They shall not be reproduced, copied, translated, or converted in whole or in part into any electronic media or machine scannable format. One exception is to make backup software for your own use. The end user license agreement on the accompanying CD/DVD applies for devices with embedded software.

The performance features described herein are binding only after they are clearly agreed upon when the contract is signed. This document is produced by Belden Singapore Pte Ltd. based on the company's knowledge as far as possible. Belden Singapore Pte Ltd. reserves the right to change the content of this document without prior notice. Belden Singapore Pte Ltd. offers no guarantee on the correctness or accuracy of the information in this document.

Belden Singapore Pte Ltd. assumes no responsibility for damages caused by the use of network components or related operating software. In addition, we also invoke the conditions of use stipulated in the license contract.

## **Safety Notice**

**IMPORTANT!** Before powering on the product, please read the safety and compatibility information of the product.

## **Environmental Statement**

This product meets the design requirements for environmental protection. The storage, use and disposal of the product shall comply with relevant national laws and regulations.

## **Target Readers**

This manual mainly applies to the following persons:

- Commissioning Engineer
- Field Maintenance Engineer
- System Maintenance Engineer

## **Manual Conventions**

Screen Output Format Conventions

FORMAT	Description
Screen print	indicates screen output information.
<i>Keywords of Screen print</i>	The red information represents the key information in the screen output.

### Icon and Symbol Conventions

FORMAT	Description
 Note:	Supplements or emphasizes the foregoing information.
 Notice:	Indicates the content that needs to be paid attention to during the installation or use of the device, which is the key to the correct installation and operation of the device.
 Warning:	Operations prohibited or operations that must be performed in accordance with prescribed steps, otherwise they may cause personal injury or device damage.

### Command Format Conventions

FORMAT	Description
<b>bold</b>	Command line keywords (the part of a command that remains unchanged and must be input so) are represented in <b>Bold Font</b> .
<i>italic</i>	Command line parameters (the part of a command that must be replaced by actual values) are represented in <i>Italic</i> .
Curly bracket "{ }"	Indicates that the option in the brackets is mandatory.
Square brackets "[ ]"	Indicates that the option in the brackets is optional.
Angle brackets "<>"	Indicates that the information in the brackets will not be displayed.
Boldface square brackets "【 】"	Indicates that the content in the brackets requires the user's attention.
Pipe " "	used for separating several options, and indicates selecting one of two or one of many.

FORMAT	Description
Slash "/"	For separating several options, it indicates that the separated options are applicable at the same time.
Sign "#"	Lines starting with a "#" are represented as comment lines.

The icons used in this manual and their meanings are as follows:

Icon	Description
	This icon and its related description represent the switch in a general sense.
	This icon and its related description represent a router in a general sense.

## Access to Our Information

The latest version of this manual is available from the Hirschmann product website at:

[www.doc.hirschmann.com](http://www.doc.hirschmann.com).

## Technical Support

Belden Singapore Pte Ltd.

## Revision History

The revision history includes the description for each manual update. The latest version of the manual contains the updated contents of all previous manual versions.

REVISION DATE	Revision Details
November 30, 2020	Released for the first time

# Contents

<b>1</b>	<b>SYSTEM OPERATION BASICS</b>	<b>54</b>
<b>1.1</b>	<b>OVERVIEW</b>	<b>54</b>
<b>1.2</b>	<b>SYSTEM OPERATION BASIC FUNCTIONS</b>	<b>54</b>
1.2.1	DEVICE CONFIGURATION MODE	54
1.2.2	COMMAND OPERATING MODE	55
1.2.3	COMMAND LINE INTERFACE	57
<b>2</b>	<b>SYSTEM LOGIN</b>	<b>63</b>
<b>2.1</b>	<b>OVERVIEW</b>	<b>63</b>
<b>2.2</b>	<b>SYSTEM LOGIN FUNCTION CONFIGURATION</b>	<b>63</b>
2.2.1	LOGGING IN TO THE DEVICE THROUGH THE CONSOLE PORT	64
2.2.2	CONFIGURING REMOTE LOGIN THROUGH TELNET	66
2.2.3	CONFIGURING REMOTE LOGIN THROUGH SSH	68
<b>2.2.4</b>	<b>CONFIGURE REMOTE LOGIN THROUGH WEB.</b>	<b>69</b>
2.2.5	SYSTEM LOGIN MONITORING AND MAINTAINING	71
<b>2.3</b>	<b>TYPICAL CONFIGURATION OF SYSTEM LOGIN EXAMPLE.</b>	<b>72</b>
2.3.1	CONFIGURE A LOCAL TERMINAL TO TELNET TO THE DEVICE.	72
2.3.2	CONFIGURE A LOCAL DEVICE TO LOG IN TO A REMOTE DEVICE VIA TELNET	73
2.3.3	CONFIGURE A LOCAL DEVICE TO LOG IN TO A REMOTE DEVICE VIA SSH	74
2.3.4	CONFIGURE A DEVICE AS AN SFTP CLIENT	76
2.3.5	CONFIGURE A DEVICE AS AN SFTP SERVER	77
2.3.6	CONFIGURE A LOCAL DEVICE TO LOG IN TO A REMOTE DEVICE VIA SSH PUBLIC KEY AUTHENTICATION	79
<b>3</b>	<b>SYSTEM CONTROL AND MANAGEMENT</b>	<b>84</b>
<b>3.1</b>	<b>OVERVIEW</b>	<b>84</b>
<b>3.2</b>	<b>LOGIN CONTROL AND MANAGEMENT FUNCTION CONFIGURATION</b>	<b>84</b>
3.2.1	SWITCH OVER BETWEEN USER LEVELS.	85
3.2.2	CONFIGURE THE COMMAND LEVEL.	87
3.2.3	CONFIGURE THE ENABLE PASSWORD.	87
3.2.4	CONFIGURE LINE PROPERTIES.	88
3.2.5	SYSTEM CONTROL AND MANAGEMENT MONITORING AND MAINTAINING.	94
<b>4</b>	<b>FTP, FTPS, TFTP AND SFTP.</b>	<b>95</b>
<b>4.1</b>	<b>OVERVIEW</b>	<b>95</b>

<b>4.2</b>	<b>FTP, FTPS, TFTP AND SFTP FUNCTION CONFIGURATION.....</b>	<b>96</b>
4.2.1	CONFIGURE AN FTP SERVER. ....	96
4.2.2	CONFIGURE AN FTP CLIENT. ....	98
4.2.3	CONFIGURE A TFTP CLIENT. ....	99
4.2.4	CONFIGURE THE TFTP SERVER.....	100
4.2.5	CONFIGURE AN SFTP SERVER.....	100
4.2.6	CONFIGURE AN SFTP CLIENT.....	101
4.2.7	FTP AND TFTP MONITORING AND MAINTAINING.....	101
<b>4.3</b>	<b>TYPICAL CONFIGURATION EXAMPLE OF FTP AND TFTP .....</b>	<b>101</b>
4.3.1	CONFIGURE A DEVICE AS AN FTP CLIENT.....	101
4.3.2	CONFIGURE A DEVICE AS AN FTP SERVER.....	103
4.3.3	CONFIGURE A DEVICE AS AN TFTP CLIENT.....	106
4.3.4	CONFIGURE A DEVICE AS AN SFTP CLIENT.....	108
4.3.5	CONFIGURE A DEVICE AS AN SFTP SERVER.....	109
4.3.6	CONFIGURE A DEVICE AS AN FTPS CLIENT.....	110
<b>5</b>	<b>FILE SYSTEM MANAGEMENT .....</b>	<b>115</b>
<b>5.1</b>	<b>OVERVIEW.....</b>	<b>115</b>
<b>5.2</b>	<b>FILE SYSTEM MANAGEMENT FUNCTION CONFIGURATION.....</b>	<b>115</b>
5.2.1	MANAGE STORAGE DEVICES. ....	116
5.2.2	MANAGE FILE DIRECTORIES.....	117
5.2.3	MANAGE FILE OPERATIONS.....	119
5.2.4	DOWNLOAD A FILE FROM FTP.....	121
5.2.5	CONFIGURE STARTUP PARAMETERS.....	122
5.2.6	FILE SYSTEM MANAGING, MONITORING, AND MAINTAINING.....	123
<b>5.3</b>	<b>TYPICAL CONFIGURATION EXAMPLE OF FILE SYSTEM MANAGEMENT.....</b>	<b>123</b>
5.3.1	CONFIGURE STARTUP PARAMETERS.....	123
<b>6</b>	<b>CONFIGURATION FILE MANAGEMENT.....</b>	<b>125</b>
<b>6.1</b>	<b>OVERVIEW.....</b>	<b>125</b>
<b>6.2</b>	<b>CONFIGURATION FILE MANAGEMENT FUNCTION CONFIGURATION.....</b>	<b>126</b>
6.2.1	SAVE THE CURRENT CONFIGURATION.....	126
6.2.2	CONFIGURE THE BACKUP SYSTEM.....	127
6.2.3	RESTORE THE STARTUP CONFIGURATION.....	128
6.2.4	CONFIGURATION FILE MANAGING, MONITORING, AND MAINTAINING.....	129

6.2.5	CONFIGURATION FILE ENCRYPTION.....	130
<b>7</b>	<b>SYSTEM MANAGEMENT.....</b>	<b>131</b>
<b>7.1</b>	<b>OVERVIEW.....</b>	<b>131</b>
<b>7.2</b>	<b>SYSTEM MANAGEMENT FUNCTION CONFIGURATION.....</b>	<b>131</b>
7.2.1	CONFIGURE THE DEVICE NAME.....	132
7.2.2	CONFIGURE THE SYSTEM TIME AND TIME ZONE.....	132
7.2.3	CONFIGURE THE LOGIN WELCOME MESSAGE.....	133
7.2.4	CONFIGURE THE SYSTEM EXCEPTION PROCESSING MODE.....	133
7.2.5	CONFIGURE TO RESTART THE DEVICE.....	135
7.2.6	CONFIGURE THE HISTORY COMMAND SAVING FUNCTION.....	136
7.2.7	CONFIGURE THE LOGIN SECURITY SERVICE.....	136
7.2.8	CONFIGURE CPU MONITORING.....	138
7.2.9	CONFIGURE DISPLAY OF PROPERTIES IN PAGES.....	138
7.2.10	OPERATION RECORD FILE MANAGEMENT.....	139
7.2.11	CONFIGURE SYSTEM SECURITY MODE.....	139
7.2.12	SYSTEM MANAGING, MONITORING, AND MAINTAINING.....	140
7.2.13	CONFIGURE THE FLEXIBLE TABLE ENTRY MODE.....	141
<b>7.3</b>	<b>TYPICAL CONFIGURATION EXAMPLE OF SYSTEM MANAGEMENT.....</b>	<b>142</b>
7.3.1	CONFIGURE USER- AND IP-BASED LOGIN RESTRICTIONS.....	142
7.3.2	CONFIGURE QUICK LOGIN RESTRICTIONS.....	144
<b>8</b>	<b>SYSTEM ALARM.....</b>	<b>146</b>
<b>8.1</b>	<b>OVERVIEW.....</b>	<b>146</b>
<b>8.2</b>	<b>SYSTEM ALARM FUNCTION CONFIGURATION.....</b>	<b>146</b>
8.2.1	CONFIGURE SYSTEM TEMPERATURE ALARMS.....	146
8.2.2	CONFIGURE SYSTEM CPU ALARMS.....	147
8.2.3	CONFIGURE THE LOW THRESHOLD OF MEMORY USAGE.....	148
8.2.4	CONFIGURE SYSTEM MEMORY ALARMS.....	148
8.2.5	CONFIGURE SYSTEM POWER SUPPLY ALARMS.....	149
8.2.6	CONFIGURE SYSTEM FAN ALARMS.....	149
<b>9</b>	<b>SYSTEM LOG CONFIGURATION.....</b>	<b>150</b>
<b>9.1</b>	<b>OVERVIEW.....</b>	<b>150</b>
<b>9.2</b>	<b>SYSTEM LOG FUNCTION CONFIGURATION.....</b>	<b>151</b>
9.2.1	CONFIGURE LOG OUTPUT FUNCTIONS.....	152

9.2.2	CONFIGURE THE TIMESTAMP FOR LOGS.....	157
9.2.3	CONFIGURE OPERATION LOG OUTPUT TO THE LOG HOST .....	158
9.2.4	CONFIGURE LOG SUPPRESSION.....	159
9.2.5	CONFIGURE LOG FILES CAPACITY.....	159
9.2.6	CONFIGURE LOG FILES ENCRYPTION .....	160
9.2.7	CONFIGURE LOG DISPLAY COLOR.....	160
9.2.8	CONFIGURE LOG FILTERING FUNCTION .....	162
9.2.9	CONFIGURE THE ORIGIN-ID OF A DEVICE.....	162
9.2.10	LOG MONITORING AND MAINTAINING.....	163
<b>10</b>	<b>SOFTWARE UPGRADE .....</b>	<b>164</b>
<b>10.1</b>	<b>OVERVIEW.....</b>	<b>164</b>
<b>10.2</b>	<b>SOFTWARE UPGRADE FUNCTION CONFIGURATION .....</b>	<b>166</b>
10.2.1	UPGRADE THE IMAGE PROGRAM PACKAGE .....	167
10.2.2	PATCH PROGRAM UPGRADE.....	169
10.2.3	CMM PROGRAM UPGRADE.....	170
10.2.4	BOOTLOADER PROGRAM UPGRADE .....	172
10.2.5	DEVINFO FILE UPGRADE.....	176
10.2.6	PACKAGE FILE UPGRADE.....	177
<b>10.3</b>	<b>EXAMPLE OF TYPICAL CONFIGURATION FOR SOFTWARE UPGRADE.....</b>	<b>180</b>
10.3.1	UPGRADE PACKAGE FILE .....	180
10.3.2	FULL UPGRADE OF ALL SOFTWARE VERSIONS .....	183
10.3.3	UPGRADE BOOTLOADER USING CONSOLE PORT.....	188
<b>11</b>	<b>BOOTLOADER .....</b>	<b>190</b>
<b>11.1</b>	<b>OVERVIEW.....</b>	<b>190</b>
<b>11.2</b>	<b>BOOTLOADER FUNCTION CONFIGURATION .....</b>	<b>190</b>
11.2.1	PREPARATION FOR BOOTLOADER FUNCTION CONFIGURATION .....	191
11.2.2	ENTER THE BOOTLOADER CONFIGURATION MODE .....	191
11.2.3	SET BOOTLOADER STARTUP PARAMETERS.....	192
11.2.4	UPGRADE BOOTLOADER PROGRAM.....	193
11.2.5	BOOTLOADER MONITORING AND MAINTAINING .....	195
<b>11.3</b>	<b>BOOTLOADER TYPICAL CONFIGURATION EXAMPLE .....</b>	<b>195</b>
11.3.1	CONFIGURE THE BOOTLOADER TO START THE IMAGE PROGRAM VIA THE NETWORK. ....	195
<b>12</b>	<b>POE MANAGEMENT .....</b>	<b>196</b>

<b>12.1</b>	<b>OVERVIEW.....</b>	<b>197</b>
<b>12.1.1</b>	<b>PD (POWER DEVICE): DEVICES THAT RECEIVE POWER. THE POWER OF THE DEVICES IS USUALLY NOT LARGE. PSE/PD INTERFACE SPECIFICATIONS.....</b>	<b>197</b>
<b>12.1.2</b>	<b>POE POWER SUPPLY PROCESS.....</b>	<b>198</b>
<b>12.2</b>	<b>POE FUNCTION CONFIGURATION.....</b>	<b>199</b>
<b>12.2.1</b>	<b>POE BASIC FUNCTION CONFIGURATION.....</b>	<b>201</b>
<b>12.2.2</b>	<b>CONFIGURE THE POE POWER.....</b>	<b>204</b>
<b>12.2.3</b>	<b>CONFIGURE POWER SUPPLY PRIORITIES.....</b>	<b>206</b>
<b>12.2.4</b>	<b>CONFIGURE PD POWER-UP AND POWER-DOWN PARAMETERS.....</b>	<b>208</b>
<b>12.2.5</b>	<b>CONFIGURE THE ABNORMALITY RECOVERY FUNCTION.....</b>	<b>211</b>
<b>12.2.6</b>	<b>CONFIGURE POE POWER ALARM THRESHOLD.....</b>	<b>213</b>
<b>12.2.7</b>	<b>POE MONITORING AND MAINTAINING.....</b>	<b>213</b>
<b>13</b>	<b>PDI.....</b>	<b>214</b>
<b>13.1</b>	<b>OVERVIEW.....</b>	<b>214</b>
<b>13.2</b>	<b>CONFIGURE PDI BASIC FUNCTIONS.....</b>	<b>214</b>
<b>13.3</b>	<b>CONFIGURE THE ARP PACKET DELIVERY INTERVAL.....</b>	<b>215</b>
<b>13.4</b>	<b>CONFIGURE THE NUMBER OF RETRIES FOR ARP PACKET DELIVERY.....</b>	<b>215</b>
<b>13.5</b>	<b>CONFIGURING IP INSPECTION TABLE ENTRIES.....</b>	<b>216</b>
<b>13.6</b>	<b>PDI MONITORING AND MAINTAINING.....</b>	<b>216</b>
<b>14</b>	<b>LUM.....</b>	<b>217</b>
<b>14.1</b>	<b>OVERVIEW.....</b>	<b>217</b>
<b>14.2</b>	<b>LUM FUNCTION CONFIGURATION.....</b>	<b>217</b>
<b>14.2.1</b>	<b>CONFIGURE ACCESS.....</b>	<b>218</b>
<b>14.2.2</b>	<b>CONFIGURE LOCAL USERS.....</b>	<b>220</b>
<b>14.2.3</b>	<b>CONFIGURE ADMINISTRATOR USER ATTRIBUTES.....</b>	<b>221</b>
<b>14.2.4</b>	<b>CONFIGURE ACCESS USER ATTRIBUTES.....</b>	<b>224</b>
<b>14.2.5</b>	<b>CONFIGURE LOCAL USER GROUPS.....</b>	<b>225</b>
<b>14.2.6</b>	<b>CONFIGURE PASSWORD POLICIES.....</b>	<b>227</b>
<b>14.2.7</b>	<b>LUM MONITORING AND MAINTAINING.....</b>	<b>230</b>
<b>14.3</b>	<b>TYPICAL LUM CONFIGURATION EXAMPLE.....</b>	<b>231</b>
<b>14.3.1</b>	<b>CONFIGURE NETWORK ADMINISTRATOR USERS.....</b>	<b>231</b>
<b>15</b>	<b>ZTP.....</b>	<b>232</b>
<b>15.1</b>	<b>OVERVIEW.....</b>	<b>232</b>

<b>15.2 ZTP FUNCTION CONFIGURATION.....</b>	<b>234</b>
15.2.1 ENABLE OR DISABLE ZTP FUNCTION .....	234
15.2.2 ZTP MONITORING AND MAINTAINING.....	235
<b>15.3 ZTP TYPICAL CONFIGURATION EXAMPLE.....</b>	<b>235</b>
15.3.1 CONFIGURE ZTP TO USE COMMON INTERMEDIATE FILES FOR ZERO-CONFIGURATION DEPLOYMENT VIA DHCP .....	235
15.3.2 CONFIGURE ZTP TO USE PYTHON INTERMEDIATE FILES FOR ZERO-CONFIGURATION DEPLOYMENT VIA DHCP .....	239
15.3.3 CONFIGURE ZTP TO USE COMMON INTERMEDIATE FILES FOR ZERO-CONFIGURATION DEPLOYMENT VIA USB.....	242
15.3.4 CONFIGURE ZTP TO USE PYTHON INTERMEDIATE FILES FOR ZERO-CONFIGURATION DEPLOYMENT VIA USB.....	245
15.3.5 CONFIGURE ZTP TO AUTOMATICALLY COMPLETE STACKING USING PYTHON INTERMEDIATE FILES VIA DHCP .....	248
<b>16 INTERFACE BASIS .....</b>	<b>255</b>
<b>16.1 OVERVIEW.....</b>	<b>255</b>
<b>16.2 BASIC FUNCTION CONFIGURATION OF INTERFACES.....</b>	<b>256</b>
16.2.1 CONFIGURE THE BASIC FUNCTIONS OF THE INTERFACES .....	256
16.2.2 CONFIGURE THE INTERFACE GROUP FUNCTION.....	260
16.2.3 CONFIGURE INTERFACE STATUS SNMP AGENT CARE LEVEL.....	261
16.2.4 BASIC MONITORING AND MAINTAINING OF INTERFACES .....	262
<b>17 ETHERNET INTERFACE .....</b>	<b>263</b>
<b>17.1 OVERVIEW.....</b>	<b>263</b>
<b>17.2 ETHERNET INTERFACE FUNCTION CONFIGURATION.....</b>	<b>264</b>
17.2.1 CONFIGURE BASIC FUNCTIONS OF PORT.....	265
17.2.2 CONFIGURE PORT DETECTION FUNCTION.....	283
17.2.3 CONFIGURE STORM SUPPRESSION .....	284
17.2.4 CONFIGURE PORT UNI/NNI TYPE.....	286
17.2.5 CONFIGURE BASIC FUNCTIONS OF L3 ETHERNET INTERFACE .....	288
17.2.6 ETHERNET INTERFACE MONITORING AND MAINTAINING .....	290
<b>17.3 TYPICAL CONFIGURATION EXAMPLE OF ETHERNET INTERFACE.....</b>	<b>291</b>
17.3.1 CONFIGURE STORM SUPPRESSION FUNCTION.....	291
<b>18 AGGREGATION GROUP INTERFACE .....</b>	<b>294</b>
<b>18.1 OVERVIEW.....</b>	<b>294</b>
<b>18.2 AGGREGATION GROUP INTERFACE FUNCTION CONFIGURATION.....</b>	<b>294</b>

18.2.1	CONFIGURE BASIC FUNCTIONS OF L3 AGGREGATION GROUP INTERFACE .....	294
18.2.2	MONITORING AND MAINTAINING OF AGGREGATION GROUP INTERFACE .....	296
<b>19</b>	<b>VLAN INTERFACE .....</b>	<b>297</b>
<b>19.1</b>	<b>OVERVIEW.....</b>	<b>297</b>
<b>19.2</b>	<b>VLAN INTERFACE FUNCTION CONFIGURATION .....</b>	<b>297</b>
19.2.1	CONFIGURE THE BASIC FUNCTIONS OF THE VLAN INTERFACE .....	297
19.2.2	VLAN INTERFACE MONITORING AND MAINTAINING .....	300
<b>19.3</b>	<b>TYPICAL CONFIGURATION EXAMPLE OF VLAN INTERFACE .....</b>	<b>301</b>
19.3.1	CONFIGURE VLAN INTERFACE .....	301
<b>20</b>	<b>LOOPBACK INTERFACE.....</b>	<b>303</b>
<b>20.1</b>	<b>OVERVIEW.....</b>	<b>303</b>
<b>20.2</b>	<b>LOOPBACK INTERFACE FUNCTION CONFIGURATION .....</b>	<b>303</b>
20.2.1	CONFIGURE THE BASIC FUNCTIONS OF THE LOOPBACK INTERFACE .....	303
<b>21</b>	<b>NULL INTERFACE .....</b>	<b>306</b>
<b>21.1</b>	<b>OVERVIEW.....</b>	<b>306</b>
<b>21.2</b>	<b>NULL INTERFACE FUNCTION CONFIGURATION .....</b>	<b>306</b>
21.2.1	CONFIGURE THE BASIC FUNCTIONS OF THE NULL INTERFACE .....	306
<b>22</b>	<b>VIRTUAL SWITCH LINK INTERFACE .....</b>	<b>308</b>
<b>22.1</b>	<b>OVERVIEW.....</b>	<b>308</b>
<b>22.2</b>	<b>VIRTUAL SWITCH LINK INTERFACE FUNCTION CONFIGURATION.....</b>	<b>308</b>
22.2.1	CONFIGURE FUNCTIONS OF THE VIRTUAL SWITCH LINK INTERFACE .....	308
22.2.2	MONITORING AND MAINTAINING OF VIRTUAL SWITCH LINK INTERFACE .....	309
<b>23</b>	<b>TUNNEL INTERFACE .....</b>	<b>310</b>
<b>23.1</b>	<b>OVERVIEW.....</b>	<b>310</b>
<b>23.2</b>	<b>TUNNEL INTERFACE FUNCTION CONFIGURATION.....</b>	<b>310</b>
23.2.1	CONFIGURE THE BASIC FUNCTIONS OF THE TUNNEL INTERFACE .....	310
23.2.2	TUNNEL INTERFACE MONITORING AND MAINTAINING .....	311
<b>24</b>	<b>VXLAN INTERFACE .....</b>	<b>312</b>
<b>24.1</b>	<b>OVERVIEW.....</b>	<b>312</b>
<b>24.2</b>	<b>VXLAN INTERFACE FUNCTION.....</b>	<b>312</b>
24.2.1	CONFIGURE BASIC FUNCTIONS OF THE VXLAN INTERFACE .....	313
24.2.2	CONFIGURE DISTRIBUTED GATEWAY FUNCTION OF VXLAN.....	313
24.2.3	VXLAN INTERFACE MONITORING AND MAINTAINING .....	314

<b>25 LINK AGGREGATION</b> .....	<b>314</b>
<b>25.1 OVERVIEW</b> .....	<b>314</b>
25.1.1 BASIC CONCEPTS.....	315
25.1.2 LINK AGGREGATION MODES.....	316
<b>25.2 OVERVIEW</b> .....	<b>318</b>
25.2.1 LOAD BALANCING .....	318
25.2.2 HASH KEY .....	318
25.2.3 LOAD BALANCING MODE.....	320
<b>25.3 FUNCTION CONFIGURATION OF LOAD BALANCING MODE</b> .....	<b>320</b>
25.3.1 ENTER THE LOAD BALANCING MODE .....	321
25.3.2 CONFIGURE THE HASH KEY OF LOAD BALANCING MODE .....	322
25.3.3 CONFIGURE THE DEEP ANALYSIS ALGORITHM FOR IPV4/IPV6 PACKET OF LOAD BALANCING MODE 324	
25.3.4 CONFIGURE THE DEEP ANALYSIS ALGORITHM FOR MPLS AND VXLAN PACKET OF LOAD BALANCING MODE.....	324
25.3.5 CONFIGURE THE LOAD SELECTION FOR IP TUNNEL PACKET OF LOAD BALANCING MODE .....	325
25.3.6 CONFIGURE THE LOAD SELECTION FOR MPLS, VXLAN AND TRILL PACKET OF LOAD BALANCING MODE 328	
25.3.7 CONFIGURE HASH ALGORITHM SELECTION FOR LAC AND ECMP OF LOAD BALANCING MODE 329	
25.3.8 CONFIGURE ALGORITHM SELECTION FOR IPV6 ADDRESS COMPRESSION OF LOAD BALANCING MODE 330	
<b>25.4 LINK AGGREGATION FUNCTION CONFIGURATION</b> .....	<b>331</b>
25.4.1 CONFIGURE AN AGGREGATION GROUP .....	331
25.4.2 CONFIGURE LACP PRIORITIES.....	333
25.4.3 CONFIGURE HOT PLUG FOR RAPID SWITCH OF ROOT PORT .....	334
25.4.4 LINK AGGREGATION MONITORING AND MAINTAINING .....	335
<b>25.5 TYPICAL CONFIGURATION EXAMPLE OF LINK AGGREGATION</b> .....	<b>336</b>
25.5.1 CONFIGURE A STATIC AGGREGATION GROUP.....	336
25.5.2 CONFIGURE A DYNAMIC AGGREGATION GROUP.....	339
<b>26 PORT ISOLATION</b> .....	<b>343</b>
<b>26.1 OVERVIEW</b> .....	<b>343</b>
<b>26.2 PORT ISOLATION FUNCTION CONFIGURATION</b> .....	<b>343</b>
26.2.1 CONFIGURE THE BASIC FUNCTION OF PORT ISOLATION.....	343
26.2.2 PORT ISOLATION MONITORING AND MAINTAINING.....	345

<b>26.3</b>	<b>TYPICAL CONFIGURATION EXAMPLE OF PORT ISOLATION.....</b>	<b>345</b>
26.3.1	CONFIGURE PORT ISOLATION.....	345
<b>27</b>	<b>VLAN.....</b>	<b>348</b>
<b>27.1</b>	<b>OVERVIEW.....</b>	<b>348</b>
<b>27.2</b>	<b>VLAN FUNCTION CONFIGURATION.....</b>	<b>349</b>
27.2.1	CONFIGURE BASIC ATTRIBUTES FOR VLAN.....	350
27.2.2	CONFIGURE A PORT-BASED VLAN.....	351
27.2.3	CONFIGURE A MAC ADDRESS-BASED VLAN.....	356
27.2.4	CONFIGURE AN IP SUBNET-BASED VLAN.....	358
27.2.5	CONFIGURE AN IPV6 SUBNET-BASED VLAN.....	359
27.2.6	CONFIGURE A PROTOCOL-BASED VLAN.....	360
27.2.7	CONFIGURE THE TYPES OF FRAMES THAT CAN BE RECEIVED BY THE PORT.....	361
27.2.8	VLAN MONITORING AND MAINTAINING.....	362
<b>27.3</b>	<b>VLAN TYPICAL CONFIGURATION EXAMPLE.....</b>	<b>363</b>
27.3.1	CONFIGURE A PORT-BASED VLAN.....	363
27.3.2	CONFIGURE A MAC ADDRESS-BASED VLAN.....	365
27.3.3	CONFIGURE AN IP SUBNET-BASED VLAN.....	367
27.3.4	CONFIGURE AN IPV6 SUBNET-BASED VLAN.....	369
27.3.5	CONFIGURE A PROTOCOL-BASED VLAN.....	371
<b>28</b>	<b>QINQ AND VLAN MAPPING.....</b>	<b>373</b>
<b>28.1</b>	<b>OVERVIEW.....</b>	<b>373</b>
<b>28.2</b>	<b>QINQ AND VLAN MAPPING FUNCTION CONFIGURATION.....</b>	<b>373</b>
28.2.1	CONFIGURE BASIC QINQ FUNCTION.....	374
28.2.2	CONFIGURE PORT-BASED FLEXIBLE QINQ FUNCTION.....	375
28.2.3	CONFIGURE 1: 1 VLAN MAPPING FUNCTION.....	377
28.2.4	CONFIGURE N: 1 VLAN MAPPING FUNCTION.....	378
28.2.5	CONFIGURE THE PROTOCOL TYPE OF OUTER VLAN TAG OF THE PORT.....	380
28.2.6	CONFIGURE QINQ DROP FUNCTION.....	381
28.2.7	QINQ AND VLAN MAPPING MONITORING AND MAINTAINING.....	382
<b>28.3</b>	<b>EXAMPLE OF TYPICAL QINQ AND VLAN MAPPING CONFIGURATION.....</b>	<b>383</b>
28.3.1	CONFIGURE BASIC QINQ.....	383
28.3.2	CONFIGURE FLEXIBLE QINQ.....	385

28.3.3	CONFIGURE 1: 1 VLAN MAPPING .....	388
28.3.4	CONFIGURE N: 1 VLAN MAPPING.....	390
<b>29</b>	<b>SUPER-VLAN .....</b>	<b>393</b>
<b>29.1</b>	<b>OVERVIEW.....</b>	<b>393</b>
<b>29.2</b>	<b>VLAN FUNCTION CONFIGURATION .....</b>	<b>393</b>
29.2.1	CONFIGURE A SUPER VLAN.....	393
29.2.2	CONFIGURE SUB-VLAN MEMBERS OF THE SUPER-VLAN.....	394
29.2.3	ENABLE THE ARP PROXY FUNCTION.....	395
29.2.4	ENABLE THE ND PROXY FUNCTION.....	396
29.2.5	VLAN MONITORING AND MAINTAINING .....	397
<b>29.3</b>	<b>SUPER-VLAN TYPICAL CONFIGURATION EXAMPLE .....</b>	<b>397</b>
29.3.1	CONFIGURE A SUPER VLAN.....	397
<b>30</b>	<b>PVLAN .....</b>	<b>401</b>
<b>30.1</b>	<b>OVERVIEW.....</b>	<b>401</b>
<b>30.2</b>	<b>PVLAN FUNCTION CONFIGURATION.....</b>	<b>401</b>
30.2.1	CONFIGURE PRIMARY VLAN.....	402
30.2.2	ADD PORTS INTO PRIMARY VLAN .....	403

# 1 System Operation Basics

---

## 1.1 Overview

System operation basics mainly describe the basic knowledge of device operations, including system operation basic functions, device configuration modes, command modes, and command line interface.

## 1.2 System Operation Basic Functions

Table 1-1 System Operation Basic Function Configuration List

Configuration Task	
Device configuration mode	Device configuration mode
Command operating mode	Command operating mode
Command line interface	Command line interface

### 1.2.1 Device configuration mode

Users can log in to the device for configuration and management in different modes. (For details of the login modes, please refer to the section on "System Login" in the User Manual) The device provides five typical configuration modes:

- Logging in to the device locally through the Console port. By default, users can configure the device directly in this mode.
- Logging in to the device by remote dial-up through a Modem. The device cannot be configured directly in this mode. That is, before configuration, some preparations need to be made.
- Logging in to the device remotely through Telnet. The device cannot be configured directly in this mode. That is, before configuration, some preparations need to be made.
- Logging in to the device remotely through SSH. The device cannot be configured

directly in this mode. That is, before configuration, some preparations need to be made.

- Logging in to the device remotely through WEB. The device cannot be configured directly in this mode. That is, before configuration, some preparations need to be made.

## 1.2.2 Command operating mode

The device provides a command processing subsystem for management and execution of system commands. The subsystem shell provides the following main functions:

- Registration of system commands
- Editing of system configuration commands by users
- Parsing of the commands that have been inputted by users
- Execution of system commands

If a user configures the device through shell commands, the system provides multiple operating modes for the execution of the commands. Each command mode supports specific configuration commands. In this way, hierarchical protection is provided to the system, protecting it from unauthorized access.

The shell subsystem provides multiple modes for the operating of configuration commands. These modes have different system prompts, prompting the current system mode of the user. The following lists common configuration modes:

- Common user mode (user EXEC)
- Privileged user mode (privilege EXEC)
- Global configuration mode (global configuration)
- Interface configuration mode (interface configuration)
- File system configuration mode (file system configuration)
- Access list configuration mode (access list configuration)
- Other configuration modes (They will be described in the related sections and chapters.)

The following table shows how to enter the common command modes and switch over between the modes.

Table 1-2 System Modes and Methods of Switching Over Between the Modes

Mode	How to Enter the Mode	System Prompt	How to Exit the Mode	Functions
Common user mode	Log in to the device.	Hostname>	Run the <b>exit</b> command to exit the mode.	·Change the terminal settings ·Perform basic tests.

Mode	How to Enter the Mode	System Prompt	How to Exit the Mode	Functions
				·Display the system information
Privileged user mode	In common user mode, run the <b>enable</b> command.	Hostname#	Run the <b>disable</b> or <b>exit</b> command to exit to the common user mode.	·Configure the operating parameters of the device ·Display the operating information of the device
Global configuration mode	In privileged user mode, run the configure terminal command.	Hostname(config)#	Run the <b>exit</b> command to exit to the privileged user mode.	·Configure the global parameters that are required for the device operation
Interface configuration mode	In global configuration mode, run the <b>interface</b> command (while specifying the corresponding interface or interface group).	Hostname(config-if-xxx[number])# or Hostname(config-if-group[number])#	Run the <b>exit</b> command to exit to the global configuration mode.  Run the <b>end</b> command to exit to the privileged user mode.	In this mode, configures device interfaces, including: ·Interfaces of different types ·Interface groups
File system configuration mode	In the privileged user mode, run the <b>filesystem</b> command.	Hostname(config-fs)#	Run the <b>exit</b> command to exit to the privileged user mode.	·Manage the file system of the device
Access list configuration	In global configuration mode, run the <b>ip</b>	Hostname(config-std-nacl)#	Run the <b>exit</b> command to exit to the global	Configures the Access Control List (ACL). The configuration tasks include:

Mode	How to Enter the Mode	System Prompt	How to Exit the Mode	Functions
configuration mode	<b>access-list standard</b> or <b>ip access-list extended</b> command.	Hostname(configuration-ext-nacl)#	configuration mode.  Run the <b>end</b> command to exit to the privileged user mode.	·Configure standard access control list  ·Configure extended access control list

---

## Note

- Hostname is the system name. In global configuration mode, a user can run the **hostname** command to modify the system name, and the modification takes effect immediately.
  - If a user is not in privileged user mode while the user wants to run a privileged mode command, the user can use the do command to run the required command without the need to returning back to the privileged mode. (For details, refer to the related sections in "System Operation Basics" of the command manual.) Note that the mode switchover command such as *do configure terminal* is not included.
- 

### 1.2.3 Command line interface

The command line interface is a man-machine interface that is provided by the shell subsystem to configure and use the device. Through the command line interface, users can input and edit commands to perform the required configuration tasks, and they can also query the system information and learn the system operation status.

The command line interface provides the following functions for the users:

- System help information management
- System command inputting and editing
- History command management
- Terminal display system management

#### Command Line Online Help

The command line provides the following types of online help:

- help
- Full help

- Partial help

Through the above types of online help, users can obtain various help information. The following gives some examples.

- To obtain a brief description of the online help system, enter the **help** command in any command mode.

```

Hostname#help
Help may be requested at any point in a command by entering
a question mark '?'. If nothing matches, the help list will
be empty and you must backup until entering a '?' shows the
available options.
Two styles of help for command are provided:
1. Full help is available when you are ready to enter a
  command argument (e.g. 'show ?') and describes each possible
  argument.
2. Partial help is provided when an abbreviated argument is entered
  and you want to know what arguments match the input
  (e.g. 'show pr?'.)
And "Edit key" usage is the following:
CTRL+A -- go to home of current line
CTRL+E -- go to end of current line
CTRL+U -- erase all character from home to current cursor
CTRL+K -- erase all character from current cursor to end
CTRL+W -- erase a word on the left of current cursor
CTRL+R -- erase a word on the right of current cursor
CTRL+D,DEL -- erase a character on current cursor
BACKSPACE -- erase a character on the left of current cursor
CTRL+B,LEFT -- current cursor backward a character
CTRL+F,RIGHT -- current cursor forward a character

```

- To list all commands and their brief description in any command mode, type "?" in the command mode.

```

Hostname#configure terminal
Hostname(config)#?
aaa          Authentication, Authorization and Accounting
access-list  Access List
alarm        Set alarm option of system
arl          Address translation item
arp          Set a static ARP entry
arp-security To CPU arp security
autosave    Auto save the startup configuration
banner       Define a login banner
bgp          BGP information
cable-diagnostics Cable Diagnostics on physical interface
.....

```

- Type a command followed by "?", and all sub-commands that can be executed in the current mode are displayed.

```

Hostname#show ?
access-list  List access lists
acl-object   Show acl object
arl          Address translation item
arp          Command arp
arp-security To CPU arp security
bfd          BFD Protocol information
bgp          BGP information
cable-diagnostics Cable Diagnostics on physical interface
card_list    Show information of hardware modules
clock        Print system clock information

```

```

cluster      Config cluster
cpu          Show CPU use per process

```

- Type a character string followed by "?", and all the key words starting with the character string and their description are displayed.

```

Hostname#show a?
access-list  List access lists
acl-object  Show acl object
arl          Address translation item
arp          Command arp
arp-security To CPU arp security

```

## Command Line Error Messages

For all commands that are typed by users, the command line performs a syntax check. If the commands pass the syntax check, they are executed properly; otherwise, the system reports error messages to the users. The following table shows common error messages.

Table 1-3 Command Line Error Messages

Error Message	Error Cause
% Invalid input detected at '^' marker.	No command or key word is found, the parameter type is incorrect, or the parameter value is not within the valid range.
Type "*** ?" for a list of subcommands or % Incomplete command	The inputted command is incomplete.
Hostname#wh % Ambiguous command: wh % Please select: whoami who	The inputted character string is a fuzzy command.

## History Commands

The command line interface provides a function that is similar to the Doskey function. The system automatically saves the user inputted commands into the history command cache. Then, users can invoke the history commands saved by the command line interface at any time and execute the command repeatedly, reducing unnecessary efforts in re-typing the commands. The command line interface saves up to 10 commands for each user that is connected to the device. Then, new commands overwrite old ones.

Table 1-1 Accessing History Commands of the Command Line Interface

To...	Press...	Execution Result
Access the previous history command	The up arrow key ↑ or Ctrl+P keys	If an earlier history command is available, it is displayed. If no earlier history command is available, an alarm sound is played.
Access the next history command	The down arrow key ↓ or Ctrl+P keys	If a later history command is available, it is displayed. If no later command is available, the commands are cleared, and an alarm sound is played.

### Note

- If you want to access history commands by using the up and down arrow keys, when you telnet to the device in the Windows 98 or Windows NT OS, set Terminals > Preferred Options > Simulation Options to VT-100/ANSI.
- History command display is based on the current command mode. For example, if you are in privileged mode, only history commands in privileged mode are displayed.

## Editing Features

The command line interface provides basic command editing functions. It supports multi-line editing. Each line of command can contain up to 256 characters. The following table lists the basic editing functions that are provided by the shell subsystem for the command line interface.

Table 1-4 Basic Editing Functions

Press...	Function
A common key	If the edit buffer is not full, the character is inserted to the position of the cursor, and the cursor moves to the right. If the edit buffer is full, an alarm sound is played.
The Backspace key	Deletes the character before the cursor and moves the cursor backward. If the cursor reaches the beginning of the command, an alarm sound is played.

Press...	Function
The Delete key	Deletes the character behind the cursor. If the cursor reaches the end of the command, an alarm sound is played.
The left arrow key ← or Ctrl+B keys	Moves the cursor one characters to the left. If the cursor reaches the beginning of the command, an alarm sound is played.
The right arrow key → or Ctrl+F keys	Moves the cursor one characters to the right. If the cursor reaches the end of the command, an alarm sound is played.
The up and down arrow keys ↑↓	Display history commands.
Ctrl+A	Moves the cursor to the beginning of the command line.
Ctrl+E	Moves the cursor to the end of the command line.
Ctrl+U	Deletes all characters on the left of the cursor till the beginning of the command line.

## Display Features

To facilitate users, the command line interface provides the following display features:

If the information to be displayed is more than one screen, the pause function is provided, and the prompt "---MORE---" is displayed at the lower left corner of the screen. At this time, the options displayed in the following table are available for users.

Table 1-5 Display Features

Press...	Function
Space key, down arrow key ↓, or Ctrl-F	Display the next screen.
The up arrow key ↑ or Ctrl-B keys	Display the previous screen.
The Enter key, right arrow key → or equal key =	Scroll the displayed information one line down.
The left arrow key ← or the minus key-	Scroll the displayed information one line up.

Press...	Function
Ctrl-H	Returns back to the topmost part of the displayed information.
Any other keys	Exits the display. Then, the information that has not been displayed will not be displayed.

# 2 System Login

---

## 2.1 Overview

The device supports the following system login modes:

- Logging into the device through the Console port for management and maintenance.
- Telnet (remote login). Users can manage and maintain the device remotely in this mode.
- Secure Shell (SSH). Through its encryption and authentication technology, SSH provides secure remote login management services for users.
- WEB (remote login). Users can manage and maintain the device remotely in this mode.

## 2.2 System Login Function Configuration

Table 2-1 System Login Function Configuration List

Configuration Task	
Logging in to the device through the Console port	-
Logging in to the device through the AUX port	-
Configuring remote login through Telnet	Enable the Telnet service of the device.
	The device acts as a Telnet client for remote login.
Configuring remote login through SSH	Enable the SSH service of the device.

