IP address to back up the default gateway of the user's host.
- Device1 monitors the status of VLAN3 through Track. When the uplink interface VLAN3 of Device1 is down, VRRP can sense and switch status so that the Backup will become a Master for data forwarding.

#### Network Topology

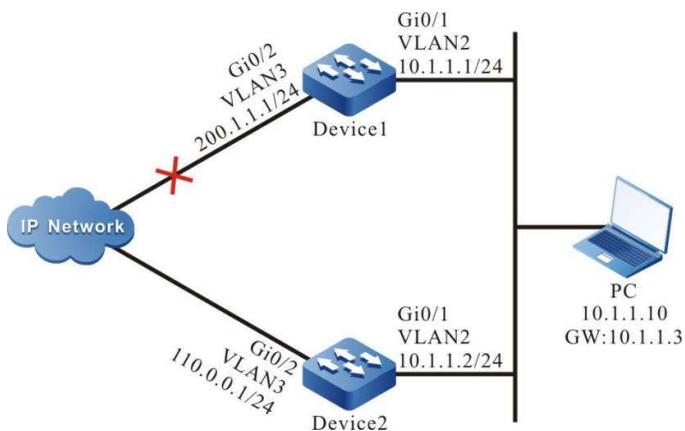

Figure 1 Network Topology for Configuring Coordination of VRRP with Track

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure a VRRP group.

#On Device1, configure VRRP group 1, with virtual IP address of 10.1.1.3 and priority of 110.

```
Device1#configure terminal
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device1(config-if-vlan2)#vrrp 1 priority 110
Device1(config-if-vlan2)#exit
```

#On Device2, configure VRRP group 1, with virtual IP address of 10.1.1.3.

```
Device2#configure terminal
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device2(config-if-vlan2)#exit
```

#View the VRRP status of Device1.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.1
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:10.1.1.1/24
State : Master
Normal priority : 110
Curmet priority : 110
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1
Authentication Mode : None
```

#View the VRRP status of Device2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.2
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:10.1.1.2/24
State : Backup
Master addr : 10.1.1.1
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1
Authentication Mode : None
```

Step 4: Configure coordination of VRRP with Track.

#On Device1, configure coordination of VRRP with Track to monitor the uplink interface VLAN3, and configure the priority decrement as 20.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 track vlan3 20
Device1(config-if-vlan2)#exit
```

#View the VRRP status of Device1.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.1
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:10.1.1.1/24
State : Master
Normal priority : 110
Curmet priority : 110
Priority reduced : 0
Preempt-mode : YES
```

```
Advertise-interval : 1
Authentication Mode : None
Track interface : vlan3
Reduce : 20
Reduce state : NO
```

When the uplink interface VLAN3 of Device1 is down, VRRP priority decreases by 20. As a result, Device2 has a higher priority, which causes status switch.

#View the VRRP status of Device1.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.1
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:10.1.1.1/24
State : Backup
Master addr : 10.1.1.2
Normal priority : 110
Curmet priority : 90
Priority reduced : 20
Preempt-mode : YES
Advertise-interval : 1
Authentication Mode : None
Track interface : vlan3
Reduce : 20
Reduce state : YES
```

#View the VRRP status of Device2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.2
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:10.1.1.2/24
State : Master
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1
Authentication Mode : None
```

---

## Note

- For the purpose of fast switch during coordination of VRRP with Track, you can configure switchover low-pri-master on the Backup.
- 

### 103.3.4 Configure Coordination of VRRP with BFD

#### Network Requirements

- Enable VRRP between Device1 and Device2.
- It at least takes 3s for the VRRP status to switch between Device1 and Device2, which means a very long period of service disconnection. Coordination of VRRP with BFD is required to be configured on Device1 and Device2 to achieve millisecond switch.

### Network Topology

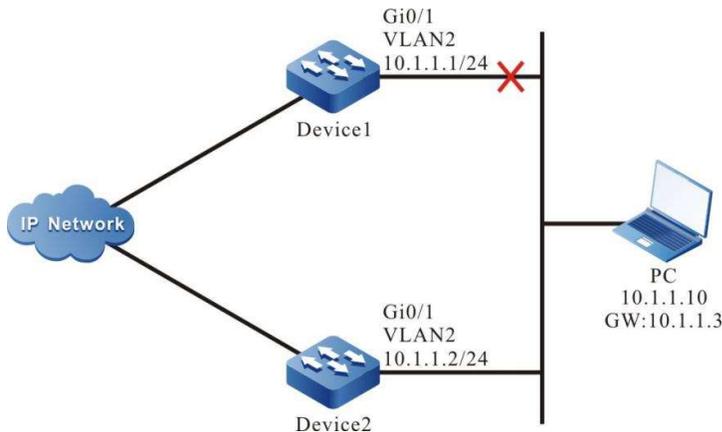

Figure 2 Network Topology for Configuring Coordination of VRRP with BFD

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure a VRRP group.

#On Device1, configure VRRP group 1, with virtual IP address of 10.1.1.3 and priority configured of 105.

```
Device1#configure terminal
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device1(config-if-vlan2)#vrrp 1 priority 105
Device1(config-if-vlan2)#exit
```

#On Device2, configure VRRP group 1, with virtual IP address of 10.1.1.3.

```
Device2#configure terminal
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device2(config-if-vlan2)#exit
```

#View the VRRP status of Device1.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.2
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:10.1.1.2/24
State : Master
Normal priority : 105
```

```
Curmet priority : 105
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

#View the VRRP status of Device2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.2
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:10.1.1.2/24
State : Backup
Master addr : 10.1.1.1
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

Step 4: Configure the coordination of Track with BFD.

#Configure coordination of Track with BFD on Device1.

```
Device1(config)#track 1
Device1(config-track)#bfd interface vlan2 remote-ip 10.1.1.2 local-ip 10.1.1.1
Device1(config-track)#exit
```

#Configure coordination of Track with BFD on Device2.

```
Device2#configure terminal
Device2(config)#track 1
Device2(config-track)#bfd interface vlan2 remote-ip 10.1.1.1 local-ip 10.1.1.2
Device2(config-track)#exit
```

#View BFD status on Device1.

```
Device1#show bfd session
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.1.1.1      10.1.1.2      6/7        UP         5000          vlan2
```

#View BFD status on Device2.

```
Device2#show bfd session
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.1.1.2      10.1.1.1      7/6        UP         5000          vlan2
```

Step 5: Configure coordination of VRRP with Track.

#On Device2, configure coordination of VRRP with Track, and configure switchover.

```
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 1 track 1 switchover
Device2(config-track)#exit
```

Step 6: Check the result.

#View the VRRP status on Device2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.1
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:10.1.1.1/24
State : Backup
Master addr : 10.1.1.2
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
Track object : 1
Switchover state : NO
```

When the line of Device1 fails, the BFD session is down, so is Track. Device2 can immediately sense and switch to Master for data forwarding.

#View the status of BFD and VRRP on Device2.

```
Device2#show bfd session
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.1.1.2      10.1.1.1      7/0        DOWN        5000          vlan2
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.2
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:10.1.1.2/24
State : Master
Normal priority : 100
Curmet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
Track object : 1
Switchover state : YES
```

---

## Note

- When VRRP coordinates with Track, Switchover needs to be configured on the Backup. Once Track down is detected, it will switch to Master immediately.
-

### 103.3.5 Configure VRRP load balancing

#### Network Requirements

- Device1 and Device2 belong to two different VRRP groups. In particular, Device1 is a Master in group 1 and a Backup in group 2; Device2 is a Backup in group 1 and a Master in group 2.
- PC1 forwards data through Device1, and PC2 does so through Device2 to realize load balancing.

#### Network Topology

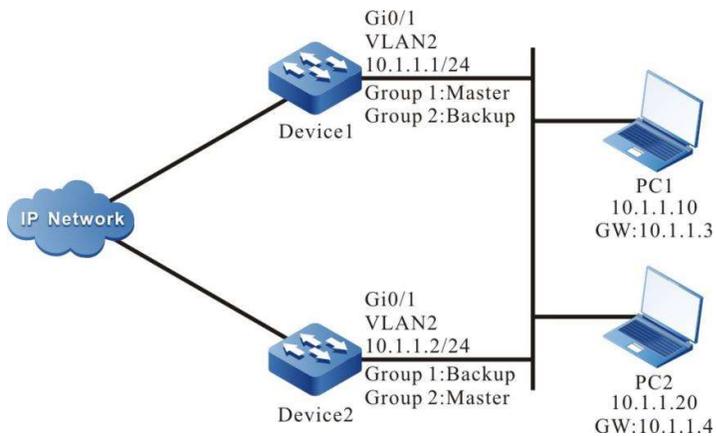

Figure 3 Network Topology for VRRP Load Balancing

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Create VRRP group 1.

#On Device1, configure VRRP group 1, with virtual IP address of 10.1.1.3 and priority configured of 110.

```
Device1#configure terminal
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device1(config-if-vlan2)#vrrp 1 priority 110
Device1(config-if-vlan2)#exit
```

#On Device2, configure VRRP group 1, with virtual IP address of 10.1.1.3.

```
Device2#configure terminal
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device2(config-if-vlan2)#exit
```

Step 4: Create VRRP group 2.

#On Device1, configure the virtual IP address of VRRP group 2 as 10.1.1.4.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#vrrp 2 ip 10.1.1.4
Device1(config-if-vlan2)#exit
```

#On Device2, configure the virtual IP address of VRRP group 2 as 10.1.1.4 and the priority as 110.

```
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#vrrp 2 ip 10.1.1.4
Device2(config-if-vlan2)#vrrp 2 priority 110
Device2(config-if-vlan2)#exit
```

Step 5: Check the result.

#On Device1, view VRRP status in group 1 and 2.

```
Device1#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.1
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01 , installed into HW
Depend prefix:10.1.1.1/24
State : Master
Normal priority : 110
Currnet priority : 110
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None

Virtual router : 2
Virtual IP address : 10.1.1.4
Virtual MAC address : 00-00-5e-00-01-02
Depend prefix:10.1.1.1/24
State : Backup
Master addr : 10.1.1.2
Normal priority : 100
Currnet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 1 s
Authentication Mode : None
```

#On Device2, view VRRP status in group 1 and 2.

```
Device2#show vrrp
Interface vlan2 (Flags 0x1)
Pri-addr : 10.1.1.2
Vrf : 0
Virtual router : 1
Virtual IP address : 10.1.1.3
Virtual MAC address : 00-00-5e-00-01-01
Depend prefix:10.1.1.2/24
State : Backup
Master addr : 10.1.1.1
Normal priority : 100
Currnet priority : 100
Priority reduced : 0
Preempt-mode : YES
```

Advertise-interval : 1 s  
Authentication Mode : None

Virtual router : 2  
Virtual IP address : 10.1.1.4  
Virtual MAC address : 00-00-5e-00-01-02 , installed into HW  
Depend prefix:10.1.1.2/24  
State : Master  
Normal priority : 110  
Current priority : 110  
Priority reduced : 0  
Preempt-mode : YES  
Advertise-interval : 1 s  
Authentication Mode : None

It is indicated that as a Master of VRRP group 1, Device1 also acts as a Backup in VRRP group 2. On the contrary, as a Master of VRRP group 2, Device2 also acts as a Backup in VRRP group 1. When a device fails, the two PCs forward data through the other one. This can achieve both load balancing and mutual backup.

# 104 VRRPv3

## 104.1 Overview

VRRPv3 is the short name for Virtual Router Redundancy Protocol Version 3. In short, VRRPv3 is a fault tolerance protocol. It can ensure when the next-hop device of the host fails, it can be timely replaced by another device to ensure the continuity and reliability of communication. To enable the VRRPv3 to work, first you need to create a virtual IP address and MAC address to add a virtual device to this network. The host on this network can communicate with the virtual device without knowing any information of the physical device on this network. A virtual device is composed of a master device and several backup devices. The master device can implements forwarding function. When the master device fails, the backup device becomes a new master device to continue to perform its task.

The master and backup devices are hereinafter referred to as "Master" and "Backup" respectively.

## 104.2 VRRPv3 Function Configuration

Table 104 VRRPv3 Function Configuration List

Configuration Task	
Configure Basic Functions of VRRPv3	Enable VRRPv3 Protocol
	Configure VRRPv3 Priority
	Configure VRRPv3 Preemption Mode
	Configure Virtual MAC Address of VRRPv3
Configure Static VRRPv3 Functions	Configure Static VRRPv3
Configure Association of VRRPv3 with Track	Configure Coordination of VRRPv3 with Track to Monitor Uplink of Master
	Configure Coordination of VRRPv3 with Track to Monitor Interconnecting Lines of Master and Backup

## 104.2.1 Configure Basic Functions of VRRPv3

In various configuration tasks of VRRPv3, you must enable VRRPv3 first. For the virtual IPv6 link-local address of VRRPv3 group, other functional performance configured cannot take effect until the IPv6 link-local address of interface is enabled.

### Configuration Condition

Before configuring the basic VRRPv3 functions, do the following:

- Enable the IPv6 link-local address of interface.

### Enable VRRPv3 Protocol

To enable VRRPv3 functions, you are required to create a VRRPv3 group under the interface and configure IPv6 link-local virtual address. If global virtual address needs to be configured, the network segment of this virtual address must be the same as that of the global real address on the interface.

Table 1 Enabling VRRPv3 Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure link-local virtual address of VRRPv3 group	<b>ipv6 vrrp vrid ip ip-address link-local</b>	Mandatory By default, VRRPv3 is not enabled.
Configure global virtual address of VRRPv3 group	<b>ipv6 vrrp vrid ip ip-address</b>	Optional The global virtual address configured must be in the same network segment with the global real address on the interface. By default, global virtual address is disabled.

### Configure VRRPv3 Priority

After VRRPv3 is configured, if no priority is set, the default priority 100 will be used; the device with a higher priority will be elected as the Master responsible for forwarding packets, and others will become

Backups; if all devices have the same priority, the election will be conducted according to the size of the interface IPv6 link-local address of each device, and the device with a larger interface IPv6 link-local address becomes the Master. You can set the priority of VRRPv3 as needed. The larger the value, the higher the priority.

Table 2 Configuring VRRPv3 Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure the priority of VRRPv3 group	<b>ipv6 vrrp vrid priority</b> <i>priority</i>	Mandatory By default, the VRRPv3 priority is 100.

### Configure VRRPv3 Preemption Mode

Configure VRRPv3. In preemption mode, once other devices in VRRPv3 group finds their priority is higher than that of current Master, they will become the Master; in non-preemption mode, if the Master doesn't fail, other devices cannot become a Master even if they are configured with higher priority.

Table 104 Configuring VRRPv3 Preemption Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VRRPv3 group as preemption mode	<b>ipv6 vrrp vrid preempt</b>	Mandatory By default, the preemption function is enabled.

### Configure Real MAC Address of VRRPv3

The virtual router in a VRRPv3 group has one virtual MAC address. According to RFC5798, the format of the virtual MAC address is as follows: 00-00-5E-00-02-{vrid}. It is noteworthy that virtual MAC address is used by default.

Table 3 Configuring Real MAC Address of VRRPv3

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure virtual MAC address fir VRRPv3	<b>ipv6 vrrp vrid use-bia</b>	Mandatory By default, VRRPv3 will use virtual MAC address.

### Note

- By default, virtual MAC address is used after VRRPv3 configuration. When the commands mentioned in this section are configured, real MAC address is used by the host to forward packets; after deleting these commands, the virtual MAC address is used by the host to forward packets.

## 104.2.2 Configure Static VRRPv3 Functions

After the static VRRP function is enabled, VRRPv3 doesn't perform protocol interaction, the status will ultimately remain at master, and NA responses can be given normally. This applies to single-device virtual gateways and MLAG scenarios.

### Configuration Condition

Before configuring static VRRPv3 function, do the following:

- Configure a VRRPv3 group.

### Configure Static VRRP Function

Table 104-6 Configuring Static VRRPv3

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	Mandatory
Configure Static VRRPv3	<b>ipv6 vrrp <i>vrid</i> static</b>	Mandatory Configure static VRRPv3. <i>vrid</i> is the group number of VRRPv3.

### 104.2.3 Configure Coordination of VRRPv3 with Track

VRRPv3 can monitor the status of uplink and the line connecting Master and Backup to improve the reliability of VRRPv3.

#### Configuration Condition

Before configuring the coordination of VRRPv3 with Track, do the following:

- Configure a VRRPv3 group.

#### Configure Coordination of VRRPv3 with Track to Monitor Uplink of Master

Configure coordination with Track on the Master. By associating the interface or BFD and RTR through Track, you can make it focus on the status of uplink interface. If the uplink interface is down, VRRPv3 can reduce the priority of the Master with the consumption value configured. At this time, upon receipt, the Backup will automatically switch to Master (it is worth noting that the priority of Master is lower than that of Backup at this time). If it's necessary to switch to Backup quickly, you can configure the command of fast switch upon receipt of low-priority packet on the Backup. For details, see the figure below.

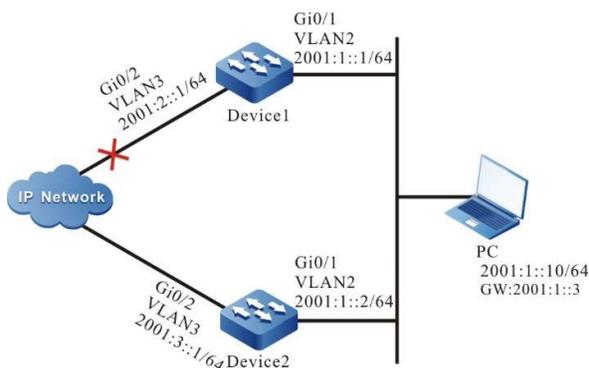

Figure 104-1 Configuring Coordination of VRRPv3 with Track to Monitor Uplink of Master

## Configure Coordination of VRRPv3 with Track to Associate Uplink Interface

Associate VRRPv3 with the uplink interface to be cared about through Track. When the uplink interface is down, the Master will automatically lower its priority and the Backup will receive the VRRPv3 packet with a low priority and switch to Master; if the user has configured "fast switch upon receipt of low-priority packet", i.e. "low-pri-master" function, the Backup will quickly switch to Master.

Table 4 Configuring VRRPv3 to Coordinate Track to Associate with Uplink Interface  
(Configured on Master)

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter interface mode.	<b>interface</b> <i>interface-name</i>	Mandatory
Configure association of VRRPv3 with uplink interface	<b>ipv6 vrrp vrid track</b> <i>interface-name</i> [ <i>decrement</i> ]	Mandatory By default, VRRPv3 is not coordinated with Track.
Configure the function of fast switch after VRRPv3 receives low-priority packet	<b>ipv6 vrrp vrid switchover low-pri-master</b>	Optional By default, the low-pri-master function is disabled. This command is configured on the Backup for fast switch after the priority of Master decreases.

## Configure VRRPv3 to Coordinate Track (Associate Track with BFD and RTR)

If Track is associated with BFD and RTR, the Master can directly associate with this Track to monitor the lines. When any failure occurs on the lines, the Master decreases its priority. At this moment, the Backup switches to Master after receiving the VRRPv3 packet with a low priority. If the user configures the "fast switch upon receipt of low-priority packet", i.e. "low-pri-master" function, the Backup will quickly switch to Master.

Table 5 Configuring Coordination of Master with Track (Associate Track with BFD and RTR)

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter interface mode.	<b>interface</b> <i>interface-name</i>	Mandatory
Configure association of VRRPv3 with uplink interface	<b>ipv6 vrrp vrid track track-id</b> [ <i>decrement</i> ]	Mandatory By default, VRRPv3 is not coordinated with Track.
Configure the function of fast switch after VRRPv3 receives low-priority packet	<b>ipv6 vrrp vrid switchover low-pri-master</b>	Optional By default, the low-pri-master function is disabled.  This command is configured on the Backup for fast switch after the priority of Master decreases.

---

## Note

- For the creation of Track and the configurations of Association of Track with BFD or RTR, see Track-related chapter in the User Manual.
  - The low-pri-master function enables the Backup to switch quickly when receiving low-priority packets, even if it is in non-preemption mode. If this function is not configured, when low-priority packets are received, the Backup will switch after the next timeout period. When the switch time is not strictly required, it's unnecessary to configure the low-pri-master function. However, when the switch time is strictly required, this function can make the switch time reach millisecond level.
- 

### Configure Coordination of VRRPv3 with Track to Monitor Interconnecting Lines of Master and Backup

After coordination of VRRPv3 with Track to monitor interconnecting lines of Master and Backup is configured, when the line between Master and Backup is down, the Backup will quickly switch to Master. For details, see the figure below.

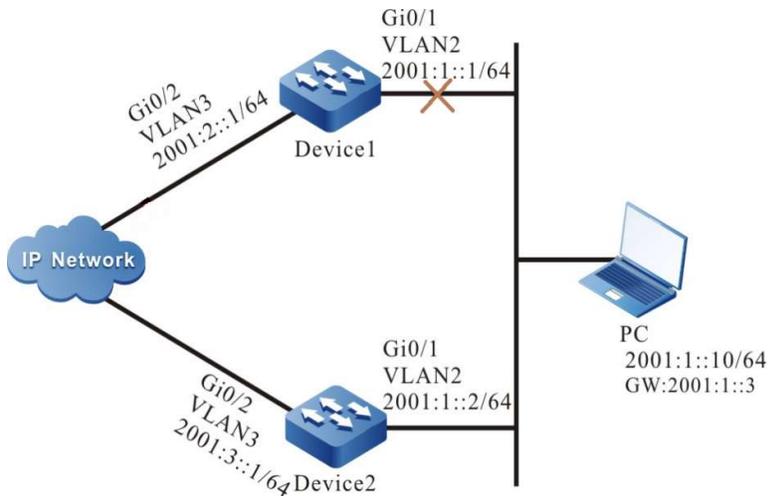

Figure 104-2 Configure Coordination of VRRPv3 with Track to Monitor Interconnecting Lines of Master and Backup

Table 104-9 Configuring Coordination of VRRPv3 with Track to Monitor Interconnecting Lines of Master and Backup

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter interface mode.	<b>interface interface-name</b>	Mandatory
Configure the function of fast switch when the Backup VRRPv3 device finds the line between Master and Backup becomes down	<b>ipv6 vrrp vrid track track-id switchover</b>	Mandatory By default, VRRPv3 is not coordinated with Track.

### Note

- For the configurations of associating Track with BFD and RTR, see Track-related chapter in the User Manual.
- Track can be associated with BFD to monitor the interconnecting lines between Master and Backup.

## 104.2.4 VRRPv3 Monitoring and Maintaining

Table 6 VRRPv3 Monitoring and Maintaining

Command	Description
<b>show ipv6 vrrp [ interface <i>interface-name</i> ]   [brief]</b>	Show the VRRPv3 configuration information, including virtual IP address, virtual MAC address, device status, device priority, and dependent device interface address.

## 104.3 Typical Configuration Example of VRRPv3

### 104.3.1 Configure IPv6-based Single VRRP Backup Group

#### Network Requirements

- On Device1 and Device2, create an IPv6-based single VRRP backup group so that Device1 and Device2 can share a virtual IPv6 link-local address and global address to back up the default gateway of the user's host, reducing the time of network disconnection.

#### Network Topology

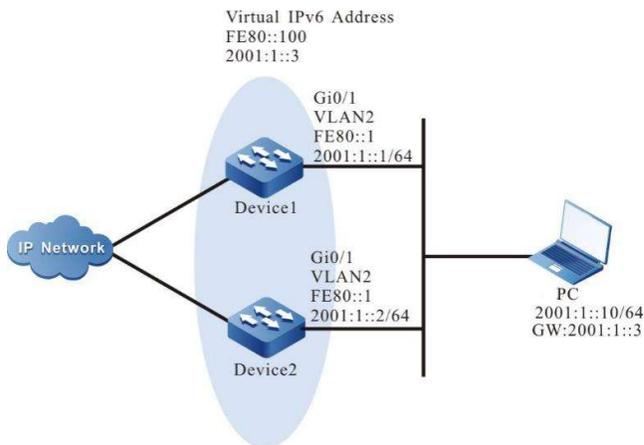

Figure 104-3 Network Topology for Configuring IPv6-based Single VRRP Backup Group

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IPv6 address of each interface, and turn on the switch of RA response and RA period sending.

```
Device1#configure terminal
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 address fe80::1 link-local
Device1(config-if-vlan2)#ipv6 address 2001:1::1/64
```

```

Device1(config-if-vlan2)#no ipv6 nd suppress-ra period
Device1(config-if-vlan2)#no ipv6 nd suppress-ra response
Device1(config-if-vlan2)#exit
Device2#configure terminal
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 address fe80::2 link-local
Device2(config-if-vlan2)#ipv6 address 2001:1::2/64
Device2(config-if-vlan2)#no ipv6 nd suppress-ra period
Device2(config-if-vlan2)#no ipv6 nd suppress-ra response
Device2(config-if-vlan2)#exit

```

Step 3: Create an IPv6-based VRRP group.

#On Device1, configure VRRP group 1, with virtual IP address of 2001:1::3 and fe80::100 and priority configured of 110.

```

Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 vrrp 1 ip fe80::100 link-local
Device1(config-if-vlan2)#ipv6 vrrp 1 ip 2001:1::3
Device1(config-if-vlan2)#ipv6 vrrp 1 priority 110
Device1(config-if-vlan2)#exit

```

#On Device2, configure VRRP group 1, with virtual IP address of 2001:1::3 and fe80::100.

```

Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 vrrp 1 ip fe80::100 link-local
Device2(config-if-vlan2)#ipv6 vrrp 1 ip 2001:1::3
Device2(config-if-vlan2)#exit

```

Step 4: Check the result.

#View IPv6 VRRP status on Device1.

```

Device1#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
  Pri-addr : fe80::1
  Vrf : 0
  Pri-matchaddr : fe80::1
  Virtual router : 1
  Mac mode: real mac mode
  Virtual IP address : fe80::100
  Global address count:1
    Global Match address : 2001:1::1
    Global Virtual IP address : 2001:1::3
  Virtual MAC address : 00-00-5e-00-02-01
  State : Master
  Normal priority : 110
  Curmet priority : 110
  Priority reduced : 0
  Preempt-mode : YES
  Advertise-interval : 100
  Authentication Mode : None

```

#View IPv6 VRRP status on Device2.

```

Device2#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
  Pri-addr : fe80::2
  Vrf : 0
  Pri-matchaddr : fe80::2
  Virtual router : 1
  Mac mode: real mac mode
  Virtual IP address : fe80::100
  Global address count:1
    Global Match address : 2001:1::2
    Global Virtual IP address : 2001:1::3
  Virtual MAC address : 00-00-5e-00-02-01
  State : Backup

```

Master addr : fe80::1  
Normal priority : 100  
Current priority : 100  
Priority reduced : 0  
Preempt-mode : YES  
Advertise-interval : 100  
Authentication Mode : None

It can be seen that the VRRP status of Device1 is Master, and that of Device2 is Backup. Device1 shares a virtual IP address with Device2. The host communicates with the network through this address. When Device1 fails, Device2 immediately switches to Master for data forwarding.

---

## Note

- By default, VRRPv3 works in preemption mode, and the default priority is 100.
  - For VRRPv3 status, the device with a higher priority is the Master. When they have the same priority, the device with a larger interface IP link-local address is the Master.
- 

### 104.3.2 Configure IPv6-based Coordination of VRRP with Track

#### Network Requirements

- On Device1 and Device2, create an IPv6-based single VRRP backup group so that Device1 and Device2 can share a virtual IPv6 link-local address and virtual global address to back up the default gateway of the user's host, reducing the time of network disconnection.
- Device1 monitors the status of VLAN3 through Track. When the uplink interface VLAN3 of Device1 is down, VRRPv3 can sense the down event on the monitoring event and lower its priority so that the Backup will become a Master for data forwarding.

#### Network Topology

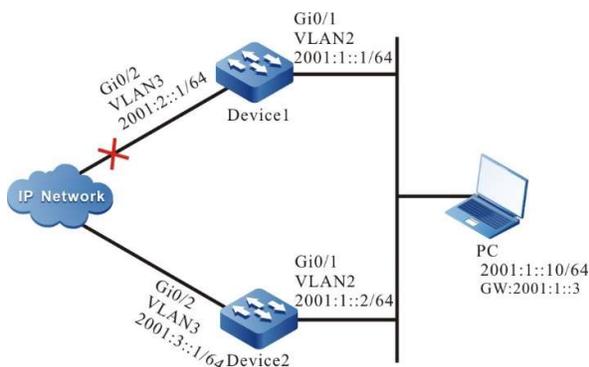

Figure 104-4 Network Topology for Configuring IPv6-based Coordination of VRRP with Track

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure the IPv6 address of each interface, and turn on the switch of RA response and RA period sending.

```
Device1#configure terminal
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 address fe80::1 link-local
Device1(config-if-vlan2)#ipv6 address 2001:1::1/64
Device1(config-if-vlan2)#no ipv6 nd suppress-ra period
Device1(config-if-vlan2)#no ipv6 nd suppress-ra response
Device1(config-if-vlan2)#exit
Device2#configure terminal
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 address fe80::2 link-local
Device2(config-if-vlan2)#ipv6 address 2001:1::2/64
Device2(config-if-vlan2)#no ipv6 nd suppress-ra period
Device2(config-if-vlan2)#no ipv6 nd suppress-ra response
Device2(config-if-vlan2)#exit
```

Step 3: Create an IPv6-based VRRP group.

#On Device1, configure VRRP group 1, with virtual IP address of 2001:1::3 and fe80::100 and priority configured of 110.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 vrrp 1 ip fe80::100 link-local
Device1(config-if-vlan2)#ipv6 vrrp 1 ip 2001:1::3
Device1(config-if-vlan2)#ipv6 vrrp 1 priority 110
Device1(config-if-vlan2)#exit
```

#On Device2, configure VRRP group 1, with virtual IP address of 2001:1::3 and fe80::100.

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 vrrp 1 ip fe80::100 link-local
Device2(config-if-vlan2)#ipv6 vrrp 1 ip 2001:1::3
Device2(config-if-vlan2)#exit
```

#View IPv6 VRRP status on Device1.

```
Device1# show ipv6 vrrp
Interface vlan2 (Flags 0x9)
Pri-addr : fe80::1
Vrf : 0
Pri-matchaddr : fe80::1
Virtual router : 1
Mac mode: real mac mode
Virtual IP address : fe80::100
Global address count:1
  Global Match address : 2001:1::1
  Global Virtual IP address : 2001:1::3
Virtual MAC address : 00-00-5e-00-02-01
State : Master
Normal priority : 110
Current priority : 110
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None
```

#View IPv6 VRRP status on Device2.

```
Device2#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
Pri-addr : fe80::2
Vrf : 0
```

```

Pri-matchaddr : fe80::2
Virtual router : 1
Mac mode: real mac mode
Virtual IP address : fe80::100
Global address count:1
  Global Match address : 2001:1::2
  Global Virtual IP address : 2001:1::3
Virtual MAC address : 00-00-5e-00-02-01
State : Backup
Master addr : fe80::1
Normal priority : 100
Current priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None

```

Step 4: Configure coordination of VRRP with Track.

#On Device1, configure coordination of VRRPv3 with Track to monitor the uplink interface VLAN3, and configure the priority decrement as 20.

```

Device1#configure terminal
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 vrrp 1 track vlan3 20
Device1(config-if-vlan2)#exit

```

#View IPv6 VRRP status on Device1.

```

Device1#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
Pri-addr : fe80::1
Vrf : 0
Pri-matchaddr : fe80::1
Virtual router : 1
Mac mode: real mac mode
Virtual IP address : fe80::100
Global address count:1
  Global Match address : 2001:1::1
  Global Virtual IP address : 2001:1::3
Virtual MAC address : 00-00-5e-00-02-01
State : Master
Normal priority : 110
Current priority : 110
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None
Track interface : vlan3
Reduce : 20
Reduce state : NO

```

Step 5: Check the result.

When the monitoring interface VLAN3 of Device1 becomes down, VRRP priority decreases by 20. As a result, Device2 has a higher priority and switches to Master.

#View IPv6 VRRP status on Device1.

```

Device1#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
Pri-addr : fe80::1
Vrf : 0
Pri-matchaddr : fe80::1
Virtual router : 1
Mac mode: real mac mode
Virtual IP address : fe80::100

```

```

Global address count:1
  Global Match address : 2001:1::1
  Global Virtual IP address : 2001:1::3
Virtual MAC address : 00-00-5e-00-02-01
State : Backup
Master addr : fe80::2
Normal priority : 110
Current priority : 90
Priority reduced : 20
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None
Track interface : vlan3
Reduce : 20
Reduce state : YES

```

#View IPv6 VRRP status on Device2.

```

Device2#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
Pri-addr : fe80::2
Vrf : 0
Pri-matchaddr : fe80::2
Virtual router : 1
Mac mode: real mac mode
Virtual IP address : fe80::100
Global address count:1
  Global Match address : 2001:1::2
  Global Virtual IP address : 2001:1::3
Virtual MAC address : 00-00-5e-00-02-01
State : Master
Normal priority : 100
Current priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None

```

### 104.3.3 Configure IPv6-based VRRP load Balancing

#### Network Requirements

- Create two IPv6-based VRRP backup groups on Device1 and Device2 which belong to two different VRRP groups. In particular, Device1 is a Master in group 1 and a Backup in group 2; Device2 is a Backup in group 1 and a Master in group 2.
- PC1 forwards data through Device1, and PC2 does so through Device2 to realize load balancing.

#### Network Topology

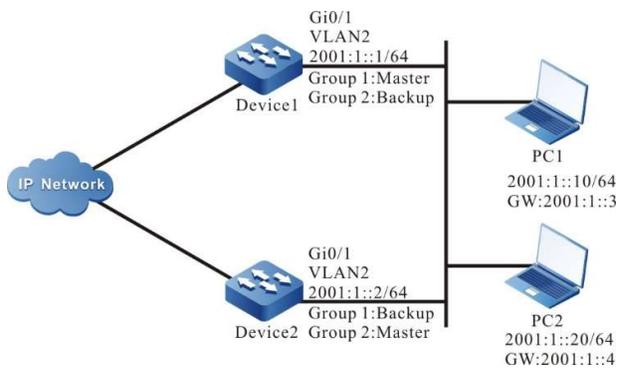

Figure 104-5 Network Topology for Configuring IPv6-based Load Balancing

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure the IPv6 address of each interface, and turn on the switch of RA response and RA period sending.

```
Device1#configure terminal
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 address fe80::1 link-local
Device1(config-if-vlan2)#ipv6 address 2001:1::1/64
Device1(config-if-vlan2)#no ipv6 nd suppress-ra period
Device1(config-if-vlan2)#no ipv6 nd suppress-ra response
Device1(config-if-vlan2)#exit
Device2#configure terminal
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 address fe80::2 link-local
Device2(config-if-vlan2)#ipv6 address 2001:1::2/64
Device2(config-if-vlan2)#no ipv6 nd suppress-ra period
Device2(config-if-vlan2)#no ipv6 nd suppress-ra respons
Device2(config-if-vlan2)#exit
```

Step 3: Create IPv6-based VRRP group 1.

#On Device1, configure VRRP group 1, with virtual IP address of 2001:1::3 and fe80::100 and priority configured of 110.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 vrrp 1 ip fe80::100 link-local
Device1(config-if-vlan2)#ipv6 vrrp 1 ip 2001:1::3
Device1(config-if-vlan2)#ipv6 vrrp 1 priority 110
Device1(config-if-vlan2)#exit
```

#On Device2, configure VRRP group 1, with virtual IP address of 2001:1::3 and fe80::100.

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 vrrp 1 ip fe80::100 link-local
Device2(config-if-vlan2)#ipv6 vrrp 1 ip 2001:1::3
Device2(config-if-vlan2)#exit
```

Step 4: Create IPv6-based VRRP group 2.

#On Device1, configure VRRP group 2, with the virtual IP address of 2001:1::4 and fe80::200.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 vrrp 2 ip fe80::200 link-local
Device1(config-if-vlan2)#ipv6 vrrp 2 ip 2001:1::4
Device1(config-if-vlan2)#exit
```

#On Device2, configure VRRP group 2, with virtual IP address of 2001:1::4 and fe80::200 and priority configured of 110.

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 vrrp 2 ip fe80::200 link-local
Device2(config-if-vlan2)#ipv6 vrrp 2 ip 2001:1::4
Device2(config-if-vlan2)#ipv6 vrrp 2 priority 110
Device2(config-if-vlan2)#exit
```

Step 5: Check the result.

#On Device1, view IPv6 VRRP status in group 1 and 2.

```
Device1#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
Pri-addr : fe80::1
Vrf : 0
Pri-matchaddr : fe80::1
Virtual router : 1
Mac mode: real mac mode
Virtual IP address : fe80::100
Global address count:1
  Global Match address : 2001:1::1
  Global Virtual IP address : 2001:1::3
Virtual MAC address : 00-00-5e-00-02-01
State : Master
Normal priority : 110
Currnet priority : 110
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None

Pri-matchaddr : fe80::1
Virtual router : 2
Mac mode: real mac mode
Virtual IP address : fe80::200
Global address count:1
  Global Match address : 2001:1::1
  Global Virtual IP address : 2001:1::4
Virtual MAC address : 00-00-5e-00-02-02
State : Backup
Master addr : fe80::2
Normal priority : 100
Currnet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None
```

#On Device2, view IPv6 VRRP status in group 1 and 2.

```
Device2#show ipv6 vrrp
Interface vlan2 (Flags 0x9)
Pri-addr : fe80::2
Vrf : 0
Pri-matchaddr : fe80::2
Virtual router : 1
Mac mode: real mac mode
Virtual IP address : fe80::100
Global address count:1
  Global Match address : 2001:1::2
  Global Virtual IP address : 2001:1::3
Virtual MAC address : 00-00-5e-00-02-01
State : Backup
Master addr : fe80::1
Normal priority : 100
Currnet priority : 100
Priority reduced : 0
Preempt-mode : YES
Advertise-interval : 100
Authentication Mode : None

Pri-matchaddr : fe80::2
Virtual router : 2
Mac mode: real mac mode
Virtual IP address : fe80::200
Global address count:1
```

Global Match address : 2001:1::2  
Global Virtual IP address : 2001:1::4  
Virtual MAC address : 00-00-5e-00-02-02  
State : Master  
Normal priority : 110  
Current priority : 110  
Priority reduced : 0  
Preempt-mode : YES  
Advertise-interval : 100  
Authentication Mode : None

It can be seen that as a Master of VRRP group 1, Device1 also acts as a Backup in VRRP group 2; as a Master of VRRP group 2, Device2 also acts as a Backup in VRRP group 1. When a device fails, the two PCs forward data through the other one. This can achieve both load balancing and mutual backup.

# 105 VBRP

---

## 105.1 Overview

VBRP (Virtual Backup Router Protocol) provides a backup function for gateway. It is used by multiple devices to maintain the uninterrupted forwarding of virtual gateway. VBRP maps multiple devices involved into a virtual router, and ensures that there is only one device which is forwarding packets on behalf of the virtual router. When the device responsible for forwarding task fails to work normally for some reason, another backup device will forward packets on behalf of the virtual router, and the device which cannot work normally will no longer undertake the forwarding task. This switching process is so short that it is transparent for the host in the LAN. As a result, you can reach the purpose of gateway backup.

The master and backup devices are hereinafter referred to as "Active" and "Standby" respectively.

## 105.2 VBRP Function Configuration

Table 105 VBRP Function Configuration List

Configuration Task	
Configure Basic Mode of VBRP	Enable VBRP Protocol
	Configure VBRP Priority
	Configure VBRP Preemption Mode
	Configure Real MAC Address of VBRP
Configure VBRP Network Authentication	Configure Simple Text Authentication of VBRP
	Configure VBRP MD5 Authentication
	Configure Coordination of VBRP with Track to Associate Uplink Interface

Configuration Task	
Configure Coordination of VBRP with Track to Associate Uplink Interface	Configure Coordination of VBRP with Track to Associate MLAG Role

### 105.2.1 Configure Basic Functions of VBRP

In various configuration tasks of VBRP, you must enable VBRP function first. Other functional performance configured cannot take effect until the virtual IP address of VBRP group is in the same network segment with interface IP address.

#### Configuration Condition

Before configuring basic functions of VBRP, do the following:

- Configure interface IP address.

#### Enable VBRP Protocol

To enable the VBRP function, you need to create a VBRP group under the interface and add the VBRP device to this group.

Table 105 Enabling VBRP Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VBRP group	<b>standby</b> [ <i>group-number</i> ] <b>ip</b> [ <i>ip-address</i> ]	Mandatory  Configure to add the device to the VBRP group. The <i>group-number</i> is 0 by default, and <i>ip-address</i> is a virtual IP address.

#### Configure VBRP Priority

After VBRP is configured, if no priority is set, the default priority 100 will be used; the device with a higher priority will be elected as the Active responsible for forwarding packets, and others will become Standbys; if all devices have the same priority, the election will be conducted according to the size of the interface IP

address of each device, and the device with a larger interface IP address becomes the Active. You can set the priority of VBRP as needed. The larger the value, the higher the priority.

Table 1 Configuring VBRP Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure the priority of VBRP group	<b>standby</b> [ <i>group-number</i> ] <b>priority</b> <i>value</i>	Mandatory Configure priority for this VRRP. The default priority is 100.

### Configure VBRP Preemption Mode

In preemption mode, once other devices in VBRP group finds their priority is higher than that of current Active, they will become the Active; in non-preemption mode, if the Active doesn't fail, other devices cannot become an Active even if they are configured with higher priority.

Table 2 Configuring VBRP Preemption Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VBRP group as preemption mode	<b>standby</b> [ <i>group-number</i> ] <b>preempt</b> [ <i>delay delay-time</i> ]	Mandatory Configure this VBRP as preemption mode. By default, it is in non-preemption mode.

### Configure Real MAC Address of VBRP

After VBRP is configured, if the VBRP group should use real MAC address, the following command should be used for configuration. When the virtual router responds to an ARP request, it provides a real MAC address instead of a virtual MAC address. It is noteworthy that virtual MAC address is used by default.

Table 3 Configuring Real MAC Address of VBRP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VBRP with real MAC address	<b>standby</b> [ <i>group-number</i> ] <b>use-bia</b>	Mandatory By default, virtual MAC address is used.

---

### Note

- By default, virtual MAC address is used after VBRP configuration is done. When the command **standby use-bia** is configured, real MAC address is used by the host to forward packets; after the command **no standby use-bia** is used, the virtual MAC address of corresponding interface is used by the host to forward packets.
- 

## 105.2.2 Configure VBRP Network Authentication

There are two types of authentication for VBRP, i.e. simple text authentication and MD5 authentication. For simple text authentication, there should be no more than 8 characters; for MD5 authentication, no more than 64 characters are required.

### Configuration Condition

Before configuring basic functions of VBRP, do the following:

- Configure VBRP group.

### Configure Simple Text Authentication of VBRP

Check and verify the effectiveness of VBRP packets by configuring VBRP authentication. VBRP simple text authentication can be configured with the following command.

Table 4 Configuring VBRP Simple Text Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure Simple Text Authentication of VBRP	<b>standby</b> <i>group-number</i> <b>authentication</b> { <i>string</i> }	Mandatory  The authentication key configured is a string of no more than 8 characters.  By default, simple text authentication is disabled.

### Configure VBRP MD5 Authentication

Check and verify the effectiveness of VBRP packets by configuring VBRP authentication. VBRP MD5 authentication can be configured with the following command.

Table 5 Configuring VBRP MD5 Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure VBRP MD5 Authentication	<b>standby</b> <i>group-number</i> <b>authentication</b> { <b>md5</b> { <b>key-id</b> <i>key-identifier</i> <b>key-string</b> <i>key-string</i> }   { <b>key-string</b> <i>key-string</i> } }	Mandatory  MD5 network authentication is configured, with a length of no more than 8 characters.  By default, MD5 authentication is disabled.

### 105.2.3 Configure Coordination of VBRP with Track

Associate VBRP with the uplink interface to be cared about through Track. When the uplink interface is down, the Active will automatically lower its priority and the Standby will receive the packet with a low priority and switch to Active. For details, see the figure below.

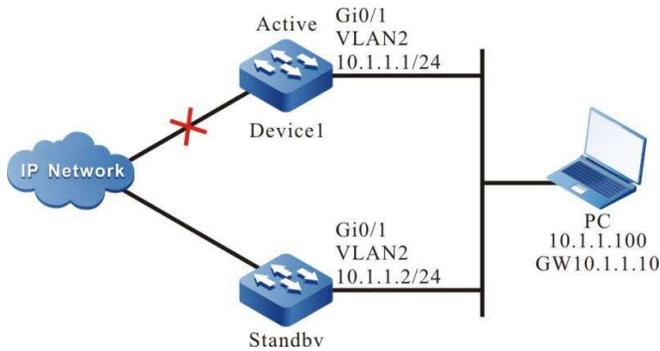

Figure 105 Configuring Coordination of VBRP with Track to Monitor Uplink of Active

#### Configuration Condition

Before configuring basic functions of VBRP, do the following:

- Configure VBRP group.

#### Configure Coordination of VBRP with Track to Associate Uplink Interface

Associate VBRP with the uplink interface to be cared about through Track. When the uplink interface is down, the Active will automatically lower its priority and the Standby will receive the VBRP packet with a low priority and switch to Active.

Table 6 Configuring Coordination of VBRP with Track to Associate with Uplink Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure coordination of VBRP with Track to associate uplink interface	<b>standby</b> [ <i>group-number</i> ] <b>track</b> { { <i>interface-name</i> }   <i>track-id</i> } [ <i>decrement</i> ]	Mandatory Configure the associated interface <i>interface-name</i> . When this interface becomes <i>down</i> , the <i>decrement</i> of its priority decreases by 10 by default.

### Configure Coordination of VBRP with Track to Associate BFD and RTR

If Track is associated with BFD and RTR, the Active can directly associate with this Track group to monitor the lines. When any failure occurs on the lines, the Active decreases its priority. At this moment, the Standby switches to Active after receiving the VBRP packet with a low priority.

Table 7 Configuring Coordination of VBRP with Track to Associate with BFD and RTR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure coordination of VBRP with Track to associate uplink interface	<b>standby</b> [ <i>group-number</i> ] <b>track</b> { <i>track-id</i> } [ <i>decrement</i> ]	Mandatory Configure the associated Track <i>track-id</i> and associate this Track with BFD and RTR; by default, the priority decreases by 10.

---

#### Note

- For the configurations of associating Track with BFD and RTR, see Track-related chapter in the User Manual.
- 

### Configure Coordination of VBRP with Track to Associate MLAG Role

After configuration, the MLAG active device can perform protocol interaction; the MLAG standby device which maintains at standby doesn't perform protocol interaction.

Table 8 Configuring Coordination of VBRP with Track to Associate MLAG Role

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure coordination of VBRP with Track to associate uplink interface	<b>standby</b> [ <i>group-number</i> ] <b>track mlag role</b>	Mandatory  Configure the associated MLAG role.  In particular, group-number is the VBRP group number.

## 105.2.4 VBRP Monitoring and Maintaining

Table 9 VBRP Monitoring and Maintaining

Command	Description
<b>Show standby</b> [brief]   [ all ]   [ interface <i>interface-name</i> group gid]	Show the VBRP configuration information, including virtual IP address, virtual MAC address, device status, device priority, and dependent device interface address.

## 105.3 Typical Configuration Example of VBRP

### 105.3.1 Configure Basic Mode of VBRP

#### Network Requirements

- Enable VBRP between Device1 and Device2 so that Device1 and Device2 can share a virtual IP address to back up the default gateway of the user's host, reducing the time of network disconnection.

#### Network Topology

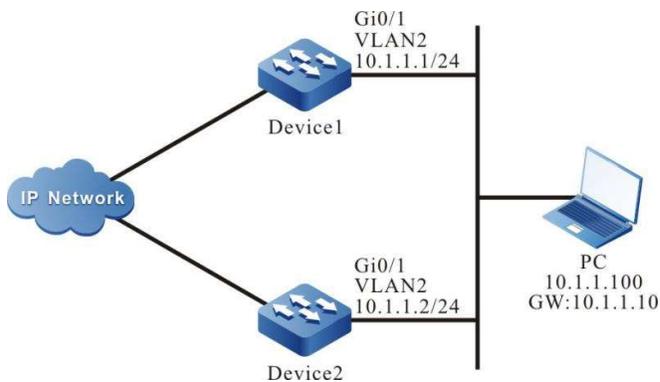

Figure 105 Network Topology for Configuring Basic Mode of VBRP

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Create VBRP group.

#On Device1, configure VBRP group 1, with virtual IP address of 10.1.1.10; enable the preemption function; configure priority as 110.

```
Device1#configure terminal
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#standby 1 ip 10.1.1.10
Device1(config-if-vlan2)#standby 1 preempt
Device1(config-if-vlan2)#standby 1 priority 110
```

#On Device2, configure VBRP group 1, with virtual IP address of 10.1.1.10, and enable the preemption function.

```
Device2#configure terminal
Device1(config-if-vlan2)#standby 1 ip 10.1.1.10
Device1(config-if-vlan2)#standby 1 preempt
Device1(config-if-vlan2)#standby 1 priority 110
```

Step 4: Check the result.

#View the VBRP status of Device1.

```
Device1#show standby
Interface vlan2
  Primary address 10.1.1.1, state up
  Group 1
  State is Active
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 193.168.1.1/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC, installed into HW
  Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.633348 secs
  Preemption enabled, delay 0 sec
```

```
Active router is local
Standby router is 10.1.1.2,priority 100 (expires in 8.466648 secs)
Priority 110 (configured 110)
```

#View the VBRP status of Device2.

```
Device2#show standby
Interface vlan2
  Primary address 10.1.1.2, state up
  Group 1
  State is Standby
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 10.1.1.2/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC
  Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.450022 secs
  Preemption enabled, delay 0 sec
  Active router is 10.1.1.1, priority 110 (expires in 7.266656 secs)
  Standby router is local
  Priority 100 (configured 100)
```

It can be seen from the VBRP status that Device1, in Active status, has a VBRP priority of 110, and Device2 has a VBRP status of Standby. When Device1 fails, Device2 automatically switches to Active for data forwarding.

---

## Note

- For VBRP status, the device with a higher priority is the Active. When they have the same priority, the device with a larger interface IP address is the Active.
  - By default, VBRP works in the non-preemption mode. Preemption mode which needs to be configured manually is recommended.
  - By default, the default VBRP priority is 100.
- 

## 105.3.2 Configure Coordination of VBRP with Track

### Network Requirements

- Enable VBRP between Device1 and Device2.
- Device1 monitors the status of VLAN3 through Track. When the uplink interface VLAN3 of Device1 is down, VBRP can sense and switch status so that the Standby will become an Active for data forwarding.

### Network Topology

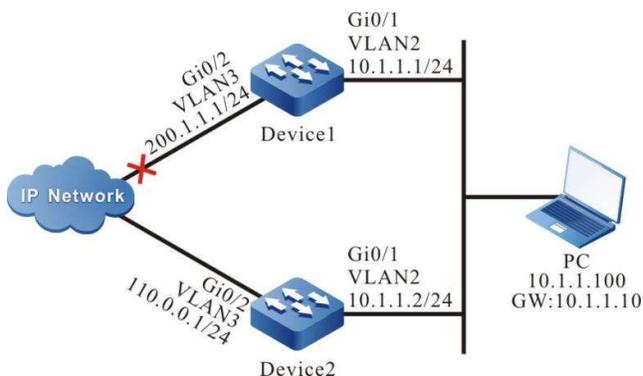

Figure 1 Network Topology for Coordination of VBRP with Track

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Create VBRP group.

#On Device1, configure VBRP group 1 with virtual IP address of 10.1.1.10; enable the preemption function; configure priority as 110.

```
Device1#configure terminal
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#standby 1 ip 10.1.1.10
Device1(config-if-vlan2)#standby 1 preempt
Device1(config-if-vlan2)#standby 1 priority 110
```

#On Device2, configure VBRP group 1 with virtual IP address of 10.1.1.10, and enable the preemption function.

```
Device2#configure terminal
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#standby 1 ip 10.1.1.10
Device2(config-if-vlan2)#standby 1 preempt
```

#View the VBRP status of Device1.

```
Device1#show standby
Interface vlan2
  Primary address 10.1.1.1, state up
Group 1
  State is Active
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 10.1.1.1/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC, installed into HW
  Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.533352 secs
  Preemption enabled, delay 0 sec
  Active router is local
  Standby router is 10.1.1.2, priority 100 (expires in 9.283362 secs)
  Priority 110 (configured 110)
```

#View the VBRP status of Device2.

```
Device2#show standby
Interface vlan2
  Primary address 10.1.1.2, state up
  Group 1
  State is Standby
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 10.1.1.2/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC
  Hello time 3 sec, hold time 10 sec
    Next hello sent in 2.516646 secs
  Preemption enabled, delay 0 sec
  Active router is 10.1.1.1, priority 110 (expires in 9.516646 secs)
  Standby router is local
  Priority 100 (configured 100)
```

Step 4: Configure coordination of VBRP with Track.

#On Device1, configure coordination of VBRP with Track to monitor the uplink interface VLAN3, and configure the priority decrement as 20.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#standby 1 track vlan 3 20
```

#View the VBRP status of Device1.

```
Device1#show standby
Interface vlan2
  Primary address 10.1.1.1, state up
  Group 1
  State is Active
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 10.1.1.1/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC, installed into HW
  Hello time 3 sec, hold time 10 sec
    Next hello sent in 0.533352 secs
  Preemption enabled, delay 0 sec
  Active router is local
  Standby router is 10.1.1.2, priority 100 (expires in 9.283362 secs)
  Priority 110 (configured 110)
  Track interface vlan3 state Up decrement 20
```

#When the uplink interface VLAN3 of Device1 is down, VBRP priority decreases by 20. As a result, Device2 has a higher priority, which causes status switch.

#View the VBRP status of Device1.

```
Device1#show standby
Interface vlan2
  Primary address 10.1.1.1, state up
  Group 1
  State is Standby
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 10.1.1.1/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC
  Hello time 3 sec, hold time 10 sec
    Next hello sent in 0.800008 secs
  Preemption enabled, delay 0 sec
  Active router is 10.1.1.2, priority 100 (expires in 7.766676 secs)
```

```
Standby router is local
Priority 90 (configured 110)
Track interface vln3 state Down decrement 20
```

#View the VBRP status of Device2.

```
Device2#show standby
Interface vln2
  Primary address 10.1.1.2, state up
Group 1
  State is Active
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 10.1.1.2/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC, installed into HW
  Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.533352 secs
  Preemption enabled, delay 0 sec
  Active router is local
  Standby router is 10.1.1.1, priority 90 (expires in 9.283362 secs)
  Priority 100 (configured 100)
```

### 105.3.3 Configure VBRP load Balancing Mode

#### Network Requirements

- Device1 and Device2 belong to two different VBRP groups. In particular, Device1 is an Active in group 1 and a Standby in group 2; Device2 is a Standby in group 1 and an Active in group 2.
- PC1 forwards data through Device1, and PC2 does so through Device2 to realize load balancing.

#### Network Topology

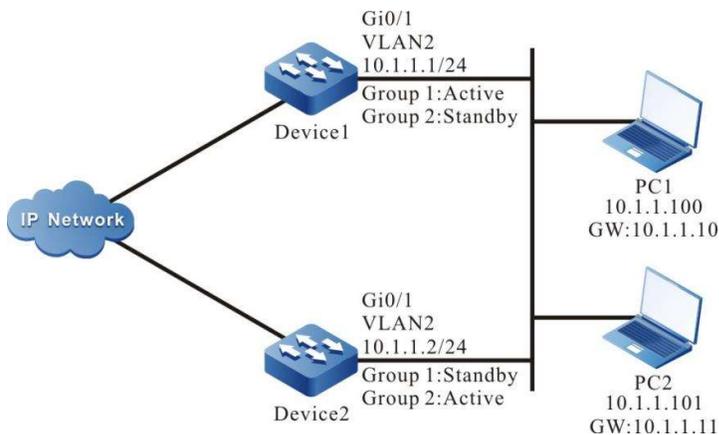

Figure 2 Network Topology for VBRP Load Balancing

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Create VBRP group 1.

#On Device1, configure VBRP group 1 with virtual IP address of 10.1.1.10; enable the preemption function; configure priority as 110.

```
Device1#configure terminal
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#standby 1 ip 10.1.1.10
Device1(config-if-vlan2)#standby 1 preempt
Device1(config-if-vlan2)#standby 1 priority 110
```

#On Device2, configure VBRP group 1 with virtual IP address of 10.1.1.10, and enable the preemption function.

```
Device2#configure terminal
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#standby 1 ip 10.1.1.10
Device2(config-if-vlan2)#standby 1 preempt
```

Step 4: Create VBRP group 2.

#On Device1, configure VBRP group 2 with virtual IP address of 10.1.1.11, and enable the preemption function.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#standby 2 ip 10.1.1.11
Device1(config-if-vlan2)#standby 2 preempt
```

#On Device2, configure VBRP group 1 with virtual IP address of 10.1.1.11; enable the preemption function; configure priority as 120.

```
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#standby 2 ip 10.1.1.11
Device2(config-if-vlan2)#standby 2 preempt
Device2(config-if-vlan2)#standby 2 priority 120
```

Step 5: Check the result.

#On Device1, view VBRP status in group 1 and 2.

```
Device1#show standby
Interface vlan2
  Primary address 10.1.1.1, state up
  Group 1
  State is Active
  Virtual IP address is 10.1.1.10
  Refer to local IP prefix 10.1.1.1/24
  Local virtual MAC address is 0000.0c07.ac01
  Current MAC type VMAC, installed into HW
  Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.633348 secs
  Preemption enabled, delay 0 sec
  Active router is local
  Standby router is 10.1.1.2, priority 100 (expires in 7.83370 secs)
```

```
Priority 110 (configured 110)
Group 2
State is Standby
Virtual IP address is 10.1.1.11
Refer to local IP prefix 10.1.1.1/24
Local virtual MAC address is 0000.0c07.ac02
Current MAC type VMAC
Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.950002 secs
Preemption enabled, delay 0 sec
Active router is 10.1.1.2, priority 120 (expires in 7.300028 secs)
Standby router is local
Priority 100 (configured 100)
```

#On Device2, view VBRP status in group 1 and 2.

```
Device2#show standby
Interface vlan2
Primary address 10.1.1.2, state up
Group 1
State is Standby
Virtual IP address is 10.1.1.10
Refer to local IP prefix 10.1.1.2/24
Local virtual MAC address is 0000.0c07.ac01
Current MAC type VMAC
Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.600016 secs
Preemption enabled, delay 0 sec
Active router is 10.1.1.1, priority 110 (expires in 7.700012 secs)
Standby router is local
Priority 100 (configured 100)
Group 2
State is Active
Virtual IP address is 10.1.1.11
Refer to local IP prefix 10.1.1.2/24
Local virtual MAC address is 0000.0c07.ac02
Current MAC type VMAC, installed into HW
Hello time 3 sec, hold time 10 sec
  Next hello sent in 0.816674 secs
Preemption enabled, delay 0 sec
Active router is local
Standby router is 10.1.1.1, priority 100 (expires in 8.33332 secs)
Priority 120 (configured 120)
```

It is indicated that as an Active of VBRP group 1, Device1 also acts as a Standby in VBRP group 2. On the contrary, as an Active of VBRP group 2, Device2 also acts as a Standby in VBRP group 2. When a device fails, the two PCs forward data through the other one. This can achieve both load balancing and mutual backup.

# 106 Load-Balance Virtual Router Redundancy Protocol

## 106.1 Overview

Load-Balance Virtual Router Redundancy Protocol (Load-Balance VRRP) is a routing protocol which allows dynamic load of clients configured with the same gateway when there are multiple gateway exits in the LAN. It also considers the redundant backup feature.

The master and backup devices are hereinafter referred to as "Master" and "Backup" respectively.

## 106.2 Load-Balance Virtual Router Redundancy Protocol Function

### Configuration

Table 106 Load-Balance VRRP Function Configuration List

Configuration Task	
Configure Current VRRP Mode	Enable Load-Balance VRRP Mode
Configure Basic Functions of Load-Balance VRRP	Enable Load-Balance VRRP
	Configure Priority for Load-Balance VRRP
	Configure Virtual MAC Address of Load-Balance VRRP
Configure Timer of Load-Balance VRRP	Configure Interval of HELLO Packet Period
	Configure Interval of Keep Packet Period
	Configure Dead Timer for Virtual MAC Address
	Configure Terminal Aging Timer on Forwarding Lane
	Configure Terminal Detection Timer on Forwarding Lane

## 106.2.1 Configure Current Mode of Load-Balance VRRP

Among various configuration tasks of Load-Balance VRRP, Load-Balance VRRP mode must be enabled first. This mode and VRRP standard protocol are mutually exclusive.

### Configuration Condition

None

### Enable Load-Balance VRRP Mode

Table 1 Enabling Load-Balance VRRP Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>vrrp mode load-balance</b>	Mandatory

## 106.2.2 Configure Basic Functions of Load-Balance VRRP

Among various configuration tasks of VRRP, Load-Balance VRRP mode must be enabled first. Other functional performance configured cannot take effect until the virtual IP address of Load-Balance VRRP group is in the same network segment with the interface IP address.

### Configuration Condition

Before configuring the basic VRRP functions, do the following:

- Configure interface IP address.

### Enable Load-Balance VRRP

To enable the Load-Balance VRRP function, you are required to create a Load-Balance VRRP group under the interface and configure virtual IP address.

Table 106 Enabling VRRP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	Mandatory

Step	Command	Description
Configure Load-Balance VRRP group	<b>vrrp vrid ip ip-address</b>	Mandatory  Enable Load-Balance VRRP. In particular, vrid is the Load-Balance VRRP group number, and ip-address is the virtual IP address.

---

## Note

- In the Load-Balance VRRP mode, the virtual IP shall not be the same as the interface IP.
- 

### Configure Priority for Load-Balance VRRP

After Load-Balance VRRP is configured, if no priority is set, the default priority 100 will be used; the device with a higher priority will be elected as the Master responsible for forwarding packets, and others will become Backups; if all devices have the same priority, the election will be conducted according to the size of the interface IP address of each device, and the device with a larger interface IP address becomes the Master. You can set the priority of Load-Balance VRRP as needed. The larger the value, the higher the priority.

Table 2 Configuring Load-Balance VRRP Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface interface-name</b>	Mandatory
Configure the priority of Load-Balance VRRP group	<b>vrrp vrid priority priority</b>	Mandatory  Configure Load-Balance VRRP priority. The default priority is 100.

### Configure Simple Text Authentication of Load-Balance VRRP

After the Load-Balance VRRP is configured, if not set, simple text authentication is disabled by default; neighbors cannot be successfully established or negotiate unless the authentications in the Load-Balance VRRP group are consistent.

Table 106-5 Configuring Simple Text Authentication of Load-Balance VRRP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure simple text authentication of Load-Balance VRRP	<b>vrrp vrid authentication text</b> <i>string</i>	Mandatory  By default, the simple text authentication function is disabled.  The authentication key should have no more than 8 characters.

### Configure Real MAC Address of Load-Balance VRRP

Each virtual router in a Load-Balance VRRP has one virtual MAC address. According to the provisions of Load-Balance VRRP, the format of the virtual MAC address is as follows: 00.01.7a.00.{vrid}.{mid}. The mid value is assigned by the master. When the virtual router responds to an ARP request, it provides a virtual MAC address instead of a real MAC address of the interface. It is noteworthy that virtual MAC address is used by default.

Table 3 Configuring Real MAC Address of Load-Balance VRRP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure real MAC address for Load-Balance VRRP	<b>vrrp vrid use-bia</b>	Mandatory  By default, virtual MAC address is used.

---

 **Note**

- By default, virtual MAC address is used after VRRP configuration. When the commands mentioned in this section are configured, the real MAC address on corresponding interface is used by the host to forward packets; after deleting these commands, the virtual MAC address of corresponding interface is used by the host to forward packets.
- 

### 106.2.3 Configure Timer of Load-Balance VRRP

In Load-Balance VRRP, perform corresponding actions according to corresponding timer so as to maintain relevant status.

#### Configuration Condition

Before configuring Load-Balance VRRP timer, do the following:

- Switch current VRRP mode to Load-Balance VRRP mode
- Enable this Load-Balance VRRP group

#### Configure Interval of HELLO Packet Period

Hello packet is responsible for advertising some of its information to its neighbors and maintaining neighbor relation. Therefore, the neighbors within the same group should have consistent sending periods of Hello packets.

Table 4 Configuring Interval of Hello Packet Sending Period

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure interval of Hello packet sending period of Load-Balance VRRP group	<b>vrrp vrid timers hello</b> <i>Hello-time</i> [ <b>hold</b> <i>Hold-time</i> [ <b>preserved</b> <i>Preserved-time</i> [ <b>delay-vote</b> <i>Delay-vote-time</i> ] ] ]	Mandatory Configure interval of Hello packet sending period. In particular, vrid is VRRP group number, and Hello-time specifies the sending period of Hello packet in VRRP group.

Step	Command	Description
		Hold-time specifies the hold time of neighbors in VRRP group. Preserved-time specifies the hold time of virtual MAC in VRRP group. Delay-vote-time specifies the time of voting delay in group.

### Configure Interval of Keep Packet Period

Keep packet is mainly responsible for advertising the virtual mac address of this virtual router to layer-2 switch to refresh the layer-2 MAC entries of the switch for traffic redirection.

Table 5 Configuring Interval of Keep Packet Sending Period

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure interval of Keep packet sending period of Load-Balance VRRP group	<b>vrrp vrid timers keep</b> <i>keep-time</i>	Mandatory  Configure interval of Keep packet sending period. In particular, vrid is Load-Balance VRRP group number, and Keep-time specifies the sending period of Keep packet of Load-Balance VRRP group.

### Configure Dead Timer for Virtual MAC Address

After the owner fails, the virtual mac will experience the hold state and reach the dead state. The time of the dead state configured should be greater than the ARP aging time of the underlying terminal.

Table 6 Configuring Dead Timer of Virtual MAC Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure dead time for virtual MAC address of Load-Balance VRRP group	<b>vrp vrid timers zombie</b> <i>zombie-time</i>	Mandatory Configure Dead Timer for Virtual MAC Address In particular, vrid is Load-Balance VRRP group number, and Zombie-time specifies the dead time of virtual mac of Load-Balance VRRP group.

### Configure Terminal Aging Timer on Forwarding Lane

When managing the terminal in the forwarding layer, if this terminal is not online for a long time, it will be aged to release the resources occupied by this terminal. As a result, the terminal entries of this group will be refreshed.

Table 7 Configuring Terminal Aging Timer on Forwarding Lane

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure terminal aging timer of Load-Balance VRRP group on forwarding lane	<b>vrp vrid timers forwarding ageing</b> <i>forwarding-ageing-time</i>	Mandatory Configure terminal aging timer on forwarding lane. In particular, vrid is VRRP group number, and forwarding-ageing-time specifies the terminal aging time on forwarding lane in VRRP group.

## Configure Terminal Detection Timer on Forwarding Lane

When managing the terminal on forwarding lane, the online status of this terminal will be periodically detected so as to update the status of this local terminal.

Table 8 Configuring Terminal Detection Timer on Forwarding Lane

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory
Configure terminal detection timer of Load-Balance VRRP group on Forwarding Lane	<b>vrp vrid timers forwarding dtct</b> <i>forwarding-dtct-time</i>	Mandatory Configure terminal detection timer on forwarding lane. In particular, vrid is the Load-Balance VRRP group number. Forwarding-dtct-time specifies the terminal detection time on forwarding lane in Load-Balance VRRP group.

## 106.2.4 Load-Balance VRRP Monitoring and Maintaining

Table 9 VRRP Monitoring and Maintaining

Command	Description
Show vrrp [ interface <i>interface-name</i> ]	Show the Load-Balance VRRP configuration information, including virtual IP address, virtual MAC address, device status, device priority, dependent device interface address, and coordination group.

## 106.3 Typical Configuration Example of Load-Balance VRRP

### 106.3.1 Configure Basic Functions of Load-Balance VRRP

#### Network Requirements

- On Device1 and Device2, create a Load-Balance VRRP backup group so that Device1 and Device2 can share a virtual IP address to back up the default gateway of the user's host, reducing the time of network disconnection.
- The Load-Balance VRRP implements load function by assigning the traffic of different users' host to different VRRP devices for forwarding within a group. Unlike common VRRP, the Backup devices in Load-Balance VRRP can also forward traffic so that users can configure the same gateway address for all the hosts in the network to implement the load balancing function.

#### Network Topology

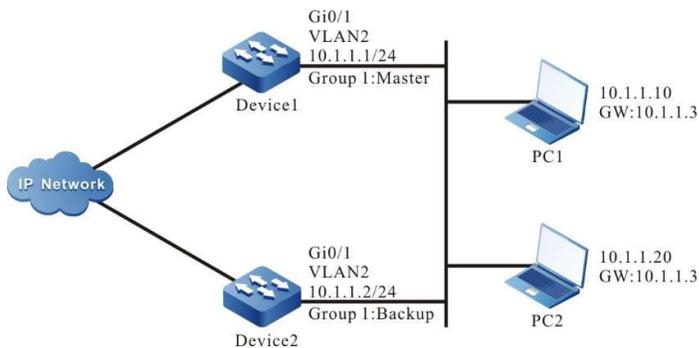

Figure 106 Network Topology for Configuring Basic Functions of Load-Balance VRRP

#### Configuration Steps

Step 1: Configure IPv4 addresses for the ports. (Omitted)

Step 2: Configure the device as Load-Balance VRRP mode.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#vrrp mode load-balance
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#vrrp mode load-balance
```

#### #View the VRRP mode of Device1.

```
Device1#show vrrp-pub mode

Current mode:load_balance
Current switch:0
```

#View the VRRP mode of Device2.

```
Device2#show vrrp-pub mode
Current mode:load_balance
Current switch:0
```

It is indicated that both Device1 and Device2 are running Load-Balance VRRP mode.

Step 3: Create a Load-Balance VRRP backup group.

#On Device1, create backup group 1, with virtual IP address of 10.1.1.3 and priority configured of 110.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device1(config-if- vlan2)#vrrp 1 priority 110
Device1(config-if- vlan2)#exit
```

#On Device2, create backup group 1, with virtual IP address of 10.1.1.3.

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#vrrp 1 ip 10.1.1.3
Device2(config-if- vlan2)#exit
```

Step 4: View the Load-Balance VRRP status.

#View the neighbor table of Load-Balance VRRP on Device1.

```
Device1#show vrrp neighbor

Gid Neighbor Priority Uid Virtual-ip Master Hold-time Interface
1 10.1.1.2 100 412780 10.1.1.3 10.1.1.1 36 vlan2
```

#It is indicated from the neighbor field that Device1 has successfully established neighbor relation with Device2.

#View the neighbor table of Load-Balance VRRP on Device2.

```
Device2#show vrrp neighbor

Gid Neighbor Priority Uid Virtual-ip Master Hold-time Interface
1 10.1.1.1 110 348619 10.1.1.3 10.1.1.1 33 vlan2
```

#It is indicated from the neighbor field that Device2 has successfully established neighbor relation with Device1.

#View the Load-Balance VRRP status of Device1.

```
Device1#show vrrp
Interface vlan2
Vrf:0
Virtual router : 1
Mac mode: virtual mac mode
Forwording mac :
00.01.7a.00.01.01 ,installed into HW
Virtual IP address : 10.1.1.3
Match address : 10.1.1.1
State : Master
Priority : 110
Hello interval(sec) : 10
next hello in 3 secs
Hold time(sec) : 40
```

```
Delay vote time(sec) : 40
Delay delete time(sec) : 20
Preserve time(sec) : 40
Keep(min) : 15
Zombie(min) : 10
Uid : 348619
Terminal number : 0/1000
```

It is indicated from the State field that Device1 has been elected as a Master.

#View the Load-Balance VRRP status of Device2.

```
Device2#show vrrp
Interface vlan2
Vrf:0
Virtual router : 1
  Mac mode: real mac mode
  Forwarding mac :
    00.01.7a.00.01.02 ,installed into HW
  Virtual IP address : 10.1.1.3
  Match address : 10.1.1.2
  State : Backup
  master:10.1.1.1
  Priority : 100
  Hello interval(sec) : 10
    next hello in 6 secs
  Hold time(sec) : 40
  Delay vote time(sec) : 40
  Delay delete time(sec) : 20
  Preserve time(sec) : 40
  Keep(min) : 15
  Zombie(min) : 10
  Uid : 412780
  Terminal number : 0
```

It is indicated from the State field that Device2 has become a Backup.

#View the MAC address forwarding allocation table of Load-Balance VRRP on Device1.

```
Device1# show vrrp fmac

Gid Virtual-ip Forwarding-mac Owner Backup Owner-state Timeout Interface
1 10.1.1.3 0001.7a00.0101 10.1.1.1 - Active - vlan2
1 10.1.1.3 0001.7a00.0102 10.1.1.2 - Active - vlan2
```

Only the Master have the MAC address forwarding allocation function. It is indicated from the corresponding relation between Owner and Forwarding-mac that the MAC forwarding address allocated to 10.1.1.1 is 0001.7a00.0101, and that allocated to 10.1.1.2 is 0001.7a00.0102.

---

## Note

- The Load-Balance VRRP can work in non-preemption mode only.
  - The Load-Balance VRRP enables election delay timer in init status, 4 times the hello interval by default. Elect after time-out.
  - The Load-Balance VRRP elects according to the priority. The device with a higher priority is the Master. When they have the same priority, the device with a larger interface IP address is the Master, and others become Backups.
-

Step 5: Check the result.

#Test the connectivity on PC1 and PC2 by pinging gateway. #View the gateway forwarding MAC address assigned by the Master to the host terminal on Device1.

```
Device1#show vrrp terminal
```

Gid	Virtual-ip	Terminal	Forwarding-mac	Interface
1	10.1.1.3	10.1.1.10	0001.7a00.0101	vlan2
1	10.1.1.3	10.1.1.20	0001.7a00.0102	vlan2

It can be seen from the table above that different gateway forwarding MAC addresses have been assigned to host terminals PC1 and PC2. Plus the MAC forwarding address assigned by the Master to Device1 and Device2 mentioned in step 4, you can see that the traffics of PC1 and PC2 are forwarded by Device1 and Device2 respectively for load balancing.

#View the MAC forwarding address allocation table for terminal gateway of Backup on Device2.