Configuration Task	
	The device acts as an SSH client for remote login.
Configure remote login through WEB.	Configure remote login through HTTP.
	Configure remote login through HTTPS.

## Note

- For user configuration related to Telnet and SSH remote login, refer to the section on "login control and management".

### 2.2.1 Logging in to the device through the Console port

To connect a terminal to the device through the Console port to configure the device, perform the following steps:

Step 1: Select a terminal.

The terminal can be a terminal with a standard RS-232 serial port or an ordinary PC, and the latter one is more frequently used. If the remote dial-up login mode is selected, two Modems are required.

Step 2: Connect the physical connection of the Console port.

Ensure that the terminal or the device that provides the Console port has been powered off, and then connect the RS-232 serial port of the terminal to the Console port of the device. The following figure shows the connection.

Figure 2-1 Connection for Login via the Console Port

Step 3: Configure the HyperTerminal.

After powering on the terminal, you need to set the communication parameters of the terminal, that is, baud rate of 9600 bps, 8 data bits, 1 stop bit, no parity check, and no data stream control. For a PC with the Windows XP or Windows NT OS, run the HyperTerminal program, and set the communication parameters of the serial port of the HyperTerminal according to the previously mentioned settings. The following takes the HyperTerminal in the Windows NT OS for example.

- Create a connection:

Input a connection name, and select a Windows icon for the connection.

Figure 2-2 Creating a Connection

- Select a serial communication port:

According to the serial communication port that has been connected, select COM1 or COM2.

Figure 2-3 Selecting a Serial Communication Port

- Configure parameters for the serial communication port:

Baud rate: 9600 bps

Data bit: 8 bits

Parity check: None

Stop bit: 1 bit

Data stream control: None

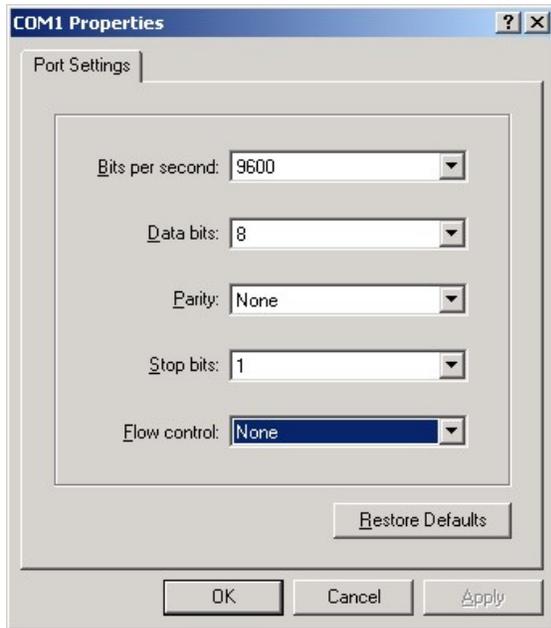

Figure 2-4 Configuring Parameters for the Serial Communication Port

- Login success authentication:

After the device with the Console port is powered on, the startup information of the device is displayed on the terminal. After the startup is completed, the "Press any key to start the shell!" message is displayed. If login authentication is configured to be required, input the user name and password; otherwise, press any key to log in directly. After the login succeeds, the "Hostname>" prompt is displayed on the terminal. Then, you can configure the device.

## 2.2.2 Configuring remote login through Telnet

### Configuration Condition

None

### Enable the Telnet service of the device.

A user can log in to the device remotely through Telnet for management and maintenance. Before using the Telnet service, enable the Telnet service of the device. After the Telnet service of the device is enabled, the Telnet service port 23 is monitored.

Table 2-2 Enabling the Telnet Service of the Device

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Telnet service of the device.	<b>telnet server enable</b>	Mandatory By default, the Telnet service is enabled.

**The device acts as a Telnet client for remote login.**

The user takes the device as a Telnet client to log in to the specified Telnet server for configuration and management.

Table 2-3 Taking the Device as a Telnet Client for Remote Login

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Telnet client of the device.	<b>telnet client enable</b>	Optional By default, the Telnet client is enabled.
The device acts as a Telnet client for remote login.	<b>telnet [ vrf vrf-name ] { hostname   remote-host } [ port-number ] [ ipv4   ipv6 ] [ source-interface interface-name ]</b>	Mandatory

---

 **Note**

- The Telnet client can log in to a remote device only when the Telnet server function of the remote device is enabled, and the network between the Telnet client and the remote device is normal.
-

## 2.2.3 Configuring remote login through SSH

### Configuration Condition

None

### Enable the SSH service of the device.

After the SSH server of a device is enabled, the device accepts the connection request initiated by the user from the SSHv1 or SSHv2 client. After the client passes the authentication, the client can access the device. After the SSH service of the device is enabled, the SSH service port 22 is monitored. If the **ip ssh server** command is configured without parameter **sshv1-compatible**, it indicates that an SSH client can log in only through SSHv2.

Table 2-4 Enabling the SSH Service of the Device

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enable the SSH service of the device.	<b>ip ssh server</b> [ <i>listen-port</i> ][ <b>sshv1-compatible</b> ] [ <i>listen-port</i> ]	Mandatory By default, the SSH service is disabled.

### The device acts as an SSH client for remote login.

The device acts as an SSH client to log in to the specified SSH server remotely through the SSHv1 or SSHv2 protocol. During the login, a user name and a password are required for authentication from the SSH server.

Table 2-5 Taking the Device as a Telnet Client for Remote Login

Step	Command	Description
The device acts as an SSH client for remote login.	<b>ssh</b> [ <i>vrf vrf-name</i> ] <b>version</b> { <b>1</b>   <b>2</b> } <i>remote-host port-number</i> [ <b>source-interface</b> <i>interface-name</i> ] <i>user auth-method 1 password</i>	Mandatory

- The Telnet client can log in to a remote device only when the SSH service of the remote device is enabled, and the network between the SSH client and the remote device is normal.

### The Device Acts as an SFTP Client to Access SFTP Server

The device acts as an SFTP client to log in to a specified SFTP server remotely through the SSHv2 protocol. During the login, a user name and a password are required for authentication from the SFTP server. The SFTP client can download files from the SFTP server or upload files to the SFTP server upon successful login.

Table 2-6 Taking the Device as an SFTP Client to Access SFTP Server

Step	Command	Description
The Device Acts as an SFTP Client to Access SFTP Server	<b>sftp {get   put} [ vrf vrf-name ] remote-host port-number [ source-interface interface-name ] user password src-filename dst-filename [compress]</b>	Mandatory

### Note

- The SFTP client can log in to a remote device only when the SSH service of the remote device is enabled, and the network between the SFTP client and the remote device is normal.

## 2.2.4 Configure remote login through WEB.

To facilitate the configuration and maintenance of network devices, the device provides WEB-based network management function. The device provides a built-in WEB server that allows you to log in to the device from PC and use the WEB interface to configure and maintain the device directly.

The device supports two login modes for the built-in WEB server: HTTP login mode and HTTPS login mode.

The device supports IPv4 WEB login and IPv6 WEB login.

### Configuration Condition

None

### Configure remote login through HTTP.

A user can log in to the device remotely through HTTP for management and maintenance. Before logging in to the HTTP device via HTTP, enable the HTTP service of the device.

Table 2-7 Configuring Login Through HTTP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the HTTP server.	<b>ip http server</b>	Mandatory By default, the WEB server is not enabled.
Configure the HTTP server port.	<b>ip http port <i>port_number</i></b>	Optional By default, the HTTP server port number is 80.

---

 **Note**

Before starting the HTTP server, copy the corresponding WBROM files to /flash.

---

**Configure remote login through HTTPS.**

A user can log in to the device remotely through HTTPS for management and maintenance. Before logging in to the HTTPS device via HTTP, enable the HTTPS service of the device.

Table 2-8 Configuring Login Through HTTPS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the HTTP server.	<b>ip http server</b>	Mandatory By default, the WEB server is not enabled.
Enable the HTTPS server.	<b>ip http secure-server</b>	Mandatory By default, the WEB server is not enabled.

Step	Command	Description
Configure the HTTPS server port.	<b>ip http port</b> <i>port_number</i>	Optional By default, the HTTPS server port number is 443.
Configure certificates used in the HTTPS service.	<b>ip http certificate</b> <i>ca-store</i>	Optional By default, the HTTPS service uses self-signed certificate.

---

### Note

For the configuration of trust domain and certificate import, please refer to the section on "PKI".

---

## 2.2.5 System Login Monitoring and Maintaining

Table 2-9 System Login Monitoring and Maintaining

Command	Description
<b>show fingerprint</b>	Display the fingerprint information of the SSH public key.
<b>show ip http</b>	Display the WEB configuration information.
<b>show ip http login-user</b>	Display the user information after successful WEB login.
<b>show ip http restricted-user</b>	Display the user information after failed WEB login.
<b>show ip http statistics</b>	Display the WEB server statistics information.

## 2.3 Typical Configuration of System Login Example.

### 2.3.1 Configure a Local Terminal to Telnet to the Device.

#### Network Requirements

- A PC is used as a local terminal to log in to the device through Telnet.
- A route must be available between the PC and the device.

#### Network Topology

Figure 2-5 Network Topology for Configuring a Local Terminal to Telnet to the Device

#### Configuration Steps

Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure the enable password.

```
Device#configure terminal
Device(config)#enable password admin
```

Step 4: Telnet to the device.

#On the PC, run the Telnet program, and input the IP address of VLAN 2.

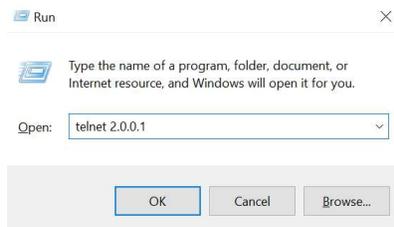

Figure 2-6 Telnet to the Device on PC

Step 5: Check the result.

#If the login succeeds, a window as shown in the following figure is displayed.

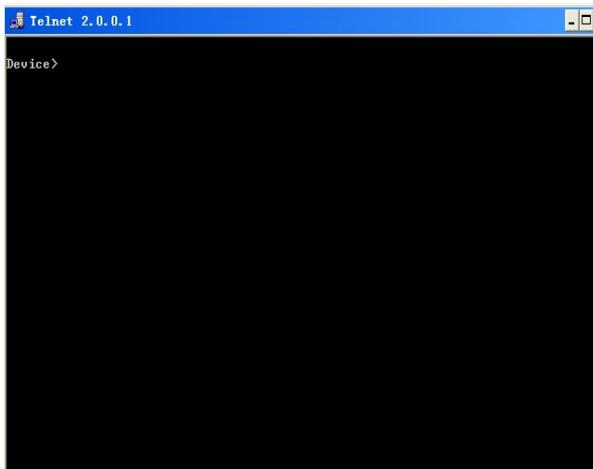

Figure 2-7 Window Displayed after Telnet Success

After logging in to the device Device successfully, input the correct enable password to obtain the required operation rights of the device. To log out of the device, input the exit command continuously.

---

### Note

- If the "Too many clients or invalid access" message is displayed, it indicates that the number of login users has reached the maximum allowed number of login users of the device. In this case, wait a while and try to log in again.
  - If the "%enable operation is locked by login-secure service" message is displayed, it indicates that the number of enable password input errors exceeds the number of continuous login authentication failures. If the number of enable password input errors reaches the number specified by the system, the system rejects the login connection request from the IP address during the specified time.
  - If the "Password required, but none set" message is displayed, it indicates that no login password has been configured.
- 

## 2.3.2 Configure a Local Device to Log in to a Remote Device via Telnet

### Network Requirements

- The local device Device1 acts as the Telnet client, while the remote device Device2 acts as the Telnet server.
- A route must be available between the two devices.
- The PC can normally log in to Device1.

### Network Topology

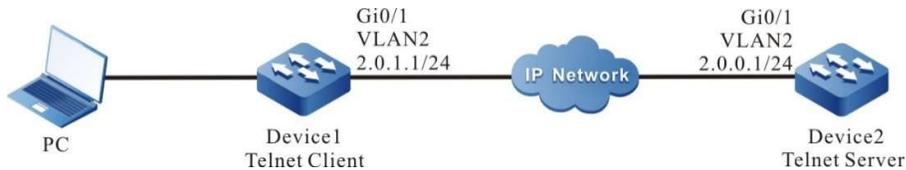

Figure 2-8 Network Topology for Configuring a Local Device to Telnet to a Remote Device

### Configuration Steps

- Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Log in to Device1 through the PC. (Omitted)
- Step 4: On Device1, run the following command to Telnet to Device2.

```
Device1#telnet 2.0.0.1
```

#Enter the shell screen of Device2.

```
Connect to 2.0.0.1 ...done
Device2>
```

After logging in to the device Device2 successfully, input the correct enable password to obtain the required operation rights of the device. To log out of the device, input the exit command continuously.

---

### Note

- If the "Too many clients or invalid access" message is displayed, it indicates that the number of login users has reached the maximum allowed number of login users of the device. In this case, wait a while and try to log in again.
  - If the "%enable operation is locked by login-secure service" message is displayed, it indicates that the number of enable password input errors exceeds the number of continuous login authentication failures. If the number of enable password input errors reaches the number specified by the system, the system rejects the login connection request from the IP address during the specified time.
  - If the "Password required, but none set" message is displayed, it indicates that no login password has been configured within line vty.
- 

## 2.3.3 Configure a Local Device to Log in to a Remote Device via SSH

### Network Requirements

- The local device Device1 acts as the SSH client, while the remote device Device2 acts as the SSH server.
- A route must be available between the two devices.
- The PC can normally log in to Device1.

### Network Topology

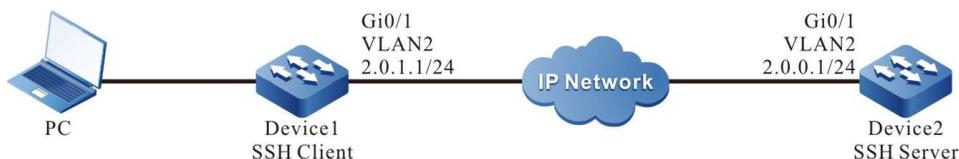

Figure 2-9 Network Topology for Configuring a Local Device to Log in to a Remote Device via SSH

### Configuration Steps

- Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure a local user and the related properties.

#Configure the user name and password of Device2.

```
Device2#configure terminal
Device2(config)#local-user admin1 class manager
Device2(config-user-manager-admin1)#service-type ssh
Device2(config-user-manager-admin1)#password 0 admin1
Device2(config-user-manager-admin1)#exit
```

- Step 4: Enable the SSH server function of Device2.

```
Device2(config)#ip ssh server
```

- Step 5: Set the login authentication mode to local authentication.

```
Device2(config)#line vty 0 15
Device2(config-line)#login aaa
Device2(config-line)#exit
```

- Step 6: #On Device1, log in to Device2 through SSH.

#Configure Device1 to log in to Device2 through SSH.

```
Device1#ssh version 2 2.0.0.1 22 admin1 auth-method 1 admin1
The authenticity of host '2.0.0.1' can't be established
RSA key fingerprint is 7b:ed:cc:81:cf:12:36:6f:f7:ff:29:15:63:75:64:10.
Are you sure you want to continue connecting (yes/no)? yes
Device2>
```

- Step 7: Check the result.

If the login succeeds, the shell screen of Device2 is displayed.

---

## Note

- If the "Connection closed by foreign host" message is displayed, it indicates that the SSH service of the peer end is disabled, or the inputted user name or password is incorrect.
  - The SSH server can be configured not to use authentication. If the SSH server does not use authentication, when a client logs in, a user can use any character string as the user name and password.
- 

### 2.3.4 Configure a Device as an SFTP Client

#### Network Requirements

- Take the PC as an SFTP server, and the device acts as an SFTP client. The network between the server and the device is normal.
- On the SFTP server, the user name for a device to log in to the FTP server is admin, and the password is admin. The files to be downloaded are placed in the SFTP server directory.
- The device acts as the SFTP client to upload files to and download files from the SFTP server.

#### Network Topology

Figure 2-10 Network Topology for Configuring the Device as an SFTP Client

#### Configuration Steps

- Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configure an SFTP server, and place the files to be downloaded in the SFTP server directory. (Omitted)
- Step 3: Configure the IP addresses of the devices so that the network between the client and the server is normal. (Omitted)

Step 4: Device acts as the SFTP client to upload files to and download files from the SFTP server.

#Download a file from the SFTP server to the file system of the device.

```
Device#sftp get 2.0.0.1 22 admin admin sp8-g-6.6.7(46)-dbg.pck sp8-g-6.6.7(46)-dbg.pck
The authenticity of host '2.0.0.1 (2.0.0.1)' can't be established.
RSA key fingerprint is e4:dd:11:2e:82:34:ab:62:59:1c:c8:62:1d:4b:48:99.
Are you sure you want to continue connecting (yes/no)? yes
```

```
Downloading#####
#####OK!
```

#Upload the startup file in the file system of Device to the SFTP server.

```
Device#sftp put 2.0.0.1 22 admin admin startup startup.txt
The authenticity of host '2.0.0.1 (2.0.0.1)' can't be established.
RSA key fingerprint is e4:dd:11:2e:82:34:ab:62:59:1c:c8:62:1d:4b:48:99.
Are you sure you want to continue connecting (yes/no)? yes
```

```
Uploading#####
#####OK!
```

Step 5: Check the result.

#After the copy process is completed, check whether the downloaded file exists in the file system of the device. In the SFTP server, check whether the uploaded file exists. (Omitted)

```
Device(config-fs)#dir
size  date  time  name
-----

10207  MAR-01-2015  01:17:54  history
11676148  MAR-26-2013  07:51:32  sp8-g-6.6.7(46)-dbg.pck
2048  JAN-10-2015  17:30:20  snmp      <DIR>
```

## 2.3.5 Configure a Device as an SFTP Server

### Network Requirements

- The device acts as an SFTP server, while PC acts as an SFTP client. The network between the client and the server is normal.
- On the SFTP server Device, the user name is admin1, and the password is admin1. The file system directory of the device acts as the root directory of the SFTP server.
- The PC acts as the SFTP client to upload files to and download files from the SFTP server device.

### Network Topology

Figure 2-11 Network Topology for Configuring the Device as an SFTP Server

### Configuration Steps

- Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports so that the network between the PC and the device is normal. (Omitted)
- Step 3: On Device, enable the SFTP service, and configure the authorized user name and password.

#On the SFTP server Device, configure the authorized user name and password.

```
Device#configure terminal
Device(config)#local-user admin1 class manager
Device(config-user-manager-admin1)#service-type ssh
Device(config-user-manager-admin1)#password 0 admin1
Device(config-user-manager-admin1)#exit
```

#Enable SSH service on Device (SFTP is a sub-module of the SSH protocol)

```
Device(config)#ip ssh server
```

- Step 4: The PC acts as the SFTP client to upload files to and download files from the SFTP server Device.

#In the following part, the Linux system is taken as an example to illustrate the process.

#Input the correct IP address, user name, and password to log in to the SFTP server.

```
[root@aas ~]# sftp admin1@2.1.1.1
Connecting to 2.1.1.1...
admin@2.1.1.1's password:
sftp>
```

#Obtain the startup file in the file system of the SFTP server Device.

```
sftp> get startup startup
Fetching /flash/startup to startup
/flash/startup                               100% 13KB 12.9KB/s 00:00
```

#After the file copy process is completed, the file is available in the specified operation directory.

```
sftp> ls
sp8-g-6.6.7(74)-dbg.pck sp8-g-6.6.7(76)-dbg.pck startup      tech      test_pc
sftp>
```

#Upload the files in the PC to the file system of SFTP server Device.

```
sftp> put sp8-g-6.6.7(76)-dbg.pck sp8-g-6.6.7(76)-dbg.pck
Uploading sp8-g-6.6.7(76)-dbg.pck to /flash/ sp8-g-6.6.7(76)-dbg.pck
sp8-g-6.6.7(76)-dbg.pck 100% 11424KB 16.0KB/s 00:00
```

#After the file copy process is completed, the file is available in the file system of the device.

```
Device(config-fs)#dir

### 2.3.6 Configure a Local Device to Log in to a Remote Device via SSH Public Key Authentication

#### Network Requirements

- A PC is used as a local terminal where the SecureCRT software is installed.
- A PC is used as a local terminal to log in to the device via SSH public key.

#### Network Topology

Figure 2-12 Network Topology for Configuring a Local Device to Log in to a Remote Device via SSH Public Key Authentication

#### Configuration Steps

Step 1: Configure IP addresses for the ports and configure the routing protocol to enable intercommunication between the PC and Device. (Omitted).

Step 2: Configure SSH service and FTP function.

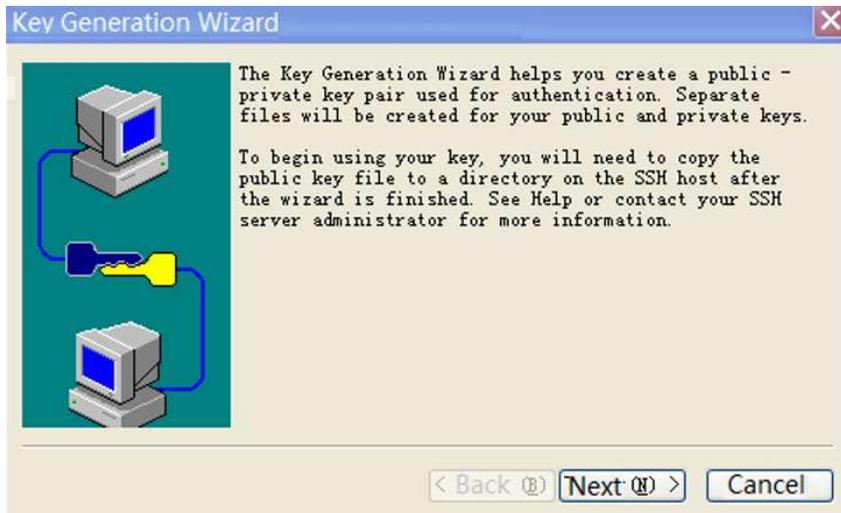

```
Device#configure terminal
Device(config)#ip ssh server
```

Step 3: Configure the login user name for Device.

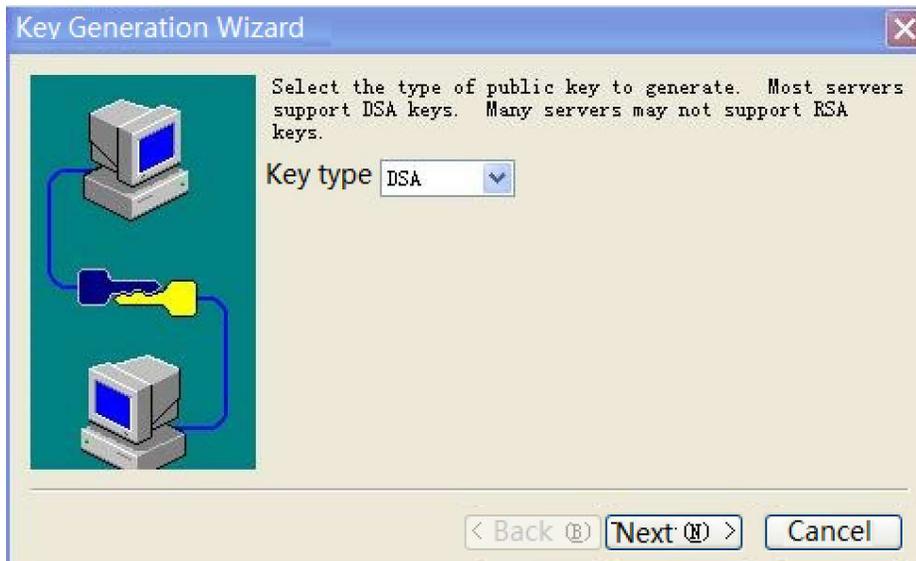

```
Device(config)#local-user user1 class manager
Device(config-user-manager-user1)#service-type ssh
Device(config-user-manager-user1)#exit
```

Step 4: Generate the SSH public key file on the PC.

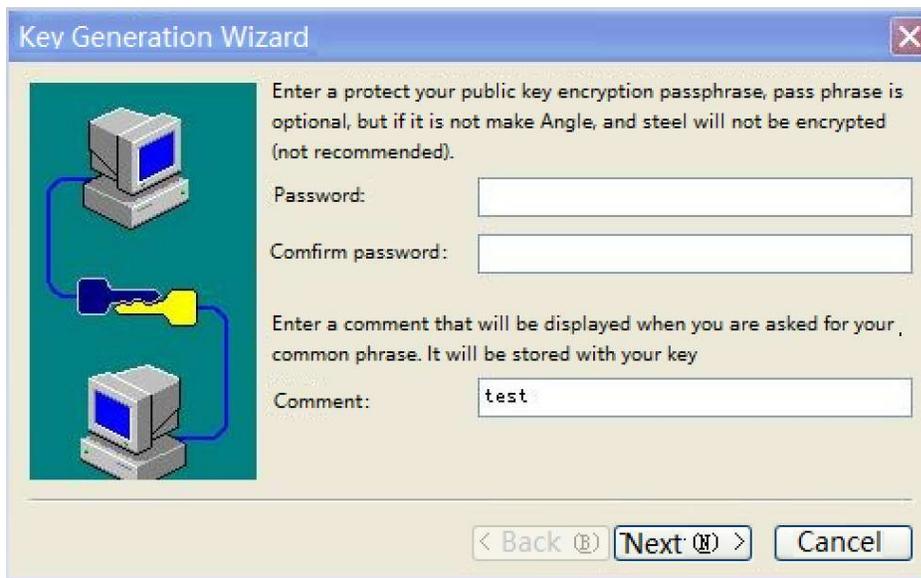

# Windows operating system is used as an example herein, and Version 6.1.2 of SecureCRT is used. Open the SecureCRT software toolbar on the PC and click on "Tools", then click on "Create Public Key (C)" in the drop-down menu, the key generation wizard will pop up, click on Next.

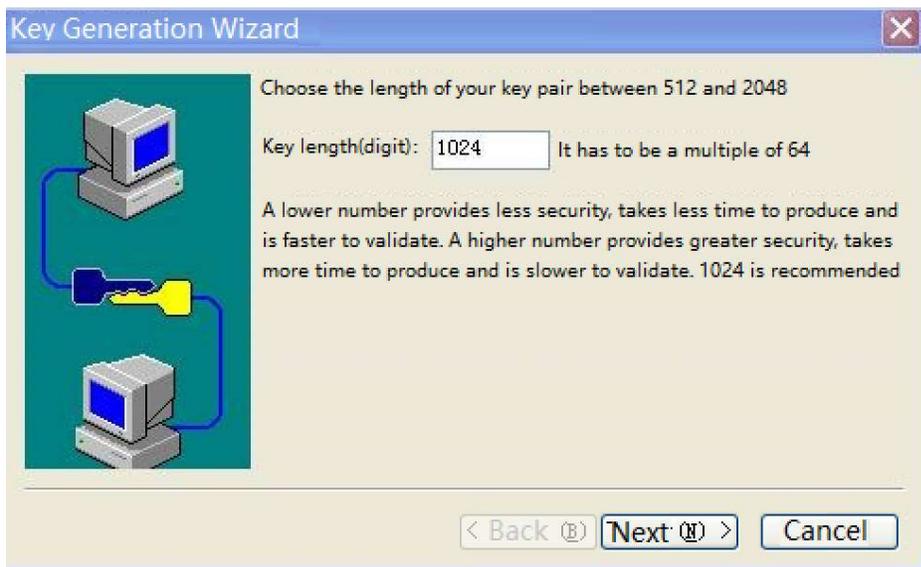

# Key type, choose either from DSA and RSA, here DSA is chosen as an example, click on Next.

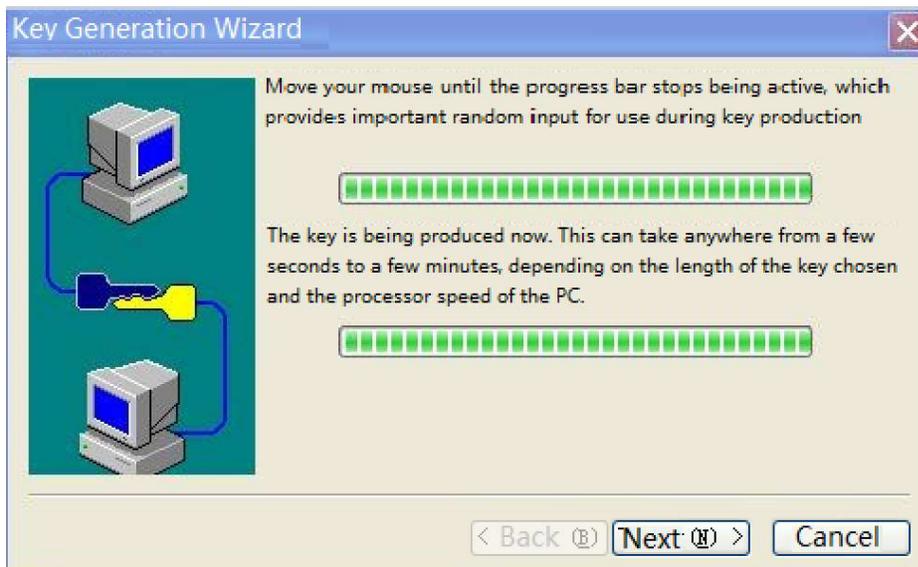

#Passphrase is locally valid and can be ignored, click on Next.

\#Key length to be filled in according to the instructions, click on Next.

#Key generation, you need to keep moving the mouse, after the key is generated, click on Next.

#Select the storage key format, note that here you must select the OpenSSH key format, click "Finish".

#Create the file "authorized\_keys" in the FTP server path of the PC, copy all the contents of the public key file "Identity.pub" to "authorized\_keys". authorized\_keys", and Device will copy the file "authorized\_keys" to the path /flash/sshpubkey/user1/.

```
Device#filesystem
Device(config-fs)#mkdir sshpubkey
Device(config-fs)#cd sshpubkey
Device(config-fs)#mkdir user1
Device(config-fs)#cd user1
Device(config-fs)#copy ftp 2.0.0.1 username password authorized_keys file-system authorized_keys
```

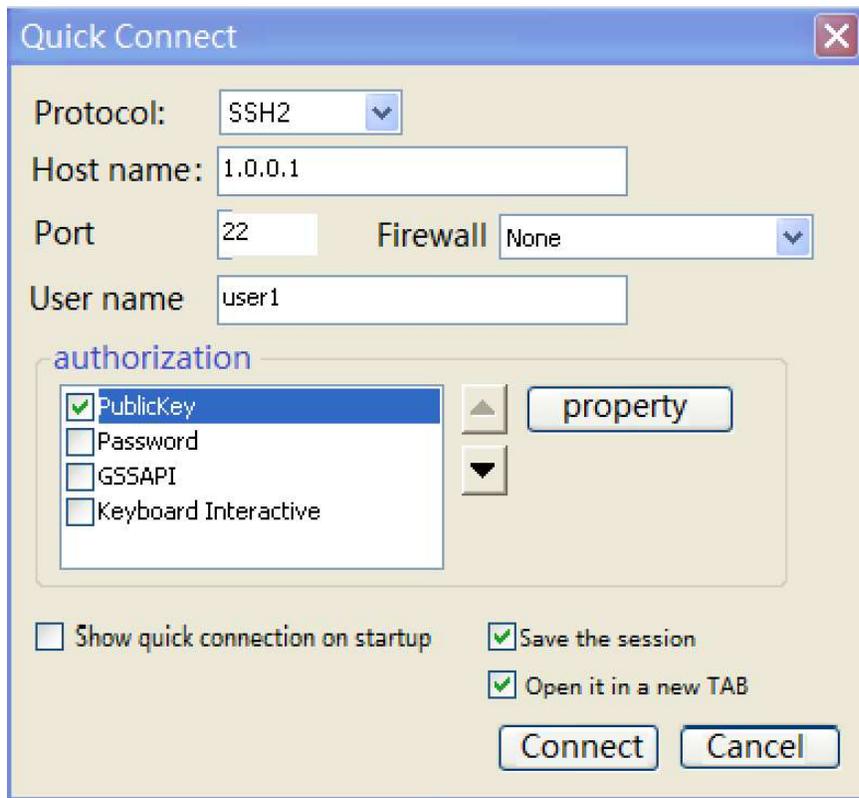

---

## Note

- OpenSSH must be selected as the storage key format, other formats are not supported.
  - When copying the content of "Identity.pub", you need to select all and then copy it without line breaks.
  - When there are multiple clients logging in with the same user name, paste another public key after the public key information stored in "authorized\_keys" in a new line, and so on.
  - By default, the device does not have the directory /flash/sshpubkey/user1/ and needs to be created in filesystem, where user1 is the user name used for authentication and the user name is the user existing on the device, if the user name is user2, then /flash/sshpubkey/user2/ needs to be created.
  - SSH public key authentication does not support SSHv1 version.
- 

Step 5: Check the result.

The PC uses SecureCRT software to establish an SSH connection, using publickey priority or unique authentication, click on "Connect" to see that the connection will not be asked for a password and can log in to the device directly.

# 3 System Control and Management

---

## 3.1 Overview

To enhance the operation security of the device, in user login or enable operation, the device provides multiple authentication management types (including AAA. Refer to the related sections and chapters in AAA configuration manual.) Only the user with the required operation rights can log in or perform the enable operation successfully.

To authorize different set of executable commands to different level of users, the device commands are divided into levels 0-15, and user levels are divided into levels 0-15. Among the levels, level 0 has the lowest rights while level 15 has the highest rights.

## 3.2 Login Control and Management Function Configuration

Table 3-1 Login Control and Management Configuration List

Configuration Task	
Switch over between user levels.	Switch over between user levels.
Configure the command level.	Configure the command level.
Configure the enable password.	Configure the enable password.
Configure users and the related properties.	Configure auto commands.
	Configure no password authentication during login.
	Configure user passwords.
	Configure the user privilege level.
Configure line properties.	Enter the line configuration mode of the Console port.

Configuration Task	
	Enter the line configuration mode of the Telnet or SSH user.
	Configure Absolute Time for Login User Operation
	Configure the privilege level of the login user.
	Configure users to automatically execute commands after login.
	Configure auto command execution options.
	Configure login user idle timeout time.
	Configure the line password.
	Configure the login authentication mode.
	Configure the line authorization mode.
	Configure the line accounting mode.
	Enable the Modem function of the Console port.
	Configure the user login timeout time.

### 3.2.1 Switch over between user levels.

If a user name and password of the corresponding level is configured, the user can run the enable level (0-15) command and then enter the correct password to enter the required user level. Meanwhile, the user has the execute permission of the user level and the lower levels.

If the current user level is higher than the user level that the user wants to enter, then no authentication is required, and the user directly enters the required user level. If the user level that the user wants to enter is higher than the current user level, authentication is required according to the current configuration, and the authentication mode is selected according to the configuration.

If the enable password of the corresponding level has been configured (by using the **enable password level** command), while the enable authentication of Authorization, Authentication and Accounting (AAA) is not configured or the AAA enable authentication is set to use the enable method, use the enable password for authentication.

If the enable password of the required level has not been configured, but the enable authentication method is set to use the local enable password for authentication, there are two cases:

a) In the case of a Telnet user, the login fails. If AAA has not been configured, the "% No password set" is prompted. If AAA has been configured, the "% Error in authentication" message is prompted.

b) For a Console port user, if AAA has been configured, try to use the enable password for authentication during the login. If the enable password has not been configured, use the none authentication method. That is, the login passes the authentication by default. If AAA has not been configured, the "% No password set" message is prompted, and the authentication fails.

If enable authentication succeeds, the user enters the specified user level and the user has execution permission of the level. To query the user level of the current user, run the **show privilege** command.

If the aaa authentication enable-method is configured and a related method list is used to enable authentication, then the related method is required for authentication, including:

a) If aaa authentication enable-method none is configured, no password is required.

b) If aaa authentication enable-method enable is configured, and the enable password is configured, use the password for authentication. Otherwise, the "% Bad passwords" message is prompted, and the authentication fails.

c) If aaa authentication enable default radius is configured, Remote Authentication Dial in User Service (RADIUS) authentication is used. Note that the enable authentication user names for RADIUS are fixed, that is, \$enable+level\$. Here "level" is a number in the range of 1-15, that is, the level that the user wants to enter. The RADIUS user names are fixed, therefore, during authentication, no user name is required. The user needs only to input the password. If passwords have been set for users of different levels on the RADIUS server, after inputting the correct password, the login succeeds; otherwise, the login fails. For example, in running the enable 10 command, the fixed user name is \$enable10\$. If the user name exists on the RADIUS server, input the password corresponding to the user name, and then the authentication succeeds.

d) If aaa authentication enable default tacacs is configured, Terminal Access Controller Access Control System (TACACS) authentication is used. If the user name is displayed during login, keep the user name for login, and input the enable password of the user name. Otherwise, input a user name and the enable password of the user name. If the inputted user name exists in the TACACS server and the enable password of the TACACS has been set, the authentication succeeds; otherwise, the authentication fails.

---

 **Note**

- The previously mentioned enable authentication methods can form a combination in use.
-

None

### Switch over between user levels.

If a user has the corresponding authority, the user can switch from the common user mode to the privileged user mode by switching over between user levels with a command. Then, the user has the authority of the user level. If a user runs the command in the privileged user mode, the user level switchover is performed according to the command parameter.

Table 3-2 Switching Over Between User Levels

Step	Command	Description
Switch over between user levels.	<b>enable</b> [ <i>level-number</i> ]	Mandatory  By default, the user level is level 15.

### 3.2.2 Configure the command level.

#### Configuration Condition

None

#### Configure the command level.

In the application program, each shell command has a default level, which can be modified through the **privilege** command. A user can execute only the commands with the level equal to or smaller than the user level. For example, a user with the user level 12 can execute only the commands with the levels 0-12. In configuring the command level, you need to make use of command modes. You can modify the level of a single command or all commands in a specified command mode.

Table 3-3 Configuring the Command Level

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the command level.	<b>privilege</b> <i>privilege-mode</i> <b>level</b> <i>level-number</i> [ <b>all</b>   <b>command</b> <i>command-line</i> ]	Mandatory

### 3.2.3 Configure the enable password.

#### Configuration Condition

None

### Configure the enable password.

The enable password is the password that is used by a level of users to enter the local level. If no level is specified in the enable command, the password is set as the enable password of level 15 by default.

Table 3-4 Configuring Enable Password

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the enable password.	<b>enable password</b> [ <b>level</b> <i>level-number</i> ] [ <b>0</b> ] <i>password</i>	Mandatory By default, no enable password is configured.

### 3.2.4 Configure line properties.

The device supports up to one Console port user and 16 Telnet or SSH users to log in at the same time. Line commands can set different authentication and authorization properties for the login users.

#### Configuration Condition

None

#### Enter the line configuration mode of the Console port.

To configure the Console port properties, you need to enter the line configuration mode of the Console port.

Table 3-5 Entering the Line Configuration Mode of the Console Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port.	<b>line con 0</b>	Mandatory

#### Enter the line configuration mode of the Telnet or SSH user.

To configure the Telnet or SSH properties, you need to enter the line configuration mode of Telnet or SSH.

Table 3-6 Entering the Line Configuration Mode of the Telnet or SSH User

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Telnet or SSH user.	<b>line vty</b> { <i>vtty-min-number</i> } [ <i>vtty-max-number</i> ]	Mandatory

### Configure Absolute Time for Login User Operation

The absolute time for the login user operation refer to the timeout time from the successful login of a user to the automatic exit of the user, in the unit of minute. If the absolute time is set to 0, it indicates that the time is not limited. By default, the time is 0. In addition, five seconds before the configured time expires, the following prompt message is displayed: Line timeout expired.

Table 3-7 Configuring the Absolute Time for the Login User Operation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line</b> { <b>con 0</b>   <b>vtty</b> <i>vtty-min-number</i> [ <i>vtty-max-number</i> ] }	Mandatory
Configure the absolute time for the login user operation.	<b>absolute-timeout</b> <i>absolute-timeout-number</i>	Mandatory By default, the absolute time is 0, that is, no time limit.

### Configure Privilege Level of Login User

Configure the privilege level of the login user. The default privilege level is 1. A user can execute only the commands with the level equal to or smaller than the current level.

Table 3-8 Configuring the Privilege Level of the Login User

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line</b> { <b>con 0</b>   <b>vtty</b> <i>vtty-min-number</i> [ <i>vtty-max-number</i> ] }	Mandatory
Configure the privilege level of the login user.	<b>privilege level</b> <i>level-number</i>	Mandatory  By default, the authorized user level is 1.

### Configure Access Control List

Configure the user Access Control List (ACL) so that only hosts allowed by the ACL can log in to the device.

Table 3-9 Configuring Line Access Control List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of Virtual Type Terminal (VTY).	<b>line</b> { <b>vtty</b> <i>vtty-min-number</i> [ <i>vtty-max-number</i> ] }	Mandatory
Configure Access Control List	<b>access-class</b> { <i>access-list-number</i>   <i>access-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory
Configure ipv6 ACL Control List	<b>ipv6 access-class</b> { <i>access-list-number</i>   <i>access-list-name</i> }{ <b>in</b>   <b>out</b> }	Optional

### Configure users to automatically execute commands after login.

Configure the commands to be automatically executed after users successfully log in. By default, no command is to be automatically executed.

Table 3-10 Configuring the Commands to be Automatically Executed after Successful Login

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line { con 0   vty vty-min-number [ vty-max-number ] }</b>	Mandatory
Configure the commands to be automatically executed after successful login.	<b>autocommand</b> <i>command-line</i>	Mandatory

### Configure auto command execution options.

You can configure delay time for auto commands, and configure whether to disconnect the user connection after the commands are executed automatically. By default, the command execution is not delayed, and the user connection is disconnected after the commands are executed automatically.

The auto command execution options include delay and whether to disconnect the user connection after command execution.

Table 3-11 Configuring Auto Command Execution Options

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line { con 0   vty vty-min-number [ vty-max-number ] }</b>	Mandatory
Configure the auto command execution options.	<b>autocommand-option</b> { <b>nohangup</b> [ <b>delay</b> <i>delay-time-number</i> ]   <b>delay</b> <i>delay-time-number</i> [ <b>nohangup</b> ] }	Mandatory

### Note

- The **autocommand-option** command is valid only after the **autocommand** function is

---

configured.

---

### Configure login user idle timeout time.

If the time in which login user does not perform any operation on the device is longer than the idle timeout time, the device make the current login user to log out. The default idle timeout exit time is 5 minutes. If the time is set to 0, then idle timeout does not take effect.

Table 3-12 Configuring the Idle Timeout Exit Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line { con 0   vty vty-min-number [ vty-max-number ] }</b>	Mandatory
Configuring the idle timeout exit time.	<b>exec-timeout exec-timeout-minute_number [ exec-timeout-second_number ]</b>	Mandatory The default idle timeout exit time is 5 minutes.

### Configure the line password.

Use 0 and 7 to indicate whether the line password is in plain text or cipher text. 0 indicates that the password is in plain text while 7 indicates that the password is in cipher text. In interaction mode, only plain-text password is allowed. That is, in this mode, only the parameter value 0 is used.

Table 3-13 Configuring the Line Password

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line { con 0   vty vty-min-number [ vty-max-number ] }</b>	Mandatory
Configure the line password.	<b>password 0 password</b>	Mandatory

### Configure the login authentication mode.

The device supports the following login authentication modes:

Login authentication using login password: the line password authentication is used.

Login authentication using login aaa: AAA authentication is used.

No login means that no authentication is required to log in.

Telnet uses the no login authentication mode by default, and SSH uses the local user authentication mode by default.

Table 3-14 Configuring Login Authentication Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line { con 0   vty vty-min-number [ vty-max-number ] }</b>	Mandatory
Configure the login authentication mode.	<b>login {aaa [ domain-name   default]   password}</b>	This command affects AAA authentication, authorization, and billing.

#### Configure the user login timeout time.

When a user logs in to the device, if the waiting time for entering the user name or password times out, then the system will prompt a login failure. By default, the timeout time for login is 30 seconds. Users can configure the timeout time for login using this function.

Table 15-3 Configuring the Timeout Time for User Login

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the line configuration mode of the Console port or Virtual Type Terminal (VTY).	<b>line { con 0   vty vty-min-number [ vty-max-number ] }</b>	Mandatory
Configure the timeout time for user login.	<b>timeout login respond respond-time-value</b>	Mandatory By default, the time to enter the username or

Step	Command	Description
		password before the session timeout is 30 seconds.

### 3.2.5 System Control and Management Monitoring and Maintaining

Table 3-16 System Control and Management Monitoring and Maintaining

Command	Description
<b>clear line</b> { <b>con</b> <i>con-number</i>   <b>vty</b> <i>vty-number</i> }	Clear a terminal service.
<b>show privilege</b>	View the privilege level of the current user.
<b>show users</b>	Display the configured user information.

# 4 FTP, FTPS, TFTP and SFTP.

---

## 4.1 Overview

File Transfer Protocol (FTP) is used between a server and a client to transmit files. It improves file sharing, and provides an efficient and reliable data transmission mode between the user and remote computer. The FTP protocol usually uses TCP port 20 and 21 for transmission. Port 20 transmits data in active mode, and port 21 transmits control messages.

Similar to most Internet services, FTP uses the client/server communication mechanism. To connect to an FTP server, usually you are required to have the authorized account of the FTP server. On the Internet, a large number of FTP servers are anonymous FTP servers, which aim at provide file copying services to the public. For this type of FTP server, users need not register with the server or obtain authorization from the FTP servers.

FTP supports two types of file transmission modes:

- ASCII transmission mode, in which text files are transmitted.
- Binary transmission mode, in which program files are transmitted.

If the device acts as an FTP client, only the binary transmission mode is supported. If the device acts as an FTP server, both transmission modes are supported.

FTP supports two working modes:

- Active mode: An FTP client first sets up a connection with an FTP server through the TCP21 port and sends commands through this channel. If the FTP client wants to receive data, it sends the PORT command through this channel. The PORT command contains through which port the client receives data. Then the FTP server connects its TCP20 port to the specified port of the FTP client to transmit data. The FTP server must set up a new connection with the FTP client to transmit data.
- Passive mode: The method of setting up the control channel in passive mode is similar to that in active mode. However, after the connection is set up, the PASV command instead of the PORT command is sent. After the FTP server receives the PASV command, it opens a high end port (with the port number larger than 1024) and inform the client to transmit data through this port. The FTP client connects to the port of the FTP server, and then the FTP server transmits data through this port.

Many Intranet clients cannot log in to the FTP server in active mode, because the server fails to set up a new connection with an Intranet client.

When the device acts as an FTP client, it sets up a data connection in active mode.

FTPS is an enhanced FTP protocol that uses standard FTP protocols and commands at the Secure Sockets Layer (SSL), adding SSL security features to the FTP protocol and data channels. FTPS is also known as "FTP-SSL" or "FTP-over-SSL". SSL is a protocol that encrypts and decrypts data in a secure connection between a client and an SSL-enabled server. Only the FTP client on the device supports this feature. Trivial File Transfer Protocol (TFTP) is a simple file transfer protocol which is based on the User Datagram Protocol (UDP). It transmits data through UDP port 69. The protocol is designed for transmission of small files; therefore, it does not have as many functions as the FTP protocol. It does not support list of directories or authentication. The device only implements the functions of the TFTP client.

SFTP (Secure File Transfer Protocol /Secure FTP) is a new feature added in SSH 2.0. SFTP is built on top of SSH connection, which allows remote users to securely log in to the device and perform operations such as file management and file transfer, providing a higher level of security for data transfer. SFTP provides a secure method for transferring files. SFTP is a sub-function of SSH that enables secure file transfer. SFTP encrypts the transmission of authentication information and the transmitted data, so it is very safe to use SFTP. If you have high requirements for network security, SFTP can be used to replace FTP. However, since SFTP file transfer uses encryption/decryption technology, the transfer efficiency is lower than FTP file transfer.

## 4.2 FTP, FTPS, TFTP and SFTP Function Configuration

Table 4-1 FTP and TFTP Function Configuration List

Configuration Task	
Configure an FTP server.	Configure the functions of an FTP server.
Configure an FTP client.	Configure the functions of an FTP client.
Configure a TFTP client.	Configure the functions of a TFTP client.
Configure an SFTP Server	Configure the functions of an SFTP Server.
Configure an SFTP client.	Configure the functions of an SFTP client.

### 4.2.1 Configure an FTP server.

#### Configuration Condition

None

## Configure the functions of an FTP server.

Before configuring the device as the FTP server, first enable the FTP server function. Then, the FTP client can access the FTP server. For security sake, the device provides the FTP service only to authorized users, and it limits the maximum allowed number of concurrent login users.

Table 4-2 Configuring FTP Server Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the FTP server function.	<b>ftp enable</b>	Mandatory By default, the FTP server function is disabled.
Create an user administrator and enter the user administrator mode	<b>local-user <i>user-name</i> class manager</b>	-
Configure service-type that supports FTP for users	<b>service-type ftp</b>	-
Configure user password	<b>password 0 <i>password</i></b>	Mandatory By default, the user name and password are not configured. For details of the command, refer to the section on "LUM".
Configure the FTP service listening port number	<b>ftp listen-port [ <i>port-num</i> ]</b>	Optional By default, the FTP service listening port number is 21.
Configure the maximum allowed number of concurrent login users.	<b>ftp max-user-num <i>user-num</i></b>	Optional By default, the maximum allowed number of concurrent login users is 1.
Configure the connection timeout time.	<b>ftp timeout <i>time</i></b>	Optional

Step	Command	Description
		By default, the connection timeout time is 300 seconds.

#### 4.2.2 Configure an FTP client.

##### Configuration Condition

None

##### Configure the functions of an FTP client.

On the device, when you use the copy command to **copy** files (Refer to the related sections in "File System Management") or use the **sysupdate** command to upgrade the software version (Refer to the related sections in "Software Upgrade"), the device can be triggered to act as the FTP client and set up a connection with the remote FTP server.

The connection between an FTP client and an FTP server uses the address of the outgoing interface of the route to the FTP server as the source address by default. Users can also use the **ip ftp source-address** or **ip ftp source-interface** commands to specify the FTP client source address or source interface.

Table 4-3 Configuring FTP Client Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure FTP Client Source Address.	<b>ip ftp { source-interface <i>interface-name</i>   source-address <i>ip-address</i> }</b>	Optional By default, the address of the outgoing interface of the route to the FTP server is used as the source address.
Configure the FTP Client to Use Port Mode as a Priority.	<b>ip ftp port-first</b>	Optional By default, preference is given to passive mode for establishing data connections to the server

---

 **Note**

- In some network environments, because of security factors, the communication between the address of the outgoing interface of the route to the FTP server and the FTP server may be restricted, while communication with other service interface addresses are normal. In such case, you can use the `ip ftp source-address`, `ip ftp source-interface` commands to specify the FTP client source address or source interface.
- 

### 4.2.3 Configure a TFTP client.

#### Configuration Condition

None

#### Configure the functions of a TFTP client.

On the device, when you use the **copy** command to copy files (Refer to the related sections in "File System Management") or use the **sysupdate** command to upgrade the software version (Refer to the relevant sections on "Software Upgrade"), the device can be triggered to act as the TFTP client and set up a connection with the remote TFTP server.

The connection between a TFTP client and a TFTP server uses the address of the outgoing interface of the route to the TFTP server as the source address by default. Users can also use the **ip tftp source-address** or **ip tftp source-interface** commands to specify the TFTP client source address or source interface.

Table 4-4 Configuring TFTP Client Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TFTP Client Source Address	<b>ip tftp { source-interface <i>interface-name</i>   source-address <i>ip-address</i> }</b>	Optional By default, the address of the outgoing interface of the route to the TFTP server is used as the source address to communicate with the TFTP server.

---

 **Note**

- 
- In some network environments, because of security factors, the communication between the address of the outgoing interface of the route to the TFTP server and the TFTP server may be restricted, while communication with other service interface addresses are normal. In such case, you can use the `ip tftp source-address`, `ip tftp source-interface` commands to specify the TFTP client source address or source interface.
- 

#### 4.2.4 Configure the TFTP Server

##### Configuration Condition

None

##### Configure TFTP Server Function

Before configuring the device as the TFTP server, first enable the TFTP server function. Then, the TFTP client can access the TFTP server.

Table 4-5 Configuring TFTP Server Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the TFTP server function.	<b>tftp enable</b>	Mandatory By default, the TFTP server function is disabled.

#### 4.2.5 Configure an SFTP Server

##### Configuration Condition

None

##### Configure the functions of an SFTP Server.

Before configuring the device as the SFTP server, first enable the SFTP server function. Then, the SFTP client can access the SFTP server. Since SFTP is a sub-function of SSH, the configuration to enable SFTP service is the same as that to enable SSH remote login service.

Table 4-6 Configuring SFTP Server Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable the SFTP server function.	<b>ip ssh server [ sshv1-compatible ] [ listen-port ]</b>	Mandatory By default, the SFTP server function is disabled.

#### 4.2.6 Configure an SFTP client.

##### Configuration Condition

None

##### Configure the functions of an SFTP client.

The device acts as an SFTP client and connects to the SFTP server to download files from the SFTP server or upload files to the SFTP server.

Table 4-7 Configuring SFTP Client Function

Step	Command	Description
Configure the device to act as the SFTP client to upload files to and download files from the SFTP server.	<b>sftp { get   put } [vrf vrf-name] host-ip-address port-number [source-interface interface-name] user password src-filename dest-filename [compress]</b>	Optional

#### 4.2.7 FTP and TFTP monitoring and maintaining

None

### 4.3 Typical Configuration Example of FTP and TFTP

#### 4.3.1 Configure a Device as an FTP Client

##### Network Requirements

- A PC acts as an FTP server, and the device Device acts as an FTP client. The network between the server and the device is normal.

- On the FTP server, the user name for a device to log in to the FTP server is admin, and the password is admin. The files to be downloaded are placed in the FTP server directory.
- The device acts as the FTP client to upload files to and download files from the FTP server.

### Network Topology

Figure4–1 Network Topology for Configuring a Device as an FTP Client

### Configuration Steps

- Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configure an FTP server, and place the files to be downloaded in the FTP server directory. (Omitted)
- Step 3: Configure the IP addresses of the devices so that the network between the client and the server is normal. (Omitted)
- Step 4: Device acts as the FTP client to upload files to and download files from the FTP server. (Omitted)

#In the file system mode of Device, copy one file from the FTP server to the file system of Device.