```
Device2#show vrrp terminal
```

Gid	Virtual-ip	Terminal	Forwarding-mac	Interface
1	10.1.1.3	10.1.1.10	0001.7a00.0101	vlan2
1	10.1.1.3	10.1.1.20	0001.7a00.0102	vlan2

The Master will synchronize the MAC forwarding address allocation table for terminal gateway to all VRRP devices.

# 107 Track

---

## 107.1 Overview

Track can be used to monitor some information when the system is operating. Other service modules can monitor the changes that occur during system operation by associating with Track. After the service module is associated with Track, when the information monitored by Track changes, Track will notify the service module which then process the changes accordingly. For example, in practical applications, VRRP and VBRP often monitor the status of uplink interface, network reachability and other information by associating with Track, and adjust their own priorities based on this information for the switch between active and standby devices.

## 107.2 Track Function Configuration

Table 107 Track Function Configuration List

Configuration Task	
Configure Track Group	Configure Track Group
Configure Monitoring Object	Configure Status of Monitoring Interface
	Configure Direct Route of Monitoring Interface
	Configure Bandwidth Utilization Rate Alarm in Incoming and Outgoing Directions of Monitoring Interface
	Configure Reachability of Monitoring Route
	Configure Status of Monitoring Aggregation Group
	Configure to Monitor Status of Layer-2 Ethernet Interface

Configuration Task	
	Configure Monitoring RTR Group
	Configure Monitoring BFD Session

### 107.2.1 Configure Track Group

#### Configuration Condition

None

#### Configure Track Group

The system can be configured with multiple Track groups that are independent of each other, and a Track group may contain multiple monitoring objects.

The Track group has two logics, i.e. "and" and "or":

- When the logic of Track group is "and", the status of Track group will become up only when all monitoring objects therein are in up status; otherwise, it will be in down status;
- When the logic of Track group is "or", the status of Track group will become up only if one monitoring object therein is in up status; otherwise, it will be in down status.

Table 107 Configuring Track Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create a Track group	<b>track <i>group-id</i></b>	Mandatory
Configure the logic of Track group	<b>logic { operator [ AND   OR ]   reverse }</b>	Optional AND: Logical "and" OR: Logical "or" Reverse: Logical reverse  By default, the logic of Track group is "and"; the logical reverse function doesn't take effect.

---

 **Note**

- When the service module needs to monitor some information through Track, in addition to configuring monitoring object in the Track group, you are also required to refer to relevant chapter of each service module in the User Manual to configure the service module to associate with the Track group command.
- 

## 107.2.2 Configure Monitoring Object

### Configuration Condition

Before configuring monitoring object, do the following:

- Configure Track group.

### Configure Status of Monitoring Interface

The monitoring object to be configured in the Track group is interface status. When the network layer protocol of interface is up, the status of this monitoring object is up; when the network layer protocol of interface is down, the status of this monitoring object is down.

Table 1 Configuring to Monitor IPv4 Status of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track-id</b>	-
Configure Status of Monitoring Interface	<b>interface interface-name</b> <b>line-protocol</b>	Mandatory

Table 2 Configuring to Monitor IPv6 Status of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track-id</b>	-
Configure Status of Monitoring Interface	<b>interface interface-name</b> <b>line-ipv6-protocol</b>	Mandatory

### Configure Direct Route of Monitoring Interface

The monitoring object to be configured in the Track group is direct route of interface. When the interface has an IP address and its status is up, the status of the monitoring object is up; when the interface doesn't have any IP address or its status is down, the status of the monitoring object is down.

Table 107 Configuring to Monitor Direct IPv4 Route of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track-id</b>	-
Configure Direct Route of Monitoring Interface	<b>interface interface-name</b> <b>ip-routing</b>	Mandatory

Table 3 Configuring to Monitor Direct IPv6 Route of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track-id</b>	-
Configure Direct Route of Monitoring Interface	<b>interface interface-name</b> <b>ipv6-routing</b>	Mandatory

### Configure to Monitor Bandwidth Utilization Rate Alarm of Interface

In the Track group, the monitoring object can be configured with bandwidth utilization rate alarm in incoming and outgoing directions of interface. When the incoming traffic of an interface is higher than the bandwidth utilization rate alarm value in the incoming direction set for the interface, the status of the monitoring object is up; when the incoming traffic of the interface is lower than the bandwidth utilization alarm value in the incoming direction set for the interface, the status of the monitoring object is down; when the outgoing traffic of the interface is higher than the bandwidth utilization value in the outgoing direction set for the interface, the status of the monitoring object is up; when the outgoing traffic of the interface is lower than the bandwidth utilization alarm value in the outgoing direction set for the interface, the status of the monitoring object is down.

Table 107 Configuring to Monitor Bandwidth Utilization Rate Alarm of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track -id</b>	-
Configure bandwidth utilization rate of monitoring interface	<b>interface interface-name</b> <b>trap-threshold [ input   output ]</b>	Mandatory

## Note

- For configurations related to bandwidth alarm value of interface, refer to the interface-related chapter in the User Manual.

### Configure Reachability of Monitoring Route

The monitoring object to be configured in the Track group is route reachability. When there is a route leading to the network configured, the status of the monitoring object is up; otherwise, the status of the monitoring object is down.

Table 4 Configuring to Monitor IPv4 Route Reachability

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track -id</b>	-
Configure Reachability of Monitoring Route	<b>ip-route ip-address network mask [ vrf vrf-name ] [ metric metric-value ]</b>	Mandatory  If there are metric options, the status of the monitoring object is up only when the metric value of route leading to the network is less than the value configured.

Table 5 Configuring to Monitor IPv6 Route Reachability

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track -id</b>	-
Configure Reachability of Monitoring Route	<b>ipv6-route ipv6-address/mask-length [ vrf vrf-name ] [ metric metric-value ]</b>	Mandatory  If there are metric options, the status of the monitoring object is up only when the metric value of route leading to the network is less than the value configured.

### Configure Status of Monitoring Aggregation Group

The monitoring object to be configured in the Track group is status of aggregation group. When the status of aggregation group is up, the status of the monitoring object is up; when status of aggregation group is down, the status of the monitoring object is down.

Table 6 Configuring to Monitor Status of Aggregation Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track group-id</b>	Mandatory
Configure Status of Monitoring Aggregation Group	<b>link-aggregation link-aggregation-id</b>	Mandatory

### Configure to Monitor Status of Layer-2 Ethernet Interface

The monitoring object to be configured in the Track group is status of layer-2 Ethernet interface. When the layer-2 Ethernet interface is up, the status of the monitoring object is up; when the layer-2 Ethernet interface is down, the status of the monitoring object is down.

Table 7 Configuring to Monitor Status of Layer-2 Ethernet Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track group-id</b>	Mandatory
Configure to Monitor Status of Layer-2 Ethernet Interface	<b>switchport interface-name</b>	Mandatory

### Configure Monitoring RTR Group

The monitoring object to be configured in the Track group is RTR group. When the status of RTR group is up, the status of the monitoring object is up; when status of RTR group is down, the status of the monitoring object is down. RTR (Response Time Reporter) is a network detection and monitoring tool. Track can indirectly monitor network communications by monitoring RTR group.

Table 8 Configuring to Monitor RTR Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track -id</b>	-
Configure Monitoring RTR Group	<b>rtr rtr-group-id</b>	Mandatory

---

### Note

- For configurations related to RTR group, refer to the SLA-related chapter in the User Manual.
- 

### Configure Monitoring BFD Session

The monitoring object to be configured in the Track group is BFD session. When the status of BFD session is up, the status of the monitoring object is up; when status of BFD session is down, the status of the monitoring object is down. BFD protocol is a unified standardized network-wide detection mechanism used to quickly detect and monitor the connections of paths or IP route forwarding in the network. Track can indirectly monitor network connections by monitoring BFD session.

Table 9 Configuring to Monitor Single-hop Session of BFD IPv4

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track -id</b>	-
Configure Monitoring BFD Session	<b>bfd interface interface-name remote-ip ip-address local-ip ip-address</b>	Mandatory When configuring to monitor BFD session, you are required to configure on both ends of the BFD session; otherwise, the BFD session cannot be successfully established.

Table 10 Configuring to Monitor Single-hop Session of BFD IPv6

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Track configuration mode	<b>track track -id</b>	-
Configure Monitoring BFD Session	<b>bfd interface interface-name remote-ipv6 ipv6-address local-ipv6 ipv6-address</b>	Mandatory When configuring to monitor BFD session, you are required to configure on both ends of the BFD session; otherwise, the BFD session cannot be successfully established.

Table 11 Configuring to Monitor Multi-hop Session of BFD IPv4

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the Track configuration mode	<b>track track -id</b>	-
Configure Monitoring BFD Session	<b>bfd multihop control</b> <b>remote-ip ip-address local-ip ip-address [multiplier multiplier-value min-transmit-interval minimum-transmit-interval-value min-receive-interval minimum-receive-interval-value]</b>  <b>bfd multihop echo</b> <b>interface interface-name</b> <b>remote-ip ip-address [multiplier multiplier-value min-transmit-interval minimum-transmit-interval-value min-receive-interval minimum-receive-interval-value]</b>	Mandatory  When configuring to monitor BFD session, you are required to configure on both ends of the BFD session; otherwise, the BFD session cannot be successfully established.

### 107.2.3 Track Monitoring and Maintaining

Table 12 Track Monitoring and Maintaining

Command	Description
<b>show track object group-id</b>	Show the information of Track group
<b>show track bfd-session</b>	Show the information of BFD session monitored by Track
<b>show track route-request</b>	Show the information of route monitored by Track

# 108 BFD

---

## 108.1 Overview

BFD (Bidirectional Forwarding Detection) protocol is a unified standardized network-wide detection mechanism used to quickly detect and monitor the connections of paths or IP route forwarding in the network. It provides a universal, standardized, medium-independent, and protocol-independent fast failure detection mechanism, which can quickly detect the line failures between two devices for upper-layer applications (e.g. routing protocols).

BFD can detect failures on any type of paths between systems, and BFD sessions are established based on the needs of upper-layer applications. If multiple application protocols correspond to the same path, a BFD session can be used for detection.

The processing flow of BFD protocol and upper-layer application protocol includes:

- (1) Upper-layer application protocol sends neighbor information (including peer IP address, local IP address, and interface) to the BFD protocol.
- (2) The BFD protocol inquires whether there is a corresponding session. If not, it creates corresponding session based on the neighbor information received. Then the BFD session sends BFD control packets to drive the operation of BFD state machine. The BFD control packets complete corresponding session with a three-way handshake after the transition from Down (start) to Init (initialization) and then to Up (completed). During the process of establishing session, the session parameters are negotiated, including packet sending interval and detection interval.
- (3) After the session is established, the path conditions are detected by periodically sending detection packets. If the BFD control packet sent by the peer device is not received during the detection interval, the BFD protocol will consider the path faulty and advertise the failure information to the upper-layer application protocol.
- (4) After receiving the failure report, the upper-layer application protocol enables the neighbor and notifies the BFD protocol to delete the session when deleting the neighbor. If no other upper-layer protocol needs to detect this session link,

corresponding session will be deleted.

There are two types of detection path, i.e. single-hop path detection and non-single-hop path detection.

## 108.2 BFD Function Configuration

Table 108 BFD Function Configuration List

Configuration Task	
Configure Basic Functions of BFD	Configure Minimum Sending Interval of Single-hop BFD Control Packets
	Configure Minimum Receiving Interval of Single-hop BFD Control Packets
	Configure Detection Timeout Multiple of Single-hop BFD Session
	Configure Authentication Parameter of Single-hop BFD Session
	Configure Minimum Sending Interval of Non-single-hop BFD Control Packets
	Configure Minimum Receiving Interval of Non-single-hop BFD Control Packets
	Configure Detection Timeout Multiple of Non-single-hop BFD Session
	Configure Authentication Parameter of Non-single-hop BFD Session
	Configure Output Interface as Physical Output Interface of BFD Session of Tunnel Interface

### 108.2.1 Configure Basic Functions of BFD

#### Configuration Condition

Before configuring the basic BFD functions, do the following:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Configure the upper-layer application coordinated with BFD.

### Configure Minimum Sending Interval of Single-hop BFD Control Packets

Table 108 Configuring Minimum Sending Interval of Single-hop BFD Control Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Minimum Sending Interval of Single-hop BFD Control Packets	<b>bfd min-transmit-interval</b> <i>value</i>	Optional By default, the minimum sending interval of single-hop BFD control packets is 1000 milliseconds.

---

### Note

- The actual sending interval of local BFD packets = MAX (the minimum sending interval of local BFD control packets, and the minimum receiving interval of peer BFD control packets).
- 

### Configure Minimum Receiving Interval of Single-hop BFD Control Packets

Table 108 Configuring Minimum Receiving Interval of Single-hop BFD Control Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Minimum Receiving Interval of Single-hop BFD Control Packets	<b>bfd min-receive-interval</b> <i>value</i>	Optional By default, the minimum receiving interval of single-hop BFD control packets is 1000 milliseconds.

---

### Note

- The actual sending interval of peer BFD control packets = MAX (the minimum sending interval of peer BFD control packets, and the minimum receiving interval of local BFD control packets).
- 

### Configure Detection Timeout Multiple of Single-hop BFD Session

Table 108108 Configuring Detection Timeout Multiple of Single-hop BFD Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Detection Timeout Multiple of Single-hop BFD Session	<b>bfd multiplier</b> <i>value</i>	Optional By default, the detection timeout multiple of single-hop BFD session is 5.

---

### Note

- In order to ensure the effectiveness of BFD session detection, please be careful when configuring the minimum value of BFD detection timeout multiple.
- The actual local BFD detection time = peer BFD session detection timeout multiple × the actual sending interval of peer BFD packets.

### Configure Authentication Parameter of Single-hop BFD Session

Table 108 Configuring Authentication Parameter of Single-hop BFD Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Authentication Parameter of Single-hop BFD Session	<b>bfd authentication</b> <i>key-id</i> { { <b>m-md5</b>   <b>m-sha1</b>   <b>m-sm3</b>   <b>md5</b>   <b>sha1</b>   <b>sm3</b> } { <b>0</b> <i>plain-key</i>   <b>7</b> <i>cipher-key</i> } }   { <b>simple</b> { <b>0</b> <i>plain-password</i>   <b>7</b> <i>cipher-password</i> } }	Optional By default, authentication parameter of single-hop BFD session is not configured.

### Note

- After the BFD authentication function is enabled on the interface, it is valid for the single-hop session based on this interface only.
- In order to ensure BFD authentication can correctly take effect, the authentication information of the interfaces on both ends of the BFD session must be consistent.

### Configure Minimum Sending Interval of Non-single-hop BFD Control Packets

Table 108 Configure Minimum Sending Interval of Non-single-hop BFD Control Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure Minimum Sending Interval of Non-single-hop BFD Control Packets	<b>bfd non-single-hop min-transmit-interval</b> <i>value</i>	Optional By default, the minimum sending interval of non-single-hop BFD control packets is 1000 milliseconds.

## Note

- The actual sending interval of local BFD packets = MAX (the minimum sending interval of local BFD control packets, and the minimum receiving interval of peer BFD control packets).
- After configuring the minimum receiving interval of non-single-hop BFD control packets, it will be valid for IPv4/IPv6 multi-hop session and MPLS LSP session. If the minimum receiving interval of non-single-hop BFD control packets is specified in the registered module, it takes effect according to the specified value of the module. If the minimum receiving interval of non-single-hop BFD control packets for the same session is specified in multiple registered modules, it takes effect according to the minimum value specified.

### Configure Minimum Receiving Interval of Non-single-hop BFD Control Packets

Table 108 Configuring Minimum Receiving Interval of Non-single-hop BFD Control Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Minimum Receiving Interval of Non-single-hop BFD Control Packets	<b>bfd non-single-hop min-receive-interval</b> <i>value</i>	Optional By default, the minimum receiving interval of non-single-hop BFD control packets is 1000 milliseconds.

---

## Note

- The actual sending interval of peer BFD control packets = MAX (the minimum sending interval of peer BFD control packets, and the minimum receiving interval of local BFD control packets).
  - After configuring the minimum sending interval of non-single-hop BFD control packets, it will be valid for IPv4/IPv6 multi-hop session and MPLS LSP session. If the minimum sending interval of non-single-hop BFD control packets is specified in the registered module, it takes effect according to the specified value of the registered module. If the minimum sending interval of non-single-hop BFD control packets for the same session is specified in multiple registered modules, it takes effect according to the minimum value specified.
- 

### Configure Detection Timeout Multiple of Non-single-hop BFD Session

Table 108 Configuring Detection Timeout Multiple of Non-single-hop BFD Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Detection Timeout Multiple of Non-single-hop BFD Session	<b>bfd non-single-hop multiplier <i>value</i></b>	Optional By default, the detection timeout multiple of non-single-hop BFD session is 5.

---

## Note

- In order to ensure the effectiveness of BFD session detection, please be careful when configuring the minimum value of BFD detection timeout multiple.
  - The actual local BFD detection time = peer BFD session detection timeout multiple × the actual sending interval of peer BFD packets.
  - After configuring the detection timeout multiple of non-single-hop BFD session, it will be valid for IPv4/IPv6 multi-hop session and MPLS LSP session. If the detection timeout multiple of non-single-hop BFD session is specified in the registered module, it takes effect according to the specified value of the registered module. If the detection timeout multiple of non-single-hop BFD session for the same session is specified in multiple registered modules, it takes effect according to the minimum value specified.
- 

### Configure Authentication Parameter of Non-single-hop BFD Session

Table 108 Configuring Authentication Parameter of Non-single-hop BFD Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Authentication Parameter of Non-single-hop BFD Session	<b>bfd non-single-hop authentication</b> <i>key-id</i> { { <b>m-md5</b>   <b>m-sha1</b>   <b>m-sm3</b>   <b>md5</b>   <b>sha1</b>   <b>sm3</b> } { <b>0 plain-key</b>   <b>7 cipher-key</b> } }   { <b>simple</b> { <b>0 plain-password</b>   <b>7 cipher-password</b> } }	Optional  By default, authentication parameter of non-single-hop BFD session is not configured.

### Note

- After configuring the non-single-hop BFD authentication function, it will be valid for IPv4/IPv6 multi-hop session and MPLS LSP session.
- In order to ensure BFD authentication can correctly take effect, the authentication information of both ends of the non-single-hop BFD session must be consistent.

### Configure Fast Detection Function of BFD Session

Table 1 Configuring Fast Detection Function of BFD Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure fast detection function of BFD session	<b>bfd fast-detect</b>	Optional  By default, the fast detection function of BFD session is disabled.

## 108.2.BFD Monitoring and Maintaining

Table 108 BFD Monitoring and Maintaining

Command	Description
<b>show bfd capability</b>	Show the information of BFD capability
<b>show bfd discriminator</b>	Show local identification value of BFD
<b>show bfd session</b>	Show the information of BFD IPv4 session
<b>show bfd session ipv6</b>	Show the information of BFD IPV6 session
<b>show bfd session mpls</b>	Show the information of BFD MPLS session
<b>show bfd session summary</b>	Show the summary of BFD session

## 108.3 Typical Configuration Example of BFD

### 108.3.1 Configure Basic Functions of BFD

#### Network Requirements

- As a connecting device, Device 4 transmits the data in a transparent way.
- OSPF protocol is running on Device1, Device2 and Device3, and BFD detection function is configured on Device1 and Device3.
- Modify BFD parameters. When the line between Device4 and Device3 fails, the service data between Device1 and Device3 can be switched in milliseconds.

#### Network Topology

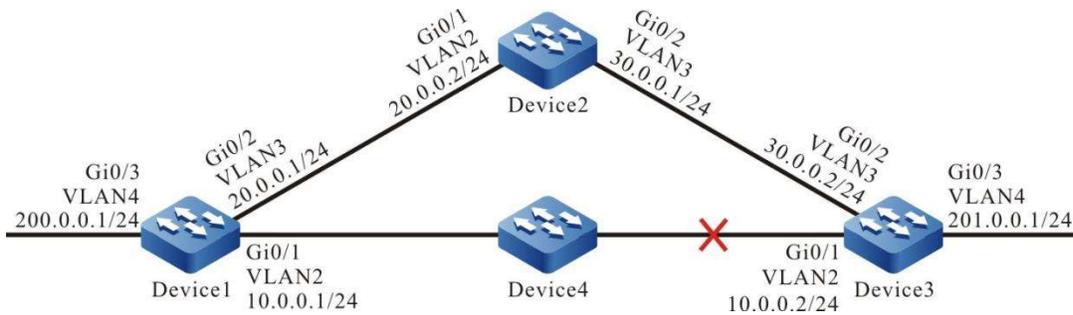

Figure 108 Network Topology for Configuring Basic Functions of BFD

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure OSPF.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 200.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 30.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 201.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

Step 4: Configure coordination of OSPF with BFD.

#### #Configure Device1.

```
Device1(config)#bfd fast-detect
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip ospf bfd
Device1(config-if-vlan2)#exit
```

### #Configure Device3.

```
Device3(config)#bfd fast-detect
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip ospf bfd
Device3(config-if-vlan2)#exit
```

### #View the BFD session of Device1.

```
Device1#show bfd session 10.0.0.2 detail
Total session number: 1
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.0.0.1      10.0.0.2      12/19      UP          5000          vlan2
Type:direct
Local State:UP Remote State:UP Up for:21h:55m:28s Number of times UP:4
Send Interval:1000ms Detection time:5000ms(1000ms*5)
Local Diag:1 Demand mode:0 Poll bit:0
MinTxInt:1000 MinRxInt:1000 Multiplier:5
Remote MinTxInt:1000 Remote MinRxInt:1000 Remote Multiplier:5
Authentication: Disable
```

Registered modules: OSPF has been successfully coordinated with BFD. The session is established normally, and the detection timeout period is 5 seconds.

### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:20:01, vlan2
C 20.0.0.0/24 is directly connected, 00:25:22, vlan3
O 30.0.0.0/24 [110/2] via 20.0.0.2, 00:12:31, vlan3
   [110/2] via 10.0.0.2, 00:11:20, vlan2
C 127.0.0.0/8 is directly connected, 00:31:09, lo0
C 200.0.0.0/24 is directly connected, 00:20:10, vlan4
O 201.0.0.0/24 [110/2] via 10.0.0.2, 00:11:30, vlan2
```

According to the routing table, the route 201.0.0.0/24 prefers the lines between Device1 and Device3 for communication.

Step 5: Configure BFD parameters.

#On Device1, change the minimum sending interval and minimum receiving interval of BFD control packets to 100 milliseconds and the detection timeout multiple to 3.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#bfd min-transmit-interval 100
Device1(config-if-vlan2)#bfd min-receive-interval 100
Device1(config-if-vlan2)#bfd multiplier 3
Device1(config-if-vlan2)#exit
```

#On Device3, change the minimum sending interval and minimum receiving interval of BFD control packets to 100 milliseconds and the detection timeout multiple to 3.

```
Device3(config)#interface vlan2
Device3(config-if-vlan2)#bfd min-transmit-interval 100
Device3(config-if-vlan2)#bfd min-receive-interval 100
Device3(config-if-vlan2)#bfd multiplier 3
Device3(config-if-vlan2)#exit
```

Step 6: Check the result.

#View the BFD session of Device1.

```
Device1#show bfd session detail
Total session number: 1
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.0.0.1      10.0.0.2        12/19      UP          300           vlan2
Type:direct
Local State:UP Remote State:UP Up for: 0h:11m:27s Number of times UP:1
Send Interval:100ms Detection time:300ms(100ms*3)
Local Diag:0 Demand mode:0 Poll bit:0
MinTxInt:100 MinRxInt:100 Multiplier:3
Remote MinTxInt:100 Remote MinRxInt:100 Remote Multiplier:3
Registered protocols:OSPF
```

After the BFD parameters are changed the BFD detection timeout period will be negotiated to 300 milliseconds from 5 seconds.

#When the lines between Device1 and Device3 fail, BFD can quickly identify these failures and notify OSPF which will switch route to Device2 for communication and view the routing table on Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:25:00, vlan2
C 20.0.0.0/24 is directly connected, 00:30:33, vlan3
O 30.0.0.0/24 [110/2] via 20.0.0.2, 00:17:32, vlan3
C 127.0.0.0/8 is directly connected, 00:36:10, lo0
C 200.0.0.0/24 is directly connected, 00:25:11, vlan4
O 201.0.0.0/24 [110/3] via 20.0.0.2, 00:00:10, vlan3
```

By comparing with the routing table mentioned in step 3, you will find that the route 201.0.0.0/24 has switched to Device2 for communication.

On Device3, the BFD is processed in a manner which is similar to that on Device1.

# 109 EEP

---

## 109.1 Overview

EEP (Embedded Event Platform) is a extensible and customizable event detection and processing mechanism which is directly provided in the device. It provides a method which enables users to monitor specific event, obtain information and set actions when the event occurs.

## 109.2 EEP Function Configuration

Table109 EEP Function Configuration Task List

Configuration Task	
Configure EEP Policy	Configure EEP Policy
Configure EEP Event	Configure EEP to Bind to Empty Event
	Configure EEP to Bind to Timer Event
	Configure EEP to Bind to TRACK Event
Configure EEP Action	Configure EEP Action

### 109.2.1 Configure EEP Policy

#### Configuration Condition

None

#### Configure EEP Policy

The system can be configured with multiple EEP policies that are independent of each other. In an EEP policy, only an EEP event and at most 50 EEP actions can be configured.

The EEP policy has three states, i.e. init, running and suspend:

- When the EEP policy is created for the first time, its status is init.
- In the EEP policy which has been created, configure EEP event and EEP action, and change the EEP policy status to running. In this status, after detecting the EEP event configured, the EEP policy will perform the EEP actions configured in turn.
- The user can suspend all EEP policies configured or a specified EEP policy with the command **event platform suspend {policy policy-name}**. The EEP policy state changes to suspend. In this status, after detecting the EEP event configured, the EEP policy will not perform the EEP actions configured.

Table 109 Configuring EEP Policy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create EEP policy	<b>event platform applet</b> <i>policy-name</i>	Mandatory
Suspend EEP policy	<b>event platform suspend</b> <b>{policy policy-name}</b>	Optional

## 109.2.2 Configure EEP Event

### Configuration Condition

Before configuring the EEP event, do the following:

- Configure EEP policy.

### Configure EEP to Bind to Empty Event

Table 109 Configuring EEP to Bind to Empty Event

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enter the EEP policy configuration mode	<b>event platform applet</b> <i>policy-name</i>	-
Configure EEP to Bind to Empty Event	<b>event none</b>	Mandatory

## Note

- When EEP is bound to an empty event, the EEP policy will have no event to be monitored. Thus, the user can only trigger the EEP policy bound to empty event to perform EEP action with the command **event platform run** *policy-name*.

### Configure EEP to Bind to Timer Event

The timer event bound to EEP has four types:

- Absolute timer: Trigger timer event when the specified time configured by the user is up.
- Calendar timer: Trigger timer event when the periodic time configured by the user is up.
- Countdown timer: Trigger timer event when the countdown time configured by the user is up.
- Watchdog timer: Trigger timer event when the watchdog time configured by the user is up.

Table 109 Configuring EEP to Bind to Timer Event

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EEP policy configuration mode	<b>event platform applet</b> <i>policy-name</i>	-

Configure EEP to bind to absolute timer event	<b>event timer absolute</b> <i>year month day hour:minute[:second]</i>	Optional
Configure EEP to bind to calendar timer event	<b>event timer calendar</b> { <b>per-day</b> <i>hour:minute[:second]</i>   <b>per-hour</b> <i>minute</i> / <b>per-month</b> <i>day hour:minute[:second]</i> / <b>per-week</b> <i>week hour:minute[:second]</i> }	Optional Value range of <i>minute</i> : 0~59 Value range of <i>day</i> : 1~28 Value range of <i>week</i> : 0~6, 0 means Sunday
Configure EEP to bind to countdown timer event	<b>event timer countdown</b> <i>time-value</i>	Optional Value range of <i>time-value</i> : 1~107374182, in second
Configure EEP to bind to watchdog timer event	<b>event timer watchdog</b> <i>time-value</i>	Optional Value range of <i>time-value</i> : 1~107374182, in second

### Configure EEP to Bind to TRACK Event

Table 109 Configuring EEP to Bind to TRACK Event

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EEP policy configuration mode	<b>event platform applet</b> <i>policy-name</i>	-
Configure EEP to Bind to TRACK Event	<b>event track</b> <i>track-id</i> { <i>up-to-down</i> / <i>down-to-up</i> }	Optional Value range of <i>track-id</i> : 1~500

## 109.2.3 Configure EEP Action

Table 109 Configuring EEP Actions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the EEP policy configuration mode	<b>event platform applet</b> <i>policy-name</i>	-
Configure EEP to perform command line actions	<b>action</b> <i>action-number</i> { <b>cli-command</b> <i>cli-command-string</i>   <b>force-switchover</b>   <b>reload</b> [ <b>master</b>   <b>slave</b> ]   <b>syslog</b> [ <b>msg</b> <i>message-text</i>   <b>priority</b> <i>priority-value</i>   <b>msg</b> <i>message-text</i> ]}	Optional Value range of <i>action-number</i> : 1~1000

---

### Note

- EEP policy performs command line actions by *action-number* (from small to large).
  - The command line *cli-command-string* is performed in the configured mode by default.
- 

## 109.2.4 EEP Monitoring and Maintaining

Table 109 EEP Monitoring and Maintaining

Command	Description
<b>show eep policy registered</b> { <i>detail</i>   <i>INEXIST-EVENT</i>   <i>NONE-EVENT</i>   <i>TIMER-EVENT</i>   <i>TRACK-EVENT</i> }	View the information of all EEP policy states

## 109.3 Typical Configuration Example of EEP

### 109.3.1 Configure EEP policy and PBR Coordination

#### Network Requirements

- The OSPF protocol is run on all devices, and PBR is configured on Device1.
- By configuring PBR, PC can access the server 2.2.2.2 through Device1 and Device2.
- After EEP is associated with PBR, when the interface of Device1 connecting Device2 is down, EEP quickly notifies PBR to delete the next-hop configuration so that the PC can access the server 2.2.2.2 through Device1 and Device3; when the link between Device1 and Device2 returns to normal, EEP notifies PBR to add the next-hop configuration so that PC can access the server 2.2.2.2 through Device1 and Device2.

#### Network Topology

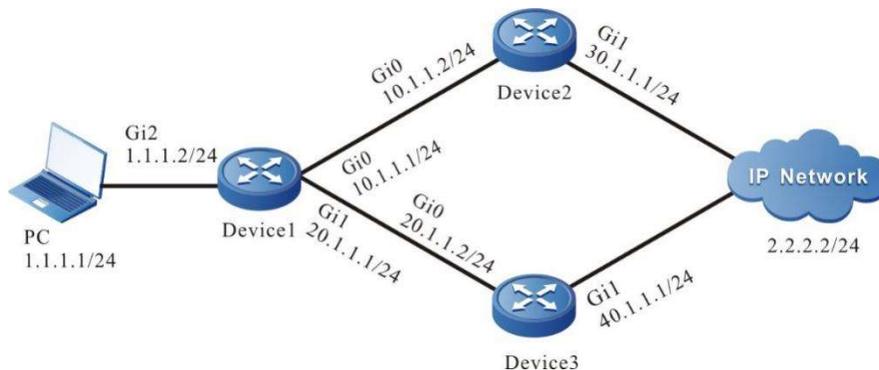

Figure 109 Network Topology for Configuring EEP Policy and PBR Coordination

#### Configuration Steps

Step 1: Configures IP addresses for the ports. (Omitted)

Step 2: Enable the unicast routing protocol OSPF, so that all devices in the network can communicate with each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 1.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 20.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
```

```
Device2(config)#router ospf 100
Device1(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#network 30.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device1(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 20.1.1.0 0.0.0.255 area 0
Device3(config-ospf)#network 40.1.1.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#It can be seen from the routing table of Device1 that there are two next hops that can reach the network 2.2.2.0/24.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.1.1.0/24 is directly connected, 22:14:53, gigabitethernet2
L 1.1.1.1/32 is directly connected, 22:14:53, gigabitethernet2
O 2.2.2.0/24 [110/3] via 10.1.1.2, 00:00:09, gigabitethernet0
   [110/3] via 20.1.1.2, 00:00:09, gigabitethernet1
C 10.1.1.0/24 is directly connected, 21:41:21, gigabitethernet0
L 10.1.1.1/32 is directly connected, 21:41:21, gigabitethernet0
C 20.1.1.0/24 is directly connected, 15:19:15, gigabitethernet1
L 20.1.1.1/32 is directly connected, 15:19:15, gigabitethernet1
O 30.1.1.0/24 [110/2] via 10.1.1.2, 18:55:36, gigabitethernet0
O 40.1.1.0/24 [110/2] via 20.1.1.2, 00:22:08, gigabitethernet1
C 127.0.0.0/8 is directly connected, 87:42:47, lo0
L 127.0.0.1/32 is directly connected, 87:42:47, lo0
```

#On Device1, change the cost value of interface gigabitethernet0 to 100 so that the route leading to the network 2.2.2.0/24 prefers the interface gigabitethernet1.

```
Device1(config)#interface gigabitethernet0
Device1(config-if-gigabitethernet0)#ip ospf cost 100
Device1(config-if-gigabitethernet0)#exit
```

### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.1.1.0/24 is directly connected, 23:27:34, gigabitethernet2
L 1.1.1.1/32 is directly connected, 23:27:34, gigabitethernet2
O 2.2.2.0/24 [110/3] via 20.1.1.2, 01:12:50, gigabitethernet1
C 10.1.1.0/24 is directly connected, 22:54:03, gigabitethernet0
L 10.1.1.1/32 is directly connected, 22:54:03, gigabitethernet0
C 20.1.1.0/24 is directly connected, 16:31:57, gigabitethernet1
L 20.1.1.1/32 is directly connected, 16:31:57, gigabitethernet1
O 30.1.1.0/24 [110/3] via 20.1.1.2, 00:31:42, gigabitethernet0
O 40.1.1.0/24 [110/2] via 20.1.1.2, 01:34:50, gigabitethernet1
C 127.0.0.0/8 is directly connected, 88:55:28, lo0
L 127.0.0.1/32 is directly connected, 88:55:28, lo0
```

#On the PC, view with Traceroute the paths through which the server 2.2.2.2 can be reached.

```
C:\Documents and Settings\Administrator>tracert 2.2.2.2

Tracing route to 2.2.2.2 over a maximum of 30 hops

  0  1 ms    1 ms    1 ms  1.1.1.2
  1  <1 ms   <1 ms   <1 ms 20.1.1.2
  .
  .
  .
  n  <1 ms  <1 ms  <1 ms 2.2.2.2
Trace complete.
```

It is indicated that PC can access the server 2.2.2.2 through Device1 and Device3.

Step 3: Configure policy route on Device1.

#Configure the access control list 1001 and permit PC to access the network 2.2.2.0/24.

```
Device1(config)#ip access-list extended 1001
Device1(config-ext-nacl)#permit ip any 2.2.2.0 0.0.0.255
Device1(config-ext-nacl)#exit
```

#Configure the policy route aaa, associate with the access control list 1001, and specify the next hop as 10.1.1.2.

```
Device1(config)#route-policy aaa permit 10
Device1(config-pbr)#match ip address acl 1001
Device1(config-pbr)#set ip next-hop 10.1.1.2
Device1(config-pbr)#exit
```

#View the information of the policy route aaa of Device1.

```
Device1#show route-policy aaa
route-policy aaa
sequence 10 permit:
  match ip address acl 1001
  set ip next-hop 10.1.1.2
```

Step 4: Apply the policy route.

#Apply the policy route aaa on the interface gigabitethernet2 of Device1.

```
Device1(config)#interface gigabitethernet2
Device1(config-if-gigabitethernet2)#ip policy aaa
Device1(config-if-gigabitethernet2)#exit
```

#On the PC, view with Traceroute the paths through which the server 2.2.2.2 can be reached.

```
C:\Documents and Settings\Administrator>tracert 2.2.2.2

Tracing route to 2.2.2.2 over a maximum of 30 hops

  0  1 ms    1 ms    1 ms  1.1.1.2
  1  <1 ms   <1 ms   <1 ms 10.1.1.2
  .
  .
  .
  n  <1 ms  <1 ms  <1 ms 2.2.2.2
Trace complete.
```

It is indicated that after the policy route is applied on the interface gigabitethernet2, PC can access the server 2.2.2.2 through Device1 and Device2.

Step 5: Configure EEP policy to associate with PBR.

#Configure TRACK 1 to monitor the status of interface gigabitethernet 0.

```
Device1(config)#track 1
Device1(config-track)#interface gigabitethernet0 line-protocol
Device1(config-track)#exit
```

#Configure EEP policy e1 on Device1 to bind to track group 1 to monitor the status of interface gigabitethernet0. When the interface gigabitethernet0 of Device1 is down, notify PBR to delete corresponding next-hop configuration.

```
Device1(config)#event platform applet e1
Device1(config-EEP)#event track 1 up-to-down
Device1(config-EEP)#action 1 cli-command route-policy aaa permit 10
Device1(config-EEP)#action 2 cli-command no set ip next-hop 10.1.1.2
Device1(config-EEP)#exit
```

#Configure EEP policy e2 on Device1 to bind to track group 1 to monitor the status of interface gigabitethernet0. When the interface gigabitethernet0 of Device1 is up, notify PBR to add corresponding next-hop configuration.

```
Device1(config)#event platform applet e2
Device1(config-EEP)#event track 1 down-to-up
Warning:
Configuring event track 1 down-to-up is risky, are you sure to configure?(Yes/No)yes
Device1(config-EEP)#action 1 cli-command route-policy aaa permit 10
Device1(config-EEP)#action 2 cli-command set ip next-hop 10.1.1.2
Device1(config-EEP)#exit
```

Step 6: Check the result.

#When interface gigabitethernet0 of Device1 is down, EEP will quickly notify PBR to delete the next-hop configuration, and PC will access the server 2.2.2.2 through Device3.

```
Device1#show route-policy aaa
route-policy aaa
sequence 10 permit:
match ip address acl 1001
```

#On the PC, view with Traceroute the paths through which the server 2.2.2.2 can be reached.

```
C:\Documents and Settings\Administrator>tracert 2.2.2.2

Tracing route to 2.2.2.2 over a maximum of 30 hops

  0  1 ms   1 ms   1 ms  1.1.1.2
  1  <1 ms  <1 ms  <1 ms  20.1.1.2
    .
    .
    .
  n  <1 ms  <1 ms  <1 ms  2.2.2.2
Trace complete.
```

It is indicated that after interface gigabitethernet2 becomes down, PC can access the server 2.2.2.2 through Device1 and Device3.

#When interface gigabitethernet0 of Device1 is up, EEP will notify PBR to add the next-hop configuration, and PC will access the server 2.2.2.2 through Device2.

```
Device1#show route-policy aaa
route-policy aaa
sequence 10 permit:
  match ip address acl 1001
  set ip next-hop 10.1.1.2
```

#On the PC, view with Traceroute the paths through which the server 2.2.2.2 can be reached.

```
C:\Documents and Settings\Administrator>tracert 2.2.2.2
```

```
Tracing route to 2.2.2.2 over a maximum of 30 hops
```

```
 0  0 ms  0 ms  0 ms  1.1.1.1

.....
 n  <1 ms  <1 ms  <1 ms  2.2.2.2
Trace complete.
```

It is indicated that after interface gigabitethernet2 becomes up, PC can access the server 2.2.2.2 through Device1 and Device2.

# 110 ERPS

---

## 110.1 Overview

In the Ethernet layer-2 network, STP (Spanning Tree Protocol) is generally used for network reliability. However, the convergence time of STP, in second, is long when there is a large network diameter. In order to reduce the convergence time and eliminate the influence of network size, ERPS (Ethernet Ring Protection Switching) technology is born. ERPS is a layer-2 damage protocol standard defined by ITU-T, with a protocol standard number of ITU-T G.8032/Y1344. It is also called G.8032 which is a reliable and stable Ethernet link layer technology. When the Ethernet ring network is complete, it can prevent the broadcast storm caused by data loop. When the Ethernet ring network link fails, with a high convergence speed, it can quickly restore the communication path between the nodes on the ring network. At the same time, if the manufacturer's devices within the ring network all support this protocol, interconnection can be achieved.

## Definitions of ERPS-related concepts:

- ERPS ring, a basic unit of ERPS protocol, is a group of interconnected network devices configured with the same control VLAN (Virtual Local Area Network). It has main ring and subring. The former is closed, while the latter is not closed. The attributes of main ring and subring are determined by users.
- Port role: According to the ERPS protocol, there are three types of port roles, i.e. RPL owner port, RPL neighbor port, and general port. In particular, RPL neighbor port is supported by ERPSv2 only.
- RPL owner port: An ERPS ring has one RPL owner port only, specified by users. The ERPS protocol prevents link loops by blocking the forwarding state of the RPL owner port. The link where the RPL owner port is located is the RPL (Ring Protection Link).
- RPL neighbor port means the node port directly connected to the RPL owner port. Normally, both RPL owner port and RPL neighbor port will be blocked to prevent loops. When the ERPS ring network fails, both RPL owner port and RPL neighbor port will be unblocked.
- General port: In the ERPS ring, all ports except RPL owner and RPL neighbor are general ports. They are responsible for monitoring the status of their own direct links and notify other node ports of the changes in a timely manner.
- ERPS control VLAN is used to transmit ERPS protocol packets. Control VLAN is specified by users. ERPS control VLAN (Virtual Local Area Network) cannot be used for other services. Each ERPS ring has a different control VLAN.
- ERPS data instance is a data instance mapped by data VLAN which requires ERPS ring protection.

## 110.2 ERPS Function Configuration

Table 110 ERPS Function Configuration List

Configuration Task	
Configure ERPS Ring	Configure ERPS Ring
	Enable ERPS Protocol
Configure ERPS Ring Timer	Configure ERPS Ring Timer
Configure ERPS Network Optimization	Configure ERPS Port Block Switch Mode

	Clear Blocking Point Configured for ERPS
	Configure ERPS Topology Change Advertisement
	Configure ERPS TC Limiting Function
Configure Coordination of ERPS with CFM	Configure ERPS to Coordinate with CFM

### 110.2.1 Configure ERPS Ring

When configuring ERPS ring, you are required to configure the ports accessing ERPS ring on each node and the nodes on the ring.

#### Configuration Condition

Before configuring ERPS ring, do the following:

- Create control VLAN;
- Close the ring network protocol of ring port;
- Configure the ring port as trunk mode;
- Add the ring port to the control VLAN to which the ring belongs;
- Configure the mapping relationship between MSTP instance and the VLAN to be included.

#### Configure ERPS Ring

Configure basic functions of ERPS ring

Table 110 Configuring ERPS Ring

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create ERPS ring	<b>erps ring <i>ring-id</i></b>	Mandatory By default, no ERPS ring is created, and

		the value range of the ring is 1~64.
Configure the control VLAN of ERPS ring	<b>control vlan</b> <i>vlan-id</i>	Mandatory  By default, no control VLAN of ERPS ring is configured.
Configure the data instance of ERPS ring	<b>instance</b> <i>instance-list</i>	Mandatory  By default, no data instance of ERPS ring is configured.
Configure port PORT0 of ERPS ring	<b>port0</b> { <b>interface</b> <i>interface-name</i>   interface <b>link-aggregation</b> <i>link-aggregation-id</i> } [ <b>rpl</b> { <b>owner</b>   <b>neighbour</b> } ]	Mandatory  By default, no port PORT0 of ERPS ring is configured.  <b>rpl owner:</b> owner port, the port of which is RPL  <b>rpl neighbour:</b> neighbour port, the port of which is RPL  It is a general port if no rpl is configured.
Configure port PORT1 of ERPS ring	<b>port1</b> { <b>interface</b> <i>interface-name</i>   interface <b>link-aggregation</b> <i>link-aggregation-id</i> } [ <b>rpl</b> { <b>owner</b>   <b>neighbour</b> } ]	Mandatory  By default, ERPS port1 is not configured.  <b>rpl owner:</b> owner port, the port of which is RPL  <b>rpl neighbour:</b> neighbour port, the port of which is RPL

		It is a general port if no rpl is configured.
Configure ERPS ring version	<b>version { v1 / v2 }</b>	Optional By default, the version is version v2.
Configure the mel value of ERPS ring packet	<b>mel level-id</b>	Optional By default, the mel value is 7, and the value range is 0~7.
Configure the ERPS ring as a subring	<b>sub-ring</b>	Optional By default, the ERPS ring is a main ring.
Configure the non-revertive mode of ERPS ring	<b>revertive disable</b>	Optional By default, ERPS is in revertive mode.
Configure the virtual channel of ERPS subring	<b>virtual-channel enable</b>	Optional By default, ERPS has a non-virtual channel.

---

## Note

- ERPS control VLAN is used to transmit ERPS protocol packets only rather than for other services. All the nodes in the same ERPS ring need to be configured with the same mel value.
  - In the networking environment with intersecting rings, virtual channel of subring is not recommended for networking.
- 

### Enable ERPS Protocol

Upon completion of the configuration mentioned above, use this command to enable ERPS protocol.

Table 110 Enabling Protocol on ERPS Ring

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the ERPS configuration mode	<b>erps ring <i>ring-id</i></b>	-
Enable ERPS Protocol	<b>erps enable</b>	Mandatory  By default, the ERPS protocol is not enabled on the ring.

## 110.2.2 Configure ERPS Ring Timer

### Configuration Condition

Before configuring ERPS timer, do the following:

- Configure ERPS ring.

### Configure ERPS Ring Timer

After the node device or link failure in the ERPS ring is recovered, in order to prevent network flapping, the ERPS ring timer will be enabled to reduce the interruption time of service traffic.

Table 110 Configuring ERPS Ring Timer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the ERPS configuration mode	<b>erps ring <i>ring-id</i></b>	-
Configure Guard timer of ERPS ring	<b>guard-timer <i>time-value</i></b>	Mandatory  By default, the timeout period of the Guard timer is 500 milliseconds, and the range of the Guard

		timer is 10 to 2000 milliseconds.
Configure Hold-off timer of ERPS ring	<b>holdoff-timer</b> <i>time-value</i>	Mandatory  By default, the timeout period of the Hold-off timer is 0 millisecond, and the range of the Guard timer is 0 ~ 10000 milliseconds.
Configure WTR timer of ERPS ring	<b>wtr-timer</b> <i>time-value</i>	Mandatory  By default, the timeout period of the Guard timer is 5 minutes, and the range of the WTR timer is 1 ~ 12 minutes.

### 110.2.3 Configure ERPS Network Optimization

#### Configuration Condition

Before configuring ERPS network optimization, ensure that:

- Configure ERPS ring.

#### Configure ERPS Port Block Switch Mode

Since the bandwidth of the link where the RPL owner port is located may carry more user traffic, you may consider blocking the link with a low bandwidth so that the user traffic can go back to RPL for transmission.

Table 110 Configuring ERPS Port Block Switch Mode

Step	Command	Description
Configure ERPS Port Block Switch Mode	<b>erps ring</b> <i>ring-id</i> { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-</i>	Mandatory  By default, the ERPS port blocking point

	<i>aggregation-id</i> } <b>switch</b> { <b>force</b>   <b>manual</b> }	switch mode is not configured.
--	---	--------------------------------

### Clear Blocking Point Configured for ERPS

Clear the blocking point switch operation configured for ERPS ring.

Table 110 Clearing Blocking Point Configured for ERPS

Step	Command	Description
Clear Blocking Point Configured for ERPS	<b>clear erps ring</b> <i>ring-id</i>	Mandatory

### Configure ERPS Topology Change Advertisement

When the topology of the ERPS ring changes without notifying layer-2 network in time, the MAC address entries before the downstream network topology changes still remain in the MAC address table of layer-2 network, which will cause interruption of user traffic. In order to ensure the normal communication of user traffic, you are required to select the topology change notification object of the ERPS ring according to the user's actual network.

Table 110 Configuring ERPS Ring Topology Change Advertisement

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the ERPS configuration mode	<b>erps ring</b> <i>ring-id</i>	-
Configure ERPS ring topology change advertisement	<b>tc-notify erps ring</b> <i>ring-list</i>	Mandatory  By default, the ERPS topology change is not notified.

### Configure ERPS TC Limiting Function

Frequent topology change notifications will result in a decrease in CPU processing capacity and the frequent refreshing of Flush-FDB packets on the ERPS ring to occupy network bandwidth. To avoid this situation, topology change notification packets should be suppressed. The device is protected by configuring the ERPS topology change protection interval and the maximum threshold value for processing topology change packets within the topology change protection interval, and avoiding frequent deletion of MAC address entries and ARP entries.

Table 110 Configuring ERPS TC Limiting Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the ERPS configuration mode	<b>erps ring</b> <i>ring-id</i>	-
Configure to enable the ERPS topology change TC limiting function	<b>tc-limit enable</b>	Mandatory  By default, the TC limiting function is not enabled.
Configure the timer interval of ERPS topology change TC limit	<b>tc-limit interval</b> <i>interval-value</i>	Optional  By default, the time interval is 2 seconds, and the value range is 1~500 seconds.
Configure the threshold value of ERPS topology change TC limit	<b>tc-limit threshold</b> <i>threshold-value</i>	Optional  The default value is 3, and the value range is 1~64.

## 110.2.4 Configure Coordination of ERPS with CFM

### Configuration Condition

Before configuring the coordination of ERPS with CFM (Connectivity Fault Management), do the following:

- Configure basic ERPS functions.
- Configure CFM function

### Configure Coordination of ERPS with CFM

After configuring the Ethernet CFM coordination function on the ring port added to ERPS ring, you can accelerate the detection of failures to realize the fast convergence of topology and reduce the interruption time of traffic.

Table 110 Configuring Coordination of ERPS with CFM

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Coordination of ERPS with CFM	<b>erps ring</b> <i>ring-id</i> <b>track cfm domain</b> <i>domain-name</i> <b>service-instance</b> <i>ser-name</i> <b>mep</b> <i>mep-id</i> <b>remote-mep</b> <i>rmep-id</i>	Mandatory  By default, the port is not coordinated with CFM.

## 110.2.5 ERPS Monitoring and Maintaining

Table 110 ERPS Monitoring and Maintaining

Command	Description
<b>clear erps [ring ring-id] statistics</b>	Clear ERPS-related statistics
<b>show erps [ring ring-id] config</b>	Show the ERPS configuration information
<b>show erps [ring ring-id] detail</b>	Show the detailed information of ERPS
<b>show erps [ring ring-id] statistics</b>	Show the ERPS statistics

## 110.3 Typical Configuration Example of ERPS

### 110.3.1 Configure Basic Functions of ERPS

#### Network Requirements

- All Devices are within the same layer-2 network.
- ERPS is enabled on all Devices and used to disconnect the link loop in the network.

#### Network Topology

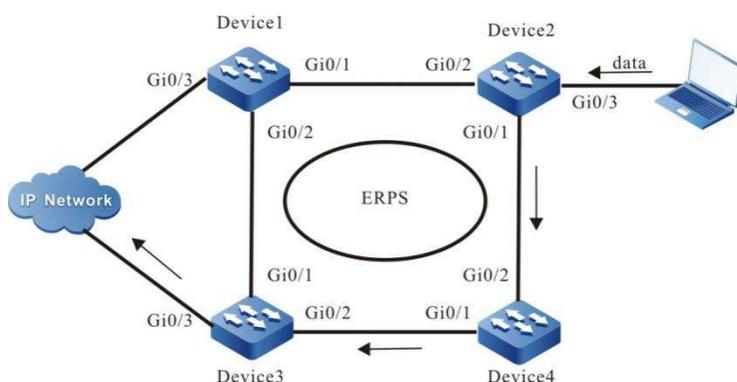

Figure 110 Configuring Basic Functions of ERPS

#### Configuration Steps

Step 1: Configure VLANs, and configure the link type of the ports.

#On Device1, create VLAN2 and VLAN100~VLAN200, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN100~VLAN200 to pass, and disable the spanning tree and storm suppression under the port.

```
Device1#configure terminal
Device1(config)#vlan 2,100-200
Device1(config)# interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#shutdown
Device1(config-if-gigabitethernet0/1)# switchport mode trunk
Device1(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device1(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device1(config-if-gigabitethernet0/1)# no storm-control unicast
Device1(config-if-gigabitethernet0/1)# no storm-control broadcast
Device1(config-if-gigabitethernet0/1)# no storm-control multicast
Device1(config-if-gigabitethernet0/1)# no spanning-tree enable
Device1(config-if-gigabitethernet0/1)#exit
Device1(config)# interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/2)# switchport mode trunk
Device1(config-if-gigabitethernet0/2)# no switchport trunk allowed vlan all
Device1(config-if-gigabitethernet0/2)# switchport trunk allowed vlan add 2,100-200
Device1(config-if-gigabitethernet0/2)# no storm-control unicast
Device1(config-if-gigabitethernet0/2)# no storm-control broadcast
Device1(config-if-gigabitethernet0/2)# no storm-control multicast
Device1(config-if-gigabitethernet0/2)# no spanning-tree enable
Device1(config-if-gigabitethernet0/2)#end
```

#On Device2, create VLAN2 and VLAN100~VLAN200, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN100~VLAN200 to pass, and disable the spanning tree and storm suppression under the port.

```
Device2#configure terminal
Device2 (config)#vlan 2,100-200
Device2 (config)# interface gigabitethernet 0/1
Device2 (config-if-gigabitethernet0/1)#shutdown
Device2 (config-if-gigabitethernet0/1)# switchport mode trunk
Device2 (config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device2 (config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device2 (config-if-gigabitethernet0/1)# no storm-control unicast
Device2(config-if-gigabitethernet0/1)# no storm-control broadcast
Device2(config-if-gigabitethernet0/1)# no storm-control multicast
Device2 (config-if-gigabitethernet0/1)# no spanning-tree enable
Device2 (config-if-gigabitethernet0/1)#exit
Device2 (config)# interface gigabitethernet 0/2
Device2 (config-if-gigabitethernet0/2)# switchport mode trunk
Device2 (config-if-gigabitethernet0/2)# no switchport trunk allowed vlan all
Device2 (config-if-gigabitethernet0/2)# switchport trunk allowed vlan add 2,100-200
Device2 (config-if-gigabitethernet0/2)# no storm-control unicast
Device2(config-if-gigabitethernet0/2)# no storm-control broadcast
Device2(config-if-gigabitethernet0/2)# no storm-control multicast
Device2 (config-if-gigabitethernet0/2)# no spanning-tree enable
Device2 (config-if-gigabitethernet0/2)#end
```

#On Device3, create VLAN2 and VLAN100~VLAN200, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN100~VLAN200 to pass, and disable the spanning tree and storm suppression under the port.

```
Device3#configure terminal
Device3 (config)#vlan 2,100-200
Device3 (config)# interface gigabitethernet 0/1
Device3 (config-if-gigabitethernet0/1)#shutdown
```

```

Device3 (config-if-gigabitethernet0/1)# switchport mode trunk
Device3 (config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device3 (config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device3 (config-if-gigabitethernet0/1)# no storm-control unicast
Device3 (config-if-gigabitethernet0/1)# no storm-control broadcast
Device3 (config-if-gigabitethernet0/1)# no storm-control multicast
Device3 (config-if-gigabitethernet0/1)# no spanning-tree enable
Device3 (config-if-gigabitethernet0/1)# exit
Device3 (config)# interface gigabitethernet 0/2
Device3 (config-if-gigabitethernet0/2)# switchport mode trunk
Device3 (config-if-gigabitethernet0/2)# no switchport trunk allowed vlan all
Device3 (config-if-gigabitethernet0/2)# switchport trunk allowed vlan add 2,100-200
Device3 (config-if-gigabitethernet0/2)# no storm-control unicast
Device3 (config-if-gigabitethernet0/2)# no storm-control broadcast
Device3 (config-if-gigabitethernet0/2)# no storm-control multicast
Device3 (config-if-gigabitethernet0/2)# no spanning-tree enable
Device3 (config-if-gigabitethernet0/2)# end

```

#On Device4, create VLAN2 and VLAN100~VLAN200, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN100~VLAN200 to pass, and disable the spanning tree and storm suppression under the port.

```

Device4#configure terminal
Device4 (config)#vlan 2,100-200
Device4 (config)# interface gigabitethernet 0/1
Device4 (config-if-gigabitethernet0/1)#shutdown
Device4 (config-if-gigabitethernet0/1)# switchport mode trunk
Device4 (config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device4 (config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device4 (config-if-gigabitethernet0/1)# no storm-control unicast
Device4 (config-if-gigabitethernet0/1)# no storm-control broadcast
Device4 (config-if-gigabitethernet0/1)# no storm-control multicast
Device4 (config-if-gigabitethernet0/1)# no spanning-tree enable
Device4 (config-if-gigabitethernet0/1)# exit
Device4 (config)# interface gigabitethernet 0/2
Device4 (config-if-gigabitethernet0/2)# switchport mode trunk
Device4 (config-if-gigabitethernet0/2)# no switchport trunk allowed vlan all
Device4 (config-if-gigabitethernet0/2)# switchport trunk allowed vlan add 2,100-200
Device4 (config-if-gigabitethernet0/2)# no storm-control unicast
Device4 (config-if-gigabitethernet0/2)# no storm-control broadcast
Device4 (config-if-gigabitethernet0/2)# no storm-control multicast
Device4 (config-if-gigabitethernet0/2)# no spanning-tree enable
Device4 (config-if-gigabitethernet0/2)# end

```

Step 2: Configure MST instance.

#On Device1, configure MST instance 1 to map vlan100-200, and activate the instance.

```

Device1#configure terminal
Device1 (config)# spanning-tree mst configuration
Device1 (config-mst)# instance 1 vlan 100-200
Device1 (config-mst)# active configuration pending
Device1 (config-mst)# end

```

#On Device2, configure MST instance 1 to map vlan100-200, and activate the instance.

```

Device2#configure terminal
Device2 (config)# spanning-tree mst configuration
Device2 (config-mst)# instance 1 vlan 100-200
Device2 (config-mst)# active configuration pending

```

```
Device2 (config-mst)#end
```

#On Device3, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device3#configure terminal
Device3 (config)# spanning-tree mst configuration
Device3 (config-mst)# instance 1 vlan 100-200
Device3 (config-mst)# active configuration pending
Device3 (config-mst)#end
```

#On Device4, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device4#configure terminal
Device4 (config)# spanning-tree mst configuration
Device4 (config-mst)# instance 1 vlan 100-200
Device4 (config-mst)# active configuration pending
Device4 (config-mst)#end
```

### Step 3: Configure ERPS.

#On Device1, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the owner port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device1# configure terminal
Device1(config)#erps ring 1
Device1(config-erps1)# control vlan 2
Device1(config-erps1)# port0 interface g0/1
Device1(config-erps1)# port1 interface g0/2 rpl owner
Device1(config-erps1)# instance 1
Device1(config-erps1)# erps enable
Device1(config-erps1)# exit
Device1(config)# interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#no shutdown
Device1(config-if-gigabitethernet0/1)# end
```

#On Device2, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device2# configure terminal
Device2(config)#erps ring 1
Device2(config-erps1)# control vlan 2
Device2(config-erps1)# port0 interface g0/2
Device2(config-erps1)# port1 interface g0/1
Device2(config-erps1)# instance 1
Device2(config-erps1)# erps enable
Device2(config-erps1)# exit
Device2(config)# interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#no shutdown
Device2(config-if-gigabitethernet0/1)# end
```

#On Device3, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the neighbor port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device3# configure terminal
Device3(config)#erps ring 1
Device3(config-erps1)# control vlan 2
Device3(config-erps1)# port0 interface g0/1 rpl neighbor
```

```

Device3(config-erps1)# port1 interface g0/2
Device3(config-erps1)# instance 1
Device3(config-erps1)# erps enable
Device3(config-erps1)# exit
Device3(config)# interface gigabitethernet 0/1
Device3(config-if-gigabitethernet0/1)#no shutdown
Device3(config-if-gigabitethernet0/1)# end

```

#On Device4, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```

Device4# configure terminal
Device4(config)#erps ring 1
Device4(config-erps1)# control vlan 2
Device4(config-erps1)# port0 interface g0/1
Device4(config-erps1)# port1 interface g0/2
Device4(config-erps1)# instance 1
Device4(config-erps1)# erps enable
Device4(config-erps1)# exit
Device4(config)# interface gigabitethernet 0/1
Device4(config-if-gigabitethernet0/1)#no shutdown
Device4(config-if-gigabitethernet0/1)# end

```

Step 4: Check the result.

#After the network topology is stable, check the ERPS information of the Device. Take Device1 as an example.

#View the ERPS information of Device1.

```

Device1# show erps ring 1 detail

## Note

- Before configuring ERPS, ensure the link status of at least one point in the ring network is down. Otherwise, there will be loops.

### 110.3.2 Configure ERPS Load

#### Network Requirements

- All devices are within the same layer-2 network.
- The data traffic of Data1 is transmitted through Device2-Device1, and that of Data2 is transmitted through Device4-Device3 to achieve load sharing and provide link backup.

#### Network Topology

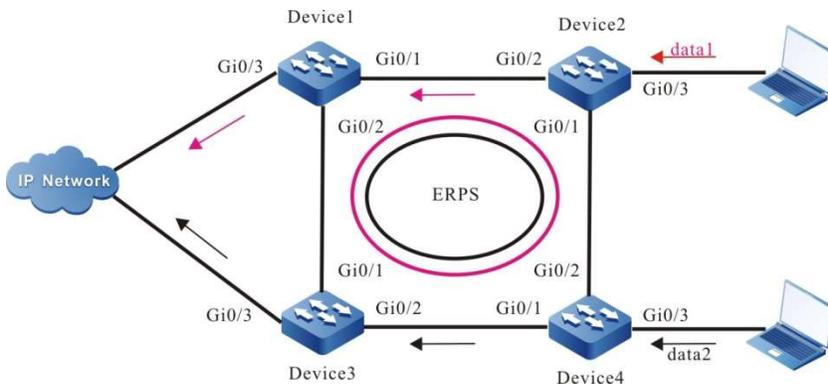

Figure 110 Configuring ERPS Load

#### Configuration Steps

Step 1: Configure VLANs, and configure the link type of the ports.

#On Device1, create VLAN2~VLAN3, VLAN100~VLAN200 and VLAN300~VLAN400, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2~VLAN3, VLAN100~VLAN200 and VLAN300~VLAN400 to pass, and disable the spanning tree and storm suppression under the port.

```
Device1#configure terminal
Device1(config)#vlan 2-3,100-200,300-400
Device1(config)# interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#shutdown
Device1(config-if-gigabitethernet0/1)# switchport mode trunk
Device1(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device1(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device1(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device1(config-if-gigabitethernet0/1)# no storm-control unicast
Device1(config-if-gigabitethernet0/1)# no storm-control broadcast
Device1(config-if-gigabitethernet0/1)# no storm-control multicast
Device1(config-if-gigabitethernet0/1)# no spanning-tree enable
Device1(config-if-gigabitethernet0/1)#exit
Device1(config)# interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/1)# switchport mode trunk
Device1(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device1(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device1(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device1(config-if-gigabitethernet0/1)# no storm-control unicast
Device1(config-if-gigabitethernet0/1)# no storm-control broadcast
Device1(config-if-gigabitethernet0/1)# no storm-control multicast
Device1(config-if-gigabitethernet0/1)# no spanning-tree enable
Device1(config-if-gigabitethernet0/1)#end
```

#On Device2, create VLAN2~VLAN3, VLAN100~VLAN200 and VLAN300~VLAN400, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2~VLAN3, VLAN100~VLAN200 and VLAN300~VLAN400 to pass, and disable the spanning tree and storm suppression under the port.

```
Device2#configure terminal
Device2(config)# vlan 2-3,100-200,300-400
Device2(config)# interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#shutdown
Device2(config-if-gigabitethernet0/1)# switchport mode trunk
Device2(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device2(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device2(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device2(config-if-gigabitethernet0/1)# no storm-control unicast
Device2(config-if-gigabitethernet0/1)# no storm-control broadcast
Device2(config-if-gigabitethernet0/1)# no storm-control multicast
Device2(config-if-gigabitethernet0/1)# no spanning-tree enable
Device2(config-if-gigabitethernet0/1)#exit
Device2(config)# interface gigabitethernet 0/2
Device2(config-if-gigabitethernet0/1)# switchport mode trunk
Device2(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device2(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device2(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device2(config-if-gigabitethernet0/1)# no storm-control unicast
Device2(config-if-gigabitethernet0/1)# no storm-control broadcast
Device2(config-if-gigabitethernet0/1)# no storm-control multicast
Device2(config-if-gigabitethernet0/1)# no spanning-tree enable
Device2(config-if-gigabitethernet0/1)#end
```

#On Device3, create VLAN2~VLAN3, VLAN100~VLAN200 and VLAN300~VLAN400, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2~VLAN3,

VLAN100~VLAN200 and VLAN300~VLAN400 to pass, and disable the spanning tree and storm suppression under the port.

```
Device3#configure terminal
Device3(config)# vlan 2-3,100-200,300-400
Device3(config)# interface gigabitethernet 0/1
Device3(config-if-gigabitethernet0/1)#shutdown
Device3(config-if-gigabitethernet0/1)# switchport mode trunk
Device3(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device3(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device3(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device3(config-if-gigabitethernet0/1)# no storm-control unicast
Device3(config-if-gigabitethernet0/1)# no storm-control broadcast
Device3(config-if-gigabitethernet0/1)# no storm-control multicast
Device3(config-if-gigabitethernet0/1)# no spanning-tree enable
Device3(config-if-gigabitethernet0/1)#exit
Device3(config)# interface gigabitethernet 0/2
Device3(config-if-gigabitethernet0/1)# switchport mode trunk
Device3(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device3(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device3(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device3(config-if-gigabitethernet0/1)# no storm-control unicast
Device3(config-if-gigabitethernet0/1)# no storm-control broadcast
Device3(config-if-gigabitethernet0/1)# no storm-control multicast
Device3(config-if-gigabitethernet0/1)# no spanning-tree enable
Device3(config-if-gigabitethernet0/1)#end
```

#On Device4, create VLAN2~VLAN3, VLAN100~VLAN200 and VLAN300~VLAN400, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2~VLAN3, VLAN100~VLAN200 and VLAN300~VLAN400 to pass, and disable the spanning tree and storm suppression under the port.

```
Device4#configure terminal
Device4(config)# vlan 2-3,100-200,300-400
Device4(config)# interface gigabitethernet 0/1
Device4(config-if-gigabitethernet0/1)#shutdown
Device4(config-if-gigabitethernet0/1)# switchport mode trunk
Device4(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device4(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device4(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device4(config-if-gigabitethernet0/1)# no storm-control unicast
Device4(config-if-gigabitethernet0/1)# no storm-control broadcast
Device4(config-if-gigabitethernet0/1)# no storm-control multicast
Device4(config-if-gigabitethernet0/1)# no spanning-tree enable
Device4(config-if-gigabitethernet0/1)#exit
Device4(config)# interface gigabitethernet 0/2
Device4(config-if-gigabitethernet0/1)# switchport mode trunk
Device4(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device4(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device4(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3,300-400
Device4(config-if-gigabitethernet0/1)# no storm-control unicast
Device4(config-if-gigabitethernet0/1)# no storm-control broadcast
Device4(config-if-gigabitethernet0/1)# no storm-control multicast
Device4(config-if-gigabitethernet0/1)# no spanning-tree enable
Device4(config-if-gigabitethernet0/1)#end
```

Step 2: Configure MST instance.

#On Device1, configure MST instance 1 to map vlan100-200 and MST instance 2 to map vlan300-400, and activate the instance.

```
Device1#configure terminal
Device1(config)# spanning-tree mst configuration
Device1(config-mst)# instance 1 vlan 100-200
Device1(config-mst)# instance 2 vlan 300-400
Device1(config-mst)# active configuration pending
Device1(config-mst)#end
```

#On Device2, configure MST instance 1 to map vlan100-200 and MST instance 2 to map vlan300-400, and activate the instance.

```
Device2#configure terminal
Device2(config)# spanning-tree mst configuration
Device2(config-mst)# instance 1 vlan 100-200
Device2(config-mst)# instance 2 vlan 300-400
Device2(config-mst)# active configuration pending
Device2(config-mst)#end
```

#On Device3, configure MST instance 1 to map vlan100-200 and MST instance 2 to map vlan300-400, and activate the instance.

```
Device3#configure terminal
Device3(config)# spanning-tree mst configuration
Device3(config-mst)# instance 1 vlan 100-200
Device3(config-mst)# instance 2 vlan 300-400
Device3(config-mst)# active configuration pending
Device3(config-mst)#end
```

#On Device4, configure MST instance 1 to map vlan100-200 and MST instance 2 to map vlan300-400, and activate the instance.

```
Device4#configure terminal
Device4(config)# spanning-tree mst configuration
Device4(config-mst)# instance 1 vlan 100-200
Device4(config-mst)# instance 2 vlan 300-400
Device4(config-mst)# active configuration pending
Device4(config-mst)#end
```

### Step 3: Configure ERPS.

#On Device1, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device1# configure terminal
Device1(config)#erps ring 1
Device1(config-erps1)# control vlan 2
Device1(config-erps1)# port0 interface g0/1
Device1(config-erps1)# port1 interface g0/2
Device1(config-erps1)# instance 1
Device1(config-erps1)# erps enable
Device1(config-erps1)# end
```

#On Device1, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/1 as the normal port of ring2, gigabitethernet0/2 as the normal port of ring2, and instance 2 as the data vlan of ring2; enable the ERPS function of ring2.

```

Device1# configure terminal
Device1(config)#erps ring 2
Device1(config-erps1)# control vlan 3
Device1(config-erps1)# port0 interface g0/1
Device1(config-erps1)# port1 interface g0/2
Device1(config-erps1)# instance 2
Device1(config-erps1)# erps enable
Device1(config-erps1)# exit
Device1(config)# interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#no shutdown
Device1(config-if-gigabitethernet0/1)# end

```

#On Device2, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the owner port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```

Device2# configure terminal
Device2(config)#erps ring 1
Device2(config-erps1)# control vlan 2
Device2(config-erps1)# port0 interface g0/1 rpl owner
Device2(config-erps1)# port1 interface g0/2
Device2(config-erps1)# instance 1
Device2(config-erps1)# erps enable
Device2(config-erps1)# exit

```

#On Device2, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/1 as the neighbor port of ring2, gigabitethernet0/2 as the normal port of ring2, and instance 2 as the data vlan of ring2; enable the ERPS function of ring2.

```

Device2# configure terminal
Device2(config)#erps ring 2
Device2(config-erps1)# control vlan 3
Device2(config-erps1)# port0 interface g0/1 rpl neighbor
Device2(config-erps1)# port1 interface g0/2
Device2(config-erps1)# instance 2
Device2(config-erps1)# erps enable
Device2(config-erps1)# exit
Device2(config)# interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#no shutdown
Device2(config-if-gigabitethernet0/1)# end

```

#On Device3, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```

Device3# configure terminal
Device3(config)#erps ring 1
Device3(config-erps1)# control vlan 2
Device3(config-erps1)# port0 interface g0/1
Device3(config-erps1)# port1 interface g0/2
Device3(config-erps1)# instance 1
Device3(config-erps1)# erps enable
Device3(config-erps1)# exit

```

#On Device3, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/1 as the normal port of ring2, gigabitethernet0/2 as the normal port of ring2, and instance 2 as the data vlan of ring2; enable the ERPS function of ring2.

```

Device3# configure terminal
Device3(config)#erps ring 2

```

```

Device3(config-erps1)# control vlan 3
Device3(config-erps1)# port0 interface g0/1
Device3(config-erps1)# port1 interface g0/2
Device3(config-erps1)# instance 2
Device3(config-erps1)# erps enable
Device3(config-erps1)# exit
Device3(config)# interface gigabitethernet 0/1
Device3(config-if-gigabitethernet0/1)#no shutdown
Device3(config-if-gigabitethernet0/1)# end

```

#On Device4, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the neighbor port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```

Device4# configure terminal
Device4(config)#erps ring 1
Device4(config-erps1)# control vlan 2
Device4(config-erps1)# port0 interface g0/1
Device4(config-erps1)# port1 interface g0/2 rpl neighbour
Device4(config-erps1)# instance 1
Device4(config-erps1)# erps enable
Device4(config-erps1)# exit

```

#On Device4, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/1 as the normal port of ring2, gigabitethernet0/2 as the owner port of ring2, and instance 2 as the data vlan of ring2; enable the ERPS function of ring2.

```

Device4# configure terminal
Device4(config)#erps ring 2
Device4(config-erps1)# control vlan 3
Device4(config-erps1)# port0 interface g0/1
Device4(config-erps1)# port1 interface g0/2 rpl owner
Device4(config-erps1)# instance 2
Device4(config-erps1)# erps enable
Device4(config-erps1)# exit
Device4(config)# interface gigabitethernet 0/1
Device4(config-if-gigabitethernet0/1)#no shutdown
Device4(config-if-gigabitethernet0/1)# end

```

Step 4: Check the result.

#After the network topology is stable, check the ERPS information of the Device. Take Device2 as an example.

#View the ERPS information of Device2.

```

## Note

- When loading, the logical rings on the same physical ring cannot be configured with the same data instance.

### 110.3.3 Configure ERPS Intersecting Rings

#### Network Requirements

- All devices are within the same layer-2 network.
- Device1-Device2-Device4-Device3 and Device3-Device5-Device6-Device4 form two physical loops respectively. ERPS is enabled on all Devices to disconnect the link loop.

#### Network Topology

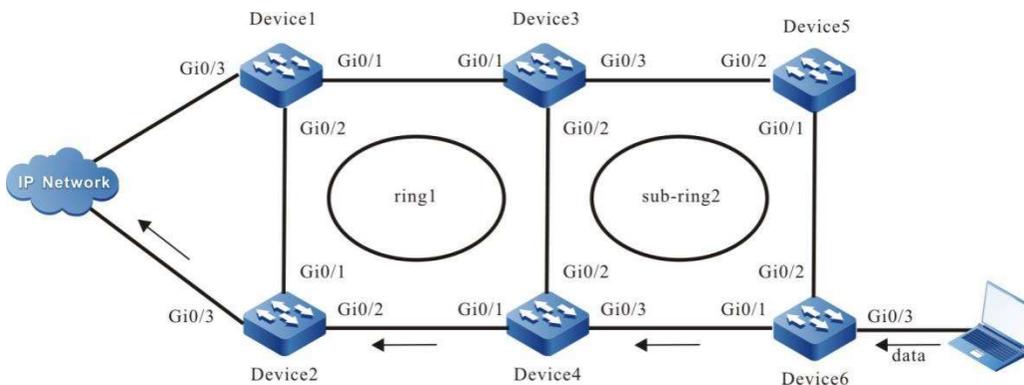

Figure 110 Configuring ERPS Intersecting Rings

#### Configuration Steps

Step 1: Configure VLANs, and configure the link type of the ports.

#On Device1, create VLAN2 and VLAN100~VLAN200, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN100~VLAN200 to pass, and disable the spanning tree and storm suppression under the port.

```
Device1#configure terminal
Device1(config)#vlan 2,100-200
```

```

Device1(config)# interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#shutdown
Device1(config-if-gigabitethernet0/1)# switchport mode trunk
Device1(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device1(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device1(config-if-gigabitethernet0/1)# no storm-control unicast
Device1(config-if-gigabitethernet0/1)# no storm-control broadcast
Device1(config-if-gigabitethernet0/1)# no storm-control multicast
Device1(config-if-gigabitethernet0/1)# no spanning-tree enable
Device1(config-if-gigabitethernet0/1)#exit
Device1(config)# interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/1)# switchport mode trunk
Device1(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device1(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device1(config-if-gigabitethernet0/1)# no storm-control unicast
Device1(config-if-gigabitethernet0/1)# no storm-control broadcast
Device1(config-if-gigabitethernet0/1)# no storm-control multicast
Device1(config-if-gigabitethernet0/1)# no spanning-tree enable
Device1(config-if-gigabitethernet0/1)#end

```

#On Device2, create VLAN2 and VLAN100~VLAN200, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN100~VLAN200 to pass, and disable the spanning tree and storm suppression under the port.

```

Device2#configure terminal
Device2(config)#vlan 2,100-200
Device2(config)# interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#shutdown
Device2(config-if-gigabitethernet0/1)# switchport mode trunk
Device2(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device2(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device2(config-if-gigabitethernet0/1)# no storm-control unicast
Device2(config-if-gigabitethernet0/1)# no storm-control broadcast
Device2(config-if-gigabitethernet0/1)# no storm-control multicast
Device2(config-if-gigabitethernet0/1)# no spanning-tree enable
Device2(config-if-gigabitethernet0/1)#exit
Device2(config)# interface gigabitethernet 0/2
Device2(config-if-gigabitethernet0/1)# switchport mode trunk
Device2(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device2(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device2(config-if-gigabitethernet0/1)# no storm-control unicast
Device2(config-if-gigabitethernet0/1)# no storm-control broadcast
Device2(config-if-gigabitethernet0/1)# no storm-control multicast
Device2(config-if-gigabitethernet0/1)# no spanning-tree enable
Device2(config-if-gigabitethernet0/1)#end

```

#On Device3, create VLAN2~VLAN3 and VLAN100~VLAN200, configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 as Trunk, permitting services of VLAN2 and VLAN100~VLAN200 to pass; configure the link type of port gigabitethernet0/3 as Trunk, permitting services of VLAN3 and VLAN100~VLAN200, and disable the spanning tree and storm suppression under the port.

```

Device3#configure terminal
Device3(config)#vlan 2-3,100-200
Device3(config)# interface gigabitethernet 0/1
Device3(config-if-gigabitethernet0/1)#shutdown
Device3(config-if-gigabitethernet0/1)# switchport mode trunk
Device3(config-if-gigabitethernet0/1)# no switchport trunk allowed vlan all
Device3(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2,100-200
Device3(config-if-gigabitethernet0/1)# no storm-control unicast
Device3(config-if-gigabitethernet0/1)# no storm-control broadcast

```

```

Device3(config-if-gigabitethernet0/1)# no storm-control multicast
Device3(config-if-gigabitethernet0/1)# no spanning-tree enable

Device3(config-if-gigabitethernet0/1)#end
```

Step 2: Configure MST instance.

#On Device1, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device1#configure terminal
Device1(config)# spanning-tree mst configuration
Device1(config-mst)# instance 1 vlan 100-200
Device1(config-mst)# active configuration pending
```

```
Device1(config-mst)#end
```

#On Device2, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device2#configure terminal
Device2(config)# spanning-tree mst configuration
Device2(config-mst)# instance 1 vlan 100-200
Device2(config-mst)# active configuration pending
Device2(config-mst)#end
```

#On Device3, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device3#configure terminal
Device3(config)# spanning-tree mst configuration
Device3(config-mst)# instance 1 vlan 100-200
Device3(config-mst)# active configuration pending
Device3(config-mst)#end
```

#On Device4, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device4#configure terminal
Device4(config)# spanning-tree mst configuration
Device4(config-mst)# instance 1 vlan 100-200
Device4(config-mst)# active configuration pending
Device4(config-mst)#end
```

#On Device5, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device5#configure terminal
Device5(config)# spanning-tree mst configuration
Device5(config-mst)# instance 1 vlan 100-200
Device5(config-mst)# active configuration pending
Device5(config-mst)#end
```

#On Device6, configure MST instance 1 to map vlan100-200, and activate the instance.

```
Device6#configure terminal
Device6(config)# spanning-tree mst configuration
Device6(config-mst)# instance 1 vlan 100-200
Device6(config-mst)# active configuration pending
Device6(config-mst)#end
```

### Step 3: Configure ERPS.

#On Device1, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the owner port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device1# configure terminal
Device1 (config)#erps ring 1
Device1 (config-erps1)# control vlan 2
Device1 (config-erps1)# port0 interface g0/1
Device1 (config-erps1)# port1 interface g0/2 rpl owner
Device1 (config-erps1)# instance 1
Device1 (config-erps1)# erps enable
Device1 (config-erps1)# end
Device1 (config)# interface gigabitethernet 0/1
Device1 (config-if-gigabitethernet0/1)#no shutdown
Device1 (config-if-gigabitethernet0/1)# end
```

#On Device2, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the neighbor port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device2# configure terminal
Device2(config)#erps ring 1
Device2(config-erps1)# control vlan 2
Device2(config-erps1)# port0 interface g0/1 rpl neighbour
Device2(config-erps1)# port1 interface g0/2
Device2(config-erps1)# instance 1
Device2(config-erps1)# erps enable
Device2(config-erps1)# exit
Device2(config)# interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#no shutdown
Device2(config-if-gigabitethernet0/1)# end
```

#On Device3, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device3# configure terminal
Device3(config)#erps ring 1
Device3(config-erps1)# control vlan 2
Device3(config-erps1)# port0 interface g0/1
Device3(config-erps1)# port1 interface g0/2
Device3(config-erps1)# instance 1
Device3(config-erps1)# erps enable
Device3(config-erps1)# exit
Device2(config)# interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#no shutdown
Device2(config-if-gigabitethernet0/1)# end
```

#On Device3, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/3 as the normal port of ring2, instance 1 as the data vlan of ring2, and ring2 as a subring; enable the ERPS function of ring2.

```
Device3# configure terminal
Device3(config)#erps ring 2
Device3(config-erps1)# control vlan 3
Device3(config-erps1)# port0 interface g0/3
Device3(config-erps1)# instance 1
Device3(config-erps1)# sub-ring
Device3(config-erps1)# erps enable
Device3(config-erps1)# exit
Device3(config)# interface gigabitethernet 0/3
Device3(config-if-gigabitethernet0/1)#no shutdown
Device3(config-if-gigabitethernet0/1)# end
```

#On Device4, configure ERPS ring1. Configure vlan2 as the control vlan of ring1, gigabitethernet0/1 as the normal port of ring1, gigabitethernet0/2 as the normal port of ring1, and instance 1 as the data vlan of ring1; enable the ERPS function of ring1.

```
Device4# configure terminal
Device4(config)#erps ring 1
Device4(config-erps1)# control vlan 2
Device4(config-erps1)# port0 interface g0/1
Device4(config-erps1)# port1 interface g0/2
Device4(config-erps1)# instance 1
Device4(config-erps1)# erps enable
Device4(config-erps1)# exit
```

```
Device4(config)# interface gigabitethernet 0/1
Device4(config-if-gigabitethernet0/1)#no shutdown
Device4(config-if-gigabitethernet0/1)# end
```

#On Device4, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/3 as the normal port of ring2, instance 1 as the data vlan of ring2, and ring2 as a subring; enable the ERPS function of ring2.

```
Device4# configure terminal
Device4(config)#erps ring 2
Device4(config-erps1)# control vlan 3
Device4(config-erps1)# port0 interface g0/3
Device4(config-erps1)# instance 1
Device4(config-erps1)# sub-ring
Device4(config-erps1)# erps enable
Device4(config-erps1)# exit
Device4(config)# interface gigabitethernet 0/3
Device4(config-if-gigabitethernet0/1)#no shutdown
Device4(config-if-gigabitethernet0/1)# end
```

#On Device5, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/2 as the normal port of ring2, gigabitethernet0/1 as the owner port of ring2, instance 1 as the data vlan of ring2, and ring2 as a subring; enable the ERPS function of ring2.

```
Device4# configure terminal
Device4(config)#erps ring 2
Device4(config-erps1)# control vlan 3
Device4(config-erps1)# port0 interface g0/1 rpl owner
Device4(config-erps1)# port0 interface g0/2
Device4(config-erps1)# instance 1
Device4(config-erps1)# sub-ring
Device4(config-erps1)# erps enable
Device4(config-erps1)# exit
Device4(config)# interface gigabitethernet 0/1
Device4(config-if-gigabitethernet0/1)#no shutdown
Device4(config-if-gigabitethernet0/1)# end
```

#On Device6, configure ERPS ring2. Configure vlan3 as the control vlan of ring2, gigabitethernet0/2 as the neighbor port of ring2, gigabitethernet0/1 as the normal port of ring2, instance 1 as the data vlan of ring2, and ring2 as a subring; enable the ERPS function of ring2.

```
Device4# configure terminal
Device4(config)#erps ring 2
Device4(config-erps1)# control vlan 3
Device4(config-erps1)# port0 interface g0/1
Device4(config-erps1)# port0 interface g0/2 rpl neighbour
Device4(config-erps1)# instance 1
Device4(config-erps1)# sub-ring
Device4(config-erps1)# erps enable
Device4(config-erps1)# exit
Device4(config)# interface gigabitethernet 0/1
Device4(config-if-gigabitethernet0/1)#no shutdown
Device4(config-if-gigabitethernet0/1)# end
```

Step 4: Check the result.

#After the network topology is stable, check the ERPS information of the Device. Take Device3 as an example.

#View the ERPS information of Device3.

```

# 111 Network Test and Fault Diagnosis

---

## 111.1 Overview

With the network test and fault diagnosis tool, we can check the network connection status and diagnose the system fault. In daily maintenance, when it is necessary to check the network connection, we can use the ping function and traceroute function. When it is necessary to diagnose the system fault, we can open the system debugging information to diagnose the system fault.

## 111.2 Network Test and Fault Diagnosis Application

Table 111-1 Application List of Network Test and Fault Diagnosis

Application functions	
Ping function	ping
	ping ip
	Interactive ping
	grouping
Traceroute function	traceroute
	Interactive traceroute
System debugging function	System debugging

### 111.2.1 Ping Function

The ping function is used to check the network connection status and the availability of hosts. The ping function sends the ICMP echo request packet to the host and waits for the ICMP echo response, used to judge whether the destination is reachable. ping can also measure the round trip time from the source to the destination.

#### Configuration Condition

None

#### ping

Table 111-2 Ping

Step	Command	Description
Check whether the specified destination address is reachable	<b>ping</b> [ <b>vrf</b> <i>vrf-name</i> ] { [ <b>ip</b> <i>host-name</i> / <i>ip-address</i> ] / [ <b>ipv6</b> <i>host-name</i> / <i>ipv6-address</i> ]   <i>host-name</i> / <i>ip-address</i>   <i>ipv6-address</i> } [ <b>-l</b> <i>packet-length</i> ] [ <b>-w</b> <i>wait-time</i> ] [ <b>-n</b> <i>packet-number</i> / <b>-t</b> ]	Mandatory

## Interactive Ping

If you need to use options such as loose source routing options, strict source routing options, logging routes, logging timestamps, or need to know the maximum ICMP packet size supported by the peer device, you can use interactive ping to achieve this.

Table 3-111 Interactive Ping

Step	Command	Description
Enter the interactive ping mode.	<b>ping [ vrf vrf-name ]</b>	Mandatory  Execute this command in privileged user mode to enter ping interactive mode.
Configure Network Protocol Types	<b>Protocol [ ip ]: [ ip   ipv6]</b>	Optional  By default, the IPv4 protocol is used.
Configure the destination IP address or host name.	<b>Target IP address or hostname: { ip-address   host-name }</b>	Mandatory
Configure the number of attempts to send ICMP request packet.	<b>Repeat count [5]: [ repeat-count ]</b>	Optional  By default, the number is 5.
Configure the length of the ICMP request packet.	<b>Datagram size [76]: [ datagram-size ]</b>	Optional  The length of the packet is the length of the entire IP packet.  By default, the packet length is 76 bytes.
Configure the timeout time for ICMP responses.	<b>Timeout in seconds [2]: [ timeout ]</b>	Optional  By default, the timeout is 2 seconds.

Step	Command	Description
Enable extended options.	<b>Extended commands</b> [no]: [ yes / no ]	Optional  The configuration commands for the extended options are visible only after the extended options are enabled.  By default, the extension option is not enabled.
Configure the extended option, source IP address or output interface for ICMP request packets.	<b>Source address or interface:</b> { <i>ip-address</i> / <i>interfacename</i> }	Optional  The command can only be configured if the extended option is enabled.  By default, the source address and output interface of the request packets are not specified.
Configure extended selection, service type of ICMP request packet.	<b>Type of service [0]:</b> [ <i>tos</i> ]	Optional. This command is supported only for IPv4 protocol.  The command can only be configured after the extended option is enabled.  By default, the TOS value is 0.
Configure extended options to ban reassembly.	<b>Set DF bit in IP header?</b> [ no ]: [ yes / no ]	Optional. This command is supported only for IPv4 protocol.  The command can only be configured after the

Step	Command	Description
		<p>extended option is enabled.</p> <p>By default, no DF flag is set and reassembly is permitted.</p>
<p>Configure extended options to verify the data content of the response packet.</p>	<p><b>Validate reply data?</b> [ no ]: [ yes / no ]</p>	<p>Optional. This command is supported only for IPv4 protocol.</p> <p>The command can only be configured after the extended option is enabled.</p> <p>By default, no data content is verified.</p>
<p>Configure extended options to enable ICMP request data content of the packet.</p>	<p><b>Data pattern [abcd]:</b> [ <i>data-pattern</i> ]</p>	<p>Optional</p> <p>The command can only be configured after the extended option is enabled.</p> <p>By default, the data content template is set as "abcd".</p>
<p>Configure extended options, loose source routing options, strict source routing options, logging routes, logging timestamps, and display details.</p>	<p><b>Loose, Strict, Record, Timestamp,</b> <b>Verbose[ none ]:</b> [ l   s ] [ r / t / v ]</p>	<p>Optional. This command is supported only for IPv4 protocol.</p> <p>The command can only be configured after the extended option is enabled.</p> <p>By default, the extended option is not configured.</p>

Step	Command	Description
Enable sweep of the ICMP request packet.	<b>Sweep range of sizes</b> [ no ]: [ yes / no ]	Optional. This command is supported only for IPv4 protocol.  By default, the sweep option is disabled.
Configure the sweep start value.	<b>Sweep min size [36]:</b> [ <i>min-size</i> ]	Optional. This command is supported only for IPv4 protocol.  This command can only be configured after sweep is enabled.  By default, the sweep start value is 36.
Configure sweep end value.	<b>Sweep max size</b> [18024]: [ <i>max-size</i> ]	Optional. This command is supported only for IPv4 protocol.  This command can only be configured after sweep is enabled.  By default, the end value of sweep is 18024.
Configure sweep increment.	<b>Sweep interval [1]:</b> [ <i>interval</i> ]	Optional. This command is supported only for IPv4 protocol.  This command can only be configured after sweep is enabled.  By default, the sweep increment is 1.

The device supports sending multiple ICMP echo requests at once to get a more accurate network connection status based on the number of ICMP reply packets returned by the destination host.

Table 4-5 Grouping

Step	Command	Description
Send multiple ICMP request packets to check if the specified destination address is reachable.	<b>grouping</b> [ <i>vrf vrf-name</i> ] { <i>hostname   ip-address</i> } [ [ -l <i>packet-length</i> ] [ -g <i>packet-group</i> ] [ -w <i>wait-time</i> ] [ -n <i>packet-number</i> ] [ -t ]	Mandatory

### Note

- When pinging the destination host name, first configure the DNS function. Otherwise, ping fails. For DNS configuration, refer to “DNS Configuration” in “IP Network Protocol Configuration”.

## 111.2.2 Traceroute Function

The traceroute function is used to view the gateway through which a packet passes from the source to the destination. It is mainly used to detect whether the destination is reachable and to analyze the faulty network nodes. The executing process of traceroute is: First send one IP packet with TTL 1 to the destination host; the first-hop gateway drops the packet and returns one ICMP timeout error packet. In this way, traceroute gets the first gateway address in the path. And then traceroute sends one packet with TTL 2. In this way, get the address of the second-hop gateway. Continue the process until reaching the destination host. The UDP port number of the traceroute packet is the port number of the destination that cannot be used by any application program. After the destination receives the packet, return one error packet of the port unreachable. In this way, get all gateway addresses on the path.

### Configuration Condition

None

### Traceroute

Table 6-7 Traceroute

Step	Command	Description
View the gateway through which the data packet travels from the source to the destination.	<b>tracert</b> [ <b>vrf vrf-name</b> ] {{ <b>ip host-name</b>   <b>ip-address</b> }   {{ <b>ipv6 host-name</b>   <b>ipv6-address</b> }   <b>host-name</b>   <b>ip-address</b>   <b>ipv6-address</b> } [ -f start-ttl] [ -w wait-time] [ -m max-ttl]	Mandatory

## Interactive Traceroute

Table 8-9 Interactive Traceroute

Step	Command	Description
Enter interactive traceroute mode.	<b>tracert</b> [ <b>vrf vrf-name</b> ]	Mandatory  Execute this command in privileged user mode to enter interactive traceroute mode.
Configure Network Protocol Types	<b>Protocol</b> [ <b>ip</b> ]: [ <b>ip</b>   <b>ipv6</b> ]	Optional  By default, the IPv4 protocol is used.
Configure the destination IP address or host name.	<b>Target IP address or hostname</b> : { <i>ip-address</i>   <i>host-name</i> }	Mandatory
Configure the source IP address or output interface for traceroute packets.	<b>Source address or interface</b> : { <i>ip-address</i>   <i>interface-name</i> }	Optional  By default, the source IP address or output interface of the packet is not specified.

Step	Command	Description
Configure the timeout period for each inspection packet response.	<b>Timeout in seconds [3]:</b> <i>timeout</i>	Optional By default, the timeout is 3 seconds.
Configure the number of attempts to send inspection packets with the same TTL value.	<b>Probe count [3]:</b> <i>probe-count</i>	Optional By default, the number is 3.
Configure the minimum TTL value for inspection packets.	<b>Minimum Time to Live [1]:</b> <i>min-ttl</i>	Optional By default, the minimum TTL value is 1.
Configure the maximum TTL value for inspection packets.	<b>Maximum Time to Live [30]:</b> <i>max-ttl</i>	Optional By default, the maximum TTL value is 30.
Configure the destination UDP port number of the inspection packets.	<b>Port Number [33434]:</b> <i>port-number</i>	Optional By default, the destination port number is 33434.
Configure loose source routing options, strict source routing options, logging routes, logging timestamps, and display details.	<b>Loose, Strict, Record, Timestamp, Verbose[ none ]:</b> [ l   s ] [ r / t / v ]	Optional. This command is supported only for IPv4 protocol. By default, the option is not configured.

### 111.2.3 System Debugging Function

To help the user diagnose the problem, the most function modules of the device provide the debugging function.

The debugging function has two switch controls:

- The debugging switch of the module, controlling whether to generate the debugging information of the module
- The output switch of the screen, controlling whether to output the debugging information to the terminal

#### Configuration Condition

None

#### System Debugging

Table 111-10 System Debugging

Step	Command	Description
Turn on the system debugging screen output switch for remote login.	<b>terminal monitor</b>	Optional Remote login includes telnet, ssh and other methods. By default, the switch is off.
Enter the global configuration mode.	<b>configure terminal</b>	-
Turn on the system debugging screen output switch in the console.	<b>logging console</b>	Optional By default, the switch is on.
Exit global configuration mode	<b>exit</b>	-
Turn on the debugging switch of the system function module.	<b>debug { all   module-name [ option ] }</b>	Optional By default, the debugging switches of all functional

Step	Command	Description
		modules of the system are off.

### Note

- The debugging information can be displayed on the terminal only after configuring debug module-name option, terminal monitor or logging console at the same time.
- The generating and output of the debugging information affect the system performance, so when it is necessary, had better use the debug module-name option command to open the specified debugging switch. The debug all command opens all debugging switches, so we had better not use. After debugging ends, close the corresponding debugging switch in time or use the no debug all command to close all debugging switches.

## 111.2.4 Network Test and Fault Diagnosis Monitoring and Maintaining

Table 11-12 System Test and Fault Diagnosis Monitoring and Maintaining

Command	Description
<b>show debugging</b>	Display information about the function modules in the system for which the debugging switch is turned on.

## 111.3 Typical Configuration Example of Network Test and Fault Diagnosis

### 111.3.1 Application of Ping

#### Network Requirements

- Device1 failed to log into Device3 using telnet IP address, now you need to confirm whether IP route is reachable between Device1 and Device3.

- Device1 failed to log into Device3 using telnet IPv6 address, now you need to confirm whether IPv6 route is reachable between Device1 and Device3.

## Network Topology

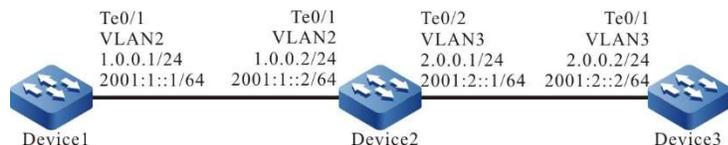

Figure 111-1 Network Topology for the Application of Ping

## Configuration Steps

Step 1: Configure the IP address and IPv6 global unicast address of each interface. (Omitted)

Step 2: Use the ping command to see if Device1 and Device3 are reachable to each other.

#Check whether Device1 ping Device3's IP address 2.0.0.2 can be pinged through.