```
Device#filesystem
Device(config-fs)#copy ftp 2.0.0.1 admin admin sp4-g-6.5.0(41).pck file-system sp4-g-6.5.0(41).pck
Device (config-fs)#exit
```

#In the file system mode of Device, copy the startup file of Device into the FTP server.

```
Device#filesystem
Device(config-fs)#copy file-system startup ftp 2.0.0.1 admin admin startup.txt
```

- Step 5: Check the result.

#After the copy process is completed, check whether the downloaded file exists in the file system of Device.

In the FTP server, check whether the uploaded file exists. (Omitted)

```
Device(config-fs)#dir

---

## Note

- If the "FTP: Ctrl socket connect error(0x3c): Operation timed out" message is printed, it indicates that the server cannot be reached, and the cause may be that the route is not available or the server has not been started.
  - If the "Downloading##OK!" message is printed, it indicates that the file is copied successfully.
- 

### 4.3.2 Configure a Device as an FTP Server

#### Network Requirements

- Device1 acts as an FTP server, while PC and Device2 act as FTP clients. The network between the client and the server is normal.
- On the FTP server Device1, the user name is admin1, and the password is admin1. The file system directory of Device1 acts as the root directory of the FTP server.
- The PC and Device2 act as the FTP client to upload files to and download files from the FTP server Device1.

#### Network Topology

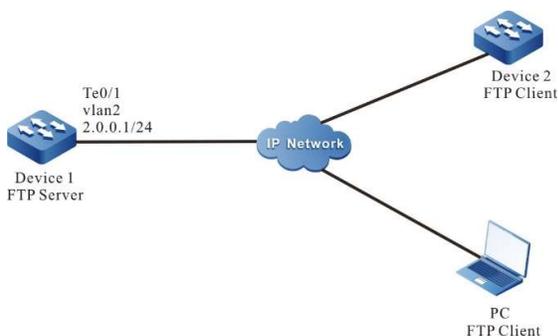

Figure4–2 Network Topology in Which a Device Acts as an FTP Server

#### Configuration Steps

- Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs.  
(Omitted)

Step 2: Configure the IP addresses of the interfaces so that the network between the PC, Device 2, and Device 1 are normal. (Omitted)

Step 3: On Device1, enable the FTP service, and configure the authorized user name and password.

#On Device1, enable the FTP service, and configure the authorized user name and password.

```
Device1#configure terminal
Device1(config)#local-user admin1 class manager
Device1(config-user-manager-admin1)#service-type ftp
Device1(config-user-manager-admin1)#password 0 admin1
Device1(config-user-manager-admin1)#exit
```

#On Device1, enable the FTP service.

```
Device1(config)#ftp enable
```

#On Device1, set the maximum number of concurrent users to 2.

```
Device1(config)#ftp max-user-num 2
```

Step 4: Check the result.

#Check whether the FTP service function is enabled on Device1.

```
Device#show ip sockets
Active Internet connections (including servers)
PCB Proto Recv-Q Send-Q Local Address Foreign Address (state)
-----
27cf8a4 TCP 0 0 0.0.0.0.80 0.0.0.0 LISTEN
27ce0a4 TCP 0 0 130.255.104.43.22 130.255.98.2.3590 ESTABLISHED
27d0be4 TCP 0 0 0.0.0.0.21 0.0.0.0 LISTEN
27d0824 TCP 0 0 127.0.0.1.2622 127.0.0.1.1026 ESTABLISHED
```

If the FTP service function has enabled, you can find that port 21 is in the listen state.

Step 5: Use Device2 as an FTP client to copy a startup file from FTP server Device1 to local.

```
Device2#filesystem
Device2(config-fs)#copy ftp 2.0.0.1 admin1 admin1 startup file-system startup
```

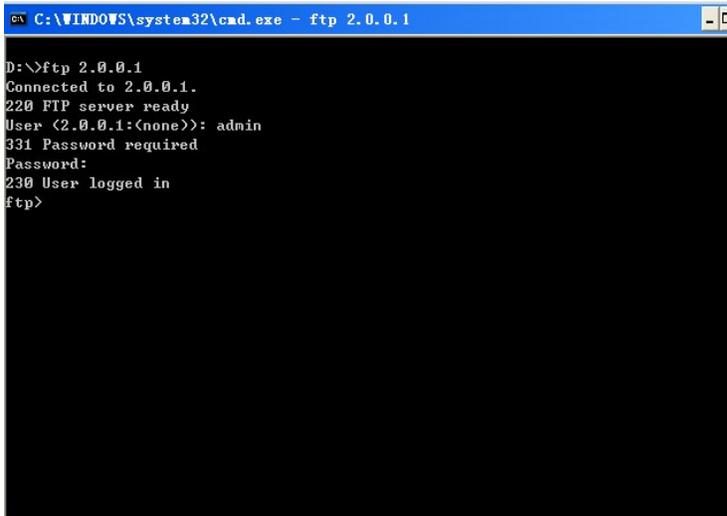

Step 6: Use PC as an FTP client to copy a startup file from FTP server Device1 to PC.

#In the following part, the Windows DOS screens are taken as an example to illustrate the process.

#In the Windows DOS screen, input the correct IP address, user name, and password to log in to the FTP server.

```
D:\>ftp 2.0.0.1
Connected to 2.0.0.1.
220 FTP server ready
User (2.0.0.1:(none)): admin
331 Password required
Password:
230 User logged in
```

ftp> _
```

Figure4-5 Copying a Configuration File from the FTP Server

After the file copy process is completed, the file is available in the specified Windows directory.

---

 **Note**

- If the "421 Session limit reached, closing control connection" message is printed, it indicates that the number of connections has exceeds the maximum number allowed by the server.
- When you use a device to copy a file, if the " Ctrl socket connect error(0x3c): Operation timed out" message is printed, the cause may be that the server function is not enabled, or the route between the server and the client is not reachable.
- When you connect the FTP server through the FTP client PC, if the " connect :Unknown error number" is printed, the cause may be that the server function is not enabled, or the route between the server and the client is not reachable.

### 4.3.3 Configure a Device as an TFTP Client

#### Network Requirements

- A PC acts as a TFTP server, and Device acts as a TFTP client. The network between the server and the device is normal. The files to be downloaded are placed in the TFTP server directory.
- The device acts as the TFTP client to upload files to and download files from the TFTP server.

#### Network Topology

Figure 4–6 Network Topology in Which a Device Acts as a TFTP Client

### Configuration Steps

- Step 1: Create Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configure the IP addresses of all interfaces so that the network between the client and the server is normal. (Omitted)
- Step 3: Enable the TFTP server function on PC, and place the files to be downloaded in the TFTP server directory. (Omitted)
- Step 4: Device acts as the TFTP client to upload files to and download files from the TFTP server.

#On Device, copy a file from the TFTP server to the file system of Device.

```

Device#filesystem
Device(config-fs)#copy tftp 2.1.2.1 sp4-g-6.5.0(41).pck file-system sp4-g-6.5.0(41).pck
Device(config-fs)#exit
  
```

#On Device, copy the startup file from Device to the TFTP server.

```

Device#filesystem
Device(config-fs)#copy startup-config tftp 2.1.2.1 startup.txt
  
```

- Step 5: Check the result.

After the copy process is completed, check whether the downloaded file exists in the file system of Device. In the TFTP server, check whether the uploaded file exists. (Omitted)

```

Device(config-fs)#dir
size    date    time    name
-----
102227  MAR-01-2013 05:24:32 logging
10147   MAR-26-2013 07:58:50 startup
10202   MAR-01-2013 05:26:46 history
6598624 MAR-26-2013 07:51:32 sp4-g-6.5.0(41).pck
1024    JAN-10-2013 17:30:20 snmp      <DIR>

736512  MAR-27-2013 10:30:48 web-Spl-1.1.168.rom
  
```

- 
- If the "Downloading####OK!" message is printed, it indicates that the file copy is successful. The message shows the file size, which is determined by the actual file size.
  - When you use a device to copy a file, if the "tftp Failed! ErrorNum: 0x41, ErrorType: Host unreachable." message is printed, the cause may be that the TFTP server function is not enabled, or the route between the server and the client is not reachable.
- 

### 4.3.4 Configure a Device as an SFTP Client

#### Network Requirements

- Take the PC as an SFTP server, and the device acts as an SFTP client. The network between the server and the device is normal.
- On the SFTP server, the user name for a device to log in to the SFTP server is admin, and the password is admin. The files to be downloaded are placed in the SFTP server directory.
- The device acts as the SFTP client to upload files to and download files from the SFTP server.

#### Network Topology

Figure4–7 Network Topology for Configuring a Device as an SFTP Client

#### Configuration Steps

- Step 1: Configure an SFTP server, and place the files to be downloaded in the SFTP server directory. (Omitted)
- Step 2: Configure the IP addresses of the devices so that the network between the client and the server is normal. (Omitted)
- Step 3: Device acts as the SFTP client to upload files to and download files from the SFTP server.

#Download a file from the SFTP server to the file system of the device.

```
Device#sftp get 2.0.0.1 22 admin admin sp8-g-6.6.7(46)-dbg.pck sp8-g-6.6.7(46)-dbg.pck
The authenticity of host '2.0.0.1 (2.0.0.1)' can't be established.

### 4.3.5 Configure a Device as an SFTP Server

#### Network Requirements

- Device acts as an SFTP server, while a PC acts as an SFTP client. The network between the client and the server is normal.
- On the SFTP server Device, the user name is admin1, and the password is admin1. The file system directory of Device acts as the root directory of the SFTP server.
- A PC acts as the SFTP client to upload files to and download files from the SFTP server Device.

#### Network Topology

Figure 4–8 Network Topology for Configuring a Device as an SFTP Server

#### Configuration Steps

Step 1: Configure IP addresses for the ports so that the network between the PC and the device is normal. (Omitted)

Step 2: On Device, enable the SFTP service, and configure the authorized user name and password.

#On the SFTP server Device, configure the authorized user name and password.

```

Device#configure terminal
Device(config)#local-user admin1 class manager
Device(config-user-manager-admin1)#service-type ssh
Device(config-user-manager-admin1)#password 0 admin1

```

```
Device(config-user-manager-admin1)#exit
```

#Enable SSH service on Device (SFTP is a sub-module of the SSH protocol)

```
Device(config)#ip ssh server
```

Step 3: The PC acts as the SFTP client to upload files to and download files from the SFTP server Device.

#In the following part, the Linux system is taken as an example to illustrate the process.

#Input the correct IP address, user name, and password to log in to the SFTP server.

```
[root@aas ~]# sftp admin1@2.1.1.1
Connecting to 2.1.1.1...
admin1@2.1.1.1's password:
sftp>

### 4.3.6 Configure a Device as an FTPS Client

#### Network Requirements

- A PC acts as an FTP server, and the device Device acts as an FTP client. The network between the server and the device is normal.

- Secure data transmission is guaranteed by establishing secure data channels between the FTP Server and the FTP Client.
- FTP client can upload files to and download files from the FTP server.

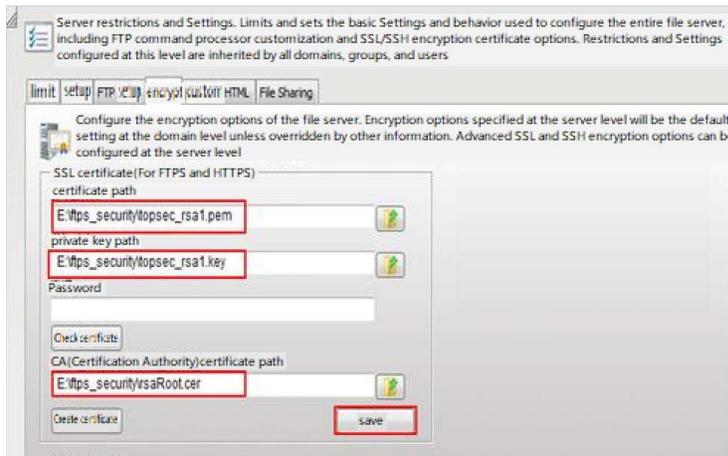

### Network Topology

Figure 4–9 Network Topology for Configuring a Device as an FTPS Client

### Configuration Steps

- Step 1: Configure IPv4 addresses for the ports. (Omitted)
- Step 2: Install certificate on FTP Server and set FTP user certificate path, private key path, and CA certificate path.

- Step 3: FTP Client imports FTP CA certificate, user certificate, and private key.

#Create a domain test on the device:

```

Device#configure terminal
Device(config)#crypto ca identity test
Device(ca-identity)#exit
  
```

#ftp binds to domain test:

```

Device(config)#ip ftp secure-identity test
  
```

#Open the CA certificate (rsaRoot.cer) in Notepad, then copy the content, type crypto ca import certificate to test in shell, and follow the prompts to import the certificate into the device domain test:

```

Device(config)#crypto ca import certificate to test
  
```

```

# 5 File System Management

---

## 5.1 Overview

The following lists the storage medium of the device and their functions:

- SDRAM: Synchronous Dynamic Random Access Memory (SDRAM) provides the space for executing application programs of the device.
- FLASH: Stores application programs, configuration files, and the BootROM programs, and so on.
- EEPROM: Electrically Erasable and Programmable Read-Only Memory, stores system configuration files and user information which is frequently changed.
- USB: Used to store user data.

The device manages the following types of files:

- BootROM files: Store basic data for system initialization.
- Device application programs: Implement tasks such as route forwarding, file management, and system management.
- Configuration files: Store the system parameters that are configured by the users.
- Log files: Stores system log information.

---

### Note

- The filesystem command is used to access the file system and can be run on both Master and Slave.
- 

## 5.2 File System Management Function Configuration

Table 5-1 File System Management Function Configuration List

Configuration Task	
Manage storage devices.	Display the information about a storage device.
	Format a storage device.
Manage file directories.	Display the information about a file directory.
	Display the current working path.
	Change the current working path.
	Create a directory.
	Delete a directory.
Manage file operations	Copy a file.
	Rename a file.
	Display the content of a file.
	Delete a file.
Execute a configuration file manually.	Execute a configuration file manually.
Configure startup parameters.	Configure startup parameters.

### 5.2.1 Manage storage devices.

#### Configuration Condition

Before performing operations on storage devices, ensure that:

- The system has started normally.

#### Display the information about a storage device.

By displaying the information about a storage device, you can view the features of the storage device and the size of the remaining space.

Table 5-2 Displaying the Information about a Storage Device

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Display the information about a storage device.	<b>volume</b>	Mandatory

### Format a storage device.

If the space of a storage device is unavailable, you can use the format command to format the storage device.

Table 5-3 Formatting a Storage Device

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Format a storage device.	<b>format { /flash   /syslog   /usb }</b>	Optional

---

## Caution

- Exercise caution in formatting a storage device, because the operation may cause permanent loss of all files on the storage device, and the files cannot be recovered.
- 

## 5.2.2 Manage file directories.

### Configuration Condition

Before performing operations on file directories, ensure that:

- The system has started normally.

### Display the information about a file directory.

By displaying the information about a file directory, you can view the details of the files in the specified directory.

Table 5-4 Displaying File Directory Information

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Display the information about a directory.	<b>dir [ path ]</b>	Mandatory

**Display the current working path.**

By displaying the current working path, you can view the details of the current path.

Table 5-5 Displaying the Current Working Path

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Display the current working path.	<b>pwd</b>	Mandatory

**Change the current working path.**

By changing the current working path, you can switch over a user to the specified directory.

Table 5-6 Changing the Current Working Path

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Change the current working path.	<b>cd path</b>	Mandatory

**Create a directory.**

If you want to create a directory in the file system, perform this operation.

Table 5-7 Creating a Directory

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Create a directory.	<b>mkdir</b> <i>directory</i>	Mandatory

### Delete a directory.

If you delete a directory through this operation, all sub-directories and files in the directory are deleted.

Table 5-8 Deleting a Directory

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Delete a directory.	<b>rmdir</b> <i>directory</i> [ <b>force</b> ]	Mandatory

---

### Note

- Exercise caution when deleting a directory, because the operation of deleting the directory may permanently delete all sub-directories and files in the directory, and the files cannot be recovered.
- 

## 5.2.3 Manage file operations

### Configuration Condition

Before performing operations on files, ensure that:

- The system has started normally.

### Copy a file.

In the file system, you can copy a file to the specified directory.

Table 5-9 Copying a File

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Copy a file.	<b>copy</b> <i>src-parameter dest-parameter</i>	Mandatory

## Note

- The copy command can be used to copy files between the file system, the FTP server, and the TFTP server. For details, refer to the section on the usage of the copy command in the configuration manual.

### Rename a file.

In the file system, you can change the name of a file into a specified name.

Table 5-10 Renaming a File

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Rename a file.	<b>rename</b> <i>src-filename dest-filename</i>	Mandatory

### Display the content of a file.

In the file system, you can view the content of a file.

Table 5-11 Displaying the Content of a File

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Display the content of a file.	<b>type</b> <i>path/filename</i>	Mandatory

## Delete a file.

In the file system, you can delete a file that is no longer in need.

Table 5-12 Deleting a File

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Delete a file.	<b>delete <i>path/filename</i></b>	Mandatory

---

### Note

- Exercise caution when you use the delete command because it permanently deletes a file, and the file cannot be recovered.
- 

## 5.2.4 Download a File from FTP

### Configuration Condition

Before manually downloading the file from the FTP, first complete the following tasks:

- The system has started normally.
- Ensure that the route between the FTP server and the device interface is reachable and the route can be pinged through.

### Download a File from the FTP Server

Use a command for downloading the file from the FTP and you can download the related file on the FTP server to the file system

Table 5-13 Downloading a File from the FTP server

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-

Step	Command	Description
Download a File from the FTP Server	<pre> <b>ftpcopy</b> [ vrf vrf-name ] host-ip-address username password src-filename { /flash   /syslog   /usb   dest-filename }  <b>ftpscopy</b> [ vrf vrf-name ] host-ip-address username password src-filename { /flash   /syslog   /usb   dest-filename } <b>VerifyType</b> { none   peer } </pre>	Optional

---

## Note

- The ftpcopy command can be used to download files from the FTP server to the file system. For details, refer to the section on the usage of the ftpcopy command and the ftpscopy command in the configuration manual.
- 

## 5.2.5 Configure startup parameters.

### Configuration Condition

Before configuring startup parameters, ensure that:

- The system has started normally.

### Configure startup parameters.

\In configuring startup parameters, you can configure the application program file that is to be used in the next startup.

Table 5-14 Configuring Startup Parameters

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-

Step	Command	Description
Configure startup parameters.	<b>boot-loader</b> <i>path/filename</i> [ <i>bootline-number</i> ]	Mandatory

## 5.2.6 File System Managing, Monitoring, and Maintaining

Table 5-15 File System Managing, Monitoring, and Maintaining

Command	Description
<b>clear boot-loader</b> [ <i>bootline-number</i> ]	Clear the startup parameters with the specified index.
<b>show filesystem</b>	Display the information about the file system.
<b>show file location</b>	Display the location of the system file in the file system.
<b>show file descriptor</b>	Display the location of the system file in the file system and the descriptor.
<b>show boot-loader</b>	Display the system startup parameters.

## 5.3 Typical Configuration Example of File System Management

### 5.3.1 Configure startup parameters.

#### Network Requirements

None

#### Network Topology

None

#### Configuration Steps

Step 1: Enter the file system configuration mode.

Step 2: Configure system startup options.

#View the system startup parameters.

```
Device#filesystem
Device(config-fs)#show boot-loader
The app to boot at the next time is: flash0: /flash/sp26-g-9.5.0.2(20)(R).pck
The app to boot at the this time is: flash0: /flash/sp26-g-9.5.0.2(20)(R).pck
Boot-loader0: flash0: /flash/sp26-g-9.5.0.2(20)(R).pck

Device(config-fs)#exit
```

**#Copy the file sp26-g-9.5.0.2(20)(R).pck to flash via ftp, and then modify the sp26-g-9.5.0.2(20)(R).pck file in flash to be the next system startup option, and set the priority to 0.**

```
Device#filesystem
Device(config-fs)#boot-loader /flash/sp26-g-9.5.0.2(20)(R).pck

Boot-loader0 set OK
Device(config-fs)#exit
```

**#View the configuraiton result.**

```
Device(config-fs)#show boot-loader
The app to boot at the next time is: flash0: /flash/sp26-g-9.5.0.2(20)(R).pck
The app to boot at the this time is: flash0: /flash/sp26-g-9.5.0.2(20)(R).pck

Boot-loader0: flash0: /flash/sp26-g-9.5.0.2(20)(R).pck
Boot-loader4: backup0: sp26-g-9.5.0.2(20)(R).pck
Device(config-fs)#exit
```

# 6 Configuration File Management

---

## 6.1 Overview

Configuration file management is a function that is used to manage device configuration files. Through the command line interface provided by the device, users can easily manage configuration files. If the device needs to automatically load the current configuration of users after restart, the current configuration commands must be saved into the configuration file before the device restarts. Users can upload configuration files to or download configuration files from another device through FTP or TFTP, realizing batch device configuration. The device configuration is categorized into the following two types:

Startup configuration:

When the device starts, it loads the startup configuration file with the name "startup" by default, and it completes the initialization configuration of the device. This configuration is called startup configuration. Here the device has two startup configuration files, one is the default startup configuration file, and the other is the backup startup configuration file. When the device starts, if the default startup configuration file does not exist, the system copies the backup startup configuration file to the location of the default startup configuration file and loads this startup configuration file.

Current configuration:

Current configuration is a set of commands that take effect currently. It consists of startup configuration and the configuration that is added or modified by the user after startup. The current configuration is saved in the memory database. If the current configuration is not saved into the startup configuration file, the configuration information gets lost after the device restarts.

The following describes the contents and formats of the configuration files:

- Configuration files are saved in the file system in the form of text files.
- The contents of the configuration files are saved in the form of configuration commands, and only non-default configuration is saved.
- Configuration files are organized based on command modes. All commands in one command mode are organized together to form a paragraph.
- Paragraphs are organized according to a certain rule: system configuration mode, interface configuration mode, and configuration modes of different protocols.

- Commands are organized according to their relations. The related commands form a group, and different groups are separated by blank lines.

## 6.2 Configuration File Management Function Configuration

Table 6-1 Configure File Management List

Configuration Task	
Save the current configuration.	Save the current configuration.
Back up device configuration.	Back up the current configuration.
	Back up the startup configuration.
Restore the startup configuration.	Restore the startup configuration.

### 6.2.1 Save the current configuration.

#### Configuration Condition

None

#### Save the current configuration.

If the current configuration of the user can take effect only after the device starts, you need to save the current configuration into the startup configuration file.

Table 6-2 Saving the Current Configuration

Step	Command	Description
Save the current configuration to the startup configuration file.	<b>write</b>	Mandatory

#### Note

- If the device is restarted or powered off while the configuration file is being saved, configuration information may get lost.
- Saving the current configuration not only saves the configuration to the startup

---

configuration file, but also saves the configuration to the backup startup configuration file.

---

## 6.2.2 Configure the Backup System

### Configuration Condition

Before configuring the backup system parameters, ensure that:

- The route between the device and the server is reachable.
- The configuration file to be backed up exists; otherwise, backup fails.

### Back up the current configuration.

In backing up the current configuration, you can use a command to back up the current configuration to the FTP server.

Table 6-3 Backing Up the Current Configuration

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Back up the current configuration to a remote host through the FTP protocol.	<b>copy running-config { file-system dest-filename   ftp [ vrf vrf-name ] { hostname   ip-address } username password dest-filename   startup-config   tftp [ vrf vrf-name ] { hostname   ip-address } dest-filename ftps [ vrf vrf-name ] { hostname   ip-address } username password dest-filename VerifyType { none   peer } }</b>	Mandatory

### Back up the startup configuration.

In backing up the startup configuration, you can use a command to back up the startup configuration to the FTP server.

Table 6-4 Backing Up the Startup Configuration

Step	Command	Description
Enter the file system configuration mode.	<b>enable</b>	-
Save the startup configuration to a remote host through the FTP protocol.	<b>copy startup-config { file-system dest-filename   ftp [ vrf vrf-name ] { hostname   ip-address } username password dest-filename   ftps [ vrf vrf-name ] { hostname   ip-address } username password dest-filename VerifyType { none   peer }   tftp [ vrf vrf-name ] { hostname   ip-address } dest-filename }</b>	Mandatory

### 6.2.3 Restore the startup configuration.

#### Configuration Condition

Before restoring the startup configuration, ensure that:

- The route between the device and the server is reachable.
- The configuration file that is to be restored exists.

#### Restore the startup configuration.

In restoring the startup configuration, you can use a command to download the startup configuration file from the FTP server and set it as the startup configuration file that is used after restart. In this way, after the device is restarted, the device can load the startup configuration file.

Table 6-5 Restoring the Startup Configuration

Step	Command	Description
Enter the file system configuration mode.	<b>filesystem</b>	-
Restore the startup configuration.	<b>copy { file-system src-filename   ftp [ vrf vrf-name ] { hostname   ip-address } username password src-filename   ftps [ vrf vrf-name ] { hostname   ip-address } username password src-</b>	Mandatory

Step	Command	Description
	<i>filename</i>   <b>tftp</b> [ <b>vrf vrf-name</b> ] { <i>hostname</i>   <i>ip-address</i> } <i>src-</i> <i>filename</i> } { <b>file-system dest-</b> <i>filename</i>   <b>startup-config</b> }	

## Note

- Before overwriting the local startup configuration, ensure that the configuration file matches the device type and matches the current system version.
- After performing the operation of restoring the startup configuration, the current configuration is not changed. After the device is restarted, the startup configuration is restored.

## 6.2.4 Configuration File Managing, Monitoring, and Maintaining

Table 6-6 Configuring File Management, Monitoring and Maintaining

Command	Description
<b>show running-config</b> [ <b>after-interface</b>   <b>before-interface</b>   <b>interface</b> [ <i>interface-name</i> ]   [ <i>configuration</i> ] ] [ { <b>begin</b>   <b>exclude</b>   <b>include</b> } <i>expression</i>   <b>redirect</b> { <b>file</b> <i>file-name</i>   <b>ftp</b> [ <b>vrf vrf-name</b> ] { <i>hostname</i>   <i>ip-address</i> } <i>user-name password file-name</i> } }   <b>ftps</b> [ <b>vrf vrf-name</b> ] { <i>hostname</i>   <i>ip-address</i> } <i>user-name password file-name</i> } } ]	Display the current configuration information.
<b>show startup-config</b> [ <i>file-number</i>   {   { <b>begin</b>   <b>exclude</b>   <b>include</b> [ <b>context</b> ] } <i>expression</i>   <b>redirect</b> { <b>file</b> <i>filename</i>   <b>ftp</b> { [ <b>vrf vrf-name</b> ] { <i>hostname</i>   <i>ip-address</i> } <i>user-name password file-name</i> } }   <b>ftps</b> { [ <b>vrf vrf-name</b> ] { <i>hostname</i>   <i>ip-address</i> } <i>user-name password file-name</i> } } } ]	Display the startup configuration information.

## 6.2.5 Configuration File Encryption

### Configuration Condition

- Configuration file encryption requires a USB device to be plugged in.

### Configure Encryption of Configuration Files

Configuration file encryption is to encrypt the configuration file using the SM4 algorithm, the key is specified by the user, when the user specifies the key, it will encrypt the configuration file when the next write action is executed.

Operation record encryption refers to encrypting the configuration file using the State Secrets SM4 algorithm, the key is specified by the user, and when the user specifies the key, the encryption starts for the subsequent operation records.

Table 6-7 Configuration File Encryption and Operation Record Encryption

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configuration File Encryption	<b>service encryption startup algorithms SM4 key</b> <i>password</i>	Configuration file encryption, and the user specifies the key.
Operation record encryption	<b>service encryption history algorithms SM4 key</b> <i>password</i>	Operation record encryption, and the user specifies the key.

---

### Note

- Encryption of the configuration file takes effect at the next write action executed after the encryption function is configured. Encryption of operation record takes effect immediately after the encryption function is configured.
  - An external USB device must be plugged in to configure the encryption function. The operation record encryption function does not require a USB device.
-

# 7 System Management

---

## 7.1 Overview

Through system management, users can view the current working status of the system, configure the basic functional parameters of the device, and perform basic maintenance and management of the device. System management provides the following functions: configure the device name, configure the system time and time zone, configure the login welcome message, configure the system exception processing mode, configure to restart the device, configure the password encryption service, configure the history command saving function, configure the login security service, configure monitor CPU, configure display of properties in pages.

## 7.2 System Management Function Configuration

Table 7-1 System Management Function Configuration List

Configuration Task	
Configure the device name.	Configure the device name.
Configure the system time and time zone.	Configure the system time and time zone.
Configure the login welcome message.	Configure the login welcome message.
Configure the system exception processing mode.	Configure the system exception processing mode.
Configure to restart the device.	Configure to restart the device.
Configure the encryption service.	Configure the encryption service.
Configure the history command saving function.	Configure the history command saving function.
Configure the login security service.	Configure the login security service.
Configure CPU monitoring.	Configure CPU monitoring.

Configuration Task	
Configure display of properties in pages.	Configure display of properties in pages.
Configure system security mode.	Configure system security mode.

### 7.2.1 Configure the device name.

#### Configuration Condition

None

#### Configure the device name.

A device name is used to identify a device. A user can change the device name according to the actual requirement. The modification takes effect immediately, that is, the new device name is displayed in the next system prompt.

Table 7-2 Configure the Device Name

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the device name.	<b>hostname</b> <i>host-name</i>	Mandatory

### 7.2.2 Configure the system time and time zone.

#### Configuration Condition

None

#### Configure the system time and time zone.

The system time and time zone is the time displayed in the timestamp of system information. The time is determined by the configured time and time zone. You can run the **show clock** command to view the time information of the system. To make the device work normally with other devices, the system time and time zone must be accurate.

Table 7-3 Configuring the System Time and Time Zone

When a system exception occurs, the system directly restarts to restore the system. The system exception processing mode is configured in three aspects: The first is enabling periodical exception detection. The system periodically detects the task status, code segment, and semaphore dead lock with a cycle of 10s, 10s, and 30s respectively. Secondly, an exception level is configured. If exceptions of the level and higher levels occur, the device restarts. Exception levels include: alert, critical, emergency, error, and warn. You can also configure the health monitoring exception processing mode, which includes the ignore mode and the reload mode.

Table 7-5 Configuring the System Exception Processing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure exception processing mode.	<b>exception { period-detect enable   reboot [ level { alert   critical   emergency   error   warn } ]   detect-health {ignore   reload} }</b>	Mandatory By default, Periodic exception detection is enabled, When an exception occurs, the exception level for device restart is <b>critical</b> ; By default, the health monitoring is enabled, and the processing mode by default is Ignore when an exception is detected by health monitoring.
Configure exception processing mode in stacking mode.	<b>exception { period-detect enable   reboot {device <i>device-num</i>   level device <i>device-num</i> { alert   critical   emergency   error   warn } }   detect-health <i>device-num</i> {ignore   reload} }</b>	Mandatory By default, Periodic exception detection is enabled, When an exception occurs, the exception level for device restart is <b>critical</b> ; By default, the health monitoring is enabled, and the processing mode by default is Ignore when

Step	Command	Description
		an exception is detected by health monitoring.

---

### Note

- If the device is configured to restart at a certain exception level, then an exception of the level and above occurs, the device will restart.
  - The exception levels in descending order are: emergency, alert, critical, error and warn.
- 

## 7.2.5 Configure to restart the device.

### Configuration Condition

None

### Restart a Device

When a device fault occurs, you can choose to restart the device according to the actual situation so as to eliminate the fault. The device restart modes include cold restart and hot restart. In a cold restart, the user can directly power off the device and power on the device again. In a hot restart, the user restarts the device by using a restart command. During the hot restart process, the device is not powered off.

Table 7-6 Restarting a Device

Step	Command	Description
Restart a device using the command or restart all active virtual switch member devices in the stacking domain using the command in stacking mode.	<b>reload</b>	Mandatory

---

### Note

- If you forcibly power off and restart a device that is in the operating status, hardware damage or data loss may be caused. Therefore, this restart mode is usually not
-

---

recommended.

- If you use the reload command to restart the device, all the services of the device are interrupted. Exercise caution when performing this operation.
- 

## 7.2.6 Configure the history command saving function.

### Configuration Condition

None

### Configure the history command saving function.

With the history command saving function, you can query and collect the history commands that have been executed. Before the history command saving function is configured, history commands are saved in the memory file system. After the function is configured, the system automatically saves history commands in the flash file system.

Table 7-7 Configuring the History Command Saving Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to save history commands.	<b>shell-history save</b>	Mandatory By default, the history command saving function is enabled.

## 7.2.7 Configure the login security service.

### Configuration Condition

None

### Enable the System Login Security Service

To enhance the system security, the device provides the system login security service function. The functions include:

- Prevents brute force cracking of user login passwords.
- Prevents the fast connection function.

The function of brute force cracking prevention prevents malicious illegal users from forcedly cracking the user name and password for logging in to the device. If the system finds that the number of continuous login authentication failures of a user reaches the number specified by the system, the system rejects the login request from the IP address within the specified period of time.

The function of preventing fast connections prevents illegal users from initiating a large number of login requests within a short period time because this may occupy a lot of system and network resources. If the number of repeated login connections from a user reached a specified number, the system rejects the login connection requests from the IP address within the specified period of time.

Table 7-8 Enabling the System Login Security Service

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the system login security service.	<b>service login-secure</b> <b>{ telnet   ssh   ftp   snmp }</b>	Mandatory By default, the system login security service is disabled.

### Configure the Parameters of the System Login Security Service

Table 7-9 Configuring the Parameters of the System Login Security Service

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the duration for Telnet module to forbid logins from an offending IP address.	<b>login-secure</b> telnet ip-addr <b>forbid-time</b> <i>forbid-time-number</i>	Mandatory By default, the duration is 10 minutes.
Configure the maximum number of continuous login authentication failures of an offending IP address forbidden by the Telnet module.	<b>login-secure</b> telnet ip-addr <b>max-try-time</b> <i>max-try-time-number</i>	Mandatory By default, the number is 5.
Configure the aging time for the Telnet module to forbid an offending IP	<b>login-secure</b> telnet ip-addr <b>record-aging-time</b> <i>record-aging-time-number</i>	Mandatory By default, the aging time is 15 minutes.

Step	Command	Description
address from recording information.		

## 7.2.8 Configure CPU monitoring.

### Configuration Condition

None

### Configure CPU monitoring.

Through CPU monitoring, the system monitors the CPU occupancy to learn the current operation status of the CPU. The following shows the contents of CPU monitoring:

- Monitor the CPU occupancy of each process in the system, and you can view the relevant information after configuration by entering the **show cpu** command. Enable the CPU occupancy history statistics function, and you can view the relevant information after configuration by using the **show cpu monitor** command.

Table 10-11 Configuring CPU Monitoring

Step	Command	Description
Enter the global configuration mode.	<b>enable</b>	-
Enable monitoring of CPU occupancy of each process.	<b>spy cpu</b>	Mandatory By default, the CPU occupancy monitoring function is not enabled.
Enable the CPU occupancy historical statistics function.	<b>monitor cpu</b>	Mandatory By default, the CPU occupancy historical statistics function is enabled.

## 7.2.9 Configure display of properties in pages.

### Configuration Condition

None

### Configure Display of Properties in Pages

System information can be displayed in pages, making it easy for users to view the information. Users can set to display device information in pages according to the actual requirement.

Table 7-12 Configuring Display of Properties in Pages

Step	Command	Description
Enter the global configuration mode.	<b>enable</b>	-
Configure Display of Properties in Pages	<b>more { on   off   displine [ num ] }</b>	Mandatory By default, the function of display in pages is enabled. By default, 24 lines are displayed in <b>displine</b> .

## 7.2.10 Operation record file management

### Configuration Condition

None

### Configure Operation Record File

Operation records are saved in flash by default, and operation record file management is mainly to change the location where operation records are saved.

Table 7-13 Configuring File Encryption and Operation Record Encryption

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Operation record file management	<b>shell-history location</b> <i>device-name</i>	User-specified location for saving operation records.
Operation record file size specification.	<b>shell-history file max-size</b> <i>num</i>	Users specify the size of the operation record file.

## 7.2.11 Configure system security mode.

### Configuration Condition

None

### Configure system security mode.

Table 7-14 Configuring System Security Mode

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	
Configure system security mode.	<b>ssac mode</b> <i>{strict   loose}</i>	The system security mode can be configured as strict mode or loose mode.

## 7.2.12 System Managing, Monitoring, and Maintaining

Table 7-15 System Managing, Monitoring, and Maintaining

Command	Description
<b>show clock</b>	Display system clock information.
<b>show cpu</b>	Display CPU occupancy information.
<b>show device</b>	Display system device information.
<b>show environment</b>	Display board temperature information.
<b>show history</b>   { <b>begin</b> <i>expression</i>   <b>exclude</b> <i>expression</i>   <b>include</b> <i>expression</i>   <b>redirect</b> { <b>file</b> <i>file-name</i>   <b>ftp</b> [ <b>vrf</b> <i>vrf-name</i> ] { <i>hostname</i>   <i>ip-address</i> } <i>user-name password file-name</i>   <b>ftps</b> [ <b>vrf</b> <i>vrf-name</i> ] { <i>hostname</i>   <i>ip-address</i> } <i>user-name password file-name</i> }	Display history command information.
<b>show language</b>	Display system language version information.
<b>show login-secure</b> { <b>telnet</b>   <b>ssh</b>   <b>ftp</b>   <b>snmp</b> }{ <b>ip-addr</b>   <b>user</b>   <b>quick-connect</b> }	Display system login security service Information.
<b>show login-secure quick-connect</b>	Display quick connection information for system login security.

Command	Description
<b>show mbuf allocated</b> [ <i>pool-name</i> ]	Display mbuf information.
<b>show memory</b>	Display memory information.
<b>show pool</b> [ <b>detail</b>   <b>information</b> ]	Display system memory pool information.
<b>show process</b> [ <i>task-name</i> ]	Display the main tasks in the system and their running status.
<b>show semaphore</b> { <i>sem-name</i>   <b>all</b>   <b>binary</b>   <b>counting</b>   <b>list</b>   <b>mutex</b> } [ <b>any</b>   <b>pending</b>   <b>unpending</b> ]	Display system semaphore information.
<b>show spy</b>	Display monitoring switch status.
<b>show stack</b>	Display the usage of each task stack in the system.
<b>show system fan</b> [ <b>brief</b> ]	Display system fan information.
<b>show system lpu</b> [ <i>lpu-num</i>   <b>brief</b> ]	Display system LPU information.
<b>show system module brief</b>	Display summary information for all module components of the device.
<b>show system mpu</b> [ <b>brief</b>   <i>mpu-num</i> ]	Display system MPU information.
<b>show system power</b> [ <i>power-num</i>   <b>brief</b> ]	Display system power information.
<b>show tech-support</b> { <b>sys-base</b> [ <b>detail</b> ]   <b>drv-base</b> [ <b>detail</b> ]   <b>I2-base</b> [ <b>detail</b> ]   <b>I3-base</b> [ <b>detail</b> ]   <b>all</b> } [ <b>page</b>   <b>to-memory</b>   <b>to-flash</b> ]	Display technical support information.
<b>show version</b> [ <b>detail</b> ]	Display system version information.

### 7.2.13 Configure the flexible table entry mode.

#### Configuration Condition

None

#### Configure the flexible table entry mode.

Flexible table entry mode is configured to adjust some of the device's table entry specifications, such as MAC address table, routing table, etc., for different scenarios.

Table 16-17 Configuring the Flexible Table Entry Mode

Step	Command	Description
Configure the flexible table entry mode.	<b>flexible-table mode</b> { <b>BALANCE</b>   <b>LARGE_L2</b>   <b>LARGE_ROUTE</b>   <b>MAC_ROUTE</b>   <b>ENHANCED</b> }	By default, the flexible table entry mode is BALANCE.

## 7.3 Typical Configuration Example of System Management

### 7.3.1 Configure user- and IP-based login restrictions

#### Network Requirements

- PC1 and PC2, as local terminals, can log in to Device via Telnet and ssh.
- Device can restrict login to PC1 and PC2 by user and IP.

#### Network Topology

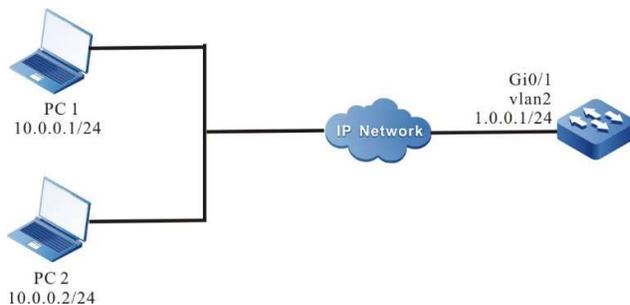

Figure 7-1 Network Topology for Configuring User- and IP-based Login Restrictions

#### Configuration Steps

Step 1: Configure the IP address of each interface and configure the routing protocol to enable intercommunication between PC1, PC2 and Device. (Omitted)

Step 2: Configure the user- and IP-based login restriction function.

#Enable telnet, ssh login security function.

```
Device#configure terminal
Device(config)#service login-secure telnet
```

```
Device(config)#service login-secure ssh
```

#Configure the maximum number of retries to 5 for telnet and ssh IP addresses and 5 for users, respectively.

```
Device(config)#login-secure telnet ip-addr max-try-time 5
Device(config)#login-secure telnet user max-try-time 5
Device(config)#login-secure ssh ip-addr max-try-time 5
Device(config)#login-secure ssh user max-try-time 5
```

Step 3: Enable the ssh service of Device, configure the username and password, and set up local login authentication.

```
Device(config)#ip ssh server
Device(config)#local-user user1 class manager
Device(config-user-manager-user1)#service-type ssh
Device(config-user-manager-user1)#password 0 admin
Device(config-user-manager-user1)#exit
Device(config)#line vty 0 15
Device(config-line)#login aaa
Device(config-line)#exit
```

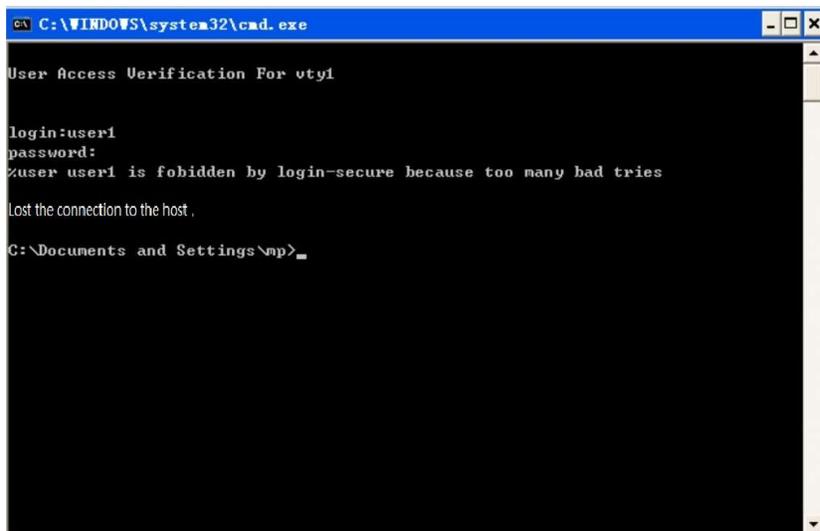

Step 4: Check the result.

#PC1 attempts to log in to Device via telnet with username user1, and after entering the wrong password 6 times in a row, the user information of the telnet login security statistics is displayed on Device:

```
Device#show login-secure telnet user
telnet module forbidden user information:
user      try-time  forbid-time  number  record-time
-----
user1     6         00:09:00     0       00:01:00
```

You can see that user1 is considered as a login attack user and is not allowed to login to the device via telnet for 10 minutes.

PC1 uses user1 to log in to Device via telnet for the second time, the system prompts that login is rejected.

```
C:\WINDOWS\system32\cmd.exe
User Access Verification For vty1

login:user1
password:
user user1 is forbidden by login-secure because too many bad tries

Lost the connection to the host.
C:\Documents and Settings\np>
```

#PC2 attempts to log in to Device via ssh, using unconfigured username of Device, and after logging in 6 times in a row, the ip information in the ssh login security statistics is displayed:

```
Device#show login-secure ssh ip-addr
```

```
ssh module forbidden login address:
client address try-time forbid-time type number record-time
-----
10.0.0.2 6 00:09:00 login 0 00:01:00
```

You can see that PC2's IP address is considered to be a login attack address, and PC2 is not allowed to log in to the device via ssh for 10 minutes.

At this point, PC2 logs in to Device via ssh again and will be prompted that login is rejected.

---

## Note

- When the number of logins exceeds the configured maximum number of retries, it will be considered a login attack and rejected of login; logins equal to the configured maximum will not be forbidden.
  - Some ssh clients on the PC will retry internally when login fails, and the device will still record this as multiple logins.
  - By default, the telnet and ssh login security functions of the device are enabled.
- 

### 7.3.2 Configure quick login restrictions

#### Network Requirements

- PC1 and PC2, as local terminals, can log in to Device via Telnet.
- PC1 is restricted from logging in after repeated quick logins to Device, while PC2 is not affected.

#### Network Topology

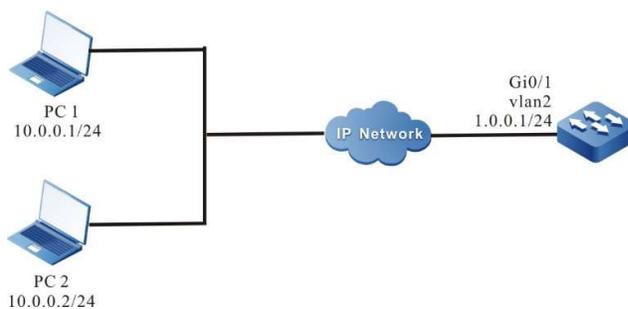

Figure 2-7 Network Topology for Configuring Quick Login Restriction

#### Configuration Steps

- Step 1: Configure the IP address of each interface and configure the routing protocol to enable intercommunication between PC1, PC2 and Device. (Omitted)
- Step 2: Configure telnet quick login restriction function.

#Enable telnet login security function and configure the maximum number of quick logins to 20 and forbid time to 10.

```
Device#configure terminal
Device(config)#service login-secure telnet
Device(config)#login-secure telnet quick-connect max-times 20
Device(config)#login-secure telnet quick-connect forbid-time 10
```

Step 3: Configure the login username and password of Device , and set it to use local authentication to log in.

```
Device(config)#local-user user1 class manager
Device(config-user-manager-user1)#service-type ssh
Device(config-user-manager-user1)#password 0 admin
Device(config-user-manager-user1)#privilegeprivilege 15
Device(config)#line vty 0 15
Device(config-line)#login aaa
Device(config-line)#exit
```

Step 4: Check the result.

#PC1 logs in and out via telnet for 21 times repeatedly using user1, with no more than 30 seconds between each login, the quick connection information in the telnet login security statistics is displayed:

```
Device#show login-secure telnet quick-connect
telnet module quick connect info:
connect ip      connect times  last connect time      forbid-time  record-time
-----
10.0.0.1       21           TUE AUG 11 20:22:38 2015 00:09:00    00:01:00
```

You can see that PC1 is considered as a login attack address and is not allowed to login to the device via telnet for 10 minutes.

PC2 can successfully log in to Device via telnet.

# 8 System Alarm

---

## 8.1 Overview

With the system alarm function, if an exception occurs, the system sends an alarm prompt message so that the user can pay attention to the exception of the device and take the corresponding measures to ensure stable operation of the device. System alarms include temperature alarms, power supply abnormality alarms, and fan abnormality alarms. For the system temperature alarms, if the CPU or environment temperature reaches the threshold, abnormal system alarm log information is generated. By default, the CPU temperature alarm threshold is 110°C and the environment temperature alarm threshold is 110°C. Power supply and fan exceptions also generate abnormal system alarm log information.

## 8.2 System Alarm Function Configuration

Table 8-1 System Alarm Function Configuration List

Configuration Task	
Configure System Temperature Alarms	Configure System Temperature Alarms
Configure System CPU Alarms	Configure System CPU Alarms
Configure System Memory Alarms	Configure System Memory Alarms
Configure System Power Supply Alarms	Configure System Power Supply Alarms
Configure System Fan Alarms	Configure System Fan Alarms

### 8.2.1 Configure System Temperature Alarms

#### Configuration Condition

Before configuring system alarms, ensure that:

- After the system is started and operates stably, all boards are loaded successfully.
- After the system is started and operates stably, the power supply and fans operate normally.

### Configure System Temperature Alarms

Configure the system temperature alarms is to configure the system switch chip, CPU and motherboard alarm temperature, when the switch chip, CPU or motherboard temperature reaches a certain threshold value, the system alarm log message will be generated.

Table 8-2 Configuring System Temperature Alarms

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure switch chip, CPU or motherboard temperature alarm thresholds	<b>alarm temperature { mpu   lpu   sfu }{ switch   cpu   inletair} temperature</b>	Mandatory
Configure the temperature alarm threshold of an active virtual switch member device's switch chip, CPU or motherboard in a stacked environment.	<b>alarm temperature device device-num { mpu   lpu   sfu }{ switch   cpu   inletair} temperature</b>	Mandatory

### 8.2.2 Configure System CPU Alarms

#### Configuration Condition

Before configuring system alarms, ensure that:

- After the system is started and operates stably, all boards are loaded successfully.

#### Configure System CPU Alarms

Configure system CPU alarms is the function that sends an CPU utilization exception alarm when the monitoring threshold is exceeded after the threshold of CPU utilization monitoring is configured.

Table 8-3 Configuring System CPU Alarms

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the system CPU utilization alarm threshold	<b>cpu utilization warn- threshold [ rate-value ]</b>	Optional

### 8.2.3 Configure the low threshold of memory usage

#### Configuration Condition

Before configuring the system threshold alarms, first complete the following tasks:

- After the system is started and operates stably, all boards are loaded successfully.

#### Configure the Low Threshold of Memory Usage

Configure the low threshold of system memory usage refers to the function that sends the system into a state of memory shortage when the system memory falls below the low threshold after the low threshold of system memory usage is configured.

Table 4-8 Configuring System Memory Threshold Alarms

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure system memory threshold alarms.	<b>memory threshold low low-value</b>	Optional  By default, the low threshold of system memory is 64M.

### 8.2.4 Configure System Memory Alarms

#### Configuration Condition

Before configuring system alarms, ensure that:

- After the system is started and operates stably, all boards are loaded successfully.

#### Configure System Memory Alarms

Configuring system memory alarms is a function that alerts you of system memory utilization exception when the monitoring threshold is exceeded after the system memory utilization monitoring threshold is configured.

Table 8-5 Configuring System Memory Alarms

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the system memory utilization alarm threshold	<b>memory utilization warner-threshold</b> [ <i>rate-value</i> ]	Optional By default, the system memory utilization alarm threshold is 95%.

## 8.2.5 Configure System Power Supply Alarms

### Configuration Condition

None

### Configure System Power Supply Alarms

If a power supply fault or exception occurs, the system immediately generates log information about system power supply alarms. This helps the user to pay attention to the exception of the device power supply and take the corresponding measures to get rid of the fault and ensure stable operation of the device. By default, the system power supply alarm function is enabled.

## 8.2.6 Configure System Fan Alarms

### Configuration Condition

None

### Configure System Fan Alarms

If a system fan fault or exception occurs, the system immediately generates log information about the system fan alarm. This helps the user to pay attention to the exception of the device fans and take the corresponding measures to get rid of the fault and ensure stable operation of the device. By default, the system fan alarm function is enabled.

# 9 System Log Configuration

---

## 9.1 Overview

System log information is categorized into eight levels, including: **emergencies**, **alerts**, **critical**, **errors**, **warnings**, **notifications**, **informational**, and **debugging**. Here levels 0-6 are log information and level 7 is debugging information. For details, refer to the following table.

Table9-1 Description of the System Log Level Fields

Field	Level	Description
<b>emergencies</b>	0	Fatal fault. The system is unavailable, the device stops and it needs to be restarted.
<b>alerts</b>	1	Serious error. Functions of a certain type become unavailable, and the services are stopped.
<b>critical</b>	2	Critical error. Irreversible problems occur on the functions of a certain type, and some functions are affected.
<b>errors</b>	3	Error Message
<b>warnings</b>	4	Warning message.
<b>notifications</b>	5	Event notification message.
<b>informational</b>	6	Message prompt and notification.
<b>debugging</b>	7	Debugging message.

System log information is outputted to five directions: control console (Console terminal), monitor console (Telnet or SSH terminal), log server, log files (memory log files and flash log files) and email. The output to the five directions is controlled by respective configuration commands. The debugging information is outputted to two directions, control console and monitor console. In some special cases, the debugging information can also be configured to output to the log server or log files.

Table 9-2 Directions for Log Output

Log Output Direction	Description
Control console	System log information is outputted to the Console terminal.
Monitor console	System log information is outputted to the Telnet or SSH terminal.
Log server	System log information is outputted to the log server.  By default, logs of levels 0-5 are outputted to the log server.
Log files	System log information is outputted to the system memory or flash memory.  By default, log information of levels 0-5 is outputted to the system memory, and log information of levels 0-5 is outputted to the flash memory.
email	System log information is outputted to the log email.  By default, logs of level 0~4 are outputted to the log email.

The log module runs in a separate syslog process. The main thread of the syslog process receives the log information sent from the system, first processes the log data and allocates cache space, and then mounts it to the cache queue corresponding to each output terminal according to the configured output action. Since the cache queue has a length limit, there is a situation that logs are lost when a large number of logs are outputted. In such case, the log module will count the lost logs. There are two threads for log scheduling output (log information output to console, monitor, log server and log file run in the same sub-thread, and log information output to email runs in another sub-thread), and a timer is enabled in the scheduling thread for each output direction, and the timer gets log data from the queue corresponding to the terminal after each response and outputs it to the corresponding terminal as configured by the user.

## 9.2 System Log Function Configuration

Table 9-3 Log Function Configuration List

Configuration Task	
Configure Log Output Functions	Configure Log Output to the Control Console
	Configure Log Output to the Monitor Console
	Configure Log Output to the Server
	Configure Log Output to Files
	Configure log output to email
Configure the Timestamp for Logs	Configure the Timestamp for Logs
Configure operation log output to the log server	Configure operation log output to the log server
Configure log duplicate suppression function	Configure log suppression
Configure log files capacity	Configure log files capacity
Configure log files encryption function	Configure log files encryption
Configure log display color	Configure log display color
Configure log filtering function	Configure log filtering function
Configure the origin-id of a device	Configure the origin-id of a device

### 9.2.1 Configure Log Output Functions

#### Configuration Condition

None

#### Configure Log Output to the Control Console

The control console refers to a Console terminal. It is a channel through which the system output log information to the control console.

Table 9-4 Configuring Log Output to the Control Console

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the log output function.	<b>logging enable</b>	Optional By default, the log output function is enabled.
Enable log display on the control console.	<b>logging source</b> { <i>module-name</i>   <b>default</b> } <b>console</b> { <b>level severity</b>   <b>deny</b> }	Optional By default, log display on the control console is enabled.

### Configure Log Output to the Monitor Console

The monitor console refers to the Telnet or SSH terminal, which is used for managing remote devices. When configuring to display log output to the monitor console, the log display on the current terminal shall be enabled.

Table 9-4 Configuring Log Output to the Monitor Console

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the log output function.	<b>logging enable</b>	Optional By default, the log output function is enabled.
Enable log display on the monitor console.	<b>logging source</b> { <i>module-name</i>   <b>default</b> } <b>monitor</b> { <b>level severity</b>   <b>deny</b> }	Optional By default, log display function of the global control console is enabled.
Enable log display on the current monitor console.	<b>terminal monitor</b>	Mandatory By default, log display function of the current control console is not enabled.

### Configure Log Output to the Server

In order to record log information more comprehensively, you can configure log output to the log server for easy maintenance and management of the system. When configuring log output to the log server, the host address or domain name of the log server shall be configured.

Table 9-5 Configuring Log Output to the Log Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the log output function.	<b>logging enable</b>	Optional By default, the log output function is enabled.
Configure Log Output to the Log Server	<b>logging server</b> <i>server-name</i> [ <b>vrf</b> <i>vrf-name</i> ] { <b>ip</b> <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i> / <b>hostname</b> <i>host-name</i> } [ <b>port</b> <i>port-num</i> ] [ <b>facility</b> <i>facility-name</i> ] [ <b>level</b> <i>severity</i> ]	Mandatory By default, log output to the log server is not enabled.
Configure Log Output to Source IP Address.	<b>logging server source</b> { <b>ip</b> <i>ip-address</i>   <b>ipv6</b> <i>ipv6-address</i>   <b>interface</b> <i>interface-name</i> }	Optional By default, the outgoing interface for sending log information will be determined based on the route, and the primary IP address of the outgoing interface will be used as the source IP address for the log output.
Configure a Specified Level of Log Output to the Log Server	<b>logging source</b> { <i>module-name</i>   <b>default</b> } <b>server</b> [ <i>server-name</i> &<1-8> ] { <b>level</b> <i>severity</i>   <b>deny</b> }	Optional By default, logs of level 0-5 are outputted to the log host.

### Configure Log Output to Files

Log files can be stored either in memory or in Flash storage. For log information stored in memory, only the content from after the syslog is started until before the system or the syslog process is restarted is kept. By

default, log information at level 5 (**notifications**) and above is kept. The log information stored in Flash memory is saved as level 5 (**notifications**) and above by default, please refer to the detailed definition in Table 9-1 for log levels. When the log file size reaches the configured maximum capacity, the oldest log file will be deleted first when adding a new log (log information is recorded by multiple log files), and then a new log file will be created and the new log information will be recorded into the new log file.

Table 9-6 Configuring Log Output to Files

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the log output function.	<b>logging enable</b>	Optional By default, the log output function is enabled.
Configure Log Saved to Flash	<b>logging source { module-name   default } file { level severity   deny }</b>	Optional By default, logs of level 0-5 are saved to Flash.
Configure Log Saved to Memory	<b>logging source { module-name   default } buffer { level severity   deny }</b>	Optional By default, logs of level 0-5 are saved to memory.
Configure Log Files Capacity Alarms	<b>logging { buffer / file } warning warning-value recover-value</b>	Optional By default, the log information alarm threshold is at 90% and the recovery threshold is at 70%.
Configure Log Files Compression	<b>logging compress [ gunzip ]</b> <b>logging compress maximum value</b>	Optional By default, log compression function is not enabled.

### Configure Log Output to Email

In order to record log information more comprehensively, you can configure log information to be outputted to the corresponding recipient and copy-to email address via email.

Table 9-7 Configuring Log Output to Email

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the log output function.	<b>logging enable</b>	Optional By default, the log output function is enabled.
Configure Email Template	<b>logging email</b> <i>email-profile</i>	Mandatory By default, the template for log output to the email is not configured.
Configure the email address of the recipient receiving the log information.	<b>mail recipient</b> <i>mail-address</i>	Mandatory By default, the email address of the recipient receiving the log information is not configured.
Configure the copy-to email address receiving the log information.	<b>mail copyto</b> <i>mail-address</i>	Optional By default, no copy-to email address receiving the log information is configured.
Configure the email address of the sender of the log information.	<b>mail sender</b> <i>mail-address</i>	Mandatory By default, not email address of the sender of the log information is configured.
Configure the email password of the sender of the log information.	<b>mail sender password</b> <i>password-string</i>	Mandatory By default, no email password of the sender of the log information is configured.

Step	Command	Description
Configure the email domain address of the recipient receiving the log information.	<b>mail server</b> <i>server-name</i>	Optional By default, the characters after the @ character in the sender's email address are used as the sender's domain address.
Configure the email subject of the sender of the log information.	<b>mail subject</b> <i>subject-name</i>	Optional By default, no email subject of the sender of the log information is configured.
Configure a specified level of log information to be outputted to the corresponding recipient and copy-to email address via email.	<b>logging source</b> { <i>module-name</i>   <b>default</b> } <b>email</b> { <b>level</b> <i>severity</i>   <b>deny</b> }	Optional By default, logs of level 0-4 are outputted to email.

## 9.2.2 Configure the Timestamp for Logs

### Configuration Condition

None

### Configure the Timestamp for Logs

Timestamp for logs provides a detailed record of when the log was generated. By default, the log timestamp takes the form of absolute time, but it also supports the form of Uptime (relative time). When configuring absolute time, you can specify the year of logging and log with millisecond precision, with detailed log time output.

Table 9-8 Configuring Timestamp for Logs

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Type of Timestamp for Logs	<b>logging timestamps uptime</b>	Optional By default, the log information uses the absolute timestamp.
Configure the Type of Timestamp for Logs	<b>logging timestamp-format { msec   timezone   year }</b>	Optional By default, log information is displayed in a timestamped format with the year of logging.

### 9.2.3 Configure Operation Log Output to the Log Host

#### Configuration Condition

Configure log output to the log host first.

#### Configure operation log output to the log server

When the operation log is configured to be sent to the log server, you can view the user-generated operation log on the log server.

Table 9-9 Configuring Log Output to the Log Host

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the log output function.	<b>logging enable</b>	Optional By default, the log output function is enabled.
Configure Log Host	<b>logging server <i>server-name</i> [ vrf <i>vrf-name</i> ] { ip <i>ip-address</i>   ipv6 <i>ipv6-address</i>   hostname <i>host-name</i> }</b>	Mandatory By default, the function of sending logs to the

Step	Command	Description
	[ <b>port</b> <i>port-num</i> ] [ <b>facility</b> <i>facility-name</i> ] [ <b>level</b> <i>severity</i> ]	log server is not enabled.
Configure operation log output to the log server	<b>logging operation to-server</b>	Mandatory By default, the function of sending operation logs to the log server is not enabled.

## 9.2.4 Configure log suppression

### Configuration Condition

None

### Configure Log Duplicate Suppression

Since in some cases the module may keep outputting the same logs over and over again, affecting the observation of other logs, this can be avoided by enabling the log duplicate suppression function. Repeated log information are outputted once within each suppression cycle, and the number of times this log was suppressed during the suppression cycle is outputted at the end of the suppression cycle.

Table 9-11 Configuring Log Duplicate Suppression

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the function of log duplicate suppression.	<b>logging suppress duplicates interval</b> <i>interval-num</i>	Mandatory By default, the function of log suppression is enabled.

## 9.2.5 Configure log files capacity

### Configuration Condition

None

### Configure log files capacity

Due to the limitation of Flash memory capacity, the log file capacity can be configured in the range of 1M to 32M. When the log information storage exceeds the configured maximum capacity limit, new logs will overwrite the old log information (overwrite the old log information file in file units).

Table 9-10 Configuring Log Files Capacity

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure log files capacity	<b>logging file size</b> <i>file-max-size</i>	Optional By default, the log files capacity is 1M bytes.

## 9.2.6 Configure log files encryption

### Configuration Condition

None

### Configure log files capacity

Considering the security of log information, the log files stored in flash can be encrypted. When the log files encryption function is configured, the logs generated subsequently will be stored in the form of cipher text in the log files. If the password of the log files is changed, logs previously stored in the form of cipher text will not be displayed in plain text. The log information will be displayed in plain text only when the password is reconfigured to the password used to generate the logs.

Table 9-11 Configuring Log Files Encryption

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure log files encryption	<b>logging file encryption</b> <i>algorithms SMV4 key</i> <i>password</i>	Optional By default, no encryption is configured for the log files in Flash.

## 9.2.7 Configure log display color

### Configuration Condition

None

### Configure log display color

When displaying log information, different levels of log information can be configured to display different colors in order to highlight the importance of the information. By default, the function of log display color is enabled and different log levels correspond to default log display colors, please refer to the following table:

Table 9-12 Log Colors Description

Field	Description
<b>emergencies</b>	Red
<b>alerts</b>	Purple
<b>alerts</b>	Blue
<b>errors</b>	Brown
<b>warnings</b>	Cyan
<b>notifications</b>	White
<b>informational</b>	Green
<b>debugging</b>	Green

Table 9-13 Configuring Log Display Color

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure log display colors corresponding to log levels	<b>logging color</b> [ <i>logging-level</i> <i>logging-color</i> ]	Optional By default, each log level has its default log display color.

### Note

- When the control or monitoring console needs to output the color of log information, the color option of the display terminal shall be configured, otherwise, the color of the log information cannot be displayed.

## 9.2.8 Configure log filtering function

### Configuration Condition

None

### Configure log filtering function

When configuring log filtering, you can specify to display not only log information containing the filter string, but also log information without the filter string and the log information level range. When this command is used, the filter string needs to be used together with the log level range.

Table 9-14 Configuring the Log Filtering Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure log filtering function	<b>logging filter</b> { <b>exclude</b> <i>exclude-string</i>   <b>include</b> <i>include-string</i>   <b>level</b> <i>high-level low-level</i> }	Optional By default, the log filtering function is not enabled.

## 9.2.9 Configure the origin-id of a device

### Configuration Condition

None

### Configure the origin-id of a device

When configuring the origin-id of a device, a maximum 63 characters can be configured. After configuring, the hostname field of the logs sent to the log server will be replaced by the origin-id string.

Table 9-15 Configuring the Origin-id of a Device

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the origin-id of a device	<b>logging origin-id string</b> <i>origin-id</i>	Optional By default, the origin-id of a device is not configured.

## 9.2.10 Log Monitoring and Maintaining

Table 9-16 Log Monitoring and Maintaining

Command	Description
<b>clear logging</b> [ <b>buffer</b>   <b>file</b> ]	Clear log information stored in memory or Flash.
<b>show logging</b> [ <b>buffer</b>   <b>file</b> ]	Display log information stored in memory or Flash.
<b>show logging</b> { <b>file</b>   <b>buffer</b> } <b>desc</b>	Reverse display of log information stored in memory or Flash.
<b>show logging filter</b>	Display log filtering configuration information.
<b>show logging operation</b>	Display log information stored in the operation log files.
<b>show logging</b> [ { <b>file</b>   <b>buffer</b> } [ <b>begin-level</b> <i>level-value</i> / [ <b>start-time</b> <i>stime</i> [ <b>end-time</b> <i>etime</i> ] ] [ <b>detail</b> ] ] ]	Display log information stored in the operation log files, and with the filtering option of time and level to display filtered log information.
<b>show logging</b> { <b>file</b>   <b>buffer</b> } <b>message-counter</b>	Display the size of the log files and the number of log entries stored in Flash or memory of the device.

# 10 Software Upgrade

---

## 10.1 Overview

Software upgrade provides a more stable software version and more abundant software features for the user.

Upgraded programs are stored in the storage mediums of the device in the form of files or data blocks. The software modules with different functions cooperate to keep the device in the stable working state and support the hardware features of the device and application services of users.

Users can upgrade software through the TFTP/FTP network transmission mode or the YmodemYmodem transmission mode of the Console port. In upgrading software of different types, users must carefully read the operation steps and notes and cautions described in the manuals related to the software upgrade.

In upgrading software, you usually need to upgrade software of each type. If the software of a type is not updated during the upgrade process, you need not upgrade the software again. Usually, you can restart the device only after the all software versions are upgraded.

The following types of software are available:

- **Image package:** A MPU package with the .pck suffix contains a collection of programs (operating system, applications, etc.) for the normal operation of the system.
- **CMM program:** Chassis Management Module (CMM) program with the suffix .bin or .pck. The CMM is responsible for monitoring the frame power and fan status, and providing status information of related boards.
- **FPGA (Field Programmable Gate Array) program:** The program with the suffix .bin is mainly used to implement the logic control of the device and the sending and receiving of service data.
- **Bootloader program:** A program with the suffix .bin or .pck. MPU bootloader program is cured in the ROM of the MPU and SPU, and is the first to be executed after the device is powered on. This program initializes the base system and its main function, and is mainly used to guide the operating system to load.
- **CPLD (Complex Programmable Logic Device) programs,** with the suffix .pck, are digital integrated circuits that construct logic functions.

- **Devinfo:** OEM program containing information such as model ID and function ID of various devices and boards. It is mainly used for upgrading when the equipment is retrofitted.
- **Patch:** Patch is a fast, low-cost way to fix defects in product software versions. The main advantage of patching over upgrading software versions is that it does not disrupt the business that the device is currently running, i.e., defects in the current software version of the device can be fixed without rebooting the device.
- **Package packager:** A package file containing image, bootloader, cmm programs, which allows for upgrade of multiple types of software programs at once, convenient and time-saving.

The correspondence between the above-mentioned types of upgrade software and types of board is shown in the table:

Table 10-1 Correspondence between Upgrade Software and Different Types of Boards

	image Package	cmm Procedures	fpga Procedures	bootload Procedures	cpld Procedures	devinfo DOCUMENTATION	patch DOCUMENTATION	package Package file
Main Process ing Unit ( MPU)	√	√	√	√	√	√	√	√

	image Packag e	cmm Proc edur es	fpga Proc edur es	bootload Procedur es	cpld Proc edur es	devinfo DOCUM ENTATI ON	patch DOCU MENT ATION	package Package file
ca rd								
S P U d a u g ht er ca rd	-	√		√	√-			√
F or w ar di n g b o ar d	-	√		√	√-			√

---

 **Note**

- WAN business board daughter cards like CPOS, POS, etc. have FPGA program, while Ethernet business board daughter cards does not have FPGA program.
- 

## 10.2 Software Upgrade Function Configuration

Table 10-2 Software Upgrade Function Configuration List

Configuration Task	
Upgrade the image Program Package	Upgrade MPU iamge package via TFTP/FTP
CMM program upgrade	Upgrade CMM program via TFTP/FTP
FPGA program upgrade	Upgrade FPGA program via TFTP/FTP
bootloader Program Upgrade	Upgrade bootloader program via TFTP/FTP
CPLD program upgrade	Upgrade CPLD program via TFTP/FTP
Devinfo file upgrade	Upgrade devinfo file package via TFTP/FTP
Patch file upgrade	Patch upgrade via TFTP/FTP
Package packager upgrade	Upgrade package packager via TFTP/FTP

### 10.2.1 Upgrade the image Program Package

The image package is suitable for MPU upgrade.

#### Configuration Preparation

Before upgrading the image program package, ensure that:

- Ensure that the route between the TFTP/FTP server and the device interface is reachable and the route can be pinged through.
- The TFTP/FTP server configuration is correct, and the image program is stored in the specified directory of the TFTP/FTP server.
- Ensure the remaining flash space is sufficient. If the space is insufficient, manually delete files on flash that are not in use.
- The configuration files have been backed up.

#### Upgrade the image Program Package in TFTP/FTP Mode

Enter the privileged user mode, ensure that the device can obtain the upgrade program through the external TFTP/FTP server, and then use the sysupdate image command to upgrade the program package.

Table 10-3 Upgrading the image Program Package in TFTP/FTP Mode

Step	Command	Description
Enter the privileged user mode.	None	Mandatory

Step	Command	Description
Upgrade the image program package.	<b>sysupdate image [ device { memberId   all } ] mpu { cardNo   all } [ vrf vrf-name ] { dest-ip-address   dest-ipv6-address } filename [ ftp ftp-username ftp-password ] [ reload ]</b>	Mandatory  If the FTP option is not specified, TFTP is used for upgrade by default.

For example: In standalone mode, upgrade the active/standby MPU image program via the FTP server 130.255.168.45.

```

Hostname#sysupdate image mpu all 130.255.168.45 sp9a-g-9.7.1.1(74)(R).pck ftp a a
#The device will prompt the following:

checking "sp9a-g-9.7.1.1(74)(R).pck" : ...OK

```

May 21 2020 08:48:26 SWICTH MPU0 %SYS\_UPDATE-RESULT-5:Upgrade image to sp9a-g-9.7.1.1(74)(R).pck from ftp: 130.255.168.45 successfully !

#The above information indicates that the image program of the active/standby MPU has been successfully upgraded.

---

 **Note**

- If the command option reload is added, the system prompts whether to save the configuration and whether to restart the device. However, usually the device is started after all programs are
-

---

upgraded. Therefore, the reload option is not recommended.

- Before the upgrade, ensure that there is sufficient space in the flash. If the space is insufficient, the upgrade fails. In this case, you can manually delete files that are not in need from the flash memory to obtain more space for upgrading application programs.
  - When the active/standby MPU flash space is insufficient, it will prompt whether to delete the extra image file, if the space remains insufficient after deleting, the upgrade fails.
  - It takes a long time to upgrade the image program package. A smaller remaining space in the flash memory results in longer upgrade time.
  - After the upgrade is completed, to run the new image program, restart the device.
  - If there are two MPUs in the device, you need to upgrade them synchronously. If the versions of the two MPUs are inconsistent, it may lead to abnormal startup and operation.
  - When upgrading the active/standby MPU at the same time, the upgrade fails if one of them does not meet the upgrade conditions.
  - When upgrading the active/standby MPU simultaneously, the upgrade will continue when the standby MPU is not in position.
  - If the device fails to start normally, open the monitor screen, modify the startup mode to network startup. After the device is started successfully, start the upgrade. For the method, refer to the related section in the monitor configuration manual and command manual.
- 

---

## Warning

- During the upgrade process, ensure the device cannot be powered off, and avoid unplugging of the MPU or rebooting operation; otherwise, the system may not boot up and the flash file system of the MPU may be damaged.
- 

### 10.2.2 Patch program upgrade.

#### Configuration Condition

Before upgrading the patch program, the following tasks shall be completed:

- The route between the TFTP/FTP server and the device interface is reachable, and the TFTP/FTP server and the device can ping each other successfully.
- The TFTP/FTP server configuration is correct, and the patch program is stored in the specified directory of the TFTP/FTP server.
- The configuration files have been backed up.

#### Patch upgrade via TFTP/FTP

Enter the privileged user mode, ensure that the device can obtain the upgrade program through the external TFTP/FTP server, and then use the `sysupdate patch` command to upgrade the program package.

Table 10-4 Upgrading the Patch Program Package in TFTP/FTP Mode

Step	Command	Description
Enter the privileged user mode.	None	Mandatory
Upgrade patch program.	<b>sysupdate patch [device {memberId   all}] mpu {cardId   all } [ vrf vrf-name ] dest-ip-address filename [ ftp ftp-username ftp-password ]</b>	Mandatory  If the FTP option is not specified, TFTP is used for upgrade by default.

Upgrade the patch program with the file name sp9a-g-9.7.1.1.HP001.pat from the device interface via FTP server 130.255.168.45.

```
Hostname#sysupdate patch mpu all 130.255.168.45 sp9a-g-9.7.1.1.HP001.pat ftp a a
```

#The device will prompt the following:

```
checking "sp9a-g-9.7.1.1.HP001.pat" : ...OK
downloading "sp9a-g-9.7.1.1.HP001.pat" : #OK
Download "sp9a-g-9.7.1.1.HP001.pat" (16300 Bytes) successfully.
Update patch of master MPU:
Writing file to filesystem.....OK!

Patch update: operating, please wait for a moment
.....(Omitted).....

sysupdate patch to sp9a-g-9.7.1.1.HP001.pat from tftp: 130.255.168.4545 successfully !
```

#The above information indicates that the patch program of the device has been successfully upgraded, and the report and log information of the upgrade result will be outputted after the upgrade is completed.

### 10.2.3 CMM program upgrade

The CMM program is applicable to upgrading the MPU, forwarding board, SPU mother card and SPU daughter card.

#### Configuration Preparation

Before upgrading the CMM program, the following tasks shall be completed:

- Ensure that the route between the TFTP/FTP server and the device interface is reachable and the route can be pinged through.
- The TFTP/FTP server is correctly configured and the CMM program is correctly stored in the specified TFTP/FTP directory.
- The configuration files have been backed up.

#### Upgrade CMM program via TFTP/FTP

Enter privileged user mode, ensure that the device can get the upgrade program from external TFTP/FTP server, and then upgrade the program via sysupdate cmm command.

Table 10-5 Upgrading the CMM Program in TFTP/FTP Mode

Step	Command	Description
Enter the privileged user mode.	None	Mandatory
CMM program upgrade	<b>sysupdate cmm [ device { memberId   all } ] { { mpu   lpu   sfu } { cardNo   all }   all } [ vrf vrf-name ] { dest-ip-address   dest-ipv6-address } filename [ ftp ftp-username ftp-password ] [ reload ]</b>	Mandatory If the FTP option is not specified, TFTP is used for upgrade by default.