```
Device1#ping 2.0.0.2

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to 2.0.0.2 , timeout is 2 seconds:
.....
Success rate is 0% (0/5).
```

#Check whether Device1 ping Device3's IPv6 address 2001:2::2 can be pinged through.

```
Device1#ping 2001:2::2

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to 2001:2::2 , timeout is 2 seconds:
.....
Success rate is 0% (0/5).
```

Step 3: Use the ping command to see if Device1 and Device2 are reachable to each other.

#Check whether Device1 ping Device2's IP address 1.0.0.2 can be pinged through.

```
Device1#ping 1.0.0.2

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to 1.0.0.2 , timeout is 2 seconds:
!!!!!!
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

#Check whether Device1 ping Device2's IPv6 address 2001:1::2 can be pinged through.

```
Device1#ping 2001:1::2

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to 2001:1::2 , timeout is 2 seconds:
!!!!!!
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

Step 4: Use the ping command to see if Device2 and Device3 are reachable to each other.

#Check whether Device2 ping Device3's IP address 2.0.0.2 can be pinged through.

```
Device2#ping 2.0.0.2
```

```
Press key (ctrl + shift + 6) interrupt it.  
Sending 5, 76-byte ICMP Echos to 2.0.0.2 , timeout is 2 seconds:  
!!!!  
Success rate is 100% (5/5). Round-trip min/avg/max = 0/0/0 ms.
```

#Check whether Device2 ping Device3's IPv6 address 2001:2::2 can be pinged through.

```
Device2#ping 2001:2::2
```

```
Press key (ctrl + shift + 6) interrupt it.  
Sending 5, 76-byte ICMP Echos to 2001:2::2 , timeout is 2 seconds:  
!!!!  
Success rate is 100% (5/5). Round-trip min/avg/max = 0/176/883 ms.
```

From the above troubleshooting results, we can see that Device1 can communicate with Device2, and Device2 can communicate with Device3. The problem appears between Device1 and Device3. You can view the routing and other configurations subsequently, or use the **debug ip icmp** command and **debug ipv6 icmp** command to check whether the contents of ICMP packets and ICMPv6 packets are correct respectively, or you can use the traceroute command introduced in the following section to confirm the faulty network node.

### 111.3.2 Application of Traceroute

#### Network Requirements

- Device1 failed to log in to Device3 using telnet IP address, now you need to confirm whether the IP route between Device1 and Device3 is reachable, if the route is not reachable, then you need to identify the faulty network node.
- Device1 failed to log in to Device3 using telnet IPv6 address, now you need to confirm whether the IPv6 route between Device1 and Device3 is reachable, if the route is not reachable, then you need to identify the faulty network node.

#### Network Topology

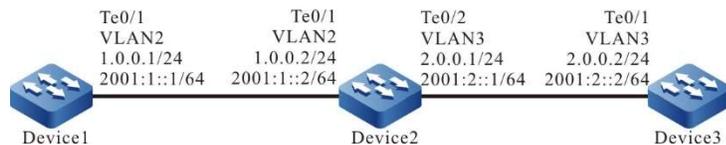

Figure 111-2 Network Topology for the Application of Traceroute

#### Configuration Steps

Step 1: Configure the IP address and IPv6 global unicast address of each interface. (Omitted)

Step 2: Use the traceroute command to identify the faulty node between Device1 and Device3.

#Use the traceroute command to identify the IPv4 faulty node between Device1 and Device3.

```
Device1#traceroute 2.0.0.2
Type escape sequence to abort.
Tracing the route to 2.0.0.2 , min ttl = 1, max ttl = 30 .

 1 1.0.0.2  0 ms  0 ms  0 ms
 2 * * *
 3 * * *
 4 * * *
 5 * * *
 6
```

Use the traceroute command to identify the IPv6 faulty node between Device1 and Device3.

```
Device1#traceroute 2001:2::2
Type escape sequence to abort.
Tracing the route to 2001:2::2 , min ttl = 1, max ttl = 30 .

 1 2001:1::2 0 ms  0 ms  0 ms
 2 * * *
 3 * * *
 4 * * *
 5 * * *
 6
```

From the above troubleshooting results, the traceroute packet from Device1 can reach Device2, and the traceroute packet from Device2 cannot reach Device3. Subsequently, you need to check the route configuration and lines of Device2 and Device3, or use the **debug ip icmp** command and **debug ipv6 icmp** command to check whether the content of ICMP packet and ICMPv6 packet is correct, and you can use the ping command in the previous section to check the connectivity between Device2 and Device3.

# 112 Keepalive Gateway

---

## 112.1 Overview

Keepalive gateway sets the Ethernet interface to send the keepalive packet to the specified gateway address, used to monitor the reachability of the destination gateway. When the gateway is unreachable, close the interface IP protocol layer.

After configuring the keepalive gateway on one interface, the interface regularly sends the ARP request packet to the configured gateway address. When the interface does not receive the ARP response packet for successive N times (N is the retry times configured for the user), close the interface IP protocol layer. Until receiving the ARP response packet again, enable the interface IP protocol layer.

## 112.2 Keepalive Gateway Function Configuration

Table 112-1 Keepalive Gateway Function Configuration List

Configuration Task	
Configure keepalive gateway.	Configure keepalive gateway basic functions.
	Configure the parameters for sending keepalive packets.
	Configure keepalive IPv6 associated gateway.

### 112.2.1 Configure Keepalive Gateway.

#### Configuration Condition

Before configuring the keepalive gateway function, do the following:

- Configure interface IP address.

### Configure Keepalive Gateway Basic Functions.

Table 112-2 Configuring Keepalive Gateway Basic Functions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure keepalive gateway function.	<b>keepalive gateway</b> <i>ip-address</i> [high-prio] [ <i>interval</i>   <b>msec</b> <i>interval</i> ] [ <i>retry-count</i> ]	Mandatory  By default, the keepalive gateway function is not enabled on the interface.

### Configure the Parameters for Sending Keepalive Packets.

Configure the parameters for sending keepalive packets to control the sending rate of the keepalive gateway packets. When the sending rate of keepalive packets reaches the configured value, you can continue to send keepalive packets after the configured time is paused.

Table 112-3 Configuring Parameters for Sending Keepalive Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the sending rate of keepalive packets.	<b>keepalive gateway disperse pkt-rate</b> <i>packet-rate</i>	Optional  By default, the maximum sending rate of keepalive packets is 100pps.
Configure the time for sending keepalive packets.	<b>keepalive gateway disperse pause-time</b> <i>pause-time</i>	Optional  By default, the time for sending keepalive packets is 100 milliseconds.

### Configure Keepalive IPv6 Associated Gateway.

When keepalive IPv6 associated gateway is configured, the IPv6 protocol layer of the interface will be turned off at the same time when the gateway is unreachable.

Table 112-4 Configuring Keepalive IPv6 Associated Gateway

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the sending rate of keepalive packets.	<b>keepalive gateway ipv6-respond-ipv4</b>	Optional By default, keepalive the IPv6 associated gateway is disabled.

### 112.2.2 Keepalive Gateway Monitoring and Maintaining

Table 112-5 Keepalive Gateway Monitoring and Maintaining

Command	Description
<b>clear keepalive gateway statistics</b> [ <i>interface-name</i> ]	Clear the incoming and inbound and outbound statistics of keepalive gateway.
<b>show keepalive gateway</b> [ <i>interface-name</i> ]	View interfaces with keepalive gateway enabled, and their configurations.
<b>show keepalive gateway disperse</b>	View the configuration of the sending parameters of the keepalive packets.
<b>show keepalive gateway statistics</b> [ <i>interface-name</i> ]	View statistics on gateway activities.

## 112.3 Typical Configuration Example of Keepalive Gateway

### 112.3.1 Configure Keepalive Gateway Function.

#### Network Requirements

- As a connecting device, Device 4 transmits the data in a transparent way.
- Device1, Device2, and Device3 are running the OSPF protocol for routing interactions.
- Device3 is preferred for the data flow from Device1 to the 201.0.0.0/24 network segment.
- The line between Device1 and Device3 has the enabled keepalive gateway. When the line between Device1 and Device3 fails, the keepalive gateway function will quickly detect the failure and modify the state of the relevant interface to down, and OSPF will switch the route to Device2 for communication after it senses the state change of the interface.

### Network Topology

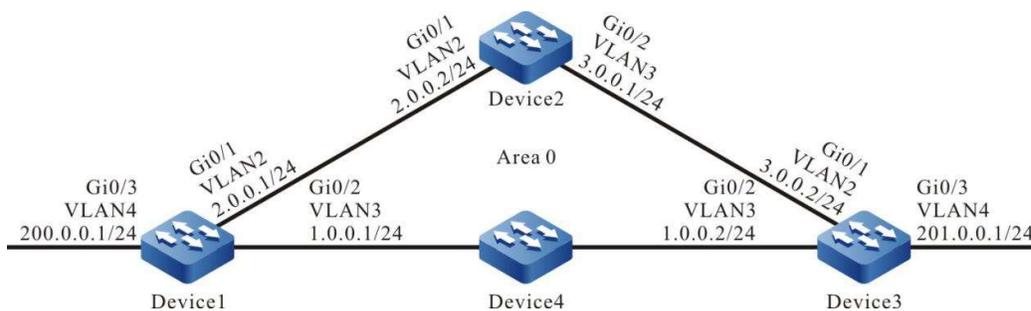

Figure 112-1 Network Topology for Configuring Keepalive Gateway

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure OSPF process.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 200.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
```

```
Device3(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 201.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, Ex - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

C 1.0.0.0/24 is directly connected, 00:20:17, vlan3
C 2.0.0.0/24 is directly connected, 13:01:32, vlan2
O 3.0.0.0/24 [110/2] via 2.0.0.2, 01:11:40, vlan2
   [110/2] via 1.0.0.2, 00:02:00, vlan3
C 200.0.0.0/24 is directly connected, 01:31:58, vlan4
O 201.0.0.0/24 [110/2] via 1.0.0.2, 00:02:00, vlan3
```

#Device3 is preferred for the data flow from Device1 to the 201.0.0.0/24 network segment.

---

### Note

- Device2 and Device3 are viewed in the same way as Device1, and the viewing process is omitted.
- 

Step 4: Configure keepalive gateway.

#### #Configure Device1.

```
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#keepalive gateway 1.0.0.2
Device1(config-if-vlan3)#exit
```

#### #Configure Device3.

```
Device3(config)#interface vlan 3
Device3(config-if-vlan3)#keepalive gateway 1.0.0.1
Device3(config-if-vlan3)#exit
```

#### #View the keepalive gateway information of Device1.

```
Device1#show keepalive gateway
interface vlan3 gateway 1.0.0.2 time 10s retry 3 remain 3 now UP
```

#### #View the keepalive gateway information of Device3.

```
Device3#show keepalive gateway
interface vlan3 gateway 1.0.0.1 time 10s retry 3 remain 3 now UP
```

Step 5: Check the result.

#When the line between Device1 and Device3 fails, the keepalive gateway function will quickly detect the failure and change the state of interface VLAN3 to down.

```
Device1#show keepalive gateway
interface vlan3 gateway 1.0.0.2 time 10s retry 3 remain 0 now DOWN
```

#OSPF senses the state change of interface VLAN3 and switches the route to Device2 for communication.

```
Device1# show ip ospf interface vlan3
VLAN3 is down, line protocol is down
OSPF is enabled, but not running on this interface
```

```
Device1#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, Ex - IRMP external, o - SNSP, B - BGP, i-ISIS
```

```
Gateway of last resort is not set
```

```
C 2.0.0.0/24 is directly connected, 13:16:40, vlan2
O 3.0.0.0/24 [110/2] via 2.0.0.2, 00:01:25, vlan2
C 200.0.0.0/24 is directly connected, 00:10:53, vlan4
O 201.0.0.0/24 [110/3] via 2.0.0.2, 00:00:18, vlan2
```

# It is indicated that Device2 is preferred for the data flow from Device1 to the 201.0.0.1/24 network segment.

# 113 SLA

---

## 113.1 Overview

SLA (Service Level Agreements) calculates the related parameters according to the packet transmission and outputs the report at last. SLA, also called RTR (Response Time Reporter), is one network detection and monitoring tool. SLA regularly sends the packets of the specified protocol to detect and monitor the network communication. SLA can diagnose different network applications and output the test result by configuring different types of RTR entities and adjusting.

SLA basic concepts:

- RTR Entity: RTR Entity is one universal concept and not related with the specific type of RTR entity. The current RTR entity types of the system include: the ICMP-echo entity, ICMP-path-echo entity, ICMP-path-jitter entity, and UDP-echo entity used to detect the network communication; the VoIP-jitter entity used to detect the network transmitting the VoIP packets; the FLOW-statistics entity used to detect the interface traffic; the MAC-ping entity used to detect the Ethernet link communication service quality.
- RTR Group: One RTR entity group is the set of one or multiple entities;
- RTR responder: The RTR responder is configured at the destination, mainly used to set up the connection with the source and respond the detection packet sent by the source. Most entities do not need to configure the responder, but when using the UDP-echo entity and VoIP-jitter entity, we should configure the responder.
- RTR Schedule: If only configuring the RTR entity or RTR entity group, we cannot detect, but should initiate the scheduling so that the detection can be completed.

## 113.2 SLA Function Configuration

Table 113-1 SLA Function Configuration List

Configuration Task	
Enable RTR.	Enable RTR.

Configuration Task	
Configure an RTR entity.	Create an RTR entity.
	Configure ICMP-echo Entity
	Configure an ICMPv6-echo entity.
	Configure ICMP-path-echo Entity
	Configure ICMP-path-jitter Entity
	Configure VoIP-jitter Entity
	Configure UDP-echo Entity
	Configure FLOW-statistics Entity
	Configure entity common configuration.
Configure RTR Entity Group	Configure RTR Entity Group
Configure RTR Responder	Configure RTR Responder
Configure RTR Scheduler	Configure RTR Scheduler
Configure Pausing Scheduling Entity	Configure Pausing Scheduling Entity
Configure Restoring Scheduling Entity	Configure Restoring Scheduling Entity

### 113.2.1 Enable RTR.

Among the various configuration tasks of RTR, it must be enabled first before the configuration of other functional features can take effect.

#### Configuration Condition

None

#### Enable RTR.

Table 113-1 Enabling RTR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable RTR.	<b>rtr enable</b>	Mandatory By default, RTR is not enabled.

### 113.2.2 Configure an RTR entity.

#### Configuration Condition

Before configuring an RTR entity, do the following:

Enable RTR.

#### Create an RTR entity.

There is one type of detection for each type of entity. After creating an RTR entity and entering the configuration mode for that entity, you can configure the specific parameters of the entity.

Table 113-3 Creating an RTR Entity

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create an RTR entity.	<b>rtr <i>entity-id entity-type</i></b>	Mandatory

#### Configure ICMP-echo Entity

The ICMP-echo entity is to detect the network communication. It regularly sends the ICMP echo request packet to one destination address in the network, so as to get the delay and packet loss of the packet transmission from the detection end to the destination end. In one detection period, as long as the ICMP-echo entity receives one ICMP echo request response packet, the entity status is reachable.

The general network devices all support ping, so the entity can take effect in detecting the network communication. With the rich scheduling policies and log recording function, we can let the network administrator get to know the network communication status and history information in time and reduce inputting the common ping command frequently at the same time.

Table 113-4 Configuring an ICMP-Echo Entity

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the ICMP-echo entity configuration mode.	<b>rtr entity-id [ icmpecho ]</b>	-
Configure the detection attributes.	<b>set [ vrf vrf-name ] target-ip-address [ npacket ] [ data-size ] [ timeout ] [ frequency-value ] [ extend source-ip-address [ tos ] [ set-DF ] [ verify-data ] ]</b>	Mandatory  By default, no detection attribute of the entity is configured.
Configure to set the rtt value as the basis for determining whether the entity is reachable.	<b>status-care rtt</b>	Optional  By default, the rtt value is not used to determine whether the entity is reachable.
Configure entity common configuration.	Please refer to the section on configuring entity common configuration.	Optional

---

## Note

- The schedule interval (frequency-value) of the ICMP-echo entity needs to satisfy the following requirements: schedule interval > npacket \* timeout.
  - If a scheduler is configured for the entity, the aging time of the scheduler must be greater than the schedule interval for the entity.
- 

### Configuring ICMPv6-Echo Entities

The role of an ICMPV6-echo entity is to detect the network communication. It regularly sends the ICMP echo request packet to one destination address in the network, so as to get the delay and packet loss of the packet transmission from the detection end to the destination end. In one detection period, as long as the ICMPV6-echo entity receives one ICMP echo request response packet, the entity status is reachable.

The general network devices all support ping, so the entity can take effect in detecting the network communication. With the rich scheduling policies and log recording function, we can let the network administrator get to know the network communication status and history information in time and reduce inputting the common ping command frequently at the same time.

Table 113-5 Configuring an ICMPV6-Echo Entity

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the ICMP-echo entity configuration mode.	<b>rtr <i>entity-id</i> [ icmpv6echo ]</b>	-
Configure the detection attributes.	<b>set [ vrf <i>vrf-name</i> ] <i>target-ip-address</i> [ <i>npacket</i> ] [ <i>data-size</i> ] [ <i>timeout</i> ] [ <i>frequency-value</i> ] [ <b>extend</b> <i>source-ip-address</i> [ <i>tos</i> ] [ <i>verify-data</i> ] ]</b>	Mandatory By default, no detection attribute of the entity is configured.
Configure to set the rtt value as the basis for determining whether the entity is reachable.	<b>status-care rtt</b>	Optional By default, the rtt value is not used to determine whether the entity is reachable.
Configure entity common configuration.	Please refer to the section on configuring entity common configuration.	Optional

### Note

- The schedule interval (frequency-value) of the ICMPV6-echo entity needs to satisfy the following requirements: schedule interval > npacket \* timeout.
- If a scheduler is configured for the entity, the aging time of the scheduler must be greater than the schedule interval for the entity.

### Configure ICMP-path-echo Entity

The ICMP-path-echo entity is to detect the network communication. It regularly sends the ICMP echo request packet to one destination address in the network, so as to get the delay and packet loss of the packet transmission from the detection end to the destination end, as well as the delay and packet loss between the detection end and the intermediate devices from the detection end to the destination. In one detection period, as long as the ICMP-path-echo entity receives one ICMP echo request response packet, the entity status is reachable.

The general network devices all support ping, so the entity can take effect in detecting the network communication. With the rich scheduling policies and log recording function, we can let the network administrator get to know the network communication status (for example, which network device on the path has serious delay) and history information in time.

Table 113-6 Configuring an ICMP-Path-Echo Entity

Step	Command	Description
Enter the system configuration mode	<b>configure terminal</b>	-
Enter the ICMP-path-echo entity configuration mode.	<b>rtr <i>entity-id</i> [ icmp-path-echo ]</b>	-
Configure the detection attributes.	<b>set dest-ipaddr <i>target-ip-address</i></b> <b>[ source-ipaddr <i>source-ip-address</i> ]</b>	Mandatory
Configure loose source station routing.	<b>lsr-path [ <i>hop-ip-address-list</i>   none ]</b>	Optional By default, no loose source station routing is configured.
Configure to detect only the network conditions from the source to the destination.	<b>targetOnly [ true   false ]</b>	Optional By default, targetOnly is true to detect only the network conditions from the source to the destination.  If targetOnly is configured to false, it will detect the network conditions from the source to the destination hop by hop.

Step	Command	Description
Configure whether to verify the data content of the response packet.	<b>verify-data</b> [ true   false ]	Optional By default, no data content is verified.
Configure entity common configuration.	Please refer to the section on configuring entity common configuration.	Optional

### Configure ICMP-path-jitter Entity

The ICMP-path-jitter entity is to detect the network communication. It regularly sends the ICMP echo request packet to one destination address in the network, so as to get the delay, jitter, and packet loss of the packet transmission from the detection end to the destination end, as well as the delay, jitter and packet loss between the detection end and the intermediate devices from the detection end to the destination. In one detection period, as long as the ICMP-path-jitter entity receives one ICMP echo request response packet, the entity status is reachable.

The general network devices all support ping, so the entity can take effect in detecting the network communication. With the rich scheduling policies and log recording function, we can let the network administrator get to know the network communication status (for example, which network device on the path has serious delay) and history information in time.

Table 113-7 Configuring an ICMP-Path-Jitter Entity

Step	Command	Description
Enter the system configuration mode	<b>configure terminal</b>	-
Enter the ICMP-path-jitter entity configuration mode.	<b>rtr entity-id</b> [ icmp-path-jitter ]	-
Configure the detection attributes.	<b>set dest-ipaddr</b> <i>target-ip-address</i> [ <i>pkt-number</i> ] [ <i>pkt-interval</i> ] <b>[ source-ipaddr</b> <i>source-ip-address</i> ]	Mandatory
Configure the IP address of the loose source station routing.	<b>lsr-path</b> [ <i>hop-ip-address-list</i>   <b>none</b> ]	Optional By default, no source station routing is configured.

Step	Command	Description
Configure to detect only the network conditions from the source to the destination.	<b>targetOnly</b> [ true   false ]	Optional  By default, targetOnly is true to detect only the network conditions from the source to the destination.  If targetOnly is configured to false, it will detect the network conditions from the source to the destination hop by hop.
Configure the jitter threshold and the overrun rule.	<b>threshold-jitter</b> <i>jitter</i> <b>direction</b> { be   se }	Optional  By default, the jitter threshold is 6000 milliseconds and the overrun rule is be.
Configure whether to verify the data content of the response packet.	<b>verify-data</b> [ true   false ]	Optional  By default, no data content is verified.
Configure entity common configuration.	Please refer to the section on configuring entity common configuration.	Optional

---

## Note

- When the over-limit rule is be and the actual value is larger than or equal to the threshold, it is judged as over-limit; when the over-limit rule is se and the actual value is smaller than or equal to the threshold, it is judged as over-limit.
- 

### Configure VoIP-jitter Entity

The VoIP-jitter entity is the RTR entity used to measure the transmission quality of the VoIP packet in the general IP network.

The VoIP-jitter entity can simulate the G.711 A Law, G.711 mu Law, and G.729A codec or the customized codes to send the UDP packet with the corresponding rate, packet interval and size from the source device

to the destination device, measure the turnaround time, uni-directional packet loss and uni-directional delay of the packet, and calculates the ICPIF value based on the statistics information. At last, estimate the MOS value according to the ICPIF value. In the detection period, as long as the VoIP-jitter entity receives one detection response packet, the status of the entity is reachable.

Table 113-8 Configuring a VoIP-litter Entity

Step	Command	Description
Enter the system configuration mode	<b>configure terminal</b>	-
Enter the VoIP-jitter entity configuration mode.	<b>rtr <i>entity-id</i> [ jitter ]</b>	Mandatory If the entity already exists, go directly to entity configuration mode.
Configure the detection attributes.	<b>set dest-ipaddr <i>target-ip-address</i> dest-port <i>target-port</i> { g711alaw   g711ulaw   g729a   user_defined packet-size <i>packet-number</i> packet-interval <i>schedule-interval</i> } [ source-ipaddr <i>source-ip-address</i> ] [ source-port <i>source-port</i> ]</b>	Mandatory
Configure the source-to-destination one-way delay threshold and the overrun rule.	<b>threshold-sd-delay <i>sd-delay</i> direction { be   se }</b>	Optional By default, the source-to-destination delay threshold is 5000 milliseconds and the overrun rule is be.
Configure the source-to-destination one-way jitter threshold and the overrun rule.	<b>threshold-sd-jitter <i>sd-jitter</i> direction { be   se }</b>	Optional By default, the source-to-destination one-way jitter threshold is 6000 milliseconds, and the overrun rule is be.
Configure the source-to-destination packet loss threshold and the overrun rule.	<b>threshold-sd-pktloss <i>sd-packet</i> direction { be   se }</b>	Optional By default, the source-to-destination packet loss threshold is 60000, and the overrun rule is be.

Step	Command	Description
Configure the destination-to-source one-way delay threshold and the overrun rule.	<b>threshold-ds-delay</b> <i>ds-delay</i> <b>direction</b> { <b>be</b>   <b>se</b> }	Optional  By default, the destination-to-source delay threshold is 5000 milliseconds and the overrun rule is be.
Configure the destination-to-source one-way jitter threshold and the overrun rule.	<b>threshold-ds-jitter</b> <i>ds-jitter</i> <b>direction</b> { <b>be</b>   <b>se</b> }	Optional  By default, the destination-to-source one-way jitter threshold is 6000 milliseconds, and the overrun rule is be.
Configure the destination-to-source packet loss threshold and the overrun rule.	<b>threshold-ds-pktloss</b> <i>ds-packet</i> <b>direction</b> { <b>be</b>   <b>se</b> }	Optional  By default, the destination-to-source packet loss threshold is 60000, and the overrun rule is be.
Configure the threshold and the overrun rule for icpif value.	<b>threshold-icpif</b> <i>icpif-value</i> <b>direction</b> { <b>be</b>   <b>se</b> }	Optional  By default, the icpif threshold is 100000000, and the overrun rule is be.
Configure the threshold and the overrun rule for mos value.	<b>threshold-mos</b> <i>mos-value</i> <b>direction</b> { <b>be</b>   <b>se</b> }	Optional  By default, the mos threshold value is 10000000 and the overrun rule is be.
Configure entity common configuration.	Please refer to the section on configuring entity common configuration.	Optional

---

## Note

- When using the VoIP-jitter entity detection, besides configuring the VoIP-jitter entity, we also need to configure the RTR responder at the destination.
- By default, the VoIP-jitter entity sends many packets, which occupy the network

---

bandwidth, so when configuring the entity exceeds one hour, the shell prompts.

- When the VoIP-jitter entity detects the network transmitting the VoIP packet, the clocks of the source and the destination need to be consistent, so before scheduling the VoIP-jitter entity, we also need to configure the NTP server at the destination and NTP client at the source. After the clocks are synchronized, configure the RTR responder, and at last, configure the scheduler. For detailed configuration of NTP, please refer to NTP related sections in the User Manual.
  - When the over-limit rule is be and the actual value is larger than or equal to the threshold, it judged as over-limit; when the over-limit rule is se and the actual value is smaller than or equal to the threshold, it is judged as over-limit.
- 

### Configure UDP-echo Entity

The UDP-echo entity mainly detects the UDP packet transmitted in the IP network. In the entity, we need to specify the destination address and port of the sent packet. We can monitor the transmission of the UDP packet in the IP network by scheduling the entity. In one detection period, as long as the UDP-echo entity receives one detection response packet, the entity status is reachable.

The UDP-echo entity can monitor efficiently to record the turnaround delay, packet loss and other information of the UDP packet in the IP network, even record the monitored history information by logs so that the network administrator can get to know the network communication and fix the fault.

Table 113-9 Configuring an UDP-Echo Entity

Step	Command	Description
Enter the system configuration mode	<b>configure terminal</b>	-
Enter the UDP-echo entity configuration mode.	<b>rtr <i>entity-id</i> [ udpecho ]</b>	Mandatory If the entity already exists, go directly to entity configuration mode.
Configure the detection attributes.	<b>set dest-ipaddr <i>target-ip-address</i> dest-port <i>target-port</i> [ source-ipaddr <i>source-ip-address</i> ] [ source-port <i>source-port</i> ]</b>	Mandatory By default, the detection attribute of an UDP-echo entity is not configured.
Configure packet padding content.	<b>data-pattern <i>pad</i></b>	Optional By default, the padding content is "ABCD".

Step	Command	Description
Configure entity common configuration.	Please refer to the section on configuring entity common configuration.	Optional

## Note

- When using the UDP-echo entity detection, besides configuring the UDP-echo entity, we also need to configure the RTR responder at the destination.

### Configure FLOW-statistics Entity

The FLOW-statistics entity is to detect the interface traffic and one entity corresponds to one interface. We can monitor the traffic on the interface by scheduling the entity. In one detection period, as long as there are packets passing the interface monitored by the FLOW-statistics entity, the entity status is reachable.

The interval of the FLOW-statistics entity monitoring the interface traffic is 10s-10min. We can record the traffic peak value information on the interface by monitoring, even can record the history information of the traffic statistics during each monitoring, so as to make the network administrator get to know the network communication status and fix the fault.

Table 113-10 Configuring a FLOW-Statistics Entity

Step	Command	Description
Enter the system configuration mode	<b>configure terminal</b>	-
Enter the FLOW-statistics entity configuration mode.	<b>rtr entity-id [ flow-statistics ]</b>	Mandatory If the entity already exists, go directly to entity configuration mode.
Configure the detection attributes.	<b>flow-statistics interface</b> <i>interface-name interval interval</i>	Mandatory
Configure the inflow threshold and the	<b>threshold-inflow flow-value</b> <b>direction { be   se }</b>	Optional

Step	Command	Description
overrun rule for the interface.		By default, the inflow threshold of the interface is 200000000bps (bits/sec), and the overrun rule is be.
Configure the threshold for the number of packets received by the interface and the overrun rule.	<b>threshold-inpacket</b> <i>packet-value</i> <b>direction { be   se }</b>	Optional By default, the threshold for the number of packets received by the interface is 200000000, and the overrun rule is be.
Configure the outflow threshold and the overrun rule for the interface.	<b>threshold-outflow</b> <i>flow-value</i> <b>direction { be   se }</b>	Optional By default, the interface outflow threshold is 200000000 bps (bits per second), and the overrun rule is be.
Configure the threshold for the number of packets sent by the interface and the overrun rule.	<b>threshold-outpacket</b> <i>packet-value</i> <b>direction { be   se }</b>	Optional By default, the threshold for the number of packets sent by the interface is 200000000, and the overrun rule is be.
Configure entity common configuration.	Please refer to the section on configuring entity common configuration.	Optional

---

## Note

- When the over-limit rule is be and the actual value is larger than or equal to the threshold, it is judged as over-limit; when the over-limit rule is se and the actual value is smaller than or equal to the threshold, it is judged as over-limit.
- 

### Configure Entity Common Configuration.

Table 113-11 Configuring Entity Common Configuration

Step	Command	Description
Configure alarm types.	<b>alarm-type</b> [ <b>log</b>   <b>log-and-trap</b>   <b>trap</b>   <b>none</b> ]	Optional By default, the alarm mode is none, i.e. no alarm.
Configure the number of history records to be saved.	<b>number-of-history-kept</b> <i>history-number</i>	Optional By default, 1 history record is saved.
Configure the period for saving history.	<b>periods</b> <i>periods</i>	Optional By default, 1 history record is saved at the end of each schedule.
Configure timeout.	<b>timeout</b> <i>timeout</i>	Optional By default, the timeout is: For ICMP-path-echo entity, the timeout is 5000 milliseconds. For ICMP-path-jitter entity, the timeout is 5000 milliseconds. For VoIP-jitter entity, the timeout is 50000 milliseconds. For UDP-echo entity, the timeout is 5000 milliseconds. Entities that do not support the common command: ICMP-echo entity ICMPv6-echo entity FLOW-statistics entity
Configure the TOS value of a packet.	<b>tos</b> <i>tos-value</i>	Optional By default, the TOS value is 0. Entities that do not support the common command: ICMP-echo entity ICMPv6-echo entity

Step	Command	Description
		FLOW-statistics entity
Configure the VRF attribute of an entity.	<b>vrf</b> <i>vrf-name</i>	Optional By default, the VRF attribute of entity is not configured. Entities that do not support the common command: ICMP-echo entity ICMPv6-echo entity FLOW-statistics entity
Configure the schedule interval for the entity.	<b>frequency</b> <i>seconds</i>	Optional By default, the schedule interval is: For ICMP-path-echo entity, the interval is 60 seconds. For ICMP-path-jitter entity, the interval is 60 seconds. For UDP-echo entity, the interval is 60 seconds. Entities that do not support the common command: ICMP-echo entity ICMPv6-echo entity VoIP-jitter entity FLOW-statistics entity
Configure the length of the detection packet.	<b>request-data-size</b> <i>data-size</i>	Optional By default, the length of a detection packet is: For ICMP-path-echo entity, the length is 70 bytes. For ICMP-path-jitter entity, the length is 70 bytes. For UDP-echo entity, the length is 16 bytes.

Step	Command	Description
		<p>Entities that do not support the common command:</p> <p>ICMP-echo entity</p> <p>ICMPv6-echo entity</p> <p>VoIP-jitter entity</p> <p>FLOW-statistics entity</p>
<p>Configure the packet loss threshold and the overrun rule.</p>	<p><b>threshold-pktloss</b> <i>pktloss</i> <b>direction</b> { <b>be</b>   <b>se</b> }</p>	<p>Optional</p> <p>By default, the packet loss threshold is:</p> <p>For ICMP-echo entity, the threshold is 150.</p> <p>For ICMPv6-echo entity, the threshold is 150.</p> <p>For ICMP-path-echo entity, the threshold is 1.</p> <p>For ICMP-path-jitter entity, the threshold is 100.</p> <p>For UDP-echo entity, the threshold is 1.</p> <p>The overrun rule is be.</p> <p>Entities that do not support the common command:</p> <p>VoIP-jitter entity</p> <p>FLOW-statistics entity</p>
<p>Configure the bi-directional delay threshold and the overrun rule.</p>	<p><b>threshold-rtt</b> <i>rtt</i> <b>direction</b> { <b>be</b>   <b>se</b> }</p>	<p>Optional</p> <p>By default, the bi-directional delay threshold is:</p> <p>For ICMP-echo entity, the threshold is 9000 milliseconds.</p> <p>For ICMPv6-echo entity, the threshold is 9000 milliseconds.</p> <p>For ICMP-path-echo entity, the threshold is 9000 milliseconds.</p>

Step	Command	Description
		<p>For ICMP-path-jitter entity, the threshold is 9000 milliseconds.</p> <p>For VoIP-jitter entity, the threshold is 9000 milliseconds.</p> <p>For UDP-echo entity, the threshold is 9000 milliseconds.</p> <p>The overrun rule is be.</p> <p>Entities that do not support the common command:</p> <p>FLOW-statistics entity</p>

## Note

- If the RTR entity already exists and the entity is in the un-scheduled state, execute the `rtr entity-id` command to enter the entity configuration mode directly.
- When the over-limit rule is `be` and the actual value is larger than or equal to the threshold, it is judged as over-limit; when the over-limit rule is `se` and the actual value is smaller than or equal to the threshold, it is judged as over-limit.
- The schedule interval of the ICMP-path-echo entity needs to meet the following requirement:  $\text{schedule interval} > \text{timeout}$ .
- The schedule interval of the ICMP-path-jitter entity needs to meet the following requirements:  $\text{schedule interval} > \text{timeout}$ ;  $\text{timeout}$  needs to meet the following requirements:  $\text{timeout} > \text{pkt-number} * \text{pkt-interval}$ ; For the `pkt-number` parameter and the `pkt-interval` parameter, refer to the `set` command of the ICMP-path-echo entity.
- When the schedule interval of the VoIP-jitter entity selects simulating G.711ALaw, G.711muLaw, and G.729A codec, it is necessary to meet the following requirement:  $\text{schedule interval} > \text{timeout} + 5$ ; when selecting the customized codec, it is necessary to meet the following requirement:  $\text{schedule interval} > \text{schedule-interval} + 5$ ; `schedule-interval` needs to meet the following requirement:  $\text{schedule-interval} > \text{packet-number} * \text{packet-interval}$ ; for the `schedule-interval`, `packet-number` and `packet-interval` parameters, refer to the `set` command of the VoIP-jitter entity.
- The schedule interval of the UDP-echo entity needs to meet the following requirement:  $\text{schedule interval} > \text{timeout} + 5$ .

### 113.2.3 Configure RTR Entity Group

One RTR entity group is the set of one or multiple RTR entity groups. One RTR entity can belong to multiple RTR entity groups and the group cannot become the member of the group. One group can only contain one

member once. The RTR entity group is identified by the group ID uniquely and the group name is automatically generated by the system.

The RTR entity group is mainly to schedule one RTR set. The scheduling for the RTR entity group is equivalent to the scheduling for all RTR entities in the RTR entity group. The detection result is saved in the history records of the RTR entity.

### Configuration Condition

Before configuring an RTR entity group, do the following:

Enable RTR.

### Configure RTR Entity Group

Table 113-12 Configuring an RTR Entity Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the configuration mode of an RTR entity group.	<b>rtr group</b> <i>group-id</i>	Mandatory If no corresponding RTR entity group exist, it will be created automatically.
Add members to an RTR entity group.	<b>member</b> <i>entity-list</i>	Optional By default, an RTR entity group does not contain any members.
Configure options of an RTR entity group.	<b>option {or   and }</b>	Optional By default, the status option of an RTR entity group is and (the group status is showed as reachable when all entities in the group are reachable).
Configure the schedule interval between members within the RTR entity group.	<b>interval</b> <i>interval</i>	Optional By default, the schedule interval for group members is 0 seconds.

Step	Command	Description
Configure the RTR entity group to automatically generate a scheduler.	<b>group probe</b>	Optional By default, the RTR entity group is not configured to auto-generate a scheduler.

## Note

- One VoIP-jitter entity or UDP-echo entity cannot be added to multiple groups for scheduling. Otherwise, the scheduling result may be wrong.
- The calculation method for the scheduling interval of the RTR entity group is as follows: scheduling interval = the maximum of all member scheduling intervals + (member quantity – 1) \* scheduling interval between the members.

### 113.2.4 Configure RTR Responder

The RTR responder is mainly used to set up the connection with the source end and respond the detection packets sent by the source end, so as to ensure that the detection result is correct. The VoIP-jitter entity and the UDP-echo entity need to set up the connection with the destination end, so we should configure the RTR responder at the destination end.

#### Configuration Condition

Before configuring an RTR entity responder, do the following:

Enable RTR.

#### Configure RTR Responder

Table 113-13 Configuring an RTR Responder

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure RTR Responder	<b>rtr responder</b>	Mandatory By default, no RTR responder is configured.

### 113.2.5 Configure RTR Scheduler

The RTR scheduler is the policy of the scheduling detection for the RTR entity or group. The RTR scheduler can take one entity member as the object and also can take one RTR entity group as the object, but cannot take the group and entity as the object together. The RTR scheduler is identified by the schedule ID uniquely and not related with the RTR entity type, but the scheduling interval should consider the attributes of the scheduled RTR entity or the members in the RTR entity group. The RTR scheduler provides rich scheduling policies and can select to schedule at once or start to schedule after some time, even can set the absolute time of starting the scheduling. Besides, the scheduler can automatically demise after the set scheduling times and also can always exist.

#### Configuration Condition

Before configuring an RTR scheduler, do the following:

Configure the RTR entity or RTR entity group that need to be scheduled.

#### Configure RTR Scheduler

Table 113-14 Configuring an RTR Scheduler

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure an RTR scheduler to schedule an entity or group.	<b>rtr schedule</b> <i>schedule-id</i> { <b>entity</b> <i>entity-id</i>   <b>group</b> <i>group-id</i> } <b>start</b> { <i>hh:mm</i> [ <i>:ss</i> ]   <i>date month year</i>   <b>after</b> <i>hh:mm</i> [ <i>:ss</i> ]   <b>now</b> } <b>ageout</b> <i>ageout-time</i> <b>life</b> { <b>forever</b>   <i>life-time</i> } <b>repeat</b> <i>repeat-times</i> }	Mandatory  By default, no RTR scheduler is configured.

#### Note

- The age time of the RTR scheduler should be larger than the scheduling interval of the scheduling object. Otherwise, after one scheduling, the scheduler is deleted because of aging and timeout.

### 113.2.6 Configure Pausing Scheduling Entity

For an entity undergoing scheduling, you can configure to suspend schedule of that entity.

### Configuration Condition

Before configuring to suspend entity schedule, do the following:

The entity is in scheduling.

### Configure Pausing Scheduling Entity

Table 113-15 Configuring to Suspend Entity Schedule

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Pausing Scheduling Entity	<b>rtr <i>entity-id</i> halt</b>	Optional By default, an entity in schedule is not suspended.

---

### Note

- Only one entity can configure rtr halt. If the entity is the member of the RTR entity group, we cannot configure rtr halt.
  - After configuring rtr halt and if still not configuring rtr resume before the scheduling period ends, the scheduler of scheduling the entity is deleted because of aging and timeout.
- 

### 113.2.7 Configure Restoring Scheduling Entity

For entities that are suspended from scheduling, you can configure to resume scheduling of that entity.

### Configuration Condition

Before configuring to recover schedule of an entity, do the following:

- The entity is suspended from scheduling.

### Configure Pausing Scheduling Entity

Table 113-16 Configuring Pausing Entity Scheduling

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Restoring Scheduling Entity	<b>rtr <i>entity-id</i> resume</b>	Optional

## 113.2.8 SLA Monitoring and Maintaining

Table 113-17 SLA Monitoring and Maintaining

Command	Description
<b>show rtr entity</b> [ <i>entity-id</i> ]	Display information about an RTR entity.
<b>show rtr group</b> [ <i>group-id</i> ]	Display information about an RTR entity group.
<b>show rtr history</b> <i>entity-id</i>	Display history records of a specified RTR entity.
<b>show rtr schedule</b> [ <i>schedule-id</i> ]	Display information about an RTR scheduler.

## 113.3 Typical Configuration Example of SLA

### 113.3.1 Configure an ICMP-echo Entity to Detect the Network Communication

#### Network Requirements

- The ICMP-echo entity is used on Device1 to detect the network communication from Device1 to Device3.

#### Network Topology

Figure 113-1 Network Topology for Configuring an ICMP-Echo Entity

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP address and route of each interface to enable communication between Device1 and Device3. (Omitted)
- Step 3: Configure an ICMP-echo-type entity and add attribute parameters.

#Configure Device1.

```
Device1#config terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 icmpEcho
Device1(config-rtr-icmpEcho)#set 132.1.1.1 5 70 2 12 extend 131.1.1.1 0 TRUE FALSE
Device1(config-rtr-icmpEcho)#alarm-type log
Device1(config-rtr-icmpEcho)#number-of-history-kept 255
Device1(config-rtr-icmpEcho)#threshold-pktLoss 10 direction be
Device1(config-rtr-icmpEcho)#threshold-rtt 1000 direction be
Device1(config-rtr-icmpEcho)#exit
```

#View the parameters of an ICMP-echo entity.

```
Device1#show rtr entity 1
-----
ID:1      name:icmpEcho1      Created:TRUE
*****type:ICMPECHO*****
CreatedTime:WED OCT 31 14:49:31 2012
LatestModifiedTime:WED OCT 31 14:53:53 2012
Times-of-schedule:0
TargetIp:132.1.1.1
Transmit-packets:5
Totally-send-packets:0
Packet-size:70
Timeout:2(s)
Alarm-type:log
Threshold-of-rtt:1000(ms) direction:be
Threshold-of-packet-loss:10 direction:be
Number-of-history-kept:255
Periods:1
Extend parameters:
sourceIp:131.1.1.1  tos:0  DF(DON'T FRAG):TRUE  Verify-data:FALSE
In-scheduling:FALSE
Schedule frequency:12(s)
Status:DEFAULT
```

The results show that the entity parameters are consistent with the configuration.

In-scheduling:FALSE indicates that the entity is not scheduled.

Status:DEFAULT indicates that the entity status is DEFAULT.

---

 **Note**

- When an entity is not scheduled, its status is DEFAULT; when an entity is scheduled, if the entity is reachable, its status is REACHABLE, if it is unreachable, its status is UNREACHABLE.
-

Step 4: Schedule a defined ICMP-echo entity, and define attribute parameters of the schedule.

#### #Configure Device1

```
Device1(config)#rtr schedule 1 entity 1 start now ageout 100 life forever
```

Step 5: Check the result.

1) When the network communication from Device1 to Device3 is normal.

#### #View the status of an entity.

```
Device1#show rtr entity 1
-----
ID:1      name:IcmpEcho1    Created:TRUE
*****type:ICMPECHO*****
CreatedTime:WED OCT 31 14:49:31 2012
LatestModifiedTime:WED OCT 31 14:53:53 2012
Times-of-schedule:1
Time-of-last-schedule:WED OCT 31 14:54:07 2012
TargetIp:132.1.1.1
Transmit-packets:5
Totally-send-packets:5
Packet-size:70
Timeout:2(s)
Alarm-type:log
Threshold-of-rtt:1000(ms) direction:be
Threshold-of-packet-loss:10 direction:be
Number-of-history-kept:255
Periods:1
Extend parameters:
sourceIp:131.1.1.1  tos:0  DF(DONT FRAG):TRUE  Verify-data:FALSE
In-scheduling:TRUE
Schedule frequency:12(s)
Status:REACHABLE
```

In-scheduling:TRUE indicates that the entity is in scheduling.

Status: REACHABLE means that the entity status is reachable, that is, the network communication from Device1 to Device3 is normal.

1) When the network communication from Device1 to Device3 fails.

Since the entity parameters are configured with the alarm mode as log, the alarm message is printed on the device when the network is down, as follows:

```
Oct 31 14:54:46: [tRtrIcmpRev]Rtr 1 (ICMPECHO) rtt [9000ms] was exceeded(>=) threshold [1000ms].
```

#### #View the status of an entity.

```
Device1#show rtr entity 1
-----
ID:1      name:IcmpEcho1    Created:TRUE
*****type:ICMPECHO*****
CreatedTime:WED OCT 31 14:49:31 2012
LatestModifiedTime:WED OCT 31 14:53:53 2012
Times-of-schedule:4
Time-of-last-schedule:WED OCT 31 14:54:43 2012
TargetIp:132.1.1.1
Transmit-packets:5
```

```
Totally-send-packets:20
Packet-size:70
Timeout:2(s)
Alarm-type:log
Threshold-of-rtt:1000(ms) direction:be
Threshold-of-packet-loss:10 direction:be
Number-of-history-kept:255
Periods:1
Extend parameters:
sourceIp:131.1.1.1  tos:0  DF(DON'T FRAG):TRUE  Verify-data:FALSE
In-scheduling:TRUE
Schedule frequency:12(s)
Status:UNREACHABLE
```

In-scheduling:TRUE indicates that the entity is in scheduling.

Status: UNREACHABLE means that the entity status is unreachable, that is, the network communication from Device1 to Device3 fails.

#View the history records.

```
Device1#show rtr history 1
-----
ID:1  Name:IcmpEcho1  CurHistorySize:4  MaxHistorysize:255
History recorded as following:
WED OCT 31 14:54:46 2012
    PktLoss:5    ,Rtt:invalid
WED OCT 31 14:54:32 2012
    PktLoss:0    ,Rtt:11    (ms)
WED OCT 31 14:54:20 2012
    PktLoss:0    ,Rtt:2    (ms)
WED OCT 31 14:54:07 2012
    PktLoss:0    ,Rtt:2    (ms)
```

The history records provide details about the packet loss and latency of each schedule; an invalid Rtt indicates that there is a failure in the network causing the network to be unreachable.

### 113.3.2 Configure an ICMP-path-echo Entity to Detect the Network Communication

#### Network Requirements

- An ICMP-path-echo entity is used on Device1 to detect the network communication of the path from Device1 to Device3.

#### Network Topology

Figure 113-1 Network Topology for Configuring an ICMP-Path-Echo Entity

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure the IP address and route of each interface to enable communication between Device1, Device2 and Device3. (Omitted)

Step 3: Configure an ICMP-path-echo-type entity and add attribute parameters.

#Configure Device1.

```
Device1#config terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 icmp-path-echo
Device1(config-rtr-icmpppathecho)#set dest-ipaddr 192.0.0.2 source-ipaddr 110.1.0.1
Device1(config-rtr-icmpppathecho)#number-of-history-kept 255
Device1(config-rtr-icmpppathecho)#targetOnly false
Device1(config-rtr-icmpppathecho)#exit
```

#View the parameters of an ICMP-path-echo entity.

```
Device1#show rtr entity 1

```

After 10 scheduling sessions, the scheduling stops and the entity status is DEFAULT.

### 113.3.3 Configure an ICMP-path-jitter Entity to Detect the Network Communication

#### Network Requirements

- An ICMP-path-jitter entity is used on Device1 to detect the network communication of the path from Device1 to Device3.

#### Network Topology

Figure 113-2 Network Topology for Configuring an ICMP-Path-Jitter Entity

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP address and route of each interface to enable communication between Device1, Device2 and Device3. (Omitted)
- Step 3: Configure an ICMP-path-jitter-type entity and add attribute parameters.

#### #Configure Device1.

```
Device1#config terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 icmp-path-jitter
Device1(config-rtr-icmppathjitter)#set dest-ipaddr 192.0.0.2 10 20 source-ipaddr 110.1.0.1
Device1(config-rtr-icmppathjitter)#number-of-history-kept 255
Device1(config-rtr-icmppathjitter)#targetOnly false
Device1(config-rtr-icmppathjitter)#exit
```

#### #View the parameters of an ICMP-path-jitter.

The history records provide details about the packet loss, latency and jitter of each schedule.

### 113.3.4 Configuring a VoIP-jitter Entity to Detect Network Transmission of Voice Packets

#### Network Requirements

- A VoIP-jitter entity is used on Device1 to detect the transmission of voice packets from Device1 to Device3.

#### Network Topology

Figure 113-113 Network Topology for Configuring VoIP-Jitter Entities

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP address and route of each interface to enable communication between Device1 and Device3. (Omitted)
- Step 3: Configure ntp for clock synchronization.

#Configure Device3.

```

Device3#config terminal
Device3(config)#ntp master

```

#Configure Device1.

```

Device1(config)#ntp server 192.0.0.2

```

#View if Device3 has been successfully specified as the clock server, indicating that the clock has been synchronized.

```

Device3#show ntp status
Current NTP status information
Clock is synchronized, stratum 8, reference is 127.127.8.10

```

reference time is D4321EF4.7BBBBB68 (08:01:56.483 Wed Oct 24 2012)

#View if Device1 has been successfully specified as a clock client, indicating that the clock has been synchronized with the server address displayed.

```
Device1#show ntp status
Current NTP status information
Clock is synchronized, stratum 9, reference is 192.0.0.2
reference time is D43222C1.91110F31 (08:18:09.566 Wed Oct 24 2012)
```

Step 4: Configure a responder on Device3 as the responder.

#Configure Device3

```
Device3(config)#rtr enable
Device3(config)#rtr responder
```

Step 5: Configure the VoIP-jitter entity on Device1 and add the attribute parameters.

#Configure Device1.

```
Device1#config terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 jitter
Device1(config-rtr-jitter)#set dest-ipaddr 192.0.0.2 dest-port 1234 g711alaw source-ipaddr 110.1.0.1 source-port 1234
Device1(config-rtr-jitter)#number-of-history-kept 255
Device1(config-rtr-jitter)#exit
```

#View the entity parameters.

  SdDelay:16 (ms),DsDelay:7 (ms),SdJitter:10 (ms),DsJitter:13 (ms),
  Mos:5.000000 ,icpif:0.000000
WED OCT 24 16:06:46 2012
  SdPktLoss:0 ,DsPktLoss:0 ,Rtt:17 (ms),
  SdDelay:16 (ms),DsDelay:9 (ms),SdJitter:11 (ms),DsJitter:13 (ms),
  Mos:5.000000 ,icpif:0.000000
```

The history records provide details about one-way packet loss, round-trip delay, one-way delay, and one-way jitter for each schedule.

---

## Note

- Before a VoIP-jitter entity is configured, the NTP service needs to be configured to achieve network clock synchronization and the rtr responder command needs to be configured on the destination end to set it as the responder. Note that the scheduling result will be incorrect if the clock is not synchronized or the responder is not configured.
- 

### 113.3.5 Configuring a UDP-echo Entity to Detect Network Transmission of UDP Packets

#### Network Requirements

- A UDP-echo entity is used on Device1 to detect the transmission of UDP packets from Device1 to Device3.

#### Network Topology

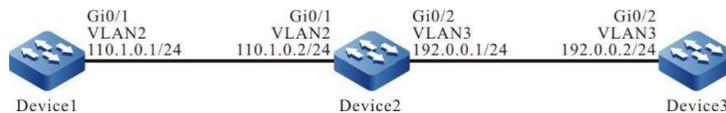

Figure 3-4 Network Topology for Configuring UDP-Echo Entities

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP address and route of each interface to enable communication between Device1 and Device3. (Omitted)
- Step 3: Configure a responder on Device3 as the responder.

#### #Configure Device3

```
Device3#config terminal
Device3(config)#rtr enable
Device3(config)#rtr responder
```

- Step 4: Configure the UDP-echo entity on Device1 and add the attribute parameters.

#### #Configure Device1.

```

Device1#config terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 udpecho
Device1(config-rtr-udpecho)#set dest-ipaddr 192.0.0.2 dest-port 1001 source-ipaddr 110.1.0.1 source-port 1001

```

The history records provide details about the rate (number-based and bit-based) of the input and output interface vlan2 for each schedule.

---

## Note

- The reachability of the FLOW-statistics entity is defined as follows: When the entity is in scheduling, and there is traffic flow in the IN or OUT direction of the interface, the entity status is REACHEABLE, otherwise, it is UNREACHABLE.
- 

### 113.3.7 Configuring an ICMP-Echo Ipv6 Entity to Detect Network Communication

#### Network Requirements

- The ICMP-echo ipv6 entity is used on Device1 to detect the network communication from Device1 to Device3.

#### Network Topology

Figure 113-7 Network Topology for Configuring an ICMP-Echo Ipv6 Entity

#### Configuration Steps

- Step 1: Configure the IPV6 address and route of each interface to enable communication between Device1 and Device3. (Omitted)
- Step 2: Configure an ICMP-echo ipv6 entity and add attribute parameters.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 icmpv6echo
Device1(config-rtr-icmpv6echo)#set 2136::2 5 70 2 12 extend 2135::1 0 TRUE
Device1(config-rtr-icmpv6echo)#alarm-type log
Device1(config-rtr-icmpv6echo)#number-of-history-kept 255
Device1(config-rtr-icmpv6echo)#threshold-pktLoss 10 direction be
Device1(config-rtr-icmpv6echo)#threshold-rtt 1000 direction be
Device1(config-rtr-icmpv6echo)#exit
```

#### #View the parameters of an ICMP-echo ipv6 entity.

```
Device1#show rtr entity 1
-----
ID:1      name:Icmpv6Echo1      Created:TRUE
*****type:ICMPV6ECHO*****
CreatedTime:Tue Sep 17 10:05:52 2019
LatestModifiedTime:Tue Sep 17 10:21:06 2019
```

```
Times-of-schedule:0
TargetIpv6:2136::2
Transmit-packets:5
Totally-send-packets:0
Packet-size:70
Timeout:2(s)
Alarm-type:log
Threshold-of-rtt:1000(ms) direction:be
Threshold-of-packet-loss:10 direction:be
Number-of-history-kept:255
Periods:1
Extend parameters:
sourceIpv6:2135::1 tos:0 Verify-data:TRUE
In-scheduling:FALSE
Schedule frequency:12(s)
Status:DEFAULT
```

-----

The results show that the entity parameters are consistent with the configuration.

In-scheduling: FALSE indicates that the entity is not scheduled.

Status: DEFAULT indicates that the entity status is DEFAULT.

---

## Note

- When an entity is not scheduled, its status is DEFAULT; when an entity is scheduled, if the entity is reachable, its status is REACHABLE, if it is unreachable, its status is UNREACHABLE.
- 

Step 3: Schedule a defined ICMP-echo ipv6 entity, and define attribute parameters of the schedule.

### #Configure Device1

```
Device1(config)#rtr schedule 1 entity 1 start now ageout 20 life forever
```

Step 4: Check the result.

1) When the network communication from Device1 to Device3 is normal.

### #View the status of an entity.

```
Device1#show rtr entity 1
```

```
-----
ID:1      name:Icmpv6Echo1      Created:TRUE
*****type:ICMPV6ECHO*****
CreatedTime:Tue Sep 17 10:05:52 2019
LatestModifiedTime:Tue Sep 17 10:21:06 2019
Times-of-schedule:2
Time-of-last-schedule:Tue Sep 17 10:24:08 2019
TargetIpv6:2136::2
Transmit-packets:5
Totally-send-packets:10
Packet-size:70
Timeout:2(s)
Alarm-type:log

User manual
Release 1.0 01/2022
```

```
Threshold-of-rtt:1000(ms) direction:be
Threshold-of-packet-loss:10 direction:be
Number-of-history-kept:255
Periods:1
Extend parameters:
sourceipv6:2135::1 tos:0 Verify-data:TRUE
In-scheduling:TRUE
Schedule frequency:12(s)
Status:REACHABLE
-----
```

In-scheduling: TRUE indicates that the entity is in scheduling.

Status: REACHABLE means that the entity status is reachable, that is, the network communication from Device1 to Device3 is normal.

1) When the network communication from Device1 to Device3 fails.

Since the entity parameters are configured with the alarm mode as log, an alarm message will be printed when the threshold value is reached or exceeded, as follows:

```
%SLA-4:Rtr 1 (ICMPV6ECHO) rtt [9000ms] was exceeded(>=) threshold [1000ms].
```

#View the status of an entity.

```
Device1#show rtr entity 1
-----
ID:1      name:Icmpv6Echo1      Created:TRUE
*****type:ICMPV6ECHO*****
CreatedTime:Tue Sep 17 10:05:52 2019
LatestModifiedTime:Tue Sep 17 10:21:06 2019
Times-of-schedule:21
Time-of-last-schedule:Tue Sep 17 10:28:08 2019
TargetIpv6:2136::2
Transmit-packets:5
Totally-send-packets:105
Packet-size:70
Timeout:2(s)
Alarm-type:log
Threshold-of-rtt:1000(ms) direction:be
Threshold-of-packet-loss:10 direction:be
Number-of-history-kept:255
Periods:1
Extend parameters:
sourceipv6:2135::1 tos:0 Verify-data:TRUE
In-scheduling:TRUE
Schedule frequency:12(s)
Status:UNREACHABLE
-----
```

In-scheduling: TRUE indicates that the entity is in scheduling.

Status: UNREACHABLE means that the entity status is unreachable, that is, the network communication from Device1 to Device3 fails.

#View the history records.

```
Device1#show rtr history 1
-----
ID:1 Name:Icmpv6Echo1 CurHistorySize:4 MaxHistorySize:255
History recorded as following:
Tue Sep 17 10:24:42 2019
  PktLoss:5 ,Rtt:invalid
```

```

Tue Sep 17 10:24:29 2019
  PktLoss:1 ,Rtt:400 (ms)
Tue Sep 17 10:24:17 2019
  PktLoss:0 ,Rtt:1 (ms)
Tue Sep 17 10:24:05 2019
  PktLoss:0 ,Rtt:0 (ms)
-----

```

The history records provide details about the packet loss and latency of each schedule; an invalid Rtt indicates that there is a failure in the network causing the network to be unreachable.

### 113.3.8 Configure TRACK to Coordinate with SLA

#### Network Requirements

- TRACK is in coordination with SLA. The validity of static routes on Device1 is determined on the basis of entity status.

#### Network Topology

Figure 113-8 Network Topology for Configuring TRACK to Coordinate with SLA

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: On Device1, configure the ICMP-echo entity to detect the network communication from Device1 to Device2, and add the entity to the entity group.

#### #Configure Device1.

```

Device1#config terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 icmpecho
Device1(config-rtr-icmpecho)#set 110.1.0.2 5 70 2 12 extend 110.1.0.1 0 true false
Device1(config-rtr-icmpecho)#number-of-history-kept 255
Device1(config-rtr-icmpecho)#exit
Device1(config)#rtr group 1
Device1(config-rtr-group)#member 1
Device1(config-rtr-group)#exit

```

- Step 4: Define TRACK, and associate it with SLA.

#### #Configure Device1.

```

Device1(config)#track 1
Device1(config-track)#rtr 1

```

Step 5: Add a static route and associate it with TRACK.

#Configure Device1.

```
Device1(config)#ip route 192.0.0.0 255.255.255.0 110.1.0.2 track 1
```

Step 6: Schedule the entity and checking the validity of the static route.

#Configure Device1.

```
Device1(config)#rtr schedule 1 group 1 start now ageout 100 life forever
```

Step 7: Check the result.

1) When the network communication from Device1 to Device2 is normal.

#View the status of an entity group.

```
Device1#show rtr group 1
-----
ID:1      name:rtrGroup1  Members schedule interval:0
Option: AND  Status:REACHABLE
*****
type:SINGLE  Entity Id :1
```

The entity group status is REACHEABLE.

#View the route of network segment 192.0.0.0/24 in the routing table of 'Device1.

```
Device1#show ip route 192.0.0.0
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

S 192.0.0.0/24 [1/10] via 110.1.0.2, 00:00:09, vlan2
```

The result shows that there is a route to the network segment 192.0.0.0/24, indicating that the static route is determined to be valid when the entity group status is RECHABLE.

1) When the network communication from Device1 to Device2 fails.

#View the status of an entity group.

```
Device1#show rtr group 1
-----
ID:1      name:rtrGroup1  Members schedule interval:0
Option: AND  Status:UNREACHABLE
*****
type:SINGLE  Entity Id :1
```

The entity group status is UNREACHEABLE.

#View the route of network segment 192.0.0.0/24 in the routing table of 'Device1.

```
Device1#show ip route 192.0.0.2
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
```

D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

The result shows that there is no route to the network segment 192.0.0.0/24, indicating that the static route is determined to be invalid when the entity status is UNREACHABLE.

### 113.3.9 Configure TRACK to Coordinate with ICMP-Echo Ipv6

#### Network Requirements

- TRACK is in coordination with icmp-echo ipv6. The validity of static routes on Device1 is determined on the basis of entity status.

#### Network Topology

Figure 113-6 Network Topology for Configuring TRACK to Coordinate with Icmp-Echo Ipv6

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: On Device1, configure the ICMP-echo ipv6 entity to detect the network communication from Device1 to Device2, and add the entity to the entity group.

#### #Configure Device1.

```
Device1#config terminal
Device1(config)#rtr enable
Device1(config)#rtr 1 icmpv6echo
Device1(config-rtr-icmpv6echo)# set 2135::2 5 70 2 12 extend 2135::1 0 FALSE
Device1(config-rtr-icmpv6echo)#number-of-history-kept 255
Device1(config-rtr-icmpv6echo)#exit
Device1(config)#rtr group 1
Device1(config-rtr-group)#member 1
Device1(config-rtr-group)#exit
```

Step 3: Define TRACK, and associate it with SLA.

#### #Configure Device1.

```
Device1(config)#track 1
Device1(config-track)#rtr 1
Device1(config-track)#exit
```

Step 4: Add a static route and associate it with TRACK.

#Configure Device1.

```
Device1(config)#ipv6 route 2136::/64 2135::2 track 1
```

Step 5: Schedule an entity group.

#Configure Device1.

```
Device1(config)#rtr schedule 1 group 1 start now ageout 20 life forever
```

Step 6: Check the result.

1) When the network communication from Device1 to Device2 is normal.

#View the status of an entity group.

```
Device1#show rtr group 1
```

```
-----  
ID:1      name:rtrGroup1    Members schedule interval:0  
Option: AND  Status:REACHABLE  
*****  
type:SINGLE  Entity Id :1
```

The entity group status is REACHEABLE.

#View the route of network segment 2136::/64 in the routing table of Device1.

```
Device1#show ipv6 route 2136::/64  
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS  
U - Per-user Static route  
O - OSPF, OE-OSPF External, M - Management
```

```
S 2136::/64 [1/0]  
via 2135::2 [0], 00:50:17, vlan100  
2135::2 [0], vlan100
```

The result shows that there is a route to the network segment 2136::/64, indicating that the coordinated static route is determined to be valid when the entity group status is RECHABLE.

1) When the network communication from Device1 to Device2 fails.

#View the status of an entity group.

```
Device1#show rtr group 1
```

```
-----  
ID:1      name:rtrGroup1    Members schedule interval:0  
Option: AND  Status:UNREACHABLE  
*****  
type:SINGLE  Entity Id :1
```

The entity group status is UNREACHEABLE.

#View the route of network segment 2136::/64 in the routing table of Device1.

```
Device1#show ipv6 route 2136::/64  
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS  
U - Per-user Static route
```

The result shows that there is no route to the network segment 2136::/64, indicating that the coordinated static route is determined to be invalid when the entity status is UNREACHABLE.

# 114 NTP

---

## 114.1 Overview

NTP (Network Time Protocol) is the standard Internet protocol used to synchronize the time in Internet. NTP is to synchronize the device time to the standard time. Currently, the adopted time standard is UTC (Universal Time Coordinated).

The design of NTP fully considers the complexity of the time synchronization on Internet. NTP provides the strict, practical, and valid mechanism, applicable to the Internet environments with various scales and speeds. NTP not only corrects the present time, but also continuously tracks the time change and can adjust automatically. Even if the network fails, it can maintain the time stability. NTP generates less network overhead and has measures to ensure network security. The adoption of these measures allows NTP to obtain reliable and accurate time synchronization over the Internet.

In practice, an appropriate NTP working mode should be selected according to the network deployment to meet the network clock synchronization requirements under different circumstances. NTP supports the following three working modes:

- Client/Server Mode

In client/server mode, the client sends a clock synchronization packet to the server with the Mode field set at 3 (client mode), and the server automatically enters the server mode after receiving the packet and sends a response packet with the Mode field set at 4 (server mode). The client synchronizes the system clock after receiving the response packet. In this mode, the client can synchronize the clock from the server, while the server cannot synchronize the clock from the client.

- Peer-to-Peer (P2P) Mode

In P2P mode, NTP packets with the Mode field set at 3 (client mode) and 4 (server mode) are first interacted between the active and passive peers. After that, the active peer sends a clock synchronization packet with the Mode field set at 1 (active peer mode) to the passive peer, and the passive peer automatically enters the passive peer mode after receiving the packet and sends a clock synchronization packet with the Mode field set at 2 (passive peer mode). After packet interaction, the P2P mode is established. In this mode, the active and passive peers can synchronize their clocks with each other. If both clocks are already synchronized, the clock with the smaller number of layers prevails.

- Broadcast Mode

In broadcast mode, the broadcast server periodically sends a clock synchronization packet with the Mode field set at 5 (broadcast server mode) to the broadcast address 255.255.255.255, and the broadcast client listens to the broadcast packet from the broadcast server. After the broadcast client receives the first broadcast packet, NTP packets with the Mode field set at 3 (client mode) and 4 (server mode) are interacted between the broadcast client and the broadcast server to obtain the network latency between the broadcast client and the broadcast server. After that, the broadcast client continues to listen for broadcast packets and synchronizes the system clock based on the received broadcast packets.

## 114.2 NTP Function Configuration

Table 114-114 NTP Function Configuration List

Configuration Task	
Configure NTP basic functions.	Configure the NTP client/server mode.
	Configure NTP P2P mode.
	Configure NTP broadcast mode.
Configure NTP optional parameters.	Configuring the NTP reference clock.
	Configure the source interface for NTP packets.
	Configure the sending and receiving control of NTP packets.
	Configure the number of NTP dynamic sessions.
Configure the NTP authentication function.	Configure the NTP client/server mode authentication.

Configuration Task	
	Configure the NTP P2P mode authentication
	Configure the NTP broadcast mode authentication.
Configure the NTP access control.	Configure the NTP access control.

### 114.2.1 Configure NTP Basic Functions

#### Configuration Condition

Before configuring NTP basic functions, do the following tasks:

- Configure the network layer address of the interface so that the network layer is reachable between the NTP clock service requesting end and the clock service delivering end.
- NTP is enabled on the NTP clock service delivering end.

#### Configure the NTP Client/Server Mode

Under the NTP client/server mode, no special configuration is required on the server, but it is necessary to ensure that the server clock is synchronized and the number of clock layers is less than the number of clock layers on the client.

The following configuration is required on the NTP client.

Table 1-2 Configuring the NTP Client

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Specify the NTP server.	<b>ntp server</b> [ <b>vrf</b> <i>vrf-name</i> ] { <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i>   <i>domain-name</i> } [ <b>version</b> <i>version-number</i>   <b>key</b> <i>key-number</i>   <b>source</b> <i>interface-name</i> ]*	Mandatory By default, no NTP server is specified.

- 
- The *ip-address* parameter is a unicast address and cannot be a broadcast address, a multicast address, or the IP address of this device.
  - The *ipv6-address* parameter is a global unicast address or the Link-Local address, or a multicast address.
  - After specifying the source interface for sending client packets by **source** interface-name, the primary IP address or the first global unicast IPV6 address of the interface will be set as the source IP address for sending client packets. If the configured server address is an IPv6 Link-local address, the source interface must be specified.
  - Multiple servers can be specified by configuring the **ntp server** or **ntp server ipv6** command multiple times, up to a maximum of 64 servers (the sum of ipv4+ipv6+domains) can be specified.
- 

### Configure NTP P2P Mode

When using the NTP P2P mode, there is no need to specifically configure the passive peer, however, you need to ensure that the passive peer can send and receive NTP packets, which can be achieved by configuring the **ntp enable (ipv6)** command on the passive peer or any of the NTP command in "1.2.1 Configuring NTP Basic Functions" to enable NTP.

The following configuration is required on the NTP active peer.

Table 114-114 Configuring the NTP Active Peer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Specify the NTP passive peer.	<b>ntp peer [ vrf vrf-name ] { ip-address   ipv6 ipv6-address   domain-name } [ version version-number   key key-number   source interface-name ] *</b>	Mandatory By default, no NTP passive peer is specified.

---

### Note

- The *ip-address* parameter is a unicast address and cannot be a broadcast address, a multicast address, or the IP address of this device.
  - The *ipv6-address* parameter is a global unicast address or the Link-Local address, or a multicast address.
  - After specifying the source interface for sending active peer packets by **source interface-name**, the primary IP address or the first global unicast IPV6 address of the interface will
-

---

be set as the source IP address for sending active peer packets. If the configured peer address is an IPv6 Link-local address, the source interface must be specified.

- Multiple passive peers can be specified by configuring the **ntp peer** or **ntp peer ipv6** command multiple times, up to a maximum of 64 passive peers (the sum of ipv4+ipv6+domain) can be specified.
- 

### Configure NTP Broadcast Mode

When using the NTP broadcast mode, both the broadcast server and the broadcast client need to be configured, and the clock of the broadcast server needs to be synchronized and the number of clock layers is less than the number of clock layers of the broadcast client. Since an interface for sending NTP broadcast packets needs to be specified on the broadcast server and an interface for receiving NTP broadcast packets needs to be specified on the broadcast client, the configuration of the broadcast mode can only be performed in the specific interface mode.

The following configuration is required on the NTP broadcast client.

Table 3-4 Configuring the NTP Broadcast Client

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable the NTP broadcast client on the interface.	<b>ntp broadcast-client</b>	Mandatory By default, NTP broadcast client is disabled on the interface.

The following configuration is required on the NTP broadcast server.

Table 5-6 Configuring the NTP Broadcast Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Enable the NTP broadcast server on the interface.	<b>ntp broadcast-server</b> [ <b>key</b> <i>key-number</i>   <b>version</b> <i>version-number</i> ]*	Mandatory  By default, NTP broadcast server is disabled on the interface.

## 114.2.2 Configure NTP Optional Parameters

### Configuration Condition

None

### Configuring the NTP reference Clock

NTP can synchronize system time in two ways:

- Synchronization with local clock: i.e., the local clock is used as the NTP reference clock.
- Synchronization with other clock sources in the network: i.e., using any of the three aforementioned NTP working modes.

Table 7-8 Configuring the Local Clock as the NTP Reference Clock

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the local clock as the NTP reference clock.	<b>ntp master</b> [ <i>stratum-number</i> ]	Mandatory  By default, the local clock is not configured as the NTP reference clock.

### Note

- After configuring the local clock as the NTP reference clock, the NTP cannot synchronize the clock from other clock sources in the network.

- After configuring the local clock as the NTP reference clock, the local device can be used as a clock source to synchronize other devices in the network. Please use this configuration with caution to avoid causing clock errors on other devices in the network.

### Configure the Source Interface for NTP Packets

If the source interface for a NTP packet is configured, the primary IP address of the specified source interface will be selected as the source IP address of the packet when the device actively sends a NTP packet.

Table 9-10 Configuring the Source Interface for the NTP Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the source interface for NTP packets.	<b>ntp source <i>interface-name</i></b>	Mandatory By default, the source interface of a NTP packet is not configured.

### Note

- If the source interface is specified using the command `ntp server` or `ntp peer`, the source interface specified by the command `ntp server` or `ntp peer` is used first.
- If `ntp broadcast` is configured in the interface mode, the source interface for a NTP broadcast packet is the interface on which the above command is configured.
- If the source interface of the specified NTP packet is in the down state, the source address of the default routing interface primary address or the first global unicast address encapsulating `ntp` is restored to send packets.
- If the source interface of the specified NTP packet has no configured address and is in up state, and there is no corresponding `ipv4` or `ipv6` address, the source address of the default routing interface primary address or the first global unicast address encapsulating `ntp` is restored to send the packet.

### Configure the Sending and Receiving Control of NTP Packets

By default, the device does not receive and send all NTP packets. You can enable receiving and sending NTP packets by configuring the sending and receiving control of NTP packets.

Table 11-12 Configuring the Sending and Receiving Control of NTP Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable to receive and send NTP packets.	<b>ntp enable [ipv6]</b>	Mandatory By default, receiving and sending NTP packets is prohibited.

## Note

- After configuring the **no ntp enable** command, all IPV4 NTP packets will be prohibited from being received and sent, and if the **ntp enable** command is configured, receiving and sending IPV4 NTP packets will be enabled.
- After configuring the **no ntp enable ipv6** command, all IPV6 NTP packets will be prohibited from being received and sent. If the **ntp enable ipv6** command is configured, the receiving and sending of IPV6 NTP packets will be enabled.

### Configure the Number of NTP Dynamic Sessions

Set the maximum number of NTP dynamic connections allowed to be established locally by configuring the number of NTP dynamic sessions.

Table 13-14 Configuring the Number of NTP Dynamic Sessions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Set the maximum number of NTP dynamic connections allowed to be established locally.	<b>ntp max-dynamic-sessions <i>number</i></b>	Mandatory By default, the number of NTP dynamic sessions allowed to be established is 100.

### 114.2.3 Configure the NTP Authentication Function

In some networks with high security requirements, authentication needs to be enabled when running the NTP protocol. By authenticating the interaction packets between the NTP clock service requesting end and the delivering end, it ensures that the clock service requesting end is synchronized to a legitimate time, improving network security.

#### Configuration Condition

Before configuring the NTP authentication function, do the following tasks:

- Configure the network layer address of the interface so that the network layer is reachable between the NTP clock service requesting end and the clock service delivering end.
- NTP is enabled on the NTP clock service delivering end.

#### Configure the NTP Client/Server Mode Authentication

When configuring the NTP client/server mode authentication, you need to enable authentication on both the client and the server, configure the authentication key, set the authentication key as a trusted key, and specify the key associated with the server on the client.

The following configuration is required on the NTP client.

Table 15-16 Configuring NTP Client Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the NTP authentication function.	<b>ntp authenticate</b>	Mandatory By default, the NTP authentication function is not enabled.
Configure the authentication key.	<b>ntp authentication-key</b> <i>key-number</i> <b>md5</b> { <b>0</b> <i>plain-key</i>   <b>7</b> <i>cipher-key</i> }	Mandatory By default, no authentication key is configured.
Configure the specified key as a trusted key.	<b>ntp trusted-key</b> <i>key-number</i>	Mandatory By default, no trusted key is specified.

Step	Command	Description
Specify the key associated with the server.	<b>ntp server</b> [ <i>vrf vrf-name</i> ] { <i>ip-address</i>   <i>domain-name</i>   <b>ipv6</b> <i>ipv6-address</i> } [ <b>version</b> <i>version</i>   <b>source</b> <i>interface-name</i> ] <b>key</b> <i>key-number</i>	Mandatory

The following configuration is required on the NTP server.

Table 17-18 Configuring NTP Server Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the NTP authentication function.	<b>ntp authenticate</b>	Mandatory By default, the NTP authentication function is not enabled.
Configure the authentication key.	<b>ntp authentication-key</b> <i>key-number</i> <b>md5</b> { <i>0 plain-key</i>   <i>7 cipher-key</i> }	Mandatory By default, no authentication key is configured.
Configure the specified key as a trusted key.	<b>ntp trusted-key</b> <i>key-number</i>	Mandatory By default, no trusted key is specified.

## Note

- The server and client need to be configured with the same authentication key.

### Configure the NTP P2P Mode Authentication

When configuring the NTP peer mode authentication, you need to enable authentication on both active and passive peers, configure the authentication key, set the authentication key as a trusted key, and specify the key associated with the passive peer on the active peer.

The following configuration is required on the NTP active peer.

Table 19-20 Configuring NTP Active Peer Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the NTP authentication function.	<b>ntp authenticate</b>	Mandatory By default, the NTP authentication function is not enabled.
Configure the authentication key.	<b>ntp authentication-key</b> <i>key-number</i> <b>md5</b> { <i>0 plain-key</i>   <i>7 cipher-key</i> }	Mandatory By default, no authentication key is configured.
Configure the specified key as a trusted key.	<b>ntp trusted-key</b> <i>key-number</i>	Mandatory By default, no trusted key is specified.
Specify the key associated with the passive peer.	<b>ntp peer</b> [ <i>vrf vrf-name</i> ] <i>ip-address</i>   <i>domain-name</i>   <b>ipv6</b> <i>ipv6-address</i> [ <b>version</b> <i>version</i>   <b>source</b> <i>interface-name</i> ] <b>key</b> <i>key-number</i>	Mandatory

The following configuration is required on the NTP passive peer.

Table 21-22 Configuring NTP Passive Peer Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the NTP authentication function.	<b>ntp authenticate</b>	Mandatory By default, the NTP authentication function is not enabled.
Configure the authentication key.	<b>ntp authentication-key</b> <i>key-number</i> <b>md5</b> { <i>0 plain-key</i>   <i>7 cipher-key</i> }	Mandatory By default, no authentication key is configured.

Step	Command	Description
Configure the specified key as a trusted key.	<b>ntp trusted-key</b> <i>key-number</i>	Mandatory By default, no trusted key is specified.

## Note

- Active and passive peers need to be configured with the same authentication key.

### Configure the NTP Broadcast Mode Authentication

When configuring the NTP broadcast mode authentication, you need to enable authentication on both the broadcast client and the broadcast server, configure the authentication key, set the authentication key as the trusted key, and specify the key associated with this broadcast server on the broadcast server.

The following configuration is required on the NTP broadcast client.

Table 23-24 Configuring NTP Broadcast Client Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the NTP authentication function.	<b>ntp authenticate</b>	Mandatory By default, the NTP authentication function is not enabled.
Configure the authentication key.	<b>ntp authentication-key</b> <i>key-number</i> <b>md5</b> { <b>0</b> <i>plain-key</i>   <b>7</b> <i>cipher-key</i> }	Mandatory By default, no authentication key is configured.
Configure the specified key as a trusted key.	<b>ntp trusted-key</b> <i>key-number</i>	Mandatory By default, no trusted key is specified.

The following configuration is required on the NTP broadcast server.

Table 25-26 Configuring NTP Broadcast Server Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the NTP authentication function.	<b>ntp authenticate</b>	Mandatory By default, the NTP authentication function is not enabled.
Configure the authentication key.	<b>ntp authentication-key</b> <i>key-number</i> <b>md5</b> { <b>0</b> <i>plain-key</i>   <b>7</b> <i>cipher-key</i> }	Mandatory By default, no authentication key is configured.
Configure the specified key as a trusted key.	<b>ntp trusted-key</b> <i>key-number</i>	Mandatory By default, no trusted key is specified.
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Specify the key associated with the broadcast server.	<b>ntp broadcast-server</b> [ <b>version</b> <i>version-number</i> ] <b>key</b> <i>key-number</i>	Mandatory

---

 **Note**

- The broadcast server and the broadcast client need to be configured with the same authentication key.
- 

### 114.2.4 Configure the NTP Access Control

#### Configuration Condition

Before configuring the **NTP** access control, do the following tasks:

- Configure the ACL associated with the access control.

#### Configure the NTP Access Control

NTP can restrict access to the local NTP service by associating it with an ACL.

Table 27-28 Configuring NTP Access Control

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the NTP access control.	<b>ntp access-control list</b> <i>access-list-name</i>	Mandatory By default, the NTP access control is not configured.

### 114.2.5 NTP Monitoring and Maintaining

Table 29-30 NTP Monitoring and Maintaining

Command	Description
<b>show ntp associations [ipv6]</b>	Display NTP session information.
<b>show ntp status</b>	Display NTP status information.
<b>snmp-server enable traps ntp [stratum-change   sync-lost   sync-success]*</b>	Enable the Trap function of NTP.

## 114.3 Typical Configuration Example of NTP

### 114.3.1 Configure the NTP IPV4 Server and Client

#### Network Requirements

- Device1 is the NTP server and Device2 is the NTP client.
- Device1 and Device2 are interconnected through their respective interface VLAN2, and are route reachable.
- The NTP server is the clock source and the client gets the clock from the server.

#### Network Topology

Figure 1-2 Network Topology for Configuring NTP Server and Client

### Configuration Steps

Step 1: Configure IP addresses for the interfaces (omitted).

Step 2: Configure the NTP server Device1.

#Enable NTP IPV4 for Device1, configure the time as China Standard Time, local clock as the reference clock, and the number of clock layers at 3.

```
Device1#configure terminal
Device1(config)#ntp enable
Device1(config)#clock timezone BINJING 8
Device1(config)#ntp master 3
Device1(config)#exit
```

Step 3: Configure the NTP client Device2.

#Enable NTP IPV4 for Device2 and configure the time as China Standard Time.

```
Device2#configure terminal
Device2(config)#ntp enable
Device2(config)#clock timezone BINJING 8
```

#Specify the NTP server Device1, and the IP address is 1.0.0.1.

```
Device2(config)#ntp server 1.0.0.1
Device2(config)#exit
```

Step 4: Check the result.

#On the client Device2, execute **show ntp status** command to check the clock synchronization status and other information, indicating that the client and the NTP server Device1 has been synchronized, the number of clock layers is greater than Device1 by 1, which is 4.

```
Device2#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 4, reference is 1.0.0.1
reference time is D442EB0E.432F29BD (01:49:02.262 Tue Nov 06 2012)
```

#Execute the **show clock** command on the client Device2 to check the device clock.

```
Device2#show clock
BEIJING(UTC+08:00) TUE NOV 06 09:49:30 2012
```

## 114.3.2 Configure the NTP IPv4 Server and Multi-Level Client

### Network Requirements

- Device1 is the NTP server, and Device2 and Device3 are the NTP clients.
- Device2 is interconnected with Device1 and Device3 through interface vlan2 and vlan3, respectively, and the routes are reachable.
- Device1 provides the clock for Device2 and Device2 provides the clock for Device3.

### Network Topology

Figure 3-4 Network Topology for Configuring NTP Server and Multi-Level Client

### Configuration Steps

Step 1: Configure IP addresses for the interfaces (omitted).

Step 2: Configure the NTP server Device1.

#Enable NTP IPv4 for Device1, configure the time as China Standard Time, local clock as the reference clock, and the number of clock layers at 3.

```
Device1#configure terminal
Device1(config)#ntp enable
Device1(config)#clock timezone BINJING 8
Device1(config)#ntp master 3
Device1(config)#exit
```

Step 3: Configure the NTP client Device2.

#Enable NTP IPv4 for Device2 and configure the time as China Standard Time.

```
Device2#configure terminal
Device2(config)#ntp enable
Device2(config)#clock timezone BINJING 8
```

#Specify the NTP server Device1 with the IP address 1.0.0.1.

```
Device2(config)#ntp server 1.0.0.1
```

Step 4: Configure the NTP client Device3.

#Configure to enable NTP IPv4 for Device3 and configure the time as China Standard Time.

```
Device3#configure terminal
Device3(config)#ntp enable
Device3(config)#clock timezone BINJING 8
```

#Specify the NTP server Device2 with the IP address 2.0.0.1.

```
Device3(config)#ntp server 2.0.0.1
```

Step 5: Check the results and the clock synchronization information on Device2 and Device3 respectively.

#On the client Device2, execute **show ntp status** command to check the clock synchronization status and other information, indicating that Device2 and the NTP server Device1 has been synchronized, the number of clock layers is greater than Device1 by 1, which is 4.

```
Device2#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 4, reference is 1.0.0.1
reference time is D44CC35E.BAA6A190 (13:02:22.729 Tue Nov 13 2012)
```

#Execute the **show clock** command on the client Device2 to check the device clock.

```
Device2#show clock
BEIJING(UTC+08:00) TUE NOV 13 21:02:24 2012
```

#On the client Device3, execute **show ntp status** command to check the clock synchronization status and other information, indicating that Device3 and Device2 has been synchronized, the number of clock layers is greater than Device2 by 1, which is 5.

```
Device3#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 5, reference is 2.0.0.1
reference time is D44CC365.5CC8C4C8 (13:02:29.362 Tue Nov 13 2012)
```

#Execute the **show clock** command on the client Device3 to check the device clock.

```
Device3#show clock
BEIJING(UTC+08:00) TUE NOV 13 21:02:36 2012
```

### 114.3.3 Configure NTP Server and Client with MD5 Authentication

#### Network Requirements

- Device1 acts as the NTP server, Device2 acts as the NTP client, and both sides are authenticated with the MD5 algorithm.
- Device1 and Device2 are interconnected through their respective interface VLAN2, and are route reachable.
- The NTP server is the clock source and the client gets the clock from the server.

#### Network Topology

Figure 114-114 Network Topology for Configuring NTP Server and Client with MD5 Authentication

### Configuration Steps

Step 1: Configure IP addresses for the interfaces (omitted).

Step 2: Configure the NTP server.

#Enable NTP IPV4 for Device1, configure the time as China Standard Time, local clock as the reference clock, and the number of clock layers at 3.

```
Device1#configure terminal
Device1(config)#ntp enable
Device1(config)#clock timezone BINJING 8
Device1(config)#ntp master 3
Device1(config)#exit
```

Enable authentication.

```
Device1(config)#ntp authenticate
```

#Configure the authentication key serial number as 1, the algorithm as MD5, and the key as admin.

```
Device1(config)#ntp authentication-key 1 md5 0 admin
```

#Configure the key with serial number 1 to be trusted.

```
Device1(config)#ntp trusted-key 1
```

Step 3: Configure the NTP client.

#Enable NTP IPV4 for Device2 and configure the time as China Standard Time.

```
Device2#configure terminal
Device2(config)#ntp enable
Device2(config)#clock timezone BINJING 8
```

#Specify the NTP server for the client, and the IP address is 1.0.0.1.

```
Device2(config)#ntp server 1.0.0.1
```

Enable authentication.

```
Device2(config)#ntp authenticate
```

#Configure the authentication key serial number as 1, the algorithm as MD5, and the key as admin.

```
Device2(config)#ntp authentication-key 1 md5 0 admin
```

#Configure the key with serial number 1 to be trusted.

```
Device2(config)#ntp trusted-key 1
```

Step 4: Check the result.

#On the client Device2, execute **show ntp status** command to check the clock synchronization status and other information, indicating that the client and the NTP server Device1 has been synchronized, the number of clock layers is greater than Device1 by 1, which is 4.

```
Device2#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 4, reference is 1.0.0.1
reference time is D442ECE1.8BB7B219 (01:56:49.545 Tue Nov 06 2012)
```

#Execute the **show clock** command on Device2 to check the device clock.

```
Device2#show clock
BEIJING(UTC+08:00) TUE NOV 06 09:56:52 2012
```

---

## Caution

- The NTP client and the server must have the same authentication serial number and the same key.
- 

### 114.3.4 Configure the NTP IPV4 P2P Mode

#### Network Requirements

- Device1, Device2 and Device3 are interconnected through their respective interfaces and are reachable by route.
- Device1 sets the local clock as the reference clock and the layer number is 3.
- Device2 acts as the NTP client, and set Device1 as the NTP server.
- Device3 sets Device2 as the peer, Device3 as the active peer, and Device2 as the passive peer.

#### Network Topology

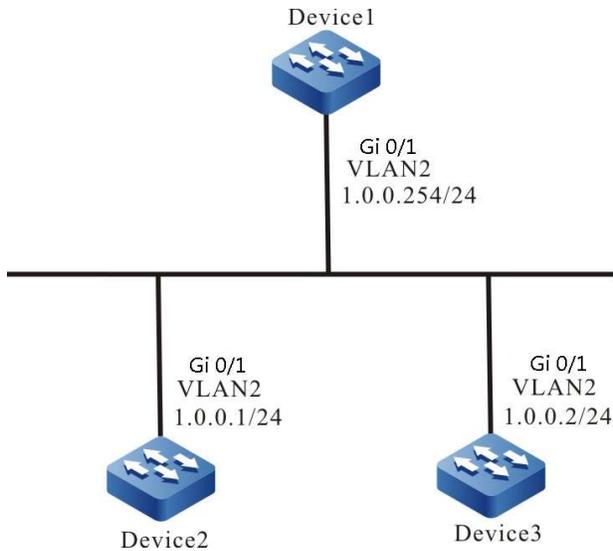

Figure 5-6 Network Topology for Configuring the NTP P2P Mode

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Enable NTP IPV4 on Device1, and configure the time as China Standard Time and the number of local clock layers as 3.

```
Device1#configure terminal
Device1(config)#ntp enable
Device1(config)#clock timezone BINJING 8
Device1(config)#ntp master 3
```

Step 3: Device2 specifies Device1 as the NTP server.

#Enable NTP IPV4 on Device2 and configure the time as China Standard Time.

```
Device2#configure terminal
Device2(config)#ntp enable
Device2(config)#clock timezone BEIJING 8
```

#Specify the NTP server IP address as 1.0.0.254.

```
Device2(config)#ntp server 1.0.0.254
```

Step 4: Device3 sets Device2 as the peer.

#Enable NTP IPV4 on Device3 and configure the time as China Standard Time.

```
Device3#configure terminal
Device3(config)#ntp enable
Device3(config)#clock timezone BEIJING 8
```

#Specify the NTP peer IP address as 1.0.0.1.

```
Device3(config)#ntp peer 1.0.0.1
```

Step 5: Check the result.

#Execute the **show ntp status** command on client Device2 to check the clock synchronization status and other information.

```
Device2#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 4, reference is 1.0.0.254
reference time is D8E9785D.221F1F5 (03:09:17.8 Tue Apr 28 2015)
```

Device2 clock layer number is larger than Device1 by 1, which is 4, and the reference clock server address is 1.0.0.254, indicating that the client Device2 and the server Device1 have been synchronized.

#Execute the **show clock** command on the client Device2 to check the device clock.

```
Device2#show clock
BEIJING(UTC+08:00) TUE APR 28 11:10:36 2015
```

#Execute the **show ntp status** command on the active peer Device3 to check the clock synchronization status and other information.

```
Device3#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 5, reference is 1.0.0.1
reference time is D8E9795C.29835CC9 (03:13:32.162 Tue Apr 28 2015)
```

Device3 clock layer number is larger than Device2 by 1, which is 5, and the reference clock server address is 1.0.0.1, indicating that active peer Device3 has been synchronized with passive peer Device2.

#Execute the **show clock** command on the client Device3 to check the device clock.

```
Device3#show clock
BEIJING(UTC+08:00) TUE APR 28 11:16:19 2015
```

### 114.3.5 Configure NTP Broadcast Mode

#### Network Requirements

- Device1, Device2 and Device3 are interconnected through their respective interfaces and are reachable by route.
- Device1 sets the local clock as the reference clock and the layer number is 3.
- Device1 acts as the NTP broadcast server and sends NTP broadcast packets from the vlan2 interface.
- Device2 and Device3 are NTP broadcast clients, listening for NTP broadcast packets on their respective interfaces vlan2.

## Network Topology

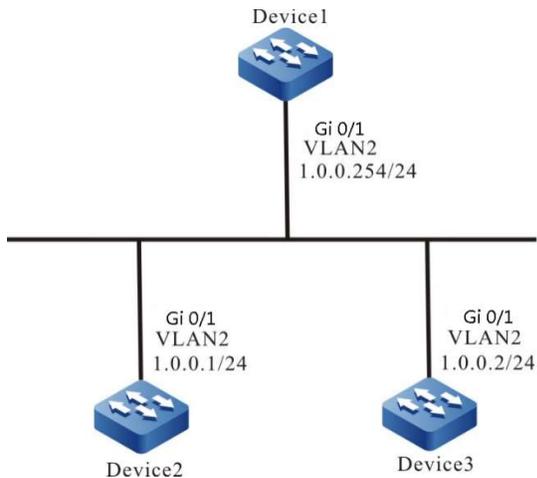

Figure 7-8 Network Topology for Configuring the NTP Broadcast Mode

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Device1 sets the local clock as the reference clock and the layer number as 3. Configure Device1 as the NTP broadcast server to send NTP broadcast packets on interface vlan2.

#Enable NTP IPV4 on Device1, and configure the time as China Standard Time and the number of local clock layers as 3.

```
Device1#configure terminal
Device1(config)#ntp enable
Device1(config)#clock timezone BINJING 8
Device1(config)#ntp master 3
```

#Configure Device1 as the NTP broadcast server to send NTP broadcast packets on interface vlan2.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ntp broadcast-server
```

Step 3: Configure Device2 as the NTP broadcast client to listen for NTP broadcast packets on interface vlan2.

```
Device2#configure terminal
Device2(config)#ntp enable
Device2(config)#clock timezone BINJING 8
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ntp broadcast-client
```

Step 4: Configure Device3 as the NTP broadcast client to listen for NTP broadcast packets on interface vlan2.

```
Device3#configure terminal
Device3(config)#ntp enable
Device3(config)#clock timezone BINJING 8
```

```
Device3(config)#interface vlan2
Device3(config-if- vlan2)#ntp broadcast-client
```

Step 5: Check the result.

#Execute the show ntp status command on client Device2 to check the clock synchronization status and other information.

```
Device2#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 4, reference is 1.0.0.254
reference time is D8E97C99.5110D9FE (03:27:21.316 Tue Apr 28 2015)
```

Device2 clock layer number is larger than Device1 by 1, which is 4, and the reference clock server address is 1.0.0.254, indicating that the client Device2 and the server Device1 have been synchronized.

#Execute the show clock command on the client Device2 to check the device clock.

```
Device2#show clock
BEIJING(UTC+08:00) TUE APR 28 11:27:22 2015
```

#Execute the show ntp status command on client Device3 to check the clock synchronization status and other information.

```
Device3#show ntp status
Current NTP status information
NTP ipv4 is enabled
NTP ipv6 is disabled
Clock is synchronized, stratum 4, reference is 1.0.0.254
reference time is D8E97CAC.78F42CA6 (03:27:40.472 Tue Apr 28 2015)
```

Device3 clock layer number is larger than Device1 by 1, which is 4, and the reference clock server address is 1.0.0.254, indicating that the client Device3 and the server Device1 have been synchronized.

#Execute the show clock command on the client Device3 to check the device clock.

```
Device3#show clock
BEIJING(UTC+08:00) TUE APR 28 11:27:41 2015
```

### 114.3.6 Configure the NTP IPV6 Server and Client

#### Network Requirements

- Device1 is the NTP server and Device2 is the NTP client.
- Device1 and Device2 are interconnected through their respective interface VLAN2, and are route reachable.
- The NTP server is the clock source and the client gets the clock from the server.

#### Network Topology

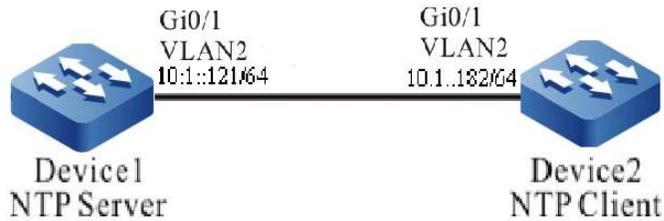

Figure 9-10 Network Topology for Configuring the NTP IPV6 Server and Client

### Configuration Steps

Step 1: Configure the IPv6 address of each interface (omitted).

Step 2: Configure the NTP server Device1.

#Enable NTP IPV6 on Device1, and configure the time as China Standard Time, local clock as the reference clock, and the number of local clock layers as 3.

```
Device1#configure terminal
Device1(config)#ntp enable ipv6
Device1(config)#clock timezone BINJING 8
Device1(config)#ntp master 3
Device1(config)#exit
```

Step 3: Configure the NTP client Device2.

#Enable NTP IPV6 on Device2 and configure the time as China Standard Time.

```
Device2#configure terminal
Device2(config)#ntp enable ipv6
Device2(config)#clock timezone BINJING 8
```

#Specify the NTP server Device1 with the IPV6 address 10:1::121.

```
Device2(config)#ntp server ipv6 10:1::121
Device2(config)#exit
```

Step 4: Check the result.

#On the client Device2, execute **show ntp status** command to check the clock synchronization status and other information, indicating that the client and the NTP server Device1 has been synchronized, the number of clock layers is greater than Device1 by 1, which is 4.

```
Device2#show ntp status
Current NTP status information
NTP ipv4 is disabled
NTP ipv6 is enabled
Clock is synchronized, stratum 4, reference is 10:1::121
reference time is D442EB0E.432F29BD (01:49:02.262 Tue Nov 06 2012)
```

#Execute the **show clock** command on the client Device2 to check the device clock.

```
Device2#show clock
```

### 114.3.7 Configure the NTP IPV6 P2P Mode

#### Network Requirements

- Device1, Device2 and Device3 are interconnected through their respective interfaces and are reachable by route.
- Device1 sets the local clock as the reference clock and the layer number is 3.
- Device2 acts as the NTP client, and set Device1 as the NTP server.
- Device3 sets Device2 as the peer, Device3 as the active peer, and Device2 as the passive peer.

#### Network Topology

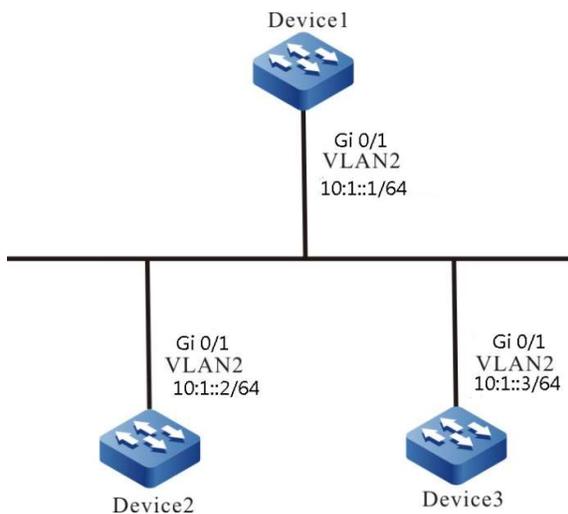

Figure 11-12 Network Topology for Configuring the NTP IPV6 Mode

#### Configuration Steps

Step 1: Configure the IPv6 address for each interface. (Omitted)

Step 2: Enable NTP IPV6 on Device1, and configure the time as China Standard Time and the number of local clock layers as 3.

```

Device1#configure terminal
Device1(config)#ntp enable ipv6
Device1(config)#clock timezone BINJING 8
Device1(config)#ntp master 3
  
```

Step 3: Device2 specifies Device1 as the NTP server.

#Enable NTP IPV6 on Device2 and configure the time as China Standard Time.

```

Device2#configure terminal
Device2(config)#ntp enable ipv6
  
```

```
Device2(config)#clock timezone BEIJING 8
```

#Specify the NTP server IPV6 address as 10:1::1.

```
Device2(config)#ntp server ipv6 10:1::1
```

Step 4: Device3 sets Device2 as the peer.

#Enable NTP IPV6 on Device3 and configure the time as China Standard Time.

```
Device3#configure terminal
Device3(config)#ntp enable ipv6
Device3(config)#clock timezone BEIJING 8
```

#Specify the NTP peer IPV6 address as 10:1::2.

```
Device3(config)#ntp peer ipv6 10:1::2
```

Step 5: Check the result.

#Execute the **show ntp status** command on client Device2 to check the clock synchronization status and other information.

```
Device2#show ntp status
Current NTP status information
NTP ipv4 is disabled
NTP ipv6 is enabled
Clock is synchronized, stratum 4, reference is 10:1::1
reference time is D8E9785D.221F1F5 (03:09:17.8 Tue Apr 28 2015)
```

Device2 clock layer number is larger than Device1 by 1, which is 4, and the reference clock server address is 10:1::1, indicating that the client Device2 and the server Device1 have been synchronized.

#Execute the **show clock** command on the client Device2 to check the device clock.

```
Device2#show clock
BEIJING(UTC+08:00) TUE APR 28 11:10:36 2015
```

#Execute the **show ntp status** command on the active peer Device3 to check the clock synchronization status and other information.

```
Device3#show ntp status
Current NTP status information
NTP ipv4 is disabled
NTP ipv6 is enabled
Clock is synchronized, stratum 5, reference is 10:1::2
reference time is D8E9795C.29835CC9 (03:13:32.162 Tue Apr 28 2015)
```

Device3 clock layer number is larger than Device2 by 1, which is 5, and the reference clock server address is 10:1::2, indicating that active peer Device3 has been synchronized with passive peer Device2.

#Execute the **show clock** command on the client Device3 to check the device clock.

```
Device3#show clock
BEIJING(UTC+08:00) TUE APR 28 11:16:19 2015
```

# 115 Port Mirror

---

## 115.1 Overview

### 115.1.1 Overview

Port mirror, also called SPAN (Switched Port Analyzer), is one management mode used to monitor the data flow of the device port. SPAN includes the local SPAN, remote SPAN and encapsulated remote SPAN.

### 115.1.2 Basic Concepts

#### SPAN Session

SPAN session means to mirror the data flow of one or multiple monitor ports on the device and send to the destination port. The mirrored data flow can be the input data flow and also can be the output data flow or mirror the input and output data flow at the same time. We can configure SPAN for the disabled port and the SPAN session does not take effect, but as long as the related port is enabled, SPAN takes effect.

#### Local SPAN

Local SPAN supports the port mirror on one device. All mirror ports and destination ports are on the same device.

#### Remote SPAN

Remote SPAN, also called RSPAN (Remote Switched Port Analyzer), supports that the mirror port can destination port are not on one device, realizing the remote monitoring across the L2 network. In the specified RSPAN VLAN, each RSPAN Session makes the mirror packets be forwarded in the L2 network. RSPAN includes RSPAN Source Session, RSPAN VLAN, and RSPAN Destination Session. We need to configure RSPAN source session and RSPAN destination session on different devices. When configuring the RSPAN source session, we need to specify one or multiple mirror ports and one RSPAN VLAN. The data mirrored by the monitor port is sent to RSPAN VLAN. To configure RSPAN destination session on another device, we need to specify the destination port and RSPAN VLAN. RSPAN destination session sends RSPAN VLAN data to the destination port.

#### Encapsulated Remote SPAN

Encapsulated Remote SPAN, also known as ERSPAN (Encapsulated Remote Switched Port Analyzer), provides the ability to encapsulate mirrored packets through specific tunnels across Layer-3 network for

data monitoring purposes. When configuring an ERSPAN session, you need to specify one or more monitoring ports, a source IP address, and a destination IP address.

## **VLAN SPAN**

VLAN SPAN supports VLAN mirroring on a single device. Mirror a copy of one or more monitored VLAN streams to the destination port. The mirrored data flow can be the input data flow and also can be the output data flow or mirror the input and output data flow at the same time.

### **Traffic Type**

Traffic type includes Receive (Rx) (the received traffic of the mirror port, Transmit (Tx) (the forwarded traffic of the mirror port, and Both (the received and forwarded traffic of the mirror port).

### **SPAN Source Port**

SPAN source port is also called monitored port. Its data is monitored for network analysis. The monitored data flow can be at the input direction, output direction or both. It can function in different VLANs. The source port can be general port or aggregation group. One source port can only belong to one SPAN session.

### **SPAN Destination Port**

SPAN destination port can only be one separate actual physical port or aggregation group. One destination port can only be used in one SPAN session. The destination port can be general port or aggregation group.

The device supports taking the destination port as the general forwarding port, but for universality and to make the monitored data not be interfered by other data flow, it is suggested to delete the destination port from all VLANs.

---

## **Note**

- The destination port should not be connected to other devices, as this may result in a network loop.
  - The destination port cannot carry any other services.
  - The destination port should be greater than or equal to the bandwidth of the monitored port, otherwise packet loss may occur.
  - The destination port cannot enable LACP (Link Aggregation Control Protocol) or the 802.1X function to avoid mirroring data from being affected.
  - Up to 4 destination ports can be supported for a single session. Depending on the chip, the number of destination ports supported by different boards may vary.
-

## RSPAN VLAN

RSPAN VLAN should be one idle VLAN, specially used by RSPAN. We can select one idle VLAN during configuration, but should ensure that the other devices on the path from the mirror port to the destination port are all configured with the VLAN and add the corresponding ports of the other devices on the path to the VLAN.

## 115.2 SPAN Function Configuration

Table 115-115 SPAN Function Configuration List

Configuration Task	
Configure Local SPAN	Configure a Local SPAN session
Configure RSPAN	Configure RSPAN VLAN
	Configure a RSPAN source session
	Configure a RSPAN destination session
Configure VLAN SPAN	Configure a VLAN SPAN session

### 115.2.1 Configure Local SPAN

Local SPAN is used to analyze the data flow of the local device port.

#### Configuration Condition

None

#### Configure a Local SPAN Session

The Local SPAN session can copy packets received or forwarded by one or more source ports, and forward them from the destination port without affecting the forward of normal service of the source port.

Table 1-2 Configure Local SPAN Sessions

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Configure the source of a Local SPAN session.	<b>monitor session</b> <i>session-number</i> <b>source</b> { <b>interface</b> <i>interface-list</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> } [ <b>both</b>   <b>tx</b>   <b>rx</b> ]	Mandatory  By default, the source of a Local SPAN session is not configured.
Configure the destination of a Local SPAN session.	<b>monitor session</b> <i>session-number</i> <b>destination</b> { <b>interface</b> <i>interface-list</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> }	Mandatory  By default, the destination of a Local SPAN session is not configured.

---

## Note

- When configuring the source of a session and specifying the port on which mirroring is enabled as the aggregation group, the specified aggregation group should have been created. If the aggregation group has not been created, the configuration fails. Similarly, when configuring a session destination and specifying the mirror packet forwarding port as the aggregation group, the specified aggregation group should also have been created. If the aggregation group has not been created, the configuration fails.
  - The same port cannot be both the source and destination port for the same session.
  - The same port cannot be used in more than one session at the same time.
- 

### 115.2.2 Configure RSPAN

The RSPAN session is used to analyze the data flow from the source port of a remote device that is reachable by the Layer-2 network. An RSPAN session consists of an RSPAN source session and an RSPAN destination session.

#### Configuration Condition

None

#### Configure RSPAN VLAN

An RSPAN session enable mirrored packets to traverse the Layer-2 network by tagging the mirrored packets with RSPAN VLAN tags.

Table 115-115 Configuring RSPAN VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan</b> <i>vlan-id</i>	-
Configure VLAN as RSPAN VLAN.	<b>remote-span</b>	Mandatory  By default, no RSPAN VLAN is configured.

 **Note**

- The RSPAN VLAN should not carry other service traffic, only RSPAN traffic.
- RSPAN VLAN disables the MAC address learning function.
- Do not configure any ports into the RSPAN VLAN except those used to carry RSPAN traffic.

**Configure a RSPAN Source Session**

After configuring the RSPAN source session, the mirror packet is tagged with RSPAN VLAN and then forwarded from the destination port of the RSPAN source session.

Table 115-115 Configuring RSPAN Source Sessions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the source of an RSPAN source session.	<b>monitor session</b> <i>session-number</i> <b>source</b> { <b>interface</b> <i>interface-list</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> } [ <b>both</b>   <b>tx</b>   <b>rx</b> ]	Mandatory  By default, the source of an RSPAN source session is not configured.

Step	Command	Description
Configure the destination of an RSPAN source session.	<b>monitor session</b> <i>session-number</i> <b>destination remote vlan</b> <i>vlan-id</i> <b>interface</b> <i>interface-name</i>	Mandatory By default, the destination of an RSPAN source session is not configured.

## Note

- When configuring the source of a session and specifying the port on which mirroring is enabled as the aggregation group, the specified aggregation group should have been created. If the aggregation group has not been created, the configuration fails.
- Specify that the VLAN must be set as an RSPAN VLAN before an RSPAN source session.
- The source and destination of the same session cannot appear at the same port.
- The same port cannot be used in more than one session at the same time.
- The destination port of an RSPAN source session can only be a normal port, not an aggregation group.
- The RSPAN source session supports only one destination port.

### Configure a RSPAN Destination Session

When the RSPAN destination session receives a packet, it identifies the mirror packet based on the RSPAN VLAN tag and forwards the mirror packet to the analysis device.

Table 3-4 Configuring RSPAN Destination Sessions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the source of an RSPAN destination session.	<b>monitor session</b> <i>session-number</i> <b>source remote vlan</b> <i>vlan-id</i>	Mandatory By default, the source of an RSPAN destination session is not configured.
Configure the destination of an RSPAN destination session.	<b>monitor session</b> <i>session-number</i> <b>destination</b> { <b>interface</b> <i>interface-list</i>	Mandatory

Step	Command	Description
	<b>interface link-aggregation</b> <i>link-aggregation-id</i> }	By default, the destination of an RSPAN destination session is not configured.

## Note

- Specify that the VLAN must be set as an RSPAN VLAN before an RSAPN destination session.
- The same port cannot be used in more than one session at the same time.
- The type of the destination port of an RSPAN destination session should be Hybrid.

### 115.2.3 Configure ERSPAN

An ERSPAN session is used to analyze the data flow from remote device ports that are reachable through the Layer-3 network.

#### Configuration Condition

None

#### Configure an ERSPAN Session

The destination of an ERSPAN source session is used to specify the source IP address, destination IP address, VLAN tag, TTL value, TOS priority of the ERSPAN source session encapsulation, and the mirrored packet can traverse the Layer-3 network after the IP header is encapsulated.

Table 5-6 Configuring ERSPAN Source Sessions

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure the source of an ERSPAN source session.	<b>monitor session</b> <i>session-number</i> <b>source</b> { <b>interface</b> <i>interface-list</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> } [ <b>both</b>   <b>tx</b>   <b>rx</b> ]	Mandatory  By default, the source of an ERSPAN source session is not configured.

Step	Command	Description
Configure the destination of an ERSPAN source session.	<b>monitor session</b> <i>session-number</i> <b>destination type erspan-source source-ip</b> <i>source-ip-addr</i> <b>destination-ip</b> <i>destination-ip-addr</i> [ <b>vrf</b> <i>vrf-name</i> ] [ <b>vlan</b> <i>vlan-id</i> ][ <b>ttl</b> <i>ttl-value</i> ] [ <b>tos</b> <i>tos-value</i> ]	Mandatory  By default, the destination of an ERSPAN source session is not configured.

## Note

- When configuring a session destination and specifying the mirror packet forwarding port as the aggregation group, the specified aggregation group should also have been created. If the aggregation group has not been created, the configuration fails.
- The same port cannot be used in more than one session at the same time.
- The source IP address must be able to look up the MAC address corresponding to the IP address directly.
- The specified source IP address is configured on the device.
- The next hop-out port must not belong to an aggregation group.
- An ERSPAN session with multiple destination ports is supported. The source IPs can be the same or different, but the destination IPs must be different.

### 115.2.4 Configure VLAN SPAN

The VLAN SPAN session is used to analyze the data flow of the specified VLAN.

#### Configuration Condition

None

#### Configure a VLAN SPAN Session

VLAN SPAN is similar to Local SPAN. The VLAN SPAN session can copy packets received or forwarded by one or more VLAN, and forward them from the destination port without affecting the forward of normal service of the VLAN.

Table 7-8 Configuring VLAN SPAN Sessions

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure the source VLAN of a VLAN SPAN session.	<b>monitor session <i>session-number</i> source vlan [ both   tx   rx ]</b>	Mandatory By default, the source VLAN of a VLAN SPAN session is not configured.
Configure the reflector port of a VLAN SPAN session.	<b>monitor session <i>session-number</i> reflector-port interface <i>interface-name</i></b>	Mandatory By default, the reflector port of a VLAN SPAN session is not configured.
Configure the destination of a VLAN SPAN session.	<b>monitor session <i>session-number</i> destination interface <i>interface-list</i></b>	Mandatory By default, the destination of a VLAN SPAN session is not configured.

## Note

- The reflector port and destination port of a VLAN SPAN session cannot be a member port of the source VLAN of the VLAN SPAN session.
- The destination port of a VLAN SPAN session can only be a normal port, not an aggregation group.
- The same port cannot be both the reflector and destination port for the same session.
- The source VLAN member ports of a VLAN SPAN session cannot appear in multiple sessions at the same time.
- The reflected port of a VLAN SPAN session cannot carry other service traffic and can only be used by a VLAN SPAN session.
- When configuring the source VLAN for a VLAN SPAN session, if the member ports of the source VLAN already belong to other sessions, the ports will be deleted by the aforementioned sessions.
- The system supports only one VLAN SPAN session.

## 115.2.5SPAN Monitoring and Maintaining

Table 115-115 SPAN Monitoring and Maintaining

Command	Description
<b>show monitor rspan-vlan</b>	Display RSPAN VLAN.
<b>show monitor session</b> { <i>session-number</i>   <b>all</b>   <b>local</b>   <b>remote</b> }	Display the SPAN session configuration information.

## 115.3 Typical Configuration Example of Port Mirroring

### 115.3.1 Configure Local SPAN

#### Network Requirements

- PC1, PC2, and PC3 are connected to Device, and PC1 and PC2 communicate in VLAN 2;
- Configure Local SPAN on Device with the source port as gigabitethernet0/1 and the destination port as gigabitethernet0/3 to enable PC3 to monitor the packets sent and received by Device port gigabitethernet0/1.

#### Network Topology

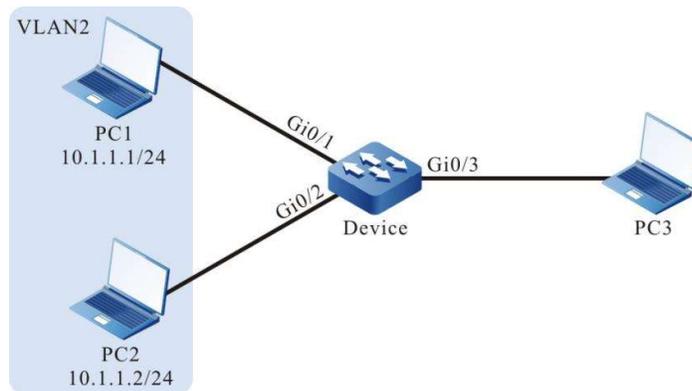

Figure 1-2 Network Topology for Configuring Local SPAN

#### Configuration Steps

Step 1: Configure VLANs and the link type of the ports.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 on Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

Step 2: Configure Local SPAN.

#Configure Local SPAN on Device, with the port for mirroring source session as gigabitethernet0/1 and the port for destination session as gigabitethernet0/3.

```
Device(config)#monitor session 1 source interface gigabitethernet 0/1 both
Device(config)#monitor session 1 destination interface gigabitethernet 0/3
```

#Check the Local SPAN session information of on Device.

```
Device#show monitor session all
-----
Session 1
Type      : SPAN Local Session
Destination Interface : gigabitethernet0/3
Source Interface(both): gi0/1
```

Step 3: Check the result.

#When PC1 and PC2 communicate with each other, the packets sent and received on port gigabitethernet0/1 can be captured on PC3.

### 115.3.2Configure RSPAN

#### Network Requirements

- PC1 and PC2 are connected to Device1 and communicate in VLAN2, and PC3 is connected to Device2.
- Configure RSPAN on Device1 and Device2 to enable PC3 to monitor the packets sent and received on Device1 port gigabitethernet0/1 through RSPAN VLAN3.

#### Network Topology

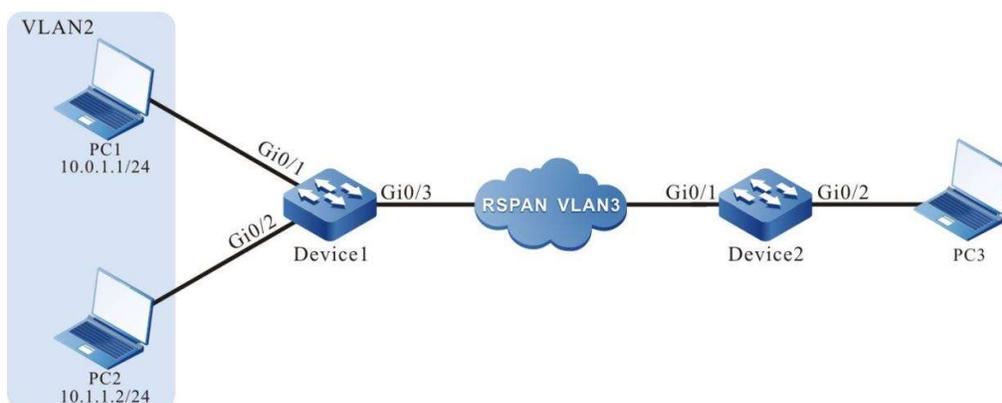

Figure 3-4 Network Topology for Configuring RSPAN

#### Configuration Steps

Step 1: Configure VLANs and the link type of the ports.

#Create VLAN2 on Device1.

```
Device1#configure terminal
Device1(config)#vlan 2
Device1(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 on Device1 as Access, allowing the services of VLAN2 to pass.

```
Device1(config)#interface gigabitethernet 0/1-0/2
Device1(config-if-range)#switchport mode access
Device1(config-if-range)#switchport access vlan 2
Device1(config-if-range)#exit
```

#On Device1, configure the link type of port gigabitethernet0/3 as Trunk.

```
Device1(config)#interface gigabitethernet 0/3
Device1(config-if-gigabitethernet0/3)#switchport mode trunk
Device1(config-if-gigabitethernet0/3)#exit
```

#Configure the link type of port gigabitethernet0/1 on Device2 as Trunk.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode trunk
Device2(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of port gigabitethernet0/2 as Hybrid on Device2.

```
Device2(config)#interface gigabitethernet 0/2
Device2(config-if-gigabitethernet0/2)#switchport mode hybrid
Device2(config-if-gigabitethernet0/2)#exit
```

Step 2: Configure RSPAN on Device1 and Device2.

#Configure VLAN3 as RSPAN VLAN on Device1 and configure port gigabitethernet0/3 to allow services of VLAN3 to pass.

```
Device1(config)#vlan 3
Device1(config-vlan3)#remote-span
Device1(config-vlan3)#exit
Device1(config)#interface gigabitethernet 0/3
Device1(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 3
Device1(config-if-gigabitethernet0/3)#exit
```

#Configure RSPAN on Device1, with the port for mirroring source session as gigabitethernet0/1 and the port for destination session as gigabitethernet0/3.

```
Device1(config)#monitor session 1 source interface gigabitethernet 0/1 both
Device1(config)#monitor session 1 destination remote vlan 3 interface gigabitethernet 0/3
```

# View RSPAN session information on Device1.

```
Device1#show monitor session all
-----
Session 1
Type      : RSPAN Source Session
RSPAN VLAN   : 3
Destination Interface : gigabitethernet0/3
Source Interface(both): gi0/1
```

#Configure VLAN3 as RSPAN VLAN on Device2 and configure port gigabitethernet0/1 to allow services of VLAN3 to pass.

```
Device2(config)#vlan 3
```

```

Device2(config-vlan3)#remote-span
Device2(config-vlan3)#exit
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 3
Device2(config-if-gigabitethernet0/1)#exit

```

#Configure RSPAN on Device2, with the port for mirroring source session as RSPAN VLAN3 and the port for destination session as gigabitethernet0/2.

```

Device2(config)#monitor session 1 source remote vlan 3
Device2(config)#monitor session 1 destination interface gigabitethernet 0/2

```

#View RSPAN session information on Device2.

```

Device2#show monitor session all
-----
Session 1
Type      : RSPAN Destination Session
RSPAN VLAN : 3
Destination Interface : gigabitethernet0/2

```

Step 3: Check the result.

#When PC1 and PC2 communicate with each other, the packets sent and received on Device1 port gigabitethernet0/1 can be captured on PC3.

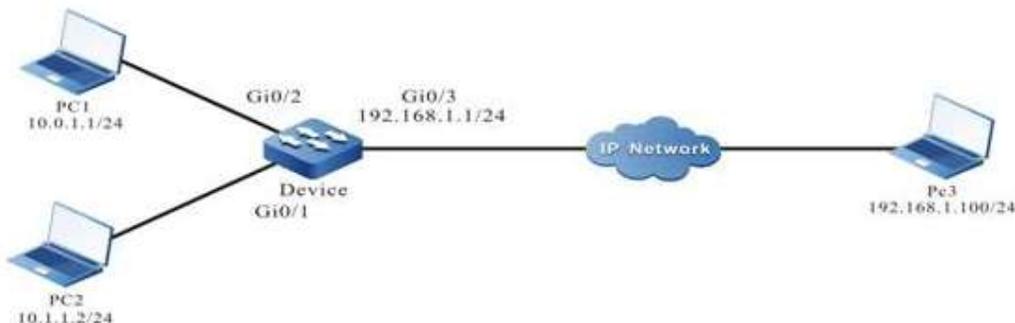

### 115.3.3 Configure ERSPAN

#### 5.3.3.1 Source session

#### Network Requirements

- PC1 and PC2 are connected to Device, and PC1 and PC2 communicate in VLAN 2.
- PC3 communicate with Device through the IP network.
- Configure ERSPAN on Device with the source IP address as 192.168.1.1/24 and the destination IP address as 192.168.1.100/24 to enable PC3 to monitor the packets sent and received on Device port gigabitethernet0/1.

#### Network Topology

## Figure 115-115 Network Topology for Configuring ERSPAN

### Configuration Steps

Step 1: Configure the VLAN, the link type of the port, and the interface address.

#Create VLAN2 and VLAN3 on Device.

```
Device#configure terminal
Device(config)#vlan 2-3
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 on Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

#Configure the link type of port gigabitethernet0/3 on Device as Access, allowing the services of VLAN3 to pass.

```
Device(config)#interface gigabitethernet 0/3
Device(config-if-gigabitethernet0/3)#switchport mode access
Device(config-if-gigabitethernet0/3)#switchport access vlan 3
Device(config-if-gigabitethernet0/3)#exit
```

Configure interface IP address on Device.

```
Device(config)#interface vlan 3
Device(config-if-vlan3)#ip address 192.168.1.1 255.255.255.0
Device(config-if-vlan3)#exit
```

Step 2: Configure ERSPAN on Device.

#Configure ERSPAN on the Device, with the port for mirroring the source session as gigabitethernet0/1, the source IP address of the destination session as 192.168.1.1, and the destination IP address as 192.168.1.100.

```
Device(config)#monitor session 1 source interface gigabitethernet 0/1 both
Device(config)#monitor session 1 destination type erspan-source source-ip 192.168.1.1 destination-ip 192.168.1.100
```

#View ERSPAN session information on Device.

```
Device#show monitor session all
-----
Session 1
Type          : ERSPAN Source Session
Destination Interface : gigabitethernet0/3
Source IP Address: 192.168.1.1
Destination IP Address: 192.168.1.100
Source Mac Address: 0001.7a54.5c94
Next Hop Mac Address: 0000.1100.0001
Erspan L2 Vlan:3
Source Interface(both): gi0/1
```

Step 3: Check the result.

#When PC1 and PC2 communicate with each other, the packets sent and received on port gigabitethernet0/1 can be captured on PC3.

### 115.3.4 Configure VLAN SPAN

#### Network Requirements

- PC1, PC2, and PC3 are connected to Device, and PC1 and PC2 communicate in VLAN 2;
- Configure VLAN SPAN on Device with the source vlan as vlan2 and the destination port as gigabitethernet0/3 to enable PC3 to monitor the packets sent and received by the vlan2 interface of Device.

#### Network Topology

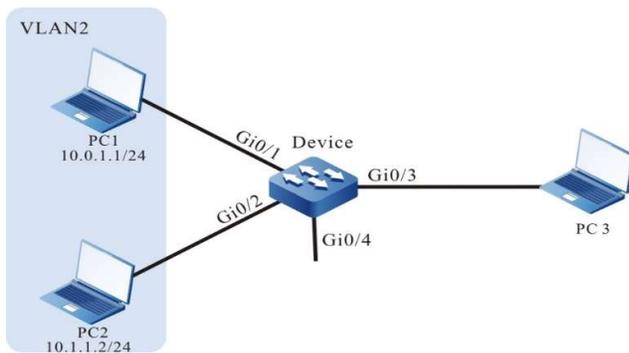

Figure 5-6 Network Topology for Configuring VLAN SPAN

#### Configuration Steps

Step 1: Configure VLANs and the link type of the ports.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 on Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode trunk
Device(config-if-range)# switchport trunk allowed vlan add 2
Device(config-if-range)#exit
```

Step 2: Configure VLAN SPAN.

#Configure VLAN SPAN on Device, with the port for mirroring source session as VLAN2 and the port for destination session as gigabitethernet0/3.

```
Device(config)#monitor session 1 source vlan 2 both
Device(config)#monitor session 1 reflector-port interface gigabitethernet0/4
Device(config)# monitor session 1 destination interface gigabitethernet0/3
Device#show monitor session all
-----
Session 1
Type      : SPAN Local VLAN Session
Destination Interface : gi0/3
Reflector Interface  : gi0/4
Source VLAN(both): 2
```

Step 3: Check the result.

#When PC1 and PC2 communicate with each other, the packets sent and received on VLAN2 can be captured on PC3.

# 116 LLDP

---

## 116.1 Overview

### 116.1.1 Overview of LLDP Protocol

LLDP (Link Layer Discovery Protocol) is the link layer protocol defined in the IEEE 802.1ab standard. It organizes the information of the local device to TLV (Type/Length/Value), encapsulates in LLDPDU (Link Layer Discovery Protocol Data Unit) and sends to the direct-connected neighbor device. Meanwhile, it saves the LLDPDU received from the neighbor device in the standard MIB (Management Information Base) mode. With LLDP, the device can save and manage its own and direct-connected neighbor device information for the network management system to query and judge the link communication status.

### 116.1.2 TLV Type Information

TLV that LLDP can encapsulate includes the basic TLV, organization-defined TLV and MED (Media Endpoint Discovery) TLV. Basic TLV is a group of TLV regarded as the basis of the network device management. Organization defined TLV and MED TLV is the TLV defined by the standard organization and other institutions, used to strengthen the management for the network devices. We can configure whether to release in LLDPDU according to the actual demand.

#### Basic TLV

In basic TLV, there are several types of TLV, which are mandatory for realizing the LLDP function, that is, should be released in LLDPDU, as shown in the following table.

Table 1-2 Basic TLV Description

TLV Type	Description	Whether it must be released
End of LLDPDU TLV	Mark the end of LLDPDU	Yes
Chassis ID TLV	MAC address of the sending device.	Yes
Port ID TLV	Used to identify the port on the sender of LLDPDU. When the device does not send the MED TLV, the content is the port name, and when the MED TLV is scheduled to be sent, the content is the MAC address of the port.	Yes
Time To Live TLV	The time-to-live of local device information on neighbor devices.	Yes
Port Description TLV	Description string of the port.	no
System Name TLV	Name of the device.	no
System Description TLV	DESCRIPTION OF SYSTEM	no
System Capabilities TLV	The main functions of the system, and those of which that are enabled.	no
Management Address TLV	Management address, and the corresponding interface number and OID (Object Identifier). The management address can be a manually configured IP address; if not configured, the primary IP address of the	Yes

TLV Type	Description	Whether it must be released
	management port of the device is selected; if the management port is not configured, the primary IP address of the VLAN through which the interface is allowed is selected; if no primary IP address is configured for any VLAN, the management address value is null. The TLV will be sent by default.	

### Organization-defined TLV

The organization-defined TLV includes the 802.1 organization-defined TLV and 802.3 organization-defined TLV, as shown in the following table.

Table 116-116 802.1 Organization Definition TLV Description

TLV Type	Description	Whether it must be released
Port VLAN ID TLV	Port VLAN ID	no
Port And Protocol VLAN ID TLV	Port and Protocol VLAN ID	no
VLAN Name TLV	Port VLAN Name	no
Protocol Identity TLV	The protocol type supported by the port, the local device does not support sending Protocol Identity TLVs, but can receive TLVs of such type.	no

Table 3-4 802.3 Organizational Definition TLV Description

TLV Type	Description	Whether it must be released
MAC/PHY Configuration/Status TLV	The rate and duplex status of the port; whether the port rate auto-negotiation is supported; whether the auto-negotiation function is enabled; and the current rate and duplex status.	no
Power Via MDI TLV	Power supply capacity of the port.	no
Link Aggregation TLV	Whether the port supports link aggregation and whether it can enable link aggregation.	no
Maximum Frame Size TLV	The maximum frame length supported, taking the configured MTU (Max Transmission Unit) of the port.	no

**MED TLV**

MED TLV specific information is shown in the table below.

Table 116-116 MED TLV Description

TLV Type	Description	Whether it must be released
LLDP-MED Capabilities TLV	The MED device type of the device and the type of LLDP MED TLV that can be	no

TLV Type	Description	Whether it must be released
	encapsulated in the LLDPDU.	
Network Policy TLV	Information about the port's VLAN ID, supported applications (such as voice and video), the priority of the application, and the policy used, etc.	no
Extended Power-via-MDI TLV	Power supply capacity of the device.	no
Hardware Revision TLV	Hardware version of the device.	no
Firmware Revision TLV	Firmware version of the device.	no
Software Revision TLV	Software version of the device.	no
Serial Number TLV	Serial number of the device.	no
Manufacturer Name TLV	Manufacturer of the device.	no
Model Name TLV	Module name of the device.	no
Asset ID TLV	Assertion identifiers for the device for directory management and assertion tracking.	no
Location Identification TLV	Location identification information of connected devices for use by other	no

TLV Type	Description	Whether it must be released
	devices in location-based applications.	

### 116.1.3 LLDP Working Mechanism

#### LLDP Working Mode

Four LLDP working modes are supported by port:

- RxTx: It either sends or receives LLDPDU.
- Tx: It only sends LLDPDU.
- Rx: It only receives LLDPDU.
- Disable: It neither sends nor receives LLDPDU.

#### LLDP Sending Mechanism

The LLDP sending mechanism:

- When the port works in the RxTx or Tx mode, regularly send LLDPDU to the neighbor device according to the sending period of the LLDP packet;
- After the port enables the polling function, regularly poll whether the LLDP concerned configuration in the local device changes. If the configuration changes, send LLDPDU at once. To prevent the frequent change of the local information from causing lots of the sent LLDPDU, it is necessary to delay and wait for some time and then continue to send the next LLDPDU when sending one LLDPDU every time.
- When some configuration related with the local device LLDP changes (for example, select the released TLV type), or if finding the configuration change after enabling the polling function, enable the fast sending mechanism, that is, immediately send the LLDPDU of the specified quantity continuously, and then restore the normal LLDP packet sending period.
- When the global LLDP function is disabled or the port enabled with LLDP executes shutdown, adds to the aggregation group, and disables the LLDP, as well as restarts the device, send one LLDPDU with CLOSE TLV to inform the neighbor device.

#### LLDP Receiving Mechanism

When the port works in the RxTx or Rx mode, check the validity of the received LLDPDU and the carried TLV. After passing the validity check, save the neighbor information to the local device and set the age time of the neighbor information at the local device according to the TTL (Time To Live) carried in LLDPDU. If the TTL value in the received LLDPDU is 0, age the neighbor information at once. The storing

capability of the LLDP protocol for the neighbor is limited. If the neighbor reach the threshold, more neighbor advertising packets are dropped and cannot be saved.

## 116.2 LLDP Function Configuration

Table 116-116 LLDP Function Configuration List

Configuration Task	
Configure LLDP basic functions.	Enable the LLDP function globally.
	Enable port LLDP functions.
	Enable the LLDP port-based learning neighbor function.
Configure the LLDP working mode.	Configure the LLDP working mode.
Configure TLV allowed to be released.by LLDP.	Configure the basic TLV allowed to be released.
	Configure the organization-defined TLV that is allowed to be released.
	Configure the MED TLV that are allowed to be released.
Configure the LLDP parameters.	Configure the time-to-live of neighbors.
	Configure the delay time for sending packets.
	Configure the sending period of packets.
	Configure the number of fast packets to be sent.
	Configuration delay of reinitialization.

Configuration Task	
	Configure the inspection cycle of LLDP configuration.

### 116.2.1 Configure LLDP basic functions.

Enable the LLDP function both globally and on ports to allow the LLDP to work properly. The local device gets the neighbor device information by interacting LLDPDUs with other devices.

#### Configuration Condition

None

#### Enable the LLDP Function Globally.

Table 116-116 Enabling the LLDP Function Globally

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the LLDP function globally.	<b>lldp run</b>	Mandatory By default, the LLDP function is not enabled globally.

#### Enable port LLDP functions.

Table 116-116 Enabling the LLDP Function on Ports

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable port LLDP functions.	<b>lldp enable</b>	Optional By default, the LLDP function is enabled on ports.

### Enable the LLDP port-based learning neighbor function.

After configuring the LLDP port-based learning neighbor function, you are able to learn and display neighbors based on a single port of the device. By default, the device learns and displays neighbors based on ports and aggregation group ports.

Table 5-6 Enabling the LLDP Port-Based Learning Neighbor Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the LLDP port-based learning neighbor function.	<b>lldp mode-ap</b>	Optional By default, this function is disabled.

### 116.2.2 Configure the LLDP working mode.

#### Configuration Condition

None

### Configure the LLDP Working Mode.

Users can set different working modes depending on the role of the device in the network. It is recommended to configure the LLDP working mode as Rx if it is a seed device (central device for network topology collection), otherwise it is recommended to configure the LLDP working mode as Tx.

Table 7-8 Configuring the LLDP Working Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the LLDP working mode to Rx.	<b>lldp receive</b>	Optional
Configure the LLDP working mode to Tx.	<b>lldp transmit</b>	By default, the LLDP working mode is RxTx.
Configure the LLDP working mode to RxTx.	<b>lldp receive-transmit</b>	

## 116.2.3 Configure TLV Allowed to Be Released by LLDP

By releasing TLV, you allow neighbor devices to obtain details of local devices.

### Configuration Condition

None

### Configure Basic TLV Allowed to be Released by LLDP

Users can release different basic TLVs according to the needs of the actual application.

Table 9-10 Configuring the Basic TLVs Allowed to be Released by LLDP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Basic TLV Allowed to be Released by LLDP	<b>lldp tlv-select { basic-tlv { all   port-description   system-capability   system-description   system-name } }</b>	Optional  By default, all basic TLVs are allowed to be released.

### Configure Organization-Defined TLVs Allowed to Be Released

Users can release different organization-defined TLV according to the needs of the actual application.

Table 116-116 Configuring the Organization-Defined TLV Allowed to be Released by LLDP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Organization-Defined TLVs Allowed to be Released	<b>lldp tlv-select</b> { <b>dot1-tlv</b> { <b>all</b>   <b>port-vlan-id</b>   <b>protocol-vlan-id</b>   <b>vlan-name</b> }   <b>dot3-tlv</b> { <b>all</b>   <b>link-aggregation</b>   <b>mac-physic</b>   <b>max-frame-size</b>   <b>power</b> } }	Optional  By default, all organization-defined TLVs are allowed to be released.

### Configure MED TLVs Allowed to Be Released by LDDP

Users can release different MED TLVs according to the needs of the actual application.

Table 11-1213 Configuring the MED TLVs Allowed to be Released by LLDP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the MED TLVs Allowed to be Released by LDDP	<b>lldp med-tlv-select</b> { <b>all</b>   <b>capability</b>   <b>location-id</b>   <b>elin-address</b> <i>phonenum</i>   <b>network-policy</b>   <b>power-via-mdi</b>   <b>inventory</b> }	Optional By default, not all MED TLVs are allowed to be released.

## 116.2.4 Configure LLDP Parameters

### Configuration Condition

None

### Configure the Time-to-live of Neighbors.

Specify the time-to-live (TTL) of local device information on the neighbor device by configuring the TTL of neighbors, so that the neighbor device can delete the local device information after the local device's TTL expires.

Table 116-116 Configuring Neighbor TTL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure the TTL of local devices on the neighbor devices.	<b>lldp holdtime</b> <i>holdtime-value</i>	Optional By default, the TTL of local devices on the neighbor devices is 120 seconds.

### Configure the Delay Time for Sending Packets

By configuring the packet sending delay time, you can prevent the frequent changes of local information from causing a large number of LLDPDUs to be sent.

Table 116-14 Configuring the Delay Time for Sending Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the delay time for sending LLDP packets.	<b>lldp transmit-delay</b> <i>transmit-delay-value</i>	Optional By default, LLDP packets are sent with a delay time of 2 seconds.

### Configure the Sending Period of Packets

By configuring sending period of a packet, the local device will send a LLDP packet to the neighbor device periodically, so that the information of the local device on the neighbor device will not expire.

Table 15-16 Configuring the Sending Period of Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the sending period of LLDP packets.	<b>lldp transmit-interval</b> <i>transmit-interval-value</i>	Optional By default, the interval of sending a LLDP packet is 30 seconds.

## Configure the Number of Fast Packets to Be Sent

When some configurations related to LLDP of the local device (e.g., the type of TLV selected for releasing) change, or when the polling mechanism checks that the LLDP care configuration information in the local device changes after enabling the polling function, in order to let other devices discover the changes of the local device as soon as possible, the fast sending mechanism will be enabled, i.e., the specified number (default is 3) of LLDPDUs will be sent continuously immediately before reverting to the normal sending period.

Table 17-18 Configuring the Number of Fast Packets Sent

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the number of fast packets to be sent.	<b>lldp fast-count</b> <i>fast-count-value</i>	Optional By default, the number of fast packets sent is 3.

## Configuration Delay of Reinitialization

When the port working mode changes, the port protocol state machine will be re-initialized. To prevent frequent changes of the port working mode from constantly re-initializing the port protocol state machine, you can configure the re-initialization delay time of the port.

Table 19-20 Configuring the Reinitialization Delay

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configuration delay of reinitialization.	<b>lldp reinit</b> <i>reinit-value</i>	Optional By default, the reinitialization delay time is 2 seconds.

## Configure the Inspection Cycle of LLDP Configuration

To enable timely notification of LLDP configuration changes to the neighbor device, you can configure to set the LLDP configuration inspection period.

Table 21-22 Configuring the LLDP Configuration Inspection Period

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable the polling function and configure the polling period.	<b>lldp check-change-interval</b> <i>check-change-interval-value</i>	Optional By default, the polling function is disabled.

## 116.2.5 LLDP Monitoring and Maintaining

Table 23-24 LLDP Monitoring and Maintaining

Command	Description
<b>clear lldp neighbors</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Clear neighbor information.

Command	Description
<b>show lldp neighbors</b> [ <b>detail</b>   <b>interface</b> <i>interface-name</i> [ <b>detail</b> ]   <b>interface link-aggregation</b> <i>link-aggregation-id</i> [ <b>detail</b> ] ]	Display neighbor information.
<b>show lldp neighbors oui</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Display neighbor OUI address information and write Voice-VLAN OUI table entry status.
<b>clear lldp statistics</b>	Clear LLDP packet statistics.
<b>show lldp statistics</b> { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> }	Display LLDP packet sending and receiving statistics for the specified port.
<b>show lldp</b>	Display information about LLDP global configuration.
<b>show lldp interface</b> <i>interface-name</i>	Display the LLDP working mode of the specified port and check the polling period for LLDP configuration changes.
<b>show lldp interface link-aggregation</b> <i>link-aggregation-id</i>	Display the LLDP working mode of the specified aggregation group and check the polling period for LLDP configuration changes.
<b>show lldp tlv-select</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Used to display configuration information of basic TLVs and organization-defined TLVs.
<b>show lldp voice neighbors</b> [ <b>detail</b>   <b>interface</b> <i>interface-name</i> [ <b>detail</b> ]   <b>interface link-aggregation</b> <i>link-aggregation-id</i> [ <b>detail</b> ] ]	Display voice neighbor information.

## 116.3 Typical Configuration Example of LLDP

### 116.3.1 Configure the Basic Functions of LLDP

#### Network Requirements

- Configure the LLDP function on Device1, Device2 and Device3 respectively to achieve link-layer neighbor discovery.

#### Network Topology

Figure 1-2 Network Topology for Configuring Basic Functions of LLDP

#### Configuration Steps

Step 1: Enable the LLDP function on Device.

#Enable the LLDP function on Device1.

```
Device1#configure terminal
Device1(config)#lldp run
```

#Enable the LLDP function on Device2.

```
Device2#configure terminal
Device2(config)#lldp run
```

#Enable the LLDP function on Device3.

```
Device3#configure terminal
Device3(config)#lldp run
```

Step 2: Configure the LLDP function on ports.

#Enable the LLDP function on port gigabitethernet0/1 of Device1.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#lldp enable
Device1(config-if-gigabitethernet0/1)#exit
```

#On ports gigabitethernet0/1 and gigabitethernet0/2 of Device2, enable the LLDP function.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#lldp enable
Device2(config-if-gigabitethernet0/1)#exit
Device2(config)#interface gigabitethernet 0/2
Device2(config-if-gigabitethernet0/2)#lldp enable
Device2(config-if-gigabitethernet0/2)#exit
```

#Enable the LLDP function on port gigabitethernet0/1 of Device3.

```
Device3(config)#interface gigabitethernet 0/1
Device3(config-if-gigabitethernet0/1)#lldp enable
Device3(config-if-gigabitethernet0/1)#exit
```

Step 3: Check the result.

#View neighbor information on Device1.

```
Device1#show lldp neighbors

1 neighbor entries in system
Capability codes:
  (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
  (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
Index   Local Intf      Hold-time  Capability  Peer Intf   Device ID
1       gi0/1           120       P,R,        gi0/1       Device2

Total entries displayed: 1
```

Device1 discovers neighbor Device2.

#View the information of Device1 neighbor.

```
Device1#show lldp neighbors detail
Neighbor 1:
1. Basic information

- 

# 117 SNMP

---

## 117.1 Overview

SNMP (Simple Network Management Protocol) is one standard protocol of managing Internet. It ensures that the management information can be transmitted between Network Managing Station and managed device SNMP agent. It is convenient for the system administrator to manage the network system.

SNMP is one application layer protocol in the client/server mode. It mainly includes three parts:

- NMS (Network Management Station) ;
- SNMP agent
- MIB (Management Information Base) 。

The structure set of all managed objects maintained by the device is called MIB. The managed objects are organized according to the hierarchical tree structure. MIB defines the network management information got by one device. To be consistent with the standard network management protocol, each device should use the format defined in MIB to display the information. One subset of IOS ASN.1 defines the syntax for MIB. Each MIB uses the tree structure defined in ASN.1 to organize all available information. Each piece of information is one node with punctuation and each node contains one object ID and one short text description.

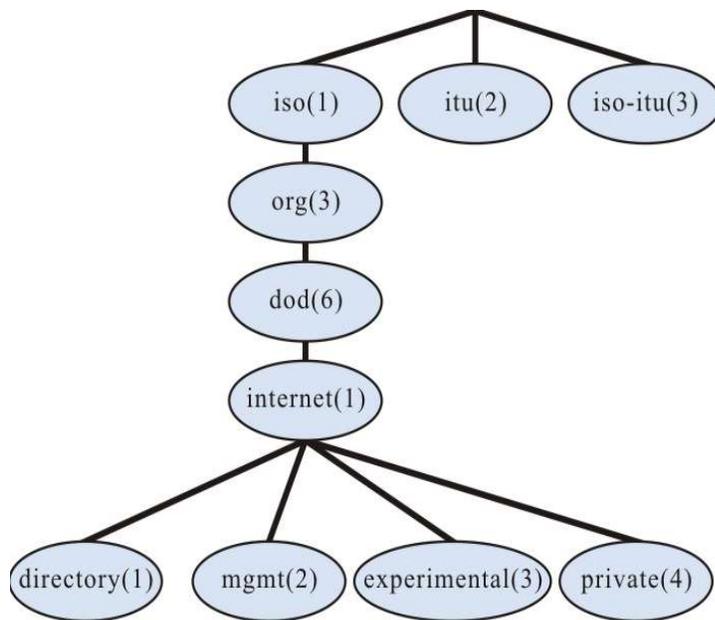

Figure 117-117 Schematic Diagram of the ASN.1 Tree for Network Management

SNMP protocol versions include SNMPv1, SNMPv2, and SNMPv3.

- SNMPv1: The first version of the SNMP protocol. The disadvantages: security problem, bandwidth waste, no communication capability between managers, the protocol only provides the limited operations;
- SNMPv2: It makes some improvement on the basis of SNMPv1, making the functions stronger and the security better;
- SNMPv3: original identity, information integrity and some aspects of re-transmission protect, content confidentiality, authorization and process control, the remote configuration and management capability needed by the above three capabilities;

Therefore, the development of SNMPv3 is centralized on two targets, that is, provide the workable security platform at the enhanced architecture and maintain the consistency of the network management system.

The SNMP protocol mainly includes the following operations:

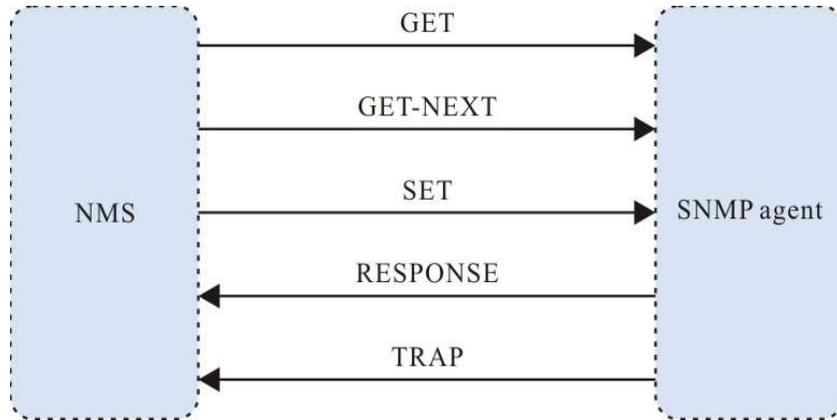

Figure 1-2 SNMP Management Operation Diagram

- Get-request: SNMP network work station gets one or multiple parameters from the SNMP agent.
- Get-next-request: SNMP network work station gets the next parameter of one or multiple parameters from the SNMP agent.
- Get-bulk: SNMP network work station gets the batch parameters from the SNMP agent.
- Set-request: SNMP network work station sets one or multiple parameters of the SNMP agent.
- Get-response: SNMP agent returns one or multiple parameters and it is the responding operation of the SNMP agent for the above three operations.
- Trap: The packet sent by the SNMP agent actively, informing that something happens to the SNMP network work station.

SNMPv1 and SNMPv2 use the authentication name to check whether to have the right to use the MIB object, so only when the authentication name of the network work station is consistent with one authentication name defined in the device, we can manage the device.

The authentication name has the following two attributes:

- Read-only: The read authority of the authorized network work station for all MIB objects of the device;
- Read-write: The read and write authority of the authorized network work station for all MIB objects of the device.

SNMPv3 determines which security mechanism to be adopted to process the data by the security model and the security level. There are three security models: SNMPv1, SNMPv2c, and SNMPv3.

Table 1-2 Supported Security Models and Security Levels

Security Model	Security Level	Certificates	encryption	Description
SNMPv1	NoAuthNoPriv	Authentication name	None	Confirm data legitimacy by authentication name.
SNMPv2c	NoAuthNoPriv	Authentication name	None	Confirm data legitimacy by authentication name.
SNMPv3	NoAuthNoPriv	User Name	None	Confirm data legitimacy by username.
SNMPv3	AuthNoPriv	MD5/SHA	None	Data authentication using HMAC-MD5/HMAC-SHA.
SNMPv3	AuthPriv	MD5/SHA	DES	Data authentication using HMAC-MD5/HMAC-SHA and data encryption using CBC-DES.

## 117.2 SNMP Function Configuration

Table 117-117 SNMP Function Configuration List

Configuration Task	
Configure basic functions of SNMP.	Enable the SNMP service.
	Configure the MIB view.
	Configure the contact information of the administrator.
	Configure the physical location information of the device.

Configuration Task	
Configure SNMPv1/v2.	Configure SNMP community names.
	Configure the SNMP Trap function.
Configure SNMPv3.	Configure an SNMP user group.
	Configure an SNMP user.
	Configure an SNMP advertisement.
	Configure SNMP agent forwarding.

## 117.2.1 Configure Basic Functions of SNMP

### Configuration Condition

None

### Enable the SNMP Service

If the device is enabled with SNMP service, then the device can be configured and managed by the SNMP network management software.

Table 117-117 Enabling the SNMP Service

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enable the SNMP service.	<b>snmp-server start [ rfc ]</b>	Mandatory The SNMP service is disabled by default.

### Configure the MIB View

By using the view-based access control model, it is determined whether the managed objects associated with an operation are allowed by the view, and only those managed objects that are allowed by the view are allowed to be accessed.

Table 117-117 Configuring the MIB View

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure the MIB view.	<b>snmp-server view</b> <i>view-name oid-string</i> { <b>include</b>   <b>exclude</b> }	Mandatory By default, the SNMP view name is Default.
Configure the type of system uptime obtained in the MIB.	<b>snmp-server mib2 sysuptime</b> { <b>snmp-agent-uptime</b>   <b>system-uptime</b> }	Mandatory By default, its type is system-uptime.

### Configure the Contact Information of the Administrator

Administrator contact information is an information node in the SNMP protocol, which can be obtained by the network management software via SNMP.

Table 3-4 Configuring the Contact Information of Administrator

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure the contact information of the administrator.	<b>snmp-server contact</b> <i>contact-line</i>	Mandatory

### Configure the Physical Location Information of the Device

The physical location information of the device is an information node in the SNMP protocol, which can be obtained by the network management software via SNMP.

Table 5-6 Configuring the Physical Location of the Device

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure the physical location information of the device.	<b>snmp-server location</b> <i>location</i>	Mandatory

### 117.2.2 Configure SNMPv1/v2.

#### Configuration Condition

Before configuring SNMPv1/v2, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.

#### Configure SNMP Community Names

SNMPv1/SNMPv2c uses community-name-based security scheme. An SNMP community name can be regarded as a password between the NMS and SNMP agents, which means the SNMP agent only accepts management operations with the same community name, and SNMPs with different community names will be discarded directly and not be responded.

Table 117-117 Configuring Community Name

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure SNMP agent community names.	<b>snmp-server community</b> <i>community-name [ view</i> <i>view-name ] { ro   rw }</i> <i>[ access-list-number  </i> <i>access-list-name]</i>	Mandatory  By default, the community name is public.

## 117.2.3 Configure SNMPv3.

### Configuration Condition

Before configuring the SNMPv3, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.

### Create an SNMP User Group

When performing control, you can associate certain users with a group. Users in the same group all have the same access rights.

- A group can be configured to associate with a view. There are three types of such views: read-only views, writable views, and advertisement views.
- You can configure the security level of the group and configure whether authentication and encryption are required.

Table 7-8 Creating SNMP User Groups

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Create an SNMP User Group	<b>snmp-server group</b> <i>group-name</i> <b>v3</b> { <b>authnopriv</b>   <b>authpriv</b>   <b>noauth</b> } [ <b>notify</b> <i>notify-view</i>   <b>read</b> <i>read-view</i>   <b>write</b> <i>write-view</i> ]	Mandatory <b>authnopriv</b> means authentication without encryption. <b>authpriv</b> means both authenticated and encrypted. <b>noauth</b> means encryption without authentication.

### Create an SNMP User

Through the user-based security model for security management, NMSs can only communicate through the SNMP agent using a legitimate user, which of course needs to be configured.

For SNMPv3, you can also specify the security level, authentication algorithm (MD5 or SHA), authentication password, encryption algorithm (DES), and encryption password.

Table 9-10 Configuring Users

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Create an SNMP User	<b>snmp-server user</b> <i>user-name</i> <i>group-name</i> [ <b>remote</b> <i>ip-address</i> <i>port-num</i> ] <b>v3</b> [ <b>auth</b> { <b>md5</b>   <b>sha</b>   <b>SM3</b> } <i>password</i> [ <b>encrypt</b> { <b>des</b>   <b>aes</b>   <b>SM4</b> } <i>password</i> ] ] [ <b>access</b> <i>access-list-number</i>   <i>access-list-name</i>   <b>ipv6</b> <i>access-list-number</i> ]	Mandatory

## Note

- Configure User Security Model (USM)-based SNMPv3 users, saving the authentication and encryption information for each user. Note that the encryption protocol can be configured only after the authentication protocol has been configured.
- For remote users (the so-called remote is relative to the local SNMPv3 entity, if the local SNMPv3 entity has to deal with other SNMPv3 entities, then the other SNMPv3 entities are called remote SNMPv3 entities, which are mentioned in noify and proxy), you also need to specify the IP address and UDP port number of the remote user. When configuring a remote user, please note that you must first configure the engageID of the remote SNMP entity corresponding to that user. In addition, each user must correspond to a group so that a security model and security name can be mapped to a group name through view-based access control.
- When configuring automatic agent forwarding, if you don't know the ip address of the device being proxied, just enter 0.0.0.0 as ip-address. In addition, automatic agent forwarding must be used in combination with the keepalive mechanism.

## Configure an SNMP Advertisement

The types of SNMPv3 advertisement configurations are as follows:

- SNMPv3 advertisement configuration: configure the SNMPv3 advertisement, specify the type of the advertisement message as inform.
- SNMPv3 advertisement filtering configuration: advertisement filtering indicates the filtering used to determine whether an advertisement message should be sent to a destination address.
- SNMPv3 advertisement address mapping table configuration: associate an advertisement address with a filter table.

Table 117-10 Configuring an Advertisement

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure an SNMP advertisement.	<b>snmp-server notify notify</b> <i>notify-name taglist inform</i>	Mandatory
Configure SNMP advertisement filtering.	<b>snmp-server notify filter</b> <i>filter-name oid-subtree</i> { <b>exclude</b>   <b>include</b> }	Mandatory  exclude: means to filter out all advertisements of the objects under the MIB subtree.  include: indicates that all objects under the MIB subtree are notified.
Configure SNMP address parameters.	<b>snmp-server</b> <b>AddressParam</b> { <i>address-name</i>   <b>paramIn</b> } <b>v3</b> <i>user-name</i> { <b>noauth</b>   <b>authpriv</b>   <b>authnopriv</b> }	Mandatory
Configure SNMP advertisement filtering mapping table.	<b>snmp-server notify profile</b> <i>filter-name address-param</i>	Mandatory  <i>filter-name</i> : Specify the name of the advertisement filter to be mapped.

Step	Command	Description
		<i>address-param</i> : Specify the name of the address parameter to be mapped.

### Configure SNMP Agent Forwarding

If the NMS cannot directly access a managed SNMP agent, then an intermediate device is required to support agent forwarding. Currently, only SNMPv3 supports agent forwarding.

Table 117-11 Configuring Agent Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure SNMP remote engine identity.	<b>snmp-server engineID remote</b> <i>ip-address port-num</i> [ <b>vrf</b> <i>vrf-name</i> ] <i>engine-id</i> [ <i>group-name</i> ]	Mandatory Configure the engine identity of an SNMP entity that needs to be forwarded by the agent.
Configure SNMP address parameters.	<b>snmp-server AddressParam</b> [ <i>address-name</i>   <b>paramIn</b> ] <b>v3</b> <i>user-name</i> { <b>noauth</b>   <b>authpriv</b>   <b>authnopriv</b> }	Mandatory
Configure the SNMP advertisement address.	<b>snmp-server TargetAddress</b> <i>target-name ip-address port-num address-param taglist</i> <i>time-out retry-num</i>	Mandatory
Configure SNMP agent forwarding.	<b>snmp-server proxy</b> <i>proxy-name</i> { <b>inform</b>   <b>trap</b>   <b>read</b>   <b>write</b> } { <i>engineId</i>   <b>auto</b> } <i>engineId address-param target-addr</i> [ <i>context-name</i> ]	Mandatory

## 117.2.4 Configure SNMP Trap

Trap is a message sent proactively by the SNMP agent to the NMS to report some specific events. Trap packets are divided into: generic trap and custom trap. Generic trap includes the following: Authentication, Linkdown, Linkup, Coldstart, Warmstart, crc-error, out-packet-error, out-usage-rate, in-packet-error, in-usage-rate, while custom traps are output according to the needs of each module.

Table 117-12 Configuring Trap

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable traps for link interface down or up.	<b>snmp-server enable traps snmp [ linkup   linkdown ]</b>	Mandatory SNMP Trap is not enabled by default.
Enter the interface configuration mode	<b>interface</b> <i>interface-type</i> <i>interface-num</i>	Optional
Configure trap for interface status change.	<b>snmp trap link-status</b>	Optional
Configure trap target host.	<b>snmp-server host</b> { <i>ip-address</i>   <i>host-name</i> } <b>traps</b> { <b>community</b> <i>community-name</i> <b>version</b> { <b>1</b>   <b>2</b> }   <b>user</b> <i>username</i> <b>authnopriv</b>   <b>authpriv</b>   <b>noauth version 3</b> } [ <b>port</b> <i>port-num</i>   <b>vrf</b> <i>vrf-name</i> ]	Mandatory The ip-address needs to be specified as the IP address of the NMS.
Configure the source address of a trap packet.	<b>snmp-server trap-source</b> <i>ip-address</i>	Optional

**Note**

- Since trap information is usually large in quantity, it may occupy device resources and affect device performance. So it is recommended to enable the trap function of specified modules as needed, and avoid enabling all modules' trap.

## 117.2.5SNMP Monitoring and Maintaining

Table 117-13 SNMP Monitoring and Maintaining

Command	Description
<b>show snmp-server</b>	Check information on SNMP protocol packet statistics.
<b>show snmp-server AddressParams</b>	Check information on SNMP-agent address parameters.
<b>show snmp-server community</b>	Check the information of an SNMP-agent community.
<b>show snmp-server contact</b>	Check the contact information of the device's administrator.
<b>show snmp-server context</b>	Check the SNMPv3 contextual environment.
<b>show snmp-server engineGroup</b>	Display information of an SNMP-agent engine group.
<b>show snmp-server engineID</b>	Display information of an SNMP-agent engine ID.
<b>show snmp-server group</b>	Check the information of an SNMP-agent user group.
<b>show snmp-server Host</b>	Display information of an SNMP-agent trap host.
<b>show snmp-server location</b>	Check the information about the location of the device.

Command	Description
<b>show snmp-server notify filter</b>	Display information of SNMP-agent advertisement filtering.
<b>show snmp-server notify notify</b>	Display information of an SNMP-agent advertisement.
<b>show snmp-server notify profile</b>	Display information associated with an SNMP-agent advertisement.
<b>show snmp-server port</b>	Check the port number configured for the SNMP protocol.
<b>show snmp-server proxy</b>	Check the information of SNMP-agent forwarding.
<b>show snmp-server reg-list</b>	Check the module information of SNMP-registered MIBs.
<b>show snmp-server TargetAddress</b>	Check the information of SNMP-agent address table entry.
<b>show snmp-server user</b>	Check the SNMP user information.
<b>show snmp-server view</b>	Check the SNMP view information.

## 117.3 Typical Configuration Example of SNMP

### 117.3.1 Configure an SNMP v1/v2c Proxy Server

#### Network Requirements

- Device acts as an SNMP Agent device that is route reachable to the NMS server.
- The NMS monitors and manages Device through SNMP v1 or SNMP v2c, and Device will actively report to the NMS in case of failure or error.

#### Network Topology

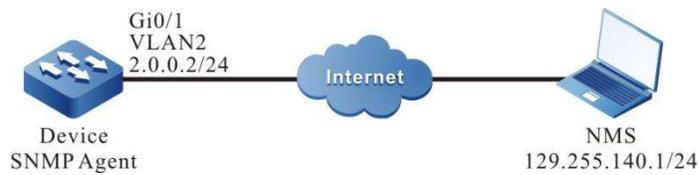

Figure 3-4 Network Topology for Configuring SNMP v1/v2c Proxy Servers

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Enable an SNMP agent on Device and configure the community name of the SNMP.

#### #Configure Device.

Enable the SNMP agent and configure the name of the node view as default, the read-only community name as public, and the read-write community name as public.

```
Device#configure terminal
Device(config)#snmp-server start
Device(config)#snmp-server view default 1.3.6.1 include
Device(config)#snmp-server community public view default ro
Device(config)#snmp-server community public view default rw
```

- Step 4: Configure Device to actively send Trap packets to the Network Management System (NMS) and use the community name public.

#### #Configure Device.