For example: In standalone mode, upgrade the CMM program of all active boards via the FTP server 130.255.168.45.

```

Hostname#sysupdate cmm all 130.255.168.45 sz02-cmm-tim4-1.0.1.4.pck ftp a a
#The device will prompt the following:
checking "sz02-cmm-tim4-1.0.1.4.pck" : ...OK
downloading "sz02-cmm-tim4-1.0.1.4.pck" : #OK
Download "sz02-cmm-tim4-1.0.1.4.pck" (361268 Bytes) successfully.
Update CMM of master MPU:Successfully!
Update CMM of LPU3:Successfully!
Update CMM of LPU7:Successfully!
Update CMM of LPU9:Successfully!
Update CMM of SFU1:Successfully!
%Sysupdate cmm is in process, please wait...

Apr 16 2021 13:43:09 switch MPU0 %SYS_UPDATE-RESULT-5:cmm : Mpu 0 upgrade successfully!
%Sysupdate cmm finished.

```

sysupdate cmm result information list:

```

-----
Card    result information
-----
Mpu 0   upgrade successfully!
Lpu 3   upgrade successfully!
Lpu 7   upgrade successfully!
Lpu 9   upgrade successfully!
Sfu 1   upgrade successfully!

```

#The above information indicates that the CMM program of the MPU, forwarding board, SPU mother card and SPU daughter card has been successfully upgraded.

### Note

- For business board daughter card, it is only shown when the upgrade fails.

- 
- The device needs to be rebooted after the CMM upgrade is completed.
- 

## Warning

- During the upgrade process, ensure that the device cannot be powered off, and avoid the unplugging of boards or rebooting operation; otherwise, the system may not be booted up.
  - You need to ensure that all boards share the same CMM version, otherwise it will lead to the system operation abnormality.
- 

### 10.2.4 bootloader Program Upgrade

The bootloader program is suitable for upgrading the MPU, forwarding board, SPU mother card and SPU daughter card.

#### Configuration Preparation

Before upgrading the bootloader program, you need to complete the following tasks:

- Ensure that the route between the TFTP/FTP server and the device interface is reachable and the route can be pinged through.
- The TFTP/FTP server is correctly configured and the bootloader program is correctly stored in the specified TFTP/FTP directory.
- The configuration files have been backed up.

#### Upgrade bootloader program via TFTP/FTP

Enter privileged user mode, ensure the device can get the upgrade program from external TFTP/FTP server, and then upgrade the program via `sysupdate bootloader` command.

Table 10-6 Upgrading the bootloader Program in TFTP/FTP Mode

Step	Command	Description
Enter the privileged user mode.	None	Mandatory
Upgrade bootloader program.	<code>sysupdate bootloader [ device { memberId   all } ] {{{ mpu   lpu   sfu } { cardNo   all } }   all } [ vrf vrf-name ] { dest-ip-address   dest-ipv6-address } filename [ ftp ftp-</code>	Mandatory If the FTP option is not specified, TFTP is used for upgrade by default.

Step	Command	Description
	<code>username ftp-password ]</code> <code>[ reload ]</code>	

For example: In standalone mode, upgrade the bootloader program on all active MPUs simultaneously via the FTP server 130.255.168.45.

```

Hostname#sysupdate bootloader mpu all 130.255.168.45 sz02-bootloader-nl02-9.6.0.3ft15-1.1.18.pck ftp a
#The device will prompt the following:
checking " sz02-bootloader-nl02-9.6.0.3ft15-1.1.18.pck " : ...OK
downloading " sz02-bootloader-nl02-9.6.0.3ft15-1.1.18.pck " : ####OK
Download " sz02-bootloader-nl02-9.6.0.3ft15-1.1.18.pck " (3637108 Bytes) successfully.
Update bootloader start.
.....OK.

%Sysupdate bootloader is in process, please wait...
%Sysupdate bootloader finished.

sysupdate bootloader result information list:
-----
Card    result information
-----
Mpu 0   upgrade successfully!
Mpu 1   upgrade successfully!

```

#The above information indicates that the bootloader program of the active MPU has been successfully upgraded.

---

 **Note**

- When upgrading, please select the correct bootloader version, and upgrade the bootloader of all service boards on the device synchronously to avoid occurrence of exceptions.
- If the command option reload is added, the system prompts whether to save the configuration and whether to restart the device. However, usually the device is started after all programs are upgraded. Therefore, the reload option is not recommended.
- After the upgrade is complete, in order to run the new bootloader program, you need to reboot the board or the device.
- The bootloader program of all device MPUs need to be upgraded simultaneously to avoid the occurrence of exceptions.
- Please select the correct bootloader version for the upgrade to avoid the occurrence of exceptions.

---

 **Warning**

- During the upgrade process, ensure that the device cannot be powered off, and avoid unplugging of the MPU or rebooting operation; otherwise, the system may not boot up and the bootloader file of
-

---

the MPU may be damaged.

---

### Upgrade bootloader Program via Console

Ensure that the HyperTerminal can access the device through the Console port, enter the bootloader mode, adjust the baud rate, and upgrade through the ymodem of the HyperTerminal. If there are two MPUs on the device, they need to be upgraded separately.

For detailed descriptions of the commands, please refer to the relevant sections of the "bootloader" command manual.

Table 10-7 Upgrading the bootloader Program via the Console Port

Step	Command	Description
Set up the HyperTerminal.	None	Mandatory  Run the HyperTerminal program and select the corresponding serial port (e.g. com1), set up its properties, that is, baud rate is 9600 bps, soft flow control, 8 data bits, no parity check, 1 stop bit.
Enter the bootloader mode	None	Mandatory  When the device reboots, press CTRL+C to enter the bootloader mode.
Modify the baud rate of the Console port and the HyperTerminal to speed up the upgrade	<b>srate</b> { <i>speed</i> }	Optional  Modify the baud rate of the device Console port to 115200bps, then disconnect the HyperTerminal, modify the baud rate of the HyperTerminal to 115200bps, and reconnect.
Upgrade bootloader program.	<b>mupdate bootloader</b>	Mandatory  Enter the mupdate bootloader command in bootloader mode, then select the ymodem protocol in HyperTerminal,

Step	Command	Description
		select the bootloader program and start sending.

For example: Upgrade the bootloader program of the active MPU through the Console port.

```
#The device will prompt the following:
Download bootloader start...
Transferring sz03-bootloader-M-cn6x-1.0.77.pck,...
100% 1911 KB 3 KB/sec 00:08:17 0 Errors

## Total Size = 0x001ddd94 = 1957268 Bytes
Download bootloader OK.
bootloader image check:
..... done
Un-Protected 8 sectors

..... done
Erased 8 sectors
run command=cp,b 200000f8 0x17c00000 0xeb020
Copy to Flash... done
..... done
Protected 8 sectors
Update bootloader OK.
```

#The above information indicates that the bootloader program of the active MPU has been successfully upgraded.

---

## Note

- Upgrade the bootloader program of the standby MPU through the Console port, the operation process is the same as the active MPU.
  - When upgrading the bootloader program, make sure the speed rate of the HyperTerminal and the speed rate of the device Console port are in consistency.
  - When upgrading the bootloader program, it is recommended to set the transfer rate to 115200bps, so as to shorten the upgrade transfer time.
  - When upgrading the bootloader program, if the default rate of the Console port is modified, when loading the image package, the Console port rate of the device is automatically restored to 9600bps, and the rate of the HyperTerminal needs to be modified as well.
  - It is recommended to try upgrading the bootloader program via TFTP/FTP, and use the Console port to upgrade the bootloader program only when the conditions for the former are not met.
- 

## Warning

- During the upgrade process, ensure that the device cannot be powered off, and avoid the unplugging of the MPU or rebooting operation; otherwise, the system may not boot up and the bootloader file of the MPU may be damaged.
-

## 10.2.5 Devinfo file upgrade

The devinfo file is used for MPU upgrade.

### Configuration Preparation

The following tasks need to be completed before the devinfo file can be upgraded:

- Ensure that the route between the TFTP/FTP server and the device interface is reachable and the route can be pinged through.
- The TFTP/FTP server is correctly configured and the devinfo file is correctly stored in the specified TFTP/FTP directory.
- The configuration files have been backed up.

### Upgrade Devinfo Files via TFTP/FTP

Enter the privileged user mode to ensure the device can get the upgrade program from external TFTP/FTP server, and can be upgraded through sysupdate devinfo command.

Table 10-8 Upgrading devinfo File via TFTP/FTP

Step	Command	Description
Enter the privileged user mode.	None	Mandatory
Devinfo file upgrade	<b>sysupdate devinfo [ device { memberId   all } ] mpu { cardNo   all } [ vrf vrf-name ] { dest-ip-address   dest-ipv6-address } filename [ ftp ftp-username ftp-password ] [ reload ]</b>	Mandatory If the FTP option is not specified, TFTP is used for upgrade by default.

For example: In standalone mode, upgrade the devinfo files on all active/standby MPUs via the FTP server 130.255.168.45.

```

Hostname#sysupdate devinfo mpu all 130.255.168.45 devInfo(v2.2) ftp a a
#The device will prompt the following:
checking "devInfo(v2.2)": ...OK
downloading "devInfo(v2.2)": #OK
Download "devInfo(v2.2)" (6275 Bytes) successfully.
Writing file to filesystem....OK!

```

```

%Sysupdate devinfo is in process, please wait...
%Sysupdate devinfo finished.

```

```

sysupdate devinfo result information list:

```

```

-----
Card    result information
-----

```

```

Mpu 0    upgrade successfully!
Mpu 1    upgrade successfully!

```

---

#The above information indicates that the devinfo file of the active/standby MPU in position has been successfully upgraded.

---

### Note

- If the command option reload is added, the system prompts whether to save the configuration and whether to restart the device. However, usually the device is started after all programs are upgraded. Therefore, the reload option is not recommended.
  - After the upgrade is complete, in order to run the devinfo file, you need to reboot the board or the device.
  - The devinfo files of all active/standby MPUs on the device need to be upgraded in synchronization to avoid anomalies.
  - Please select the correct devinfo file version for the upgrade to avoid the occurrence of exceptions.
- 

---

### Warning

- During the upgrade process, ensure that the device cannot be powered off, and avoid the unplugging of MPU or rebooting operation; otherwise, the system may not boot up properly and the devinfo file may be damaged.
- 

## 10.2.6 Package file upgrade

The package file contains image, bootloader, cmm, and devinfo files, which can be upgraded all at once through the package file.

### Configuration Preparation

The following tasks need to be completed before the package file can be upgraded:

- Ensure that the route between the TFTP/FTP server and the device interface is reachable and the route can be pinged through.
- The TFTP/FTP server is correctly configured and the package file is correctly stored in the specified TFTP/FTP directory.
- The configuration files have been backed up.

### Upgrade Package Files via TFTP/FTP

Enter privileged user mode, ensure the device can get the upgrade program from external TFTP/FTP server, and then upgrade the program via sysupdate package command.

Table 10-9 Upgrading Package File via TFTP/FTP

Step	Command	Description
Enter the privileged user mode.	None	Mandatory
Upgrade Package File	<b>sysupdate package [ device { memberId   all } ] [ vrf vrf-name ] { dest-ip-address   dest-ipv6-address } filename [ ftp ftp-username ftp-password ] [ no-comparision ] [ reload ]</b>	Mandatory If the FTP option is not specified, TFTP is used for upgrade by default.

For example: In standalone mode, package and upgrade programs of all active boards via the FTP server 130.255.168.45.

```
Hostname#sysupdate package 130.255.168.45 sp9a-g-9.7.1.1(74)(R)-001.pkg FTP a a
```

#The device will prompt the following:

```
Downloading "sp9a-g-9.7.1.1(74)(R)-001.pkg" header...OK!
Checking "sp9a-g-9.7.1.1(74)(R)-001.pkg" header...OK!
```

image file version comparision:

```
-----
Component      Component version  File version
-----
Mpu 0          9.7.1.1(72)(integrity)  9.7.1.1(74)
```

The current-version of cards is greater than or equal to that in package.

NOTICE:input 'Yes' to upgrade all files in the package, 'No' to ignore the above component(s). (Yes|No)?y

#The above information indicates that the package files of all types of active boards have been successfully upgraded.

---

### Note

- For business board daughter card, it is only shown when the upgrade fails.
  - If the command option reload is added, the system prompts whether to save the configuration and whether to restart the device. However, usually the device is started after all programs are upgraded. Therefore, the reload option is not recommended.
- 

---

### Warning

- During the upgrade process, ensure that the device cannot be powered off, and avoid the unplugging of boards or rebooting operation; otherwise, the system may not boot up properly and files may be damaged.
- 

## 10.3 Example of typical configuration for software upgrade

### 10.3.1 Upgrade Package File

#### Network Requirements

- A PC acts as an FTP server, and Device acts as an FTP client. The network between the server and the device is normal.
- On the FTP server, set the user name of the device for logging in to the FTP server as admin and the password is admin; place the packaged program for upgrade under the FTP server directory to upgrade all software versions that the device supports for packaged upgrade.

#### Network Topology

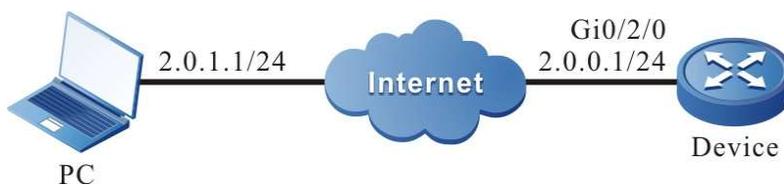

Figure 10-1 Network Topology for Packaged Upgrading of All Supported Software Versions

#### Configuration Steps

- 
- Step 1: Configure the FTP server and place the packaged program for upgrade in the directory of the FTP server. (Omitted)
- Step 2: Back up the device configuration file. (Omitted)
- Step 3: Configure the IP address of the interface to connect the device to the FTP server network. (Omitted)
- Step 4: Upgrade the packaged program.

#Use sysupdate to upgrade the packaged program.

```
Device#sysupdate package 2.0.1.1 sp9a-g-9.7.1.1(74)(R)-001.pkg ftp admin admin no-comparision
```

After the upgrade is completed, a list of upgrade results is printed out for the user to determine the upgrade results of programs included in the packaged upgrade file on the device.

package sysupdate result information list:

-----  
sp9a-g-9.7.1.1(74)(R).pck sysupdate result information list:

-----  
Mpu 0 - upgrade successfully!

sz03-bootloader-M-cn6x-1.0.75.pck sysupdate result information list:

-----  
Mpu 0 - upgrade successfully!

pkg\_info.txt sysupdate result information list:

-----  
Mpu 0 - upgrade successfully!

---

## Caution

- Please ensure that all boards are in position with their status in Start OK before packaged upgrade. Please do not unplug any board during the upgrade process to avoid upgrade abnormalities affecting the subsequent start-up of the board.

---

## Note

If you select the "no-comparison" parameter, the program will be upgraded directly using the version in the program without comparing the image versions. If this parameter is not selected, the image version will be compared, and if the image version in the packaged upgrade program is lower than or the same as the running version of the device, the device will prompt the user and wait for the user to confirm whether to upgrade the image program in the upgrade package. Whether the user chooses to upgrade the program or not, it will not affect the upgrade of other upgrade files in the upgrade package. If the image file is the only file included in the upgrade package, the package upgrade ends if the user chooses not to upgrade.

- This command also allows you to add the "reload" parameter, which can reboot the device directly after the upgrade is completed.
- 

Step 5: Command to reboot the device

#Use the reload command to reboot the device.

```
Device#reload
Save current configuration to startup-config(Yes|No)?y
Please confirm system to reload(Yes|No)?y
```

It is up to the user to decide whether to save the configuration before rebooting.

---

## Note

- If the "reload" parameter is included in the upgrade command, this step is omitted.
- 

Step 6: Check the result.

#After the upgrade is completed and the device is rebooted, check the version information of the upgraded file in the program via the show package version command.

```
Device#show package version

package   :sp9a-g-9.7.1.1(74)(R)-001.pkg
image     :sp9a-g-9.7.1.1(74)(R).pck

## ! Caution

- The version of the upgrade file in the packaged upgrade program can be viewed via the show package version command, and the final upgrade result can be viewed via the show system verison brief command.

## 10.3.2 Full Upgrade of All Software Versions

### Network Requirements

- A PC acts as an FTP server, and the device Device acts as an FTP client. The network between the server and the device is normal.
- On the FTP server, set the user name of the device for logging in to the FTP server as admin and the password is admin; place the image program and bootloader program for upgrade under the FTP server directory to upgrade all software versions of the device.

### Network Topology

Figure 10-2 Network Topology for Upgrading of All Software Versions

### Configuration Steps

- Step 1: Configure the FTP server and place the image program and bootloader program for upgrade in the directory of the FTP server. (Omitted)
- Step 2: Back up the device configuration file. (Omitted)

Step 3: Configure the IP address of the interface to connect the device to the FTP server network.  
(Omitted)

Step 4: Upgrade the image program.

#Check if there is enough space left in the file system before upgrading the image program.

```
Device#filesystem  
Device(config-fs)#volume
```

#Use sysupdate to upgrade the image program of the MPU.

```
Device#sysupdate image mpu all 2.0.0.1 sp9a-g-9.7.1.1(74)(R).pck ftp admin admin
```

For information on image program upgrade process and whether the upgrade was successful, please refer to the relevant section on "Image Program Package Upgrade" in "Software Upgrade Configuration".

Step 5: Upgrade bootloader program.

#Use sysupdate to upgrade the bootloader program of the MPU.

```
Device#sysupdate bootloader mpu all 2.0.0.1 sz03-bootloader-M-cn6x-1.0.75.pck ftp admin admin
```

For information on bootloader program upgrade process and whether the upgrade was successful, please refer to the relevant section on "Bootloader Upgrade" in "Software Upgrade Configuration".

Step 6: Upgrade CMM program.

#Use sysupdate to upgrade the CMM program on all boards.

```
Device#sysupdate cmm all 2.0.0.1 sz02-cmm-tim4-1.0.1.4.pck ftp admin admin
```

For information on CMM program upgrade process and whether the upgrade was successful, please refer to the relevant sections on "CMM Upgrade" in "Software Upgrade Configuration".

Step 7: Upgrade FPGA program.

#Upgrade the FPGA program of the active/standby MPUs, CPOS, POS, E1 and other WAN daughter cards as needed, as shown in the following example: Use sysupdate to upgrade the FPGA program of all CPOS daughter cards on the device.

```
Device#sysupdate fpga all 2.0.0.1 pb035mpuc_fpv001_101.bin ftp admin admin
```

The upgrade command for the active/standby MPUs, POS, E1 and other WAN daughter cards shall follow suit, and only the file name needs to be changed. For information on FPGA program upgrade process and whether the upgrade was successful, please refer to the relevant section on "FPGA Upgrade" in "Software Upgrade Configuration".

---

---

## Note

- When upgrading FPGA, if the board type is not specified, the corresponding board will be searched automatically according to the FPGA program type for upgrading.
  - In general, FPGA program's update frequency is relatively low, so please confirm that the upgrade version is higher than the current running version of the system before upgrade. Please refer to step 10 below to check the current FPGA version of the system.
- 

### Step 8: Upgrade CPLD files

#Use sysupdate to upgrade the CPLD program on board.

```
Device#sysupdate cpld all 2.0.0.1 pb009pb009_nss12800_cpld_clv015.pck ftp admin admin
```

For information on CPLD program upgrade process and whether the upgrade was successful, please refer to the relevant section on "CPLD Program Package Upgrade" in "Software Upgrade Configuration".

### Step 9: Devinfo program upgrade

#Use sysupdate to upgrade the devinfo program of the MPU.

```
Device#sysupdate devinfo mpu all 2.0.0.1 devInfo(v2.2) ftp admin admin
```

For information on devinfo program upgrade process and whether the upgrade was successful, please refer to the relevant section on "Devinfo Upgrade" in "Software Upgrade Configuration".

### Step 10: Command to reboot the device.

#Use the **reload** command to reboot the device.

```
Device#reload
Save current configuration to startup-config(Yes|No)?y
Please confirm system to reload(Yes|No)?y
```

It is up to the user to decide whether to save the configuration before rebooting.

### Step 11: Check the result.

# After the upgrade is complete and the device is rebooted, verify that all versions have been updated by checking the version numbers of various programs.

#Verify that the image and bootloader programs of the active/standby MPU have been upgraded successfully.

```
Device#show system mpu

- 
- The interface of the device that can reach the FTP server by routing can be either a dc0 out-of-band management interface or a service interface.
  - There is no strict order for upgrading image and bootloader programs as mentioned above, but remember, you need to upgrade all programs before rebooting the whole device.
  - Before upgrading, you should ensure that there is enough space left in the flash file system of the active/standby MPU for saving the upgraded image files. If the remaining space on the device is insufficient, delete redundant files in the file system of the device; it is recommended to ensure that the remaining space of flash of the active/standby MPU is more than 170M before upgrading, otherwise the upgrade time may be extended.
  - If some programs have not been modified in the new released version, the unmodified programs can be left unupgraded.
  - If an exception occurs during the upgrade process, resulting in the unsuccessful upgrade of some boards, you can upgrade this part of the board separately later on.
- 

### 10.3.3 Upgrade bootloader using Console port.

#### Network Requirements

- A PC is directly connected to the device Console port.
- Use the Console port to upgrade the bootloader program of the active/standby MPU.

#### Network Topology

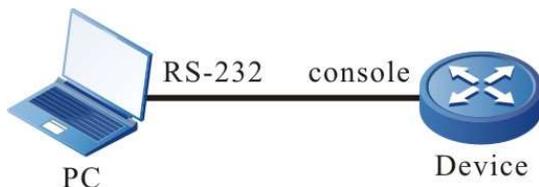

Figure 10-3 Using the Console Port to Upgrade the bootloader Program

#### Configuration Steps

Step 1: A PC is properly connected to the Console port of the device. (Omitted)

Step 2: Open the bootloader screen.

Press and hold "ctrl+c" to open the bootloader screen when the device has just booted up and printed "Press ctrl+c to enter bootloader mode: 0".

Step 3: Set the transfer rate to 115200bps to speed up the upgrade.

```
bootloader#srata 115200
```

#After setting the transfer rate of Console port under bootloader, the transfer rate of HyperTerminal should be set to 115200bps as well.

---

Step 4: Upgrade the bootloader version in the bootloader environment.

```
bootloader#mupdate bootloader
```

#Enter the command "mupdate bootloader" to transfer the bootloader file saved on the PC using ymodem.

#Check the result.

#The following message will be printed on the bootloader screen after the upgrade is completed.

```
bootloader# mupdate bootloader
Download bootloader start...
run command=loady
## Ready for binary (ymodem) download to 0x20000000 at 115200 bps...
C
Transferring sz03-bootloader-M-cn6x-1.0.75.pck, errors 0...
 100% 1911 KB   3 KB/sec  00:08:17   0 Errors

## Total Size   = 0x001ddd94 = 1957268 Bytes
Download bootloader OK.
bootloader image check:
..... done
Un-Protected 8 sectors

..... done
Erased 8 sectors
run command=cp.b 200000f8 0x17c00000 0xeb020
Copy to Flash... done
..... done
Protected 8 sectors
Update bootloader OK..
```

Step 5: Check the result.

#Rebooting the device after the upgrade is complete, and the system will print that the system is loaded guided by the new bootloader.

```
Bootloader 1.0.75 (Build time: Apr 09 2021 - 10:38:53)
```

```
Warm boot from master sector
```

```
Press ctrl+c to enter bootloader mode: 0
```

---

### Note

- Since upgrading the bootloader program via Console port is more complicated and time-consuming, it is usually recommended to use TFTP to upgrade the bootloader program, and use the Console port to upgrade the bootloader program only when the conditions of the former are not met.
- After the upgrade is complete, exit the bootloader with the "reset" command and let the new bootloader program guide the image program to load.
- When upgrading the bootloader program, if the default baud rate of the Console port is modified, the Console port rate of the device is automatically restored to 9600bps when loading the image package, and the rate of the HyperTerminal needs to be modified as well.

# 11 Bootloader

---

## 11.1 Overview

In embedded systems, the bootloader program runs before the OS kernel runs and is used to initialize hardware devices (including Console ports, Ethernet interfaces, flash, etc.), establish memory space mapping, thus bring the system's hardware and software environment to a suitable state in order to prepare the correct environment for the eventual boot of the OS kernel. In an embedded system, there is usually no firmware program like BIOS, and the loading and booting task of the whole system is done by bootloader.

The bootloader system mainly contains the following functions:

- Set startup parameters to load IOS via network device or internal flash memory device
- Upgrade bootloader program.
- Back up bootloader program.

## 11.2 bootloader Function Configuration

Table 11-1 bootloader Function Configuration List

Configuration Task	
Enter the bootloader configuration mode	Enter the bootloader configuration mode upon startup
Set bootloader startup parameters	Set bootloader startup parameters to boot the image program in flash.

Configuration Task	
Configure the bootloader to manage the Ethernet port IP address.	Configure the bootloader to manage the Ethernet port IP address.
Upgrade bootloader program.	Upgrade bootloader program.

### 11.2.1 Preparation for bootloader function configuration

Before starting the bootloader configuration, you need to set up the local configuration environment. Connect the serial port of the host (or terminal) to the Console port of the device through the configuration cable, and the configuration of the communication parameters of the host (or terminal) and the default configuration of the Console port of the device need to be consistent. The default configuration of the Console port on the device is:

- Transmission rate: 9600bps
- Flow control mode: None
- Calibration method: None
- Stop Bit: 1Bit
- Data bits: 8Bit

### 11.2.2 Enter the bootloader configuration mode

#### Configuration Condition

None

#### Enter the bootloader configuration mode

Table 11-2 Entering the bootloader Configuration Mode

Step	Command	Description
Enter the bootloader configuration mode	None	Mandatory After the device is powered on, press and

Step	Command	Description
		hold "ctrl+c" to enter the bootloader configuration mode; after entering, the prompt message is: "bootloader#"

### Note

- After entering the bootloader configuration mode, you can perform the functions provided by the bootloader mode.

## 11.2.3 Set bootloader startup parameters

### Configuration Condition

None

### Set Bootloader Startup Parameters

Table 11-3 Setting the bootloader Startup Parameters

Step	Command	Description
Enter the bootloader configuration mode	None	Mandatory After the device is powered on, press and hold "ctrl+c" to enter the bootloader configuration mode; after entering, the prompt message is: "bootloader #"
Set IOS startup parameters under bootloader	<b>change</b> <i>index[0~3]</i> <b>dc0</b> <i>filename local-ip-addr</i>	Mandatory The first line of the command is the network

Step	Command	Description
	<pre>host-ip-addr [ gatewayip ] [ netmask ]  change index[0~3] flash0 filename</pre>	<p>startup configuration parameters, if you upgrade across network segments, you need to add the gateway and mask.</p> <p>The second line of the command is the startup configuration parameters for flash storage device.</p>

### Note

- The bootloader program of the domestic switch currently can set startup parameters to boot the image program over network.

## 11.2.4 Upgrade bootloader program.

### Configuration Condition

None

### Upgrade bootloader program.

Table 11-4 Upgrading bootloader Program

Step	Command	Description
Enter the bootloader configuration mode	None	<p>Mandatory</p> <p>After the device is powered on, press and hold "ctrl+c" to enter the bootloader configuration mode; after entering, the</p>

Step	Command	Description
		prompt message is: "bootloader#"
Start tftp server on the PC.		Mandatory  Copy the new bootloader version used for the upgrade to the root directory of tftp for the device to download the version file via tftp.
Upgrade bootloader program.	<b>update bootloader</b> <i>filename dc0 local-ip-addr host-ip-addr [gatewayip] [netmask]</i>	Mandatory  Upgrade the PCK file of bootloader via tftp server
	<b>mupdate bootloader</b>	Optional  For transmission via ymodem, refer to the command manual for details.
Back up bootloader program.	<b>bootloaderbak</b>	Optional

---

### Note

- The bootloader system program adopts a dual bootloader backup mode, i.e. it has both the main bootloader program and the backup bootloader program, using the upgrade command can only upgrade the program version of the main bootloader, while the backup bootloader program will remain unchanged.
  - After upgrading the bootloader system program, use the command **reset** or power off and reboot the device to use the latest bootloader system program.
  - When the system is loaded successfully, you can upgrade it with the **sysupdate**
-

---

command.

---

## 11.2.5 bootloader Monitoring and Maintaining

Table 11-5 bootloader Monitoring and Maintaining

Command	Description
<b>version</b>	Display the bootloader program version number.
<b>print index[0~4]</b>	Display startup parameters information specified by index.
<b>boot index[0~4]</b>	Load the startup parameters information specified by index.
<b>clear index[0~3]</b>	Clear the startup parameters information specified by index.
<b>grate</b>	Obtain data on the speed rate of the current serial port.
<b>Srate ratenum</b>	Obtain data on the speed rate of the current serial port, the value of which is taken as 9600 or 115200.

## 11.3 bootloader Typical Configuration Example

### 11.3.1 Configure the bootloader to start the Image program via the network.

#### Network Requirements

- A PC acts as a TFTP server, and Device acts as a TFTP client. The network between the server and the device is normal.
- On the TFTP server, place the image program and bootloader program that need to be upgraded in the TFTP server directory.

## Network Topology

Figure 11-1 Configuring the bootloader to Boot the Image Program via the Network

### Configuration Steps

- Step 1: Configure TFTP server and place the image program in the directory of the TFTP server. (Omitted)
- Step 2: After the device is powered on, press and hold "ctrl+c" to enter the bootloader configuration mode.
- Step 3: Configure the startup line parameters to start the Image program via the network.

For instance,

```
bootloader#change 0 dc0      sp9b-g-9.7.1.1(68)(R).pck 1.1.1.3 1.1.1.1
bootloader#boot 0
```

---

### Note

- Connect the first port of the device to the tftp server.
  - After setting the startup information, the device can communicate with the tftp server normally before performing boot.
- 

# 12 PoE Management

---

## 12.1 Overview

The existing Ethernet, with its basic structure of Cat.5 cabling unchanged, not only transmits data signals for IP-based terminals (such as IP phones, WLAN access points, and network cameras), but also provides the DC power supply for the devices. This technology is called Power over Ethernet (PoE). The PoE technology ensures not only the security of existing structured cabling but also normal operation of the existing network, greatly reducing the cost.

PoE is also called Power over LAN (PoL) or Active Ethernet. It is the latest standard specification for making use of existing standard Ethernet transmission cable to transmit data and provide power. It is compatible with the existing Ethernet systems and users. IEEE 802.3af and IEEE802.3at are the technical standards that PoE must comply with. IEEE802.3af is the basic standard of the PoE technology. It is based on the IEEE 802.3, and the standards related to direct power supply through network cables are added. It is an extension of the existing Ethernet standards. IEEE802.3at is an extension based on the IEEE802.3af.

According to the definition of the IEEE802.3af standard, a complete PoE power supply system consists of two types of devices: Power Sourcing Equipment (PSE) and Power Device (PD).

- PSE: It provides power to other devices.

**12.1.1** PD (Power Device): Devices that receive power. The power of the devices is usually not large.

### PSE/PD Interface Specifications

For the 10BASE-T and 100BASE-TX networks, IEEE802.3af defines Power Interfaces (PIs), which are interfaces between PSE/PD and network cables. Currently, it has defined two power supply modes, Alternative A (xsignal wire pairs 1, 2, 3 and 6) and Alternative B (signal wire pairs 4, 5, 7, and 8). The following is a description of the two power supply modes:

#### 1. Power supply through signal wire pairs (Alternative A)

As shown in the following figure, a PSE can supply power to a PD through signal wire pairs. Because DC and data frequency does not interfere with each other, electric current and data can be transmitted through the same wire pair. For electric cables, this is a kind of "multiplexing". Wires 1 and 2 are connected to form a positive (or negative) polarity, and wires 3 and 6 are connected to form a negative (or positive) polarity.

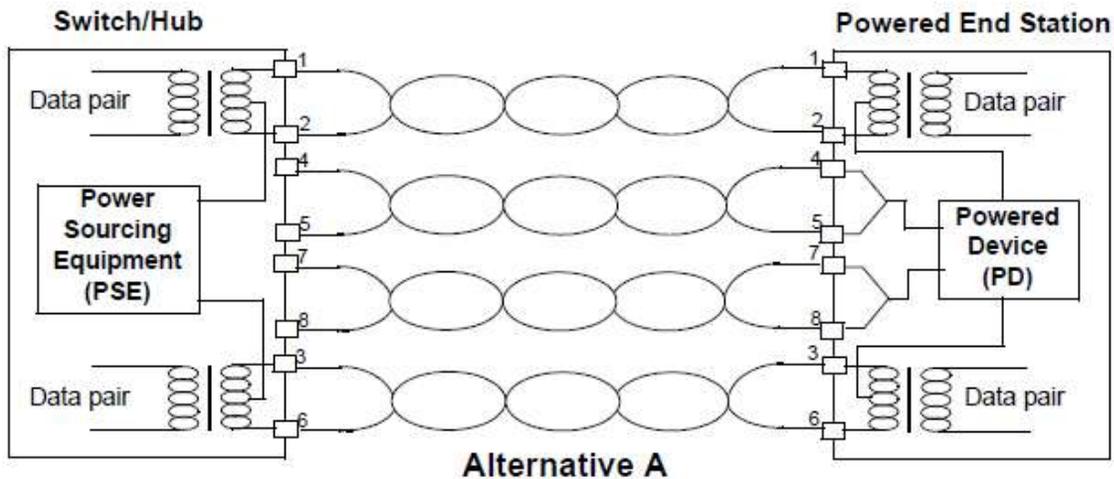

Figure 12-1 Alternative A Power Supply Mode with 10BASE-T and 100BASE-TX

2. Power supply through idle wire pairs (Alternative B)

As shown in the following figure, a PSE can supply power to a PD through idle wire pairs. Wires 4 and 5 are connected to form a positive polarity, and wires 7 and 8 are connected to form a negative polarity.

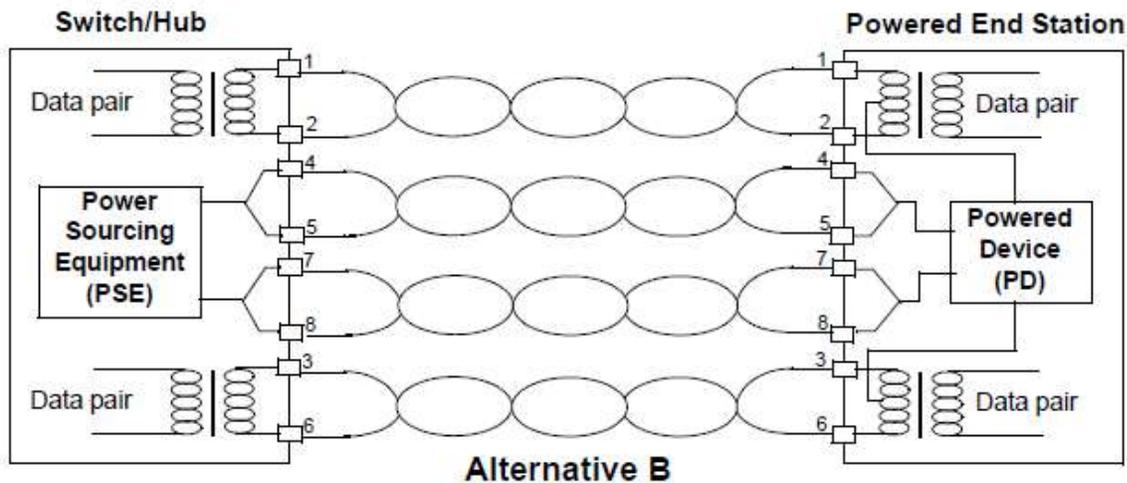

Figure 12-2 Alternative B Power Supply Mode with 10BASE-T and 100BASE-TX

According to IEEE802.3af, standard PDs must support both power supply through signal wire pairs and power supply through idle wire pairs, while PSEs need only support either of the two modes.

**12.1.2 PoE Power Supply Process**

If a PSE is installed in a network, the PoE Ethernet power supply process is as follows:

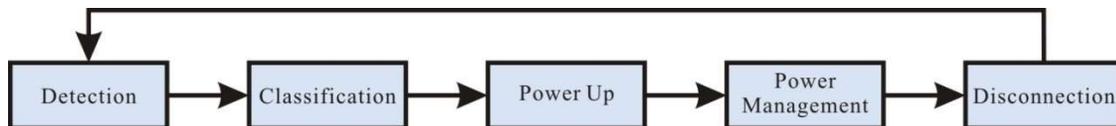

Figure 3-4 PSE Power Supply Process

- **Detection:** After a network device is connected to a PSE, the PSE first detects whether the device is a PD to ensure that the current is not supplied to non-PDs because supplying power to a device that is not a PD may damage the device. The PSE detects the resistance capacitance between the power output wire pairs to determine whether PDs exist. The PSE proceeds to the next step only after it detects PDs.
- **Classification:** After detecting PDs, the PSE classifies the PDs. It determines power grade of PDs by detecting power output current. During the power supply process, classification is optional.
- **Power Up:** Within a startup period which is configurable (usually less than 15 us), the PSE starts to provides low power voltage to PDs and gradually increases the power voltage to 48 V DC.
- **Power Management:** The PSE provides stable and reliable 48 V DC power for PDs. Once the PSE starts to supply power, it continuously detects PD current inputs. If the current consumption of a PD drops under the minimum value owing to various causes, such as the PD is disconnected, the PD encounters power consumption overload or short circuit, and the power load exceeds the PSE power supply load, the PSE regards the PD as not in position or abnormal. In this case, the PSE stops providing power to the PD.
- **Disconnection:** The PSE detects the current of PDs to determine whether PDs are disconnected. If a PD is disconnected, the PSE stop supplying power to the PD quickly (usually within 300 to 400 ms), and then the PSE returns to the Detection status.

## 12.2 PoE Function Configuration

Table 12-1 PoE Function Configuration List

Configuration Task	
PoE Basic Function Configuration	Enable the Global PoE Function
	Enable the Interface PoE Function

Configuration Task	
	Enable the Forced Power Supply Function of an Interface
	Enable the Auto Power Supply Function of an Interface
Configure the PoE Power	Configure the Total Power of PoE
	Configure the Protection Power of PoE
	Configure the Maximum Output Power Limit Mode of an Interface
	Configure the Maximum Output Power of an Interface
Configure Power Supply Priorities	Configure a PoE Power Management Mode
	Configure the Power Supply Priority of an Interface
Configure PD Power-up and Power-down Parameters	Configure Interface PD Detection Mode
	Configure Interface Classification Mode
	Configure Interface Power-up Inrush Current Mode
	Configure Interface Power Supply Wire Pairs
	Configure Interface Power Failure Detection Mode
Configure the Abnormality Recovery Function	Configure the Time for Recovery from a Power Supply Abnormality of an Interface
	Restart the PoE Power Supply

Configuration Task	
Configure PoE Power Alarm Function	Configure PoE Power Alarm Threshold

### 12.2.1 PoE Basic Function Configuration

The PoE function is controlled by configuring global PoE and interface PoE, that is, the PoE function can be used only when the global PoE and interface PoE are both enabled. If you run the command for disabling the global PoE, the PoE functions of all interfaces are disabled. If you run the command for disabling the interface PoE function, you can choose to disable the PoE function of some interfaces. The interface PoE function is a standard power supply mode, while the interface forced power supply function is a special power supply mode. You can select only one mode at a time. However, both of the two modes are valid only after the global PoE function is enabled.

#### Configuration Condition

None

#### Enable the Global PoE Function

Table 12-2 Enabling the Global PoE Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Global PoE Function	<b>power enable</b>	Optional By default, the global PoE function is enabled.

#### Enable the Interface PoE Function

Table 12-3 Enabling the Interface PoE Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable the Global PoE Function	<b>power enable</b>	Optional By default, the global PoE function is enabled.
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Enable the Interface PoE Function	<b>power enable</b>	Optional By default, the interface PoE function is enabled.

### Enable the Forced Power Supply Function of an Interface

Table 12-4 Enabling the Forced Power Supply Function of an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Global PoE Function	<b>power enable</b>	Optional By default, the global PoE function is enabled.
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Enable the Forced Power Supply Function of an Interface	<b>power force { always   once }</b>	Mandatory By default, the forced power supply function of an interface is disabled.

---

 **Note**

Forced power supply is a special power supply mode, which does not require enabling the interface PoE function.

---

### Enable the Auto Power Supply Function of an Interface

Table 12-5 Enabling the Auto Power Supply Function of an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Global PoE Function	<b>power enable</b>	Optional By default, the global PoE function is enabled.
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Enable the Auto Power Supply Function of an Interface	<b>power auto-enable</b>	Mandatory By default, the auto power supply function of an interface is disabled.

---

 **Note**

The auto-power supply function of an interface works only in manual power management mode.

---

## 12.2.2 Configure the PoE Power

### Configuration Condition

Before configuring the PoE power, ensure that:

- Enable the Global PoE Function.
- Enable the Interface PoE Function.

### Configure the Total Power of PoE

By configuring the total power of PoE, you can limit maximum output power of the device. If the total power required by all PDs exceeds the configured total power, power supply to some PDs is stopped according to the current power supply priority mode.

Table 12- 6 Configuring the Total Power of PoE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Total Power of PoE	<b>power total-power { all   system-id { all   subsystem-id } } power-value</b>	Optional By default, the total power is the maximum total power that the device power supply can provide.

### Configure the Protection Power of PoE

When a PD is normally powered, the consumed power fluctuates within a certain range. To prevent PD power-off owing to power fluctuation, part of power is reserved from the total power of the device to act as the protection power. When the consumed power of the PD increases, the increased part is allocated from the protection power.

Protection power may also be allocated as normal power supply. When the available power is insufficient for providing power to newly connected PDs, if the available power of the device and the protection power is equal to or larger than the maximum output power of the interface of the new PD, sufficient power is allocated from the protection power to the new PD.

Table 12-6 Configuring the Protection Power of PoE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Protection Power of PoE	<b>power guard-band { all   system-id { all   subsystem-id } } guard-band-value</b>	Optional By default, the protection power of the power supply is 40.0 watt.

### Configure the Maximum Output Power Limit Mode of an Interface

The maximum output power of an interface is determined by the PD classification type. You can also customize the maximum output power of an interface.

Table 12-7 Configuring the Maximum Output Power Limit Mode of an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface interface-name</b>	-
Configure the Maximum Output Power Limit Mode of an Interface	<b>power threshold-mode { classification   user }</b>	Optional By default, the maximum output power limit mode is the user customization mode.

### Configure the Maximum Output Power of an Interface

You can limit the maximum power that a PSE can supply to a PD through an interface. If the power required by a PD exceeds the maximum output power of the interface, the PSE stops power supply to it.

Table 12-8 Configuring the Maximum Output Power of an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the maximum output power limit mode to the user customization mode.	<b>power threshold-mode user</b>	Mandatory By default, the maximum output power limit mode is the user customization mode.
Configure the Maximum Output Power of an Interface	<b>power port-max-power</b> <i>max-power-value</i>	Optional By default, the maximum output power is 30.0 watt.

### 12.2.3 Configure Power Supply Priorities

With the power supply priority function, if the total power of a PSE is insufficient for powering all PDs, key PDs have the priority to obtain power. Through this function, you can configure the mode in which key PDs are powered.