```
Device(config)#snmp-server enable traps
Device(config)#snmp-server host 129.255.140.1 traps community public version 2
```

---

### Note

- The SNMP version specified in the snmp-server host command must be the same as the SNMP version running on the NMS.
- 

- Step 5: Configure the NMS.

#Set the "read-only community name" and the "read-write community name" on the SNMP v1/v2c NMS. In addition, you have to set the "timeout" and "number of retries". Users can query and configure the device through the network management system.

---

## Note

- When using the read-only community name, users can only perform query operations on the device through the network management system.
  - When using the read/write community name, users can query and configure the device through the network management system.
- 

Step 6: Check the result.

#The NMS can query and set the values of certain parameters of Device through the MIB node. The NMS can receive various trap information from Device, such as interface up and down of Device, routing changes caused by network turbulence, etc. Device will generate the corresponding trap information and send it to NMS.

### 117.3.2 Configure an SNMP v3 Proxy Server

#### Network Requirements

- Device acts as an SNMP Agent device that is route reachable to the NMS server.
- The NMS manages Device via SNMP v3.

#### Network Topology

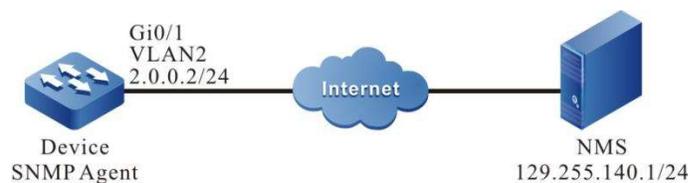

Figure 5-6 Network Topology for Configuring SNMP v3 Proxy Servers

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the interfaces (omitted).

Step 3: Enable an SNMP agent on Device and configure SNMP v3 basic information.

#Configure Device.

Enable an SNMP agent; configure the name of the node view as default, with access to all objects under node 1.3.6.1.

```
Device#configure terminal
Device(config)#snmp-server start
Device(config)#snmp-server view default1.3.6.1 include
```

Configure user group as public, security level as authpriv, read/write view, and notify view as default; configure user name as public, which belongs to the user group public, authentication algorithm as MD5, authentication password as admin, encryption algorithm as DES, and encryption password as admin.

```
Device(config)#snmp-server group public v3 authpriv read default write default notify default
Device(config)#snmp-server user public public v3 auth md5 admin encrypt des admin
```

Configure the contextual environment as public.

```
Device(config)#snmp-server context public
```

Step 4: Configure the NMS.

#On the NMS using SNMP v3, you need to set the user name and select the security level. According to different security levels, you need to set authentication algorithm, authentication password, encryption algorithm, and encryption password, among others, respectively. In addition, you have to set the "timeout" and "number of retries". Users can query and configure the device through the network management system.

Step 5: Check the result.

#The NMS can query and set the value of certain parameters of Device through the MIB node.

### 117.3.3 Configure SNMP v3 Trap Advertisements

#### Network Requirements

- Device acts as an SNMP Agent device that is route reachable to the NMS server.
- The NMS monitors Device via SNMP v3. Device will actively report to the NMS in case of failure or error.

#### Network Topology

Figure 7-8 Network Topology for Configuring SNMP v3 Trap Advertisements

### Configuration Steps

Step 1: Configure IP addresses for the interfaces (omitted).

Step 2: Enable an SNMP agent on Device and configure SNMP v3 basic information.

#### #Configure Device.

Enable an SNMP agent; configure the name of the node view as default, with access to all objects under node 1.3.6.1.

```
Device#configure terminal
Device(config)#snmp-server start
Device(config)#snmp-server view default 1.3.6.1 include
```

Configure user group as public, security level as authpriv, read/write view, and notify view as default; configure user name as public, which belongs to the user group public, authentication algorithm as MD5, authentication password as admin, encryption algorithm as DES, and encryption password as admin.

```
Device(config)#snmp-server group public v3 authpriv read default write default notify
default
Device(config)#snmp-server user public public v3 auth md5 Admin encrypt des Admin
```

Configure to have Device send all trap messages.

```
Device(config)#snmp-server enable traps
```

Step 3: Configure to have Device send SNMP v3 trap packets to the NMS.

#### #Configure Device.

Configure the SNMP v3 trap user name on the NSM as public and the security level as authpriv.

```
Device(config)#snmp-server host 129.255.140.1 version 3 user public authpriv
```

Step 4: Configure the NMS.

#The NMS needs to be configured with the same username and password as the SNMP agent, run the network management software and listen for UDP port number 162.

Step 5: Check the result.

#The NMS can receive various trap information from Device, such as interface up and down of Device, routing changes caused by network turbulence, etc. Device will generate the corresponding trap information and send it to NMS.

### 117.3.4 Configure SNMP v3 Inform Advertisements

#### Network Requirements

- Device acts as an SNMP Agent device that is route reachable to the NMS server.
- The NMS monitors Device via SNMP v3. Device will actively report to the NMS in case of failure or error.

#### Network Topology

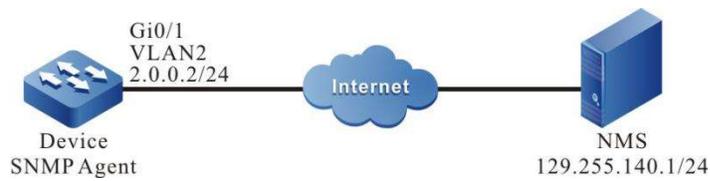

Figure 9-10 Network Topology for Configuring SNMPv3 Advertisements

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the interfaces (omitted).

Step 3: Enable an SNMP agent on Device and configure SNMP v3 basic information.

#Configure Device.

Enable an SNMP agent; configure the name of the node view as default, with access to all objects under node 1.3.6.1.

```
Device#configure terminal
Device(config)#snmp-server start
Device(config)#snmp-server view default 1.3.6.1 include
```

Configure the user group as group1, the security level as authpriv, and set as default for both read and write view and notify view.

```
Device(config)#snmp-server group group1 v3 authpriv read default write default notify default
```

Configure user name as user2, which belongs to the user group group1, authentication algorithm as MD5, authentication password as admin, encryption algorithm as DES, and encryption password as admin.

```
Device(config)#snmp-server user user2 group1 public v3 auth md5 admin encrypt des admin
```

Configure the contextual environment as public.

```
Device(config)#snmp-server context public
```

Step 4: Configure Device to send advertisement messages to the NMS.

#Configure Device.

Configure the IP address and engineID of remote users, i.e., NMS.

```
Device(config)#snmp-server engineID remote 129.255.140.1 162 bb87654321
```

Configure remote user name as user1, which belongs to the user group group1, authentication algorithm as MD5, authentication password as admin, encryption algorithm as DES, and encryption password as admin.

```
Device(config)#snmp-server user user1 group1 remote 129.255.140.1 162 v3 auth md5 admin encrypt des admin
```

Configure the local address parameter named as param-user1; configure the target address name as target-user1, use the address parameter param-user1, and the target address list name target-user1.

```
Device(config)#snmp-server AddressParam param-user1 v3 user1 authpriv  
Device(config)#snmp-server TargetAddress target-user1 129.255.140.1 162 param-user1 tag-user1 10 3
```

Configure the advertisement entity of notify as notify-user1; configure the filter entity of notify as filter-user1, containing the advertisement of all objects under node 1.3.6.1; configure the advertisement configuration table so that the filter entity filter-user1 is associated with the address parameter param-user1.

```
Device(config)#snmp-server notify notify notify-user1 tag-user1 inform  
Device(config)#snmp-server notify filter filter-user1 1.3.6.1 include  
Device(config)#snmp-server notify profile filter-user1 param-user1
```

Step 5: Configure the NMS.

#On the NMS using SNMP v3, you need to set the user name and select the security level. According to different security levels, you need to set authentication algorithm, authentication password, encryption algorithm, and encryption password, etc., and listen on UDP port number 162.

Step 6: Check the result.

#The NMS can receive various trap information from Device, such as interface up and down of Device, routing changes caused by network turbulence, etc. Device will generate the corresponding trap information and send it to NMS.

## 117.3.5 Configure SNMP v3 Agent Forwarding

### Network Requirements

- Device2 is route reachable to the NMS server.
- Device2 acts as the agenting device, i.e. Agent, and Device1 acts as the device being proxied.
- SNMP v3 is running on both Device1 and Device2.
- The NMS is running SNMP v3. The NMS manages Device1 and Device2 through SNMP v3.

### Network Topology

Figure 11-12 Network Topology for Configuring SNMP v3 Agent Forwarding

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the interfaces (omitted).
- Step 3: Enable an SNMP agent on the agent device Device2 and configure SNMP v3 basic information.

#### #Configure Device2.

Enable an SNMP agent, configure the name of the node view as default, with access to all objects under node 1.3.6.1.

```
Device2#configure terminal
Device2(config)#snmp-server start
Device1(config)#snmp-server view default 1.3.6.1 include
```

Configure user group as group-local, security level as authpriv, read/write view, and notify view as default; configure user name as user1, which belongs to the user group group-local, authentication algorithm as MD5, authentication password as proxy, encryption algorithm as DES, and encryption password as proxy.

```
Device1(config)#snmp-server group group-local v3 authpriv read default write default notify default
Device1(config)#snmp-server user user1 group-local v3 auth md5 admin encrypt des admin
```

Step 4: Enable an SNMP agent on the device being proxied, i.e. Device1, and configure the SNMP view.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#snmp-server start
Device1(config)#snmp-server view default 1.3.6.1 include
```

Step 5: Configure the information of the proxied device on the agent device Device2.

#Configure Device2.

Configure the IP address of the device being proxied and the engineID.

```
Device2(config)#snmp-server engineID remote 150.1.2.2 161 800016130300017a000137
```

Configure the user group of the proxied device as group-user, the security level as authpriv, and use default for read/write view and notify view.

```
Device2(config)#snmp-server group group-user v3 authpriv read default write default notify default
```

Configure user name as re-user, which belongs to the user group group-user, authentication algorithm as MD5, authentication password as admin, encryption algorithm as DES, and encryption password as admin.

```
Device2(config)#snmp-server user re-user group-user remote 150.1.2.2 161 v3 auth md5 admin encrypt des admin
```

Configure the local address parameter named as plocal; the name of the remote address parameter as puser; configure the target address name as tuser, and use the address parameter puser.

```
Device2(config)#snmp-server AddressParam plocal v3 user1 authpriv
Device2(config)#snmp-server AddressParam puser v3 re-user authpriv
Device2(config)#snmp-server TargetAddress tuser 150.1.2.2 161 puser taguser 10 2
```

Configure the agent forwarding name as proxy-re-user, the operation permission as write, the engineID of the proxied device as 800016130300017a000137, the address parameter used as plocal, and the target address used as tuser; and configure the name of the contextual environment as proxyuser.

```
Device2(config)#snmp-server proxy proxy-re-user write 800016130300017a000137 plocal tuser proxyuser
Device2(config)#snmp-server context proxyuser
```

#Check the engineID information of Device2.

```
Device2#show snmp-server engineID
Local engine ID: 80001613030000000052fd
IPAddress: 150.1.2.2 remote port: 161 remote engine ID: 800016130300017a000137
```

- 
- The enginID of the remote device must be the same as that of the proxied device. The enginID of the device can be viewed with the command `show snmp-server engineID`.
  - The proxied device is listening on UDP protocol and port 161.
- 

Step 6: Perform SNMPV3 related configuration on Device1, the device being proxied.

#Configure Device1.

Configure user group as g1, security level as authpriv, read/write view, and notify view as default; configure user name as re-user, authentication algorithm as MD5, authentication password as admin, encryption algorithm as DES, and encryption password as admin.

```
Device1(config)#snmp-server group g1 v3 authpriv read default write default notify default
Device1(config)#snmp-server user re-user g1 v3 auth md5 admin encrypt des admin
Device1(config)#snmp-server context proxyuser
```

Step 7: Configure the NMS.

#SNMP v3 uses authentication and encryption security mechanism, you need to set the user name and select the security level on the NMS. According to different security levels, you need to set authentication algorithm, authentication password, encryption algorithm, and encryption password, among others, respectively. In addition, you have to set the "timeout" and "number of retries". Users can use the NMS to complete the query and configuration operation of the device. When the proxied device is to be queried or configured, it is also necessary to set the enginID of the agent forwarding to be the enginID of the proxied device on the NMS.

Step 8: Check the result.

#The NMS can query and set the value of certain parameters of Device2 and Device1 through the MIB node.

## 117.4 Overview

One important function of the network management is to monitor the element performances of the network. In the traditional SNMP network management mode, the initiative of the management is mainly mastered by the network management station. Usually, the network management work station regularly polls the data of the device and then measures and analyzes in the network management system, so as to get the desired information of the administrator. In this mode, the network management work station needs to send and receive lots of packets to the network devices. When there are many devices in the network, it causes the additional load for the network. Meanwhile, the network blocking and other factors take various accidents to the running of the network management system. As for this, we put forward the RMON (Remote Network Monitoring) concept.

RMON still requires SNMP protocol support, which is actually a set of MIBs assigned under MIB-2 with the object identifier 1.3.6.1.2.1.16. Compared with other general MIB, RMON adds the calculation at Agent during realizing, that is, put the processing, such as performance statistics in the device. This realizes the distributed processing in the whole network, reducing the disadvantages brought by the polling of the network management work station.

RMON needs to realize lots of calculation functions, so the previous RMON proxy (also called Probe) is acted by a special device, distributed in the network to monitor the corresponding target. With the improvement of the processing capability of the network device, RMON is gradually integrated to the network devices, so as to realize the RMON requirement high-efficiently. However, this also puts forward higher performance requirement for the network devices. After all, the calculations of RMON occupy lots of system resources, reducing the system performance. This is also the additional cost brought by the management, so RMON is mainly realized in the hardware with the network processing capability, such as switching chip.

There are 10 groups of RMON MIB:

- statistics: to measure all Ethernet interfaces of the device, such as broadcast and conflict;
- history: to record the samples of the periodical statistics information that is taken out from the statistics group;
- alarm: to permit the administration Console user to configure the sampling interval and alarm when the values of any counters or integers (recorded by the RMON proxy) exceed the threshold value;
- host: to include the input/output traffics of various types of hosts adhering to the subnet;
- hostTopN: to contain the stored statistics information of hosts, some parameters in the host tables of these hosts are the highest;

- matrix: to indicate the error and utilization information in the form of matrix, so that the operator can use any address pair to search

for information;

- filter: to permit the monitor to monitor the packets matched with the filter;
- capture: The packet capture group creates a set of buffers to store the packets captured from the channel.
- event: to present the table of all events generated by the RMON proxy;
- tokenRing: to maintain the statistic and configuration information of a subnet which is a token ring

## 117.5 RMON Function Configuration

Table 11-12 RMON Function Configuration List

Configuration Task	
Enable the RMON function.	Enable the RMON function.
Configure RMON alarm groups.	Configure RMON alarm instances.
Configure RMON event groups.	Configure RMON to trigger events.
Configure RMON history groups.	Configure RMON history instances.
Configure RMON statistics groups.	Configure the RMON statistics management function.

### 117.5.1 Enable the RMON Function

#### Configuration Condition

None

#### Enable the RMON Function

RMON is enabled to provide the relevant resources for the monitoring function of RMON, and the resources will take effect only after the monitoring group function of RMON is configured.

Table 13-14 Enabling the RMON Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the RMON function.	<b>rmon</b>	Mandatory

## 117.5.2 Configure RMON Alarm Groups

RMON alarm group function refers to the configuration of multiple alarms, each alarm monitors an alarm instance, and an alarm event is triggered when the alarm instance data value changes beyond the rising threshold or falling threshold during the sampling interval, and the alarm is processed according to the processing method defined by the alarm event group. When the data value continuously exceeds the threshold value, only the first exceedance is alerted.

### Configuration Condition

Before configuring RMON alarm groups, do the following:

- Enable the SNMP agent function.
- Enable the trap function of RMON in SNMP.

### Configure RMON Alarm Instances

Table 15-16 Configuring RMON Alarm Instances

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the RMON function.	<b>rmon</b>	Optional

Step	Command	Description
Configure RMON alarm groups.	<b>rmon alarm</b> <i>alarm-num</i> <i>OID interval</i> { <b>absolute</b>   <b>delta</b> } <b>risingthreshold</b> <i>rising-threshold</i> [ <i>rising-event</i> ] <b>fallingthreshold</b> <i>falling-threshold</i> [ <i>falling-event</i> ] [ <b>owner</b> <i>owner</i> ]	Mandatory  By default, the alarm trigger event group is 1.  By default, the alarm group is owned by config.

### 117.5.3 Configuring RMON Extended Alarm Groups

RMON extended alarm groups can perform calculations on alarm variables, and then compare the results with the set thresholds to achieve more alarm functions.

#### Configuration Condition

Before configuring RMON alarm groups, do the following:

- Enable the SNMP agent function.
- Enable the trap function of RMON in SNMP.
- Configure a statistics group.

#### Configure RMON Alarm Instances

Table 17-18 Configuring RMON Alarm Instances

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the RMON function.	<b>rmon</b>	Optional
Configure a statistics group.	<b>rmon statistics ethernet</b> <i>statistics-num</i> <i>OID</i> [ <b>owner</b> <i>owner</i> ]	Mandatory  By default, the statistics group is owned by config.

Step	Command	Description
Configure RMON alarm groups.	<b>rmon prialarm</b> <i>alarm-num</i> <i>WORD interval</i> { <b>absolute</b>   <b>delta</b> } <b>risingthreshold</b> <i>rising-threshold rising-event</i> <b>fallingthreshold</b> <i>falling-threshold falling-event</i> <b>entrytype forever</b> [ <b>ownerowner</b> ]	Mandatory  By default, the alarm group is owned by config.

### 117.5.4 Configure RMON Event Groups

Configure the RMON event group function means configuring multiple events, defining the event number of each event and how it is handled. Events are handled in the following ways: events are recorded in the log, events send TRAP messages to the network management, events are recorded in the log and TRAP messages are sent to the network management without being handled.

#### Configuration Condition

Before configuring an RMON event group, do the following:

- Enable the SNMP agent function.
- Enable the trap function of RMON in SNMP.

#### Configuring RMON to Trigger Events

RMON triggering events is mainly used for event handling when an RMON alarm occurs.

Table 19-20 Configuring RMON to Trigger Events

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the RMON function.	<b>rmon</b>	Optional
Configure RMON event groups.	<b>rmon event</b> <i>event-num</i> [ <b>description</b> <i>event-</i>	Mandatory

Step	Command	Description
	<i>description</i> / <b>log max-num</b> / <b>owner owner</b> / <b>trap</b> <i>communit</i> ]	By default, the event group is owned by config.

### 117.5.5 Configure RMON History Groups

Configure the RMON history group function means configuring multiple history groups, and the RMON history group stores the subnet data obtained by sampling at a fixed interval. The group consists of a history control table, which defines the subnet interface number being sampled, the size of the sampling interval, and the amount of data sampled each time, and a data table, which stores the various data obtained during the sampling period.

#### Configuration Condition

Before configuring the RMON history group, do the following:

- Enable the SNMP agent function.

#### Configure RMON History Instances

The RMON history group mainly configures information such as the monitoring object of the history control table, the size of the sampling interval, and the quantity of sampled data.

Table 21-22 Configuring RMON History Groups

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the RMON function.	<b>rmon</b>	Optional
Configure RMON history groups.	<b>rmon history control</b> <i>history-num</i> <i>OID</i> <i>buckets-num</i> [ <b>interval</b> <i>interval</i> ] [ <b>owner</b> <i>owner</i> ]	Mandatory  By default the sampling interval is 1800 seconds.  By default, the history group is owned by config.

## 117.5.6 Configure RMON Statistics Groups

To configure the RMON statistics group function is to configure the statistics of Ethernet interfaces which are the monitoring objects. The statistics group provides a table, each row of which represents the statistics of a subnet, from which the network administrator can obtain various statistics of a segment (the traffic of a segment, the distribution of various types of packets, the number of various types of error packets, the number of collisions, etc.).

### Configuration Condition

Before configuring an RMON statistics group, do the following:

- Enable the RMON function.
- Enable the SNMP agent function.

### Configure the Statistics Management Function

Table 23-24 Configuring the RMON Statistics Management Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the RMON function.	<b>rmon</b>	Mandatory
Configure RMON statistics groups.	<b>rmon statistics ethernet statistics-num</b> <i>OID</i> [ <b>owner owner</b> ]	Mandatory By default, the statistics group is owned by config.

## 117.5.7 RMON Monitoring and Maintaining

Table 25-26 RMON Monitoring and Maintaining

Command	Description
<b>show rmon alarm</b>	Display the configured RMON alarms in the device.

Command	Description
<b>show rmon alarm supportVariable</b>	Display the monitoring objects supported by RMON in the device.
<b>show rmon event</b>	Display the configured RMON alarm events in the device.
<b>show rmon history</b> { <b>control</b>   <b>ethernet control-num</b> }	Display the configured RMON history groups in the device.
<b>show rmon prialarm</b>	Display the configured RMON extended alarms in the device.
<b>show rmon statistics ethernet</b>	Display the configured RMON statistics groups in the device.

## 117.6 Typical Configuration Example of RMON

### 117.6.1 Configure Basic Functions of RMON

#### Network Requirements

- Device is an RMON agent device that is route reachable to the NMS server.
- Monitoring and management of event groups, alarm groups, history groups, and statistics groups of RMON through NMS.

#### Network Topology

Figure 13-14 Network Topology for Configuring Basic Functions of RMON

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure an SNMP agent.

#Enable the SNMP agent to configure the name of the node view as default, and the read-only community name as public.

```
Device#configure terminal
Device(config)#snmp-server start
Device(config)#snmp-server view default 1.3.6.1 include
Device(config)#snmp-server community public view default ro
```

#Enable the SNMP Trap function to configure the destination address of the Trap packet and the community name to be used.

```
Device(config)#snmp-server enable traps
Device(config)#snmp-server host 129.255.151.1 traps community public
```

Step 4: Configure the RMON event groups, alarm groups, history groups, and statistics groups of Device.

#Enable an RMON agent.

```
Device(config)#rmon
```

#Configure the event group named Event with the serial number 1 to log packets in the inbound direction of port gigabitethernet0/1.

```
Device(config)#rmon event 1 description gigabitethernet0/1_in_octes log 100 trap public
```

#Configure the alarm event group named Alarm, with the monitoring object as ifInOctets.1. Configure relative value sampling, with the sampling interval to be 10 seconds. Configure the rising and falling thresholds to 100, and configure the event triggered by the threshold to be event 1.

```
Device(config)#rmon alarm 1 ifInOctets.1 10 delta risingthreshold 100 1 fallingthreshold 100 1 owner 1
```

#Configure the statistics group of RMON.

```
Device(config)#rmon statistics ethernet 1 ifIndex.1
```

#Configure the history group of RMON.

```
Device(config)#rmon history control 1 ifIndex.1 10
```

---

## Note

- The instance index number ifInOctets.1 corresponds to port gigabitethernet0/1 on the device. You can display all Layer-2 port snmp index values by show interface switchport snmp ifindex, show interface snmp ifindex to display all Layer-3 port snmp index value, show interface switchport XXXX snmp ifindex to show the specified Layer-2 port snmp index value, show interface XXXX snmp ifindex to show the

---

specified Layer-3 port snmp index value.

- The object instance index number for remote monitoring needs to be read from the interface table ifEntry in MIB-2.
- 

Step 5: Configure the NMS.

#Set the "read-only community name", "timeout" and "number of retries" on the SNMP v1/v2c NMS.

Step 6: Check the result.

#Check the RMON event group table entry configuration for Device.

```
Device#sh rmon event
Event 1 is active, owned by config
Description : gigabitethernet_0/1_in_octes
Event firing causes: log and trap, last fired at 11:38:07
```

Current log entries:

logIndex	logTime	Description
1	11:38:07	gigabitethernet_0/1_in_octes

#Check the RMON alarm table entry configuration for Device.

```
Device#show rmon alarm
Alarm 1 is active, owned by 1
Monitoring variable: ifInOctets.1, Sample interval: 10 second(s)
Taking samples type: delta, last value was 4225
Rising threshold : 100, assigned to event: 1
Falling threshold : 100, assigned to event: 1
```

#Check the RMON event group table entry configuration for Device.

```
Device#sh rmon statistics ethernet
```

#The NMS can query the History, Event and Statistics information in Device through the MIB node.

The NMS is able to receive trap information for alarm events from Device. For example, when the rate of change of traffic in the inbound direction of the monitored interface is greater than the rising threshold or less than the falling threshold, Device will generate the corresponding trap message and send it to the NMS.

## 117.7 Overview

CWMP (CPE WAN Management Protocol, i.e. user-side device WAN management protocol) is a protocol developed by BroadBandForum.org (formerly DSL Forum) for managing and configuring CPE (Customer Premise Equipment user-side equipment), also known as TR-069, which defines a common protocol framework, message specification, management method and data model for managing client-side equipment in carrier Internet broadband access networks.

CWMP can be described as a data framework model that describes the communication between end devices like broadband routers and ACS (Auto-Configuration Server) for remote and centralized configuration management of user-side devices (e.g., broadband routers, switches, Internet gateway devices, set-top boxes, etc.) from the network side.

The CWMP protocol is an application layer protocol that sits on top of IP, which makes the protocol widely applicable with no restrictions on access methods. CPE based on access methods such as ADSL (Asymmetrical Digital Subscriber Loop), Ethernet, and PON (Passive Optical Network) can use this protocol. The TR069-based system architecture is shown in the figure below. The end-to-end architecture of the CWMP protocol has three features:

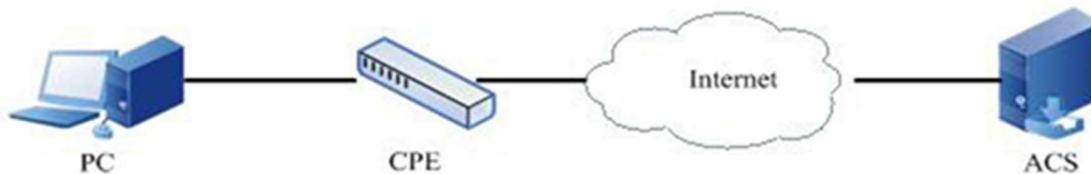

Figure 117-117 TR069-Based System Architecture

1. It has a resilient connection model where both CPE and ACS can trigger the establishment of connections, avoiding the need to maintain connections between CPE and ACS.
  2. Automatic discovery between CPE and ACS is possible.
  3. ACS can dynamically configure and monitor CPE.

For user-side devices, CWMP accomplishes the following four main tasks:

1. Automatic configuration and dynamic service configuration for CPE. For ACS, each CPE can flag itself in the protocol (e.g., model, version, etc.), and depending on the rules that can be set, ACS can issue a configuration for a specific CPE or for a group of CPEs. The CPE can automatically request configuration information in the ACS after power on, and the ACS can also initiate configuration at any desired

moment. This feature enables "zero-configuration installation" of CPE or dynamic change of service parameters controlled from the network side.

2. Management of version files and configuration files of CPE. CWMP provides the management and download of version files and configuration files in CPE. ACS can identify the version number of the user device, decide whether to update the software version of the user device remotely, and be able to know whether the update was successful when it is completed. CPE is under the control of ACS to perform backup by uploading configuration files and restore by downloading configuration files.

3. Remote upgrade of CPE device configuration. It is a function initiated by ACS to remotely upgrade the configuration of CPE. Currently, ACS remotely upgrades the device's configuration by segmenting the CPE's configuration down.

4. Implement security management of device ports: Through CWMP's custom RPC method (remote procedure call), the security management of device ports can be performed, including the functions of disabling, enabling, auto-binding, un-auto-binding, 802.1x based ports, disabling 802.1x, etc. of device ports.

---

## Warning

- The device with 16M Flash will not be powered off or rebooted during the version upgrade via CWMP, and it is necessary to ensure the correct version of the upgrade, otherwise the system may not start.

---

## Note

- When the device is operating in the VST mode, the device does not support the CWMP function.
- 

## 117.8 CWMP Function Configuration

Table 117-117 CWMP Function Configuration List

Configuration Task	
	Enter the CWMP configuration mode.

Configuration Task	
Configure basic functions of CWMP.	Enable a CWMP agent.
	Configure ACS server-related information.
	Configure the WAN device interface.
	Configure CWMP to send INFORM packets periodically.
	Configure the period for CWMP to send INFORM packets.
	Configure the CWMP file download function.
	Configure the CWMP file breakpoint transfer function.
	Configure CWMP provision code.
Configure CWMP authentication and encryption functions.	Configure CWMP authentication information.
	Configure ACS certificates for CWMP.
	Configure ACS certificate fingerprints for CWMP.
Configure CWMP extended functions.	Configure CWMP to specify the source IP address.
	Configure CWMP link backup.

### 117.8.1 Configure Basic Functions of CWMP

#### Configuration Condition

You need to enter the global configuration mode before configuring the basic functions of a CWMP agent.

#### Enter the CWMP Configuration Mode

Enter the CWMP agent configuration mode before performing any CWMP-agent-related configuration.

Table 117-117 Entering the CWMP Configuration Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory

### Enable a CWMP Agent

If the CWMP agent is enabled on the device, then the device can interact with ACS through the CWMP agent to achieve remote configuration and management of the device.

Table 117-117 Enabling CWMP Proxy Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.

### Configure ACS Server-related Information

By configuring ACS-related information, including the connection address of the ACS server, the device can communicate with the ACS server.

Table 117-117 Configuring ACS Server-Related Information

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure ACS related information.	<b>management server url</b> <i>url-string</i>	Mandatory By default, the device is not configured with the relevant parameters of ACS. For non-encrypted methods, the <i>url-string</i> uses the http protocol; for encrypted methods, the <i>url-string</i> uses the https protocol.
Configure the user name for the device to initiate a connection to the ACS.	<b>management server</b> <i>user-name</i>	Optional By default, the device is not configured with the relevant parameters of ACS. If the user name is not configured on the ACS, it can be configured without.
Configure the password corresponding to the user name for the device to initiate a connection to the ACS.	<b>management server</b> <i>password</i>	Optional By default, the device is not configured with the relevant parameters of ACS. If the user name and corresponding password are not configured on the

Step	Command	Description
		ACS, the configuration can be done without.

### Configure the WAN Device Interface

Specify the interface as the default WAN device interface in the interface mode. If no default WAN device is specified, the CWMP agent cannot send the Inform packet to connect to the ACS server.

Table 27-28 Configuring WAN Device Interfaces

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Access to the Layer-3 interface to be used.	<b>interface</b> <i>interface-name</i>	Mandatory Must be configured under the Layer-3 interface.
Configure the default WAN device.	<b>cwmp wan default</b>	Mandatory By default, no wan device interface is specified for the CWMP agent.

### Note

- Failure to specify a default WAN device will result in CWMP not being able to send Inform packets to connect to the ACS. This is because when organizing Inform packets, you need to clearly know the parameter name of the WAN device connected to the external network in the current system and the IP address of this device interface.
- When a Layer-3 interface is specified as the default WAN device, if no WAN IP address is configured in the CWMP mode and an IP address is configured for this interface, the connection request URL is generated using this interface IP address.

### Configure CWMP to Send INFORM Packets Periodically

By configuring CWMP to send Inform packets periodically, the device can send Inform packets to the ACS periodically, and the ACS will process them accordingly according to the pre-configuration after receiving the Inform packets from the device.

Table 29-30 Configuring CWMP to Send INFORM Packets Periodically

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure CWMP to send INFORM packets periodically.	<b>enable inform</b>	Mandatory By default, the function of CWMP sending INFORM packets periodically is enabled.

### Configure the Period for CWMP to Send INFORM Packets

After configuring to enable CWMP periodically send Inform packets, you can configure the period for the CWMP agent to send Inform packets. The default sending period is 43200 seconds (12 hours).

Table 117-117 Configuring the Period for CWMP to Send Inform Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory

Step	Command	Description
		By default, the CWMP agent is disabled.
Configure CWMP to send INFORM packets periodically.	<b>enable inform</b>	Mandatory By default, the function of CWMP sending INFORM packets periodically is enabled.
Configure the period for CWMP to send INFORM packets.	<b>inform interval</b> <i>inform-interval</i>	Mandatory By default, the time interval for the device to automatically and periodically send inform packets is 43200 seconds.

---

### Note

- If you have configured to enable the CWMP agent to send Inform packets without configuring the sending period for the Inform packets, CWMP sends Inform packets to ACS at the default period of 43200 seconds (12 hours).
  - After modifying the periodic sending interval of Inform packets, the modified value will take effect only after the expiration of the last interval. If you need the modification to take effect immediately, you can do so by restarting the CWMP agent, where enable and no enable are described in the relevant sections of the CWMP command manual.
- 

### Configure the CWMP File Download Function

When you need the CWMP agent to support file download for version file and configuration file, you need to configure the file download function of the CWMP agent in advance.

Table 117-117 Configuring CWMP File Download

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure the CWMP file download function.	<b>enable download</b>	Mandatory By default, CWMP does not enable the file download function.

### Configure the CWMP File Breakpoint Transfer Function

When you configure the file download function of CWMP, you can configure this function when you need CWMP to support the breakpoint transfer function of files.

Table 117-117 Configuring CWMP File Breakpoint Transfer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure the CWMP file download function.	<b>enable download</b>	Mandatory

Step	Command	Description
		By default, CWMP does not enable the file download function.
Configure the CWMP file breakpoint transfer function.	<b>enable download resume</b>	Mandatory By default, CWMP does not enable the file breakpoint transfer function.

## Note

- Before you can configure the breakpoint transfer function of CWMP files, you must configure the file download function of CWMP. If there is no configuration file download function at the beginning, the file breakpoint transfer will not work even if the file renewal function is configured later.

### Configure CWMP Provision Code

The provision code used to configure the CWMP, is used to mark the basic service information provided by the CWMP.

Table 117-117 Configuring the Provision Code of CWMP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.

Step	Command	Description
Configure CWMP provision code.	<b>provision code</b> <i>provision-code</i>	Mandatory By default, CWMP is not configured with a provision code.

## 117.8.2 Configure CWMP Authentication and Encryption Functions

### Configuration Condition

Before configuring the authentication and encryption functions of CWMP, do the following:

- The basic configuration of a CWMP agent has been completed, including the enabling configuration of the CWMP agent and the information configuration of the ACS proxied by the CWMP agent.
- When configuring the encryption function, prepare the certificate and import it manually when needed.

### Configure the Authentication Function of CWMP

When the ACS needs to initiate a connection to the device, the CWMP agent needs to be configured to authenticate the connection request from the ACS for security reasons.

Table 117-117 Configure the Authentication Function of CWMP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure the user name for the CPE to	<b>connection request username</b> <i>user-name</i>	Mandatory

Step	Command	Description
authenticate connection requests from the ACS.		By default, no user name is configured.
Configure the password for the CPE to authenticate connection requests from the ACS.	<b>connection request password</b> <i>password</i>	Mandatory By default, no password is configured.

### Configure ACS Certificates for CWMP

For security reasons, when the device connects to ACS by HTTPS, it is necessary to specify the location of the server-side certificate so that the validity of the ACS-side certificate can be verified with this certificate.

Table 117-117 Configuring the ACS Certificate of CWMP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure the CA certificate path required to connect to the ACS server via HTTPS.	<b>certificate ca</b> <i>ca-path</i>	Mandatory The default path is: <i>/flash/tr069/ca.pem.</i>

### Configure ACS Certificate Fingerprints for CWMP

From security consideration, when the device connects to ACS by HTTPS, it can configure the required certificate fingerprint and verify its validity directly with the fingerprint of the server-side certificate.

Table 31-32 Configuring the ACS Certificate Fingerprint for CWMP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure the certificate fingerprint required to connect to the ACS server via HTTPS.	<b>certificate ca fingerprint</b> <i>fingerprint-string</i>	Mandatory <i>fingerprint-string</i> specifies the fingerprint information to verify the CA certificate, the content is a 40-bit hexadecimal number.

---

### Note

- You can choose one of the two ways to configure the ACS certificate and the ACS certificate fingerprint, and if both are configured, the ACS certificate will be used first.
- 

### 117.8.3 Configure CWMP Extended Functions

#### Configuration Condition

Before configuring the extended functionality of CWMP, do the following:

- The basic configuration of CWMP has been completed, including the enabling configuration of the CWMP agent and the information configuration of the ACS proxied by the CWMP agent.
- Layer-3 interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- When you need to use the link backup function, the Layer-3 interface configured as backup should be functional, including the IP address configured and the interface

status as UP.

### Configure CWMP to Specify the Source IP Address

With a source IP address configured, the ACS communicates directly with this specified IP address.

Table 33-34 Configuring CWMP to Specify the Source IP Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the CWMP agent configuration mode.	<b>cwmp agent</b>	Mandatory
Enable a CWMP agent.	<b>enable</b>	Mandatory By default, the CWMP agent is disabled.
Configure the source IP address specified by the CWMP agent.	<b>ip source <i>ip-address</i></b>	Mandatory By default, the source address of the packet is not specified when the device is building a link with ACS, and the source address of the packet is the output interface of the packet.

### Configure CWMP Link Backup

After the link backup function is configured in the interface mode, it enables the device with multiple WAN ports to be configured, with one default WAN port and the others are backup WAN ports. Generate a connection request URL with the default WAN port IP to send to ACS during normal times. When the default WAN port is down, it will choose one from the backup WAN port as the current WAN port, and then use its IP to generate the connection request URL.

Table 35-36 Configuring CWMP Link Backup

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Layer-3 interface where backup needs to be set.	<b>interface</b> <i>interface-name</i>	Mandatory
Configure the backup interface proxied by the CWMP agent.	<b>cwmp wan backup</b>	Mandatory By default, no wan device backup interface is specified for the CWMP agent.

## Note

- Only one CWMP wan default interface and one CWMP wan backup interface can be configured per device.

## 117.8.4 CWMP Monitoring and Maintaining

Table 37-38 CWMP Monitoring and Maintaining

Command	Description
<b>show cwmp agent</b>	Display relevant information about the CWMP agent.
<b>show cwmp session</b>	Display information about CWMP agent sessions.
<b>show cwmp methods</b>	Display the RPC (Remote Procedure Call) methods supported by the CWMP agent.
<b>show cwmp parameter all</b>	Display the names of all parameters of the CWMP agent.

Command	Description
<b>show cwmp parameter</b> <i>para-string</i>	Display detailed information of a specified parameter of the CWMP agent.
<b>show cwmp parameter notify</b> { <b>active</b>   <b>all</b>   <b>forceactive</b>   <b>passive</b> }	Display the parameter names of an advertisement of the CWMP agent.
<b>show cwmp parameter values</b> [ <i>para-string</i>   <b>error</b> ]	Display detailed information of a specified parameter of the CWMP agent.

## 117.9 Typical Configuration Example of CWMP

### 117.9.1 Configure the Authentication Function of CWMP

#### Network Requirements

- Device accesses ACS through Network, enables CWMP function on Device, and configures authentication function on both Device and ACS.
- After the authentication succeeds, Device will perform version upgrade, configuration recovery, configuration backup, and configuration upgrade tasks issued by ACS.

#### Network Topology

Figure 117-117 Network Topology for Configuring the CWMP Authentication Function

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP address and route of the interface. (Omitted)
- Step 3: Configure CWMP.

#Enable the CWMP agent and file download function on Device and configure the URL of ACS.

```
Device#configure terminal
Device(config)#cwmp agent
Device(config-cwmp)#enable
Device(config-cwmp)#management server url http://129.255.136.200:8080/openacs/acs
Device(config-cwmp)#enable download
Device(config-cwmp)#exit
```

#Configure the VLAN2 interface as the default WAN device.

```
Device(config)#interface vlan 2
Device(config-if-vlan2)#cwmp wan default
Device(config-if-vlan2)#exit
```

Step 4: Configure the ACS server.

#Create a fragment template on the ACS and configure both the username and password used for authentication to be admin. (Omitted)

#Create a configuration upgrade task on the ACS, select the created fragment template, and send the configuration upgrade task to Device. (Omitted)

---

## Note

- The ACS ensures that the it can be authenticated by Device by configuring the upgrade task to send the username and password used for authentication down to Device.
- 

#Create version upgrade task/configuration recovery task/configuration backup task on ACS.

Step 5: Check the result.

#The user name and password issued by ACS to Device can be seen on Device via the **show running-config** command.

```
cwmp agent
management server url http://129.255.136.200:8080/openacs/acs
connection request username admin
connection request password admin
enable download
enable
exit
```

#Device can successfully execute the version upgrade task/configuration recovery task/configuration backup task issued by ACS.

## 117.9.2 Configure CWMP to Specify the Source IP Address

### Network Requirements

- Device accesses ACS through Network, enables CWMP function on Device.
- Specify the source IP address of CWMP as 1.0.0.1 to allow Device to access the ACS through the firewall and perform the version upgrade, configuration recovery, and configuration backup tasks issued by the ACS.

### Network Topology

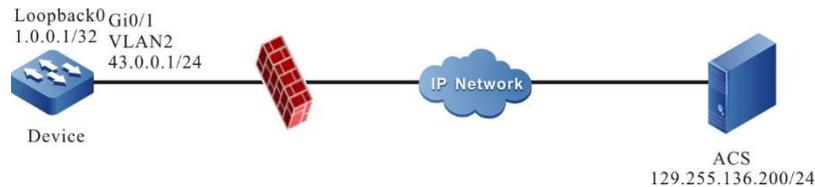

Figure 15-16 Network Topology for Configuring Specified Source IP Address

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses and routes for the ports. (Omitted)
- Step 3: Configure CWMP.

#Enable the CWMP agent and file download function on Device, configure the URL of ACS, and configure the source IP address of CWMP as 1.0.0.1.

```
Device#configure terminal
Device(config)#cwmp agent
Device(config-cwmp)#enable
Device(config-cwmp)#management server url http://129.255.136.200:8080/openacs/acs
Device(config-cwmp)#enable download
Device(config-cwmp)#ip source 1.0.0.1
Device(config-cwmp)#exit
```

#Configure the Loopback0 interface as the default WAN device.

```
Device(config)#interface loopback 0
Device(config-if-loopback0)#cwmp wan default
Device(config-if-loopback0)#exit
```

- Step 4: Configure the firewall.

#The firewall denies the passage of packets with the source IP address 43.0.0.1 and allows the passage of packets with the source IP address 1.0.0.1.

- Step 5: Configure the ACS server.

#Create version upgrade task/configuration recovery task/configuration backup task on ACS.

Step 6: Check the result.

#The configured source IP address can be seen on Device by **show running-config**.

```
Device#show running-config
cwmp agent
management server url http://129.255.136.200:8080/openacs/acs
enable download
enable
ip source 1.0.0.1
exit
```

#Device can successfully execute the version upgrade task/configuration recovery task/configuration backup task issued by ACS.

### 117.9.3 Configure CWMP Link Backup

#### Network Requirements

- Device can access the ACS through two lines, giving preference to the VLAN2 interface to communicate with the ACS.
- When the VLAN2 interface fails, Device communicates with the ACS through the VLAN3 interface, and when the VLAN2 interface is restored, Device communicates with the ACS through the VLAN2 interface.

#### Network Topology

Figure 117-117 Network Topology for Configuring CWMP Link Backup

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses and routes for the ports. (Omitted)

Step 3: Configure CWMP.

#Enable the CWMP agent and file download function on Device and configure the URL of ACS.

```
Device#configure terminal
Device(config)#cwmp agent
Device(config-cwmp)#enable
Device(config-cwmp)#management server url http://129.255.136.200:8080/openacs/acs
Device(config-cwmp)#enable download
```

```
Device(config-cwmp)#exit
```

#Configure the VLAN2 interface as the default WAN device.

```
Device(config)#interface vlan2
Device(config-if-vlan2)#cwmp wan default
Device(config-if-vlan2)#exit
```

#Configure the VLAN3 interface as the backup WAN device.

```
Device(config)#interface vlan3
Device(config-if-vlan3)#cwmp wan backup
Device(config-if-vlan3)#exit
```

Step 4: Check the result.

#Check the CWMP agent information on Device.

```
Device#show cwmp agent
Agent status: Enabled
Periodic Inform: Enabled
Download files: Enabled
Inform interval: 43200
ACS URL: http://129.255.136.200:8080/openacs/acs
ACS user name:
ACS user password:
Connection request URL: http://42.0.0.1:7547/00017A/HIT SW/00017a136922/cwmp
Connection request user name:
Connection request password:
Default WAN device: vlan2
Current WAN device: vlan2
CA certificate: /flash/tr069/ca.pem
```

It can be seen that the default WAN device is VLAN2 and the current WAN device is VLAN2. It can be seen that the IP address of Device corresponding to 42.0.0.1 in the device management page of ACS.

#Check the CWMP agent information when the VLAN2 interface on Device fails.

```
Device#show cwmp agent
Agent status: Enabled
Periodic Inform: Enabled
Download files: Enabled
Inform interval: 43200
ACS URL: http://129.255.136.200:8080/openacs/acs
ACS user name:
ACS user password:
Connection request URL: http://43.0.0.1:7547/00017A/HIT SW/00017a136922/cwmp
Connection request user name:
Connection request password:
Default WAN device: vlan2
Current WAN device: vlan3
CA certificate: /flash/tr069/ca.pem
```

It is indicated that the default WAN device is VLAN2 and the current WAN device is VLAN3. It can be seen that the IP address of Device corresponding to 43.0.0.1 in the device management page of ACS.

#After the VLAN2 interface on Device is restored, check the CWMP agent information and see that both the default WAN device and the current WAN device are VLAN2. You can see the IP address of Device on the device management page of ACS is 42.0.0.

# 118 NETCONF

---

## 118.1 Overview

NETCONF (Network Configuration Protocol) is an XML-based network management protocol that provides a programmable approach of configuring and managing network devices. Through NETCONF, you can configure device parameters, retrieve parameter values, and get statistics information. All NETCONF packets are XML-based and feature powerful filtering capabilities. Each data item has a fixed element and position. This enables devices of the same vendor to use the same access mode and result display mode. The devices of different vendors can achieve the same effect by XML mapping. This feature facilitates third-party software development and NMS software customization in the multi-vendor, multi-device environment. With the help of such NMS software, NETCONF simplifies device configuration and improves device configuration efficiency.

## 118.2 NETCONF Basic Function Configuration

Table 11- 1 NETCONF Basic Function Configuration Task List

Configuration Task	
NETCONF Server Functions Configuration	Enable the NETCONF Server Function
	NETCONF Client Session Idle Timeout Time Configuration
	Configuring the Maximum Number of NETCONF Sessions
Configuring the functions of NETCONF CALL-HOME	Configuring the functions of NETCONF CALL-HOME

## 118.2.1NETCONF Server Functions Configuration

### Configuration Condition

Before configuring the functions of NETCONF server, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Interface network layer addresses have been configured so that NETCONF client nodes are reachable at the network layer.

### Enable the NETCONF Server Function

Table 11- 2 Enabling NETCONF Server Task List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Global NETCONF Function	<b>netconf server enable</b>	Mandatory By default, the NETCONF function is disabled

### NETCONF Client Session Idle Timeout Time Configuration

Table 11- 3 NETCONF Client Session Idle Timeout Time Configuration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Global NETCONF Function	<b>netconf client idle-time</b>	Mandatory By default, the NETCONF client session idle timeout time is 3600 seconds

### Function of Configuring the Maximum Number of NETCONF Sessions

Table 11- 4 Function of configuring the maximum number of NETCONF sessions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Function of configuring the maximum number of NETCONF sessions	<b>netconf server max-session</b> <i>session-num</i>	Optional By default, the maximum number of sessions supported by NETCONF is 4

## 118.2.2 Configuring the Functions of NETCONF CALL-HOME

### Configuration Condition

Before configuring the functions of NETCONF server, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Interface network layer addresses have been configured so that NETCONF client nodes are reachable at the network layer.

### Configuring the Functions of NETCONF CALL-HOME

The configured CALL-HOME terminal can automatically connect to the configured terminal after the NETCONF service is enabled, thus establishing a NETCONF SSH connection without the client actively connecting to the NETCONF server.

Table 11- 5 NETCONF CALL-HOME Function Configuration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configuring the functions of NETCONF CALL-HOME	<b>netconf call-home client</b> <i>client-name ssh endpoint-name address host-name</i> <b>[ port port-num ]</b>	Mandatory By default, there is no call-home client

## 118.2.3 NETCONF Monitoring and Maintaining

Table 11- 6 NETCONF Monitoring and Maintaining

Command	Description
<b>debug netconf</b> [ all   cmf   conf   database   dbm   plugin   server   ssh   yang ]	Open NETCONF debugging switch
<b>show netconf session</b>	Display the current NETCONF client connection session information

## 118.3 NETCONF Typical Configuration Example

### 118.3.1 Configure the NETCONF server

#### Network Requirements

- Device1 and Device2 are NETCONF server devices, which are routed through the unicast routing protocol to the controller.
- The controller monitors and manages Device1 and Device2 via NETCONF.

#### Network Topology

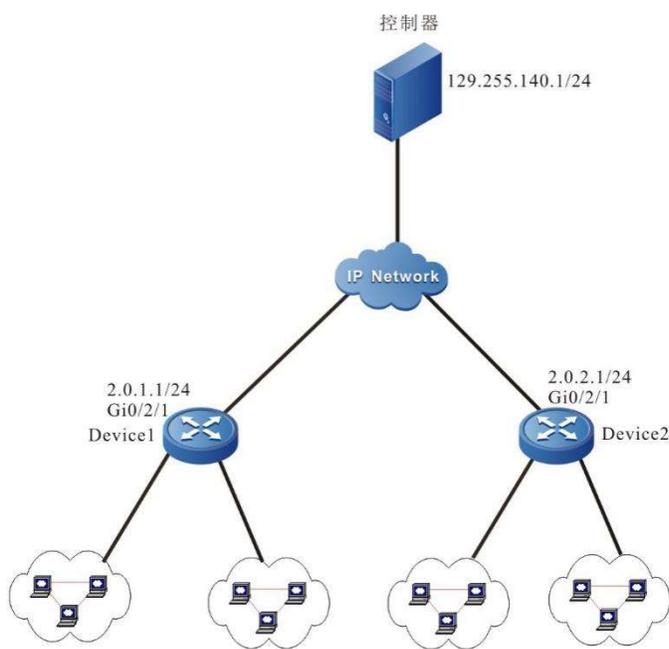

Figure 11- 1 Networking for Configuring the NETCONF Server

## Configuration Steps

A NETCONF connection is established between the configuration controller and the device, and then the controller configures and manages the device via NETCONF. The configuration of Device2 is similar to that of Device1, which shall not be repeated here.

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure NETCONF users

#Create netconf users on the device with the username "admin" and password "admin@123".

```
Device1#configure terminal
Device1(config)#local-user admin class manager

# 119 Telemetry

---

## 119.1 Overview

Telemetry is a technology that remotely collects data from network devices at high speed. It adopts the Push Mode to obtain rich monitoring data on the network device in a timely manner, so that it can quickly achieve network fault location and efficient and intelligent network operation and maintaining.

With the growing size of the network, traditional network monitoring methods (such as SNMP and CLI) are becoming less and less efficient and can no longer meet the needs of high-performance network monitoring. With the emergence of Telemetry technology, it is able to achieve higher accuracy and more real-time monitoring data collection for super large-scale networks, as well as rapid positioning and resolution of network problems, making it an important big data platform for network quality tuning and providing strong support for the requirements and development of intelligent network operation and maintaining in the future.

The Telemetry function consists of two main parts:

- **Static Subscription**  
Telemetry static subscription means that the device acts as the client, the collector acts as the server, and the device initiates the connection to the collector for data collection and uploading.
- **Dynamic Subscription**  
Telemetry dynamic subscription means that the device acts as the server and the collector acts as the client to initiate the connection to the device, and the device does the data collection and uploading.

## 119.2 Telemetry Function Configuration

Table 119-1 Telemetry Function Configuration List

Configuration Task	
	Configure sensors.

Configuration Task	
Configure Telemetry static subscriptions.	Configure collectors.
	Configure subscriptions.
	Enable subscriptions.
Configuring Telemetry dynamic subscriptions.	Configurd the GRPC server.

## 119.2.1 Configure Telemetry Static Subscriptions

### Configuration Condition

None

### Configure Sensors

When users configure Telemetry static subscription sampling data, they need to create a sampling sensor group, then specify the sampling path information, and configure the required sampling path for the sensor according to the specified sampling path information.

Table 119-2 Configuring Sensors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the sensor group mode.	<b>telemetry sensor-group</b> <i>sensor-name</i>	Mandatory If this group does not exist, it is created directly before entering the group mode, otherwise it enters the group module directly.
Configure sensor paths.	<b>sensor-path</b> <i>path-name</i>	Mandatory

## Configuring Target Collectors

When users configure Telemetry to statically subscribe to sample data, they need to create the upload target group and then specify target collectors to which the sample data is to be uploaded.

Table 119-119 Configuring Target Collectors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the sensor group mode.	<b>telemetry destination-group</b> <i>destination-name</i>	Mandatory If the group exists, it will go directly into the group mode.
Configure the destination address.	<b>ipv4-address [vrf vrf-name] ip-address port</b> <i>port-num</i>	Mandatory Vrf uses global by default. The port takes values in the range of 1 to 65535.

## Creating the Subscription

When users configure Telemetry to statically subscribe to sampling data, they need to create a subscription, associate the configured upload target group with the sampling sensor group, and finish uploading data after enabling.

Table 119-119 Creating Subscriptions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the subscription group mode,	<b>telemetry subscription</b> <i>subscription-name</i>	Mandatory
Configure the source interface that sends subscriptions.	<b>source-interface</b> <i>interface-name</i>	Optional By default, the output interface will be determined based on the route and the primary IP address of the output interface will be used as the source IP address for sending
Configure associated sensor groups.	<b>sensor-group</b> <i>sensor-name</i> [ <b>sample-interval</b> <i>sample-interval</i> ]	Mandatory If the sensor group does not exist, you need to configure the sensor group first.  The default value of sample-interval is 10000 milliseconds.
Configure the associated uploading destination group.	<b>destination-group</b> <i>destination-name</i>	Mandatory If the target group does not exist, you need to configure the uploading target group first.
Configure to enable subscriptions.	<b>subscription enable</b>	Mandatory Complete data upload after being enabled.

## 119.2.2 Configuring Telemetry Dynamic Subscriptions

### Configuration Condition

User manual  
Release 1.0 01/2022

None

### Enable GRPC Server

Dynamic subscription is when the device side is acting as the server, therefore, the GRPC server function of the device should be enabled, if you need to complete the dynamic subscription data upload, you need the collector to act as the client, and connect it to the the device side.

Table 119-119 Configuring GRPC Servers

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable GRPC Server	<b>grpc server [port <i>port-num</i>]</b>	Mandatory The default value of the <b>port</b> is 51700.

### 119.2.3 Telemetry Monitoring and Maintaining

Table 3-4 Telemetry Monitoring and Maintaining

Command	Description
<b>show telemetry sensor-group</b> [ <i>sensor-name</i> ]	View the sampling sensor information, the display includes the configured sampling path information.
<b>show telemetry destination</b> [ <i>destination-name</i> ]	View the uploading destination group information, including the configured uploading destination address information.
<b>show telemetry subscription</b> [ <i>subscription-name</i> ]	View subscription information, displaying information about the configured associated sensor group and target group.

Command	Description
<b>show telemetry sensor-path</b>	View Telemetry sensor sample paths, display includes information on supported sample paths.
<b>show telemetry dynamic-subscription</b> [ <i>dynamic-subscription-name</i> ]	View Telemetry dynamic subscription statistics, displaying information including dynamically subscribed sensor path information.

## 119.3 Typical Configuration Example of Telemetry

### 119.3.1 Configure Telemetry Static Subscriptions

#### Network Requirements

- Device acts as a Telemetry client and actively sends data to the server.
- The Telemetry service is enabled on the server and actively listens on port 30000.

#### Network Topology

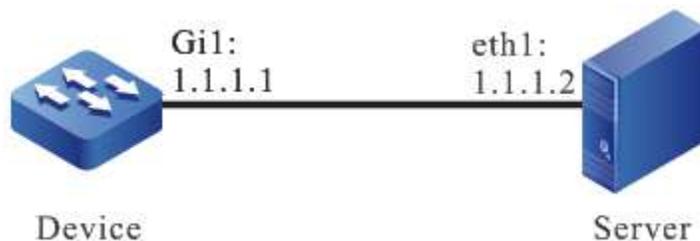

Figure 4- 1 Network Topology for Static Subscription

#### Configuration Steps

- Step 1: Enable Telemetry service on server and configure to listen on port 30000, omitted.
- Step 2: Configure the static subscription function Telemetry.

#Create a sample group sensor and configure the sample path as dmm/memInfo, which is used to count memory usage and other situation data.

```
Device#configure terminal
Device(config)#telemetry sensor-group sensor
Device(config-telemetry-sensor-group-sensor)#sensor-path dmm/memInfo
Device(config-telemetry-sensor-group-sensor)#exit
```

#Create a target group, configure the target address to be the address of the server, and configure the port to be the port the server is listening on.

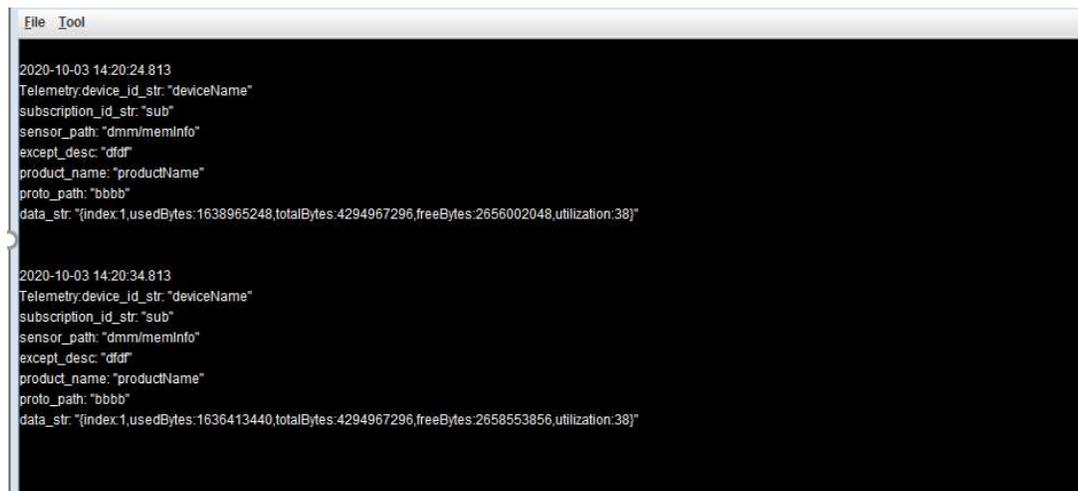

```
Device(config)#telemetry destination-group dest
Device(config-telemetry-destination-group-dest)#ipv4-address 1.1.1.2 port 30000
Device(config-telemetry-destination-group-dest)#exit
```

#Configure the subscription group, refer to the sensor combination target group configured above, and enable the subscription function.

```
Device(config)#telemetry subscription sub
Device(config-telemetry-subscription-sub)#sensor-group sensor sample-interval 10000
Device(config-telemetry-subscription-sub)#destination-group dest
Device(config-telemetry-subscription-sub)#subscription enable
```

Step 3: Check the result.

#The device can receive memory statistics via Telemetry every 10s on the collector.

```

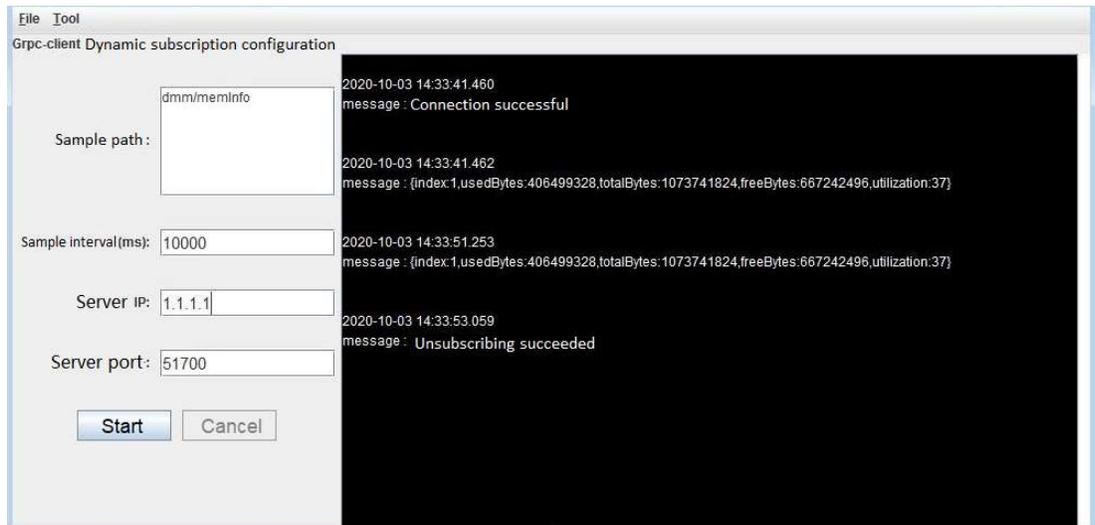

Figure 1-2 Information on Data Transmission of Clients

# 120 sFlow

---

## 120.1 Overview

sFlow, a technology for network traffic sampling and monitoring, follows the RFC3176 standard. sFlow performs different samplings according to different configurations. The sampling process is: First analyze the packet head from the sampled packet, encapsulate as the sFlow packet according to the standard definition, and send to the third-party receiver, which is convenient for the user to analyze and monitor the traffic entering the device via the third-party receiver.

sFlow includes the following two sampling modes:

- Sampler sampling mode: It is one sampling mode provided by the switching chip, sampling the traffic entering the port at random;

- Poller sampling mode: It is one software sampling mode, used to collect the packet and traffic statistics information of the port regularly.

sFlow defines the following two roles:

- Agent role: It is the sFlow agent on the device, used to manage the two sampling modes of sFlow and execute the sampling task;
- Receiver role: It is the mapping of the third-party receiver supporting the sFlow protocol on the local device, used to save the information of the third-party receiver (such as IP address and UDP port number) and regularly send the sFlow packets buffered on the device to the third-party receiver.

## 120.2 sFlow Function Configuration

Table 120-120 sFlow Function Configuration List

Configuration Task	
Configure basic functions of sFlow.	Create the agent role.
	Create receiver Role
Configure sFlow Sampling Mode	Configure sampler Sampling Mode
	Configure poller Sampling Mode

### 120.2.1 Configure Basic Functions of sFlow

#### Configuration Condition

- No.

#### Create the Agent Role

The agent role is used to configure and manage sampling. Currently, the network address type supported by the agent role can only be IPv4.

Table 120-120 Creating the Agent Role

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create the agent role.	<b>sflow agent ip</b> <i>ip-address</i>	Mandatory By default, no agent role is created.

### Create Receiver Role

The receiver role is used to save the information of the third-party receiver and send the sFlow packets buffered on the device to the third-party receiver via the UDP mode. The triggering conditions of sending packets include the following two:

- When the specified buffer area is full and cannot be filled with new sFlow sampling information, first encapsulate the buffered part to the sFlow packet, send to the third-party receiver, and then fill the new part to the buffer area. This can reduce the number of the sFlow packets sent by the device to the third-party receiver obviously.
- Encapsulate the buffered sFlow sampling information as the sFlow packet periodically and send to the third-party receiver. This can avoid that the buffered part cannot be encapsulated as the sFlow packet and sent to the third-party receiver because of not receiving new sFlow sampling information within a long time.

Table 120-120 Creating the Receiver Role

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create receiver Role	<b>sflow receiver</b> <i>receiver-index</i> <b>owner</b> <i>owner-name</i> <b>ip</b> <i>ip-address</i> [ <b>packet-size</b> <i>packet-size-value</i> <b>timeout</b> <i>timeout-value</i> <b>udp-port</b> <i>udp-port-number</i> ]	Mandatory By default, no receiver role is created.

## 120.2.2 Configure sFlow Sampling Mode

### Configuration Condition

Before configuring the sFlow sampling mode, first complete the following task:

- Create the agent role
- Create the receiver role

### Configure Sampler Sampling Mode

In the sampler sampling mode, that is port flow sampling, the switching chip samples the traffic received by the port at random. After getting the sample packet, first copy the head information of the packet, resolve the copied content, get the desired sample information from it, and at last, encapsulate the sample information and send to the corresponding third-party receiver of the receiver role.

Table 120-120 Configuring the Interface Sampler Sampling Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure sampler Sampling Mode	<b>sflow sampler receiver</b> <i>receiver-index</i> [ <b>header-size</b> <i>header-size-value</i> <b>sample-rate</b> <i>sample-rate-value</i> <b>direction</b> <i>direction-value</i> <b>type</b> <i>type-value</i> ]	Mandatory  By default, do not configure the sampler sampling mode.

### Configure Poller Sampling Mode

The poller sampling mode, that is port regular polling sampling, is to regularly encapsulate the packet and traffic statistics information on the port within the period and send to the corresponding third-party receiver of the receiver role.

Table 1-2 Configuring the Poller Sampling Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure poller Sampling Mode	<b>sflow poller</b> <i>poller-index</i> <b>receiver</b> <i>receiver-index</i> [ <b>interval</b> <i>interval-value</i> <b>type</b> <i>type-value</i> ]	Mandatory  By default, no poller sampling method is configured.

### 120.2.3sFlow Monitoring and Maintaining

Table 120-120 sFlow Monitoring and Maintaining

Command	Description
<b>clear sflow receiver</b> <i>receiver-index</i> <b>statistics</b>	Clear the sFlow sampling statistics associated with the specified receiver role.
<b>show sflow</b>	Display the configuration and operation information of sFlow.
<b>show sflow agent</b>	Display the configuration and operation information of the agent role.
<b>show sflow poller</b> [ <b>interface</b> <i>interface-name</i> ]	Display the configuration and operation information of the poller sampling method on the interface.
<b>show sflow receiver</b> [ <i>receiver-index</i> [ <b>statistics</b> ] ]	Displays sFlow sampling statistics, configuration and operational information associated with the receiver role.

Command	Description
<b>show sflow sampler</b> [ <b>interface interface-name</b> ]	Display the configuration and operation information of the sampler sampling method on the interface.

## 120.3 Typical Configuration Example of sFlow

### 120.3.1 Configure Basic Functions of sFlow

#### Network Requirements

- Device is an sFlow agent device that is route reachable to the NMS server.
- The NMS server monitors Device's interface data traffic via sFlow.

#### Network Topology

Figure 120-120 Network Topology for Configuring Basic Functions of sFlow

#### Configuration Steps

- Step 1: Configure the VLAN and add the interface to the corresponding VLAN. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure the sFlow function.

#### #Enable an sFlow agent.

```
Device#configure terminal
Device(config)#sflow agent ip 1.1.1.1
```

#Configure the destination IP address and destination UDP interface number of the sFlow statistics output packet, the sending interval of packets is 5 seconds, and the cache is 1400 bytes.

```
Device(config)#sflow receiver 1 owner 1 ip 129.255.151.10 timeout 5 udp-port 6343 packet-size 1400
```

#Sampler sampling of the flow in the inbound direction of interface gigabitethernet0/1 with a sampling frequency of 10.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#sflow sampler receiver 1 sample-rate 10 direction rx
```

#Poller sampling of flows in the inbound direction of interface gigabitethernet0/1 with a polling period of 20 seconds.

```
Device(config-if-gigabitethernet0/1)#sflow poller 1 receiver 1 interval 20
Device(config-if-gigabitethernet0/1)#exit
```

Step 4: Check the result.

#View information about the sFlow on Device.

```
Device#show sflow
```

```
sFlow Agent Configuration: (Interval = 120, Current Tick = 0x002a6476)

## 121.1 Overview

With the ever-increasing requirements of users for reducing costs and improving equipment reliability, we have proposed a technology that combines multiple physical switches into one virtual switch, namely Virtual Switching Technology (VST).

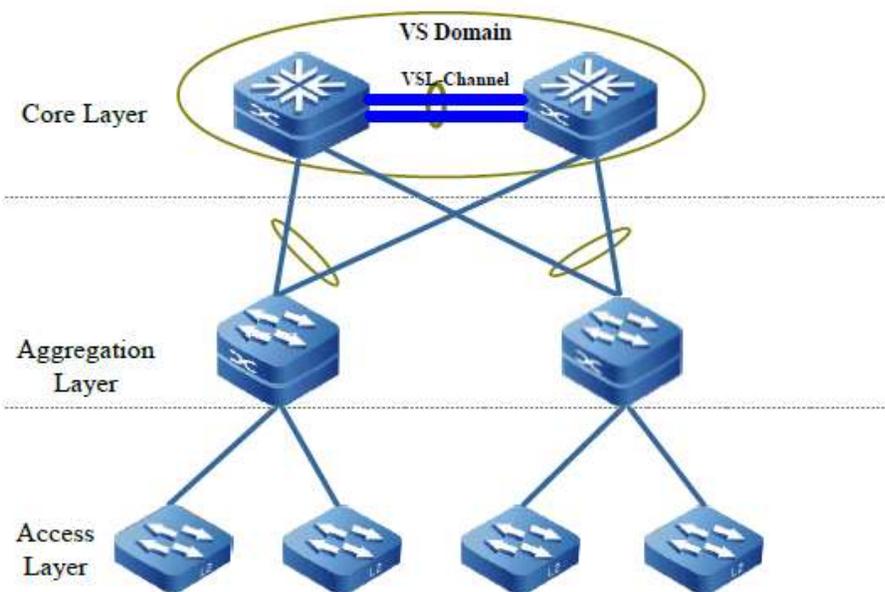

Figure 121-1 VST Physical Network View

As shown in Figure 1-1, two devices at the core layer are connected via a virtual switching link interface to form one VS Domain (virtual switching domain, also called stack system); the devices at the aggregation layer are uplinked to VS Domain via link aggregation; the VS Domain at the core layer is one virtual device to other network devices.

Compared with the traditional L2 spanning tree and L3 VRRP/VBRP technology, this technology has the following advantages:

- Exponential Increase in Bandwidth under Efficient Use

In the traditional solution, due to the operation of STP/RSTP/MSTP, one of the original two uplinks will be in the forwarding status and the other link in the backup status; multiple devices become one single logical device by the use of the virtual switching technology, and therefore, it is no longer necessary to block some links; two links form one aggregation group, which can be used to forward data, thereby effectively using the bandwidth of these links without causing the waste of bandwidth resources. In addition, the cross-device and cross-board aggregation link allow for both redundant links and dynamic load balancing, thereby effectively utilizing all bandwidth.

- High reliability

Virtual switching system is composed of multiple member devices. The master control device is responsible for the operation, management, and maintenance of the entire virtual switching system, while other member devices are in the backup status. Once the master control device fails, there will be no rely on the convergence of STP/RSTP/MSTP, VRRP/VBRP and other protocols, and the system will quickly elect the new master control device from other member devices in the backup status, ensuring

that the business of the virtual switching system experiences no interruption, and improved reliability is provided when member failure occurs.

- **Network Topology Simplification**

The virtual device formed by means of the virtual switching technology is equivalent to a single device in the network. It is connected to the peripheral devices via aggregation links. Because there is no L2 loop, there is no need to configure the STP/RSTP/MSTP protocol. Various control layer protocols run on one virtual device, thereby reducing the interaction of numerous protocol packets between the devices and shortening the routing convergence time.

- **Centralized Management**

After two or more devices form stack system, the member device control plane in the virtual switching system is in the backup status, but its data plane is active. Users can log in to the virtual switching system via the port of any member device to carry out centralized management on the entire virtual device, without connecting to each member device for separate management.

## **121.1.1 Basic Concepts**

### **Virtual Switch Domain**

Virtual switch domain is composed of one or more member devices. The member devices in the same virtual switch domain must have the same domain ID configuration. The domain ID uniquely determines one virtual switch domain. When the virtual switch domain MAC address is obtained using the virtual MAC address mode, the virtual switch domain ID uniquely determines the MAC address. Therefore, in the same LAN, the domain IDs between multiple stack systems cannot be the same.

### **Virtual Switch Member Device**

Each physical device in the virtual switch domain is also called virtual switch member device. In the same stack domain, the member ID uniquely determines one member device.

### **Virtual Switch Link Interface and its Member Port**

By binding the multiple physical ports together which are stacking capable, one virtual switch link interface (VSL-Channel) can be formed. The virtual switch link interface is logical link channel for internal protocol packet interaction and service data forwarding between member devices in the stack system, and each physical port therein is called virtual switch link member port.

The member devices join the same virtual switch domain, interconnect with each other via the virtual switch link interface, and finally form one virtual switch device.

### **LMP**

LMP (Link Manage Protocol) is used to manage the virtual switch link interface and its member ports.

## RRP

RRP (Role Resolution Protocol) is used for the role resolution of member devices in the stack system.

## TDP

TDP (Topology Discovery Protocol) is used to advertise the information of the member devices in the stack system to ensure information consistency for all member devices in the stack system.

## 121.2 VST Function Configuration

Table 121-1 VST Function Configuration List

Configuration Task	
Configure virtual switch member device	Configure virtual switch member device domain ID
	Configure virtual switch member device ID
	Configure virtual switch member device priority
Configure virtual switch link interface	Create virtual switch link interface
	Configure to add the port to the virtual switch link interface
Configure device running mode	Configure device running mode
Configure the maximum number of devices supported by the stack system	Configure the maximum number of devices supported by the stack system

## 121.2.1 Configure Virtual Switch Member Device

Before the device joins the virtual switch stack domain or after it has joined the virtual switch stack domain, you can configure the device accordingly, including modifying its member ID, domain ID, and priority.

---

### Note

- In the stack mode, after modifying the member ID or domain ID of the virtual switch member device, the newly configured member ID or domain ID will not take effect immediately. The corresponding configuration will only take effect after the corresponding virtual switch member device saves the configuration and reboots.
- 

### Configuration Condition

None

### Configure Virtual Switch Member Device Domain ID

Table 121-2 Configuring Virtual Switch Member Device Domain ID

Step	Command	Description
Enter the virtual switch member configuration mode	<b>switch virtual member</b> <i>member-id</i>	-
Configure virtual switch member device domain ID	<b>domain</b> <i>domain-id</i>	Mandatory  By default, the domain ID of the virtual switch member device is 100

---

### Caution

- In the stack mode, when adding a virtual switch member device to the virtual switch domain, you must ensure that the domain ID of every virtual switch member device is the same, otherwise the virtual switch member device will not be able to join the same virtual switch domain.
-

- 
- In the stack mode, after the domain ID is modified, the new domain ID will not take effect immediately. The new domain ID will only take effect after the virtual switch member device saves the configuration and reboots.
- 

### Configure Virtual Switch Member Device ID

For configuring the virtual switch member device ID, there are two corresponding cases: In the first case, the device has never been configured with the virtual switch member device ID and requires a virtual switch member device ID to be configured; In the second case, the device has been configured with a virtual switch member device ID and requires it to be modified into the new virtual switch member device ID. Therefore, there are two commands to configure the virtual switch member device ID. One is to configure the virtual switch member device ID, and the other is to modify the virtual switch member device ID, as shown in Table 1-3.

Table 121-3 Configuring VST Member Device ID

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure virtual switch member device ID	<b>switch virtual member</b> <i>member-id</i>	Mandatory By default, the device has no virtual switch member device ID
Modify virtual switch member device ID	<b>switch virtual member</b> <i>member-id rename</i> <i>member-id-new</i>	Optional

---

### Caution

- In the stack mode, after modifying the virtual switch member device ID, you must save the configuration and reboot the system before the new virtual switch member device ID takes effect.
  - In the stack mode, after modifying the virtual switch member device ID, you must save the configuration and reboot the system before the new virtual switch member device ID takes effect. In one virtual switch domain, the member ID of each virtual switch member device is unique, and it cannot happen that the member IDs of two virtual switch member devices are the
-

---

same, otherwise the virtual switch member devices cannot be stacked normally.

---

### Configure Virtual Switch Member Device Priority

When multiple virtual switch member devices join the same virtual switch domain, the priority of each virtual switch member device can be configured to increase the possibility of the virtual switch member device being selected as the master control device. The higher the priority value, the more preferred.

Table 121-4 Configuring Virtual Switch Member Device Priority

Step	Command	Description
Enter the virtual switch member configuration mode	<b>switch virtual member</b> <i>member-id</i>	-
Configure virtual switch member device priority	<b>priority</b> <i>priority-num</i>	Mandatory  By default, the priority of the virtual switch member device is 100

---

### Note

- The virtual switch master control devices in the virtual switch domain are selected based on the following resolution rules:
    1. The virtual switch master control device is given priority; if there are multiple virtual switch master control devices, the second step comparison is performed; if there is no virtual switch master control device, the third step comparison is performed, otherwise the comparison ends;
    2. Those as the virtual switch master control device having a long run time are given priority; if the master control devices have the same run time, the third step comparison is performed, otherwise the comparison ends;
    3. Those higher priority are given priority; if the priorities are the same, the fourth step comparison is performed, otherwise the comparison ends;
    4. Those having small member ID are given priority.
-

## 121.2.2 Configure Virtual Switch Link Interface

The virtual switch link interface (VSL-Channel) is one logical interface. Centralized management for multiple physical ports is achieved by binding together these physical ports that support stacking. Any operation on the virtual switch link interface will affect every physical member port at the same time.

### Configuration Condition

None

### Create Virtual Switch Link Interface

Table 121-5 Creating Virtual Switch Link Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create virtual switch link interface	<b>vsl-channel</b> <i>vsl-channel-id</i>	Mandatory  In stand-alone mode, vsl-channel-id is a one-dimensional value that represents a virtual switch link interface ID. In the stack mode, it is a two-dimensional value. The first dimension is a virtual switch member ID, and the second dimension is a virtual switch link interface ID.

---

### Caution

- Upon deletion of the virtual switch link interface, all member ports in the virtual switch link interface will exit the virtual switch link interface, and all the member ports' configurations are restored to the default status. Before deleting the virtual switch link

---

interface, please confirm that there will be no loops in the network after deletion.

---

### Configure to Add the Port to the Virtual Switch Link Interface

Table 121-6 Configuring to Add the Port to the Virtual Switch Link Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure to add the port to the virtual switch link interface	<b>vsl-channel</b> <i>vsl-channel-id</i> <b>mode on [ type extern ]</b>	Mandatory

---

#### Note

- All member ports in the virtual switch link interface must have the same port capability level.
- 

### 121.2.3 Configure Device Running Mode

The current device supports two running modes, that is, stand-alone mode and stack mode. The device can form one virtual switch domain with other virtual switch member devices only when it runs in the stack mode.

#### Configuration Condition

None

#### Configure Device Running Mode

Table 121-7 Configuring Device Running Mode

Step	Command	Description
Enter the privileged user mode.	<b>enable</b>	-
Configure device running mode	<b>switch mode { stand-alone   virtual }</b>	Mandatory By default, the device runs in the stand-alone mode

### Note

- When the running mode of the device changes, the device will reboot and run in the new configuration mode after the reboot.
- The different running modes of the device correspond to their respective independent boot configuration files.
- Before switching the device to run in the stack mode, you must ensure that the virtual switch member device ID has been configured, otherwise switching cannot be performed.

## 121.2.4 Configure the Maximum Number of Devices Supported by the Stack System

One stack system is composed of multiple devices. The number of devices that constitute the stack system is limited. The defined limit value is the maximum number of devices supported by the stack system.

### Configuration Condition

None

### Configure the Maximum Number of Devices Supported by the Stack System

Table 121-8 Configuring the Maximum Number of Devices Supported by the Stack System

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure the maximum number of devices supported by the stack system	<b>switch virtual max-number</b> <i>number</i>	Mandatory By default, the maximum number of devices supported by the stack system is 2

### Note

- The modification to the maximum number of devices supported by the stack system takes effect only after you save the configuration and reboot the system.

## 121.2.5 VST Monitoring and Maintaining

Table 121-9 VST Monitoring and Maintaining

Command	Description
<b>show switch virtual</b>	Show the basic information of the virtual switch domain
<b>show switch virtual local config</b>	Show the basic configuration information of the local virtual switch member device
<b>show switch virtual local current</b>	Show the basic running information of the local virtual switch member device
<b>show switch virtual member</b> <i>member-id</i> [ <b>config</b>   <b>current</b> ]	Show the basic information of the virtual switch member device
<b>show switch virtual topo</b>	Show the information about the forwarding path from the local virtual switch member device to other virtual switch member

Command	Description
	devices in the virtual switch domain
<b>show switch vsl-channel</b> [ <i>vsl-channel-id</i> ]	Show the information about the virtual switch link interface in the virtual switch domain

## 121.3 VST Typical Configuration Example

### 121.3.1 Configure the Devices to Form Chain Stack System

#### Network Requirements

- It is realized that Device0 and Device1 form chain stack system, in which Device0 becomes the master control device.

#### Network Topology

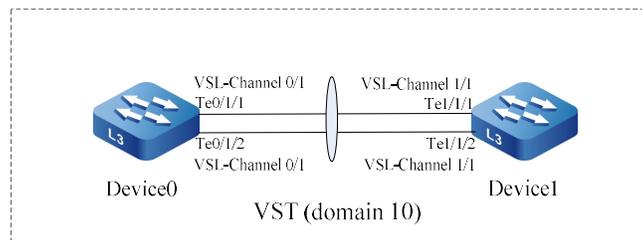

Figure 121-2 Configuring the Devices to Form Chain Stack System

#### Configuration Steps

Step 1: Configure Device0.

#On Device0, Configure the virtual switch member device ID as 0, and configure the domain ID as 10 and the priority as 255.

Device0#configure terminal

```
Device0(config)#switch virtual member 0
Do you want to modify member id(Yes|No)?y
% Member ID 0 config will take effect only after the exec command 'switch mode virtual' is issued
Device0(config-vst-member-0)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device0(config-vst-member-0)#priority 255
Device0(config-vst-member-0)#exit
```

**#On Device0, create virtual switch link interface 1, and add ports tengigabitethernet1/1 and tengigabitethernet1/2 to the virtual switch link interface 1.**

```
Device0(config)#vsl-channel 1
Device0(config-vsl-channel-1)#exit
Device0(config)#interface tengigabitethernet 1/1-1/2
Device0(config-if-range)#vsl-channel 1 mode on
Device0(config-if-range)#exit
```

**#Save the configuration on Device0.**

```
Device0#write
Are you sure to overwrite /flash/startup (Yes|No)?y
Building Configuration...done
Write to startup file ... OK
Write to mode file... OK
```

## Step 2: Configure Device1.

**#On Device1, Configure the virtual switch member device ID as 1, and configure the domain ID as 10 and the priority as 200.**

```
Device1#configure terminal
Device1(config)#switch virtual member 1
Do you want to modify member id(Yes|No)?y
% Member ID 1 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#priority 200
Device1(config-vst-member-1)#exit
```

**#On Device1, create virtual switch link interface 1, and add ports tengigabitethernet1/1 and tengigabitethernet1/2 to the virtual switch link interface 1.**

```
Device1(config)#vsl-channel 1
Device1(config-vsl-channel-1)#exit
Device1(config)#interface tengigabitethernet 1/1-1/2
Device1(config-if-range)#vsl-channel 1 mode on
```

```
Device1(config-if-range)#exit
```

**#Save the configuration on Device1.**

```
Device1#write
```

```
Are you sure to overwrite /flash/startup (Yes|No)?y
```

```
Building Configuration...done
```

```
Write to startup file ... OK
```

```
Write to mode file... OK
```

**Step 3: Configure Device0 and Device1 to run in the stack mode.**

**#Configure Device0 to run in the stack mode.**

```
Device0#switch mode virtual
```

```
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
```

```
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
```

```
Converting interface names Building configuration...
```

```
Copying the startup configuration to backup file named "startup-backupalone"...
```

```
Please wait...system reloading is in progress!
```

```
ok
```

```
Reset system!
```

```
Jul 30 2014 17:36:14: %SYS-5-RELOAD: Reload requested
```

**#Configure Device1 to run in the stack mode.**

```
Device1#switch mode virtual
```

```
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
```

```
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
```

```
Converting interface names Building configuration...
```

```
Copying the startup configuration to backup file named "startup-backupalone"...
```

```
Please wait...system reloading is in progress!
```

```
ok
```

```
Reset system!
```

```
Jul 30 2014 17:36:20: %SYS-5-RELOAD: Reload requested
```

**Step 4: Check the result.**

**#Check on Device0, chain stack system has been formed, and Device0 is the master control device.**

```
Device0#show switch virtual
```

```
Codes: L - local-device,I - isolate-device
```

```
Virtual Switch Mode      : VIRTUAL
```

Virtual Switch DomainId : 10  
Virtual Switch mac-address : 0001.7a6a.001b

----- VST MEMBER INFORMATION -----

CODE	MemberID	Role	Pri	LocalVsl	RemoteVsl

# 122 MAD

---

## 122.1 Overview

When the virtual switch link interface in the stack system fails, the stack system splits into multiple virtual switch domains, and multiple virtual switch master control devices (hereinafter referred to as master control devices) with the same global configuration appear. This case is called Multi-Active. Since the logical devices from splitting are exactly the same as the original logical device in terms of global configuration, network configuration conflicts will occur, resulting in traffic anomalies. In order to avoid the impact of this case on the business, MAD (Multi-Active Detection) is proposed.

The current stack system supports two MAD modes: MAD LACP and MAD Fast-Hello, which can meet different networking requirements.

The MAD status includes two statuses: Active status and Recovery status. Active status means normal working status, and Recovery status means disabled status. In the disabled status, all L2/3 Ethernet interfaces and VLAN interfaces except the virtual switch link member ports and reserved ports will be shut down by MAD.

When the device receives the MAD packet, it compares the data in the packet with the data of the local logic device. If the VS Domain ID (the virtual switch domain ID of the sender) in the packet is the same as

that of the local logical device, and the Master ID in the packet (the member ID of the master control device in the virtual switch domain where the sender is located) is differed from that of the local logical device, it is considered that multi-active has occurred, and multi-active resolution has begun. According to certain resolution rules, only one logical device in the same virtual switch domain remains in the Active status, and other logical devices enter the Recovery status.

Intermediate device must be used in MAD LACP networking, and intermediate device or direct connection can be used in MAD Fast-Hello networking. If the direct connection mode is used, ensure that there is a direct line between any two virtual switch member devices for multi-active detection, that is, ensure full connection.

## 122.2 MAD Function Configuration

Table 122-1 MAD Function Configuration List

Configuration Task	
Configure MAD LACP function	Configure MAD LACP function
Configure MAD Fast-Hello function	Configure MAD Fast-Hello function
Configure reserved port	Configure reserved port
Configure restoring MAD status to Active status	Configure restoring MAD status to Active status

### 122.2.1 Configure MAD LACP Function

MAD LACP Multi-active detection extends the LACP packet fields to achieve multi-active detection and resolution.

#### Configuration Condition

None

#### Configure MAD LACP Function

Table 122-2 Configuring MAD LACP Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create dynamic aggregation group	<b>link-aggregation <i>link-aggregation-id</i> mode lACP</b>	Mandatory By default, the aggregation group is not created.
Enter Aggregation Group Configuration Mode	<b>Interface link-aggregation <i>link-aggregation-id</i></b>	-
Enable MAD LACP Function	<b>mad enable</b>	Mandatory By default, the MAD LACP function is not enabled

### Note

- Only the dynamic aggregation group supports enabling the MAD LACP function.
- The intermediate device used in networking must be Our device that supports the LACP packet transparent transmission function.

## 122.2.2 Configure MAD Fast-Hello Function

MAD Fast-Hello multi-active detection protocol packets are customized by our company and directly carry data required by multi-active detection and resolution.

### Configuration Condition

None

### Configure MAD Fast-Hello Function

Table 122-3 Configuring MAD Fast-Hello Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the MAD Fast-Hello packet sending period in normal mode	<b>mad fast-hello normal interval</b> <i>interval-time</i>	Optional By default, the MAD Fast-Hello packet sending period in normal mode is 2000 milliseconds
Configure the MAD Fast-Hello packet sending period in aggressive mode	<b>mad fast-hello aggressive interval</b> <i>interval-time</i>	Optional By default, the MAD Fast-Hello packet sending period in aggressive mode is 500 milliseconds
Configure the duration of aggressive mode	<b>mad fast-hello aggressive duration</b> <i>duration-time</i>	Optional By default, the duration of aggressive mode is 120 seconds
Enter the VLAN configuration mode	<b>vlan</b> <i>vlan-id</i>	-
Configure controlling VLAN	<b>mad fast-hello control-vlan</b>	Mandatory By default, no control VLAN is configured
Enter the global configuration mode.	<b>exit</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the port link type to the Trunk type	<b>switchport mode trunk</b>	Mandatory

Step	Command	Description
		By default, the port link type is the Access type.
Shut down the spanning tree function on the port	<b>no spanning-tree enable</b>	Mandatory By default, the spanning tree function is enabled on the port
Configure control port	<b>mad fast-hello vlan <i>vlan-id</i></b>	Mandatory By default, no control port is configured

### Note

- The control VLAN and control port for MAD Fast-Hello can only be used exclusively for MAD Fast-Hello multi-active detection, and no other services can be configured.
- Shutting down the spanning tree function of the port on the MAD Fast-Hello control port is required.

## 122.2.3 Configure Reserved Port

When MAD is in the Recovery status, the reserved port will not be shut down by MAD. You can configure the ports and interfaces (such as management ports) that need to be in UP status for special purposes as reserved ports.

### Configuration Condition

None

### Configure Reserved Port

Table 122-4 Configuring Reserved Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode, only on the aggregation group after you enter the aggregation group configuration mode, and only on the current port after you enter the interface configuration mode
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	
Enter the interface configuration mode	<b>interface vlan</b> <i>vlan-id</i>	
Configure reserved port	<b>mad exclude recovery</b>	Mandatory  By default, no reserved port is configured

---

### Note

- The aggregation group that has MAD LACP enabled cannot be configured as reserved port.
- 

## 122.2.4 Configure Restoring MAD Status to Active Status

### Configuration Condition

None

## Configure Restoring MAD Status to Active Status

Table 122-5 Configuring Restoring MAD Status to Active Status

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure restoring MAD status to Active status	<b>mad restore</b>	Mandatory By default, MAD is in Active status

---

### Note

- When the MAD changes to Recovery status, MAD does not process the shut-down ports and interfaces. When the MAD is restored to Active status, only the shut-down ports and interfaces are started up.
- 

## 122.2.5MAD Monitoring and Maintaining

Table 122-6 MAD Monitoring and Maintaining

Command	Description
<b>show mad exclude recovery interface [ switchport   vlan ]</b>	Show the reserved port configured
<b>show mad fast-hello</b>	Show MAD Fast-Hello information
<b>show mad lacp</b>	Show MAD LACP information
<b>show mad status</b>	Show MAD status

## 122.3 Typical Configuration Example of MAD

### 122.3.1 Configure MAD LACP Function

#### Network Requirements

- Device0 and Device1 form a stack system with Device0 as the master control device, and PC 1 accesses the IP Network through the stack system;
- After the MAD LACP function is configured, PC 1 can access the IP Network properly after Device1 is separated from the stack system due to a fault of the virtual switch link interface. Service exceptions due to network configuration conflicts are not caused.

#### Network Topology

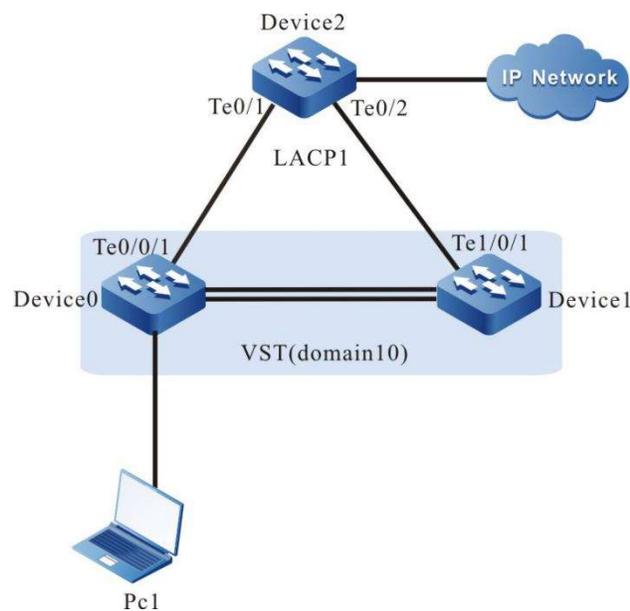

Figure 122-1 Network Topology for Configuring MAD LACP

#### Configuration Steps

Step 1: Device0 and Device1 form a stack system with Device0 as the master control device.

Omitted

Step 2: Configure the MAD LACP function on Device0.

#On Device0, create VLAN 2 and dynamic aggregation group 1, configure the link type of the aggregation group 1 to Trunk to allow services of VLAN 2 to pass.

```
Device0#configure terminal
Device0(config)#vlan 2
Device0(config-vlan2)#exit
Device0(config)#link-aggregation 1 mode lacp
Device0(config)#interface link-aggregation 1
Device0(config-link-aggregation1)#switchport mode trunk
Device0(config-link-aggregation1)#switchport trunk allowed vlan add 2
Device0(config-link-aggregation1)#exit
```

**#On Device0, add ports tengigabitethernet0/0/1 and gigabitethernet1/0/1 into the aggregation group 1.**

```
Device0(config)#interface tengigabitethernet 0/0/1,1/0/1
Device0(config-if-range)#link-aggregation 1 active
Device0(config-if-range)#exit
```

**#Enable the MAD LACP function on the aggregation group 1 of Device0.**

```
Device0(config)#interface link-aggregation 1
Device0(config-link-aggregation1)#mad enable
Device0(config-link-aggregation1)#exit
```

**Step 3: Configure Device2.**

**#On Device2, create VLAN 2 and dynamic aggregation group 1, configure the link type of the aggregation group 1 to Trunk to allow services of VLAN 2 to pass.**

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
Device2(config)#link-aggregation 1 mode lacp
Device2(config)#interface link-aggregation 1
Device2(config-link-aggregation1)#switchport mode trunk
Device2(config-link-aggregation1)#switchport trunk allowed vlan add 2
Device2(config-link-aggregation1)#exit
```

**#On Device2, add ports tengigabitethernet0/1 and gigabitethernet0/2 into the aggregation group 1.**

```
Device2(config)#interface tengigabitethernet 0/1,0/2
Device2(config-if-range)#link-aggregation 1 active
Device2(config-if-range)#exit
```

**Step 4: Check the result.**

**#View the MAD LACP information on Device0.**

```

Device0#show mad lacp
-----MAD-LACP INFORMATION-----
Link-aggregation   Mad state
-----
1                   enable

```

#After Device1 is separated from the stack system due to the fault of the virtual switch link interface, the MAD status of the stack system using Device0 as the master control device changes to Active status, and the MAD status of the stack system using Device1 as the master control device changes to Recovery status.

```

Device0#show mad status
MAD status: active

```

```

Device1#show mad status
MAD status: recovery

```

#PC 1 can access the IP Network.

### 122.3.2 Configure MAD Fast-Hello Function

#### Network Requirements

- Device0 and Device1 form a stack system with Device0 as the master control device;
- After the MAD Fast-Hello function is configured, and after Device1 is separated from the stack system due to the fault of the virtual switch link interface, service exceptions due to network configuration conflicts will not be caused.

#### Network Topology

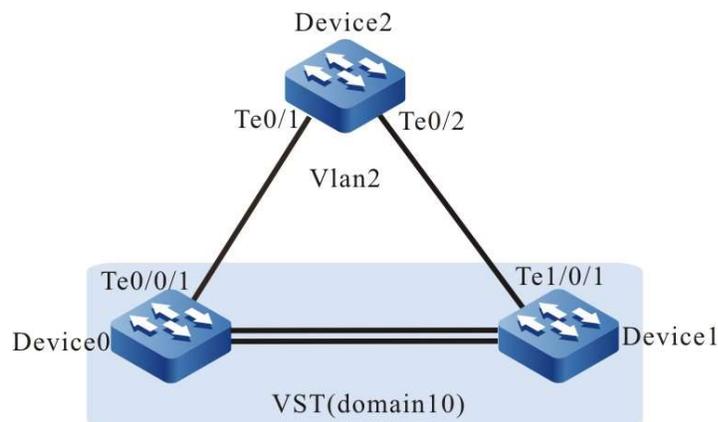

Figure 122-2 Network Topology for Configuring MAD Fast-Hello

#### Configuration Steps

**Step 1:** Device0 and Device1 form a stack system with Device0 as the master control device.

Omitted

**Step 2:** Configure the MAD Fast-Hello function on Device0.

**#Create VLAN 2 on Device0 and configure it as MAD Fast-Hello control VLAN.**

```
Device0#configure terminal
Device0(config)#vlan 2
Device0(config-vlan2)#mad fast-hello control-vlan
Device0(config-vlan2)#exit
```

**#Configure on Device0, the like types of ports tengigabitethernet0/0/1 and tengigabitethernet1/0/1 as Trunk, and join the MAD Fast-Hello control VLAN.**

```
Device0(config)#interface tengigabitethernet 0/0/1,1/0/1
Device0(config-if-range)#switchport mode trunk
Device0(config-if-range)#mad fast-hello vlan 2
Device0(config-if-range)#exit
```

**#On Device0, shut down the spanning tree function of the ports tengigabitethernet0/0/1 and gigabitethernet1/0/1.**

```
Device0(config)#interface tengigabitethernet 0/0/1,1/0/1
Device0(config-if-range)#no spanning-tree enable
Device0(config-if-range)#exit
```

**Step 3:** Configure Device2.

**#On Device2, create VLAN 2, configure the link types of ports tengigabitethernet0/1 and gigabitethernet0/2 as Trunk to allow services of VLAN 2 to pass.**

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
Device2(config)#interface tengigabitethernet 0/1,0/2
Device2(config-if-range)#switchport mode trunk
Device2(config-if-range)#switchport trunk allowed vlan add 2
Device2(config-if-range)#exit
```

**#On Device2, shut down the spanning tree function of the ports tengigabitethernet0/1 and gigabitethernet0/2.**

```
Device2(config)#interface tengigabitethernet 0/1,0/2
Device2(config-if-range)#no spanning-tree enable
Device2(config-if-range)#exit
```

Step 4: Check the result.

**#View MAD Fast-Hello enabling on Device0.**

```
Device0#show mad fast-hello
```

```
MAD Fast-Hello Information:
```

```
Normal interval : 2000 ms(default: 2000)
```

```
Aggressive interval : 500 ms(default: 500)
```

```
Aggressive duration : 120 s (default: 120)
```

```
Control vlan : 2
```

```
-----  
Interface Control vlan
```

```
-----  
te0/0/1 2
```

```
te1/0/1 2
```

**#After Device1 is separated from the stack system due to the fault of the virtual switch link interface, the MAD status of the stack system using Device0 as the master control device changes to Active status, and the MAD status of the stack system using Device1 as the master control device changes to Recovery status.**

```
Device0#show mad status
```

```
MAD status: active
```

```
Device1# show mad status
```

```
MAD status: recovery
```

# 123 MVST

---

## 123.1 Overview

At present, VST (Virtual Switching Technologies, which will combine crosswise multiple physical devices into one virtual device) technology because of its high reliability, ease of management and other characteristics gradually become a necessary networking technology to LAN. VST technology realizes the centralized management of multiple devices at the same level, but there is still the problem of decentralized management of devices on the multi-level network. Especially in the typical two-level local area network, the access layer uses numerous access devices that are enormous in amount and highly dispersed and need sequential maintenance and management, making the management work be cumbersome. Additionally, assigning each of these devices an IP address will consume a lot of IP address resources, which is undoubtedly a waste with IP address resources running short at present.

To solve the above problems, MVST (Mix Virtual Switching Technology, vertical management virtualization technology) technology is proposed. As shown in the figure below, VST technology is used for the core layer of LAN to virtualize multiple devices into one logical device, while Mix Virtual Switching Technology (MVST), a vertical management virtualization technology, is used for the vertical layer. MVST virtualizes all devices of the entire LAN into one logical device, constituting a centralized management domain (MVST domain). The management domain provides one external management IP address and the ability to manage and access each device on the LAN. In this way, "one network and one device" is truly achieved, one network has one IP, and the entire LAN can be readily managed with one device, thereby simplifying management.

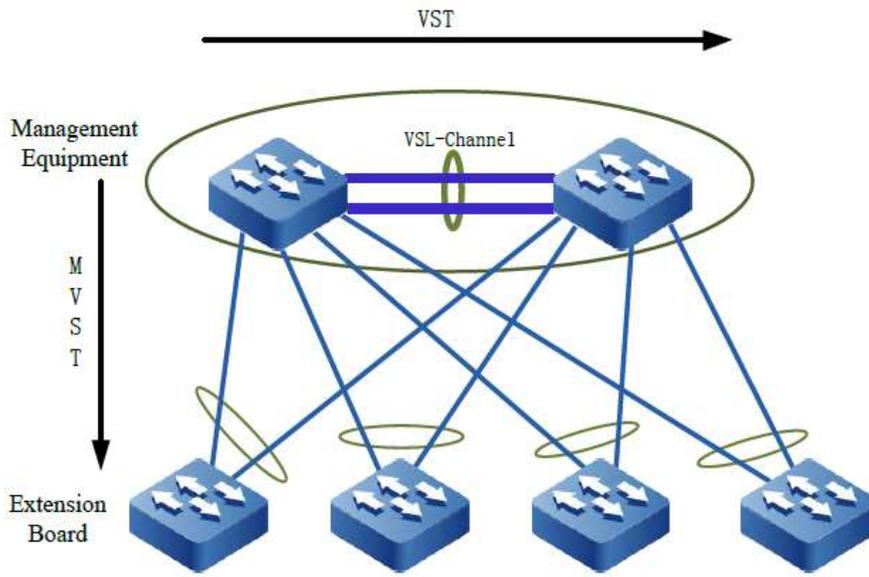

Figure 123-1 MVST Physical Network View

MVST defines three device roles depending on the different statuses and functions of devices in the LAN.

- Management device (MVST master) : responsible for configuring, managing, and monitoring all devices on the LAN.
- Extension board (MVST Slave slot): extension board for LAN that can be centrally configured and managed by the management device.
- Candidate board (MVST Candidate): not added to the MVST domain, but qualified to be extension board.

The management device in the MVST domain uses the MVST detection protocol to discover extension boards and uses the MVST topology collection protocol to collect information about each extension card in the MVST domain and draw a LAN topology. The management device adds the joined devices to the MVST domain based on the topology.

After the extension board is added to the MVST domain, users can log in to the control interface of the management device using the IP address of the management device to centrally manage the entire LAN. In addition to general configuration management, MVST technology provides the following features:

#### 1) Template-based Configuration

In application scenarios, some common basic configurations need to be applied to all extension boards in the MVST domain. You can edit these configurations to a configuration template, and then the management device issues the configuration template to the extension boards, so the extension boards are completed with the common basic configurations.

## 2) autoconfiguration

The management device backs up the startup configuration file of the extension board to the local storage medium. When the extension board is faulty and needs to be replaced with a new one, the new extension board is directly connected to the LAN through the same port without any configuration. The management device automatically sends the backup configuration file to the extension board. After the extension board is configured, the network is quickly restored.

## 3) One-click Configuration

The management device can start up Dot1x, storm control, DHCP Snooping, and Arp-check functions of all extension boards in the MVST domain by one click.

## 4) Auto upgrade

The management device prepares the IOS of the extension board in advance. When the extension board joins the MVST domain, the management device automatically detects the consistency between the current running version of the extension board and the auto upgrade version. The background performs auto upgrade in case of inconsistency. Log information is printed if the user visual interface is shown. During the upgrade process of the extension board, the user can still manage the management device or extension board to achieve both upgrade and configuration.

## 5) Password Dynamic Management

The login passwords of all extension boards in the MVST domain are dynamically generated by the management device. After the extension board successfully joins the MVST domain, the management device generates a dynamic password and sends the password to the extension board. During the operation of the extension board, if you need to log in directly through the console, the login password can only be obtained through the management device, which strengthens the security of the local area network.

## 123.2 MVST Function Configuration

Table 123-1 MVST Function Configuration List

Configuration Task	
Configure MVST basic functions	Configure the management device
	Configure extension boards
Configure MVST parameters	Configure sending interval for inspection packets
	Configure neighbor aging time

Configuration Task	
	Configure the keepalive interval of extension boards
	Configure connection status timeout for extension boards
	Configure topology parameters
Configure MVST features	Configure the upgrade function
	Configure the template function
	Configure the auto binding configuration function
	Configure personalized configuration
	Configure the device group function
	Configure the log function

### 123.2.1 Configure MVST Basic Functions

When the users need to manage devices in a certain domain through MVST technology, they can configure MVST. In the various configuration tasks of MVST, the MVST function must be enabled before other function configurations can take effect.

#### Configuration Condition

None

#### Configure the Management Device

The management device is the nerve center of MVST. It provides one management tunnel for the MVST domain, through which the administrator realizes the centralized management of the devices in the specified domain.

Table 123-2 Configuring the Management Device

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the MVST function	<b>mvst enable</b>	Mandatory By default, the MVST function is disabled
Configure the specified device as the management device for the MVST domain	<b>mvst master</b>	Mandatory By default, no management device is specified
Configure MVST domain name	<b>mvst domain-name</b> <i>domain-name</i>	Optional By default, the MVST domain name is "mvst-1"
Create MVST dedicated aggregation port	<b>mvst link-aggregation</b>	Create MVST link aggregation port
Add aggregation group members	<b>mvst interface</b> <i>interface-name join link-aggregation link-aggregation-id active</i>	Add member ports to the MVST aggregation port
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes
Enter Aggregation Group Configuration Mode	<b>Interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		effect only within the aggregation group.
Configure the downlink port to enable MVST inspection	<b>mvst inspection</b>	Mandatory By default, the port's MVST inspection function is disabled

### Configure Extension Boards

When the users want to manage a certain device through MVST, they can configure the device as an extension board of the MVST domain. The case-type device enables the MVST function, and starts up the MVST inspection function under port or link aggregation.

Table 123-3 Configuring Extension Boards

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the MVST function	<b>mvst enable</b>	Mandatory By default, the MVST function is disabled
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the
Enter Aggregation Group Configuration Mode	<b>Interface link-aggregation</b> <i>link-aggregation-id</i>	layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes

Step	Command	Description
		effect only within the aggregation group.
Configure the downlink port to enable MVST inspection	<b>mvst inspection</b>	Mandatory By default, the port's MVST inspection function is disabled

## 123.2.2 Configure MVST Parameters

### Configuration Condition

Before configuring MVST parameters, do the following for the first time:

- Configure the management device.

### Configure Sending Interval for Inspection Packets

The device that enables the MVST function periodically sends inspection packets to discover the devices connected to it, and extracts key information from the inspection packets to form its own neighbor device information table.

Table 123-4 Configuring Sending Interval for Inspection Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure sending interval for MVST inspection packets	<b>mvst inspection timer</b> <i>timer-value</i>	Mandatory By default, the interval for sending MVST inspection packets is 10 seconds

### Configure Neighbor Aging Time

The neighbor aging time refers to the survival time of the local device information on the neighbor device, enabling the neighbor device to delete the local device information after the local device survival time expires.

Table 123-5 Configuring Neighbor Aging Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the aging time of local device information in neighbor devices	<b>Mvst inspection aging-time</b> <i>aging-time-value</i>	Mandatory  By default, the aging time of local device information in neighbor devices is 30 seconds

### Configure the Keepalive Interval of Extension Boards

After the extension board joins the MVST domain, the management device and the extension board start to exchange keepalive packets. By default, keepalive packets are exchanged every 8 seconds. If the management device cannot receive 3 keepalive packets of the extension board continuously, the extension board will be transitioned from the Active (online) status to the Connect (connect) status.

Table 123-6 Configuring the Keepalive Interval of Extension Boards

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the keepalive interval of extension boards	<b>mvst handtime</b> <i>handtime-value</i>	Mandatory  By default, the keepalive interval of extension boards is 8 seconds

### Configure Connection Status Timeout for Extension Boards

If the management device receives a keepalive packet sent by the extension board within the valid time of the connection state, it will transition the extension board from the Connect status to the Active status; if it has not received the keepalive packet sent by the extension board, it transitions the extension board from the Connect status to the Disconnect status.

The management device no longer sends the keepalive packet to the extension board in the Disconnect status until it receives the keepalive packet sent by the extension board again.

Table 123-7 Configuring Connection Status Timeout for Extension Boards

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Connect status timeout for extension boards	<b>mvst holdtime</b> <i>holdtime-value</i>	Mandatory  By default, the Connect status timeout of the extension board is 80 seconds

### Configure Topology Parameters

After the MVST domain is established, the management device regularly collects the topology information of the entire MVST domain through the topology request packet. When the topology request packet spreads across the network, numerous network devices will receive the topology request packet at the same time and send topology response packets at the same time, which may cause network congestion. In order to alleviate this problem, after the management device waits for the delay time for the device to forward the topology collection request packet on each port, the second port starts to forward the topology request packet, and so on, until the last port finishes forwarding.

Table 123-8 Configuring Topology Parameters

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the topology collection period	<b>mvst topo hello-time</b> <i>hello-time-value</i>	Mandatory  By default, the topology collection period is 30 seconds.

Step	Command	Description
Configure the management device port to delay the topology collection time	<b>mvst topo port-delay-time</b> <i>port-delay-time-value</i>	Optional  By default, delay time for the management device port to collect topology is 100ms

### 123.2.3 Configure MVST Features

#### Configuration Condition

Before configuring MVST features, do the following:

- Configure MVST basic functions

#### Configure the Upgrade Function

The upgrade function refers to the management device upgrading the system image ios file or Bootloader file of the extension board.

There are two manners to upgrade the system image file or Bootloader file of the extension board:

1. Auto upgrade. When the extension board successfully joins the MVST domain, the management device automatically checks the consistency between the current running version of the extension board and the version in the auto upgrade configuration. The extension board is automatically upgraded in case of inconsistency. This upgrade manner currently only supports upgrading the IOS file for the extension board.
2. Manual upgrade. Users can upgrade the system image file or Monitor file of the extension board in real time by way of the command line according to the real-time requirements.

Table 123-9 Configuring the Upgrade Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure auto upgrade	<b>mvst auto update image { path/image-name   image-name } [ ip-address { ftp user-</b>	Mandatory

Step	Command	Description
	name user-password   tftp } [reload [write ]]reload [write ]]	By default, there is no auto upgrade configuration.
Enter the privileged user mode.	exit	-
Configure manual upgrade for extension boards	mvst update slave-slot slave-slot-id { image   bootloader } { path/filename   filename } [ ip-address { ftp user-name user- password   tftp } [ reload ]   reload ] or  mvst update device- group device-group-id { image   bootloader } { path/filename   filename } [ ip-address { ftp user-name user- password   tftp } [ reload ]   reload ]	Optional

---

### Note

- Before configuring auto upgrade, you need to make sure that the version file exists.
- 

### Configure the Template Function

The template function facilitates batch configuration management, which brings convenience to network maintenance. Users can edit the common basic configuration into one txt text file according to the network operation and maintenance requirements, the management device then issues this text file to the extension board, and the extension board completes the common basic configuration.

Table 123-10 Configuring the Template Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Specify a configuration template	<b>mvst configure template</b> <i>template-name</i>	Mandatory By default, no configuration template is specified.
Configure the management device to issue the configuration template to the extension board	<b>mvst apply configure template {service-group service-group-id   slave-slot { slave-slot-id   all } }</b>	Optional

---

### Note

- After the management device has issued the configuration template to the extension board, it should execute the command **write slave-slot** or **write device-group** to enable all extension boards to save the current configuration information to the startup configuration file.
- 

### Configure the Auto Binding Configuration Function

The management device backs up the startup configuration files of all extension boards in the MVST domain to the local storage medium through the auto binding configuration function. When the extension board needs to be replaced due to failure or other reasons, the new extension board can be automatically configured through the startup configuration file backed up.

Table 123-11 Configuring the Auto Binding Configuration Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure the port to bind to the startup configuration file	<b>mvst bind startup interface</b> <i>{interface-list   link-aggregation link-aggregation-id}</i>   <b>all</b>	Mandatory  By default, the port is not bound to the startup configuration file.

### Configure Personalized Configuration

The extension board in the MVST domain will undertake different network services due to the network environment in which they are located, so the configuration of the extension board needs to be personalized. The administrator can log in to the virtual configuration interface of the extension board through the management device to complete the configuration management for the extension board.

Table 123-12 Configuring Personalized Configuration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configuration to manage extension boards	<b>configure slave-slot</b> <i>slave-slot-id</i>	Mandatory  Log in to the virtual configuration interface of the extension board
Enter the privileged user mode.	<b>exit</b>	-
Configure the extension board to save the current configuration information to the startup configuration file	<b>write slave-slot</b> <i>slave-slot-id</i>	Optional

### Configure the Device Group Function

When all extension boards in a device group need to achieve the same function, batch configuration management can be completed by configuring the device group. The administrator can log in to the virtual configuration interface of the device group configuration prototype through the management device to complete the configuration management for the device group.

Table 123-13 Configuring the Device Group Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the device group	<b>configure device-group</b> <i>device-group-id slave-slot slave-slot-id</i>	Mandatory  The administrator logs in to the virtual configuration interface of the device group configuration prototype
Enter the privileged user mode.	<b>exit</b>	-
Configure all extension boards in the device group to save the current configuration information to the startup configuration file	<b>write device-group</b> { <i>device-group-id</i>   <b>all</b> }	Optional

### Configure the Service Group Function

When all extension boards in a service group need to achieve the same function, batch configuration management can be completed by configuring the service group, such as configuring the same configuration template. The administrator can log in to the service group interface through the management device to manage the configuration of the service group.

Table 123-14 Configuring the Service Group Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the service group	<b>Mvst service-group</b> <i>service-group-id</i>	Mandatory Create and enter the service group
Add Members	<b>In service configuration mode</b> <b>slave-slot</b> <i>slave-slot-id</i>	Mandatory Add the extension board to the service group
Specify a service group configuration template	<b>configure template</b> <i>/flash/filepath</i>	Optional Specify all next extension boards in the service group to execute the same configuration template
Enter the privileged user mode.	<b>exit</b>	-

### Configure the Log Function

The MVST log function means that the extension board sends the log information of the local device to the management device. The administrator can modify the range of log levels sent by the extension board to the management device in real time according to the requirements of the network environment.

Table 123-15 Configuring the Log Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure the log level sent by the extension board to the management device	<b>mvst slave-slot logging</b> [ <i>logging-level1</i> <i>logging-level2</i> ]	Mandatory  By default, the log level sent by the extension board to the management device is 0-5

## 123.2.4 MVST Monitoring and Maintaining

Table 123-16 MVST Monitoring and Maintaining

Command	Description
<b>show mvst auto-update config</b>	Show auto upgrade configuration information
<b>show mvst device-group</b> [ <i>device-group-id</i> ]	Show the configuration execution information of the specified device group
<b>show mvst service-group</b> [ <i>service -group-id</i> ]	Show the information of service group or specified business group
<b>show mvst inspection</b>	Show neighbor information of this device
<b>show mvst inspection opened</b>	Show the port with the MVST inspection function started up
<b>show mvst inspection queue</b>	Show MVST inspection packet-receiving queue information
<b>show mvst slave-slot</b>	Show the information of extension boards in the MVST domain

Command	Description
<b>show mvst slave-slot</b> <i>slave-slot-id</i> <b>command</b>	Show some key running information of the specified extension board
<b>show mvst slave-slot logging</b>	Show the range of log levels sent by the extension boards to the management device
<b>show mvst slave-slot password</b>	Show the login password table for the extension boards
<b>show mvst slave-slot</b> { <i>slave-slot-id</i> <b>use-info</b>   <b>use-info</b> }	Show the use information of the extension board numbers
<b>show mvst startup bind info</b>	Show port binding information
<b>show mvst statistics</b>	Show MVST packet receiving and sending statistics
<b>show mvst summary</b>	Show summary information of MVST domain
<b>show mvst topo config</b>	Show topology parameter configuration information
<b>show mvst topo information</b> [ <b>slave-slot</b> <i>slave-slot-id</i> ]	Show topology information
<b>show mvst tunnel</b>	Show the information of the tunnel between the management device and the extension boards in the MVST domain
<b>show mvst upgrade-information</b> { <b>device-group</b> <i>device-group-id</i>   <b>slave-slot</b> { <b>all</b>   <i>slave-slot-id</i> } }	Show the upgrade status information of the extension board
<b>show mvst write-information</b> <b>device-group</b> { { <i>device-group-id</i>   <b>all</b> }   <b>slave-slot</b> <i>slave-slot-id</i> }	Show the status information of the extension board about saving the current configuration

Command	Description
<b>show running-config slave-slot</b> <i>slave-slot-id</i>	Show configuration information of the current configuration of the extension board
<b>show startup-config slave-slot</b> <i>slave-slot-id</i>	Show the content of the startup configuration file of the extension board

## 123.3 Typical Configuration Example of MVST

### 123.3.1 Configure Auto Upgrade Inspection

#### Network Requirements

- Device1 and Device2 form a stack system as MVST management device, Device3, Device4, and Device5 are used as extension boards, and the last two ports of the extension boards are connected to the MVST management device;
- The management device configures auto upgrade inspection. When Device3, Device4, and Device5 are added as extension boards to the MVST domain, the extension boards can be automatically upgraded.

#### Network Topology

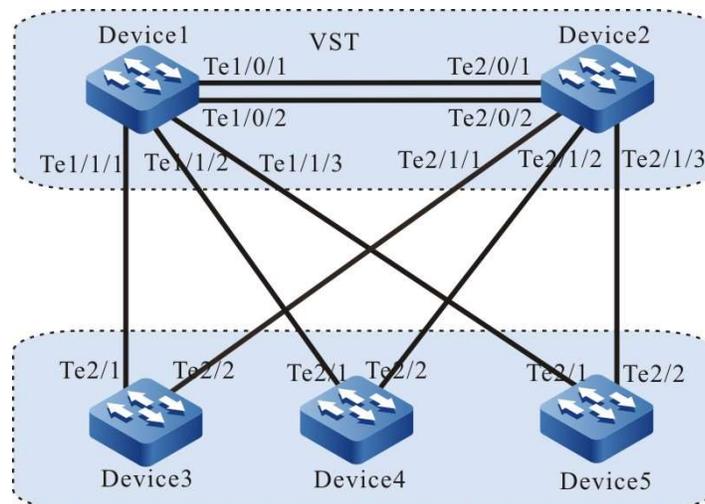

Figure 123-2 Configuring Auto Upgrade Inspection

#### Configuration Steps

Step 1: Configure the VST system.

**#On Device1, configure the virtual switch member device ID as 1, and configure the domain ID as 10 and the priority as 255.**

```
Device1#configure terminal
Device1(config)#switch virtual member 1
Do you want to modify member id(Yes|No)?y
% Member ID 1 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#priority 255
Device1(config-vst-member-1)#exit
```

**#On Device1, create virtual switch link interface 1, and add ports tengigabitethernet0/1 and tengigabitethernet0/2 to the virtual switch link interface 1.**

```
Device1(config)#vsl-channel 1
Device1(config-vsl-channel-1)#exit
Device1(config)#interface tengigabitethernet 0/1
Device1(config-if-tengigabitethernet0/1)#vsl-channel 1 mode on
Device1(config-if-tengigabitethernet0/1)#exit
Device1(config)#interface tengigabitethernet 0/2
Device1(config-if-tengigabitethernet0/2)#vsl-channel 1 mode on
Device1(config-if-tengigabitethernet0/2)#exit
```

**#Save the configuration on Device1.**

```
Device1#write
Are you sure to overwrite /flash/startup (Yes|No)?y
Building Configuration...done
Write to startup file ... OK
Write to mode file... OK
```

**#On Device2, configure the virtual switch member device ID as 1, and configure the domain ID as 10 and the priority as 200.**

```
Device2#configure terminal
Device2(config)#switch virtual member 2
Do you want to modify member id(Yes|No)?y
% Member ID 2 config will take effect only after the exec command 'switch mode virtual' is issued
Device2(config-vst-member-2)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device2(config-vst-member-2)#priority 200
Device2(config-vst-member-2)#exit
```

**#On Device2, create virtual switch link interface 1, and add ports tengigabitethernet1/1 to the virtual switch link interface 1.**

```
Device2(config)#vsl-channel 1
Device2(config-vsl-channel-1)#exit
Device2(config)#interface tengigabitethernet 0/1
Device2(config-if-tengigabitethernet0/1)#vsl-channel 1 mode on
Device2(config-if-tengigabitethernet0/1)#exit
Device2(config)#interface tengigabitethernet 0/2
Device2(config-if-tengigabitethernet0/2)#vsl-channel 1 mode on
Device2(config-if-tengigabitethernet0/2)#exit
```

**#Save the configuration on Device2.**

```
Device2#write
Are you sure to overwrite /flash/startup (Yes|No)?y
Building Configuration...done
Write to startup file ... OK
Write to mode file... OK
```

**#Configure Device1 to run in the stack mode.**

```
Device1#switch mode virtual
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
Converting interface names Building configuration...
Copying the startup configuration to backup file named "startup-backupalone"...
Please wait...system reloading is in progress!
ok
Reset system!
%SYS-5-RELOAD: Reload requested
```

**#Configure Device2 to run in the stack mode.**

```
Device2#switch mode virtual
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
Converting interface names Building configuration...
Copying the startup configuration to backup file named "startup-backupalone"...
Please wait...system reloading is in progress!
ok
Reset system!
%SYS-5-RELOAD: Reload requested
```

**#After reboot. Check on Device1, chain stack system has been formed, and Device1 is the master control device of the stack system.**

```
Device1#show switch virtual
Codes: L - local-device,I - isolate-device

Virtual Switch Mode      : VIRTUAL
Virtual Switch DomainId  : 10
Virtual Switch mac-address : 0001.7a6a.0255
```

```
----- VST MEMBER INFORMATION -----
CODE MemberID Role  Pri LocalVsl  RemoteVsl
-----
L  1    Master 255 vsl-channel 1/1  vsl-channel 2/1
    2    Member 200 vsl-channel 2/1  vsl-channel 1/1
```

**Step 2: Configure the basic functions of MVST.**

**#Configure the stack system as MVST management device on Device1.**

```
Device1(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device1(config)#mvst master
Device1(config)#mvst domain-name test
```

**#Configure stack system link aggregation on Device1 and start up MVST inspection.**

```
Device1(config)#mvst link-aggregation 1 mode lacp
Device1(config)# mvst interface tengigabitethernet 1/1/1,2/1/1 join link-aggregation 1 active
Device1(config)#interface link-aggregation 1
Device1(config-link-aggregation1)#mvst inspection
Device1(config-link-aggregation1)#exit
Device1(config)#mvst link-aggregation 2 mode lacp
Device1(config)# mvst interface tengigabitethernet 1/1/2,2/1/2 join link-aggregation 2 active
Device1(config)#interface link-aggregation 2
Device1(config-link-aggregation2)#mvst inspection
Device1(config-link-aggregation2)#exit
Device1(config)#mvst link-aggregation 3 mode lacp
Device1(config)# mvst interface tengigabitethernet 1/1/3,2/1/3 join link-aggregation 3 active
Device1(config)#interface link-aggregation 3
Device1(config-link-aggregation3)#mvst inspection
Device1(config-link-aggregation3)#exit
```

**#Enable MVST function on Device3.**

```
Device3#configure terminal
```

```
Device3#configure terminal
Device3(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device3Device3(config)#mvst link-aggregation 1 mode lacp
Device3(config)# mvst interface tengigabitethernet 2/1,2/2 join link-aggregation 1 active
Device3(config)#interface link-aggregation 1
Device3(config-link-aggregation1)#mvst inspection
Device3(config-link-aggregation1)#exit

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 1 successfully.
```

#### **#Enable MVST function on Device4.**

```
Device4#configure terminal
Device4(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device4(config)#mvst link-aggregation 2 mode lacp
Device4(config)# mvst interface tengigabitethernet 2/1,2/2 join link-aggregation 2 active
Device4(config)#interface link-aggregation 2
Device4(config-link-aggregation2)#mvst inspection
Device4(config-link-aggregation2)#exit

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 2 successfully.
```

#### **#Enable MVST function on Device5.**

```
Device5#configure terminal
Device5(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device5(config)#mvst link-aggregation 3 mode lacp
Device5(config)# mvst interface tengigabitethernet 2/1,2/2 join link-aggregation 3 active
Device5(config)#interface link-aggregation 3
Device5(config-link-aggregation3)#mvst inspection
Device5(config-link-aggregation3)#exit

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 3 successfully.
```

Step 3: Configure auto upgrade inspection.

#### **#Configure auto upgrade inspection on Device1, specify the version of the extension board to be upgraded, and add clear, reload, and write parameters.**

```
Device1(config)# mvst auto update image /flash/sp26-g-9.66.0.11(R).pck reload write
```

#### **#Check the configuration result on Device1.**

## Device1(config)# show mvst auto-update config

OPTION Codes:

- R -- Reload slave slot when update slave slot successfully
- W -- Save slave slot current configuration to startup-config

ID	OPTION	IMAGE-NAME	IMAGE-PATH
1	None	sp25-g-9.6.1.1(R).pck	/flash/sp25-g-9.6.1.1(R).pck
2	R	sp23-g-9.6.1.1(R).pck	/flash/sp23-g-9.6.1.1(R).pck
3	RW	sp26-g-9.6.0.1(R).pck	/flash/sp26-g-9.6.0.1(R).pck

Step 4: connect the extension boards Device3, Device4, and Device5 to the MVST domain, and allow auto upgrade if the inspected current version of Device3 is inconsistent with the version to be upgraded. Skip auto upgrade if the inspected versions of Device4 and Device5 are inconsistent.

#Connect Device3, Device4, and Device5 to the MVST domain in turn, and after the devices are connected, check the MVST result on Device1.

#Check the MVST result on Device1, you can see that Device3, Device4, and Device5 are added to the MVST domain in the form of extension boards. The slots are Slave-slot0, Slave-slot1, and Slave-slot2, and their host names change to switch-ss0, switch-ss1, switch-ss2.

Device1#show mvst topo information

role	domain-name	interface	mac	device-type	host-name
Slave-slot	test	link-aggregation 1	0001.7a63.bd76	NSS4330-56TXF(V1)	switch-ss0
Slave-slot	test	link-aggregation 2	0001.7a64.72aa	NSS4330-56TXF(V1)	switch-ss1
Slave-slot	test	link-aggregation 3	0001.7a63.bd43	NSS4330-56TXF(V1)	switch-ss2
Master	test		0001.7a6a.0258	NSS5810-50TXFP(V1)	Device1

#On Device1, you can check the upgrade status of the extension board in real time. Device3 is in the upgrade status. After Device3 is successfully upgraded, restart it. Device4 and Device5 are not upgraded.

Device1#show mvst upgrade-information slave-slot all

Slave slot upgrade information:

ss-id	upgrade-type	upgrade-status	start-time	over-time	hostname
-------	--------------	----------------	------------	-----------	----------

```

0 image downloading JAN/27/2015 14:58:24 switch-ss0
1 none none switch-ss1
2 none none switch-ss2

```

#Device3 is upgraded successfully. Save the configuration and reboot.

Device1#

%MVST-UPDATE\_NOTIFY-5: Update slave slot 0 image successfully.

%MVST-WRITE\_RESULT-5: The slave slot 0 write to startup file successfully.

%MVST-NOTIFY\_RELOAD-3: Slave slot 0 mpu is going to reload.

### 123.3.2 Configure Auto Issue of Common Template

#### Network Requirements

- Device1 and Device2 form a stack system as MVST management device, Device3, Device4, and Device5 are used as extension boards, and the last two ports of the extension boards are connected to the MVST management device;
- Configure Device3 as a template switch and use its configuration as a common template configuration. When Device4 and Device5 are connected to the MVST domain, the configuration template will be automatically issued;
- Change the configuration of Device3, recollect it as a common configuration template, and force it to be issued to Device4 and Device5.

#### Network Topology

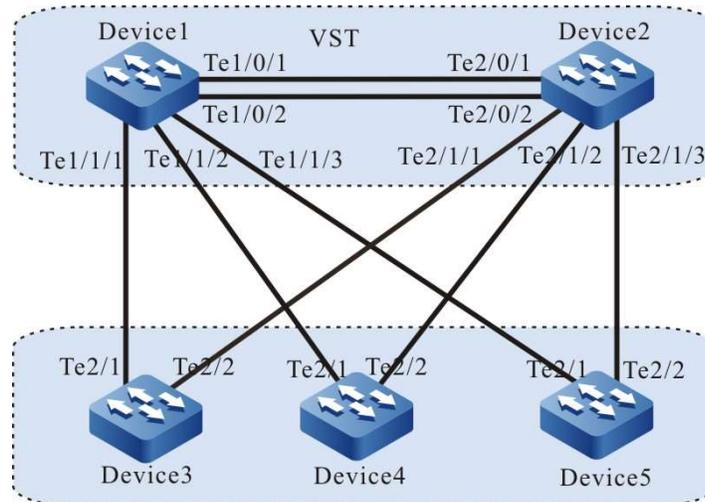

Figure 123-3 Configuring Auto Issue of Common Template

#### Configuration Steps

Step 1: Configure the VST system.

**#On Device1, configure the virtual switch member device ID as 1, and configure the domain ID as 10 and the priority as 255.**

```
Device1#configure terminal
Device1(config)#switch virtual member 1
Do you want to modify member id(Yes|No)?y
% Member ID 1 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#priority 255
Device1(config-vst-member-1)#exit
```

**#On Device1, create virtual switch link interface 1, and add ports tengigabitethernet0/1 and tengigabitethernet0/2 to the virtual switch link interface 1.**

```
Device1(config)#vsl-channel 1
Device1(config-vsl-channel-1)#exit
Device1(config)#interface tengigabitethernet 0/1
Device1(config-if-tengigabitethernet0/1)#vsl-channel 1 mode on
Device1(config-if-tengigabitethernet0/1)#exit
Device1(config)#interface tengigabitethernet 0/2
Device1(config-if-tengigabitethernet0/2)#vsl-channel 1 mode on
Device1(config-if-tengigabitethernet0/2)#exit
```

**#Save the configuration on Device1.**

```
Device1#write
Are you sure to overwrite /flash/startup (Yes|No)?y
Building Configuration...done
Write to startup file ... OK
Write to mode file... OK
```

**#On Device2, configure the virtual switch member device ID as 1, and configure the domain ID as 10 and the priority as 200.**

```
Device2#configure terminal
Device2(config)#switch virtual member 2
Do you want to modify member id(Yes|No)?y
% Member ID 2 config will take effect only after the exec command 'switch mode virtual' is issued
Device2(config-vst-member-2)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device2(config-vst-member-2)#priority 200
Device2(config-vst-member-2)#exit
```

**#On Device2, create virtual switch link interface 1, and add ports tengigabitethernet1/1 to the virtual switch link interface 1.**

```
Device2(config)#vsl-channel 1
Device2(config-vsl-channel-1)#exit
Device2(config)#interface tentengigabitethernet 0/1
Device2(config-if-tentengigabitethernet0/1)#vsl-channel 1 mode on
Device2(config-if-tentengigabitethernet0/1)#exit
Device2(config)#interface tentengigabitethernet 0/2
Device2(config-if-tentengigabitethernet0/2)#vsl-channel 1 mode on
Device2(config-if-tentengigabitethernet0/2)#exit
```

### **#Save the configuration on Device2.**

```
Device2#write
Are you sure to overwrite /flash/startup (Yes|No)?y
Building Configuration...done
Write to startup file ... OK
Write to mode file... OK
```

### **#Configure Device1 to run in the stack mode.**

```
Device1#switch mode virtual
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
Converting interface names Building configuration...
Copying the startup configuration to backup file named "startup-backupalone"...
Please wait...system reloading is in progress!
ok
Reset system!
%SYS-5-RELOAD: Reload requested
```

### **#Configure Device2 to run in the stack mode.**

```
Device2#switch mode virtual
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
Converting interface names Building configuration...
Copying the startup configuration to backup file named "startup-backupalone"...
Please wait...system reloading is in progress!
ok
Reset system!
%SYS-5-RELOAD: Reload requested
```

**#Check on Device1, chain stack system has been formed, and Device1 is the master control device of the stack system.**

```
Device1#show switch virtual
```

Codes: L - local-device,I - isolate-device

Virtual Switch Mode : VIRTUAL  
Virtual Switch DomainId : 10  
Virtual Switch mac-address : 0001.7a6a.0255

----- VST MEMBER INFORMATION -----

CODE MemberID Role Pri LocalVsl RemoteVsl

-----  
L 1 Master 255 vsl-channel 1/1 vsl-channel 2/1  
2 Member 200 vsl-channel 2/1 vsl-channel 1/1

Step 2: Configure the basic functions of MVST.

**#Configure the stack system as an MVST management device.**

```
Device1(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device1(config)#mvst master
Device1(config)#mvst domain-name test
```

**#Configure stack system link aggregation and start up MVST inspection.**

```
Device1(config)#mvst link-aggregation 1 mode lacp

Device4(config-link-aggregation2)#mvst inspection
Device4(config-link-aggregation2)#exit

```

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 2 successfully.

#### #Enable MVST function on Device5.

```

Device5#configure terminal
Device5(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device5(config)#mvst link-aggregation 3 mode lacp
Device5(config)# mvst interface tengigabitethernet 2/1,2/2 join link-aggregation 3 active
Device5(config)#interface link-aggregation 3
Device5(config-link-aggregation3)#mvst inspection
Device5(config-link-aggregation3)#exit

```

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 3 successfully.

#Add Device3 as an extension board to the MVST domain, and check the MVST result on Device1 after the device is added.

#Check the MVST result on Device1, you can see that Device3 joins the MVST domain in the form of an extension board, its slot is Slave-slot 0, and its host name changes to switch-ss0.

```

Device1#show mvst topo information

```

```

-----
role    domain-name  interface  mac      device-type  host-name

```

---

```
Slave-slot test    link-aggregation 1 0001.7a63.bd76 NSS4330-56TXF(V1) switch-ss0
Master test       0001.7a6a.0258 NSS5810-50TXFP(V1) Device1
```

Step 3: Use Device3 as a template switch and collect the common configuration template.

### #Configure Device3.

```
Device1(config)#configure slave-slot 0
switch-ss0(config)#snmp-server host 1.1.1.1
switch-ss0(config)#snmp-server start
%SNMP-WARMSTART-5 SNMP agent on host switch-ss0 is undergoing a warm start
switch-ss0(config)#snmp-server enable traps vlan
switch-ss0(config)#link-aggregation 1
switch-ss0(config-link-aggregation1)#description management link
switch-ss0(config-link-aggregation1)#exit
switch-ss0(config)#vlan 100,200,300
```

### #Check the configuration of the extension board Device3 on Device1.

```
Device1#show running-config slave-slot 0
hostname switch-ss0

vlan 100,200,300
link-aggregation 1
description management link
no spanning-tree enable
mvst inspection
exit

snmp-server start
snmp-server view default 1.2 include
snmp-server view default 1.0.8802 include
snmp-server view default 1.1.2 include
snmp-server view default 1.3.111 include
snmp-server view default 1.3.6.1 include
snmp-server community public view default ro
snmp-server enable traps vlan
snmp-server host 1.1.1.1 traps community public version 2
```

### #Save the configuration of Device3 on Device1.

```
Device1#write slave-slot 0
Are you sure to overwrite slave slot 0 /flash/startup (Yes|No)?y
Device1#
```

Jan 9 2015 16:32:34: %MVST-WRITE\_RESULT-5: The slave slot 0 write to startup file successfully.

Step 4: Automatically issue the configuration of Device3 as a common configuration template.

**#Configure common configuration auto issue on Device1**

```
Device1(config)#mvst configure template slave-slot 0
Are you sure to overwrite configure template /flash/mvst-template (Yes|No)?y
Get the slave slot 0 startup-config...OK
Write to /flash/mvst-template ....OK.
Device1(config)#
```

Step 5: Add the extension board to the MVST domain to automatically load the configuration template.

**#Connect the extension boards Device4 and Device5 to the MVST domain, you can see on Device1 the print information automatically issued by the configuration template.**

```
Device1#
%MVST-Slave_slot_add-5:Slave slot 1 add to the MVST
%MVST-Slave_slot_add-5:Slave slot 2 add to the MVST.
%MVST-EXECUTE_COFNIG-5:Slave slot 1 is going to execute configure template /flash/mvst-template.
%MVST-EXECUTE_COFNIG-5:Slave slot 1 execute configure file successfully!
%MVST-EXECUTE_COFNIG-5:Slave slot 2 is going to execute configure template /flash/mvst-template.
%MVST-EXECUTE_COFNIG-5:Slave slot 2 execute configure file successfully!
```

**#Check the MVST result on Device1. By default, the host names of Device4 and Device5 have the suffixes ss1 and ss2 added as switch-ss1 and switch-ss2 respectively.**

```
Device1#show mvst topo information
```

```
-----
role    domain-name  interface    mac          device-type  host-name

snmp-server host 1.1.1.1 traps community public version 2
```

**Step 6: Forcibly issue the common configuration template.**

**#Modify the configuration of Device3 and add ACL configuration.**

```
Device1(config)#configure slave-slot 0
switch-ss0(config)#ip access-list extended test
```

```
switch-ss0(config-ext-nacl)#permit ip 192.168.0.1 0.0.0.255 any
switch-ss0(config-ext-nacl)#permit ip any any
switch-ss0(config-ext-nacl)#exit
switch-ss0(config)#end
switch-ss0#show access-list
ip access-list extended test
10 permit ip 192.168.0.0 0.0.0.255 any
20 permit ip any any
```

#### #Save the configuration of Device3 on Device1.

```
Device1#write slave-slot 0
Are you sure to overwrite slave slot 0 /flash/startup (Yes|No)?y
Device1#
%MVST-WRITE_RESULT-5: The slave slot 0 write to startup file successfully.
%MVST-COLLECT_STARTUP-5: Collect slave slot 0 startup begin.
%MVST-COLLECT_STARTUP-5: Collect slave slot 0 startup OK.
```

#### #Recollect startup of Device3 on Device1 as a new common configuration template.

```
Device1(config)#mvst configure template slave-slot 0
Are you sure to overwrite configure template /flash/mvst-template (Yes|No)?y
Get the slave slot 0 startup-config...OK
Write to /flash/mvst-template ....OK.
```

#### #Forcibly issue the common configuration template on Device1 to Device4. Information for successful issue is displayed.

```
Device1(config)#mvst apply configure template slave-slot 1
%MVST-EXECUTE_COFNIG-5: Slave slot 1 is going to execute configure template /flash/ mvst-template
%MVST-EXECUTE_COFNIG-5: Slave slot 1 execute configure file successfully!
```

#### #Check that the configuration of Device4 contains the latest ACL configuration.

```
Device1(config)#configure slave-slot 1
switch-ss1#show access-list
ip access-list extended test
10 permit ip 192.168.0.0 0.0.0.255 any
20 permit ip any any
```

### 123.3.3 Configure Auto Issue of Binding Configuration

#### Network Requirements

- Device1 and Device2 form a stack system as MVST management device, Device3, Device4, and Device5 are used as extension boards, and the last two ports of the extension boards

are connected to the MVST management device;

- Perform differentiated configuration for Device3, Device4, and Device5, and bind configurations of the extension boards corresponding to link aggregation 1, link aggregation 2, and link aggregation 3 to the MVST management device;
- Simulating replacement with a brand new device Device6 after the failure of Device3, with the MVST management device capable of automatically issuing the previously collected configuration of Device3.
- Simulating that when link aggregation 1 of the MVST management device fails, link aggregation 4 needs to be created, and the configuration of Device3 bound to link aggregation group 1 is transitioned to link aggregation 4.

### Network Topology

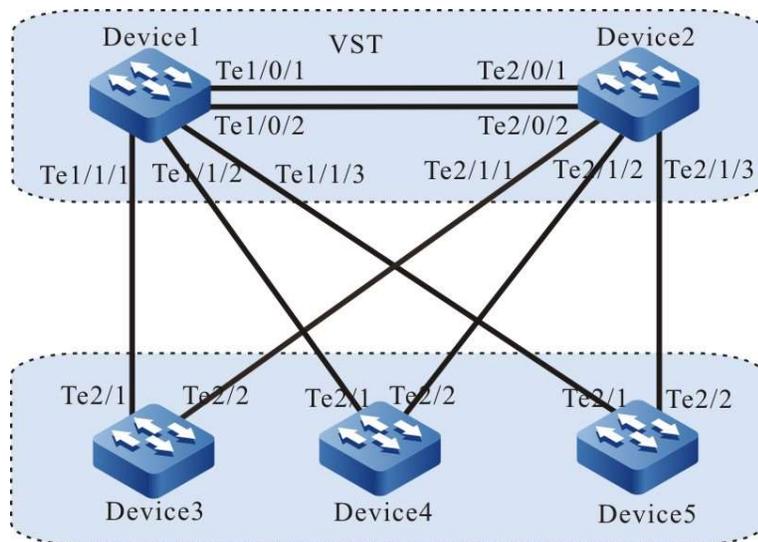

Figure 123-4 Configuring Auto Issue of Binding Configuration

### Configuration Steps

Step 1: Configure the VST system.

#On Device1, configure the virtual switch member device ID as 1, and configure the domain ID as 10 and the priority as 255.

```
Device1#configure terminal
Device1(config)#switch virtual member 1
Do you want to modify member id(Yes|No)?y
% Member ID 1 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device1(config-vst-member-1)#priority 255
Device1(config-vst-member-1)#exit
```

**#On Device1, create virtual switch link interface 1, and add ports tengigabitethernet0/1 and tengigabitethernet0/2 to the virtual switch link interface 1.**

```
Device1(config)#vsl-channel 1
Device1(config-vsl-channel-1)#exit
Device1(config)#interface tengigabitethernet 0/1
Device1(config-if-tengigabitethernet0/1)#vsl-channel 1 mode on
Device1(config-if-tengigabitethernet0/1)#exit
Device1(config)#interface tengigabitethernet 0/2
Device1(config-if-tengigabitethernet0/2)#vsl-channel 1 mode on
Device1(config-if-tengigabitethernet0/2)#exit
```

**#Save the configuration on Device1.**

```
Device1#write
Are you sure to overwrite /flash/startup (Yes|No)?y
Building Configuration...done
Write to startup file ... OK
Write to mode file... OK
```

**#On Device2, configure the virtual switch member device ID as 1, and configure the domain ID as 10 and the priority as 200.**

```
Device2#configure terminal
Device2(config)#switch virtual member 2
Do you want to modify member id(Yes|No)?y
% Member ID 2 config will take effect only after the exec command 'switch mode virtual' is issued
Device2(config-vst-member-2)#domain 10
% Domain ID 10 config will take effect only after the exec command 'switch mode virtual' is issued
Device2(config-vst-member-2)#priority 200
Device2(config-vst-member-2)#exit
```

**#On Device2, create virtual switch link interface 1, and add ports tengigabitethernet1/1 to the virtual switch link interface 1.**

```
Device2(config)#vsl-channel 1
Device2(config-vsl-channel-1)#exit
Device2(config)#interface tengigabitethernet 0/1
Device2(config-if-tengigabitethernet0/1)#vsl-channel 1 mode on
Device2(config-if-tengigabitethernet0/1)#exit
Device2(config)#interface tengigabitethernet 0/2
Device2(config-if-tengigabitethernet0/2)#vsl-channel 1 mode on
Device2(config-if-tengigabitethernet0/2)#exit
```

**#Save the configuration on Device2.**

```
Device2#write
Are you sure to overwrite /flash/startup (Yes|No)?y
Building Configuration...done
Write to startup file ... OK
Write to mode file... OK
```

**#Configure Device1 to run in the stack mode.**

```
Device1#switch mode virtual
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
Converting interface names Building configuration...
Copying the startup configuration to backup file named "startup-backupalone"...
Please wait...system reloading is in progress!
ok
Reset system!
%SYS-5-RELOAD: Reload requested
```

**#Configure Device2 to run in the stack mode.**

```
Device2#switch mode virtual
This command will convert all interface names to naming convention "interface-type member-number/slot/interface" ,
Please make sure to save current configuration.Do you want to proceed? (yes|no)?y
Converting interface names Building configuration...
Copying the startup configuration to backup file named "startup-backupalone"...
Please wait...system reloading is in progress!
ok
Reset system!
%SYS-5-RELOAD: Reload requested
```

**#Check on Device1, chain stack system has been formed, and Device1 is the master control device of the stack system.**

```
Device1#show switch virtual
Codes: L - local-device,I - isolate-device
```

```
Virtual Switch Mode      : VIRTUAL
Virtual Switch DomainId  : 10
Virtual Switch mac-address : 0001.7a6a.0255
```

```
----- VST MEMBER INFORMATION -----
```

CODE	MemberID	Role	Pri	LocalVsl	RemoteVsl
L	1	Master	255	vsl-channel 1/1	vsl-channel 2/1
	2	Member	200	vsl-channel 2/1	vsl-channel 1/1

Step 2: Configure the basic functions of MVST.

**#Configure the stack system as an MVST management device.**

```
Device1(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device1(config)#mvst master
Device1(config)#mvst domain-name test
```

**#Configure stack system link aggregation and start up MVST inspection.**

```
Device1(config)#mvst link-aggregation 1 mode lacp
Device1(config)# mvst interface tengigabitethernet 1/1/1,2/1/1 join link-aggregation 1 active
Device1(config)#interface link-aggregation 1
Device1(config-link-aggregation1)#mvst inspection
Device1(config-link-aggregation1)#exit
Device1(config)#mvst link-aggregation 2 mode lacp
Device1(config)# mvst interface tengigabitethernet 1/1/2,2/1/2 join link-aggregation 2 active
Device1(config)#interface link-aggregation 2
Device1(config-link-aggregation2)#mvst inspection
Device1(config-link-aggregation2)#exit
Device1(config)#mvst link-aggregation 3 mode lacp
Device1(config)# mvst interface tengigabitethernet 1/1/3,2/1/3 join link-aggregation 3 active
Device1(config)#interface link-aggregation 3
Device1(config-link-aggregation3)#mvst inspection
Device1(config-link-aggregation3)#exit
```

**#Enable MVST function on Device3.**

```
Device3#configure terminal
Device3#configure terminal
Device3(config)#mvst enable
%MVST-NOTIFY-5: MVST is enabled !
Device3(config)#mvst link-aggregation 1 mode lacp
Device3(config)# mvst interface tengigabitethernet 2/1,2/2 join link-aggregation 1 active
Device3(config)#interface link-aggregation 1
Device3(config-link-aggregation1)#mvst inspection
Device3(config-link-aggregation1)#exit
```

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 1 successfully.

**#Enable MVST function on Device4.**

```
Device4#configure terminal
Device4(config)#mvst enable
```

%MVST-NOTIFY-5: MVST is enabled !

Device4(config)#mvst link-aggregation 2 mode lacp

Device4(config)# mvst interface tengigabitethernet 2/1,2/2 join link-aggregation 2 active

Device4(config)#interface link-aggregation 2

Device4(config-link-aggregation2)#mvst inspection

Device4(config-link-aggregation2)#exit

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 2 successfully.

#### #Enable MVST function on Device5.

Device5#configure terminal

Device5(config)#mvst enable

%MVST-NOTIFY-5: MVST is enabled !

Device5(config)#mvst link-aggregation 3 mode lacp

Device5(config)# mvst interface tengigabitethernet 2/1,2/2 join link-aggregation 3 active

Device5(config)#interface link-aggregation 3

Device5(config-link-aggregation3)#mvst inspection

Device5(config-link-aggregation3)#exit

%MVST-NOTIFY-5: interface tengigabitethernet2/1 and interface tengigabitethernet2/2 join link-aggregation 3 successfully.

#### #Connect Device3, Device4, and Device5 to the MVST domain in turn, and check the MVST result after the devices are connected.

#Check the MVST result on Device1, you can see that Device3, Device4, and Device5 are added to the MVST domain in the form of extension boards. The slots are Slave-slot0, Slave-slot1, and Slave-slot2, and their host names change to switch-ss0, switch-ss1, switch-ss2.

Device1#show mvst topo information

```
-----  
role  domain-name  interface  mac          device-type  host-name  
-----  
Slave-slot test    link-aggregation 1  0001.7a63.bd76  NSS4330-56TXF(V1)  switch-ss0  
Slave-slot test    link-aggregation 2  0001.7a64.72aa  NSS4330-56TXF(V1)  switch-ss1  
Slave-slot test    link-aggregation 3  0001.7a63.bd43  NSS4330-56TXF(V1)  switch-ss2  
Master   test                0001.7a6a.0258  NSS5810-50TXFP(V1)  Device1
```

Step 3: Configure the function of auto issue of binding configuration.

#### #Perform differentiated configuration on Device3, Device4, and Device5.

Device1(config)#configure slave-slot 0

switch-ss0(config)#vlan 100

```
switch-ss0(config)#exit
switch-ss0#exit
switch-ss0>exit
Device1(config)#configure slave-slot 1
switch-ss1(config)#vlan 200
switch-ss1(config)#exit
switch-ss1#exit
switch-ss1>exit
Device1(config)#configure slave-slot 2
switch-ss2(config)#vlan 300
switch-ss2(config)#exit
switch-ss2#exit
switch-ss2>exit
```

### **#Save the configurations of Device3, Device4, and Device5 on Device1.**

```
Device1#write slave-slot 0
Are you sure to overwrite slave slot 0 /flash/startup (Yes|No)?y
Device1#
Jan 9 2015 16:32:34: %MVST-WRITE_RESULT-5: The slave slot 0 write to startup file successfully.

---

## 124.1 Overview

VD (Virtual Device) is virtual device technology, which is a complete 1:N virtualization technology (the virtualization technology includes two types: N:1 virtualization means that multiple physical devices are virtualized into one logical device; 1:N virtualization means that one physical device is virtualized into multiple logical devices). From the software point of view, it completely virtualizes the data plane, control plane, and management plane of the network operating system. Each user mode process starts and runs independently in the VD. Although every VD shares one kernel, the data between the VDs in the kernel is also separate. In terms of hardware, not only monoboard is used as independent logical device, but also the storage space occupied

by each VD, the available CPU and other resources are also divided. VD is made very close to a single physical device. VD has complete device functions, independent software environment and data, and independent hardware resources. One VD can even be rebooted alone like one physical device without affecting the normal running of other VDs on the physical device.

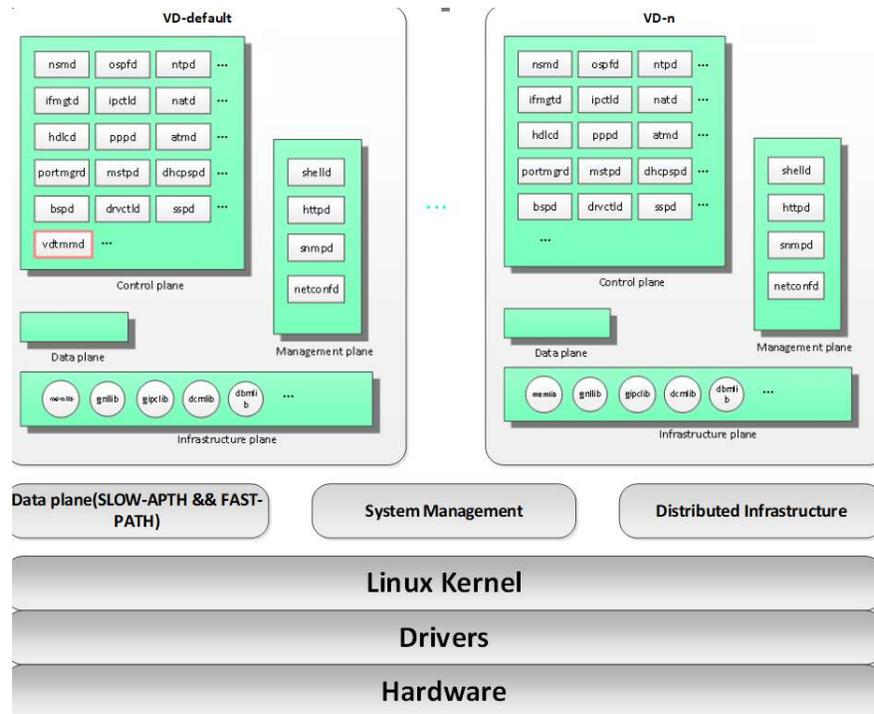

Figure 123-17 Frame Diagram of VD Technology

## 124.2 VD Function Configuration

### 124.2.1 Configure VD

By default, the device has a built-in default virtual machine VDO, called default virtual machine (host machine). All board resources belong to VDO by default, and VDO cannot be created or deleted.

#### Configuration Condition

None

#### Configure VD

VD is an entity run by a service unit and needs to be created manually.

Table 123-18 Configuring VD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create VD	<b>virtual-device</b> <i>vd-id</i>	Mandatory By default, VD0 is created by default
Assign Lpu board resources	<b>assign lpu</b> <i>&lt;slotId&gt;</i>	Mandatory By default, the manually created VD does not contain any LPU board resources
Configure the upper limit of VD memory	<b>resource memory upper-limit-in-mega</b> <i>number</i>	Optional By default, 660M memory is assigned for each VD
Configure description information	<b>description</b> <i>string</i>	Optional By default, there is no description information
Start VD	<b>virtual-device start</b>	Mandatory By default, VD is not started

### 124.2.2 Log in to VD

After VD is configured, you can log in to VD to perform service configuration. To log in to VD, you must ensure that VD has been started.

#### Configuration Condition

None

#### Log in to VD

When VD is activated, VD will start, and you can log in to VD after the start is complete

Table 123-19 Logging in to VD

Step	Command	Description
Enter the privilege configuration mode	<b>enable</b>	-
Log in to VD	<b>switch to virtual-device <i>vd- id</i> [force]</b>	Mandatory Force means mandatory login. When someone else occupies the serial port of this VD, use compulsory means.

### 124.2.3VD Monitoring and Maintaining

Table 123-20 VD Monitoring and Maintaining

Command	Description
<b>show virtual-device summary</b>	Show summary information of all VDs
<b>show virtual-device verbose [vd- id ]</b>	Show detailed information of the specified VD or all VDs
<b>show system virtual-device lpu list</b>	Show information about lpu in place in VD
<b>show virtual-device <i>vd-id</i> console log</b>	Show log information of the specified VD

## 124.3 Typical Configuration Example of VD

### Networking Requirements

- Isolate user groups, and divide different user groups into different virtual devices to realize network service flow isolation and fault isolation, and ensure reliability and safety requirements.

- As shown in Figure 123-5, the office area and the production area are divided to different VDTs according to service parts.

### Network Topology

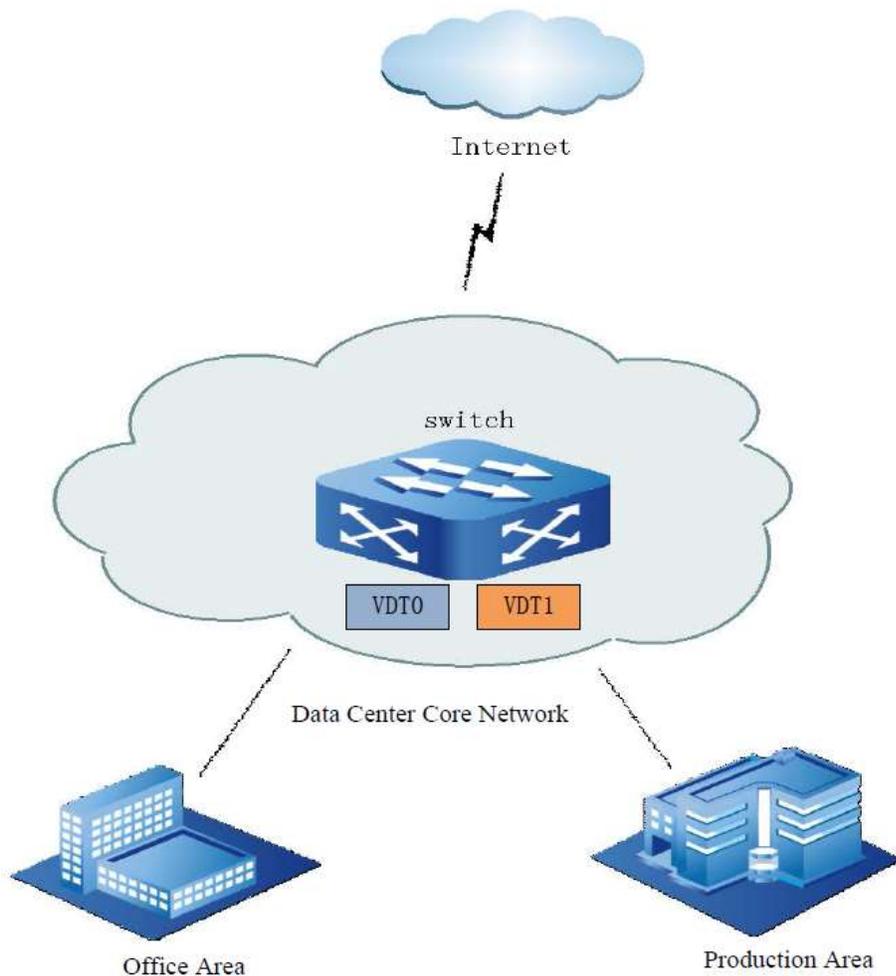

Figure 123-6 : VDT Network Topology

### Configuration Steps

Step 1: Configure VDT

#Create virtual machine vdt1 on Switch, assign LPU6 to vdt1, and activate the virtual machine

switch#conf terminal

```
switch(config)#virtual-device vdt1
switch(config-vd-1)#assign lpu 6
Please save the configuration after executing the allocation command!
This LPU will be assigned, are you sure?(yes/no)y
switch(config-vd-1)#description vdt1
switch(config-vd-1)#virtual-device start
start:ok.
switch(config-vd-1)#exit
switch(config)#
```

Step 2:        Log in to VDT.

#Log in to the corresponding virtual machine configuration service, with service configuration omitted.