#### Configuration Condition

Before configuring power supply priorities, ensure that:

- Enable the Global PoE Function.
- Enable the Interface PoE Function.

#### Configure a PoE Power Management Mode

Table 9-10 Configuring a PoE Power Management Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure a PoE Power Management Mode	<b>power manage</b> { <b>all</b>   <i>system-id</i> { <b>all</b>   <i>subsystem-id</i> } } { <b>dynamic-fifs</b>   <b>dynamic-priority</b>   <b>static-fifs</b>   <b>static-priority</b> }	Optional The default power management mode is the dynamic First In First Served (FIFS).

### Configure the Power Supply Priority of an Interface

If the PoE power management mode is dynamic priority mode, when the power supply of PSE is insufficient, the system will prioritize power supply to the PD with a higher interface power supply priority. If the interface power supply priority is the same, then priority is given to the PD with the smaller interface number.

Table 12-11 Configuration of Interface Power Supply Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure a PoE Power Management Mode to Dynamic Priority Mode	<b>power manage</b> { <b>all</b>   <i>system-id</i> { <b>all</b>   <i>subsystem-id</i> } } <b>dynamic-priority</b>	Mandatory The default power management mode is the dynamic First In First Served (FIFS).
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the Power Supply Priority of an Interface	<b>power priority</b> { <b>critical</b>   <b>high</b>   <b>medium</b>   <b>low</b> }	Optional By default, the power supply priority is low.

## 12.2.4 Configure PD Power-up and Power-down Parameters

The PoE power-up process is divided into several steps:

1. Detection: PSE detects the presence of PD.
2. Classification: PSE classifies the PD and determines the PD power consumption. This step is optional.
3. Power-Up: PSE supplies power to PD.

The parameters of the above steps can be adjusted to power different types of PDs.

### Configuration Condition

Before configuring the PD power-up parameters, first complete the following tasks:

- Enable the Global PoE Function.
- Enable the Interface PoE Function.

### Configure Interface PD Detection Mode

When an interface PoE function is enabled, the PSE detects the resistance capacitance between the power output wire pairs to determine whether PDs exist. The standard detection mode can only detect PDs that comply with IEEE802.3af and IEEE802.3at standards. The standard defines PD and non-PD, however, there is another device with a resistance and capacitance value between PD and non-PD, and the compatibility mode is used to detect this type of device.

Table 12-12 Configuring Interface PD Detection Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Interface PD Detection Mode	<b>power detect-mode</b> { <b>compatible</b>   <b>standard</b> }	Optional By default, PD detection mode is standard mode.

### Configure Interface Classification Mode

After an interface PoE function is enabled, the PSE determines the power level of the PD by detecting the power supply output current. Corresponding power is assigned to the PD according to the power level of the PD. PD classification is an optional step in the overall power-up process and can be configured to skip this step by going to unclassified mode.

Table 12-13 Configuring Interface Classification Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Interface Classification Mode	<b>power class-mode</b> { <b>standard</b>   <b>never</b> }	Optional By default, it is unclassified in the classification mode.

### Note

Some non-standard PDs may not support classification, in which case the default classification for the PD is class0 and the maximum output power of the interface is 15.4 Watts.

### Configure Interface Power-up Inrush Current Mode

The PoE standard regulates the inrush current when powering up the PD. This parameter is related to the PSE, the (parasitic) capacitance of the PD, and the PD power. For some PDs that do or do not meet the specification, the required onrush current may vary and the appropriate onrush current mode needs to be configured for the different PDs.

Table 12-14 Configuring Interface Power-up Inrush Current Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Interface Power-up Inrush Current Mode	<b>power power-up-mode</b> { <b>802.3af</b>   <b>high</b>   <b>Pre-802.3at</b>   <b>802.3at</b> }	Optional By default, the power-on inrush current mode is high inrush current.

### Configure Interface Power Supply Wire Pairs

The PoE standard regulates two power supply modes, idle wire pairs and data wire pairs. Standard PDs must support both power supply through signal wire pairs and power supply through idle wire pairs, while PSEs need only support either of the two modes.

Table 12-15 Configuring the Interface Power Supply Wire Pairs Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Interface Power Supply Wire Pairs Mode	<b>power power-pair</b> { <b>pair-A</b>   <b>pair-B</b> }	Optional By default, the power supply wire pairs mode is data wire pairs.

### Note

PSE devices only support the data wire pairs power supply mode.

## Configure Interface Power Failure Detection Mode

PSE switches can provide different power failure detection modes depending on the type of current supplied DC or AC.

Table 12- 16 Configuring Interface Power Failure Detection Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Interface Power Failure Detection Mode	<b>power disconnect{ ac   dc }</b>	Optional By default, the power failure detection mode is AC.

---

### Note

The PoE function of the PSE device is integrated into the switch, and the interface power failure detection mode on the device is AC mode by default.

---

## 12.2.5 Configure the Abnormality Recovery Function

When there is a PoE power supply abnormality, the abnormality recovery function is supported, including automatic recovery and manual recovery.

### Configuration Condition

Before configuring the abnormality recovery function, ensure that:

- Enable the Global PoE Function.
- Enable the Interface PoE Function.

## Configure the Time for Recovery from a Power Supply Abnormality of an Interface

If a PSE detects abnormal power supply status of an interface while powering PDs, it automatically disables the PoE function of the interface. After the time for recovery from a power supply abnormality elapsed, it enables the PoE function again, and tries to supply power to the PD of the interface.

Table 12-16 Configuring the Time for Recovery from a Power Supply Abnormality of an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the Time for Recovery from a Power Supply Abnormality of an Interface	<b>power recover-time</b> <i>time-value</i>	Optional By default, the recovery time for a power supply abnormality is 0 minutes, indicating immediate recovery after the abnormality.

## Restart the PoE Power Supply

When a PoE power supply abnormality occurs or the PoE power supply is abnormal, you can manually hot restart the PoE power supply to try to recover from the abnormal status.

Table 12-17 Configuring the Time for Recovery from a Power Supply Abnormality of an Interface

Step	Command	Description
Restart the PoE Power Supply	<b>power reload</b> { <b>all</b>   <i>system-id</i> }	Mandatory

---

 **Note**

During the power reboot process, the module will be initialized. You should avoid repeatedly operating power reload and wait until the power reboot is completed before executing it.

---

## 12.2.6 Configure PoE Power Alarm Threshold

### Configuration Condition

Before configuring the PoE power, ensure that:

- Enable the Global PoE Function.
- Enable the Interface PoE Function.

### Configure PoE Power Alarm Threshold

When PoE power utilization reaches or falls below the set power threshold, Trap alarms are sent.

Table 12-18 Configuring PoE Power Alarm Threshold

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure PoE Power Alarm Threshold	<b>power alarm-threshold</b> { <b>all</b>   <i>system-id</i> { <b>all</b>   <i>subsystem-id</i> } } <i>threshold-value</i>	Optional By default, the alarm threshold for power supply is 99%.

## 12.2.7 PoE Monitoring and Maintaining

Table 12-19 PoE Monitoring and Maintaining

Command	Description
<b>show power</b> { <b>manage</b>   <b>summary</b>   <b>configure interface</b> <i>interface-name</i>   <b>detect interface</b> <i>interface-name</i>   <b>pd-</b> <b>status interface</b> <i>interface-name</i>   <b>system-to-port</b> [ <i>system-id</i> ]   <b>version</b> }	Display PoE configuration, power supply status and port correspondence information, and system-to-port is only available in VST mode.

# 13 PDI

## 13.1 Overview

PDI: PD Inspection, refers to a way to detect whether the PD terminal is active, if the PD is not detected, it is considered abnormal and the POE is notified to restart the power supply.

The PDI function is controlled by configuring interface PDI, that is, the PDI function can be used only when the interface PDI is enabled.

## 13.2 Configure PDI Basic Functions

Table 13-1 Enabling Interface PDI Function

Step	Command	Description
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Enable interface PDI function.	<b>pd enable</b>	Mandatory

Step	Command	Description
		By default, the interface PDI function is not enabled.

### 13.3 Configure the ARP packet delivery interval.

Table 13-2 Configuring the Interface ARP Packet Delivery Interval

Step	Command	Description
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the interface ARP packet delivery interval.	<b>pdi inspection-interval</b>	Optional By default, the interface arp packet delivery interval is 3s.

### 13.4 Configure the number of retries for ARP packet delivery.

Table 13-3 Configuring the Number of Retries for ARP Packet Delivery

Step	Command	Description
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the number of retries for ARP packet delivery of an interface.	<b>pdi inspection-retry</b>	Optional By default, the number of retries for ARP packet delivery of an interface is 3.

## 13.5 Configuring IP Inspection Table Entries

Table 13-4 Configuring IP Inspection Table Entries

Step	Command	Description
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure ip detection table entries for PD.	<b>pdi ip-address</b>	Optional

## 13.6 PDI monitoring and maintaining

Table 13-5 1PDI Monitoring and Maintaining

Command	Description
<b>show pdi</b> {   <b>brief</b>   <b>interface</b> <i>interface-name</i>   <b>ip-entry ip-entry interface</b> <i>interface-name</i>   <b>statistic statistic interface</b> <i>interface-name</i> }	Display PDI global structure, port summary information and detailed information, etc.

# 14 LUM

## 14.1 Overview

***LUM:** Local User Manager, is a local user database used to provide local authentication for aaa.*

***RBAC:** Role Based Access Control, enables privileges to be granted to roles by establishing the association "Permissions <-> Roles", and assigns roles to users by establishing the association "Roles <-> Users", so that users can obtain the privileges of the corresponding roles. The basic idea of RBAC is to assign roles to users that define which system functions and resource objects they are allowed to operate.*

Since permissions and users are separated, RBAC has the following advantages:

- Administrators do not need to specify permissions for users one by one, but only need to pre-define roles with corresponding permissions, and then assign the roles to users. Therefore, RBAC is more adaptable to user changes and increases the flexibility of user privilege assignment.
- Since the relationship between roles and users often changes, but the relationship between roles and permissions is relatively stable, using this stable association can reduce the complexity of user authorization management and reduce management overhead.

**Role:** A collection of rules.

**Rule:** permit/deny permissions for commands of specific feature or all features.

**Feature:** Module.

## 14.2 LUM Function Configuration

Table 14-1 LUM Function Configuration List

Configuration Task	
Configure user roles	Configure user roles

Configuration Task	
Configure administrator program	Configure administrator
	Configure administrator user group
Configure access user program	Configure access user
	Configure user group

### 14.2.1 Configure Access

By default, there are four types of roles: Security-admin, Network-admin, Audit-admin and Network-operator, and the permissions of these four roles cannot be modified.

Custom role permissions are a subset of the network administrator role permissions. Module permissions that have been assigned to the Security-admin, or the Audit-admin cannot be configured. Please see the following table for specific permissions.

Table 14-2 Permissions of Individual User Role

	Logging	History	User management and user authentication	Other modules
Public Elective	NO	NO	Change your own password	Show running, exit, etc.
Security Administrator	View Operation log and related configuration commands	History configuration and operation	OK	lai module, line, service, AAA
Audit Administrator	View data log and configuration commands	NO	NO	NO

network administrator	All commands other than operation log and data log	Histroy configuration and operation	NO	OK
Network Operator	All show commands within the privileges of network operator	show command	NO	All show commands within the privileges of network operator

By default, the user does not have the role attributes configured. When the role attribute is in effect, the user level is no longer in effect, and the role replaces the user level as the basic criterion for command authorization: users have different command execution rights depending on their respective roles.

### Configuration Condition

None

### Configure user roles

Table 14-3 Configuring User Roles

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create user roles and enter user role mode at the same time	<b>role <i>role-name</i></b>	Mandatory  By default, there are four types of roles: Security-admin, Network-admin, Audit-admin and Network-operator, and the permissions of these four roles cannot be modified.

Step	Command	Description
Create a rule for the user role	<b>rule</b> <i>number</i> { <b>deny</b>   <b>permit</b> } <b>feature</b> { <b>all</b>   <i>feature-name</i> }	By default, no rules are defined for newly created user roles, i.e., the current user role does not have any privileges.  The rule modification does not take effect for users who are currently online, but for users who log in later to use the rule for that role.  Rules with smaller rule IDs have higher priority.

## 14.2.2 Configure local users

Local users are those stored on the device: including local administrators and local access users. It only takes effect when local authentication mode is used. A local user is specified as an administrator or an access user when it is created.

### Configuration Condition

None

### Configure Local Administrator User

Table 14-4 Configuring Administrator

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create an user administrator and enter the user administrator mode	<b>local-user</b> <i>user-name</i> class manager	Mandatory.  By default, no administrator user is configured.

## Configure Local Access User

Table 14-5 Configuring Access User

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create access user and enter access user mode at the same time.	<b>local-user <i>user-name</i> class network</b>	Mandatory. By default, no access user is configured.

### 14.2.3 Configure administrator user attributes

An administrator is the user who logs into the device.

The following configuration restrictions and guidelines apply when configuring the attributes of local administrator user:

- If the user authorizes the role upon login through AAA, whether the user can execute commands after logging in to the device is determined by the role, and if the role is not authorized by AAA when the user logs in, whether the user can execute commands after logging in to the device is determined by the user level.
- For SSH users, when using public key authentication, if the authentication method for logging in to the device is not configured in the user line view, the commands available to them are based on the user role or user level (user role has higher priority than user level) set in the local administrator user view with the same name as the SSH user. For more information about user roles, please refer to "Configuring Roles" in the "LUM Configuration Guide".
- The attribute regarding the maximum number of password attempts for users can be configured in both local administrator user view and administrator user group view, and the order of priority for configuration is: local administrator user view -> administrator user group view, in descending order.
- The user password lifetime attribute can be configured in local administrator user view, administrator user group view and global view, and the order of priority for configuration is: local administrator user view --> administrator user group view --> global view, in descending order.

#### Configuration Condition

None

### Configure administrator user attributes

Table 14-6 Configuring Administrator

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create an user administrator and enter the user administrator mode	<b>local-user <i>user-name</i> class manager</b>	Mandatory. By default, no administrator user is created.
Configure the administrator user password.	<b>password 0 <i>password</i></b>	Mandatory. By default, a user does not have a password.
Set the types of servers that users can use.	<b>service-type { ssh   telnet   console   ftp   web }</b>	Mandatory. By default, a user does not support any service-type.
Set the user role for the local user.	<b>user-rol <i>role-name</i></b>	Optional. <b>By default, no administrator role is configured .</b> The administrator role has higher priority over the administrator level, that is, when the role for the administrator user is configured, the administrator privileges are subject to the administrator role.

Step	Command	Description
Set the user group for the administrator user.	<b>group</b> <i>group-name</i>	Optional. By default, no user group is configured.
Configure the authorized level of login user.	<b>privilege</b> <i>privilege-level-number</i>	Optional. By default, the authorized level is 1.
Configure the commands to be executed automatically by the user.	<b>autocommand</b> <i>command-line</i>	Optional. <b>By default, users do not have commands that are configured to be executed automatically.</b>
Configure options for users to automatically execute commands.	<b>autocommand-option</b> { <b>nohangup</b> [ <b>delay</b> <i>delay-time-number</i> ]   <b>delay</b> <i>delay-time-number</i> [ <b>nohangup</b> ] }	Optional. By default, the connection is disabled after executing the command automatically, and the delay time for executing the command automatically is 0.
Configure user livetime	<b>password-control livetime</b> <i>user-live-time</i>	Optional. By default, user livetime is not restricted.
Configure the maximum number of consecutive login authentication failures for administrator users	<b>password-control max-try-time</b> <i>max-try-time-number</i>	Optional. By default, user management does not set limits on the maximum number of attempts.
Configure the maximum number	<b>max-online-num</b> <i>user-number</i>	Optional.

Step	Command	Description
of online sessions for the same user.		By default, there is no limit to the maximum number of online sessions for the same user.
Configure the file permissions available to the user.	<b>filesys-control{read   write   execute   none}</b>	Optional. By default, the user has permissions to read, write, and execute.
Configure the directories provided by the device that can be accessed or managed by the administrator	<b>work-directory</b> <i>directory</i>	Optional. The default, it is the /flash directory. This attribute currently only serves to configure the file directory of the ftp user login device.
Configure user status	<b>stat { active / block }</b>	Optional. By default, the user status is active.

#### 14.2.4 Configure access user attributes

An access user is a user who accesses the network through a device.

##### Configuration Condition

None

##### Configure access user

Table 14-7 Configuring Access Users

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	
Create access user and enter access user mode at the same time.	<b>local-user</b> <i>user-name</i> class network	Mandatory. By default, no access user is configured.
Configure access user password	<b>password 0</b> <i>password</i>	Mandatory. By default, users do not have a password, which may prevent them from logging in to the device.
Set the type of server that access users can use.	<b>service-type { xauth }</b>	Mandatory. By default, a user does not support any service-type.
Set the user group to which the access user belongs.	<b>group</b> <i>group-name</i>	Optional. By default, the user group to which the access user belongs is not configured.
Configure user status	<b>stat { active / block }</b>	Optional. By default, the user status is active.

### 14.2.5 Configure local user groups

Local users are divided into the administrator user group and the access user group.

The administrator user group is a collection of administrator user attributes that support the configuration of password lifetime and the maximum number of consecutive login authentication failures.

The access user group manages access users, with hierarchical nesting, which more graphically reflects the organizational structure of the company or department relationship. No access user attributes are supported under the access user group at this time.

## Configuration Condition

None

### Configure administrator user group

Table 14-8 Configuring the Administrator User Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create the administrator user group and enter the administrator user group mode	<b>manager-group</b> <i>group-name</i>	Mandatory. By default, no administrator user group is configured.
Configure the user password lifetime under the administrator user group	<b>password-control lifetime</b> <i>user-live-time</i>	Optional. By default, there is no limits set on the lifetime of administrator users under this user group, i.e., the password lifetime is subject to the one configured in the administrator user view.
Configure the maximum number of consecutive login authentication failures for users under the administrator user group.	<b>password-control max-try-time</b> <i>max-try-time-number</i>	Optional. By default, there is no limit to the number of consecutive login authentication failures for users under the administrator user group, that is, the maximum number of consecutive login authentication failures is subject to the one configured under the administrator user view.

## Configure Access User Groups

Table 14-9 Configuring Access User Groups

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	
Create the access user group and enter the access user group mode.	<b>user-group</b> <i>group-name</i>	Mandatory. By default, no access user group is configured.
Configure the parent group of the access user group.	<b>parent</b> <i>group-name</i>	Optional. By default, the parent group is seen as the parent path in the group name path.

### 14.2.6 Configure password policies

Our system has a strong password security policy. Password security is guaranteed from three aspects: password complexity, mandatory password change on first login, and a maximum number of password attempts. The password security policy is only valid for local administrator users.

#### Password Complexity:

- (1) Password has a minimum length requirement, and the administrator can set limits to the minimum length of the administrator user password. When setting a user password, if the length of the entered password is less than the minimum length set, the system will not allow the password to be set, and prompts "Bad password: It must contain at least 2 character(s)."
- (2) Password combination detection function where the administrator can set the type of combination of the elements that make up the user's password. The constituent elements of a password include the following four types:
  - Uppercase letters: [A to Z]

- Lowercase letters: [a~z]
- Decimal numbers: [0 to 9]
- 31 special characters (~! @\$%^&\*()\_+={}| \:;'"<>,. /')

There are 4 kinds of combinations of cryptographic elements, the specific meaning of each is as follows:

- Combination type 1 indicates that the password contains at least 1 element.
- Combination type 2 indicates that the password contains at least 2 elements.
- Combination type 3 indicates that the password contains at least 3 elements.
- Combination type 4 indicates that the password must contains all 4 elements.

When the user sets a password, the system checks whether the set password meets the configuration requirements, and only the password that meets the requirements can be set successfully.

(3) The password cannot be the same as the user name. When setting the administrator user password, if the password entered is the same as the user name, the system will not allow the password to be created.

#### **Mandatory Password Change at First Login:**

When the function of "User must change password when logging in for the first time" is enabled, the system will prompt the corresponding message upon the first login and ask the user to change the password, otherwise the user is not allowed to log in to the device. When the administrator user name is "admin", the user will be asked to change the password upon the first login, regardless of whether the "Mandatory password change on first login" function is enabled or not.

#### **Password lifetime:**

The password lifetime is used to limit the length of time a user's password can be used. When the password has been in use for longer than the password lifetime, the user is required to change the password. When a user logs in, if the user enters a password that has expired, the system will prompt that the password has expired and it must be reset before the local login can continue. If the password entered does not meet the requirements, or if the new password entered twice in a row does not match, the system will reject this login. For login in non-interactive mode, such as FTP user, after the password expires, the password of FTP user can only be changed by the administrator; however, if the password happens to expire during the login time period, it will not affect the login, however, the next FTP command will trigger offline. In particular, if the first login asks for a password change and the password has in fact reached its expiration time, the user will only be asked to change password once upon login.

#### **Maximum Number of Password Attempts:**

Setting limit on the maximum number of user attempts can be used to prevent malicious parties from decrypting passwords through multiple attempts. After the failed password attempt exceeds the maximum number of attempts, the system will add the user to the blacklist of the login-secure module, and the user account will be locked for a period of time.

## Configuration Condition

None

## Configuration Condition

Table 14-10 Configuring the Password Policy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure password complexity	<b>password-control complexity</b> { <i>min-length len</i>   <b>with user-name-check</b>   <b>composition type-number type-number</b> }	Optional. By default, the minimum length of user password is 6, and there are 2 types of password element combination. User name and password are not allowed to be the same.
Configure users to mandatory password change on first login	<b>password-control firstmodify enable</b>	Optional. By default, users are not required to change their passwords for the first login.  Users with the administrator username "admin" will be required to change their password when they log in for the first time even if the command is not enabled.
Configure user livetime	<b>password-control livetime</b> <i>user-live-time</i>	Optional. By default, no limit is set on user lifetime.

Step	Command	Description
Configure the maximum number of consecutive login authentication failures for administrator users	<b>password-control max-try-time</b> <i>max-try-time-number</i>	Optional.  This command is configured in the administrator user group view and the administrator user view.  By default, the maximum number of consecutive login authentication failures for users under the administrator user group is not configured, i.e., the maximum number of consecutive login authentication failures is subject to the one configured under the administrator user view.

## 14.2.7 LUM Monitoring and Maintaining

Table 14-11 LUM Monitoring and Maintaining

Command	Description
<b>debug user { manager   network }</b>	Enable debug information for user management.
<b>show users class { manager   network } [ username ]</b>	Display user configuration information.
<b>show role [ rolename ]</b>	Display configuration information for all or specified roles.

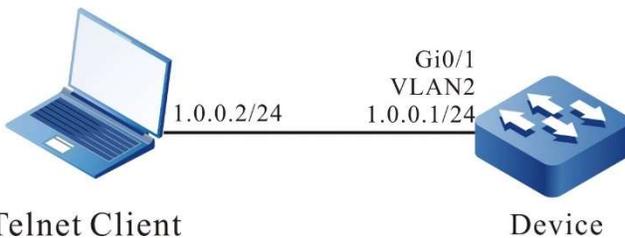

## 14.3 Typical LUM Configuration Example

### 14.3.1 Configure network administrator users

#### Network Requirements

- Configure the network administrator user and verify user's network administrator privileges.

#### Network Topology

Telnet Client

Device

Figure 14-1 Network Topology for Configuring the Network Administrator User Group

#### Configuration Steps

Step 1: Configures IP addresses for the ports. (Omitted)

Step 2: Configure administrator attributes.

#Configure user admin, the password is admin.

```
Device#configure terminal
Device(config)#local-user admin class manager
Device(config-user-manager-admin)#password 0 admin
```

#Configuration service type

```
Device(config-user-manager-admin)#service-type telnet ftp web console ssh
```

#Configure the user role to which the local user belongs as network administrator.

```
Device(config-user-manager-admin)#user-role network-admin
```

#Configure local authorization to make the role effective

```
Device(config-user-manager-admin)#exit
Device(config)#domain system
Device(config-isp-system)#aaa authentication login local
Device(config-isp-system)#aaa authorization login local
Device(config-isp-system)#exit
```

#Configure login aaa authentication for line vty

```
Device(config)#line vty 0 15
Device(config-line)#login aaa
```

Step 3: Enters the username admin and password admin in the Telnet client to successfully log in to the device.

#Verify that the admin user can execute the admin command show logging to view the logs

```
Device#show logging
Logging source configurations
console is enabled,level: 7(debugging)
monitor is enabled,level: 7(debugging)
buffer is enabled,level: 5(notifications)
file is enabled,level: 7(debugging)
The Context of logging file:
```

#Verify that the network administrator cannot execute other administrator commands

```
Device#show role
You may not be authorized to perform this operation,please check.
```

---

### Note

- The default roles for administrators are security-admin, network-operator, audit-admin, and network-admin. You can set your administrator role as needed, or you can use custom roles.
- 

# 15 ZTP

---

## 15.1 Overview

ZTP (Zero Touch Provisioning) is a feature that automatically loads version files (including system software, configuration files, license files, patch files, custom files) when a newly shipped or unconfigured device is powered on.

It is designed to solve the problem that when deploying network device, after the hardware installation of the device is completed, the administrator needs to go to the installation site to debug the software of the device. When the devices are large in number and widely distributed, administrators manually

configuring each device affects the efficiency of deployment and labor costs in a bad way. The device runs ZTP function, which can get the version file from the USB disk or the file server and load it automatically to realize the field-free configuration and deployment of the device, thus reducing the labor cost and improving the deployment efficiency.

ZTP is not a standard protocol, it is a device zero-configuration deployment solution proposed by various vendors according to market demand, and there are differences in the details of implementation, but the basic process is the same. ZTP can be deployed in a number of ways, and we currently supports DHCP zero-configuration deployment, USB zero-configuration deployment and mail deployment. The process is to automatically enter the ZTP process by booting the device with empty configuration, first try to complete the automatic deployment through the inserted USB disk, and then try to complete the automatic deployment through DHCP if the USB disk deployment fails.

Network topology of a typical DHCP zero-configuration deployment is shown in Figure 15-1. When an empty-configuration device enters the DHCP zero-configuration deployment process, it will first broadcast DHCP discovery packets through the DHCP client. If the DHCP server is not in the same network segment with the zero-configuration device ready for employment, you need to configure a DHCP relay to send DHCP discovery packets across the network segments. When the DHCP server receives the DHCP discovery packets, it will assign temporary IP address, default gateway and other information for it, and return the intermediate file server address at the same time. The DHCP client receives the answering packet from the DHCP server, parses out the intermediate file server address and other information, downloads the intermediate file via FTP/TFTP/SFTP. In the end, it will parse the intermediate file, and download the corresponding version and configuration files from the intermediate file server according to the SN of this device (Serial Number device serial number). Reboot the device to take effect.

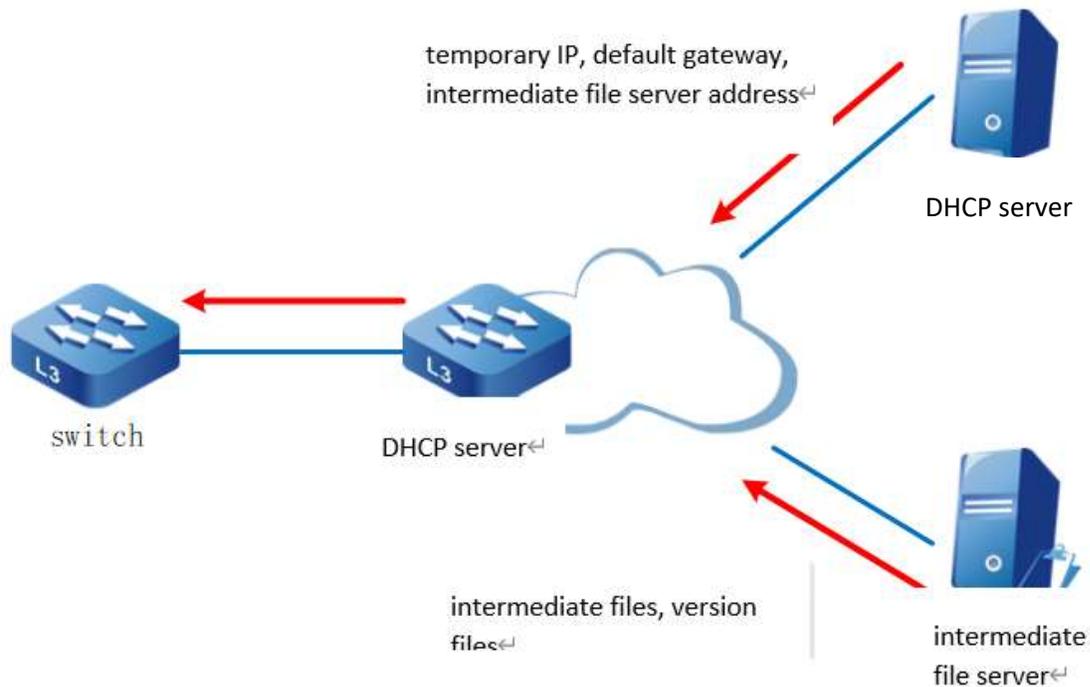

Figure 15-1 Typical Network Topology for DHCP

**DHCP server:** Used to assign temporary management IP address, default gateway, intermediate file server address and other information for the device executing ZTP.

**DHCP relay:** When the device executing ZTP and the DHCP server are in different network segments, it needs to forward the DHCP interaction packets through the DHCP relay.

**Intermediate file server:** Used to store intermediate files (intermediate file type is XML format), version files, configuration files, etc. needed by the device during the ZTP process. By parsing the intermediate file, the device executing ZTP can obtain information such as the file server address, the version file corresponding to this device, and the configuration file storage path. The intermediate file server supports TFTP, FTP, and SFTP types.

**Version file server:** Used to store the version files needed by the device, such as system software and configuration files. The version file server can be deployed on the same file server as the intermediate file server. It supports TFTP, FTP, and SFTP types.

In USB zero-configuration deployment process, the user edits the intermediate file, system version and configuration file and other information in advance and saves them in the USB. Then the USB is inserted into the device ready for zero-configuration deployment. When the device is powered on and detects the inserted USB with the intermediate file that meets the deployment requirements, it will enter the USB zero-configuration deployment process, compile the intermediate file according to the device SN, copy the corresponding system version and configuration files from the USB, and then reboot the device to take effect.

## 15.2 ZTP Function Configuration

### 15.2.1 Enable or Disable ZTP Function

Table 15-1 Enabling or Disabling the ZTP Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the ZTP function	<b>ztp enable</b>	By default, ZTP function is enabled on the device.
Disable the ZTP function.	<b>no ztp enable</b>	-

---

## Note

- When ZTP is enabled or disabled, configuration is not displayed with the show running-config command. However, the configuration will take effect after rebooting.
- 

## 15.2.2 ZTP Monitoring and Maintaining

Table 15-2 ZTP Monitoring and Maintaining

Command	Description
<b>show ztp</b>	Display ZTP information
<b>[no] debug ztp</b>	Enable or disable ZTP debugging

## 15.3 ZTP Typical Configuration Example

### 15.3.1 Configure ZTP to use common intermediate files for zero-configuration deployment via DHCP

#### Network Requirements

- A PC is used as the Console control end to monitor the device ZTP start-up process.
- Device2 acts as the DHCP server and provides DHCP service for ZTP boot process.
- Server1 acts as the file server and provides the FTP service (or TFTP, SFTP service) needed for the ZTP startup process.
- Server2 acts as the log server and receives log information generated by the ZTP startup process.

#### Network Topology

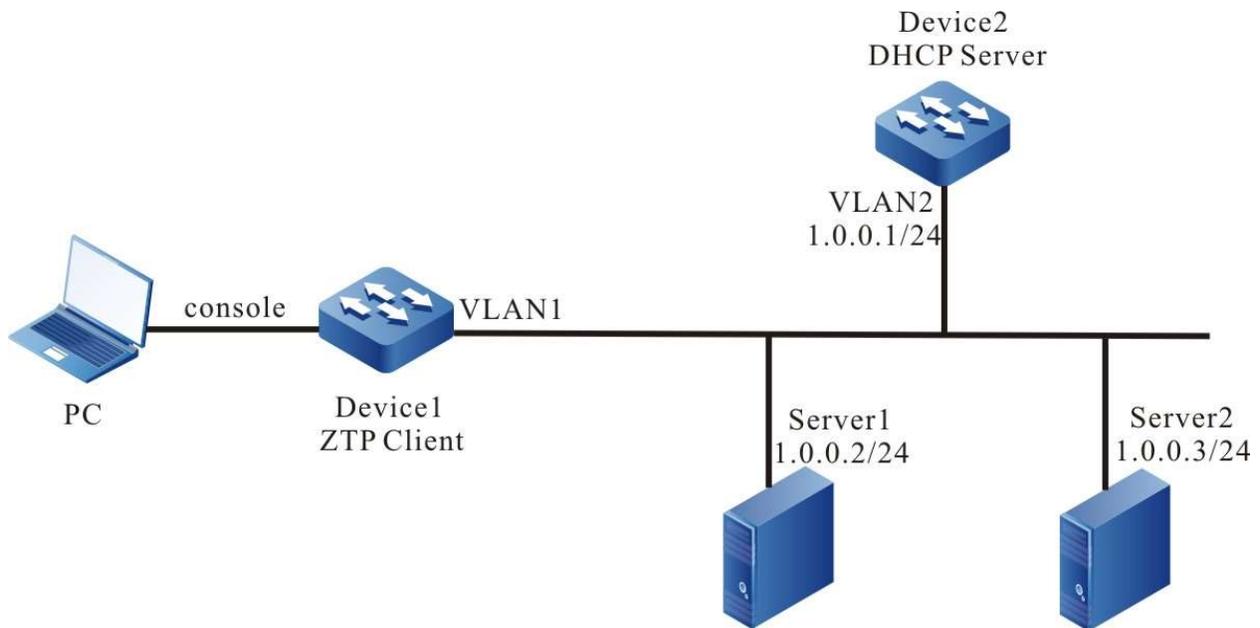

Figure 15-2 Network Topology of Device Using Common Intermediate Files for Zero-configuration Deployment via DHCP

### Configuration Steps

Step 1: Configure the FTP server and place the intermediate files (e.g. ztp.xml), version files and device configuration files downloaded into the the FTP server directory. (Omitted)

#Edit the common intermediate file as follows:

Right mouse click to open it in Excel and edit

Opening and Editing XML File in Excel

Determined as XML table and click OK.

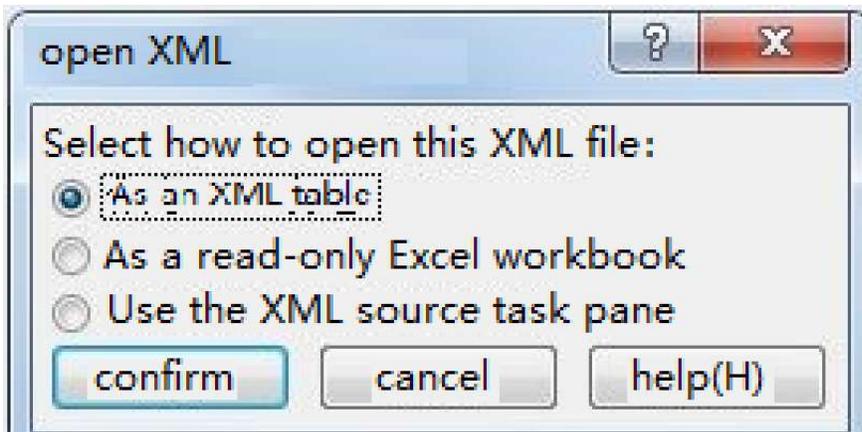

Figure 15-3 Determined as XML Table

Edit in Excel, here fill in the device serial number, version file name, version file name MD5 checksum value, configuration file name, configuration file MD5 checksum and description information, and finally save it, note that the it is saved in XML format.

	A	B	C	D
1	Serial-Number	Image-File	Image-File-MD5	Config-File
2	example_1:123456789	xxx.pck	xxx	startup
3	example_1:123456789			startup

Figure 15-4 Editing the Name of the Version and Configuration Files in the XML File

Step 2: Configure DHCP service for Device2.

```
Device2#configure terminal
Device2(config)#ip dhcp pool ztp
Device2(dhcp-config)#range 1.0.0.4 1.0.0.10 255.255.255.0
```

#Configure intermediate file name options

```
Device2(dhcp-config)#option 67 ascii ztp.xml
```

#Configuration file download method and server address, username and password options

```
Device2(dhcp-config)#option 66 ascii ftp://a:a@1.0.0.2
```

#Configure log server address options

```
Device2(dhcp-config)#option 7 ip 1.0.0.3
Device2(dhcp-config)#exit
```

#Enable DHCP service on server

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip address 1.0.0.1/24
Device2(config-if-vlan2)#ip dhcp server
Device2(config-if-vlan2)#end
```

Step 3: Device1 boots with an empty configuration and enters the ZTP process to download the version upgrade and load the configuration file.

#See that the device enters the ZTP process through logs and sends DHCP requests

```
Apr 22 2020 06:03:58 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789, Now starting dhcp upgrade...
Apr 22 2020 06:03:58 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789, DHCP discovery phase started...
```

#During the ZTP request, you can exit the ZTP process with ctrl+c, thus starting with an empty configuration, or if you don't use ctrl+c, you can continue with the ZTP process.

```
Apr 22 2020 06:04:00 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789, Press (ctrl + c) to abort Dhcp Upgrade
```

#Get the address successfully, download the common intermediate files

```
Apr 22 2020 06:04:35 Device1 MPU0 %DHCP-ASSIGNED_EXT-5:Interface vlan1 assigned DHCP address 1.0.0.4, mask 255.255.255.0.
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789, Dhcp discovery phase success
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789, Start to download temp file ztp.xml...
```

#Parse intermediate files and download version information

```
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,Download temp file ztp.xml is success
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,Start to parse temp file...
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,parse temp file is success
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,Start to download the Image file ztp.pck
```

#Download version and configuration file successfully, reboot the device automatically via ZTP

```
Apr 22 2020 06:09:26 Device1 MPU0 %SYS_UPDATE-RESULT-5:image : Mpu 0 upgrade successfully!
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,Download the Image file is success
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,Start to download the config file startup_ztp...
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,Download the config file is success
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,Dhcp upgrade is success
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,System will rebooted by DHCP upgrade
```

Step 4: Check the result.

Check the ZTP status with the show ztp command, and view whether the configuration and version are in with show running-config and show version.

```
Device1#show ztp

Last ztp method: DHCP upgrade method
Ztp state: ZTP DHCP upgrade success
Ztp important information:
  FTP server IP: 1.0.0.2
  Temporary file name: ztp.xml
  Startup file name:startup_ztp
  Image file name:ztp.pck

Current ztp method: None upgrade method
```

---

## Note

- The device obtains the file download mode through option66 of DHCP protocol. It supports FTP, TFTP and SFTP, you can choose any download mode when during configuration.
  - If the version information of common intermediate file is empty, then the device ZTP process will not engage in version upgrade, only configuration loading to continue the ZTP process, however, the configuration file can not be empty.
-

- 
- MD5 of version file and MD5 of configuration file are used for integrity check of version file and configuration file.
  - In the case that no option66 option is issued, you can issue the TFTP server address directly through option 150. In such case, you can download intermediate files, version files, configuration files through the TFTP server.
- 

### 15.3.2 Configure ZTP to use python intermediate files for zero-configuration deployment via DHCP

#### Network Requirements

- A PC is used as the Console control end to monitor the device ZTP start-up process.
- Device2 acts as the DHCP server and provides DHCP service for ZTP boot process.
- Server1 acts as the file server and provides the TFTP service (or FTP, SFTP service) needed for the ZTP startup process.
- Server2 acts as the log server and receives log information generated by the ZTP startup process.

#### Network Topology

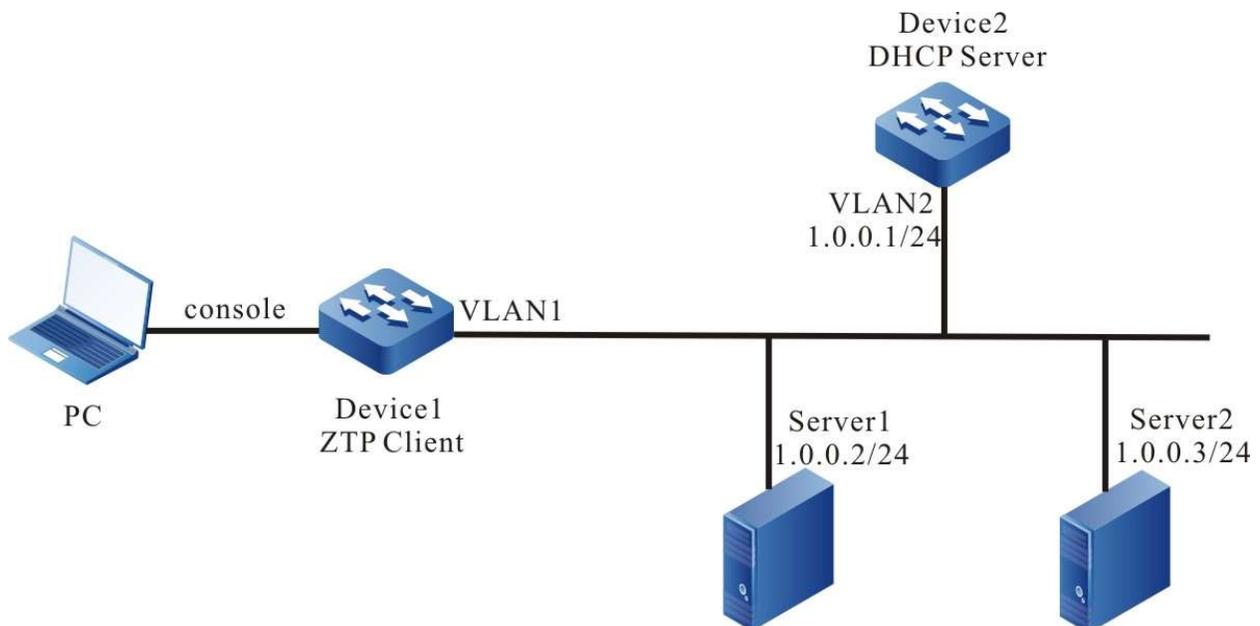

Figure 15-5 Network Topology of Device Using Python Intermediate Files for Zero-configuration Deployment via DHCP

#### Configuration Steps

Step 1: Configure the FTP server and place the intermediate files (e.g. ztp.py), version files and device configuration downloaded into the the FTP server directory. (Omitted)

#Normal python file editing can use any code editor

#Total file space required to configure ZTP

```
required_space = 100
```

#Configure file download method, and download timeout time

```
protocol = "tftp"  
username = ""  
password = ""  
hostname = "1.0.0.2"  
timeout = 1200
```

#Versions are found by version series, and version series can be found by shipping list

```
REMOTE_IMAGE_FILE = {  
    'HIT SW' : 'ztp.pck'  
}
```

#Configure remote paths to make it easy to find them on the server when downloading files over TFTP

```
remote_config_path = "/flash"  
remote_pck_path = ""
```

#Configure checksum MD5

```
remote_config_is_exist_md5 = False  
remote_pck_is_exist_md5 = False
```

Step 2: Configure DHCP service for Device2.