```
switch#switch to virtual-device vdt1
vdt1>enable
vdt1#
```

# 125 TRILL

---

## 125.1 Overview

TRILL (TRansparent Interconnection of Lots of Links) uses three-layer routing technology to construct a two-layer switching network. It has the following technical features:

1. TRILL data frames are sent hop by hop within the network according to the routing mode, and there is no need to block some ports like the spanning tree protocol, so it can make full use of ports and bandwidth resources.

2. The Spanning Tree Protocol limits the diameter of two-layer network under normal circumstances to not exceed 7, but TRILL technology has no such limitation, so TRILL is more in line with the need for building a large two-layer network.

Although the three-layer routing technology is adopted, the TRILL network is still a two-layer switching network to the outside, that is, the TRILL technology still retains the simplicity and flexibility of the two-layer switching network, which facilitates the migration of data center servers and virtual machines.

### 125.1.1 Basic Concepts

- RB

RB refers to Routing Bridge that is a switch running TRILL protocol. It can be divided into Edge RB and Transit RB according to its position in the TRILL network. Edge RB is located at the edge of the TRILL network, with Access ports and Trunk/P2P ports on it; Transit RB is located inside the TRILL network, with no Access ports but Trunk/P2P ports on it.

- system id

Each RB has a unique identifier in the TRILL network, that is, the system ID of this RB, the length is fixedly 6 bytes, and the format is similar to that of MAC address.

- nickname

Each RB has a network address in the TRILL network, that is, the nickname of this RB, the length is fixedly 2 bytes, and its function is equivalent to the IP address in the IP network.

- Port Type

There are three types of TRILL port:

1. Access type: The access port of the TRILL network. This type of port can only send and receive raw Ethernet frames, but cannot send and receive TRILL data frames.

2. Trunk type: The internal port of the TRILL network. This type of port cannot send and receive raw Ethernet frames, but can only send and receive TRILL data frames.

3. P2P type: The internal port of the TRILL network. This type of port cannot send and receive raw Ethernet frames, but can only send and receive TRILL data frames. The difference between the P2P type and the Trunk type is the fact that the P2P type port involves no concept of DRB and does not carry out DRB resolution, while the Trunk type port needs to carry out DRB resolution.

If all neighbor ports on one link are of Access type or Trunk type, then this link is called broadcast link; if two neighbor ports on one link are of P2P type, then this link is called point-to-point link.

- DRB

DRB refers to Designated Routing Bridge. In the broadcast link, two or more RBs that are neighbors to each other will resolve one RB as DRB, and the DRB is responsible for assigning AVF for VLANs on these RBs.

- AVF

AVF refers to Appointed VLAN-x Forwarder. When certain broadcast link is connected to the TRILL network via two or more Edge RBs, for traffic of certain VLAN, only one Edge RB can enter and exit the TRILL network in order to prevent loops. This RB is called AVF of this VLAN.

- Designated VLAN

In the TRILL network, TRILL data frames are transmitted via designated VLAN (abbreviated as DVLAN). In addition, the designated VLAN is also used to transmit some TRILL protocol packets (such as LSP packets, CSNP/PSNP packets, and some Hello packets).

- LSP

LSP refers to Link State Protocol Data Unit. Each RB has its own LSP, which describes the state of the link between this RB and each neighbor RB.

- LSPDB

LSPDB refers to Link State Protocol DataBase which is composed of LSPs of all RBs in the TRILL network.

## 125.1.2 TRILL Frame Format

TRILL frames include two types: TRILL data frames and TRILL protocol frames, which are introduced separately below.

- TRILL Data Frame

The TRILL data frame is formed by adding TRILL header in front of raw Ethernet frame, and then encapsulating with outer Ethernet header. The format of the TRILL data frame is shown in the figure below.

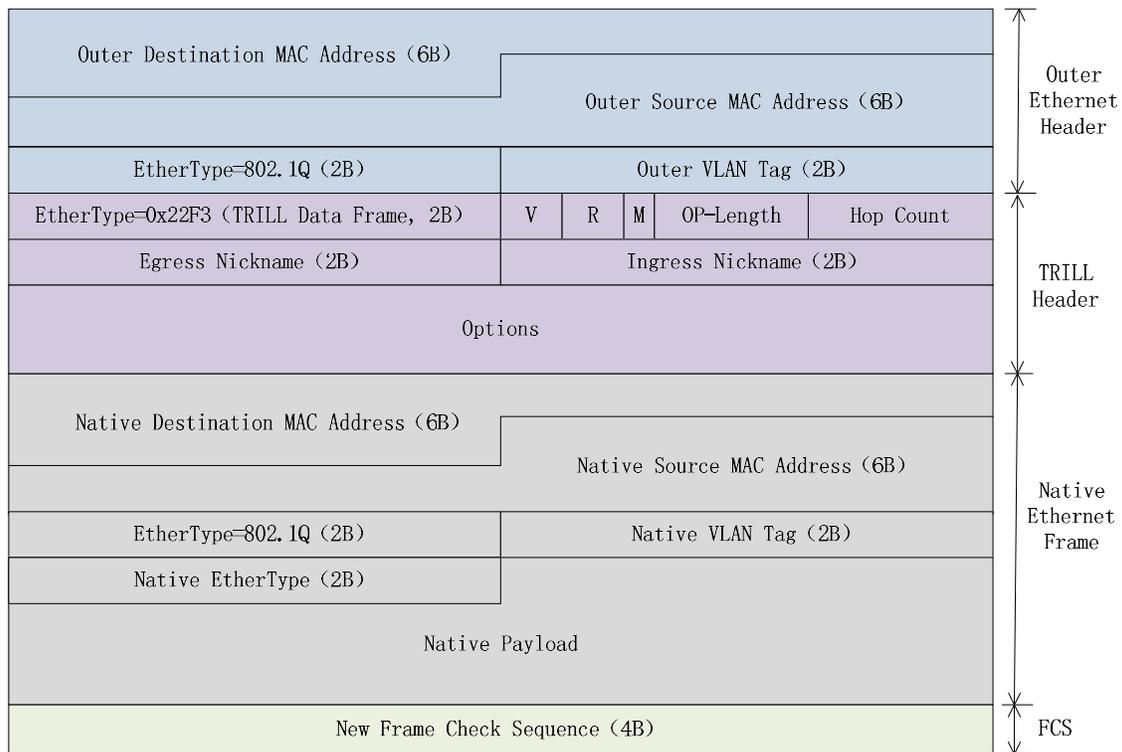

Figure 125-1 TRILL Data Frame Format

The meanings of the fields in the TRILL Header are explained as follows:

- ✧ EtherType: Ethernet type is fixedly 0x22F3, which represents TRILL data frame.
- ✧ V: Version number, currently 0.
- ✧ R: Reserved bit for future extension.
- ✧ M: Identifies whether one packet is multicast packet. 0 indicates that this packet is known unicast message, and 1 indicates that this packet is multicast packet. Since multicast, broadcast, and unknown unicast packets have the same forwarding mechanism in the TRILL network, these three types of packets are collectively referred to as multicast packets.
- ✧ OP-Length: Length of the Options field. 0 indicates that here is no Options field.
- ✧ Hop Count: Used to prevent loops. It is reduced by 1 for each hop in the TRILL network. When the hop count is 0, the RB will discard the packet.
- ✧ Egress Nickname: When M is 0, this field is the nickname of egress RB; when M is 1, this field is the nickname of the root RB of the distribution tree.
- ✧ Ingress Nickname: The nickname of the ingress RB.
- ✧ Options: TRILL header option field. This field will only be present when Op-Length is not 0.

The meanings of the fields of the Outer Ethernet Header are explained as follows:

- ✧ Outer Destination MAC Address: When M is 0, this field is the MAC address of the next hop RB; when M is 1, this field is fixedly 01-80-C2-00-00-40.
- ✧ Outer Source MAC Address: The MAC address of the RB itself that forwards the packet.
- ✧ Outer VLAN Tag: The designated VLAN of the TRILL port that forwards the packet.

- TRILL Protocol Frame

Each RB in the TRILL network needs to run the TRILL protocol and exchange TRILL protocol frames. The format of the TRILL protocol frame is shown in the figure below.

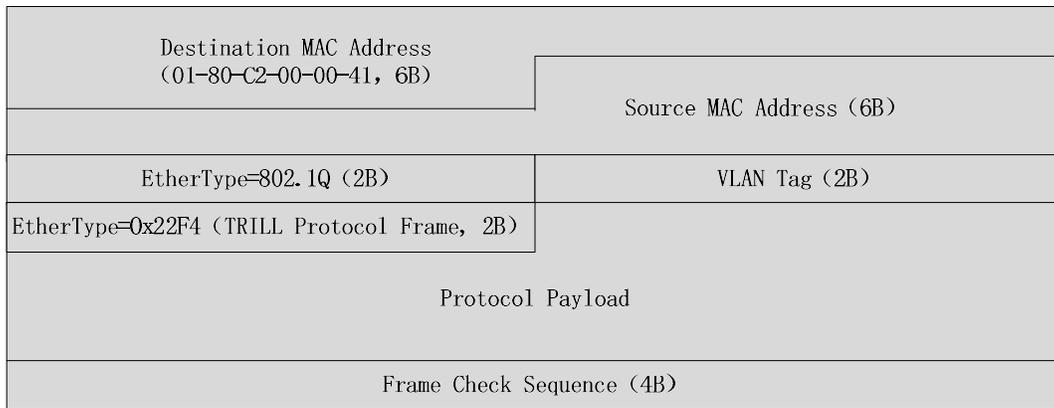

Figure 125-2 TRILL Protocol Frame Format

The meanings of some fields in the TRILL protocol frame are explained as follows:

- ✧ Destination MAC Address: fixedly 01-80-C2-00-00-41 (this multicast address is called All-IS-IS-RBridges).
- ✧ Source MAC Address: The source MAC address of the RB that sends this protocol frame.
- ✧ VLAN Tag: The VLAN that transmits the protocol frame. In most cases, this VLAN corresponds to the designated VLAN of the sending port, but for some Hello messages, this VLAN corresponds to the Announcing VLAN of the sending port.
- ✧ EtherType: Ethernet type is fixedly 0x22F4, which represents TRILL protocol frame.
- ✧ Protocol Payload: TRILL protocol packet payload, namely TRILL PDU.

### 125.1.3 TRILL Forwarding Mechanism

How the TRILL data frame is forwarded in the TRILL network is described in two cases: unicast data frame and multicast data frame.

- TRILL Unicast Data Frame Forwarding

The TRILL network in the figure below contains five RBs. Among them, RB1, RB4, and RB5 are located at the edge of the TRILL network (used as Edge RBs), RB2 and RB3 are located inside the TRILL network (used as transit RBs), and HostA and HostB are connected via the TRILL network. How the known unicast frames from HostA to HostB are forwarded over the TRILL network is analyzed below.

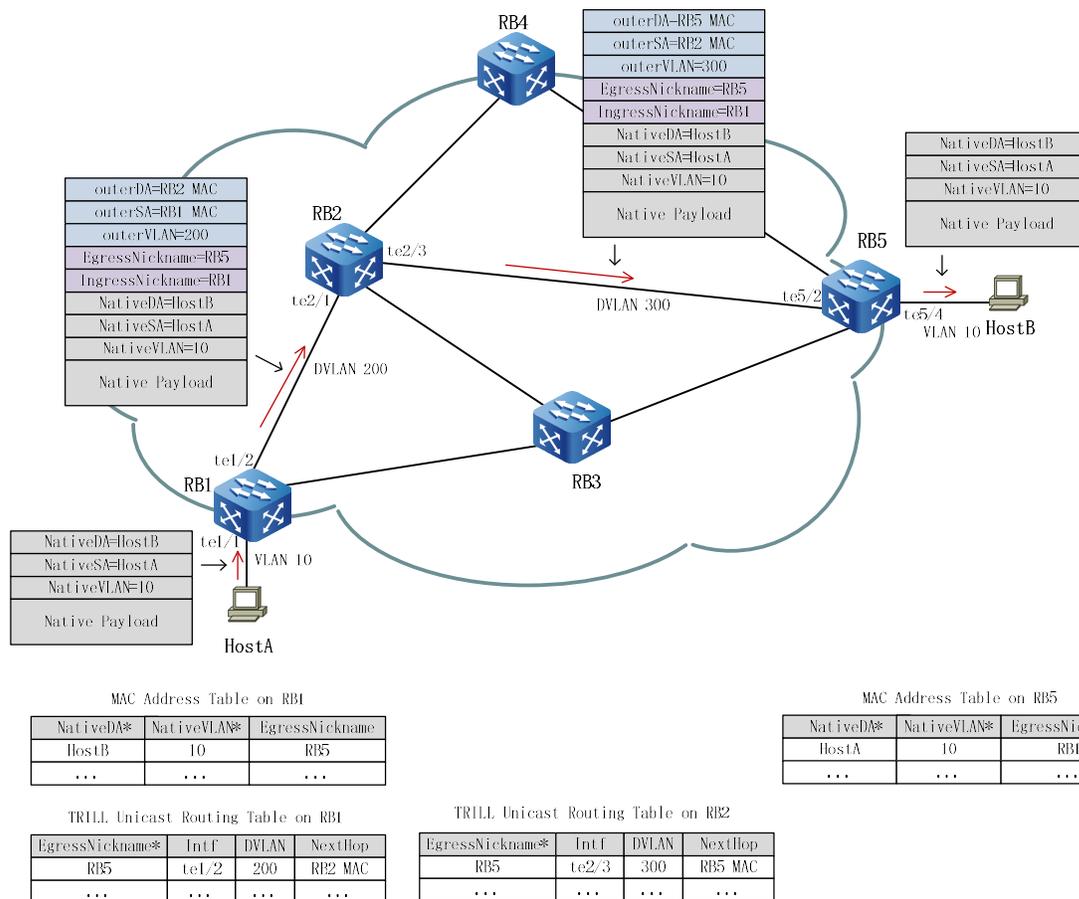

Figure 125-3 Example of TRILL Unicast Frame Forwarding Process

Take RB1 as an example. There are two tables in it (the search key of the tables is identified by \*). One table is the MAC address table, which can learn the MAC address and VLAN of HostB from the packet sent by the remote HostB, as well as the nickname of RB5 directly connected to HostB. The other table is the TRILL unicast routing table, which is calculated by the TRILL protocol. It records, from native RB (that is, RB1) to each other RB in the TRILL network, from which port should forwarding be carried out, how much outer VLAN should be encapsulated, and what MAC of next hop is.

When RB1 receives the raw Ethernet frame sent from HostA to HostB, it uses the destination MAC address and VLAN of the raw Ethernet frame to check the MAC address table, and learns that the packet should be sent to RB5. Then it uses the nickname of RB5 to check the TRILL unicast routing table, and learns that the outer Ethernet header of the packet should be encapsulated with outerVLAN as 200.

OuterDA is MAC of the next-hop neighbor RB2, outerSA is RB1's own MAC, and IngressNickname of the TRILL header is RB1's own nickname, and EgressNickname is the nickname of the destination RB5. After the TRILL frame is encapsulated, it is forwarded from te1/2 of RB1.

After RB2 receives the TRILL data frame sent by RB1, it uses EgressNickname in the TRILL header (namely, the nickname of RB5) to check its TRILL unicast routing table, and learns that the outerVLAN encapsulating the outer Ethernet header of the packet should be changed to 300. OuterDA is MAC of the next-hop neighbor RB5, outerSA is RB2's own MAC, IngressNickname and EgressNickname in the TRILL header remain unchanged, and only the hop count is reduced by 1. After the encapsulation to the TRILL frame is changed, it is forwarded from te2/3 of RB2.

Because RB5 is located at the edge of the TRILL network, after RB5 receives the TRILL data frame sent by RB2, it must first learn the remote source MAC address, and learn the MAC address and VLAN of HostA, and IngressNickname (i.e. RB1) to the MAC address table of RB5. Then it resolves the TRILL header and finds that EgressNickname of the TRILL header is RB5 itself, indicating that the TRILL data frame has reached the destination end of the TRILL network. Decapsulation is performed, and the outer Ethernet header and TRILL header are stripped off, leaving only the raw Ethernet frame. Ordinary L2 unicast forwarding is carried out according to the NativeDA and Native VLAN of the raw Ethernet frame, and the raw Ethernet frame finally reaches HostB.

- TRILL Multicast Data Frame Forwarding

TRILL supports multiple multicast distribution trees, and each multicast distribution tree is identified by the nickname of its root RB which is used as EgressNickname of this multicast distribution tree. In the TRILL network schematic below, one multicast distribution tree with RB3 as Root is shown. The red link represents the forwarding link participating in this distribution tree, while the dotted link will not participate in distribution tree forwarding. The forwarding link of each multicast distribution tree is calculated by the TRILL protocol.

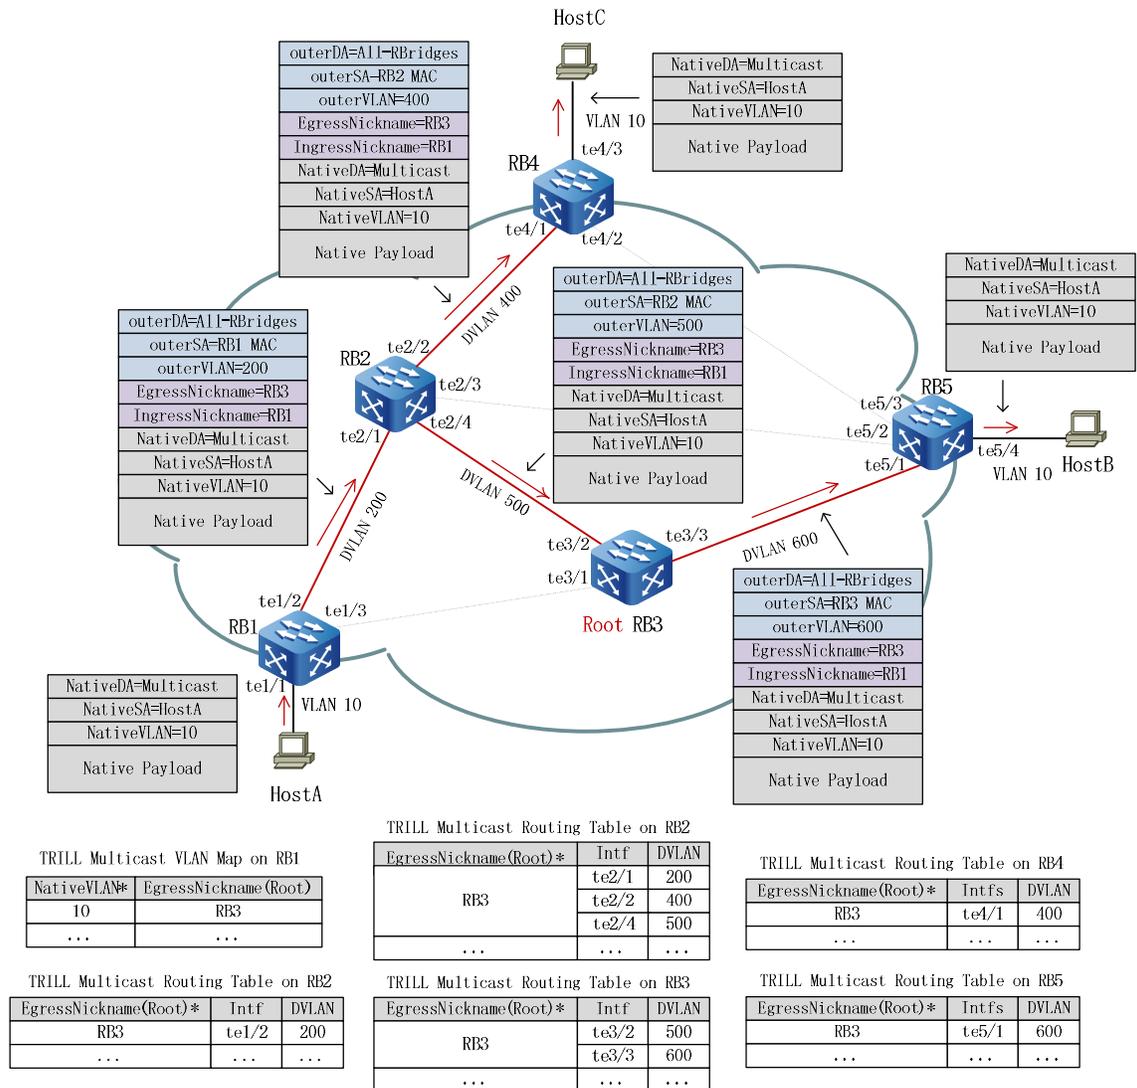

Figure 125-4 Example of TRILL Multicast Frame Forwarding Process

Each RB in the TRILL network stores the multicast routing table of each distribution tree. The multicast routing table of each distribution tree may contain one or more sub-entries. Each sub-entry is "Intf+DVLAN", indicating the egress port for forwarding TRILL multicast frames and the corresponding DVLAN. In addition, each edge RB in the TRILL network also stores the NativeVLAN to Root mapping relationship, namely, when there are multiple distribution trees in the network, which distribution tree should the multicast traffic of this VLAN should go through.

In this example, when RB1 receives a multicast packet from HostA, it first checks the NativeVLAN to Root mapping relationship, determines that the multicast packet of VLAN 10 should be forwarded via the multicast distribution tree with RB3 as Root, then uses RB3 as Root to check the TRILL multicast routing table, and learns that this distribution tree has only one sub-entry, namely, Intf te1/2+DVLAN 200. Then the raw multicast packet is encapsulated with outer Ethernet header and TRILL header. The outer VLAN of the outer Ethernet header is 200, outerDA is the fixed value All-RBridges, outerSA is RB1's own MAC,

and IngressNickname of the TRILL header is RB1's own nickname, EgressNickname is the nickname of the root RB3, and M flag is set to 1, indicating that this TRILL frame is a multicast frame. After the TRILL frame is encapsulated, it is forwarded from te1/2 of RB1.

When RB2 receives the TRILL multicast frame forwarded by RB1, it uses EgressNickname (RB3) of the TRILL header as Root to check the TRILL multicast routing table and learns that this distribution tree has three sub-entries, namely, Intf te2/1 +DVLAN 200, Intf te2/2+DVLAN 400, Intf te2/4+DVLAN 500, among them the sub-entry Intf te2/1+DVLAN 200 corresponds to the port and DVLAN where the multicast packet comes in, so RB2 should forward this multicast frame according to the other two sub-entries. RB2 reduces the hop count of the TRILL header by 1, and then forwards it from te2/2 and te2/4 after changing the encapsulation of the outer Ethernet header.

When RB3 receives the TRILL multicast frame forwarded by RB2, it uses EgressNickname (RB3) of the TRILL header as Root to check the TRILL multicast routing table and learns that this distribution tree has two sub-entries, namely, Intf te3/ 2+DVLAN 500 and Intf te3/3+DVLAN 600, in which the sub-entry Intf te3/2+DVLAN 500 corresponds to the port and DVLAN where the multicast packet comes in, so RB3 should forward the multicast frame according to the other sub-entry. RB3 reduces the hop count in the TRILL header by 1, and then forwards it from te3/3 after changing the encapsulation of the outer Ethernet header.

When RB4 receives the TRILL multicast frame forwarded by RB2, it uses EgressNickname (RB3) of the TRILL header as Root to check the TRILL multicast routing table and learns that this distribution tree has only one sub-entry, namely, Intf te4/ 1+DVLAN 400, which corresponds to the port and DVLAN where the multicast packet comes in, so RB4 does not continue to forward the multicast frame in the TRILL network. However, because RB4 is an edge RB, the multicast frame is decapsulated, the outer Ethernet header and TRILL header are stripped off, leaving only the raw Ethernet frame. Ordinary L2 multicast forwarding is carried out according to the NativeDA and Native VLAN of the raw Ethernet frame, and HostB receives the raw Ethernet frame.

When RB5 receives the TRILL multicast frame forwarded by RB3, it uses EgressNickname (RB3) of the TRILL header as Root to check the TRILL multicast routing table and learns that this distribution tree has only one sub-entry, namely, Intf te5/ 1+DVLAN 600, which corresponds to the port and DVLAN where the multicast packet comes in, so RB5 does not continue to forward the multicast frame in the TRILL network. However, because RB4 is an edge RB, the multicast frame is decapsulated, the outer Ethernet header and TRILL header are stripped off, leaving only the raw Ethernet frame. Ordinary L2 multicast forwarding is carried out according to the NativeDA and Native VLAN of the raw Ethernet frame, and HostC receives the raw Ethernet frame.

## 125.2 TRILL Function Configuration

Table 125-1 Port Security Basic Function Configuration List

Configuration Task	
Enable the TRILL protocol globally	Enable the TRILL protocol globally
Configure system id and nickname	Configure RB's system id
	Configure RB's nickname
Enable the TRILL protocol on the port	Configure the type of TRILL port
	Enable the TRILL protocol on the port
Configure the DRB priority of the port	Configure the DRB priority of the port
Configure advertising VLAN and designated VLAN of the port	Configure advertising VLAN of the port
	Configure designated VLAN of the port
Configure VLAN Forwarder	Configure VLAN Forwarder
Configure pseudo-node mode of the port	Configure pseudo-node mode of the port
Configure link overhead of the port	Configure link overhead of the port
Configure campus wide MTU	Configure campus wide MTU
Configure Hello packet sending interval	Configure Hello packet sending interval
Configure CSNP packet sending interval	Configure CSNP packet sending interval
Configure LSP related time parameters	Configure the maximum lifetime and refresh interval of LSP packets
	Configure LSP retransmission interval of the port
	Configure LSP regeneration interval
	Configure the minimum interval for sending LSP on the port

Configuration Task	
Configure to ignore LSP checksum errors	Configure to ignore LSP checksum errors
Configure SPF algorithm interval	Configure SPF algorithm interval
Configure the number of distribution trees	Configure the maximum number of distribution trees that native RB can support
	Configure the number of distribution trees that native RB desires to compute in the entire network
Configure TRILL gateway	Configure the TRILL gateway function to forwarding TRILL services via L3 interface

### 125.2.1 Enable the TRILL Protocol Globally

When configuring the TRILL protocol, you must first enable the TRILL protocol globally before configuring other TRILL features.

#### Configuration Condition

None

#### Enable the TRILL Protocol Globally

Enable the TRILL protocol globally and enter the TRILL view.

Table 125-2 Enabling the TRILL Protocol Globally

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the TRILL protocol globally and enter the TRILL view	<b>trill</b>	Mandatory By default, the TRILL protocol is not enabled globally

## 125.2.2 Configure System ID and Nickname

System id and nickname are important identifiers of RB in the TRILL network. They can be automatically assigned by the system or manually configured.

### Configuration Condition

None

### Configure RB's system ID

System id is system identifier of RB in the TRILL network.

Table 125-3 Configuring RB's system id

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter TRILL view	<b>trill</b>	-
Configure RB's system id	<b>system-id</b> <i>system-id</i>	Optional By default, RB will automatically generate one system id based on its MAC address

---

### Note

- System ids of RBs in the TRILL network must be different from each other.
- 

### Configure RB's Nickname

Nickname is address identifier of RB in the TRILL network.

Each nickname has a priority. When nickname conflict occurs between different RBs in the TRILL network, the one with the lower priority will automatically abandon the original nickname and reselect a new nickname.

Each nickname has a root priority. The higher the root priority, the more likely the nickname will become the root to a multicast tree.

Table 125-4 Configuring RB's nickname

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter TRILL view	<b>trill</b>	-
Configure RB's nickname	<b>nickname <i>nickname</i></b>	Optional By default, RB will automatically generate one nickname
Configure the priority of nickname	<b>nickname <i>nickname</i> <b>priority</b> <i>priority</i></b>	Optional By default, the priority of nickname is manually configured as 192
Configure the root priority of nickname	<b>nickname <i>nickname</i> <b>root-priority</b> <i>root-priority</i></b>	By default, the root priority of nickname is manually configured as 32768

---

## Note

- Only the manually configured priority and root priority of the nickname can be modified. The automatically generated priority of nickname is fixedly 64 and must not be modified; the automatically generated root priority of nickname is fixedly 32768 and must not be modified.
- Up to 3 nicknames can be manually configured for One RB, among them the nickname with the highest priority will become sender nickname (used as ingress nickname for encapsulating the TRILL packet).
- The number of multicast distribution trees is determined by RB having the nickname with

---

the highest root priority throughout the network, but must not exceed the minimum number of distribution trees that each RB can support.

---

### 125.2.3 Enable the TRILL Protocol on the Port

To enable the TRILL protocol on the port, it is recommended to configure the type of TRILL port first, and then enable the TRILL protocol on the port.

#### Configuration Condition

You must enable the TRILL protocol globally before enabling the TRILL protocol on the port.

#### Configure the Type of TRILL Port

There are four types of TRILL port: Access, Trunk, P2P, and Hybrid.

Table 125-5 Configuring the Type of TRILL Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the type of TRILL port	<b>trill link-type { access   trunk   p2p   hybrid}</b>	Mandatory  <b>access:</b> Configure the type of this TRILL port as Access

Step	Command	Description
		<p><b>trunk:</b> Configure the type of this TRILL port as Trunk</p> <p><b>p2p:</b> Configure the type of this TRILL port as P2P</p> <p>hybrid: Configure the type of this TRILL port as Hybrid</p> <p>By default, the type of the TRILL port is Access.</p>

## Note

- When the VLAN mode of the port is Access, the TRILL type of the port can only be Access, not Trunk or P2P. When the VLAN mode of the port is Trunk or Hybrid, the TRILL type of this port is not limited, and it can be any one of Access/Trunk/P2P/Hybrid.
- For the port that is added into any interface vlan, its TRILL type cannot be set to Trunk, P2P or Hybrid. During networking and configuration, please avoid enabling the TRILL protocol on ports that are added into any interface VLAN.
- Make sure the neighbor ports on the same link are of the same type, otherwise the neighbor relationship cannot be established.
- During networking and configuration, for Trunk, P2P, or Hybrid ports, please avoid establishing more than one TRILL neighbor on the same port of RB. Access ports are not limited so.

## Enable the TRILL Protocol on the Port

Table 125-6 Enabling the TRILL Protocol on the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable the TRILL protocol on the port	<b>trill enable</b>	Mandatory  By default, the TRILL protocol is not enabled on the port

---

## Note

- During networking and configuration, please avoid both TRILL-enabled port and TRILL-enabled port present among the member ports of the same VLAN. In other words, if certain VLAN on the switch is used for TRILL, please do not use this VLAN for other purposes.
  - The enabling of the TRILL protocol on the port is mutually exclusive with the enabling of functions such as spanning tree, EIPS, and ULPP. To enable the TRILL protocol on a port, you must first disable the spanning tree, EIPS, and ULPP functions of this port, and then enable the TRILL protocol.
- 

### 125.2.4 Configure the DRB Priority of the Port

DRB resolution is required when the link type is broadcast link. The resolution rules are as follows: RB with the highest DRB priority is chosen as DRB first; if two RBs have the same DRB priority, the one with the largest MAC address will be chosen as DRB.

#### Configuration Condition

None

### Configure the DRB Priority of the Port

Table 125-7 Configuring the DRB Priority of the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the DRB priority of the TRILL port	<b>trill drb-priority</b> <i>priority</i>	Optional priority: The value range is 0-127, the larger the value, the higher the priority By default, the DRB priority of the port is 64

---

### Note

- The DRB priority takes effect only when the link type is broadcast link. Because there is no need for DRB resolution, when the link type is point-to-point link, the DRB priority has no effect although it can be configured.
-

## 125.2.5 Configure Advertising VLAN and Designated VLAN of the Port

Neighboring RBs exchange Hello packets to discover neighbors and establish neighbor relationships. Hello packets are sent in the following VLAN sets according to different situations:

- The port being of Access type and a DRB:
  - Enable VLAN  $n$  (designated VLAN  $\cup$  advertising VLAN)
- The port being of Access type but not a DRB:
  - Enable VLAN  $n$  (designated VLAN  $\cup$  (advertising VLAN  $\cap$  AVF VLAN))
- The port being of Trunk type, P2P type or Hybrid type:
  - Enable VLAN  $n$  designated VLAN

The above "enable VLAN" refers to the set of VLANs that have been created and allowed to pass through the port. " $\cap$ " and " $\cup$ " are set operators, which represent "intersection" and "union" respectively.

All TRILL protocol packets and all TRILL data packets except Hello packets are sent via the designated VLAN.

### Configuration Condition

None

### Configure Advertising VLAN of the Port

Configure the advertising VLAN of the TRILL port to limit the VLAN range for the port to send Hello packets.

Table 125-8 Configuring Advertising VLAN of the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration

Step	Command	Description
		takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure advertising VLAN of the TRILL port	<b>trill announcing-vlan</b> { <i>vlan-list</i>   <b>null</b>   <b>default</b> }	<p>Optional</p> <p><b>vlan-list</b>: to represent the set of configured advertising VLANs</p> <p><b>null</b>: indicating that there are no advertising VLANs, with the port only sending Hello packets in the designated VLAN</p> <p><b>default</b>: Restore the advertising VLAN to the default</p> <p>By default, no advertising VLAN is configured. At this point, the advertising VLAN is in the same range as the enable VLAN.</p>

---

## Note

- To prevent the device from consuming too much CPU resources due to sending numerous Hello packets, please try to narrow the range of the advertising VLANs. In particular, in the conventional networking environment, if each RB on the link is one device from our company, it is recommended to configure the advertising VLAN to null.
- 

### Configure Designated VLAN of the Port

Table 125-9 Configuring Designated VLAN of the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure designated VLAN of the TRILL port	<b>trill desired-designated-vlan</b> { <i>vlan-id</i>   <b>default</b> }	Optional  vlan-id: Represent the desired designated VLAN  <b>default</b> : Restore the designated VLAN to the default  By default, no designated VLAN is configured. In this case, the designated VLAN is the minimum enable VLAN of the port

 **Note**

- Make sure that the configured designated VLAN is within the range of the port enabled

---

VLAN, otherwise neighbor relationship may not be established.

- It is recommended to configure the designated VLANs of adjacent ports to the same value. In this way, the designated VLANs remain unchanged upon DRB changes, thereby avoiding link flapping.
- 

## 125.2.6 Configure VLAN Forwarder

By default, DRB assumes AVFs of all VLANs. However, you can also designate certain neighbor RB to assume AVFs of some VLANs through manual configuration.

### Configuration Condition

None

### Configure VLAN Forwarder

Table 125-10 Configuring VLAN Forwarder

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure certain neighbor RB as the AVF for some VLANs	<b>trill vlan-forwarder</b> <b>nickname</b> <i>nickname</i> <b>vlan</b> <i>vlan-list</i>	Optional

---

## Note

- The configuration of VLAN Forwarder only takes effect when the port is the DRB of the link where it is located. Although the VLAN Forwarder may be configured when the port is not the DRB of the link where it is located, the configuration will not take effect.
  - If the neighbor RB has multiple nicknames, the nickname configured here must be sender nickname of this RB.
  - For the remaining VLANs that are not subjected to VLAN Forwarder configuration: (1) if the VLAN is enabled by the DRB, the DRB assumes the AVF for this VLAN; (2) if the VLAN is not enabled by the DRB, certain neighbor RB with this VLAN enabled is randomly selected by the DRB to assume the AVF for this VLAN.
- 

### 125.2.7 Configure Pseudo-node Mode of the Port

When there are more than two RBs on broadcast link (that is, three or more RBs are connected over common L2 switching network), you should enable the pseudo-node mode. After the pseudo-node mode is enabled, the DRB from resolution is responsible for creating pseudo-nodes and generating pseudo-node LSPs for describing which RBs are on this broadcast network.

#### Configuration Condition

None

#### Configure Pseudo-node Mode of the Port

Table 125-11 Configuring Pseudo-node Mode of the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable the pseudo-node mode on the port	<b>trill pseudo-node</b>	Optional By default, the pseudo-node mode of the port is disabled

## Note

- It is recommended to enable the pseudo-node mode for all TRILL ports on broadcast link when there are more than two RBs present on this broadcast link.
- You have no need to enable the pseudo-node mode when there is only one or two RBs on broadcast link.
- Since the pseudo-node mode does not work on point-to-point link, you have no need to enable the pseudo-node mode on the point-to-point link.

## 125.2.8 Configure Link Overhead of the Port

By default, link overhead of TRILL port is automatically calculated by the system based on link bandwidth. However, the user can also modify it through manual configuration.

Auto calculation formula: link overhead value = 20000000 / speed (where speed is port rate in Mbps)

### Configuration Condition

None

### Configure Link Overhead of the Port

Table 125-12 Configuring Pseudo-node Mode of the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure link overhead of the port	<b>trill wide-metric</b> { <i>value</i>   <b>default</b> }	Optional  <i>value</i> : Link overhead value configured by user. The greater the value, the higher routing overhead, and the more difficult the link is to be selected  <b>default</b> : Restore the link overhead value to auto calculation  By default, the link overhead value of the port is automatically calculated by the system

**Note**

- 
- The link overhead value of TRILL port refers to outbound overhead value, that is, value of overhead from native RB to the opposite RB through the link.
- 

## 125.2.9 Configure Campus-wide MTU

In TRILL network, each RB advertises out its own campus wide MTU, and receives campus wide MTUs sent by other RBs, thereby selecting the smallest campus wide MTU in the entire network. The length of LSP cannot exceed the smallest campus wide MTU of the entire network when LSP packaging is performed on RB. This ensures that the LSP sent by itself can be transmitted on any link in the TRILL network without being discarded.

### Configuration Condition

None

### Configure Campus-wide MTU

Table 125-13 Configuring campus wide MTU

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Port campus wide MTU	<b>trill campus-wide-mtu</b> <i>size</i>	Optional By default, campus wide MTU is 1470 bytes

---

### Note

- The length of campus wide MTU includes 18 bytes of Ethernet header and the length of LSPDU. For example, the smallest campus wide MTU of the entire network is 1470 bytes when all RBs in the entire network adopt the default campus wide MTU. In this case, maximum of PDU Length is  $1470 - 18 = 1452$  bytes upon LSP packaging for each RB.
  - The MTU value of the port should be greater than campus wide MTU, otherwise TRILL LSP will not be sent normally.
-

## 125.2.10 Configure Hello Packet Sending Interval

Each TRILL port of RB must periodically send Hello packets to establish and maintain neighbor relationship. The product of Hello packet sending interval and the keepalive multiplier is neighbor relationship keepalive time. RB informs its neighbor of the keepalive time via Hello packet. It is considered that the neighbor relationship has been DOWN if this neighbor does not receive the Hello packet within the keepalive time.

### Configuration Condition

None

### Configure Hello Packet Sending Interval

Table 125-14 Configuring Hello Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Hello packet sending interval	<b>trill hello-interval</b> <i>interval</i>	Optional By default, the Hello packet sending interval is 10 seconds

Step	Command	Description
Configure keepalive multiplier of neighbor relationship	<b>trill holding-multiplier</b> <i>number</i>	Optional By default, the keepalive multiplier of neighbor relationship is 3

## Note

- On a broadcast link, the interval at which DRB sends Hello packets is 1/3 of sending interval parameter to ensure that DRB failure can be quickly detected. For example, by default, the interval at which non-DRB sends Hello packets is 10 seconds, while the interval at which DRB sends Hello packets is 3.3 seconds.

### 125.2.11 Configure CSNP Packet Sending Interval

On a broadcast link, DRB must periodically send CSNP packets to synchronize LSPDBs throughout the network.

#### Configuration Condition

None

#### Configure CSNP Packet Sending Interval

Table 125-15 Configuring CSNP Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure CSNP packet sending interval	<b>trill csnp-interval</b> <i>interval</i>	Optional By default, the CSNP packet sending interval is 10 seconds

## 125.2.12 Configure LSP Related Time Parameters

You may adjust the following LSP related time parameters via this configuration:

- **Maximum lifetime of LSP:** The maximum lifetime of an LSP is the maximum survival time of the LSP on the device. If the device has not received update of the LSP, the LSP will be deleted when the maximum lifetime is up.
- **LSP refresh interval:** For one locally generated LSP, the LSP must be refreshed periodically even if there is no change in the content of the LSP. In this way, other devices in the network may be avoided aging the LSP, thereby keeping the LSP alive.
- **Interval for port retransmission of LSP:** On a P2P link, if the port does not receive PSNP response from the peer end within a period of time after the port sends an LSP packet, it needs to resend the LSP packet.
- **LSP regeneration interval:** the device needs to regenerate the LSP to advertise these changes in case of a network topology change. The device provides a limit for the case that each time an LSP is regenerated, there must be an interval since the last LSP is generated, so as to suppress the excessive occupation of bandwidth resources and CPU resources that may be caused by frequent changes in the network topology.
- **Minimum interval for the port to send LSPs:** When the port needs to send a large number of LSPs, the LSPs are not all sent at once, but sent in multiple splits. There is an interval for two sending operations, which makes the sending process relatively smooth and prevents a lot of bandwidth resources and CPU resources from being consumed instantly.

### Configuration Condition

None

### Configure the Maximum lifetime and Refresh Interval of the LSP

Table 125-16 Configuring the Maximum lifetime and Refresh Interval of the LSP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter TRILL view	<b>trill</b>	-
Configure the maximum lifetime of LSP	<b>max-lsp-lifetime</b> <i>time</i>	Optional By default, the maximum lifetime of an LSP is 1200 seconds
Configure refresh interval of LSP	<b>lsp-refresh-interval</b> <i>interval</i>	Optional By default, the refresh interval of LSP is 900 seconds

---

#### Note

- When configuring, note that the maximum lifetime of an LSP should be greater than the refresh interval, and it is recommended that the difference between them be at least 300 seconds. In this way, the new LSP can reach all RBs in the network before the old LSP is aged.
- 

### Configure LSP Retransmission Interval of the Port

Table 125-17 Configuring LSP Retransmission Interval of the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure LSP retransmission interval of the port	<b>trill lsp-retransmit-interval</b> <i>interval</i>	Optional  By default, the LSP retransmission interval of the port is 5 seconds

## Note

- Only the P2P link will retransmit the LSP, and the broadcast link will not retransmit the LSP, so this configuration does not take effect on the broadcast link.

## Configure LSP Regeneration Interval

Table 125-18 Configuring LSP Regeneration Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter TRILL view	<b>trill</b>	-
Configure LSP regeneration interval	<b>lsp-gen-interval</b> <i>interval</i>	Optional By default, the LSP regeneration interval is 30 milliseconds

### Configure the Minimum Interval for Sending LSP on the Port

Table 125-19 Configuring the Minimum Interval for Sending LSP on the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the minimum interval for sending LSP on the port	<b>trill lsp-tx-interval</b> <i>interval</i>	Optional By default, the port sends LSP at an minimum interval of 33 milliseconds

## 125.2.13 Configure to Ignore LSP Checksum Errors

When the RB receives an LSP packet, it needs to perform checksum calculation on the received LSP, and compare the calculated checksum with that carried in the LSP packet. By default, if the checksum in the packet is found to be inconsistent with the calculated checksum, the LSP will be discarded without processing; you can also configure to ignore checksum errors, the packet will be processed as a normal packet even if the checksum errors of the LSP are found.

### Configuration Condition

None

### Configure to Ignore LSP Checksum Errors

Table 125-20 Configuring to Ignore LSP Checksum Errors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter TRILL view	<b>trill</b>	-
Configure to ignore LSP checksum errors	<b>ignore-lsp-errors</b>	Optional By default, LSP checksum errors are not ignored

## 125.2.14 Configure SPF Algorithm Interval

When the network status changes, the TRILL protocol uses the SPF algorithm for route computing. However, when the network status is unstable, frequent SPF calculations will consume a large amount of CPU resources of the system, affecting the operation of normal services. Therefore, there must be a certain interval between two consecutive SPF calculations. The system reduces the SPF calculation interval to the minimum-interval when the network changes infrequently, and performs corresponding penalties, i.e., appropriately extends the SPF calculation interval when the network changes frequently, without exceeding the maximum-interval at most.

### Configuration Condition

None

### Configure SPF Algorithm Interval

Table 125-21 Configuring to Ignore LSP Checksum Errors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter TRILL view	<b>trill</b>	-
Configure SPF algorithm interval	<b>spf-interval</b> <i>max-interval</i> <i>min-interval</i>	Optional  By default, the maximum interval of the SPF algorithm is 50 seconds and the minimum interval is 500 seconds.

### 125.2.15 Configure the Number of Distribution Trees

In TRILL network, each RB encapsulates in the LSP for transmission, the maximum number of distribution trees that this RB can support and the number of distribution trees that the RB desires to compute in the entire network.

Based on the minimums of the number of distribution trees that the RB with the highest distribution tree root priority desires for calculation in the entire network and the maximum number of distribution trees that the various RBs in the network can support, each RB uses the smaller one (assumed as n) of the two values as the number of distribution trees to be computed by this RB. The nicknames of all RBs in the entire network are then sorted from highest priority to lowest, and the first n nicknames are used as the distribution tree root bridge list used by this RB for calculation.

#### Configuration Condition

None

#### Configure the Maximum Number of Distribution Trees that Native RB Can Support

Table 125-22 Configuring the Maximum Number of Distribution Trees that Native RB can Support

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter TRILL view	<b>trill</b>	-
Configure the maximum number of distribution trees that native RB can support	<b>dtrees maximum <i>num</i></b>	Optional By default, the maximum number of distribution trees that native RB can support is 8

### Configure the Number of Distribution Trees that Native RB Desires to Compute in the Entire Network

Table 125-23 Configuring the Number of Distribution Trees That Native RB Desires to Compute in the Entire Network

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter TRILL view	<b>trill</b>	-
Configure the number of distribution trees that native RB desires to compute in the entire network	<b>dtrees number-to-compute <i>num</i></b>	Optional By default, the RB desires to compute 1 distribution tree in the entire network

#### Note

- Only when native RB is the RB having the nickname with the highest root priority in the entire network, the number of distribution trees that the native RB desires to compute in the entire network will take effect.

## 125.2.16 TRILL Monitoring and Maintaining

Table 125-24 TRILL Monitoring and Maintaining

Command	Description
<b>show trill brief</b>	Show global brief of TRILL
<b>show trill interface brief</b>	Show TRILL brief of all ports
<b>show trill { interface <i>interface-name</i>   interface link-aggregation <i>link-aggregation-id</i> }</b>	Show TRILL running information of the port
<b>show trill neighbor brief</b>	Show the brief of all TRILL neighbors
<b>show trill neighbor [ interface <i>interface-name</i>   interface link-aggregation <i>link-aggregation-id</i> ]</b>	Show TRILL neighbor information on the port
<b>show trill vlan-forwarder [ interface <i>interface-name</i>   interface link-aggregation <i>link-aggregation-id</i> ]</b>	Show AVF information on the port
<b>show trill nickname-database</b>	Show the nickname database for the entire network
<b>show trill lspdb [ detail ]</b>	Show all LSP information in the LSPDB
<b>show trill topology</b>	Show the topology information of the TRILL unicast path
<b>show trill dtrees [ <i>nickname</i> ]</b>	Show TRILL distribution tree information
<b>show trill unicast-route</b>	Show TRILL unicast routing table entries

Command	Description
<b>show trill multicast-route [ tree-root nickname ]</b>	Show TRILL multicast routing table entries
<b>show trill rpf-table [ nickname ]</b>	Show TRILL RPF entries
<b>show trill counters rbridge</b>	Show global TRILL statistics of the RB
<b>show trill counters interface all</b>	Show TRILL statistics of all ports
<b>show trill counters { interface interface-name   interface link-aggregation link-aggregation-id }</b>	Show TRILL statistics of the designated port
<b>clear trill counters rbridge</b>	Clear the global TRILL statistics of the RB
<b>clear trill counters interface all</b>	Clear the TRILL statistics of all ports
<b>clear trill counters { interface interface-name   interface link-aggregation link-aggregation-id }</b>	Clear the TRILL statistics of the designated port
Command	Description
<b>show trill gateway</b>	Show all TRILL gateways in the TRILL network
<b>show trill gateway interface</b>	Show all TRILL gateways created by native RB

## 125.3 TRILL Gateway Function Configuration

Table 125-25 Basic Function Configuration List for TRILL Gateway

Configuration Task	
Enable the TRILL gateway globally	Enable the TRILL gateway globally

### 125.3.1 Configure TRILL Gateway

The TRILL gateway allows the RB to support the L3 route forwarding function.

The TRILL gateway is directly deployed on the RB device running the TRILL protocol. When configuring the TRILL gateway, you must first create an Interface VLAN interface and enable the TRILL gateway function on this interface. The gateway RB will be synchronized to the entire TRILL network through the LSP, and each access RB computes a path to the TRILL gateway according to its unicast route and installs to the static MAC address arriving at the gateway, thereby realizing the L3 route forwarding function for TRILL services.

#### Configuration Condition

You must enable the TRILL protocol globally before enabling the TRILL gateway on the interface.

#### Configure TRILL Gateway

Table 125-26 Configuring TRILL Gateway

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface view	<b>interface vlan <i>vlan-id</i></b>	You must create a L3 interface before enabling the TRILL gateway,
Configure TRILL gateway	<b>trill gateway enable</b>	Mandatory  By default, the TRILL gateway is not enabled.

#### Note

- In the TRILL gateway application scenario, to complete the L3 route forwarding function

---

of the TRILL gateway, you must configure all TRILL ports of the TRILL gateway as Hybrid-type ports.

---

## 125.4 Typical Configuration Example of TRILL

### 125.4.1 Configure Basic Functions of TRILL

#### Network Requirements

- TRILL is enabled for RB1-RB5 globally.
- Te0/1-Te0/3 ports of RB1-RB2 and Te0/1-Te0/2 ports of RB3-RB5 are configured as Trunk type TRILL ports, so that RB1-RB5 can learn the TRILL route from each other.
- The Te0/4 ports of RB1-RB2 and the Te0/3 ports of RB3-RB5 are configured as ACCESS-type TRILL ports for connecting to a common L2 network or terminal device to allow for the access of the original data packets to the TRILL network.
- By Modifying the original TRILL port type of RB1-RB5 from Trunk to P2P, the convergence of the TRILL network is accelerated.

#### Network Topology

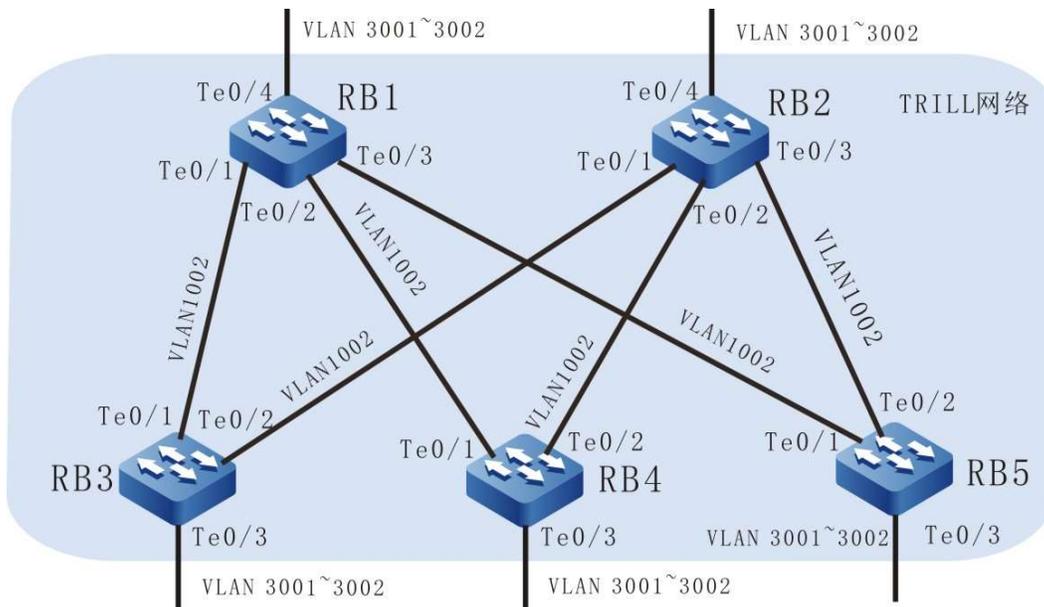

Figure 125-5 Configuring TRILL Network Topology

#### Configuration Steps

Step 1: Configure to add the ports RB1 to RB5 into the VLAN in Trunk mode. (Omitted)

Step 2: Configure to enable TRILL globally for RB1-RB5.

#Configure to enable TRILL globally on RB1 and configure Nickname as 0x0001.

```
RB1#configure terminal
RB1(config)#trill
RB1(config-trill)#nickname 0x0001
RB1(config-trill)#exit
```

#Configure to enable TRILL globally on RB2 and configure Nickname as 0x0002.

```
RB2#configure terminal
RB2(config)#trill
RB2(config-trill)#nickname 0x0002
RB2(config-trill)#exit
```

#Configure to enable TRILL globally on RB3 and configure Nickname as 0x0003.

```
RB3#configure terminal
RB3(config)#trill
RB3(config-trill)#nickname 0x0003
RB3(config-trill)#exit
```

#Configure to enable TRILL globally on RB4 and configure Nickname as 0x0004.

```
RB4#configure terminal
RB4(config)#trill
RB4(config-trill)#nickname 0x0004
RB4(config-trill)#exit
```

#Configure to enable TRILL globally on RB5 and configure Nickname as 0x0005.

```
RB5#configure terminal
RB5(config)#trill
RB5(config-trill)#nickname 0x0005
RB5(config-trill)#exit
```

Step 3: Configure the TRILL port type of RB1-RB5 as Trunk-type ports.

#Configure to shut down the spanning tree at the ports Te0/1~Te0/3 of RB1, and enable TRILL with the TRILL port type being Trunk, and the designated VLAN being 1002.

```
RB1(config)#interface tengigabitethernet 0/1
RB1(config-if-tengigabitethernet0/1)#no spanning-tree enable
RB1(config-if-tengigabitethernet0/1)#trill desired-designated-vlan 1002
RB1(config-if-tengigabitethernet0/1)#trill link-type trunk
RB1(config-if-tengigabitethernet0/1)#trill enable
RB1(config-if-tengigabitethernet0/1)#exit
RB1(config)#interface tengigabitethernet 0/2
RB1(config-if-tengigabitethernet0/2)#no spanning-tree enable
RB1(config-if-tengigabitethernet0/2)#trill desired-designated-vlan 1002
RB1(config-if-tengigabitethernet0/2)#trill link-type trunk
RB1(config-if-tengigabitethernet0/2)#trill enable
RB1(config-if-tengigabitethernet0/2)#exit
RB1(config)#interface tengigabitethernet 0/3
RB1(config-if-tengigabitethernet0/3)#no spanning-tree enable
RB1(config-if-tengigabitethernet0/3)#trill desired-designated-vlan 1002
```

```
RB1(config-if-tengigabitethernet0/3)#trill link-type trunk
RB1(config-if-tengigabitethernet0/3)#trill enable
RB1(config-if-tengigabitethernet0/3)#exit
```

#Configure to shut down the spanning tree at the ports Te0/1~Te0/3 of RB2, and enable TRILL with the TRILL port type being Trunk, and the designated VLAN being 1002.

```
RB2(config)#interface tengigabitethernet 0/1
RB2(config-if-tengigabitethernet0/1)#no spanning-tree enable
RB2(config-if-tengigabitethernet0/1)#trill desired-designated-vlan 1002
RB2(config-if-tengigabitethernet0/1)#trill link-type trunk
RB2(config-if-tengigabitethernet0/1)#trill enable
RB2(config-if-tengigabitethernet0/1)#exit
RB2(config)#interface tengigabitethernet 0/2
RB2(config-if-tengigabitethernet0/2)#no spanning-tree enable
RB2(config-if-tengigabitethernet0/2)#trill desired-designated-vlan 1002
RB2(config-if-tengigabitethernet0/2)#trill link-type trunk
RB2(config-if-tengigabitethernet0/2)#trill enable
RB2(config-if-tengigabitethernet0/2)#exit
RB2(config)#interface tengigabitethernet 0/3
RB2(config-if-tengigabitethernet0/3)#no spanning-tree enable
RB2(config-if-tengigabitethernet0/3)#trill desired-designated-vlan 1002
RB2(config-if-tengigabitethernet0/3)#trill link-type trunk
RB2(config-if-tengigabitethernet0/3)#trill enable
RB2(config-if-tengigabitethernet0/3)#exit
```

#Configure to shut down the spanning tree at the ports Te0/1~Te0/2 of RB3, and enable TRILL with the TRILL port type being Trunk, and the designated VLAN being 1002.

```
RB3(config)#interface tengigabitethernet 0/1
RB3(config-if-tengigabitethernet0/1)#no spanning-tree enable
RB3(config-if-tengigabitethernet0/1)#trill desired-designated-vlan 1002
RB3(config-if-tengigabitethernet0/1)#trill link-type trunk
RB3(config-if-tengigabitethernet0/1)#trill enable
RB3(config-if-tengigabitethernet0/1)#exit
RB3(config)#interface tengigabitethernet 0/2
RB3(config-if-tengigabitethernet0/2)#no spanning-tree enable
RB3(config-if-tengigabitethernet0/2)#trill desired-designated-vlan 1002
RB3(config-if-tengigabitethernet0/2)#trill link-type trunk
RB3(config-if-tengigabitethernet0/2)#trill enable
RB3(config-if-tengigabitethernet0/2)#exit
```

#Configure to shut down the spanning tree at the ports Te0/1~Te0/2 of RB4, and enable TRILL with the TRILL port type being Trunk, and the designated VLAN being 1002.

```
RB4(config)#interface tengigabitethernet 0/1
RB4(config-if-tengigabitethernet0/1)#no spanning-tree enable
RB4(config-if-tengigabitethernet0/1)#trill desired-designated-vlan 1002
RB4(config-if-tengigabitethernet0/1)#trill link-type trunk
RB4(config-if-tengigabitethernet0/1)#trill enable
RB4(config-if-tengigabitethernet0/1)#exit
RB4(config)#interface tengigabitethernet 0/2
RB4(config-if-tengigabitethernet0/2)#no spanning-tree enable
RB4(config-if-tengigabitethernet0/2)#trill desired-designated-vlan 1002
RB4(config-if-tengigabitethernet0/2)#trill link-type trunk
RB4(config-if-tengigabitethernet0/2)#trill enable
RB4(config-if-tengigabitethernet0/2)#exit
```

#Configure to shut down the spanning tree at the ports Te0/1~Te0/2 of RB5, and enable TRILL with the TRILL port type being Trunk, and the designated VLAN being 1002.

```

RB5(config)#interface tengigabitethernet 0/1
RB5(config-if-tengigabitethernet0/1)#no spanning-tree enable
RB5(config-if-tengigabitethernet0/1)#trill desired-designated-vlan 1002

## 125.4.2 Configure TRILL DRB Resolution

### Network Requirements

- TRILL is enabled for RB1-RB5 globally.
- Te0/1-Te0/3 ports of RB1-RB2 and Te0/1-Te0/2 ports of RB3-RB5 are configured as Trunk type TRILL ports, so that RB1-RB5 can learn the TRILL route from each other.
- The Te0/4 ports of RB1-RB2 and the Te0/3 ports of RB3-RB5 are configured as ACCESS-type TRILL ports for connecting to a common L2 network or terminal device to allow for the access of the original data packets to the TRILL network.
- The Te0/1~Te0/3 ports of RB1-RB2 act as DRB ports for their respective links.

### Network Topology

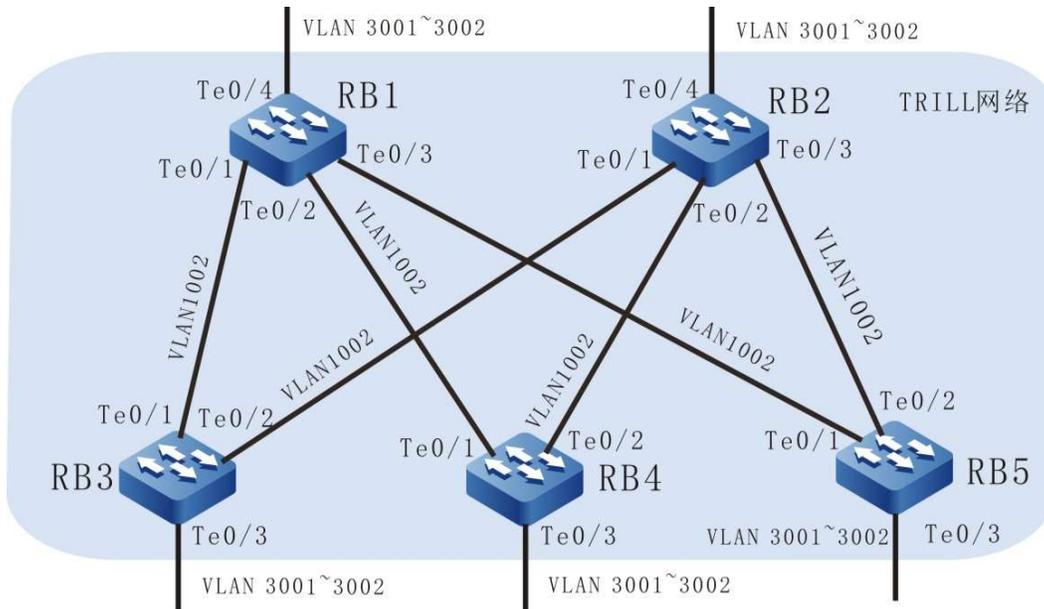

Figure 1-6 Configuring TRILL Network Topology

### Configuration Steps

Step 1: Configure the TRILL function for RB1-RB5.

Refer to the configurations of step 1 to step 4 of configuring the basic functions of TRILL.  
(Omitted)

Step 2: Configure the TRILL trunk ports of RB1-RB2 as the DRBs for their respective links.

#Configure the DRB priorities of the ports Te0/1-Te0/3 of RB1.

```
RB1(config)#interface tengigabitethernet 0/1
RB1(config-if-tengigabitethernet0/1)#trill drb-priority 127
```

```
RB1(config-if-tengigabitethernet0/1)#exit
RB1(config)#interface tengigabitethernet 0/2
RB1(config-if-tengigabitethernet0/2)#trill drb-priority 127
RB1(config-if-tengigabitethernet0/2)#exit
RB1(config)#interface tengigabitethernet 0/3
RB1(config-if-tengigabitethernet0/3)#trill drb-priority 127
RB1(config-if-tengigabitethernet0/3)#exit
```

#Configure the DRB priorities of the ports Te0/1-Te0/3 of RB2.

```
RB2(config)#interface tengigabitethernet 0/1
RB2(config-if-tengigabitethernet0/1)#trill drb-priority 127
RB2(config-if-tengigabitethernet0/1)#exit
RB2(config)#interface tengigabitethernet 0/2
RB2(config-if-tengigabitethernet0/2)#trill drb-priority 127
RB2(config-if-tengigabitethernet0/2)#exit
RB2(config)#interface tengigabitethernet 0/3
RB2(config-if-tengigabitethernet0/3)#trill drb-priority 127
RB2(config-if-tengigabitethernet0/3)#exit
```

Step 3: Check the results.

#View the DRB state of the port Te0/1 of RB1.

```

### 125.4.3 Configure Distribution Tree Root Resolution for TRILL

#### Network Requirements

- TRILL is enabled for RB1-RB5 globally.
- Te0/1-Te0/3 ports of RB1-RB2 and Te0/1-Te0/2 ports of RB3-RB5 are configured as Trunk type TRILL ports, so that RB1-RB5 can learn the TRILL route from each other.
- The Te0/4 ports of RB1-RB2 and the Te0/3 ports of RB3-RB5 are configured as ACCESS-type TRILL ports for connecting to a common L2 network or terminal device to allow for the access of the original data packets to the TRILL network.
- RB1 and RB2 act as the roots of the two distribution trees in the TRILL network, respectively, and the root priorities decrease sequentially.

#### Network Topology

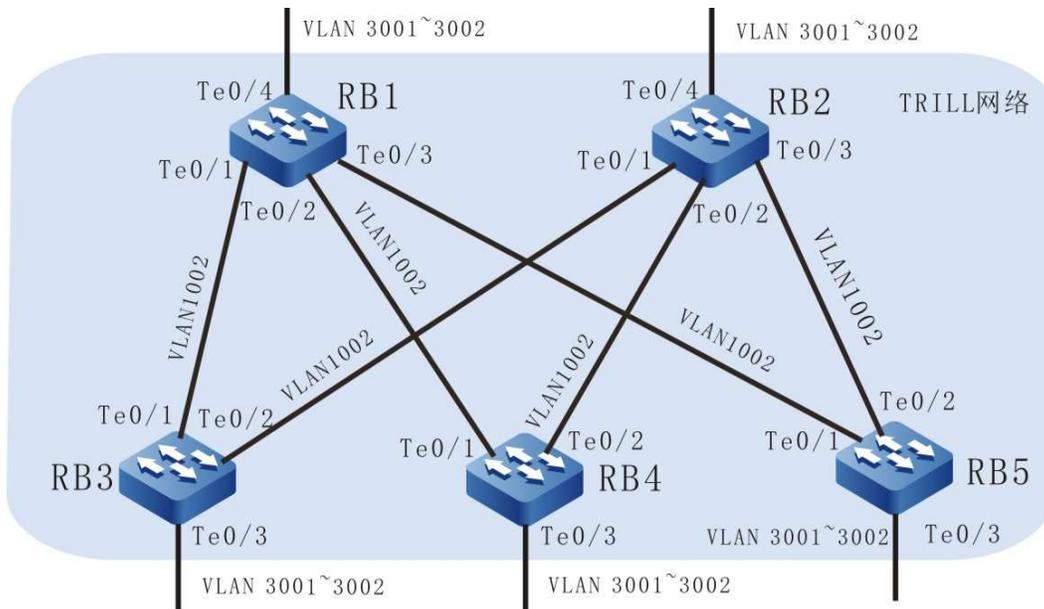

Figure 125-6 Configuring TRILL Network Topology

### Configuration Steps

Step 1: Configure the TRILL function for RB1-RB5.

Refer to the configurations of step 1 to step 4 of configuring the basic functions of TRILL.  
(Omitted)

Step 2: Configure the priorities of TRILL distribution tree roots for RB1-RB2 as 60000 and 50000, respectively, with RB1-RB5 configuring the number of distribution trees that native RB desires to compute in the entire network as 2.

#Configure the root priority of RB1 as 6000, and the number of distribution trees that native RB desires to compute in the entire network as 2.

```
RB1#configure terminal
RB1(config)#trill
RB1(config-trill)#nickname 0x0001 root-priority 60000
RB1(config-trill)#dtrees number-to-compute 2
RB1(config-trill)#exit
```

#Configure the root priority of RB2 as 5000, and the number of distribution trees that native RB desires to compute in the entire network as 2.

```
RB2#configure terminal
RB2(config)#trill
RB2(config-trill)#nickname 0x0002 root-priority 50000
RB2(config-trill)#dtrees number-to-compute 2
RB2(config-trill)#exit
```

#Configure the number of distribution trees that RB of RB3 desires to compute in the entire network as 2.

```

RB3#configure terminal
RB3(config)#trill
RB3(config-trill)#dtrees number-to-compute 2
RB3(config-trill)#exit

```

#Configure the number of distribution trees that RB of RB4 desires to compute in the entire network as 2.

```

RB4#configure terminal
RB4(config)#trill
RB4(config-trill)#dtrees number-to-compute 2
RB4(config-trill)#exit

```

#Configure the number of distribution trees that RB of RB5 desires to compute in the entire network as 2.

```

RB5#configure terminal
RB5(config)#trill
RB5(config-trill)#dtrees number-to-compute 2
RB5(config-trill)#exit

```

Step 3: Check the results.

#View the multicast route information of all distribution trees on RB1.

```

BR1#show trill multicast-route

## 125.4.4 Configure AVF VLAN Selection of TRILL

### Network Requirements

- TRILL is enabled for RB1-RB5 globally.
- Te0/1-Te0/3 ports of RB1-RB2 and Te0/1-Te0/2 ports of RB3-RB5 are configured as Trunk type TRILL ports, so that RB1-RB5 can learn the TRILL route from each other.
- The Te0/4 ports of RB1-RB2 and the Te0/3 ports of RB3-RB5 are configured as ACCESS-type TRILL ports for connecting to a common L2 network or terminal device to allow for the access of the original data packets to the TRILL network.
- AVF of RB3 acts as service VLAN 3001, and AVF of RB4 acts as service VLAN 3002.

### Network Topology

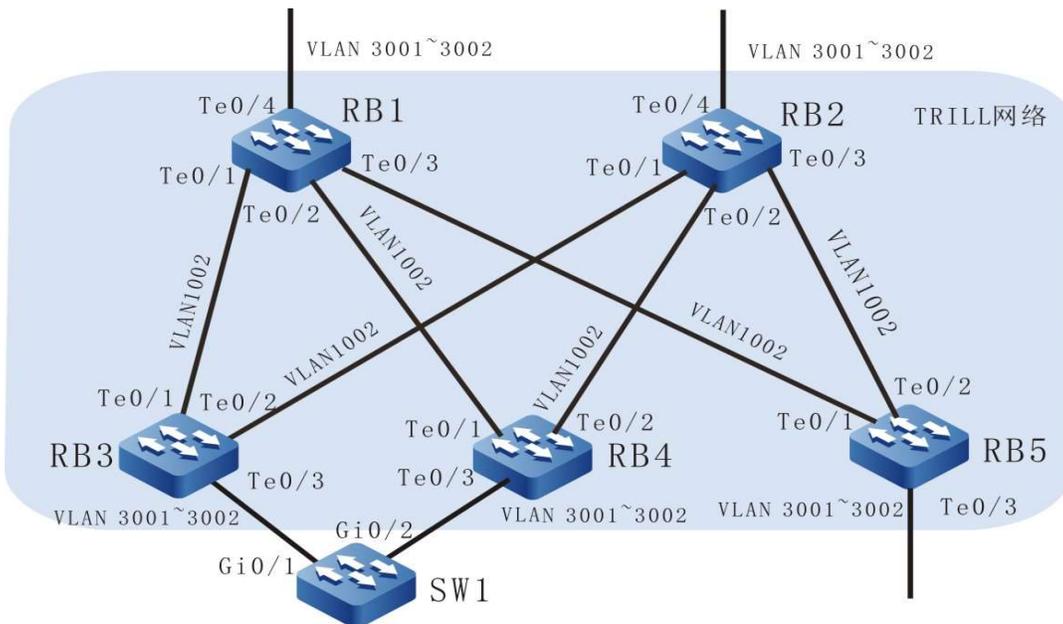

Figure 125-7 Configuring TRILL Network Topology

### Configuration Steps

Step 1: Configure the TRILL function for RB1-RB5. (Omitted)

Refer to the configurations of step 1 to step 4 of configuring the basic functions of TRILL.  
(Omitted)

Step 2: Configure the Gi0/1~Gi0/2 ports of SW1 to join vlan3001-vlan3002 in Trunk mode.  
(Omitted)

Step 3: Configure the AVFs of RB3-RB4, where RB3 acts as the AVF of VLAN3001 and RB4 acts the AVF of VLAN3002.

#Configure the Te0/3 port of RB3 as the DRB of the link to which it belongs, and designate the AVF of the service VLAN3002 as RB4.

```
RB3(config)#interface tengigabitethernet 0/3
RB3(config-if-tengigabitethernet0/3)#trill drb-priority 127
RB3(config-if-tengigabitethernet0/3)#trill vlan-forwarder nickname 0x0004 vlan 3002
RB3(config-if-tengigabitethernet0/3)#exit
```

#No need to configure RB4.

Step 4: Check the results.

#View the AVF VLAN on RB3.

```
RB3#show trill vlan-forwarder
AF VLAN on interface tengigabitethernet0/1
[none]
AF VLAN on interface tengigabitethernet0/2
[none]
AF VLAN on interface tengigabitethernet0/3
[3001]
```

#View the AVF VLAN on RB4.

```
RB4#show trill vlan-forwarder
AF VLAN on interface tengigabitethernet0/1
[none]
AF VLAN on interface tengigabitethernet0/2
[none]
AF VLAN on interface tengigabitethernet0/3
[3002]
```

## 125.4.5 Configure Load Balancing for TRILL

### Network Requirements

- TRILL is enabled for RB1-RB5 globally.
- Te0/1-Te0/3 ports of RB1-RB2 and Te0/1-Te0/2 ports of RB3-RB5 are configured as Trunk type TRILL ports, so that RB1-RB5 can learn the TRILL route from each other.
- The Te0/4 ports of RB1-RB2 and the Te0/3 ports of RB3-RB5 are configured as ACCESS-type TRILL ports for connecting to a common L2 network or terminal device to allow for the access of the original data packets to the TRILL network.

- RB1-RB5 can each generate a load balancing route for TRILL known unicast.

### Network Topology

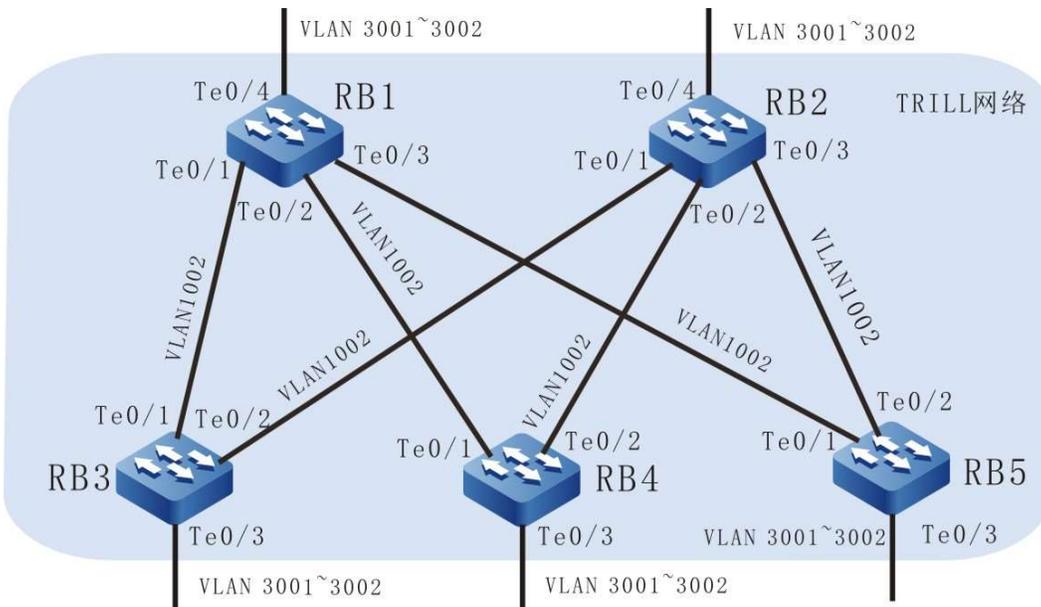

Figure 125-8 Configuring TRILL Network Topology

### Configuration Steps

Step 1: Configure the TRILL function for RB1-RB5. (Omitted)

Refer to the configurations of step 1 to step 4 of configuring the basic functions of TRILL. (Omitted)

Step 2: Check the results.

View the information of the trill unicast load balancing route via show trill unicast-route.

#View the information of the unicast load balancing route of RB1.

```

# 126 VXLAN

---

## 126.1 Overview

### 126.1.1 Background

In order for high reliability and redundant deployment, most enterprise networks and their data centers at present span multiple physical sites in different physical locations, and similar services are deployed at these sites. To consolidate data center resources and reduce management costs, it is common to virtualize data center resources. Data center virtualization has three main aspects: network virtualization, storage virtualization, and server virtualization. In server virtualization, dedicated virtualization software is used to virtualize multiple virtual machines on one physical server. Each virtual machine runs independently and has its own operating system, applications, and virtual hardware environment. In order for dynamic allocation and management of resources between sites, the virtual machines need to be freely migratable between the data centers. Since the virtual machine migration process is transparent to users with the IP address unable to be varied, this requests that before and after migration of the virtual machines the network is one L2 network, so there must be L2 network interconnection between sites in different locations.

VXLAN is one "MAC in IP" technology that is used to implement large two-layer internetworking based on the IP core network. VXLAN only maintains the MAC address and forwarding information on the edge devices of the site, without changing the internal network and core network structures of the site.

Using VXLAN as the large two-layer internetworking technology has the following advantages:

- VXLAN encapsulates the data packets sent by the virtual machine into UDP and uses the IP/MAC address of the physical network as the outer header for encapsulating, with only encapsulated parameters represented for the network. Therefore, the requirements of the large two-layer network for MAC address specification are greatly lowered. Except for the edge devices of the VXLAN network, other devices on the network have no need to identify MAC addresses of virtual machines, reducing the MAC address learning pressure for the devices and improving device performance.
- VXLAN introduces user ID similar to VLAN ID, called VXLAN network ID VNI, which consists of 24 bits and supports up to 16,777,215 VXLAN segments, thereby satisfying numerous user IDs.
- By using MAC in UDP encapsulation to extend the two-layer network, the physical network and the virtual network are decoupled. Tenants can plan their own virtual

networks without considering the restrictions on physical network IP addresses and broadcast domains, allowing for greatly reduced difficulty in network management.

## **126.1.2 Basic Concepts**

### **Network Virtual Edge Node**

NVE (Network Virtualization Edge) is a network entity that implements network virtualization. Once packets are encapsulated and converted by the NVE network entity, a virtual VXLAN network can be established between NVEs based on the L3 basic network.

### **VXLAN Tunnel End Point**

VTEP (VXLAN Tunnel End Point) is a switch device at the edge of a site. It functions as a L2 device on the site network and a L3 device on the core network. It primarily provides L2 interconnection between site networks. It completes packet encapsulation from the site network to the core network and packet decapsulation from the core network to the site network.

Core network port: A L3 port, i.e., Network Port, for the edge device to connect to the core network.

Site internal port: A L2 port, i.e., Internal Port, for the edge device to connect to site internal devices.

### **VXLAN Session**

VXLAN Session is a valid forwarding instance formed between VTEPs by establishing a VXLAN tunnel via manual configuration or protocol negotiation and associating it with an VXLAN instance. Data can be forwarded only after the VXLAN session is valid.

### **EVPN**

EVPN (Ethernet Virtual Private Network) is one L2 VPN technology. EVPN technology uses extended MP-BGP to spread the host information in the user network among sites, and uses the control plane instead of the data plane to complete cross-site MAC address learning in the user network.

VXLAN itself is one data encapsulation protocol and does not define a control plane. MAC addresses between sites are learned, using traditional traffic flooding on the data plane. The greatest disadvantage of this manner lies in that the data center carrying network has a large amount of flooding traffic. To address this issue, VXLAN introduces EVPN as the control plane to exchange BGP EVPN routes between VTEPs to implement features such as automatic VTEP discovery and mutual advertising of host information, thereby avoiding unnecessary data traffic flooding.

### 126.1.3 Protocol Specification

- RFC7348: Virtual eXtensible Local Area Network (VXLAN): A Framework for Overlaying Virtualized Layer 2 Networks over Layer 3 Networks.
- RFC 7432: BGP MPLS-Based Ethernet VPN
- RFC 8365--A Network Virtualization Overlay Solution Using Ethernet VPN (EVPN)
- draft-ietf-bess-evpn-inter-subnet-forwarding-05
- draft-ietf-bess-evpn-prefix-advertisement-11
- draft-malhotra-bess-evpn-irb-extended-mobility-03

## 126.2 VXLAN Function Configuration

Table 126-1 VXLAN Function Configuration List

Configuration Task	
Configure basic functions of VXLAN	Configure VXLAN instance
	Configure VXLAN instance description information
	Configure to add the port into the VXLAN instance
	Configure VXLAN L3 interface
	Configure NVE
	Configure to enable ARP host advertising
	Configure to enable ARP broadcast suppression
Configure static VXLAN	Configure VXLAN static headend replication list
Configure EVPN VXLAN	Configure NVE to enable EVPN
	Configure EVPN attributes of the VXLAN instance
	Configure EVPN attributes of the VRF instance (optional)

Configuration Task	
	Configure BGP to enable EVPN
	Configure BGP neighbor policy (optional)
	Configure VXLAN route map (optional)

## 126.2.1 Configure VXLAN instance

### Configuration Condition

None

### Configure VXLAN Instance

Each VXLAN instance is one independent working interval, separated by VNID, so that different VXLAN instances cannot communicate with each other, while VXLAN instances that are the same can communicate with each other, the device supports the configuration of up to 4096 VXLAN instances.

Table 126-2 Configuring VXLAN Instance

Step	Command	Description
Global configuration mode	<b>configure terminal</b>	-
VXLAN configuration mode	<b>vxlan vxlan-id</b>	Mandatory By default, no VXLAN is created
Configure VXLAN VNID	<b>vxlan vnid vnid</b>	By default, no configuring is performed

### Note

- VNID of the VXLAN instance must be configured first, otherwise other service configurations will not take effect.

## Configure VXLAN Instance Description Information

For the convenience of memorization and management, VXLAN description information can be configured according to VXLAN service type, function, connection status etc.

Table 2-3 Configuring VXLAN Description Information

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter VXLAN configuration mode	<b>vxlan vxlan-id</b>	Mandatory You can configure VXLAN description information only after entering the VXLAN configuration mode
Configure VXLAN description information	<b>description description-name</b>	Optional By default, there is no description of VXLAN

## VXLAN Instance Service Access

VXLAN does not contain any service access points when initially created. By using different access manners, virtual machines can be connected to the VXLAN network to implement VXLAN network forwarding for virtual machine services. The access modes are as follows:

Table 126-3 Configuring Service Point Mode

Mode	Description
default	Allow the port to receive all packets, regardless of whether the packets carry VLAN tags or not.  Regardless of the VXLAN encapsulation of the original packets or the decapsulation of the VXLAN packets, this type of port will not perform any VLAN Tag processing on the original packets, including adding, replacing or stripping.

Mode	Description
untag	<p>This type of port only receives packets without VLAN tags</p> <p>This mode supports both L2 forwarding and L3 forwarding</p>
dot1q	<p>This type of port only receives packets with VLAN tags with the outer VLAN tag matching the designated VLAN tag;</p> <p>This type of port will strip the outermost VLAN tag upon VXLAN encapsulation on the original packets;</p> <p>It will add the designated VLAN Tag before forwarding upon decapsulation of VXLAN packets.</p> <p>This mode needs to add the physical port into the corresponding VLAN, and the global VLAN needs to be created</p> <p>This mode supports both L2 forwarding and L3 forwarding</p>

The VXLAN instance does not contain any service access points when initially created, so you need to manually configure the following.

Table 126-4 Configuring Service Point

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure port mode	<b>interface tengigabitethernet 0/1</b>	<p>Mandatory</p> <p>You can configure to add the port into the VXLAN instance only after entering the port mode. Aggregation ports are supported</p>
Configure VXLAN Instance access method	<b>vxlan vxlan-id encapsulation { vlan vlan-id   untag   default }</b>	<p>Mandatory</p> <p>By default, no port is added into VXLAN</p>

Step	Command	Description
		After the port is added into VXLAN, the VXLAN function will take effect on the port

## Note

- When the access modes are untag and default, the same port cannot be added to multiple VXLAN instances at the same time.
- When the access mode is dot1q, the VXLAN access port needs to be configured as tag access

### Configure VXLAN L3 Interface

When enabling the L3 VXLAN function, you must configure the VXLAN L3 interface and designate the IP.

Table 126-5 Configuring VLAN Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the VXLAN interface	<b>interface vxlan <i>vxlan-id</i></b>	Mandatory By default, no VXLAN interface is configured. When enabling the L3 VXLAN function, you must perform configuring.
Configure VXLAN interface to associate with VRF	<b>ip vrf forwarding <i>vrf-name</i></b>	Optional By default, the VXLAN interface is not associated with VRF
Configure IP address for VXLAN interface	<b>ip address <i>X.X.X.X</i></b>	Mandatory

Step	Command	Description
		By default, no IP address is configured for the VXLAN interface. When enabling the L3 VXLAN function, you must perform configuring.

### Configure NVE

NVE (Network Virtualization Edge) is a network entity that implements network virtualization. Once packets are encapsulated and converted by the NVE network entity, a virtual VXLAN network can be established between NVEs based on the L3 basic network.

Table 126-6 Configuring NVE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create NVE interface	<b>interface nve</b> <i>nve-number</i>	Mandatory By default, no NVE interface is created on the device
Configure MAC address	<b>mac-address</b> <i>mac</i>	Optional By default, no MAC address is configured on the NVE interface
Configure source IP address	<b>source</b> <i>ip-address</i>	Mandatory By default, no VTEP IP address is configured on the NVE interface

### Configure to Enable ARP Host Advertising

After the ARP host advertising function is enabled under the VXLAN instance, the ARP request packets, ARP response packets, and gratuitous ARP packets received on the user-side port will generate the local ARP host table and advertise to the EVPN route, and then to neighbors via the BGP EVPN protocol,

thereby allowing for route learning between VTEPs and installation of the ARP broadcast suppression table.

Table 126-7 Enabling ARP Host Advertising

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter VXLAN configuration mode	<b>vxlan vxlan-id</b>	Mandatory
Configure to enable ARP host advertising	<b>arp host advertise</b>	Mandatory By default, the state is not enabled

#### Configure to Enable ARP Broadcast Suppression

After VXLAN enables the ARP broadcast suppression function and the ARP broadcast request packet is received on the user-side port, the request destination IP is used to query the ARP broadcast suppression table. For the ARP broadcast request packet that matches the suppression table, it can be subjected to proxy response or forwarded to unicast; for the ARP broadcast request packet that mismatches the suppression table, it can be broadcast or discarded.

After the ARP broadcast suppression function is enabled, the number of broadcast packets in the VXLAN domain can be reduced.

Table 126-8 Enabling ARP Broadcast Suppression

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter VXLAN configuration mode	<b>vxlan vxlan-id</b>	Mandatory
Configure to enable the ARP broadcast suppression function	<b>arp suppression</b>	Mandatory By default, the broadcast suppression function is disabled

Step	Command	Description
After configuring the match suppression table, performing unicast forwarding	<b>arp suppression unicast forward</b>	Optional By default, the ARP request packets that matches the suppression table undergo proxy response.
Configure the mismatch suppression table and perform discarding	<b>arp suppression mismatch discard</b>	Optional By default, the ARP request packet that mismatches the suppression table is broadcast.

## 126.2.2 Configure Static VXLAN Tunnel

### Configuration Condition

None

### Configure Static Headend Replication List for VXLAN Instance

The headend refers to the ingress node of the VXLAN tunnel, and the replication list refers to that when the ingress node of the VXLAN tunnel receives a BUM (Broadcast&Unknown-unicast&Multicast) packet, it will make multiple copies of the packet and send them to all VTEPs in the list. The headend replication list is the IP address list of the remote VTEPs that is used to direct the ingress node of the VXLAN tunnel to copy and send the BUM packet.

The headend replication list, usually called BUM VXLAN tunnel, uses the headend replication list source NVE interface to replicate the received BUM packet according to the VTEP list and send it to all VTEPs belonging to the same VNI.

Table 126-9 Configuring VXLAN Static Headend Replication List

Step	Command	Description
Global configuration mode	<b>configure terminal</b>	-

Step	Command	Description
NVE interface configuration mode	<b>interface nve</b> <i>nve-number</i>	Mandatory
Configure static headend replication list for designated VXLAN	<b>vxlan vxlan-id ingress-replication peer</b> { <i>ip-address</i>   <i>ipv6-address</i> }	Mandatory By default, no static headend replication list is configured

---

## Note

- Even if the source VTEP only corresponds to one remote VTEP, you need to execute this command to designate the corresponding VTEP address and configure the headend replication list.
- 

### 126.2.3 Configure EVPN VXLAN Tunnel

#### Configuration Condition

- Before configuring BGP EVPN method to deploy VXLAN services, ensure that:
  - The link layer protocol has been configured to ensure normal communication at the link layer.
  - Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.

#### Configure NVE to Enable EVPN Protocol

After NVE activates EVPN, automatic negotiation between VTEPs and automatic establishment of the VXLAN tunnel can be performed via the the BGP EVPN protocol.

Table 126-10 Configuring Dynamic VXLAN Tunnel

Step	Command	Description
Global configuration mode	<b>configure terminal</b>	-
NVE interface configuration mode	<b>interface nve</b> <i>nve-number</i>	Mandatory
Configure the designated VXLAN instance to associate with NVE	<b>vxlan</b> <i>vxlan-id</i>	Mandatory By default, no associating is performed
Configure the designated VXLAN instance to use EVPN to establish the headend replication list	<b>vxlan</b> <i>vxlan-id</i> <b>ingress-replication protocol bgp</b>	Optional By default, no designating is performed

### Configure EVPN Attributes of the VXLAN Instance

Rd is used to mark the EVPN routes generated by different VXLANs, isolating the different VXLANs; route-target is used to control the import and export of EVPN routes. When the VTEP initiates the EVPN route, it carries the Export RT attribute. When the VTEP decides which VXLAN to import the EVPN route into, the Export RT attribute carried by the route is used to match the Import RT of the local VXLAN.

Table 126-11 Configuring VXLAN EVPN Attribute

Step	Command	Description
Global configuration mode	<b>configure terminal</b>	-
VXLAN instance configuration mode	<b>vxlan</b> <i>vxlan-id</i>	Mandatory You can enter the EVPN configuration mode only when in

Step	Command	Description
		the VXLAN configuration mode
VXLAN EVPN configuration mode	<b>address-family evpn</b>	Mandatory You can configure VXLAN EVPN attributes only after entering the VXLAN EVPN configuration mode
Configure rd for VXLAN	<b>rd</b> <i>route-distinguisher</i>	Mandatory By default, RD for VXLAN is not configured
Configure route-target for VXLAN	<b>route-target</b> <b>[both   export   import]</b> { <i>ASN:nn</i>   <i>IP-address:nn</i> }	Mandatory By default, the Export and Import RT attributes of VXLAN are not configured

### Configure EVPN Attributes of the VRF Instance (Optional)

You need to configure the EVPN attributes of the VRF instance only when the distributed gateway is deployed, and you can skip this configuration for the centralized gateway deployment.

Table 126-12 Configuring EVPN Attributes of the VRF Instance

Step	Command	Description
Global configuration mode	<b>configure terminal</b>	-
Enter the VRF configuration mode	<b>ip vrf</b> <i>vrf-name</i>	Mandatory
Configure rd	<b>rd</b> <i>route-distinguisher</i>	Mandatory

Step	Command	Description
		By default, rd is not configured.
Configure L3VNID	<b>l3vnid</b> <i>vnid-number</i>	Mandatory  By default, L3VNID is not configured.
Enter the VRF EVPN address family configuration mode	<b>address-family evpn</b>	Mandatory
Configure route-target for VRF EVPN	<b>route-target [ both   export   import ]</b> { <i>ASN:nn</i>   <i>IP-address:nn</i> }	Mandatory  By default, the Import and Export attributes are not configured.
Associate VRF EVPN with the outbound routing policy	<b>export map</b> <i>route-map-name</i>	Optional  By default, VRF EVPN is not associated with the outbound routing policy
Associate VRF EVPN with the inbound routing policy	<b>import map</b> <i>route-map-name</i>	Optional  By default, VRF EVPN is not associated with the inbound routing policy

### Configure BGP to Enable EVPN

Enable EVPN capability for BGP to allow BGP to learn EVPN routing, creating the dynamic VXLAN tunnel, forming the VXLAN session, and adding to the forwarding table to guide VXLAN packet forwarding.

Table 126-13 Configuring BGP EVPN to Enable EVPN

Step	Command	Description
Global configuration mode	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	Mandatory By default, it is not enabled.
Configure BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Configure source address for TCP session of BGP neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-name</i>   <i>ip-address</i> }	Optional By default, the TCP session automatically selects the address of the route's output interface as source address.
Enter the BGP EVPN configuration mode	<b>address-family l2vpn evpn</b>	Mandatory
Activate EVPN capability	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Mandatory By default, it is not activated.
Configure EVPN reflector	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-reflector-client</b>	Optional By default, the reflector is not enabled
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	Optional
Configure to redistribute the VRF unicast route to EVPN	<b>advertise-l2vpn-evpn</b>	Optional

Step	Command	Description
to form a category 5 route		This configuration is only required for distributed gateway deployment.
Enter the BGP EVPN configuration mode	<b>address-family l2vpn evpn</b>	Mandatory
Configure not to change the as-path, med, and next-hop attribute values of the route when BGP advertises the route to neighbors or peer groups	<b>neighbor attribute-unchanged[ as-path   med   next-hop ]</b>	Optional This configuration is required only when an end-to-end cross-data center VXLAN network is deployed.

### Configure BGP Neighbor Policy (Optional)

By binding the route map to the BGP EVPN neighbors, you can effectively filter the routes received in the inbound direction that carry the designated VNI, or prevent advertising to the neighbors, certain routes that carry the designated VNI, in the outbound direction.

Table 126-14 Configuring BGP Neighbor EVPN Policy

Step	Command	Description
Global configuration mode	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp <i>autonomous-system</i></b>	Mandatory By default, BGP is disabled.
Enter the BGP EVPN configuration mode	<b>address-family l2vpn evpn</b>	Mandatory
Configure neighbors to apply the routing map in the inbound direction	<b>neighbor { <i>neighbor-address</i>   <i>peer-group</i></b>	Mandatory

Step	Command	Description
	<b><i>name</i> } route-map <i>rtmap-name</i> in</b>	By default, no route map is applied in the inbound direction
Configure neighbors to apply the routing map in the outbound direction	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } route-map <i>rtmap-name</i> out</b>	Mandatory By default, no route map is applied in the outbound direction

### Configure VXLAN Route Map (Optional)

When configuring the neighbor VXLAN policy, you need to bind the route map, and use the route map to acquire matches such as local VXLAN number and route next hop to control the inbound and outbound routes.

Table 126-15 Configuring VXLAN Route Map

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create Routing Map	<b>route-map <i>map-name</i> [ { permit   deny } [ <i>seq-number</i> ] ]</b>	Mandatory By default, no routing map is created.
Match vxlan-id	<b>match vxlan <i>vxlan-id</i></b>	Optional By default, matching local VXLAN numbers is not performed

### 126.2.4VXLAN Monitoring and Maintaining

Table 126-16 VXLAN Monitoring and Maintaining

Command	Description
<b>clear arp host vxlan</b> [ all   vxlan-id [ip-address] ]	Clear the local ARP host information in the VXLAN instance
<b>show arp host vxlan</b> [ vxlan-id ]	View the local ARP host information in the VXLAN instance
<b>show arp suppression</b> [ vxlan vxlan-id ]	View the ARP broadcast suppression table in the VXLAN instance
<b>show bgp l2vpn evpn</b> { all   rd route-distinguisher   vxlan-id } { all-type   type { 2 [eth-tag-id:ip-addr-len:ip-address]   3 [eth-tag-id:mac-addr-len:mac-addr:ip-addr-len:ip-addr] }   5 [eth-tag-id:ip-addr-len:ip-addr] }	Show the routing information under MVPN address family of BGP
<b>show bgp l2vpn evpn conf</b>	Show EVPN related configuration information
<b>show bgp l2vpn evpn</b> {vxlan vxlan-id   vrf vrf-name}	Show EVPN VXLAN/VRF related information
<b>show bgp l2vpn evpn</b> { all   rd route-distinguisher   vxlan-id } neighbors ip-address { advertised-routes   received-routes   routes } { all-type   type 2   type 3   type 5 }	Show the route information of the designated neighbor under the BGP EVPN address family
<b>show bgp l2vpn evpn vxlan-id statistic</b>	Show the route statistics of the designated VXLAN under the BGP EVPN address family
<b>show bgp l2vpn evpn summary</b>	Show BGP EVPN neighbor summary
<b>show vxlan vxlan-id config</b>	Show the configuration information of the designated VXLAN instance
<b>show vxlan vxlan-id instance</b>	Show the instance information of the designated VXLAN

Command	Description
<b>show vxlan vxlan-id internal</b>	Show the service access point of the designated VXLAN instance
<b>show vxlan vxlan-id session</b>	Show all session information associated with the designated VXLAN instance
<b>show vxlan config</b>	Show the global information of VXLAN
<b>show vxlan instance</b>	Show VXLAN instance information
<b>show vxlan internal [interface interface-num   interface link-aggregation link-aggregation-id ]</b>	Show the service access points of VXLAN
<b>show vxlan tunnel</b>	Show VXLAN tunnel information
<b>show vxlan session</b>	Show VXLAN session information

## 126.3 Typical Configuration Example of VXLAN

### 126.3.1 Configure Static VXLAN for Two-layer Intercommunication

#### Network Requirements

- Leaf1 and Leaf2 serve as VTEPs to create VXLAN instances.
- Leaf1 and Leaf2 establish static VXLAN tunnels through loopback interfaces.
- VMs in Server1 and Server2 on the same network segment can communicate with each other through the established VXLAN tunnel,

#### Network Topology

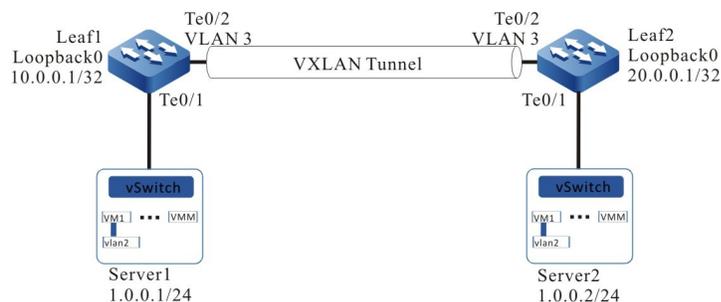

Figure 126-1 Network Topology for Configuring Static VXLAN for Two-layer Intercommunication

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports.

#Configure Leaf1.