```
Device2#configure terminal  
Device2(config)# ip dhcp pool ztp  
Device2(dhcp-config)#range 1.0.0.4 1.0.0.10 255.255.255.0
```

#Configure intermediate file name options

```
Device2(dhcp-config)#option 67 ascii ztp.py
```

#Configuration file download method and server address, username and password options

```
Device2(dhcp-config)#option 66 ascii tftp://1.0.0.2
```

#Configure log server address options

```
Device2(dhcp-config)#option 7 ip 1.0.0.3  
Device2(dhcp-config)#exit
```

#Enable DHCP service on server

```
Device2(config)#interface vlan2  
Device2(config-if-vlan2)#ip address 1.0.0.1/24  
Device2(config-if-vlan2)#ip dhcp server  
Device2(config-if-vlan2)#end
```

**Step 3:** Device1 boots with an empty configuration and enters the ZTP process to download the version upgrade and load the configuration file.

**#See that the device enters the ZTP process through logs and sends DHCP requests**

```
Apr 22 2020 06:03:58 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789, Now starting dhcp upgrade...

Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789, Start to parse temp file...
```

**#Direct execution of python scripts**

```
Execute python script start ...
/flash free space is 168(M).
Start to get remote and local file path.
remote config path is /flash/123456789.cfg
Get remote and local file path is success.
remote PCK path is ztp.pck
Start to download image file ztp.pck...
Download image file is success
Start to set boot image file /flash/ztp.pck...
```

**#Download version and configuration file successfully, reboot the device automatically via ZTP**

```
Apr 22 2020 06:09:26 Device1 MPU0 %SYS_UPDATE-RESULT-5:image : Mpu 0 upgrade successfully!
Set boot image file is success.
Start to download config file /flash/123456789.cfg...
Download config file is success.
Start to parse config file /flash/startup...
Parse config file is success.
Execute python script success.
```

```
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,script execute success
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:123456789,System will rebooted by DHCP upgrade
```

**Step 4:** Check the result.

Check the ZTP status with the show ztp command, and view whether the configuration and version are in with show running-config and show version.

```
Device1#show ztp
```

```
Last ztp method: DHCP upgrade method
Ztp state: ZTP DHCP upgrade success
Ztp important information:
  TFTP server IP: 1.0.0.2
  Temporary file name: ztp.py
```

```
Current ztp method: None upgrade method
```

---

## Note

- The device obtains the file download mode through option66 of DHCP protocol. It supports FTP, TFTP and SFTP, you can choose any download mode when during configuration.
  - The server download method issued by the DHCP server is used to download intermediate files, and the download method set in the python file is used to download version files and configuration files, which are not necessarily related.
  - If the version information is not found through the device serial number, then the device ZTP process will not engage in version upgrade, only configuration loading to continue the ZTP process, however, the configuration file cannot be empty.
  - If the file download method is TFTP, the username and password fields must be empty strings, and you cannot directly delete those two parameters.
  - The name of the configuration file downloaded by the device is based on the serial number with the suffix .md5. For example, the device serial number is 12345, then the configuration file name is 12345.md5, and the MD5 checksum file is 12345.cfg.md5.
  - After downloading the python file, the device executes the python file directly, so the python file must conform to the python syntax.
- 

### 15.3.3 Configure ZTP to use common intermediate files for zero-configuration deployment via

#### USB

##### Network Requirements

- A PC is used as the Console control end to monitor the device ZTP start-up process.
- Device1 is inserted with an USB device, which contains intermediate files, version files, and device configuration files.

##### Network Topology

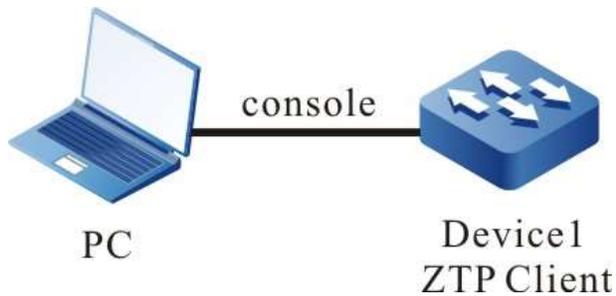

Figure 15-6 Network Topology of Device Using Common Intermediate Files for Zero-configuration Deployment via USB

### Configuration Steps

Step 1: Place the intermediate file in the USB root directory and name it `ztp_config.xml`, i.e. `/usb/ztp_config.xml`.

#Edit the common intermediate file as follows:

Right mouse click to open it in Excel and edit

Opening and Editing XML File in Excel

Determined as XML table and click OK.

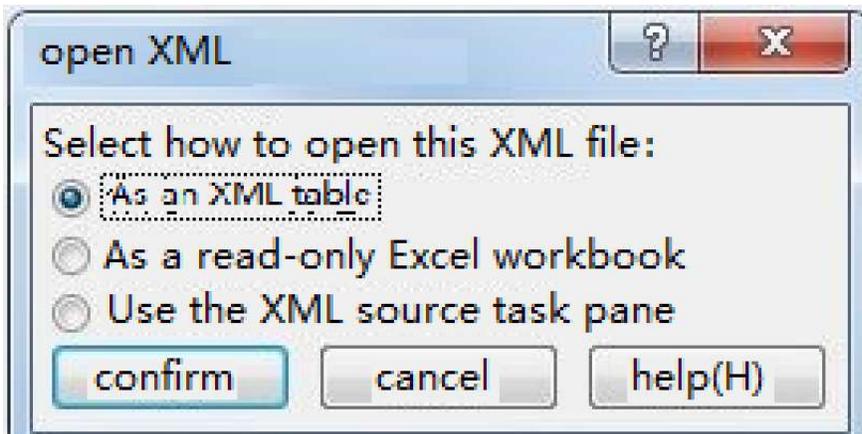

Figure 15-7 Determined as XML Table

Edit in Excel, here fill in the device serial number, version file name, version file name MD5 checksum value, configuration file name, configuration file MD5 checksum and description information, and finally save it, note that the it is saved in XML format.

	A	B	C	D
1	Serial-Number	Image-File	Image-File-MD5	Config-File
2	example_1:123456789	xxx.pck	xxx	startup
3	example_1:123456789			startup

Figure 15-8 Editing the Name of the Version and Configuration Files in the XML File

### Note

- XXX is the name of the corresponding IOS version in the USB.
- The XML intermediate file is obtained from the ZTP path of the software release notes.
- In the XML intermediate file, the required fields are serial number, version and configuration file. The serial number can be obtained from the device shipping list; the version file name and configuration file name filled in the xml intermediate file must be consistent with the IOS version file name and configuration file name in the USB, otherwise the deployment will fail.
- The version file MD5 code, configuration file MD5 code, and description information in the XML intermediate file are optional. If you need to fill in the MD5 code, it can be generated by a common MD5 code calculator.

**Step 2:** The version file and configuration file corresponding to the device serial number in the intermediate file are placed into the USB root directory, and named the same as described in the intermediate file. (Omitted)

**Step 3:** The device is powered on and enters the ztp process for deployment via USB.

#Device configuration is empty, enter USB deployment process

```
the current config file /flash/startup does not exist.
The backup file /backupramfs/startup is not exist.
The current config file /backup/startup does not exist.

May 6 2020 15:16:15 Device1 MPU0 %ZTP-USB_UPGRADE-5:SerialNum:123456789,Copy the temporary file is success.
May 6 2020 15:16:15 Device1 MPU0 %ZTP-USB_UPGRADE-5:SerialNum:123456789,Start to parse the temporary file /flash/ztp_config.xml
```

## #Upgraded versions and configurations

```
May 6 2020 15:16:15 Device1 MPU0 %ZTP-USB_UPGRADE-5:SerialNum:123456789,Parse temporary file is success
May 6 2020 15:19:53 Device1 MPU0 %ZTP-USB_UPGRADE-5:SerialNum:123456789,Sysupdate image is success
May 6 2020 15:19:53 Device1 MPU0 %ZTP-USB_UPGRADE-5:SerialNum:123456789,Start to copy config...
May 6 2020 15:19:54 Device1 MPU0 %ZTP-USB_UPGRADE-5:SerialNum:123456789,Copy config is success
```

## #Reboot after upgrade

```
May 6 2020 15:19:54 Device1 MPU0 %ZTP-USB_UPGRADE-4:SerialNum:123456789,System will be rebooted by USB Upgrade
```

Step 4: Check the results.

#Check the ZTP status with the show ztp command, and view whether the configuration and version are in with show running-config and show version.

```
Device1#show ztp
```

```
Last ztp method: USB upgrade method
Ztp state: ZTP USB Upgrade success
Ztp important information:
  Temporary file name:/usb/ztp_config.xml
  Startup file name:startup
  Image file name:ztp.pck
```

```
Current ztp method: None upgrade method
```

```
Next ztp state: disable
```

---

### Note

- If the version information of common intermediate file is empty, then the device ZTP process will not engage in version upgrade, only configuration loading to continue the ZTP process, however, the configuration file can not be empty.
  - The device will download the version and configuration file from the USB copy, so the version file and the configuration file need to be placed into the USB.
  - The name of the common intermediate file in USB can only be ztp\_config.xml.
- 

## 15.3.4 Configure ZTP to use python intermediate files for zero-configuration deployment via USB

### Network Requirements

- A PC is used as the Console control end to monitor the device ZTP start-up process.
- Device1 is inserted with an USB device, which contains intermediate files, version files, and device configuration files.

### Network Topology

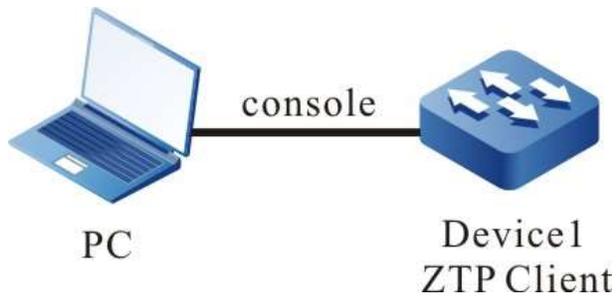

Figure 15-9 Network Topology of Device Using Python Intermediate Files for Zero-configuration Deployment via USB

### Configuration Steps

Step 1: Place the intermediate file in the USB root directory and name it `ztp_script.py`, i.e. `/usb/ztp_script.py`.

#Normal python file editing can use any code editor

#Total file space required to configure ZTP (Unit: MB)

```
required_space = 100
```

#Versions are found by version series, and version series can be found by shipping list

```
REMOTE_IMAGE_FILE = {
'HIT SW': 'ztp.pck'
}
```

#Configure the remote path and look for version files and configuration files in the `/usb` path

```
remote_config_path = "/usb"
remote_pck_path = "/usb"
```

Step 2: Copy the version file and the device configuration file to the USB root directory. The version name must be the same as the version file name corresponding to the device serial number in the intermediate file, and the configuration file name is consisting of the device serial number plus the `.cfg` suffix. For example, if the device serial number is 12345, then the configuration file name is `12345.cfg`. (Omitted)

Step 3: The device is inserted with the USB and enters the `ztp` process for deployment via USB when powered on.

#Configuration file does not exist, the USB is plugged into the device, the device enters ZTP deployment process via USB.

The current config file `/flash/startup` does not exist.

The backup file /backupramfs/startup is not exist.  
The current config file /backup/startup does not exist.  
Apr 30 2020 11:10:12 Device1 MPU0 %SYS\_UPDATE-RESULT-5:SerialNum:123456789,Now starting USB upgrade...

### #Find and parse intermediate files

Apr 30 2020 11:10:12 Device1 MPU0 %SYS\_UPDATE-RESULT-5:SerialNum:123456789,Start to copy the temporary file /usb/ztp\_script.py...  
Apr 30 2020 11:10:12 Device1 MPU0 %SYS\_UPDATE-RESULT-5:SerialNum:123456789,Copy the temporary file is success.  
Apr 30 2020 11:10:12 Device1 MPU0 %SYS\_UPDATE-RESULT-5:SerialNum:123456789,:Start to parse the temporary file /flash/ztp\_script.py

### #Invoke python to execute intermediate files

Execute python script start ...

### #Check the remaining space

/flash free space is 159(M).

### #Download configuration and version files

Start to get remote and local file path.  
Get remote and local file path is success.  
Start to set boot image file /usb/ztp.pck...

Start to copy config file /usb/12345.cfg...  
Copy config file is success.  
Start to parse config file /flash/startup...  
Parse config file is success.

### #Download successfully, restart for the version and configuration to take effect.

Execute python script success, reboot device.  
Apr 30 2020 11:13:54 Device1 MPU0 %SYS\_UPDATE-RESULT-5:SerialNum:123456789,script execute success  
Apr 30 2020 11:13:54 Device1 MPU0 %SYS\_UPDATE-RESULT-4:SerialNum:123456789,System will be rebooted by USB Upgrade

Step 4: Check the results.

#Check the ZTP status with the show ztp command, and view whether the configuration and version are in with show running-config and show version.

Device1#show ztp

```
Last ztp method: USB upgrade method
Ztp state: ZTP USB Upgrade success
Ztp important information:
  Temporary file name:/usb/ztp_script.py
  Startup file name:startup
  Image file name:ztp.pck
```

Current ztp method: None upgrade method

Next ztp state: disable

---

## Note

- After downloading the python file, the device executes the python file directly, so the python file must conform to the python syntax.
  - The device obtains the file download mode through option66 of DHCP protocol.
-

---

It supports FTP, TFTP and SFTP, you can choose any download mode when during configuration.

- If the version information is not found through the device serial number, then the device ZTP process will not engage in version upgrade, only configuration loading to continue the ZTP process, however, the configuration file cannot be empty.
  - The name of the configuration file downloaded by the device is based on the serial number with the suffix .md5. For example, the device serial number is 12345, then the configuration file name is 12345.md5, and the MD5 checksum file is 12345.cfg.md5.
  - The device will download the version and configuration file from the USB copy, so the version file and the configuration file need to be placed into the USB.
  - The name of the common intermediate file in USB can only be ztp\_script.py.
- 

### 15.3.5 Configure ZTP to automatically complete stacking using python intermediate files via DHCP

#### Network Requirements

- PC1 is used as the Console control end to monitor the device ZTP start-up process.
- Device3 acts as the DHCP server and provides DHCP service for ZTP boot process.
- Server1 acts as the file server and provides the FTP service (or TFTP, SFTP service) needed for the ZTP startup process.
- Server2 acts as the log server and receives log information generated by the ZTP startup process.
- Device1 and Device2 complete stacking through Te0/50 as a stacking link.

#### Network Topology

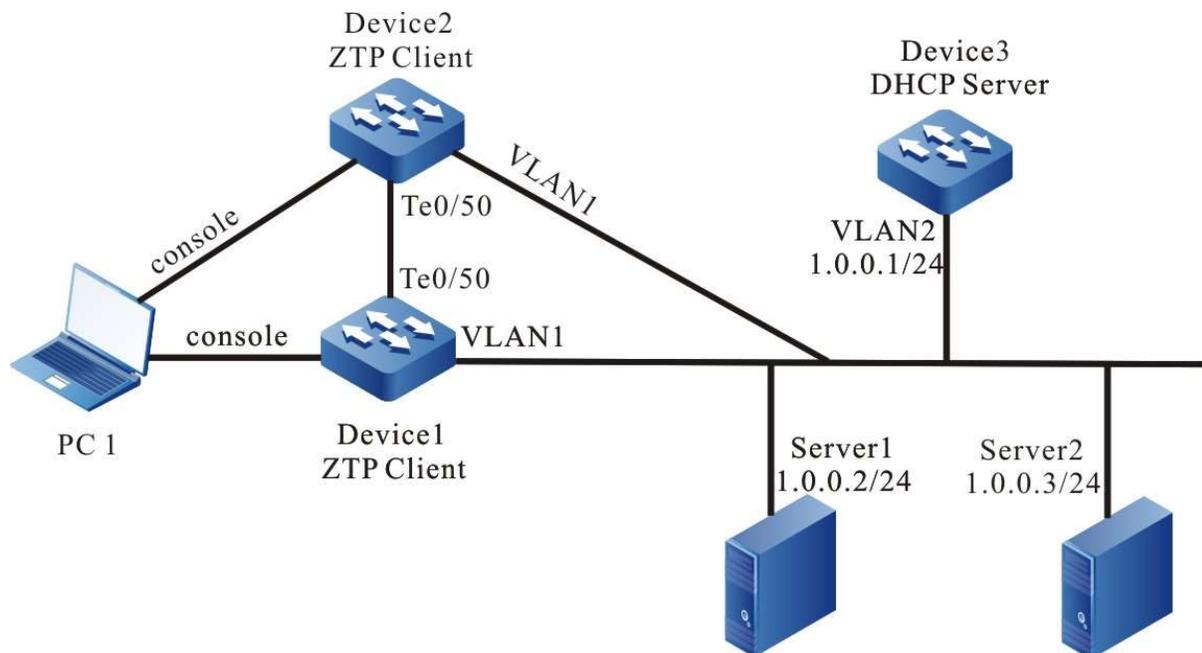

Figure 15-10 Network Topology of ZTP using python intermediate files to automatically complete stacking via DHCP

### Configuration Steps

Step 1: Configure the FTP server, edit the intermediate files, and place the intermediate files (e.g. ztp.py) and the version file corresponding to the serial number in the FTP server directory. (Omitted)

#Normal python file editing can use any code editor

#Total file space required to configure ZTP

```
required_space = 100
```

#Configure file download method, and download timeout time

```
protocol = "ftp"
username = "a"
password = "a"
hostname = "1.0.0.2"
timeout = 1200
```

#Versions are found by version series, and version series can be found by shipping list

```
REMOTE_IMAGE_FILE = {
'HIT SW' : 'ztp.pck'
}
```

#Configure remote paths to make it easy to find them on the server when downloading files over FTP

```
remote_config_path = ""
remote_pck_path = ""
```

```
remote_stack_path = ""
```

### #Configure checksum MD5

```
remote_config_is_exist_md5 = True
remote_pck_is_exist_md5 = True
remote_stack_is_exist_md5 = True
```

Step 2: Edit stack files and configuration files and upload them to the server for ZTP process download.

Here it is assumed that the device serial number of Device1 is 12345 and the device serial number of Device2 is 12340.

### #Edit stack files

Stack file is named by adding .stack to the serial number. The name of Device1 stack file is 12345.stack, and the corresponding MD5 checksum file is 12345.stack.md5, while the name of Device2 stack file is 12340.stack, and the corresponding MD5 checksum file is 12340.cfm.md5.

Stack file content: It contains serial number, stacking domain number, and stacking device member.

The content of Device1's stack file includes

```
12345 101 1
```

The content of Device2's stack file includes

```
12340 101 0
```

#Edit the configuration file, the configuration file is named by adding the suffix .cfg to the device serial number, so the name of Device1 configuration file is 12345.cfg, and the corresponding MD5 checksum file is 12345.cfg.md5, while the name of Device2 configuration file is 12340.cfg, and the corresponding MD5 checksum file is 12340.cfm.md5.

The stacking section of the configuration file must be included with !VST\_CONFIG\_BEGIN and !VST\_CONFIG\_END, the slot port configuration must be included with !PORT\_CONFIG\_BEGIN and !PORT\_CONFIG\_END, and the interface dimension set in the configuration file must be the stacked interface dimension, not the standalone dimension.

The configuration file of Device1 contains

```
!VST_CONFIG_BEGIN
!mode vsl information
vsl-channel 1/1
exit
!mode vsl end

!PORT_CONFIG_BEGIN
!slot 0/0
interface tengigabitethernet1/0/50
vsl-channel 1/1 mode on
exit
!PORT_CONFIG_END
!VST_CONFIG_END
```

The configuration file of Device2 contains

```
!VST_CONFIG_BEGIN
!mode vsl information
vsl-channel 0/1
exit
!mode vsl end

!PORT_CONFIG_BEGIN
!slot 0/0
interface tengigabitethernet0/0/50
vsl-channel 0/1 mode on
exit
!PORT_CONFIG_END
!VST_CONFIG_END
```

After uploading the configuration file and stack files to the server, the following files 12345.cfg, 12340.cfg, 12345.cfg.md5, 12340.cfg.md5 exist on the server.

### Step 3: Configure DHCP service for Device3.

```
Device3#configure terminal
Device3(config)# ip dhcp pool ztp
Device3(dhcp-config)#range 1.0.0.4 1.0.0.10 255.255.255.0
```

#### #Configure intermediate file name options

```
Device3(dhcp-config)#option 67 ascii ztp.py
```

#### #Configuration file download method and server address, username and password options

```
Device3(dhcp-config)#option 66 ascii ftp://a:a@1.0.0.2
```

#### #Configure log server address options

```
Device3(dhcp-config)#option 7 ip 1.0.0.3
Device3(dhcp-config)#exit
```

#### #Enable DHCP service on server

```
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip address 1.0.0.1/24
Device3(config-if-vlan2)#ip dhcp server
Device3(config-if-vlan2)#end
```

Step 4: Device1 and Device2 boot with an empty configuration and enters the ZTP process to download the version upgrade and load the configuration file.

Device1:

#### #See that the device enters the ZTP process through logs and sends DHCP requests

```
Apr 22 2020 06:03:58 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345, Now starting dhcp upgrade...
Apr 22 2020 06:03:58 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345, DHCP discovery phase started...
```

#During the ZTP request, you can exit the ZTP process with ctrl+c, thus starting with an empty configuration, or if you don't use ctrl+c, you can continue with the ZTP process.

```
Apr 22 2020 06:04:00 Device1MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345, Press (ctrl + c) to abort Dhcp Upgrade
```

## #Get the address successfully, download the common intermediate files

```
Apr 22 2020 06:04:35 Device1 MPU0 %DHCP-ASSIGNED_EXT-5:Interface vlan1 assigned DHCP address 1.0.0.4, mask 255.255.255.0.
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345, Dhcp discovery phase success
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345, Start to download temp file ztp.py...
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345, Download temp file ztp.py is success
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345, Start to parse temp file...
```

## #Direct execution of python scripts

```
/flash free space is 100(M).
Start to get remote and local file path.
Get remote and local file path is success.
```

## #Download version

```
Start to download image file /flash/ztp.pck...
Download image file is success
Start to set boot image file /flash/ztp.pck....
```

## #Download and parse stack file and configuration file

```
Start to download stack file /flash/12345.stack...
Download stack file is success.
Start to download config file /flash/12345.cfg...
Download config file is success.
Start to parse config file /flash/startup...
Parse config file is success.
Execute python script success.
```

## #Download version and configuration file successfully, reboot the device automatically via ZTP

```
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345,script execute success
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12345,System will rebooted by DHCP upgrade
```

The device Device2:

## #See that the device enters the ZTP process through logs and sends DHCP requests

```
Apr 22 2020 06:03:58 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340, Now starting dhcp upgrade...
Apr 22 2020 06:03:58 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340, DHCP discovery phase started...
```

#During the ZTP request, you can exit the ZTP process with ctrl+c, thus starting with an empty configuration, or if you don't use ctrl+c, you can continue with the ZTP process.

```
Apr 22 2020 06:04:00 Device1MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340, Press (ctrl + c) to abort Dhcp Upgrade
```

## #Get the address successfully, download the common intermediate files

```
Apr 22 2020 06:04:35 Device1 MPU0 %DHCP-ASSIGNED_EXT-5:Interface vlan1 assigned DHCP address 1.0.0.5, mask 255.255.255.0.
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340, Dhcp discovery phase success
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340, Start to download temp file ztp.py...
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340, Download temp file ztp.py is success
Apr 22 2020 06:04:35 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340, Start to parse temp file...
```

## #Direct execution of python scripts

```
/flash free space is 101(M).
Start to get remote and local file path.
Get remote and local file path is success.
```

## #Download version

```
Start to download image file /flash/ztp.pck...
Download image file is success
Start to set boot image file /flash/ztp.pck....
```

## #Download and parse stack file and configuration file

```
Start to download stack file /flash/12340.stack...
Download stack file is success.
Start to download config file /flash/12340.cfg...
Download config file is success.
Start to parse config file /flash/startup...
Parse config file is success.
Execute python script success.
```

## #Download version and configuration file successfully, reboot the device automatically via ZTP

```
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340,script execute success
Apr 22 2020 06:12:26 Device1 MPU0 %ZTP-DHCP_UPGRADE-5:SerialNum:12340,System will rebooted by DHCP upgrade
```

### Step 5: Check the result.

Check the ZTP status with the show ztp command, view whether the configuration and version are in with show running-config and show version, and view that the stack has taken effect with show vst-config.

```
switch#show ztp
```

```
Last ztp method: DHCP upgrade method
Ztp state: ZTP DHCP upgrade success
Ztp important inforamtion:
  FTP server IP: 1.0.0.2
  Temporary file name: ztp.py
```

```
Current ztp method: None upgrade method
```

```
Next ztp state: Next ztp state: disable(Stack mode does not support ztp.)
```