```
Leaf1(config)#interface loopback 0
Leaf1(config-if-loopback0)#ip address 10.0.0.1 255.255.255.255
Leaf1(config-if-loopback0)#exit
Leaf1(config)#interface vlan 3
Leaf1(config-if-vlan3)#ip address 2.0.0.1 255.255.255.0
Leaf1(config-if-vlan3)#exit
```

#Configure Leaf2.

```
Leaf2(config)#interface loopback 0
Leaf2(config-if-loopback0)#ip address 20.0.0.1 255.255.255.255
Leaf2(config-if-loopback0)#exit
Leaf2(config)#interface vlan 3
Leaf2(config-if-vlan3)#ip address 2.0.0.2 255.255.255.0
Leaf2(config-if-vlan3)#exit
```

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#Configure Leaf1.

```
Leaf1#configure terminal
Leaf1(config)#router ospf 100
Leaf1(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Leaf1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Leaf1(config-ospf)#exit
```

#Configure Leaf2.

```
Leaf2#configure terminal
Leaf2(config)#router ospf 100
Leaf2(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Leaf2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Leaf2(config-ospf)#exit
```

#View the routing table of Leaf1.

```

Leaf1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 00:05:40, vlan3
C 127.0.0.0/8 is directly connected, 1d:21:38:36, lo0
C 10.0.0.1/32 is directly connected, 00:06:34, loopback0
O 20.0.0.1/32 [110/2] via 2.0.0.2, 00:00:05, vlan3

```

#### #View the routing table of Leaf2.

```

Leaf2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 00:06:43, vlan3
C 127.0.0.0/8 is directly connected, 1w3d:03:35:57, lo0
O 10.0.0.1/32 [110/2] via 2.0.0.1, 00:02:36, vlan3
C 20.0.0.1/32 is directly connected, 00:07:07, loopback0

```

It is indicated that both Leaf1 and Leaf2 have learned the route of the loopback interface of the peer end by running the OSPF protocol, making preparations for the next step of Leaf1 and Leaf2 establishing IBGP neighbors via the loopback interface.

Step 4: Configure VXLAN and associate VNID so that the ports of Leaf1 and Leaf2 are added into VXLAN.

#### #Configure Leaf1.

```

Leaf1(config)# vxlan 100
Leaf1(config-vxlan-100)#vxlan vniid 100
Leaf1(config-vxlan-100)#exit
Leaf1(config)# interface tengigabitethernet 0/1
Leaf1(config-if-tengigabitethernet0/1)# vxlan 100 encapsulation vlan 2
Leaf1(config-if-tengigabitethernet0/1)#exit

```

#### #Configure Leaf2.

```

Leaf2(config)# vxlan 100
Leaf2(config-vxlan-100)#vxlan vniid 100
Leaf2(config-vxlan-100)#exit
Leaf2(config)# interface tengigabitethernet 0/1
Leaf2(config-if-tengigabitethernet0/1)# vxlan 100 encapsulation vlan 2
Leaf2(config-if-tengigabitethernet0/1)#exit

```

#### #View the VXLAN information of Leaf1.

```

Leaf1#show vxlan 100 config

vxlan 100
vxlan vniid 100
exit
Leaf1#show running-config interface te0/1

interface tengigabitethernet0/1
switchport mode trunk
switchport trunk allowed vlan add 2

```

```
switchport trunk pvid vlan 10
vxlan 100 encapsulation vlan 2
exit
```

#View the VXLAN information of Leaf2.

```
Leaf2#show vxlan 100 config

vxlan 100
vxlan vniid 100
exit

Leaf2#show running-config interface te0/1

interface tengigabitethernet0/1
switchport mode trunk
switchport trunk allowed vlan add 2
switchport trunk pvid vlan 10
vxlan 100 encapsulation vlan 2
exit
```

Step 5: Configure the static VXLAN tunnel

#Configure the nve interface of Leaf1 and configure the static headend replication member corresponding to VXLAN.

```
Leaf1(config)#interface nve 1
Leaf1(config-if-nve1)#source 10.0.0.1
Leaf1(config-if-nve1)#vxlan 100 ingress-replication peer 20.0.0.1
Leaf1(config-if-nve1)#mac-address learning disable
Leaf1(config-if-nve1)#exit
```

#Configure the nve interface of Leaf2 and configure the static headend replication member corresponding to VXLAN.

```
Leaf2(config)#interface nve 1
Leaf2(config-if-nve1)#source 20.0.0.1
Leaf2(config-if-nve1)#vxlan 100 ingress-replication peer 10.0.0.1
Leaf2(config-if-nve1)#mac-address learning disable
Leaf2(config-if-nve1)#exit
```

#View the tunnel information and VXLAN session of Leaf1.

```
Leaf1#show vxlan tunnel
Reason codes: SI - Source is Invalid:
    source address is not local;
    source interface is down;
    source interface is a tunnel or management interface.
DI - Destination is Invalid:
    destination address is local;
    destination address is unreachable;
    output interface is a tunnel or management interface.
```

Number of vxlan tunnel: 1

TunnelID	Source	Destination	State
32768	10.0.0.1	20.0.0.1	up

You can see that the VXLAN tunnel on Leaf1 is successfully established and is in UP state.

```
Leaf1#show vxlan session
Number of vxlan session: 1
-----
VXLAN-ID  SessionID  TunnelID  Source      Destination  State
-----
100      32768      32768    10.0.0.1    20.0.0.1    up
```

It is indicated that the VXLAN session with the VXLAN-ID of 100 on Leaf1 is successfully bound to the tunnel with the Tunnel ID of 32768 and is in UP state.

#View the VXLAN information of Leaf2.

```
Leaf2#show vxlan tunnel
Reason codes: SI - Source is Invalid:
               source address is not local;
               source interface is down;
               source interface is a tunnel or management interface.
DI - Destination is Invalid:
               destination address is local;
               destination address is unreachable;
               output interface is a tunnel or management interface.
```

```
Number of vxlan tunnel: 1
-----
TunnelID  Source      Destination  State
-----
32768    20.0.0.1    10.0.0.1    up
```

You can see that the VXLAN tunnel on Leaf2 is successfully established and is in UP state.

```
Leaf2#show vxlan session
Number of vxlan session: 1
-----
VXLAN-ID  SessionID  TunnelID  Source      Destination  State
-----
100      32768      32768    20.0.0.1    10.0.0.1    up
```

It is indicated that the VXLAN session with the VXLAN-ID of 100 on Leaf2 is successfully bound to the tunnel with the Tunnel ID of 32768 and is in UP state.

Step 6: Check the result.

#VM1 on Server1 pings VM1 on Server2.

```
C:\Documents and Settings\ Server 1> ping 1.0.0.2

Pinging 1.0.0.2 with 32 bytes of data:

Reply from 1.0.0.2: bytes=32 time<1ms TTL=255
```

Ping statistics for 1.0.0.2:  
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),  
Approximate round trip times in milli-seconds:  
Minimum = 0ms, Maximum = 0ms, Average = 0m

It is indicated that Server1 and Server2 can be intercommunicated across the three-layer network between Leaf1 and Leaf2.

### 126.3.2 Configure BGP EVPN VXLAN for Two-layer Intercommunication

#### Network Requirements

- Leaf1 and Leaf2 serve as VTEPs to create VXLAN instances.
- Leaf1 and Leaf2 create a BGP EVPN VXLAN tunnel, allowing for intercommunication between Server1 and Server2 on the same network segment.

#### Network Topology

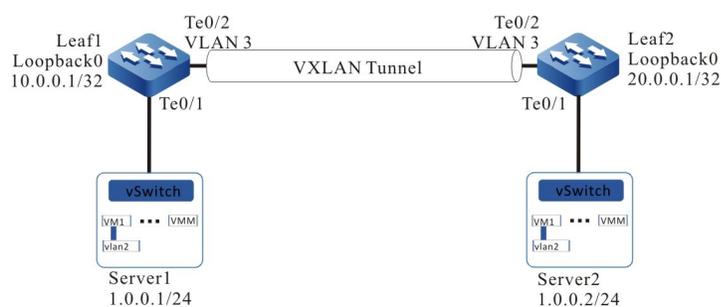

Figure 126-2 Network Topology for Configuring BGP EVPN VXLAN for Two-layer Intercommunication

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports.

#### #Configure Leaf1.

```
Leaf1(config)#interface loopback 0
Leaf1(config-if-loopback0)#ip address 10.0.0.1 255.255.255.255
Leaf1(config-if-loopback0)#exit
Leaf1(config)#interface vlan 3
Leaf1(config-if-vlan3)#ip address 2.0.0.1 255.255.255.0
Leaf1(config-if-vlan3)#exit
```

#### #Configure Leaf2.

```
Leaf2(config)#interface loopback 0
```

```
Leaf2(config-if-loopback0)#ip address 20.0.0.1 255.255.255.255
Leaf2(config-if-loopback0)#exit
Leaf2(config)#interface vlan 3
Leaf2(config-if-vlan3)#ip address 2.0.0.2 255.255.255.0
Leaf2(config-if-vlan3)#exit
```

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#### #Configure Leaf1.

```
Leaf1#configure terminal
Leaf1(config)#router ospf 100
Leaf1(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Leaf1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Leaf1(config-ospf)#exit
```

#### #Configure Leaf2.

```
Leaf2#configure terminal
Leaf2(config)#router ospf 100
Leaf2(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Leaf2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Leaf2(config-ospf)#exit
```

#### #View the routing table of Leaf1.

```
Leaf1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 00:05:40, vlan3
C 127.0.0.0/8 is directly connected, 1d:21:38:36, lo0
C 10.0.0.1/32 is directly connected, 00:06:34, loopback0
O 20.0.0.1/32 [110/2] via 2.0.0.2, 00:00:05, vlan3
```

#### #View the routing table of Leaf2.

```
Leaf2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 00:06:43, vlan3
C 127.0.0.0/8 is directly connected, 1w3d:03:35:57, lo0
O 10.0.0.1/32 [110/2] via 2.0.0.1, 00:02:36, vlan3
C 20.0.0.1/32 is directly connected, 00:07:07, loopback0
```

It is indicated that both Leaf1 and Leaf2 have learned the route of the loopback interface of the peer end by running the OSPF protocol.

Step 4: Configure VXLAN and associate VNID, and configure the EVPN address family so that the ports of Leaf1 and Leaf2 are added into VXLAN.

#### #Configure Leaf1.

```
Leaf1(config)# vxlan 100
```

```
Leaf1(config-vxlan-100)#vxlan vnid 100
Leaf1(config-vxlan-100)#address-family evpn
Leaf1(config-vxlan-100)#rd 100:1
Leaf1(config-vxlan-100)#route-target both 100:1
Leaf1(config-vxlan-100)#exit
Leaf1(config-vxlan-100)#exit
Leaf1(config)# interface tengigabitethernet 0/1
Leaf1(config-if-tengigabitethernet0/1)# vxlan 100 encapsulation vlan 2
Leaf1(config-if-tengigabitethernet0/1)#exit
```

#### #Configure Leaf2.

```
Leaf2(config)# vxlan 100
Leaf2(config-vxlan-100)#vxlan vnid 100
Leaf2(config-vxlan-100)#address-family evpn
Leaf2(config-vxlan-100)#rd 100:1
Leaf2(config-vxlan-100)#route-target both 100:1
Leaf2(config-vxlan-100)#exit
Leaf2(config-vxlan-100)#exit
Leaf2(config)# interface tengigabitethernet 0/1
Leaf2(config-if-tengigabitethernet0/1)# vxlan 100 encapsulation vlan 2
Leaf2(config-if-tengigabitethernet0/1)#exit
```

#### #View the VXLAN information of Leaf1.

```
Leaf1#show vxlan 100 config

vxlan 100
vxlan vnid 100
address-family evpn
rd 100:1
route-target import 100:1
route-target export 100:1
exit
exit
Leaf1#show running-config interface te0/1

interface tengigabitethernet0/1
switchport mode trunk
switchport trunk allowed vlan add 2
switchport trunk pvid vlan 10
vxlan 100 encapsulation vlan 2
exit
```

#### #View the VXLAN information of Leaf2.

```
Leaf2#show vxlan 100 config

vxlan 100
vxlan vnid 100
address-family evpn
rd 100:1
route-target import 100:1
route-target export 100:1
exit
exit
Leaf2#show running-config interface te0/1

interface tengigabitethernet0/1
switchport mode trunk
switchport trunk allowed vlan add 2
switchport trunk pvid vlan 10
vxlan 100 encapsulation vlan 2
exit
```

## Step 5: Configure BGP.

### #Configure Leaf1.

Configure to establish a direct EBGP peer in direct connection with Leaf2, and activate the advertising capability under the EVPN address family

```
Leaf1(config)#router bgp 100
Leaf1(config-bgp)#neighbor 2.0.0.2 remote-as 200
Leaf1(config-bgp)#address-family l2vpn evpn
Leaf1(config-bgp-af)#neighbor 2.0.0.2 activate
Leaf1(config-bgp-af)#exit-address-family
Leaf1(config-bgp)#exit
```

### #Configure Leaf2.

Configure to establish a direct EBGP peer in direct connection with Leaf2, and activate the advertising capability under the EVPN address family.

```
Leaf2(config)#router bgp 200
Leaf2(config-bgp)#neighbor 2.0.0.1 remote-as 100
Leaf2(config-bgp)#address-family l2vpn evpn
Leaf2(config-bgp-af)#neighbor 2.0.0.1 activate
Leaf2(config-bgp-af)#exit-address-family
Leaf2(config-bgp)#exit
```

### #Check BGP EVPN neighbors of Leaf1.

```
Leaf1#show bgp l2vpn evpn summary
BGP router identifier 10.0.0.1, local AS number 100
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V    AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
2.0.0.2    4    200   52   50    4   0   00:42:18   0

Total number of neighbors 1
```

### #Check BGP EVPN neighbors of Leaf2.

```
Leaf2#show bgp l2vpn evpn summary
BGP router identifier 20.0.0.1, local AS number 200
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V    AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
2.0.0.1    4    100   52   53    5   0   00:43:20   0

Total number of neighbors 1
```

It is indicated that Leaf1 and Leaf2 have successfully established BGP EVPN neighbors.

## Step 6: Create the NVE interface

#Configure the NVE interface of Leaf1 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a L2 tunnel.

```
Leaf1(config)#interface nve 1
Leaf1(config-if-nve1)#source 10.0.0.1
Leaf1(config-if-nve1)#vxlan 100 ingress-replication protocol bgp
Leaf1(config-if-nve1)#mac-address learning disable
Leaf1(config-if-nve1)#exit
```

#Configure the NVE interface of Leaf2 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a L2 tunnel.

```
Leaf2(config)#interface nve 1
Leaf2(config-if-nve1)#source 20.0.0.1
Leaf2(config-if-nve1)#vxlan 100 ingress-replication protocol bgp
Leaf2(config-if-nve1)#mac-address learning disable
Leaf2(config-if-nve1)#exit
```

#View the tunnel information and VXLAN session of Leaf1.

```
Leaf1#show vxlan tunnel
Reason codes: SI - Source is Invalid:
               source address is not local;
               source interface is down;
               source interface is a tunnel or management interface.
DI - Destination is Invalid:
               destination address is local;
               destination address is unreachable;
               output interface is a tunnel or management interface.
```

Number of vxlan tunnel: 1

TunnelID	Source	Destination	State
32768	10.0.0.1	20.0.0.1	up

```
Leaf1#show vxlan session
Number of vxlan session: 1
```

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
100	32768	32768	10.0.0.1	20.0.0.1	up

#View the tunnel information of Leaf2 and the VXLAN session.

```
Leaf2#show vxlan tunnel
Reason codes: SI - Source is Invalid:
               source address is not local;
               source interface is down;
               source interface is a tunnel or management interface.
DI - Destination is Invalid:
               destination address is local;
               destination address is unreachable;
               output interface is a tunnel or management interface.
```

Number of vxlan tunnel: 1

TunnelID	Source	Destination	State
----------	--------	-------------	-------

```
32768 20.0.0.1 10.0.0.1 up
```

```
Leaf2#show vxlan session  
Number of vxlan session: 1
```

```
-----  
VXLAN-ID  SessionID  TunnelID  Source      Destination  State  
-----  
100      32768      32768     20.0.0.1    10.0.0.1     up
```

From the information described above, you can see that the tunnel is UP, and the dynamic VXLAN multicast session between Leaf1 and Leaf2 can be established normally. At this point, L2 BUM traffic can be forwarded between Leaf1 and Leaf2.

Step 7: VM1 of Server 1 and VM1 of Server 2 ping addresses absent in the same network segment, respectively, and check the VXLAN session between Leaf1 and Leaf2

#View the VXLAN session of Leaf1.

```
Leaf1#show vxlan session 20.0.0.1  
vxlan session 32768  
state: up  
source IP: 10.0.0.1  
destination IP: 20.0.0.1  
source mac: 0001.7a00.5278  
destination mac: 0001.7a21.81e7  
interface: vlan3  
switchport: tengigabitethernet0/2  
vxlan list: 100  
vxlan unicast list: 100  
vxlan multicast list: 100
```

#View the VXLAN session of Leaf2.

```
Leaf2#show vxlan session 10.0.0.1  
vxlan session 32768  
state: up  
source IP: 20.0.0.1  
destination IP: 10.0.0.1  
source mac: 0001.7a21.81e7  
destination mac: 0001.7a00.5278  
interface: vlan3  
switchport: tengigabitethernet0/2  
vxlan list: 100  
vxlan unicast list: 100  
vxlan multicast list: 100
```

It is indicated that all dynamic unicast sessions have been established, with L2 unicast traffic available for forwarding

Step 8: Check the result.

#Ping VM1 of Server2 on VM1 of Server1.

```
C:\Documents and Settings\ Server 1> ping 1.0.0.2
```

Pinging 1.0.0.2 with 32 bytes of data:

Reply from 1.0.0.2: bytes=32 time<1ms TTL=255

Ping statistics for 1.0.0.2:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milli-seconds:

Minimum = 0ms, Maximum = 0ms, Average = 0m

It is indicated that Server1 and Server2 can be intercommunicated across the three-layer network between Leaf1 and Leaf2.

---

## Note

- BGP EVPN supports IBGP and EBGP.
  - After BGP enables the EVPN VXLAN capability, BGP neighbors will be automatically reestablished.
- 

### 126.3.3 Configure Static Centralized VXLAN Gateway

#### Network Requirements

- Create VXLAN instances on Leaf1, Spine1, and Leaf2, respectively.
- Leaf1, Spine1, and Leaf2 establish a static VXLAN tunnel via the loopback interface, which tunnel acts as a centralized VXLAN gateway on Spine1 for intercommunication between Server1 and Server3 on the same network segment and between Server2 and Server3 on different network segments.

#### Network Topology

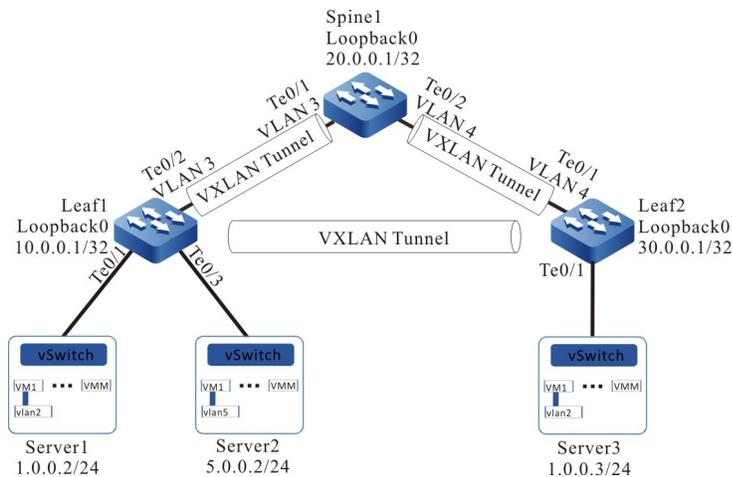

Figure 126-3 Network Topology for Configuring Static Centralized VXLAN Gateway

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports.

#### #Configure Leaf1.

```
Leaf1(config)#interface loopback 0
Leaf1(config-if-loopback0)#ip address 10.0.0.1 255.255.255.255
Leaf1(config-if-loopback0)#exit
Leaf1(config)#interface vlan 3
Leaf1(config-if-vlan3)#ip address 2.0.0.1 255.255.255.0
Leaf1(config-if-vlan3)#exit
```

#### #Configure Spine1.

```
Spine1(config)#interface loopback 0
Spine1(config-if-loopback0)#ip address 20.0.0.1 255.255.255.255
Spine1(config-if-loopback0)#exit
Spine1(config)#interface vlan 3
Spine1(config-if-vlan3)#ip address 2.0.0.2 255.255.255.0
Spine1(config-if-vlan3)#exit
Spine1(config)#interface vlan 4
Spine1(config-if-vlan4)#ip address 3.0.0.1 255.255.255.0
Spine1(config-if-vlan4)#exit
```

#### #Configure Leaf2.

```
Leaf2(config)#interface loopback 0
Leaf2(config-if-loopback0)#ip address 30.0.0.1 255.255.255.255
Leaf2(config-if-loopback0)#exit
Leaf2(config)#interface vlan 4
Leaf2(config-if-vlan4)#ip address 3.0.0.2 255.255.255.0
Leaf2(config-if-vlan4)#exit
```

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#### #Configure Leaf1.

```
Leaf1#configure terminal
Leaf1(config)#router ospf 100
Leaf1(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Leaf1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Leaf1(config-ospf)#exit
```

#### #Configure Spine1.

```
Spine1#configure terminal
Spine1(config)#router ospf 100
Spine1(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Spine1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Spine1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Spine1(config-ospf)#exit
```

#### #Configure Leaf2.

```
Leaf2#configure terminal
Leaf2(config)#router ospf 100
Leaf2(config-ospf)#network 30.0.0.1 0.0.0.0 area 0
Leaf2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Leaf2(config-ospf)#exit
```

#### #View the routing table of Leaf1.

```
Leaf1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 00:28:27, vlan3
O 3.0.0.0/24 [110/2] via 2.0.0.2, 00:00:05, vlan3
C 127.0.0.0/8 is directly connected, 2d:23:06:31, lo0
C 10.0.0.1/32 is directly connected, 1d:01:34:29, loopback0
O 20.0.0.1/32 [110/2] via 2.0.0.2, 00:00:05, vlan3
O 30.0.0.1/32 [110/3] via 2.0.0.2, 00:00:05, vlan3
```

#### #View the routing table of Spine1.

```
Spine1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 07:04:46, vlan3
C 3.0.0.0/24 is directly connected, 00:23:50, vlan4
C 127.0.0.0/8 is directly connected, 1w4d:05:02:08, lo0
O 10.0.0.1/32 [110/2] via 2.0.0.1, 00:00:57, vlan3
C 20.0.0.1/32 is directly connected, 1d:01:33:17, loopback0
O 30.0.0.1/32 [110/2] via 3.0.0.2, 00:01:33, vlan4
```

#### #View the routing table of Leaf2.

```
Leaf2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

- O 2.0.0.0/24 [110/2] via 3.0.0.1, 00:02:43, vlan4
- C 3.0.0.0/24 is directly connected, 00:22:14, vlan4
- C 30.0.0.0/24 is directly connected, 00:23:24, loopback0
- C 127.0.0.0/8 is directly connected, 4d:00:16:59, lo0
- O 10.0.0.1/32 [110/3] via 3.0.0.1, 00:02:07, vlan4
- O 20.0.0.1/32 [110/2] via 3.0.0.1, 00:02:43, vlan4

You can see that Leaf1, Spine1 and Leaf2 all have learned the route of the loopback interface of the peer end by running the OSPF protocol.

Step 4: Configure VXLAN and associate VNID so that the ports of Leaf1 and Spine1 are added into VXLAN.

#### #Configure Leaf1.

```
Leaf1(config)#vxlان 100
Leaf1(config-vxlan-100)#vxlan vnid 100
Leaf1(config-vxlan-100)#exit
Leaf1(config)# interface tengigabitetherne١ 0/1
Leaf1(config-if-tengigabitetherne١ 0/1)# vxlan 100 encapsulation vlan 2
Leaf1(config-if-tengigabitetherne١ 0/1)#exit

Leaf1(config)#vxlان 200
Leaf1(config-vxlan-200)#vxlan vnid 200
Leaf1(config-vxlan-200)#exit
Leaf1(config)# interface tengigabitetherne١ 0/3
Leaf1(config-if-tengigabitetherne١ 0/3)# vxlan 200 encapsulation vlan 5
Leaf1(config-if-tengigabitetherne١ 0/3)#exit
```

#### #Configure Spine1.

```
Spine1(config)#vxlان 100
Spine1(config-vxlan-100)#vxlan vnid 100
Spine1(config-vxlan-100)#exit
Spine1(config)# vxlan 200
Spine1(config-vxlan-200)#vxlan vnid 200
Spine1(config-vxlan-200)#exit
```

#### #Configure Leaf2.

```
Leaf2(config)#vxlان 100
Leaf2(config-vxlan-100)#vxlan vnid 100
Leaf2(config-vxlan-100)#exit
Leaf2(config)# interface tengigabitetherne١ 0/1
Leaf2(config-if-tengigabitetherne١ 0/1)# vxlan 100 encapsulation vlan 2
Leaf2(config-if-tengigabitetherne١ 0/1)#exit
```

#### #View the VXLAN information of Leaf1.

```
Leaf1#show vxlan config

vxlan 100
vxlan vnid 100
exit
```

```
vxlan 200
vxlan vnid 200
exit
```

```
Leaf1#show running-config interface te0/1
```

```
interface tengigabitethernet0/1
switchport mode trunk
switchport trunk allowed vlan add 2
switchport trunk pvid vlan 10
vxlan 100 encapsulation vlan 2
exit
```

```
Leaf1#show running-config interface te0/3
```

```
interface tengigabitethernet0/3
switchport mode trunk
switchport trunk allowed vlan add 5
switchport trunk pvid vlan 10
vxlan 100 encapsulation vlan 5
exit
```

#### #View the VXLAN information of Spine1.

```
Spine1#show vxlan config
```

```
vxlan 100
vxlan vnid 100
exit
vxlan 200
vxlan vnid 200
exit
```

#### #View the VXLAN information of Leaf2.

```
Leaf2#show vxlan config
```

```
vxlan 100
vxlan vnid 100
exit
```

```
Leaf1#show running-config interface te0/1
```

```
interface tengigabitethernet0/1
switchport mode trunk
switchport trunk allowed vlan add 2
switchport trunk pvid vlan 10
vxlan 100 encapsulation vlan 2
exit
```

#### Step 5: Configure the static VXLAN tunnel

#### #Configure the nve interface of Leaf1 and configure the static headend replication member corresponding to VXLAN.

```
Leaf1(config)#interface nve 1
Leaf1(config-if-nve1)#source 10.0.0.1
Leaf1(config-if-nve1)#vxlan 100 ingress-replication peer 20.0.0.1
Leaf1(config-if-nve1)#vxlan 100 ingress-replication peer 30.0.0.1
Leaf1(config-if-nve1)#vxlan 200 ingress-replication peer 20.0.0.1
Leaf1(config-if-nve1)#mac-address learning disable
Leaf1(config-if-nve1)#exit
```

#Configure the nve interface of Leaf1 and configure the static headend replication member corresponding to VXLAN.

```
Spine1(config)#interface nve 1
Spine1(config-if-nve1)#source 20.0.0.1
Spine1(config-if-nve1)#vxlan 100 ingress-replication peer 10.0.0.1
Spine1(config-if-nve1)#vxlan 100 ingress-replication peer 30.0.0.1
Spine1(config-if-nve1)#vxlan 200 ingress-replication peer 10.0.0.1
Spine1 (config-if-nve1)#mac-address learning disable
Spine1(config-if-nve1)#exit
```

#Configure the nve interface of Leaf2 and configure the static headend replication member corresponding to VXLAN.

```
Leaf2(config)#interface nve 1
Leaf2(config-if-nve1)#source 30.0.0.1
Leaf2(config-if-nve1)#vxlan 100 ingress-replication peer 10.0.0.1
Leaf2(config-if-nve1)#vxlan 100 ingress-replication peer 20.0.0.1
Leaf2(config-if-nve1)#mac-address learning disable
Leaf2(config-if-nve1)#exit
```

#View the tunnel information and VXLAN session of Leaf1.

```
Leaf1#show vxlan tunnel
Reason codes: SI - Source is Invalid:
                source address is not local;
                source interface is down;
                source interface is a tunnel or management interface.
DI - Destination is Invalid:
                destination address is local;
                destination address is unreachable;
                output interface is a tunnel or management interface.
```

Number of vxlan tunnel: 2

TunnelID	Source	Destination	State
32768	10.0.0.1	20.0.0.1	up
32769	10.0.0.1	30.0.0.1	up

```
Leaf1#show vxlan session
Number of vxlan session: 3
```

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
100	32768	32768	10.0.0.1	20.0.0.1	up
100	32769	32769	10.0.0.1	30.0.0.1	up
200	32768	32768	10.0.0.1	20.0.0.1	up

It is indicated that the VXLAN sessions with VXLAN-IDs of 100 and 200 share the same tunnel with the Tunnel ID of 32768.

#View the tunnel information and VXLAN session of Spine1.

```
Spine1#show vxlan tunnel
Reason codes: SI - Source is Invalid:
                source address is not local;
                source interface is down;
                source interface is a tunnel or management interface.
DI - Destination is Invalid:
                destination address is local;
```

destination address is unreachable;  
output interface is a tunnel or management interface.

Number of vxlan tunnel: 2

TunnelID	Source	Destination	State
32768	20.0.0.1	10.0.0.1	up
32769	20.0.0.1	30.0.0.1	up

Spine1#show vxlan session  
Number of vxlan session: 3

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
100	32768	32768	20.0.0.1	10.0.0.1	up
100	32769	32769	20.0.0.1	30.0.0.1	up
200	32768	32768	20.0.0.1	10.0.0.1	up

### #View the tunnel information and VXLAN session of Leaf2.

```
Leaf2#show vxlan tunnel
Reason codes: SI - Source is Invalid:
               source address is not local;
               source interface is down;
               source interface is a tunnel or management interface.
DI - Destination is Invalid:
               destination address is local;
               destination address is unreachable;
               output interface is a tunnel or management interface.
```

Number of vxlan tunnel: 2

TunnelID	Source	Destination	State
32768	30.0.0.1	10.0.0.1	up
32769	30.0.0.1	20.0.0.1	up

Leaf2#show vxlan session  
Number of vxlan session: 2

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
100	32768	32768	30.0.0.1	10.0.0.1	up
100	32769	32769	30.0.0.1	20.0.0.1	up

The information described above indicates that the tunnel is UP, the VXLAN session state is active and VXLAN is correctly associated.

### Step 6: Configure the VXLAN L3 gateway on Spine1.

```
Spine1(config)#interface vxlan 100
Spine1(config-if-vxlan100)#ip address 1.0.0.1 24
Spine1(config-if-vxlan100)#exit
Spine1(config)#int vxlan 200
Spine1(config-if-vxlan200)#ip address 5.0.0.1 24
Spine1(config-if-vxlan200)#exit
```

### #View the interface VXLAN interface and routing table of Spine1.

```
Spine1#show interface vxlan 100
vxlan100:
```

```

line protocol is up
Flags: (0xc008063) BROADCAST MULTICAST ARP RUNNING
Type: ETHERNET_CSMACD
Internet address: 1.0.0.1/24
Broadcast address: 1.0.0.255
Metric: 0, MTU: 1500, BW: 100000 Kbps, DLY: 100 usec, VRF: global
Reliability 255/255, Txload 1/255, Rxload 1/255
Ethernet address is 0001.7a21.81e7
5 minutes input rate 0 bits/sec, 0 packets/sec
5 minutes output rate 0 bits/sec, 0 packets/sec
1 packets received; 2 packets sent
1 multicast packets received
2 multicast packets sent
0 input errors; 0 output errors
0 collisions; 0 dropped
Unknown protocol 0

```

Spine1#show interface vxlan 200

vxlan200:

```

line protocol is up
Flags: (0xc008063) BROADCAST MULTICAST ARP RUNNING
Type: ETHERNET_CSMACD
Internet address: 5.0.0.1/24
Broadcast address: 5.0.0.255
Metric: 0, MTU: 1500, BW: 100000 Kbps, DLY: 100 usec, VRF: global
Reliability 255/255, Txload 1/255, Rxload 1/255
Ethernet address is 0001.7a21.81e7
5 minutes input rate 0 bits/sec, 0 packets/sec
5 minutes output rate 0 bits/sec, 0 packets/sec
0 packets received; 2 packets sent
0 multicast packets received
2 multicast packets sent
0 input errors; 0 output errors
0 collisions; 0 dropped
Unknown protocol 0

```

Spine1#show ip route

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

U - Per-user Static route

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

C 1.0.0.0/24 is directly connected, 00:02:08, vxlan100
C 2.0.0.0/24 is directly connected, 07:51:05, vlan3
C 3.0.0.0/24 is directly connected, 01:10:08, vlan4
C 5.0.0.0/24 is directly connected, 00:01:58, vxlan200
C 127.0.0.0/8 is directly connected, 1w4d:05:48:26, lo0
O 10.0.0.1/32 [110/2] via 2.0.0.1, 00:47:15, vlan3
C 20.0.0.1/32 is directly connected, 1d:02:19:36, loopback0
O 30.0.0.1/32 [110/2] via 3.0.0.2, 00:47:51, vlan4

```

Step 7: Check the result.

#Configure the gateways on Server1, Server2 and Server3.

#Ping Server1 on Server3.

```
C:\Documents and Settings\ Server 3> ping 1.0.0.2
```

```
Pinging 1.0.0.2 with 32 bytes of data:
```

```
Reply from 1.0.0.2: bytes=32 time<1ms TTL=255
```

```
Reply from 1.0.0.2: bytes=32 time<1ms TTL=255
```

```
Reply from 1.0.0.2: bytes=32 time<1ms TTL=255
Reply from 1.0.0.2: bytes=32 time<1ms TTL=255
```

```
Ping statistics for 1.0.0.2:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 0ms, Average = 0m
```

You can see that Server1 and Server3 can be intercommunicated across the three-layer network between Leaf1, Spine1 and Leaf2.

#Ping Server2 on Server3.

```
C:\Documents and Settings\ Server 3> ping 5.0.0.2
```

```
Pinging 5.0.0.2 with 32 bytes of data:
```

```
Reply from 5.0.0.2: bytes=32 time<1ms TTL=255
```

```
Ping statistics for 5.0.0.2:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 0ms, Average = 0m
```

You can see that Server2 and Server3 can be intercommunicated across the three-layer network between Leaf1, Spine1 and Leaf2.

## 126.3.4 Configure BGP EVPN VXLAN Centralized Active-Active Gateway

### Network Requirements

- Create VXLAN instances on Leaf1, Leaf2, Spine1, and Spine2, respectively.
- Leaf1, Leaf2, Spine1, and Spine2 use MP-IBGP to get through the EVPN route, create the IBGP EVPN VXLAN tunnel, and create the VXLAN centralized gateway on Spine1 and Spine2, allowing for intercommunication between VM1 of Server1 and VM1 of Server2 on different network segments.

### Network Topology

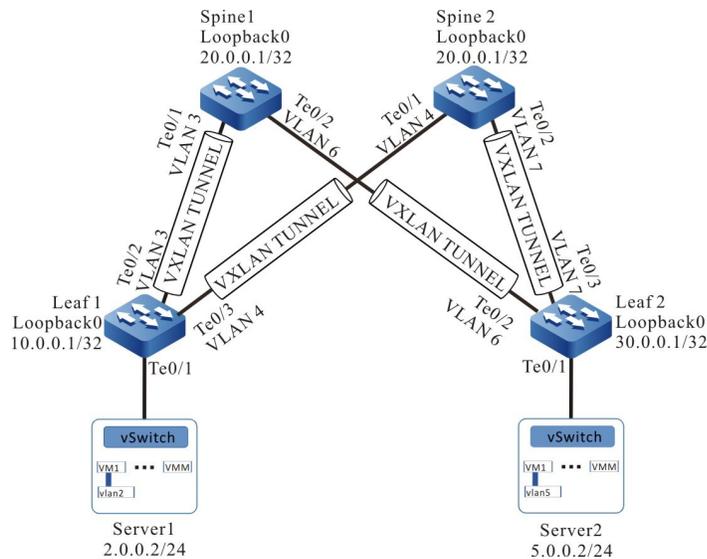

Figure 126-4 Network Topology for Configuring BGP EVPN VXLAN Centralized Active-Active Gateway

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports.

#### #Configure Leaf1.

```
Leaf1(config)#interface loopback 0
Leaf1(config-if-loopback0)#ip address 10.0.0.1 255.255.255.255
Leaf1(config-if-loopback0)#exit
Leaf1(config)#interface vlan 3
Leaf1(config-if-vlan3)#ip address 3.0.0.1 255.255.255.0
Leaf1(config-if-vlan3)#exit
Leaf1(config)#interface vlan 4
Leaf1(config-if-vlan4)#ip address 4.0.0.1 255.255.255.0
Leaf1(config-if-vlan4)#exit
```

#### #Configure Leaf2.

```
Leaf2(config)#interface loopback 0
Leaf2(config-if-loopback0)#ip address 30.0.0.1 255.255.255.255
Leaf2(config-if-loopback0)#exit
Leaf2(config)#interface vlan 6
Leaf2(config-if-vlan6)#ip address 6.0.0.2 255.255.255.0
Leaf2(config-if-vlan6)#exit
Leaf2(config)#interface vlan 7
Leaf2(config-if-vlan7)#ip address 7.0.0.2 255.255.255.0
Leaf2(config-if-vlan7)#exit
```

#### #Configure Spine1.

```
Spine1(config)#interface loopback 0
Spine1(config-if-loopback0)#ip address 20.0.0.1 255.255.255.255
```

```

Spine1(config-if-loopback0)#exit
Spine1(config)#interface loopback 1
Spine1(config-if-loopback1)#ip address 20.0.1.1 255.255.255.255
Spine1(config-if-loopback1)#exit
Spine1(config)#interface vlan 3
Spine1(config-if-vlan3)#ip address 3.0.0.2 255.255.255.0
Spine1(config-if-vlan3)#exit
Spine1(config)#interface vlan 6
Spine1(config-if-vlan6)#ip address 6.0.0.2 255.255.255.0
Spine1(config-if-vlan6)#exit

```

### #Configure Spine2.

```

Spine2(config)#interface loopback 0
Spine2(config-if-loopback0)#ip address 20.0.0.1 255.255.255.255
Spine2(config-if-loopback0)#exit
Spine2(config)#interface loopback 1
Spine2(config-if-loopback1)#ip address 20.0.2.1 255.255.255.255
Spine2(config-if-loopback1)#exit
Spine2(config)#interface vlan 4
Spine2(config-if-vlan4)#ip address 4.0.0.2 255.255.255.0
Spine2(config-if-vlan4)#exit
Spine2(config)#interface vlan 7
Spine2(config-if-vlan7)#ip address 7.0.0.2 255.255.255.0
Spine2(config-if-vlan7)#exit

```

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

### #Configure Leaf1.

```

Leaf1#configure terminal
Leaf1(config)#router ospf 100
Leaf1(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Leaf1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Leaf1(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Leaf1(config-ospf)#exit

```

### #Configure Leaf2, Spine1 and Spine2 with reference to Leaf1

### #View the routing table of Leaf1.

```

Leaf1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 3.0.0.0/24 is directly connected, 02:47:02, vlan3
C 4.0.0.0/24 is directly connected, 02:46:43, vlan4
O 6.0.0.0/24 [110/2] via 3.0.0.2, 02:32:02, vlan3
O 7.0.0.0/24 [110/2] via 4.0.0.2, 02:31:22, vlan4
C 127.0.0.0/8 is directly connected, 21:16:50, lo0
C 10.0.0.1/32 is directly connected, 02:51:55, loopback0
O 20.0.0.1/32 [110/2] via 3.0.0.2, 02:32:02, vlan3
  [110/2] via 4.0.0.2, 02:31:32, vlan4
O 20.0.1.1/32 [110/2] via 3.0.0.2, 01:51:02, vlan3
O 20.0.2.1/32 [110/2] via 4.0.0.2, 01:53:11, vlan4
O 30.0.0.1/32 [110/3] via 3.0.0.2, 02:32:02, vlan3
  [110/3] via 4.0.0.2, 02:31:22, vlan4

```

You can see that Leaf1 has learned the route of the loopback interface of the peer end by running the OSPF protocol.

Step 4: Configure VXLAN and associate VNID, and configure the EVPN address family so that the ports of Leaf1 and Leaf2 are added into VXLAN.

#### #Configure Leaf1.

```
Leaf1(config)# vxlan 100
Leaf1(config-vxlan-100)#vxlan vniid 100
Leaf1(config-vxlan-100)#address-family evpn
Leaf1(config-vxlan-evpn)#rd 100:1
Leaf1(config-vxlan-evpn)#route-target both 100:1
Leaf1(config-vxlan-evpn)#exit
Leaf1(config-vxlan-100)#exit
Leaf1(config)# interface tengigabitethernet 0/1
Leaf1(config-if-tengigabitethernet0/1)# vxlan 100 encapsulation vlan 2
Leaf1(config-if-tengigabitethernet0/1)#exit
```

#### #Configure Leaf2.

```
Leaf2(config)# vxlan 200
Leaf2(config-vxlan-200)# vxlan vniid 200
Leaf2(config-vxlan-200)#address-family evpn
Leaf2(config-vxlan-evpn)#rd 200:1
Leaf2(config-vxlan-evpn)#route-target both 200:1
Leaf2(config-vxlan-evpn)#exit
Leaf2(config-vxlan-200)#exit
Leaf2(config)# interface tengigabitethernet 0/1

#### Step 5: Configure BGP.

##### #Configure Leaf1.

Configure to establish the IBGP peers to Spine1 and Spine2, and activate the advertising capability under the EVPN address family.

```
Leaf1(config)#router bgp 100
Leaf1(config-bgp)#neighbor 20.0.1.1 remote-as 100
Leaf1(config-bgp)#neighbor 20.0.1.1 update-source loopback0
Leaf1(config-bgp)#neighbor 20.0.2.1 remote-as 100
Leaf1(config-bgp)#neighbor 20.0.1.1 update-source loopback0
Leaf1(config-bgp)#address-family l2vpn evpn
Leaf1(config-bgp-af)#neighbor 20.0.1.1 activate
Leaf1(config-bgp-af)#neighbor 20.0.2.1 activate
Leaf1(config-bgp-af)#exit-address-family
Leaf1(config-bgp)#exit
```

##### #Configure Spine1.

Configure to establish the IBGP peers to Leaf1 and Leaf2, and activate the advertising capability and reflector client under the EVPN address family.

```
Spine1(config)#router bgp 100
Spine1(config-bgp)#neighbor 10.0.0.1 remote-as 100
Spine1(config-bgp)#neighbor 10.0.0.1 update-source loopback1
Spine1(config-bgp)#neighbor 30.0.0.1 remote-as 100
Spine1(config-bgp)#neighbor 30.0.0.1 update-source loopback1
Spine1(config-bgp)#address-family l2vpn evpn
```

```

Spine1(config-bgp-af)#neighbor 10.0.0.1 activate
Spine1(config-bgp-af)#neighbor 10.0.0.1 route-reflector-client
Spine1(config-bgp-af)#neighbor 30.0.0.1 activate
Spine1(config-bgp-af)#neighbor 30.0.0.1 route-reflector-client
Spine1(config-bgp-af)#exit-address-family
Spine1(config-bgp)#exit

```

#Configure Leaf2, configure to establish the IBGP peers to Spine1 and Spine2, and activate the advertising capability under the EVPN address family. For the configurations, refer to the configuration of Leaf1.

#Configure Spine2, configure to establish the IBGP peers to Leaf1 and Leaf2, and activate the advertising capability and reflector client under the EVPN address family. For the configurations, refer to the configuration of Spine1.

#Check BGP EVPN neighbors of Leaf1.

```

```

Step 6: Configure the NVE interface and VM to trigger ARP learning.

#Configure the NVE interface of Leaf1 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a VXLAN tunnel.

```

Leaf1(config)#interface nve 1
Leaf1(config-if-nve1)#source 10.0.0.1
Leaf1(config-if-nve1)#vxlan 100 ingress-replication protocol bgp
Leaf1(config-if-nve1)#mac-address learning disable
Leaf1(config-if-nve1)#exit

```

#Configure the NVE interface of Leaf2 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a VXLAN tunnel.

```
Leaf2(config)#interface nve 1
Leaf2(config-if-nve1)#source 30.0.0.1
Leaf2(config-if-nve1)#vxlan 200 ingress-replication protocol bgp
Leaf2(config-if-nve1)#mac-address learning disable
Leaf2(config-if-nve1)#exit
```

#Configure the NVE interface of Spine1 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a VXLAN tunnel.

```
Spine1(config)#interface nve 1
Spine1(config-if-nve1)#source 20.0.0.1
Spine1(config-if-nve1)#vxlan 100,200 ingress-replication protocol bgp
Spine1(config-if-nve1)#mac-address learning disable
Spine1(config-if-nve1)#exit
```

#Configure the NVE interface of Spine2 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a VXLAN tunnel.

```
Spine2(config)#interface nve 1
Spine2(config-if-nve1)#source 20.0.0.1
Spine2(config-if-nve1)#vxlan 100,200 ingress-replication protocol bgp
Spine2(config-if-nve1)#mac-address learning disable
Spine2(config-if-nve1)#exit
```

#VM1 on Server1 and VM1 on Server2 ping the addresses absent on the same network segment, respectively.

## Step 7: Create the VXLAN L3 gateways on Spine1 and Spine2

#Create the VXLAN L3 gateway on Spine1

```
Spine1(config)#interface vxlan 100
Spine1(config-if-vxlan100)#ip address 2.0.0.1 24
Spine1(config-if-vxlan100)#mac-address 0000.5e00.0101
Spine1(config-if-vxlan100)#exit
Spine1(config)#int vxlan 200
Spine1(config-if-vxlan200)#ip address 5.0.0.1 24
Spine1(config-if-vxlan200)#mac-address 0000.5e00.0102
Spine1(config-if-vxlan200)#exit
```

#Create the VXLAN L3 gateway on Spine2

```
Spine2(config)#interface vxlan 100
Spine2(config-if-vxlan100)#ip address 2.0.0.1 24
Spine2(config-if-vxlan100)#mac-address 0000.5e00.0101
Spine2(config-if-vxlan100)#exit
Spine2(config)#int vxlan 200
Spine2(config-if-vxlan200)#ip address 5.0.0.1 24
Spine2(config-if-vxlan200)#mac-address 0000.5e00.0102
Spine2(config-if-vxlan200)#exit
```

#View the interface VXLAN interface and routing table of Spine1.

## #View the tunnel information and VXLAN session of Leaf1.

```
Leaf1#show vxlan tunnel
Reason codes: SI - Source is Invalid:
    source address is not local;
    source interface is down;
    source interface is a tunnel or management interface.
DI - Destination is Invalid:
    destination address is local;
    destination address is unreachable;
    output interface is a tunnel or management interface.
```

```
Number of vxlan tunnel: 1
```

TunnelID	Source	Destination	State
32768	10.0.0.1	20.0.0.1	up

```
Leaf1#show vxlan session
Number of vxlan session: 1
```

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
100	32768	32768	10.0.0.1	20.0.0.1	up

```
Leaf1#show vxlan session 20.0.0.1
```

```
vxlan session 32768
state: up
source IP: 10.0.0.1
destination IP: 20.0.0.1
source mac: 0001.7a91.2de8
destination mac: 0001.7a21.8203
interface: vlan4
switchport: tengigabitethernet0/3
source mac: 0001.7a91.2de8
destination mac: 0001.7a21.81e7
interface: vlan3
switchport: tengigabitethernet0/2
vxlan list: 100
vxlan unicast list: 100
vxlan multicast list: 100
```

You can see that Leaf1 has established dynamic unicast and multicast VXLAN sessions with both Spine1 and Spine2.

#View the tunnel information and VXLAN session of Leaf2.

```
Leaf2#show vxlan tunnel
Reason codes: SI - Source is Invalid:
    source address is not local;
    source interface is down;
    source interface is a tunnel or management interface.
DI - Destination is Invalid:
    destination address is local;
    destination address is unreachable;
    output interface is a tunnel or management interface.
```

```
Number of vxlan tunnel: 1
```

TunnelID	Source	Destination	State
32768	30.0.0.1	20.0.0.1	up

```
Leaf2#show vxlan session
Number of vxlan session: 1
```

```

-----
VXLAN-ID  SessionID  TunnelID  Source      Destination  State
-----
200      32768      32768     30.0.0.1    20.0.0.1    up
Leaf2#show vxlan session 20.0.0.1
vxlan session 32768
state: up
source IP: 30.0.0.1
destination IP: 20.0.0.1
source mac: 0001.7a00.5278
destination mac: 0001.7a21.81e7
interface: vlan6
switchport: tengigabitethernet0/2
source mac: 0001.7a00.5278
destination mac: 0001.7a21.8203
interface: vlan7
switchport: tengigabitethernet0/3
vxlan list: 200
vxlan unicast list: 200
vxlan multicast list: 200

```

It is indicated that Leaf2 has established dynamic unicast and multicast VXLAN sessions with both Spine1 and Spine2.

Step 8: Check the result.

#Configure the gateways on Server1 and Server2.

#Ping Server2 on Server1.

```

C:\Documents and Settings\ Server 1> ping 5.0.0.2

Pinging 5.0.0.2 with 32 bytes of data:

Reply from 5.0.0.2: bytes=32 time<1ms TTL=255

Ping statistics for 5.0.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0m

```

It is indicated that Server1 and Server2 can be intercommunicated across the three-layer network.

## 126.3.5 Configure BGP EVPN VXLAN Distributed Gateway

### Network Requirements

- Create VXLAN instances on Leaf1 and Leaf2, respectively.
- Leaf1, Spine1, and Leaf2 use MP-IBGP to get through the EVPN route, and Leaf1 and Leaf2 create the IBGP EVPN VXLAN tunnel, and create the VRF instances and VXLAN centralized gateways on Spine1 and Spine2, allowing for intercommunication between Server1 and Server 2 on the same network segment, and between Server2

```
Spine1(config)#interface vlan 4
Spine1(config-if-vlan4)#ip address 3.0.0.1 255.255.255.0
Spine1(config-if-vlan4)#exit
```

### #Configure Leaf2.

```
Leaf2(config)#interface loopback 0
Leaf2(config-if-loopback0)#ip address 30.0.0.1 255.255.255.255
Leaf2(config-if-loopback0)#exit
Leaf2(config)#interface loopback 1
Leaf2(config-if-loopback1)#ip address 30.0.1.1 255.255.255.255
Leaf2(config-if-loopback1)#exit
Leaf2(config)#interface vlan 4
Leaf2(config-if-vlan4)#ip address 3.0.0.2 255.255.255.0
Leaf2(config-if-vlan4)#exit
```

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

### #Configure Leaf1.

```
Leaf1#configure terminal
Leaf1(config)#router ospf 100
Leaf1(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Leaf1(config-ospf)#network 10.0.1.1 0.0.0.0 area 0
Leaf1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Leaf1(config-ospf)#exit
```

### #Configure Spine1.

```
Spine1#configure terminal
Spine1(config)#router ospf 100
Spine1(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Spine1(config-ospf)#network 20.0.1.1 0.0.0.0 area 0
Spine1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Spine1(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Spine1(config-ospf)#exit
```

### #Configure Leaf2.

```
Leaf2#configure terminal
Leaf2(config)#router ospf 100
Leaf2(config-ospf)#network 30.0.0.1 0.0.0.0 area 0
Leaf2(config-ospf)#network 30.0.1.1 0.0.0.0 area 0
Leaf2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Leaf2(config-ospf)#exit
```

### #View the routing table of Leaf1.

```
Leaf1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 00:56:51, vlan3
O 3.0.0.0/24 [110/2] via 2.0.0.2, 00:56:00, vlan3
C 10.0.1.0/24 is directly connected, 00:08:30, loopback1
C 127.0.0.0/8 is directly connected, 3d:03:23:29, lo0
C 10.0.0.1/32 is directly connected, 00:56:51, loopback0
O 20.0.0.1/32 [110/2] via 2.0.0.2, 00:56:00, vlan3
O 20.0.1.1/32 [110/2] via 2.0.0.2, 00:05:22, vlan3
O 30.0.0.1/32 [110/3] via 2.0.0.2, 00:55:52, vlan3
O 30.0.1.1/32 [110/3] via 2.0.0.2, 00:05:44, vlan3
```

## #View the routing table of Spine1.

```
Spine1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 01:01:05, vlan3
C 3.0.0.0/24 is directly connected, 01:01:05, vlan4
C 20.0.1.0/24 is directly connected, 00:12:40, loopback1
C 127.0.0.0/8 is directly connected, 1w4d:09:22:41, lo0
O 10.0.0.1/32 [110/2] via 2.0.0.1, 01:00:21, vlan3
O 10.0.1.1/32 [110/2] via 2.0.0.1, 00:08:04, vlan3
C 20.0.0.1/32 is directly connected, 01:01:05, loopback0
O 30.0.0.1/32 [110/2] via 3.0.0.2, 01:00:13, vlan4
O 30.0.1.1/32 [110/2] via 3.0.0.2, 00:10:05, vlan4
```

## #View the routing table of Leaf2.

```
Leaf2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 2.0.0.0/24 [110/2] via 3.0.0.1, 01:04:02, vlan4
C 3.0.0.0/24 is directly connected, 01:04:44, vlan4
C 30.0.0.0/24 is directly connected, 01:04:44, loopback0
C 30.0.1.0/24 is directly connected, 00:15:47, loopback1
C 127.0.0.0/8 is directly connected, 4d:04:40:07, lo0
O 10.0.0.1/32 [110/3] via 3.0.0.1, 01:04:02, vlan4
O 10.0.1.1/32 [110/3] via 3.0.0.1, 00:11:49, vlan4
O 20.0.0.1/32 [110/2] via 3.0.0.1, 01:04:02, vlan4
O 20.0.1.1/32 [110/2] via 3.0.0.1, 00:13:28, vlan4
```

You can see that Leaf1, Spine1 and Leaf2 all have learned the route of the loopback interface of the peer end by running the OSPF protocol.

**Step 4:** Configure VXLAN and associate VNID, and configure the EVPN address family so that the ports of Leaf1 and Leaf2 are added into VXLAN.

## #Configure Leaf1.

```
Leaf1(config)#vxlان 100
Leaf1(config-vxlان-100)#vxlان vnid 100
Leaf1(config-vxlان-100)#address-family evpn
Leaf1(config-vxlان-evpn)#rd 100:1
Leaf1(config-vxlان-evpn)#route-target both 100:1
Leaf1(config-vxlان-evpn)#exit
Leaf1(config-vxlان-100)#exit
Leaf1(config)# interface tengigabitethernet 0/1

  rd 200:1
  route-target import 200:1
  route-target export 200:1
  exit
exit
```

#### #View the VXLAN information of Leaf2.

```
Leaf2#show vxlan config
```

```
vxlan 100
  vxlan vniid 100
  address-family evpn
  rd 100:1
  route-target import 100:1
  route-target export 100:1
  exit
exit
```

```
Leaf1#show running-config interface te0/1
```

```
interface tengigabitethernet0/1
  switchport mode trunk
  switchport trunk allowed vlan add 2
  switchport trunk pvid vlan 10
  vxlan 100 encapsulation vlan 2
  exit
```

#### Step 5: Configure BGP.

#### #Configure Leaf1.

Configure to establish the IBGP peer to Spine1, and activate the advertising capability under the EVPN address family

```
Leaf1(config)#router bgp 100
Leaf1(config-bgp)#neighbor 20.0.1.1 remote-as 100
Leaf1(config-bgp)#neighbor 20.0.1.1 update-source loopback 1
```

```

Leaf1(config-bgp)#address-family l2vpn evpn
Leaf1(config-bgp-af)#neighbor 20.0.1.1 activate
Leaf1(config-bgp-af)#exit-address-family
Leaf1(config-bgp)#exit

```

### #Configure Spine1.

Configure to establish the IBGP peers respectively to Leaf1 and Leaf2, and activate the advertising capability and configuration reflector under the EVPN address family.

```

Spine1(config)#router bgp 100
Spine1(config-bgp)#neighbor 10.0.1.1 remote-as 100
Spine1(config-bgp)#neighbor 10.0.1.1 update-source loopback 1
Spine1(config-bgp)#neighbor 30.0.1.1 remote-as 100
Spine1(config-bgp)#neighbor 30.0.1.1 update-source loopback 1
Spine1(config-bgp)#address-family l2vpn evpn
Spine1(config-bgp-af)#neighbor 10.0.1.1 activate
Spine1(config-bgp-af)#neighbor 10.0.1.1 route-reflector-client
Spine1(config-bgp-af)#neighbor 30.0.1.1 activate
Spine1(config-bgp-af)#neighbor 30.0.1.1 route-reflector-client
Spine1(config-bgp-af)#exit-address-family
Spine1(config-bgp)#exit

```

### #Configure Leaf2.

Configure to establish the IBGP peer to Spine1, and activate the advertising capability under the EVPN address family.

```

Leaf2(config)#router bgp 100
Leaf2(config-bgp)#neighbor 20.0.1.1 remote-as 100
Leaf2(config-bgp)#neighbor 20.0.1.1 update-source loopback 1
Leaf2(config-bgp)#address-family l2vpn evpn
Leaf2(config-bgp-af)#neighbor 20.0.1.1 activate
Leaf2(config-bgp-af)#exit-address-family
Leaf2(config-bgp)#exit

```

### #Check BGP EVPN neighbors of Leaf1.

```

Leaf1#show bgp l2vpn evpn summary
BGP router identifier 10.0.1.1, local AS number 100

Total number of neighbors 2

```

## #Check BGP EVPN neighbors of Leaf2.

```
Leaf2#show bgp l2vpn evpn summary
BGP router identifier 30.0.1.1, local AS number 100
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V    AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
20.0.1.1    4    100   3     3     1     0  0:00:01:10   0

Total number of neighbors 1
```

## Step 6: Configure the VRF instance

### #Configure the VRF instance of Leaf1.

```
Leaf1(config)#ip vrf 1
Leaf1(config-vrf)#rd 100:2
Leaf1(config-vrf)#l3vnid 1
Leaf1(config-vrf)#address-family evpn
Leaf1(config-vrf-ipv4)#route-target both 100:2
Leaf1(config-vrf-ipv4)#exit
Leaf1(config-vrf)#exit
```

### #Configure the VRF instance of Leaf2.

```
Leaf2(config)#ip vrf 1
Leaf2(config-vrf)#rd 100:2
Leaf2(config-vrf)#l3vnid 1
Leaf2(config-vrf)#address-family evpn
Leaf2(config-vrf-ipv4)#route-target both 100:2
Leaf2(config-vrf-ipv4)#exit
Leaf2(config-vrf)#exit
```

## Step 7: Create the NVE interface

### #Configure the NVE interface of Leaf1 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a L2 tunnel.

```
Leaf1(config)#interface nve 1
Leaf1(config-if-nve1)#source 10.0.0.1
Leaf1(config-if-nve1)#vxlan 100,200 ingress-replication protocol bgp
Leaf1(config-if-nve1)#mac-address learning disable
Leaf1(config-if-nve1)#exit
```

### #Configure the NVE interface of Leaf2 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a L2 tunnel.

```
Leaf2(config)#interface nve 1
Leaf2(config-if-nve1)#source 30.0.0.1
Leaf2(config-if-nve1)#vxlan 100 ingress-replication protocol bgp
Leaf2(config-if-nve1)#mac-address learning disable
Leaf2(config-if-nve1)#exit
```

## Step 8: Configure the VXLAN L3 gateway and bind the corresponding VRF instance

### #Configure the L3 gateway of Leaf1 and bind the corresponding VRF instance

```
Leaf1(config)#interface vxlan 200
Leaf1(config-if-vxlan200)#ip vrf forwarding 1
Leaf1(config-if-vxlan200)#vxlan distribute-gateway
Leaf1(config-if-vxlan200)#ip address 5.0.0.1 24
Leaf1(config-if-vxlan200)#exit
```

#Configure the L3 gateway of Leaf2 and bind the corresponding VRF instance.

```
Leaf2(config)#interface vxlan 100
Leaf2(config-if-vxlan100)#ip vrf forwarding 1
Leaf2(config-if-vxlan100)#vxlan distribute-gateway
Leaf2(config-if-vxlan100)#ip address 1.0.0.1 24
Leaf2(config-if-vxlan100)#exit
```

#View the interface VXLAN interface and routing table of Leaf1.

```
Leaf1#show interface vxlan 200
vxlan200:

 U - Per-user Static route  
 O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:02:15, vxlan100

### #View the tunnel information and the VXLAN session of Leaf1

```
Leaf1#show vxlan tunnel
Reason codes: SI - Source is Invalid:
    source address is not local;
    source interface is down;
    source interface is a tunnel or management interface.
DI - Destination is Invalid:
    destination address is local;
    destination address is unreachable;
    output interface is a tunnel or management interface.
```

Number of vxlan tunnel: 1

TunnelID	Source	Destination	State
32768	10.0.0.1	30.0.0.1	up

```
Leaf1#show vxlan session
Number of vxlan session: 1
```

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
100	32768	32768	10.0.0.1	30.0.0.1	up

```
Leaf1#show vxlan session l3
Number of vxlan session: 1
```

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
8191	32768	32768	10.0.0.1	30.0.0.1	up

### #View the tunnel information and VXLAN session of Leaf2.

```
Leaf2#show vxlan tunnel
Reason codes: SI - Source is Invalid:
    source address is not local;
    source interface is down;
    source interface is a tunnel or management interface.
DI - Destination is Invalid:
    destination address is local;
    destination address is unreachable;
    output interface is a tunnel or management interface.
```

Number of vxlan tunnel: 1

TunnelID	Source	Destination	State
32768	30.0.0.1	10.0.0.1	up

```
Leaf2#show vxlan session
Number of vxlan session: 1
```

VXLAN-ID	SessionID	TunnelID	Source	Destination	State
100	32768	32768	30.0.0.1	10.0.0.1	up

```
Leaf2#show vxlan session l3
Number of vxlan session: 1

-----
VXLAN-ID  SessionID  TunnelID  Source      Destination  State
-----
8191      32768      32768     30.0.0.1    10.0.0.1     up
```

From the information described above, you can see that the tunnel is UP, and the dynamic VXLAN session can be normally established.

Step 9: Configure the VRF unicast route and enable the function of importing the route into the EVPN address family under the BGP VRF address family.

#Configure Leaf1.

```
Leaf1(config)#interface loopback 2
Leaf1(config-if-loopback2)#ip vrf forwarding 1
Leaf1(config-if-loopback2)#ip address 11.0.0.1 255.255.255.255
Leaf1(config-if-loopback2)#exit
Leaf1(config)#router bgp 100
Leaf1(config-bgp)#address-family ipv4 vrf 1
Leaf1(config-bgp-af)#advertise-l2vpn-evpn
Leaf1(config-bgp-af)#network 11.0.0.1 255.255.255.255
Leaf1(config-bgp-af)#exit-address-family
Leaf1(config-bgp)#exit
```

#Configure Leaf2.

```
Leaf2(config)#interface loopback 2
Leaf2(config-if-loopback2)#ip vrf forwarding 1
Leaf2(config-if-loopback2)#ip address 31.0.0.1 32
Leaf2(config-if-loopback2)#exit
Leaf2(config)#router bgp 100
Leaf2(config-bgp)#address-family ipv4 vrf 1
Leaf2(config-bgp-af)#advertise-l2vpn-evpn
Leaf2(config-bgp-af)#network 31.0.0.1 255.255.255.255
Leaf2(config-bgp-af)#exit-address-family
Leaf2(config-bgp)#exit
```

#Server1、Server2 and Server3 send the arp.

Leaf2#show ip rou
Leaf2#show ip route vrf 1
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:09:10, vxlan100
B 5.0.0.1/32 [200/0] via 10.0.0.1, 00:08:31, vxlan4097
B 5.0.0.2/32 [200/0] via 10.0.0.1, 00:08:31, vxlan4097
B 11.0.0.1/32 [200/0] via 10.0.0.1, 00:08:31, vxlan4097
C 31.0.0.1/32 is directly connected, 00:09:14, loopback2

```

From the information described above, you can see that the device normally learns the VRF unicast route through the EVPN route.

Step 10: Check the result.

#Ping Server1 on Server3.

```

C:\Documents and Settings\ Server 3> ping 1.0.0.2

Pinging 1.0.0.2 with 32 bytes of data:

Reply from 1.0.0.2: bytes=32 time<1ms TTL=255

Ping statistics for 1.0.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0m

```

You can see that Server1 and Server3 can be intercommunicated across the three-layer network between Leaf1, Spine1 and Leaf2.

#Ping Server2 on Server3.

```

C:\Documents and Settings\ Server 3> ping 5.0.0.2

Pinging 5.0.0.2 with 32 bytes of data:

Reply from 5.0.0.2: bytes=32 time<1ms TTL=255

Ping statistics for 5.0.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0m

```

It is indicated that Server2 and Server3 can be intercommunicated across the three-layer network between Leaf1, Spine1 and Leaf2.

## 126.3.6 Configure BGP EVPN Cross-Data Center Distributed Gateway

### Network Requirements

- Run the IGP protocol between Spine1, Spine2, Device1, and Device2 to get through the route.
- Run the EBGP protocol between Spine1 and Spine2 to get through the EVPN route, and run the IBGP protocol between Spine1 and Leaf1, and between Spine2 and Leaf2 to get through the EVPN route.
- With Leaf1 and Leaf2 as VTEPs, create the IBGP EVPN VXLAN tunnel, and create the VRF instances and VXLAN distributed gateways on Leaf1 and Leaf2, allowing for intercommunication between Server1 and Server 3 on the same network segment, between Server2 and Server4 on the same network segment, between Server1 and Server4 on the different network segments, and between Server2 and Server3 on the different network segments.
- Enable the import of the route to the EVPN address family under the BGP VRF address family on Leaf1 and Leaf2.

### Network Topology

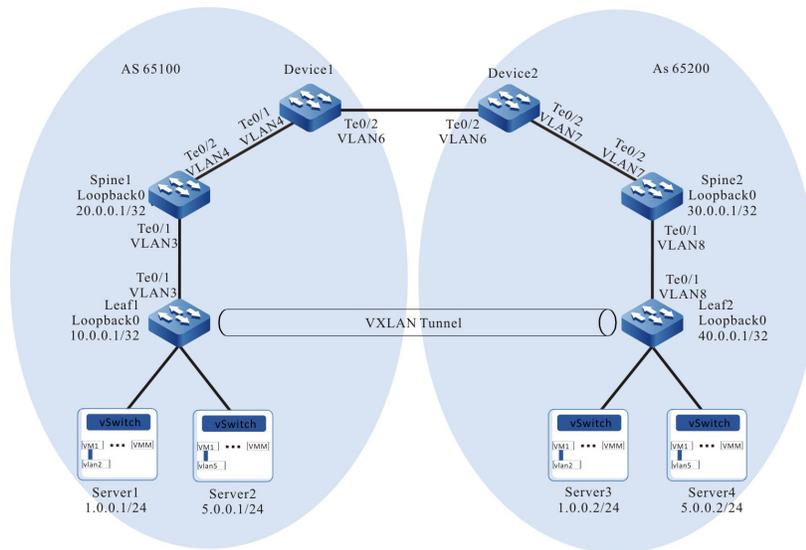

Figure 126-6 Network Topology for Configuring BGP EVPN Cross-Data Center Distributed Gateway

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other. (Omitted)

Step 4: Configure VXLAN and associate VNID on Leaf1 and Leaf2, and configure the EVPN address family so that the ports of Leaf1 and Leaf2 are added into VXLAN. (Omitted)

Step 5: Configure BGP.

#Configure Leaf1 to establish the IBGP neighbors to Spine1 and Leaf2, and activate the advertising capability under the EVPN address family. (Omitted)

#Configure Spine1 to establish the EBGP neighbors to Spine2, and activate the advertising capability under the EVPN address family and configure the function of not changing the route attributes when advertising the routes to the neighbors. (Omitted)

Step 6: Configure the VRF instance

#Configure the VRF instances of and Leaf1 and Leaf2. (Omitted)

Step 7: Create the NVE interface

#Configure the NVE interfaces of and Leaf1 and Leaf2 and configure the corresponding VXLAN to use the BGP protocol to dynamically establish a L2 tunnel. (Omitted)

Step 8: #Configure the VXLAN L3 gateways on Leaf1 and Leaf2 and bind the corresponding VRF instances (omitted)

Step 9: Configure the VRF unicast routes on Leaf1 and Leaf2 and enable the function of importing the routes into the EVPN address family under the BGP VRF address family. (Omitted)

Step 10: Check the result.

#Ping Server3 on Server1.

You can see that Server1 and Server3 can be intercommunicated across the three-layer network between Leaf1, Spine1 and Leaf2.

#Ping Server4 on Server1.

It is indicated that Server2 and Server3 can be intercommunicated across the three-layer network between Leaf1, Spine1 and Leaf2.

- 
- For all configurations and result checks in this section, please refer to section 2.3.5.
- 

# 127 NLB

---

## 127.1 Overview

NLB is a multi-server cluster load balancing feature developed by Microsoft on Windows Server. When a switch is connected to an NLB server cluster, the NLB server requires the switch to be able to send the packet whose destination IP address is the IP address of the NLB server cluster to each server in the NLB server cluster.

## 127.2 NLB Function Configuration

Table 127-1 NLB Function Configuration List

Configuration Task	
Configure NLB function	Configure the serviceloop group
	Configure the static ARP to bind the serviceloop group
	Configure the static MAC multiport

### 127.2.1 Configure NLB

#### Configuration Condition

None

#### Configure the Static ARP to Bind the Serviceloop Group

Table 127-2 Configuring the Static ARP to Bind the Serviceloop Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the static ARP to bind the servicoop group	<b>arp [ vrf vrf-name ] { ip-address   host-name } mac-address vlan vlan-id servicoop-group servicoop-group-id</b>	Mandatory

## Note

- When using the NLB function, you need to shut down [arp smac-check multicast](#).

### Configure the Static MAC Multiport

With static forwarding MAC address entries configured for multiple egress ports, after receiving packets within the corresponding VLAN, the ports matches the destination MAC addresses of the packets with the static forwarding MAC address entries that are configured on the device.

If they match successfully, the device forwards the packets through the multiple designated egress ports. This function enables the packets to be sent more flexibly

to the multiple egress ports, allowing for multi-forwarding of traffic

Table 127-3 Configuring Static Forwarding MAC Addresses That are Bound to Multiple Egress Ports

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure static forwarding MAC addresses that are bound to an aggregation group.	<b>mac-address multiport mac-address-value vlan vlan-id interface { interface-name1 [ to interface-name2 ] }</b>	Mandatory  By default, no static forwarding MAC address of the multiple egress ports is configured in the device

## 127.2.2NLB Monitoring and Maintaining

Table 127-4 NLB Monitoring and Maintaining

Command	Description
<b>show mac-address multiport</b>	Show MAC multiport information
<b>show arp</b>	Show ARP information
<b>show serviceloop-group</b>	Show serviceloop group information

## 127.3 Typical Configuration Example of NLB

### Network Requirements

- After the serviceloop group, MAC multiport, and static ARP are configured, the packets sent from PC will be sent to all NLB servers

### Network Topology

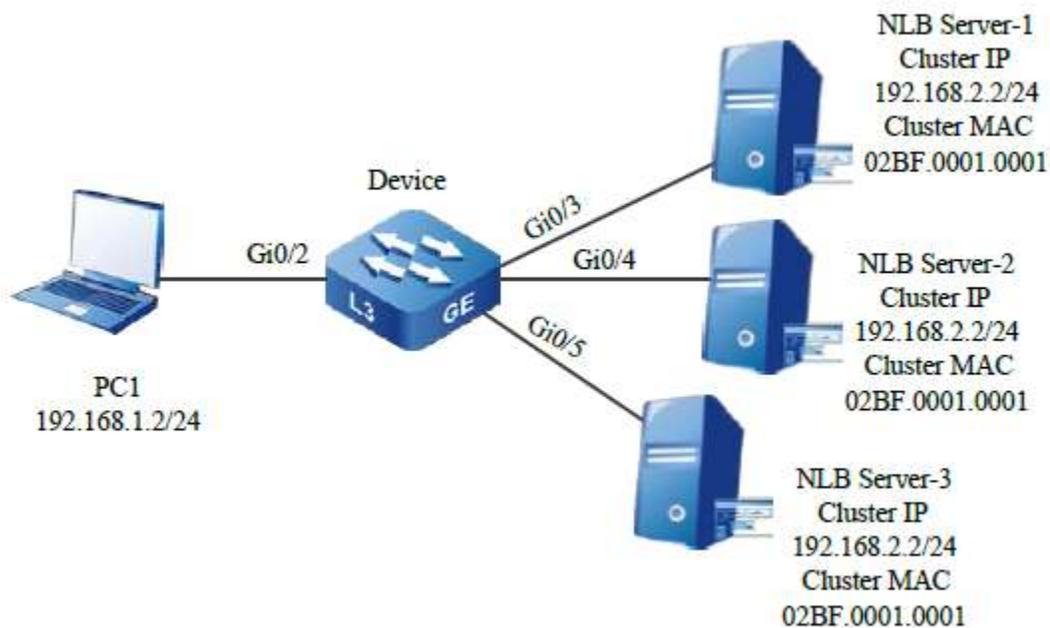

Figure 127-1 Network Topology for Configuring NLB

## Configuration Steps

Step 1: Configure link types and IP addresses of VLANs and ports on Device.

#Create VLAN2 and VLAN3 on Device.

```
Device#configure terminal
Device(config)#vlan
```

2,3

#Configure the link type of port gigabitethernet0/2 as Access to allow the VLAN2 services to pass, enable interfere vlan2, and configure the IP address as 192.168.1.1/24

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 2
Device(config-if-gigabitethernet0/2)#exit
Device(config)#interface vlan 2
Device(config-if-vlan2)#ip address 192.168.1.1 255.255.255.0
Device(config-if-vlan2)#exit
```

#Configure the port link type on gigabitethernet 0/3-gigabitethernet 0/5 of Device as Access to allow VLAN3 services to pass, enable interfere vlan3, and configure the IP address as 192.168.2.1/24 (omitted)

Step 2: Configure the serviceloop group

#Configure serviceloop group 1, and select and add any port of the device into this serviceloop group.

```
Device(config)#serviceloop-group 1
Device (config)# interface gigabitethernet 0/6
Device(config-if-gigabitethernet0/6)#serviceloop-group 1 active
Device(config-if-gigabitethernet0/6)#exit
```

Step 3: Configure the MAC multiport.

#Configure the MAC multiport on Device, and designate the egresses as gi0/3-gi0/5

```
Device#configure terminal
Device(config)#mac-address multiport 02BF.1.1 vlan 3 interface gigabitethernet 0/3,0/4,0/5
Device(config)#exit
```

Step 4: Configure static ARP

#Configure the static ARP on Device and bind the serviceloop group

```
Device#configure terminal
Device(config)# arp 192.168.2.2 02bf.1.1 vlan 3 serviceloop-group 1
Device(config)#exit
```

Step 5: Check the result.

## #View the serviceloop group

```
Device# show serviceloop-group
serviceloop group 1
Description:
Number of ports in total: 1
Serviceloop-port: gigabitethernet0/6
```

## #View the MAC multiport

```
Device# show mac-address multiport
mac      vlan      interface
02BF.0001.0001 3      gi0/3-0/5
```

## #View ARP

```
Device# show arp
Protocol Address      Age (min) Hardware Addr  Type  Interface      Switchport
Internet 192.168.1.1  -      0001.7a6a.011e  ARPA  vlan2          ---
Internet 192.168.2.1  -      0001.7a6a.011e  ARPA  vlan3          ---