```
switch X#show vst-config
Building Configuration...
```

```
!mode member information

exit
!end
```

```
!slot_14_SM89E-48XGEF-DB(V1)
!vsl mode
!slot 1/0
interface tengigabitethernet1/0/50
vsl-channel 1/1 mode on
exit
!end
```

---

## Note

- The device obtains the file download mode through option66 of DHCP protocol. It supports FTP, TFTP and SFTP, you can choose any download mode when during configuration.
  - The MD5 of version files, configuration files, and stack files are stored separately, and they are named by adding the the suffix .md5. to their respective files names.
  - The interface dimension in the configuration file for auto-stacking must be the stacked interface dimension, not the standalone interface dimension.
  - After downloading the python file, the device executes the python file directly, so the python file must conform to the python syntax.
  - If the version information is not found through the device serial number, then the device ZTP process will not engage in version upgrade, only configuration loading to continue the ZTP process, however, the configuration file cannot be empty.
-

# 16 Interface Basis

---

## 16.1 Overview

The interfaces supported by the device include physical interfaces and logical interfaces. The physical interfaces include L2 Ethernet interfaces and L3 Ethernet interfaces; the logical interfaces include aggregation group interfaces, VLAN interfaces, Loopback interfaces, Null interfaces, Tunnel interfaces, and so on.

Ethernet interface, also called L2 Ethernet interface or port, is one physical interface. It works in layer 2 in the OSI reference model-Data link layer and is mainly used for the data frame forwarding and MAC address learning.

L3 Ethernet interface is one physical interface. It works at layer 3 in the OSI reference model-network layer. Configurable with an IP address, it is mainly used for packet forwarding.

Aggregation group interface is one logical interface, formed by binding multiple physical links between two devices. It also works at the data link layer and is mainly used to expand the link bandwidth and improve the link reliability.

VLAN interface is one logical interface, used to be bound with VLAN and complete the packet forwarding between different VLANs.

Loopback interface, also called local loopback interface, is one logical interface. For packets sent to the Loopback interface, the device considers each packet to be sent to itself and will not forward the packet.

Null interface is one logical interface. Any packet sent to the Null interface will be dropped.

Tunnel interface is one logical interface that provides a transmission link for the point-to-point mode.

For different interfaces, there are corresponding configuration modes. The related configuration modes of the interfaces include:

- interface configuration mode, corresponding to the VLAN interface, the Loopback interface, the Null interface, and the Tunnel interface;

- L2 Ethernet interface configuration mode, corresponding to the L2 Ethernet interface;
- L3 Ethernet interface configuration mode, corresponding to the L3 Ethernet interface;  
and
- aggregation group configuration mode, corresponding to the aggregation group interface.

This chapter mainly describes the common function configuration of various interfaces. For the featured function configuration of various interfaces, refer to the corresponding interface chapter.

## 16.2 Basic Function Configuration of Interfaces

Table 1 Basic Function Configuration List of Interfaces

Configuration Task	
Configure the basic functions of the interfaces	Enable/disable interface
	Configure interface description
	Configure the statistics interval of the interface traffic
Configure the interface group function	Interface groups
Configure interface status SNMP agent care level	Configure interface status SNMP agent care level

### 16.2.1 Configure the basic functions of the interfaces

#### Configuration Condition

None

#### Enable/disable interface

After Ethernet interface is disabled, it cannot receive or send packets. But after the Ethernet interface is enabled, whether it can receive and send packets also depends on other settings, such as whether the peer Ethernet interface is enabled, the rates of the local port and the peer port, and whether duplex mode matches with MDIX (Media Dependent Interface Crossover).

After the aggregation group interface is disabled, all member ports are disabled; after the aggregation group interface is enabled, you can disable or enable one member port separately.

Table 2 Enabling/Disabling Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	The subsequent configuration takes effect only on the current interface after you enter the interface configuration mode, only on the aggregation group
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	interface after you enter the aggregation group configuration mode, only on the current interface after you enter the L2/L3 Ethernet interface configuration mode, and only on the current virtual switch link interface after you enter the virtual switch link interface mode
Enter virtual switch link interface configuration mode	<b>vsl-channel</b> <i>vsl-channel-id</i>	
Enable the interface	<b>no shutdown</b>	Mandatory By default, the interface is enabled
Disable the interface	<b>shutdown</b>	Mandatory By default, the interface is enabled

---

### Note

- Configure the interface enabling/disabling function, which is not supported on Null interface.
- 

## Configure interface description

The interface description is used for naming different interfaces, helping the user distinguish different interface types and actual service functions. It is convenient for the user to manage various interfaces.

Table 16 Configuring Interface Description Information

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	The subsequent configuration takes effect only on the current interface after you enter the interface configuration mode, only on the aggregation group
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	interface after you enter the aggregation group configuration mode, only on the current interface after you enter the L2/L3 Ethernet interface configuration mode, and only on the current virtual switch link interface after you enter the virtual switch link interface mode
Enter virtual switch link interface configuration mode	<b>vsl-channel</b> <i>vsl-channel-id</i>	
Configure interface description information	<b>description</b> <i>description-name</i>	Mandatory By default, the interface description information is not configured
	<b>peer-description</b> <i>description-name</i>	Mandatory By default, the peer interface description information is not configured

---

 **Note**

- Configure the interface description function, which is not supported on Null interface.
- 

### Configure the statistics interval of the interface traffic

Different interfaces carry different service traffics. Adjusting the statistics interval of the interface traffic can help the user concern the history records of the interface traffic selectively, forecasting the future trend of the interface traffic more correctly. It is convenient for the user to analyze and adjust the bored services of the interface.

Table 3 Configuring Statistics Interval of Interface Traffic

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	The subsequent configuration takes effect only on the current interface after you enter the interface configuration mode, only on the aggregation group interface after you enter the aggregation group configuration mode, only on the current port after you enter the L2 Ethernet interface configuration mode, and only on the current virtual switch link interface after you enter the virtual switch link interface mode
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	
Enter virtual switch link interface mode	<b>vsl-channel</b> <i>vsl-channel-id</i>	
Configure the statistics interval of the interface traffic	<b>load-interval</b> <i>load-interval-value</i>	Mandatory

Step	Command	Description
		By default, the statistics interval of the interface traffic is 300 seconds.

## Note

- Configure the statistics interval function of interface traffic, which is not supported on Null interface.

### 16.2.2 Configure the interface group function

Bind multiple interfaces as one interface group. Configuring various interface commands on the interface group is equivalent to configuring on all interfaces of the interface group, while it is not necessary to configure on each interface repeatedly. Display the information of one interface group is to display the information of all interfaces in the interface group.

#### Configuration Condition

The interfaces covered by the interface group should already exist.

#### Interface groups

Table 4 Configuring Interface Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create interface group in the list mode	<b>interface group</b> <i>group-id</i> <b>enum</b> <i>interface-name1</i> <i>interface-name2 ...</i> <i>interface-nameN</i> [ <b>point-to-point</b>   <b>multipoint</b> ]	Mandatory By default, the interface group is not created.
Enter the global configuration mode.	<b>configure terminal</b>	-
Create interface group by specifying range mode	<b>interface group</b> <i>group-id</i> <b>range</b> <i>start-interface-</i>	Mandatory

Step	Command	Description
	<i>name end-interface-name</i> [ <b>point-to-point</b>   <b>multipoint</b> ]	By default, the interface group is not created.

---

### Note

- The interface types in the interface group should be the same. The user can configure multiple interface groups as desired.
  - The user can configure the commands supported by all types of interfaces in the interface group, but if the interfaces covered by the interface group do not support, the commands do not take effect and there may be no error prompt. Please check whether the commands take effect by viewing the configuration.
  - If the interface group covers the logical interface and when the logical interface is deleted, the logical interface in the interface group is also deleted automatically.
- 

### 16.2.3 Configure interface status SNMP agent care level

There are actually two levels of interface UP/DOWN status in the system, one is the L2 link layer status, and the other is the L3 protocol layer (protocol) status, which can be seen with the command `show ip interface brief`. Generally, both statuses change with the physical interface UP/DOWN, but when keepalive gateway is configured on Ethernet Type interface, the L3 protocol layer status will be controlled by keepalive check status.

If SNMP agent function is enabled on the device, the network management server can obtain interface status information through public mib. Moreover, it can send interface status change information to the network management server when SNMP Trap is enabled.

By means of this function command, you can set the interface status level of SNMP agent care. By default, the interface status hierarchy of SNMP agent care is L2 link layer, but when keepalive gateway is configured on Ethernet Type interface, in order to ensure consistent linkage between the interface status presented by the network management server and the keepalive check status, you need to set the interface status level of SNMP agent care as L3 protocol layer. Therefore, in environments where keepalive check is enabled (e.g. MSTP WAN line environment), it is recommended to configure link-status-care l3.

#### Configuration Condition

None

#### Interface groups

Table 16 Configuring interface status SNMP agent care level

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure interface status network management level	<b>link-status-care { I2   I3 }</b>	Mandatory By default, the interface status SNMP agent care level is L2 link layer
Exit global configuration mode	<b>exit</b>	-

## 16.2.4 Basic Monitoring and Maintaining of Interfaces

Table 16 Basic Monitoring and Maintaining of Interfaces

Command	Description
<b>clear interface group <i>group-id</i></b>	Clear the statistics information of all interfaces in the interface group
<b>interface group <i>group-id</i> display</b>	Display all interfaces contained in the current interface group
<b>show interface group <i>group-id</i></b>	Display the information of all interfaces in the interface group

# 17 Ethernet Interface

---

## 17.1 Overview

Ethernet interface includes L2 Ethernet interface and L3 Ethernet interface.

Ethernet interface, also called L2 Ethernet interface or port, is one physical interface. It works at layer 2 in the OSI reference model-data link layer. It is mainly used to execute two basic operations:

**Data frame forwarding:** According to the MAC address (that is physical address) of the data frame, forward the data frame. Ethernet interface can only perform the L2 switching forwarding for the received packets, that is, can only receive and send the packets whose source IP and destination IP are at the same segment.

**MAC address learning:** Construct and maintain the MAC address table, used to support forwarding the data frames.

L3 Ethernet interface is one physical interface. It works at layer 3 in the OSI reference model-network layer. It is mainly used to execute following basic operations.

**Packet forwarding:** The packet is routed and forwarded according to the IP (Internet Protocol) address (ie, network address) of the packet. L3 Ethernet interface can only perform the L3 routing forwarding for the received packets, that is, can receive and send the packets whose source IP and destination IP are at the different segments.

According to the maximum rate supported by the Ethernet interface, the Ethernet interface type can be divided to the following several:

**Fastethernet:** 100M port, can be abbreviated as Fa, such as fastethernet0/1 or Fa0/1;

**Gigabitethernet:** 1000M port, can be abbreviated as Gi, such as gigabitethernet0/25 or Gi0/25;

**Tengigabitethernet:** 10 Gigabit port, can be abbreviated as Te, such as tengigabitethernet1/1 or Te1/1.

**25ge:** 25G Ethernet interface;

**40ge:** 40G Ethernet interface;

**100ge:** 100G Ethernet interface;

According to the media type of the port, the port type can be divided to copper (electrical port) and fiber (optical port).

## 17.2 Ethernet Interface Function Configuration

Table 17 Function Configuration List of Ethernet Interface

Configuration Task	
Configure Basic Functions of Port	Enter Ethernet interface configuration mode
	Enter Batch Configuration Mode of L2 Ethernet Interface
	Configure Port Rate and Duplex Mode
	Configure FEC
	Configure MDIX (Media Dependent Interface Crossover) mode
	Configure Port Media Type
	Configure MTU (Maximum Transmission Unit)
	Configure Port Flow Control
	Configure Delay Time
	Configure Port Auto Energy-Saving
	Configure Port Energy Efficient Ethernet Function
	Configure optical module type supported by the port
Configure Port Detection Function	Configure Port Status Flap Detection
	Enable Port Loopback Test
Configure Storm Suppression	Configure Storm Suppression Parameters
	Configure the action executed after the storm suppression

Configuration Task	
Configure UNI/NNI attribute	Configure UNI/NNI attribute
	Configure Connectivity of uni Port
Configure basic functions of L3 Ethernet interface	Configure L3 Ethernet interface

## 17.2.1 Configure Basic Functions of Port

### Configuration Condition

None

### Enter Ethernet interface configuration mode

To configure on the specified Ethernet interface, first enter the L2 Ethernet interface configuration mode of the Ethernet interface and then execute the corresponding configuration command.

Table 171 Enter L2 Ethernet Interface Configuration Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode

### Note

- The naming rule of the Ethernet interface number is U/S/P (Unit/Slot/Port). Unit indicates the device in stacking status, numbered from 0. When the device is initialized, it needs to be clear whether it is in the stacking status. If not, the device number defaults to 0 and is hidden.

---

Slot indicates slots on the device, numbered from 0. If there is fixed Ethernet interface, slot 0 is reserved for the fixed Ethernet interface, while service slot is numbered from 1. Port indicates Ethernet interface on each device or interface card which is numbered from 1.

- The naming rule of Ethernet interface *interface-name* is Ethernet interface type + Ethernet interface number. For example, gigabitethernet0/1 represents the gigabit Ethernet interface numbered 1; tengigabitethernet1/2 represents the 10 gigabit Ethernet interface numbered 2 on the service slot numbered 1; in stacking mode, gigabitethernet0/1/2 represents that the member number is 0, with gigabit Ethernet interface numbered 2 on the service slot numbered 1.
- 

### Enter Batch Configuration Mode of L2 Ethernet Interface

When performing the same configuration on multiple ports, to improve the configuration efficiency and reduce the repeated steps, select to enter the batch configuration mode of the L2 Ethernet interface, including the following three cases: single port, such as gigabitethernet 0/1; successive ports, using "-" to indicate one section of successive ports, such as gigabitethernet 0/3-0/5, indicating port 0/3, 0/4, and 0/5; single port and successive ports, using comma to separate them. For example, "gigabitethernet 0/1, 0/3-0/4, and 0/6" represents ports 0/1, 0/3, 0/4, and 0/6.

Table 172 Entering Batch Configuration Mode of L2 Ethernet Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter Batch Configuration Mode of L2 Ethernet Interface	<b>interface <i>interface-list</i></b>	Mandatory

---

#### Note

- L3 Ethernet interface does not support the batch configuration mode.
- 

### Configure Port Rate and Duplex Mode

Setting the port rate includes two cases:

One is to set the fixed rate according to the Ethernet interface rate capability set. The optional parameters include **10** (10M), **100** (100M), **1000** (1000M), **10000** (10000M), **25000** (25000M), **40000** (40000M), and **100000** (100000M);

The other is to set the rate as auto (auto-negotiation), specifying that the rate is negotiated by the local end and the peer port.

Similarly, setting the port duplex mode includes two cases:

One is to set the duplex mode according to the capability set of the port duplex mode. The optional parameters include full (full-duplex mode), indicating that the port can send packets when receiving the packets; half (half-duplex mode), indicating that the port can only receive or send packets at one moment, but cannot perform at the same time;

The other is to set the duplex mode as auto (auto-negotiation), indicating that the duplex mode is negotiated automatically by the local end and the peer port.

Table 173 Configuring Port Rate and Duplex Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure the port rate	<b>speed</b> { <b>10</b>   <b>100</b>   <b>1000</b>   <b>10000</b>   <b>25000</b>   <b>40000</b>   <b>100000</b>   <b>auto</b> }	Mandatory
Configure the port duplex mode	<b>duplex</b> { <b>auto</b>   <b>full</b>   <b>half</b> }	Mandatory

### Configure FEC

FEC (Forward Error Correction) is one error correction method that adds error correction information to the data packet at the sending port, and uses the error correction information at the receiving end to correct the error produced upon transmission of the data packet in order to improve the signal quality, but at the same time it will also bring some delay to the signal. The user can choose to enable or disable this function according to the actual situation.

The FEC status of the port can be manually configured by the user, or be configured in an adaptive manner. If the user does not configure the supported optical module type on the port, the FEC will be configured adaptively according to the type and rate of the module inserted in the current port upon inserting of the module or configuring of the port rate. If there is user configuration on the port, the user configuration will prevail, and no adaptation will be done upon inserting of the module into the port or configuring of SPEED.

Table 17-4 Configuring Port FEC Status

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure port FEC status	<b>[no] fec mode {base-r {auto   manual}   rs { auto   manual }   none manual}</b>	Mandatory  By default, FEC is not enabled on the port

### Note

- When the rate is not 25G or 100G, it is not allowed to configure FEC. When the port has manual configuration of FEC, it is not allowed to switch the rate to other than 25G or 100G.
- This function is not allowed to be configured on VSL member port.
- The auto configuration is adaptively issued. Before restarting the device, the user needs to use the write command to save this configuration.
- Only 25GE and 100GE interfaces support this function. The fec configuration will take effect only when the actual rate is 25G or 100G.

### Configure Port MDIX Mode

You can send and receive signals only after connecting the local end and the peer port. Therefore, the MDIX mode is used with connection cables.

The cables connecting ports are divided to two types: straight-through cable and crossover cable. To support the two types of cables, provide three kinds of MDIX modes: normal, cross and auto.

The optical port can only support straight-through cable. Therefore, MDIX mode can only be set as normal.

The electrical port is formed by eight pins. You can change the roles of the pins by setting the MDIX mode. When setting as normal, use pin 1 and 2 to send signals, and pin 3, 6 to receive signals; when setting as cross, use pin 1, 2 to receive signals, pin 3, 6 to send signals; when setting as auto, the local and peer electrical ports automatically negotiate the functions of the pins by connecting the cables.

When using the straight-through cable, the MDIX modes of the local and peer ports cannot be the same.

When using crossover cable, the MDIX modes of the local and peer ports should be the same or at least one is auto.

Table 175 Configuring MDIX Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure the mode of receiving and sending signals via network cable	<b>mdix { auto   cross   normal }</b>	Mandatory  By default, the MDIX mode of the electrical port is auto and the MDIX mode of the optical port is normal.

---

 **Note**

- The Optical port does not support this configuration.
- 

### Configure Port Media Type

Switch to use the optical port or electrical port on the Combo port by configuring the port media type. The optical port and the corresponding electrical port cannot work at the same time. When specifying one type of ports on Combo port, the other type of ports are automatically disabled.

Table 176 Configuring Media Type

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure Port Media Type	<b>media-type</b> { <b>auto</b>   <b>copper</b>   <b>fiber</b> }	Mandatory  By default, the media type of the electrical port is copper; the media type of the optical port is fiber; the media type of the Combo port is copper.

---

 **Note**

- When switching the optical port and electrical port on the Combo port, the port configuration after switching, such as rate, duplex mode, and MDIX mode, are initialized to the default values.
- 

### Configure Port MTU

The MTU configured on the port takes effect at the same time for the ingress and egress packets, and the set values are the same. When the length of the received and sent packets exceeds the set value, the packets are dropped directly.

In contrast, the MTU configured on L3 Ethernet interface only takes effect for the egress packets. When the length of the sent packet exceeds the set value, the packet first performs the IP fragmenting, making the length of the fragmented packet not exceed the set value, and then send it out.

Table 17-7 Configuring MTU

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure Port MTU	<b>mtu</b> <i>mtu-value</i>	Mandatory  By default, the port MTU is 1824 bytes.

### Configure Port Flow Control

When the sending or receiving buffer is full and if the duplex mode of the port is half-duplex, send the blocking signals back to the source end by the back pressure mode; if the duplex mode of the port is full-duplex mode, the port informs the source end to stop sending by the flow control mode.

Table 17-8 Configuring Flow Control

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Port Flow Control	<b>flowcontrol { on   off }</b>	Mandatory  By default, the flow control function of the port is disabled.

---

 **Note**

- Only when the flow control function is enabled on both the local port and the peer port, can the flow control on the local port be realized.
- 

### Configure Delay Time

When the port changes from Up to Down, first enter the set suppression time period and the switching of the port status is not felt by the system; and then after the set suppression time, report the port status change to the system. In this way, you can avoid the unnecessary running cost caused by the frequent switching of the ports status in short time.

Table 179 Configuring Delay Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Delay Time	<b>link-delay</b> <i>link-delay-value</i>	Mandatory  By default, the delay report time of the port changing from Up to Down is 0, that is, disable the delay report function; when the port changes from Up to Down, report and process immediately.

### Configure Port Auto Energy-Saving

When disabling or enabling port auto energy-saving, but not connecting cables, the port inside is always in the polling port state. To reduce the unnecessary energy consumption, automatically switch to the low energy consumption state when the port is idle by configuring the port auto energy-saving.

Table 17-10 Configuring Auto Power-down

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Port Auto Energy-Saving	<b>auto-power-down enable</b>	Mandatory  By default, the auto energy-saving function of the port is disabled.

---

### Note

- This device does not support auto power-down configuration.
- 

### Configure Port Energy Efficient Ethernet Function

When no data traffic passes, the inner port is always polling the port state. To reduce such unnecessary consumption, you can configure the interface energy efficient Ethernet function. When the interface is idle, it is automatically switched to the low energy state. When the data is normally transmitted, recover the power supply.

Table 17-11 Configuring Energy Efficient Ethernet Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode

Step	Command	Description
Configure Port Energy Efficient Ethernet Function	<b>energy-efficient-ethernet enable</b>	Mandatory  By default, the energy efficient Ethernet function of the interface is disabled.

---

### Note

- After the interfaces on the both sides of the cable are enabled with the energy efficient Ethernet function, the function can take effect.
  - The optical interface does not support such energy efficient Ethernet function.
  - The interface with the rate as 10 Mbps and with the duplex mode as any mode and the interface with the rate as 100 Mbps and the duplex mode not as the automatic negotiation mode do not support the energy efficient Ethernet function.
- 

### Configure optical module type supported by the port

The gigabit and 10 gigabit Ethernet optical interfaces are in OMM-disabled status when the optical module is not inserted in. This port can be enabled only when the type of the optical module inserted on the port is the same as the optical module type supported by the port configuration. Therefore, the optical module type supported by the port needs to be configured, which can be manually done by the user or done in an adaptive manner. If the user does not configure the supported optical module type on the port, the optical module type supported by the port will be adaptively configured according to the type of the module inserted on the port, so that the port can use the corresponding optical module normally. If there is user configuration on the port, the user configuration will prevail, and no adaptation will be done according to the type of the module inserted on the port.

The types of optical modules are divided into gigabit photoelectric modules, 10 gigabit photoelectric modules, ordinary optical modules, and unrecognizable-typed optical modules. Among them, the ordinary optical modules include gigabit optical modules, 10 gigabit optical modules, 10 gigabit high-speed cables, 40G optical modules, 40G high-speed cables and other optical modules. Unrecognizable optical modules offer no guarantee for normal use.

By default, the port supports ordinary optical modules.

Due to the different speed capability levels supported by different types of modules, the speed configuration of the port may be modified synchronously when the configuration port supports different optical module types (including user configuration and adaptive configuration).

Table 17-12 Configuring Optical Module Type Supported by the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Configure photoelectric module supported by the port	<b>optical fiber-to-copper</b> { <b>get</b>   <b>xget</b> }	Mandatory  By default, the port supports ordinary optical modules
Clear the configuration of the supported optical module type on the port	<b>no optical fiber-to-copper</b> { <b>get</b> [auto]   <b>xget</b> [auto]   <b>unknown-module auto</b> }	Mandatory  The auto command is used to clear the adaptive configuration. It cannot clear the user configuration. After the adaptive configuration is cleared, the port supports ordinary optical modules by default. In this case, you need to unplug or plug the optical module or restart the device to trigger again the adaptation.  The non-auto command is used to clear the user configuration. The optical module inserted on the port will be automatically re-adapted according to the type of this optical module.

**Note**

- This function is only allowed to be configured on the Ethernet optical interface, and not allowed to be configured on the electrical port and the combo port.
- This function is not allowed to be configured on VSL member port.
- This function is not allowed to be configured on 40G and 100G ports.
- The auto configuration is adaptively issued. Before restarting the device, the user needs to use the write command to save this configuration.

### Configure mandatory cancel of interface OMM-disabled status

If the optical module is not inserted on the Ethernet optical interface, the port will be in the OMM-disabled status and cannot receive and send packets. After inserting of the legal optical module, the OMM-disabled status of the Ethernet optical interface will be automatically canceled. But, sometimes the Ethernet port needs to be UP without the optical module inserted, such as enabling the loopback check function. In this case, you can configure to mandatorily cancel the OMM-disabled status of the Ethernet optical interface.

The Ethernet optical interface will be in the OMM-disabled status only when it has no optical module inserted. The electrical interface and Combo interface will not be set to the OMM-disabled status, and therefore, this function is not required.

Table 17-13 Enabling Mandatory Cancel of Interface OMM-disabled Status/Disabling Mandatory Cancel of Interface OMM-disabled Status

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Enable mandatory cancel of interface OMM-disabled status	<b>optical enable port manual</b>	Mandatory  By default, this function is disabled

Step	Command	Description
Disable mandatory cancel of interface OMM-disabled status	<b>no optical enable port manual</b>	Mandatory By default, this function is disabled

## Note

- This function is only allowed to be configured on the Ethernet optical interface, and not allowed to be configured on the electrical port and the combo port.
- This function is not allowed to be configured on VSL member port.

### Configure Port crc Error Packet Inspection Function

You need to configure `snmp-server enable traps crc-error` first. This function is used to count whether the crc error packets within the *time-value* time range exceed the max limit. If they exceed the max limit, an alarm trap will be sent. Within the *time-value* time range, when the number of crc error packets recovers from higher than the max limit to lower than the min limit, a recovery trap will be sent.

Table 17-14 Configuring crc Error Packet Inspection Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter L2 Ethernet interface configuration mode/aggregation group configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory The subsequent configuration takes effect only on the current interface after you enter the L2 Ethernet interface configuration mode
Configure crc error packet inspection trap function	<b>crc-error max-limit</b> max-value <b>min-limit</b> min-value <b>interval</b> <i>time-value</i>	Mandatory By default, the function of issuing the trap when crc error packet statistics of the port exceeds the alarm range is disabled.

Step	Command	Description
		<p>max-value: The max value of the number of crc error packets of the port.</p> <p>min-value: The min value of the number of crc error packets of the port.</p> <p>time-value: Set the inspection time range, in seconds, 's'.</p>
Disable the crc error packet inspection trap function	<b>no crc-error</b>	<p>Mandatory</p> <p>By default, this function is disabled</p>

### Note

- This function takes effect only on the L2 port

### Configure Port Error Packet Inspection Function

You need to configure snmp-server enable traps { in-packet-error | out-packet-error } first. This function is used to count whether the port error packets within the *time-value* time range exceed the max limit. If they exceed the max limit, an alarm trap will be sent. Within the *time-value* time range, when the number of port error packets recovers from higher than the max limit to lower than the min limit, a recovery trap will be sent.

Table 17-15 Configuring Error Packet Inspection Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter L2 Ethernet interface configuration mode/aggregation group configuration mode	<b>interface</b> <i>interface-name</i>	<p>Mandatory</p> <p>The subsequent configuration takes effect only on the current interface after you enter</p>

Step	Command	Description
		the L2 Ethernet interface configuration mode
Configure error packet inspection trap function	<b>packet-error {in-packet   out-packet} max-limit <i>max-value</i> min-limit <i>min-value</i> interval <i>time-value</i></b>	<p>Mandatory</p> <p>By default, the function of issuing the trap when error packet statistics of the port exceeds the alarm range is disabled.</p> <p><b>in-packet</b> : Enable the trap function for the number of error in-packets of the port.</p> <p><b>out-packet</b> : Enable the trap function for the number of error out-packets of the port.</p> <p>max-value: The max value of error packets of the port.</p> <p>min-value: The min value of error packets of the port.</p> <p>time-value: Set the inspection time range, in seconds, 's'.</p>
Disable the error packet inspection trap function	<b>no packet-error {in-packet   out-packet}</b>	<p>Mandatory</p> <p>By default, this function is disabled</p>

---

### Note

- This function takes effect only on the L2 port
- 

### Configure Port Traffic Ultra-Bandwidth Function

You need to configure snmp-server enable traps {in-usage-rate | out-usage-rate } first. This function is used to send an alarm trap when the bandwidth in-usage-rate/out-usage-rate of the port exceeds the max limit. When the bandwidth in-usage-rate/out-usage-rate of the port recovers from higher than the max limit to lower than the min limit, a recovered trap will be sent.

Table 17-16 Configuring Traffic Ultra-Bandwidth Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter L2 Ethernet interface configuration mode/aggregation group configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory The subsequent configuration takes effect only on the current interface after you enter the L2 Ethernet interface configuration mode
Configure traffic ultra-bandwidth trap function	<b>flow-warn { in-packet   out-packet } max-usage <i>max-value</i> min-usage <i>min-value</i></b>	Mandatory By default, the traffic ultra-bandwidth trap sending function of the port is disabled. <b>in-packet</b> : Enable the trap function for the in-usage-rate of the port. <b>out-packet</b> : Enable the trap function for the out-usage-rate of the port. <i>max-value</i> : The max value of bandwidth usage rate. <i>min-value</i> : The min value of bandwidth usage rate.
Disable the traffic ultra-bandwidth trap function	<b>no flow-warn {in-packet   out-packet}</b>	Mandatory By default, this function is disabled

 **Note**

- This function takes effect only on the L2 port

Port splitting can split one high-bandwidth physical port on the device into multiple mutually independent low-bandwidth ports. For example, the 40G port is split into 4 10G ports. The user can freely choose to use the original high-bandwidth port or split it into multiple low-bandwidth ports according to the specific type of the docking device port, which increases networking flexibility and reduces user purchase costs.

Table 17-17 Configuring Port Splitting

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	Mandatory The subsequent configuration takes effect only on the current interface after you enter the L2 Ethernet interface configuration mode
Configure port splitting	<b>split into 10GE</b>	Mandatory By default, the Ethernet interface is not split

Table 17-18 Configuring Port Merging

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name:num</i>	Mandatory The subsequent configuration takes effect only on the current interface after you enter the L2 Ethernet interface configuration mode that is optionally split
Configure port merging	<b>no split</b>	Mandatory By default, the Ethernet interface that is split is not merged

---

 **Note**

- This function takes effect only on the L2 port
- 

### Configure Port Single-Fiber Function

Configure the single-fiber function of the Ethernet interface. This function configures the Ethernet interface to only transmit packets, only receive packets, or support both transmitting and receiving packets in the single-fiber mode.

Table 17-19 Configuring Port Single-Fiber Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	Mandatory The subsequent configuration takes effect only on the current interface after you enter the L2 Ethernet interface configuration mode
Configure single-fiber function	<b>single-fiber { mode [ receive   transmit ] }</b>	Mandatory By default, the single-fiber function of the Ethernet interface is disabled. <b>mode:</b> Enable both the single-fiber transmitting and receiving functions. <b>transmit:</b> Enable the single-fiber transmitting function. <b>transmit:</b> Enable the single-fiber receiving function too.
Disable the single-fiber function	<b>no single-fiber { mode [ receive   transmit ] }</b>	Mandatory By default, this function is disabled

---

 **Note**

- This function takes effect only when the Ethernet interface is the optical interface
- 

## 17.2.2 Configure Port Detection Function

### Configure Port Status Flap Detection

When the port changes from Down to Up and if the port status flap detection is configured and it meets the detection condition, it is regarded that the status flap happens to the specified port or called Link-Flap and the port is automatically disabled and set as Error-Disabled.

Table 17-20 Configuring Port Inspection Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure port flap detection	<b>errdisable flap-setting cause link-flap max-flaps <i>max-flaps-number</i> time <i>time-value</i></b>	Mandatory By default, the trigger condition of executing Link-Flap is: within 10s, the detected port becomes Up for at least 5 times.

---

 **Note**

- When the port is disabled by the Link-Flap function and set as Error-Disabled and if it is necessary to recover automatically, you can configure the command **errdisable recovery cause** to set the above function.
- 

### Enable Port Loopback Test

When performing some troubleshooting, such as locating the port fault initially, you can enable the port loopback test function. The port enabled with the loopback test function cannot forward packets normally.

The port loopback test function includes internal loopback test and external loopback test.

During internal loopback test, change the internal receiving end and sending end of the specified port to make the packets sent by the port loopback in the device and received by the port. If the internal loopback test succeeds, it indicates that the port inside works normally. The Ethernet optical interface will be in the OMM-disabled status when the optical module is not inserted, and the internal loopback is configured not to be able to UP. In this case, you need to cancel the OMM-disabled status of the port first.

During the external loopback test, first insert one self-loop cable on the port and the packets sent by the specified port return to the port via the self-loop cable and received by the port. If the external loopback test succeeds, it indicates that the port works normally.

Table 17-21 Enabling Loopback Test

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  The subsequent configuration takes effect only on the current interface after you enter the L2/L3 Ethernet interface configuration mode
Enable Port Loopback Test	<b>loopback { internal   external }</b>	Mandatory  By default, the loopback test function for the Ethernet interface is not enabled

---

 **Note**

- The loopback test function cannot be enabled on the Ethernet interface that is shut down.
  - **loopback** command is Ethernet interface test command and will not be saved in the startup configuration file.
- 

### 17.2.3 Configure Storm Suppression

#### Configure Storm Suppression Parameters

Limit the broadcast, multicast or unknown unicast traffic on the port by configuring the storm suppression parameters. When the broadcast, multicast or unknown unicast traffic on the port exceeds the set threshold, the system drops the excessive packets, so as to make the proportion of the broadcast, multicast or unknown unicast traffic on the port reduce to the limited range and ensure the normal running of the network services.

Table 1722 Configuring Storm Suppression Parameters

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure Storm Suppression Parameters	<b>storm-control</b> { <b>broadcast</b>   <b>multicast</b>   <b>unicast</b> } { <i>percent-value</i>   <b>kpbs</b> <i>bps-value</i>   <b>pps</b> <i>pps-value</i> }	Mandatory  By default, unicast is at 3000pps, multicast is at 3000pps, and broadcast is at 400pps

---

 **Note**

- The L3 Ethernet interface does not support the configuration of storm suppression.
- 

### Configure Action Executed after Storm Suppression

When the storm is detected on the specified port and the storm suppression is enabled, you can select three policies to process the storms on the port:

One is to make recording on the device and to print on the terminal and output the alarm information of detecting storm. In this mode, the port is enabled, so the port can receive the subsequent traffic and the storm on the port cannot be removed.

One is to disable the port, to make recording on the device and print on the terminal and output the alarm information of storm being detected, and to transmit the alarm information of the storm being detected and shutting down the port to the configured log server via trap. In this mode, the port is disabled, so the port cannot receive the subsequent traffic and the storm on the port is removed at once.

The other is to make recording on the device, to print on the terminal and output the alarm information of detecting storm, and to transmit the alarm information of detecting the storm to the configured log server

via trap. In this mode, the port is enabled, so the port can receive the subsequent traffic and the storm on the port cannot be removed.

Table 17-23 Configuring Action Executed after the Storm Suppression

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the action executed after the storm suppression	<b>storm-control action</b> { <b>shutdown</b>   <b>trap</b>   <b>logging</b> }	Mandatory  By default, the action executed after the storm is detected by the port is the recording on the device, and the alarm information of detecting the storm is printed on the terminal and output

---

 **Note**

- When the port is disabled by the storm suppression function and set as Error-Disabled status and if it is necessary to recover automatically, you can configure the command **errdisable recovery cause** to set the above function.
  - The L3 Ethernet interface does not support configuring the action executed after the storm suppression.
- 

## 17.2.4 Configure Port UNI/NNI Type

### Configure Port UNI/NNI Type

Uni port is the connection port between the user device and a network; nni port is the connection interface between networks. On one device, the nni port and uni port or nni ports are interconnected with no isolation; uni ports are isolated from each other.

Table 17-24 Configuring UNI/NNI Attribute

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure UNI/NNI attribute	<b>port-type { nni   uni }</b>	Mandatory  By default, the UNI/NNI type of the L2 Ethernet interface and aggregation group is <b>nni</b>

---

### Note

- The L3 Ethernet interface does not support the UNI/NNI type.
- 

### Configure Connectivity of uni Port

By default, all uni ports of one device are isolated from each other. However, to realize the intercommunication between the specified multiple uni ports, but not change the isolation relation between these uni ports and other uni ports, you can configure the connectivity of the uni port.

When configuring the connectivity on the specified uni port, you can only set whether the uni port can forward packets to other uni ports, without affecting whether other uni ports can forward packets to the specified uni port. Therefore, to realize the intercommunication between the multiple uni ports, you should configure as community on these uni ports separately.

Table 17-25 Configuring the Connectivity of uni Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Connectivity of uni Port	<b>uni-isolate { community   isolated }</b>	Mandatory By default, the uni port cannot forward packets to other uni ports

---

### Note

- This command can take effect only on the uni port.
  - The L3 Ethernet interface does not support the configuration of the connectivity of the uni port.
- 

## 17.2.5 Configure basic functions of L3 Ethernet interface

The Ethernet interface processes the data packets at different levels, so it can work in the L2 mode or L3 mode. If the working mode of the Ethernet interface is set as L2 mode, it will be used as one L2 Ethernet interface; if the working mode of the Ethernet interface is set as L3 mode, it will be used as one L3 Ethernet interface, and its role is equivalent to VLAN interface. The L3 mode is divided into normal L3 mode and L3 mode with vlan reserved.

### Configuration Condition

None

### Configure Reserved vlan

Table 17-26 Configuring Reserved vlan

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Reserved vlan	<b>vlan reserved for routedport</b> <i>vlan-list</i>	<i>vlan-list</i> : The value range is 2 to 4094  By default, no reserved vlan is created

### Configure L3 Ethernet interface

Table 17-27 Configuring L3 Ethernet Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure L3 Ethernet interface	<b>no switchport</b> <b>[reserved-vlan]</b>	Mandatory  reserved-vlan: interface mode of reserved vlan  By default, the Ethernet interface works in L2 mode and is used as one L2 Ethernet interface
Enter L3 Ethernet sub-interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory  To enter the L3 Ethernet sub-interface configuration mode, you need to create the corresponding L3 Ethernet interface first

Step	Command	Description
		By default, there is no L3 Ethernet sub-interface

## Note

- After the working mode of the Ethernet interface is switched, all the configurations of the Ethernet interface except the description, shutdown, speed, duplex, media-type, mdix, and eee configurations will be restored to the default configuration in a new mode.
- When the Ethernet interface is used as one L3 interface, please refer to the configuration of the basic functions of the VLAN interface for the configuration of the basic functions of the L3 Ethernet interface.
- To switch the L2 Ethernet interface to the L3 Ethernet interface of the reserved vlan, you need to create the reserved vlan first.
- The L3 Ethernet interface of the reserved vlan is used only in vxlan environment.
- To switch between the ordinary L3 interface and the L3 interface of the reserved vlan, you need to switch to the L2 interface first, and then to the required L3 interface mode.

## 17.2.6 Ethernet Interface Monitoring and Maintaining

Table 17-28 Ethernet Interface Monitoring and Maintaining

Command	Description
<b>clear interface</b> <i>interface-name</i>	Clear the statistics information of the specified L3 Ethernet interface
<b>clear interface</b> { <i>interface-list</i>   <b>switchport</b> } <b>statistics</b>	Clear the packet and traffic statistics information of the port
<b>clear optical</b> { <b>all</b>   <b>interface</b> <i>interface-list</i> } <b>exception statistic</b>	Clear the exception statistics information of the optical module inserted on the Ethernet interface
<b>show errdisable flap-values</b>	Display the current setting of triggering executing Link-Flap function
<b>show interface</b> { <i>interface-list</i> [ <b>group</b> ]   <b>switchport</b> [ <b>brief</b> [ <b>down</b>   <b>up</b>   <b>vsl</b> ] ] }	Display all information or abstract information of the Ethernet interface or virtual switch link member port

Command	Description
<b>show interface <i>interface-list</i> statistics</b>	Display the packet and traffic statistics information of the port
<b>show interface switchport statistics</b> [ <b>packet</b>   <b>rate</b>   <b>ratio</b> ]	Display the packet and traffic statistics information of all ports on the device
<b>show interface all statistics</b> [ <b>packet</b>   <b>rate</b>   <b>ratio</b> ]	Display the packet and traffic statistics information of all L2 interfaces and L3 interfaces on the device
<b>show optical</b> { <b>all</b>   <b>interface <i>interface-list</i></b> } [ <b>detail</b>   <b>exception statistic</b> ]	Display the information of the optical module inserted on the Ethernet interface
<b>show port-type</b> [ <i>interface-list</i>   { <b>uni</b>   <b>nni</b> } [ <b>interface <i>interface-list</i></b> ] ]	Display the UNI/NNI attribute information of the port
<b>show group-port</b>	Display the attribute information of the same group that the Ethernet interfaces belong to
<b>show interface <i>interface-list</i> rate-peak</b> [ <b>input</b> / <b>output</b> ]	Display the traffic monitoring information of the specified port
<b>show storm-control</b> [ <b>interface <i>interface-list</i></b> ]	Display the storm suppression setting of the specified port
<b>show optical</b> { <b>all</b>   <b>interface <i>interface-list</i></b> } <b>omm-disabled status</b>	Display whether the port is in OMM-disabled status and the reason why the port is in the OMM-disabled status
<b>show routedport reserved-vlan</b>	Display the usage of reserved vlan

## 17.3 Typical Configuration Example of Ethernet Interface

### 17.3.1 Configure Storm Suppression Function

#### Network Requirements

- Configure the storm suppression function on the port of the device to suppress the broadcast, unknown unicast and multicast packets, realizing that PC2 can access Internet normally when PC1 sends lots of broadcast, unknown unicast and multicast packets.

## Network Topology

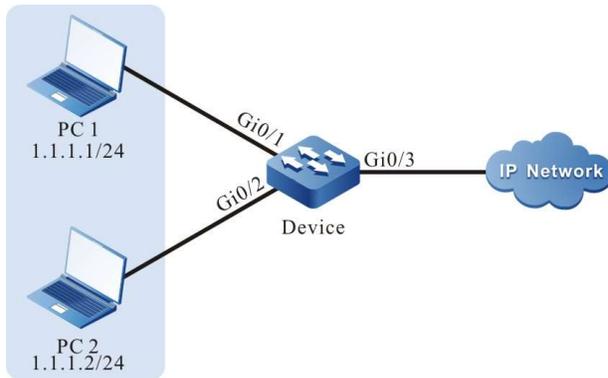

Figure 17-1 Configuring Network Topology of Storm Suppression

## Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 and gigabitethernet0/2 on Device as Access, permitting the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1,0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

#Configure the link type of port gigabitethernet0/3 on Device as Trunk, permitting the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/3
Device(config-if-gigabitethernet0/3)#switchport mode trunk
Device(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/3)#exit
```

*Step 2:* Configure the storm suppression function

#Adopt bps limitation mode to suppress the broadcast, unknown unicast and multicast packets on port gigabitethernet0/1 and the suppression rate is 1024Kbps.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#storm-control broadcast kbps 1024
Device(config-if-gigabitethernet0/1)#storm-control unicast kbps 1024
Device(config-if-gigabitethernet0/1)#storm-control multicast kbps 1024
Device(config-if-gigabitethernet0/1)#exit
```

*Step*  
3:

Check the result.

#View the storm suppression information of port gigabitethernet0/1 on Device.

```
Device#show storm-control interface gigabitethernet 0/1
Status Codes: U - unicast, B - broadcast, M - multicast
Interface      Unicast  Broadcast  Multicast  Action  Status
-----
gi0/1          1024kbps 1024kbps  1024kbps  logging -|-
```

#When PC1 sends lots of broadcast, unknown unicast and multicast packets, PC2 also can access Internet normally.

# 18 Aggregation Group Interface

## 18.1 Overview

Aggregation group interface is one logical interface, including L2 aggregation group interface and L3 aggregation group interface. When enabling the link aggregation function on multiple ports, the multiple ports with the same link aggregation feature form the aggregation group and are abstracted to aggregation group interface; meanwhile, the multiple ports with the same attribute are called the member ports of the aggregation group. It is mainly used to expand the link bandwidth and improve the connection reliability.

## 18.2 Aggregation Group Interface Function Configuration

Table 18-1 Function Configuration List of Aggregation Group Interface

Configuration Task	
Configure Basic Functions of Aggregation Group Interface	Enter the aggregation group interface configuration mode

### 18.2.1 Configure basic functions of L3 aggregation group interface

#### Configuration Condition

None

#### Configure Reserved vlan

Table 182- Configuring Reserved vlan

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure Reserved vlan	<b>vlan reserved for routedport</b> <i>vlan-list</i>	<i>vlan-list</i> : The value range is 2 to 4094  By default, no reserved vlan is created

### Configure L3 Aggregation Group Interface

Table 18-3 Configuring L3 Aggregation Group Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 aggregation group interface configuration mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	Mandatory
Configure L3 Aggregation Group Interface	<b>no switchport</b> <b>[reserved-vlan]</b>	Mandatory  reserved-vlan: interface mode of reserved vlan  By default, the aggregation Ethernet interface works in L2 mode and is used as one L2 Ethernet aggregation interface
Enter L3 aggregation group sub-interface configuration mode	<b>interface</b> <i>interface-name</i>	Mandatory  To enter the L3 aggregation group sub-interface configuration mode, you need to create the corresponding L3 aggregation interface first  By default, there is no L3 aggregation group sub-interface

---

 **Note**

- Before entering the specified aggregation group interface configuration mode, you must first create the corresponding aggregation group.
  - After the working mode of the aggregation group interface is switched, all the configurations of the aggregation group interface except the description and shutdown configurations will be restored to the default configuration in a new mode.
  - When the aggregation group interface is used as one L3 interface, please refer to the configuration of the basic functions of the VLAN interface for the configuration of the basic functions of the L3 Ethernet interface.
  - To switch the L2 aggregation group interface to the L3 aggregation group interface of the reserved vlan, you need to create the reserved vlan first.
  - The L3 aggregation interface of the reserved vlan is used only in vxlan environment.
  - To switch between the ordinary L3 interface and the L3 interface of the reserved vlan, you need to switch to the L2 interface first, and then to the required L3 interface mode.
- 

## 18.2.2 Monitoring and Maintaining of Aggregation Group Interface

Table 18-4 Monitoring and Maintaining of Aggregation Group Interface

Command	Description
<b>clear interface link-aggregation</b> <i>link-aggregation-id</i>	Clear the statistics information of the specified L3 aggregation group interface
<b>clear interface switchport link-aggregation</b> <i>link-aggregation-id</i> <b>statistics</b>	Clear the packet and traffic statistics information of the specified L2 aggregation group
<b>show interface switchport link-aggregation</b> [ <b>brief</b>   <b>description</b> ]	Display all information or description information of the L2 aggregation group
<b>show interface link-aggregation</b> <i>link-aggregation-id</i> <b>statistics</b>	Display the packet and traffic statistics information of the specified aggregation group
<b>show interface link-aggregation</b> <i>link-aggregation-id</i> <b>rate-peak</b> [ <b>input</b>   <b>output</b> ]	Display the traffic monitoring information of the specified aggregation group
<b>show port-type interface link-aggregation</b> <i>link-aggregation-id</i>	Display the UNI/NNI attribute information of the L2 aggregation group

# 19 VLAN Interface

---

## 19.1 Overview

VLAN interface is one logical interface, used to be bound with VLAN and complete the packet forwarding between different VLANs. One VLAN can only be bound to one VLAN interface. One VLAN interface also can only be bound with one VLAN.

## 19.2 VLAN Interface Function Configuration

Table 19-1 VLAN Interface Function Configuration List

Configuration Task	
Configure the basic functions of the VLAN interface	Configure VLAN interface
	Configure the logical bandwidth of the interface
	Configure interface delay
	Configure interface MTU
	Configure interface protocol delay UP

### 19.2.1 Configure the basic functions of the VLAN interface

#### Configuration Condition

None

#### Configure VLAN interface

Table 19-2 Configuring VLAN Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create VLAN interface	<b>interface vlan <i>vlan-id</i></b>	Mandatory  By default, do not create VLAN interface.

### Note

- VLAN interface is one logical interface. To work normally, you need to create the corresponding VLAN and add the physical port to VLAN. For how to create VLAN and add physical ports to the VLAN, refer to the related chapters in the User Manual VLAN.
- There is no order requirement for creating VLAN interface, creating VLAN and adding physical port to VLAN.

### Configure the logical bandwidth of the interface

The logical bandwidth of the interface affects the calculation of the route cost and QoS, but does not affect the physical bandwidth of the interface. Usually, when the interface is connected to WAN, it is suggested that the logical bandwidth of the user configuration interface is consistent with the actual bandwidth of the leased line.

Table 19-3 Configuring Logical Bandwidth of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface vlan <i>vlan-id</i></b>	-
Configure the logical bandwidth of VLAN interface	<b>bandwidth <i>width-value</i></b>	Optional  By default, the logical bandwidth of the VLAN interface is 100,000 Kbps.

### Configure interface delay

The interface delay configuration affects the calculation of the routing protocol cost, but does not affect the actual transmission delay of the interface. The user can change the cost of the routing protocol by configuring the interface delay.

Table 19-4 Configuring Interface Delay

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface vlan <i>vlan-id</i></b>	-
Configure VLAN interface delay	<b>delay <i>delay-time</i></b>	Optional By default, the delay of the VLAN interface is 10 and the unit is 10 microsecond.

### Configure interface MTU

The interface MTU decides the maximum length of the IP fragment packet and the user can configure manually.

Table 19-5 Configuring Interface MTU

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface vlan <i>vlan-id</i></b>	-
Configure VLAN interface MTU	<b>mtu <i>mtu-size</i></b>	Mandatory By default, the VLAN interface MTU is 1500 bytes.

### Configure interface protocol delay UP

UP and DOWN of the interface can be specifically divided into UP/DOWN of the link and UP/DOWN of the protocol; after the link is UP, the system informs the upper layer protocol module and other modules through the protocol UP to start transmitting and receiving packets.

In some cases (such as device restart or monoboard reset, etc.), when the link status of the interface changes from DOWN to UP, the upper-layer protocol module may not be ready and cannot process packets temporarily; at this point, the interface protocol delay UP can be configured, and the interface is delayed for a certain period of time to notify the protocol UP again.

Table 19-6 Configuring Interface Protocol Delay UP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface vlan</b> <i>vlan-id</i>	-
Configure VLAN interface protocol delay UP	<b>protocol up-delay-time</b> <i>delay-seconds</i>	Mandatory  By default, the time of the VLAN interface protocol delay UP is 0

## 19.2.2 VLAN Interface Monitoring and Maintaining

Table 19-7 VLAN Interface Monitoring And Maintaining

Command	Description
<b>clear interface vlan</b> <i>vlan-id</i>	Clear the statistics information of the specified VLAN interface
<b>show interface vlan</b> <i>vlan-id</i>	View the information of the specified VLAN interface
<b>show interface vlan</b> <i>vlan-id</i> <b>original statistics</b>	View the statistics information of the specified VLAN interface

## 19.3 Typical Configuration Example of VLAN Interface

### 19.3.1 Configure VLAN interface

#### Network Requirements

- Configure the VLAN interface on Device to realize the intercommunication between PC1 and PC2 of different VLANs.

#### Network Topology

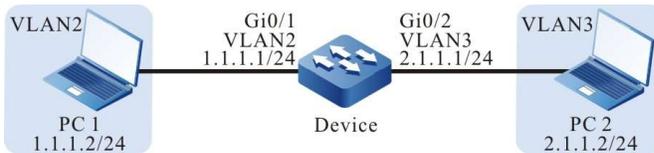

Figure 19-1 Configuring Network Topology of VLAN Interface

#### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

#Create VLAN2 and VLAN3 on Device.

```
Device#configure terminal
Device(config)#vlan 2-3
```

#Configure the link type of port gigabitethernet0/1 and gigabitethernet0/2 on Device as Access. Port gigabitethernet0/1 permits the services of VLAN2 to pass and gigabitethernet0/2 permits the services of VLAN3 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 3
Device(config-if-gigabitethernet0/2)#exit
```

*Step 2:* Configure the VLAN interface and IP address on Device.

#Create VLAN2 interface on Device whose IP address is 1.1.1.1 and subnet mask is 255.255.255.0; create VLAN3 interface whose IP address is 2.1.1.1 and subnet mask is 255.255.255.0.

```
Device(config)#interface vlan 2
Device(config-if-vlan2)#ip address 1.1.1.1 255.255.255.0
Device(config-if-vlan2)#exit
Device(config)#interface vlan 3
Device(config-if-vlan3)#ip address 2.1.1.1 255.255.255.0
Device(config-if-vlan3)#exit
```

Step  
3:

Check the result.

#View the information of VLAN interface on Device.

```
Device#show interface vlan 2
vlan2:
  line protocol is up
  Flags: (0xc008063) BROADCAST MULTICAST ARP RUNNING
  Type: ETHERNET_CSMACD
  Internet address: 1.1.1.24

  Internet address: 2.1.1.24
  Broadcast address: 2.1.1.255
  Metric: 0, MTU: 1500, BW: 100000 Kbps, DLY: 100 usec, VRF: global
  Reliability 255/255, Txload 1/255, Rxload 1/255
  Ethernet address is 0012.2355.9913
  5 minutes input rate 0 bits/sec, 0 packets/sec
  5 minutes output rate 0 bits/sec, 0 packets/sec
  0 packets received; 1 packets sent
  0 multicast packets received
  1 multicast packets sent
  0 input errors; 0 output errors
  0 collisions; 0 dropped
  Unknown protocol 0
```

#PC1 can ping PC2.

# 20 Loopback Interface

---

## 20.1 Overview

Loopback interface, also called local loopback interface, is logical virtual interface implemented by software. This interface is not affected by the physical status. As long as it is not manually disabled, its status is always enabled status. In dynamic routing protocols such as OSPF, you can select the IP address of the Loopback interface as the Router ID, as the identifier of the device. For packets sent to the Loopback interface, the device considers each packet to be sent to itself and will not forward the packet.

## 20.2 Loopback Interface Function Configuration

Table 20-1 Loopback Interface Function Configuration List

Configuration Task	
Configure the basic functions of the Loopback interface	Configuring the Loopback interface
	Configure the logical bandwidth of the interface
	Configure interface delay

### 20.2.1 Configure the basic functions of the Loopback interface

#### Configuration Condition

None

#### Configuring the Loopback interface

Table 20-2 Configuring Loopback Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create Loopback interface	<b>interface loopback</b> <i>unit – number</i>	Mandatory  By default, no Loopback interface is created

### Configure the logical bandwidth of the interface

The logical bandwidth of the interface affects the calculation of the route cost and QoS, but does not affect the physical bandwidth of the interface. Usually, when the interface is connected to WAN, it is suggested that the logical bandwidth of the user configuration interface is consistent with the actual bandwidth of the leased line.

Table 20-3 Configuring Logical Bandwidth of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the logical bandwidth of the interface	<b>bandwidth</b> <i>width-value</i>	Optional  By default, the logical bandwidth of the Loopback interface is 8,000,000 Kbps

### Configure interface delay

The interface delay configuration affects the calculation of the routing protocol cost, but does not affect the actual transmission delay of the interface. The user can change the cost of the routing protocol by configuring the interface delay.

Table 20-4 Configuring Interface Delay

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure interface delay	<b>delay</b> <i>delay-time</i>	Optional  By default, the delay of the Loopback interface is 5000, in 10 microseconds

# 21 Null Interface

---

## 21.1 Overview

Null interface is logical virtual interface implemented by software. Any packet sent to the Null interface will be dropped. Dynamic routing protocols such as OSPF will generate automatically summarized routes, and the outlet interface points to the Null interface, which can effectively avoid routing loops. The Null 0 interface is created by the device by default and cannot be disabled or deleted by the user.

## 21.2 Null Interface Function Configuration

Table 21-1 Null Interface Function Configuration List

Configuration Task	
Configure the Basic Functions of the Null Interface	Configure the Basic Functions of the Null Interface

### 21.2.1 Configure the Basic Functions of the Null Interface

#### Configuration Condition

None

#### Configure the Basic Functions of the Null Interface

Table 21-2 Configuring Basic Functions of Null Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter Null interface configuration mode	<b>interface null 0</b>	Mandatory
Configure to prohibit transmit ICMP unreachable error packets	<b>no ip unreachable</b>	Optional By default, transmitting ICMP unreachable error packets is prohibited

---

### Note

- The Null interface only supports the configuration of allowing or prohibiting transmitting of ICMP unreachable error packets.
  - Packets reaching the Null interface will be dropped, you have no need to transmit ICMP unreachable errors.
-

# 22 Virtual Switch Link Interface

## 22.1 Overview

By binding multiple physical ports together, one virtual switch link interface (VSL-Channel) can be formed. The virtual switch link interface is logical link channel for protocol packet interaction and service data forwarding between member switches in the stack system, and each physical port therein is called member port of the virtual switch link.

Each member switch joins the same switch domain, interconnects with each other through the virtual switch link interface, and finally forms one virtual switch.

## 22.2 Virtual Switch Link Interface Function Configuration

Table 22-1 Virtual Switch Link Interface Function Configuration List

Configuration Task	
Configure functions of the virtual switch link interface	Enter virtual switch link interface configuration mode

### 22.2.1 Configure functions of the virtual switch link interface

#### Configuration Condition

None

#### Enter virtual switch link interface configuration mode

Table 22-2 Entering Virtual Switch Link Interface Configuration Mode

Step	Command	Description
Enter the global configuration mode.	configure terminal	-

Step	Command	Description
Enter virtual switch link interface configuration mode	<code>vsl-channel vsl-channel-id</code>	Mandatory  In stand-alone mode, <i>vsl-channel-id</i> is a one-dimensional value that represents a virtual switch link interface number. In stack mode, it is a two-dimensional value. The first dimension is a virtual switch member number, and the second dimension is a virtual switch link interface number

---

### Note

- Before entering the virtual switch link interface configuration mode, you must first create the corresponding virtual switch link interface.
- 

## 22.2.2 Monitoring and Maintaining of Virtual Switch Link Interface

Table 22-3 Monitoring and Maintaining of Virtual Switch Link Interface

Command	Description
<b>clear vsl-channel vsl-channel-id statistics</b>	Clear the packet and traffic statistics information of the specified virtual switch link interface
<b>show vsl-channel vsl-channel-id rate-peak [ input   output ]</b>	Display the traffic monitoring information of the specified virtual switch link interface
<b>show vsl-channel vsl-channel-id statistics</b>	Display the packet and traffic statistics information of the specified virtual switch link interface

# 23 Tunnel Interface

## 23.1 Overview

Tunnel is one technology that uses one network protocol to transmit another network protocol. It includes the entire process of data encapsulation, transmission, and decapsulation. The path through which the encapsulated packets are transmitted in the network is called Tunnel. Tunnel is one virtual point-to-point connection. The devices at both ends of Tunnel are called Tunnel endpoints, and they are responsible for encapsulating and decapsulating data packets.

## 23.2 Tunnel Interface Function Configuration

Table 23-1 Tunnel Interface Function Configuration List

Configuration Task	
Configure the basic functions of the Tunnel interface	Configure the basic functions of the Tunnel interface

### 23.2.1 Configure the basic functions of the Tunnel interface

#### Configuration Condition

None

#### Configure Basic Functions of Tunnel Interface

Table 23-2 Configuring Basic Functions of Tunnel Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Create Tunnel interface and enter its configuration mode	<b>interface tunnel</b> <i>tunnel-unit</i>	Mandatory By default, no Tunnel interface is created on the device
Configure the working mode of the Tunnel interface	<b>tunnel mode</b> { <i>gre</i> [ <i>ip</i> / <i>ipv6</i> ]   <i>ipip</i>   <i>ipipv6</i>   <i>ipv6ip6</i>   <i>ipv6ip</i> [ <i>6to4</i> / <i>isatap</i> ] }	Optional By default, the working mode of the Tunnel interface is GRE over IPv4
Configure TOS of the Tunnel interface	<b>tunnel tos</b> <i>tos-value</i>	Optional By default, the Tunnel interface is not configured with TOS
Configure TTL of the Tunnel interface	<b>tunnel ttl</b> <i>ttl-value</i>	Optional By default, the TTL value of the Tunnel interface is 255

---

### Note

- The TOS value configured on the Tunnel interface is used to fill in the TOS field in the header of the outer IPv4 packet during encapsulation. If the TOS value is not configured on the Tunnel interface, use the TOS value in the header of the inner IPv4 packet instead.
  - The TTL value configured on the Tunnel interface is used to fill in the TTL field in the header of the outer IPv4 packet during encapsulation.
- 

## 23.2.2 Tunnel Interface Monitoring and Maintaining

Table 23-3 Tunnel Interface Monitoring and Maintaining

Command	Description
<b>enable</b>	Privileged mode
<b>debug tunnel {all   config   event   forward   packet }</b>	Enable the Tunnel debugging information switch
<b>show tunnel [tunnel-id] [slot slot-num]</b>	Display tunnel information

# 24 VXLAN Interface

## 24.1 Overview

The VXLAN interface is one logical interface used for L3 forwarding between different VXLAN instances. One VXLAN instance can only be bound to one VXLAN interface, and also, one VXLAN interface can only be bound to one VXLAN instance. The numbers of the VXLAN instances correspond to the VXLAN interfaces one by one.

## 24.2 VXLAN Interface Function

Table 24-1 VXLAN Interface Function Configuration List

Configuration Task	
Configure functions of the VXLAN Interface	Configure basic functions of the VXLAN Interface
	Configure distributed gateway of the VXLAN interface

## 24.2.1 Configure basic functions of the VXLAN Interface

### Configuration Condition

None

### Configure basic functions of the VXLAN Interface

Table 24-2 Configuring Basic Functions of VXLAN Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create VXLAN interface	<b>interface vxlan vxlan-id</b>	Mandatory By default, no VXLAN interface is created

### Note

- VXLAN interface is one logical interface. To make sure it works normally, you need to create a VXLAN instance with a corresponding number, and the VXLAN instance needs to be associated with a VXLAN access port or VXLAN tunnel that is UP. For how to build a VXLAN network, refer to the relevant chapters in User Manual VXLAN.

## 24.2.2 Configure Distributed Gateway Function of VXLAN

Table 24-3 Configuring Distributed Gateway Function of VXLAN Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter VXLAN interface mode	<b>interface vxlan vxlan-id</b>	-
Configure Distributed Gateway Function of VXLAN	<b>vxlan distribute-gateway</b>	Optional

Step	Command	Description
		Enable the distributed gateway function  By default, the distributed gateway of VXLAN is not enabled

### 24.2.3 VXLAN Interface Monitoring and Maintaining

Table 24-4 VXLAN Interface Monitoring And Maintaining

Command	Description
<b>show interface vxlan</b> <i>vxlan-id</i>	View the information of the specified VXLAN interface

# 25 Link Aggregation

---

## 25.1 Overview

Through link aggregation, multiple physical links between two devices are bound to form a logic link so as to expand link capacity. Within the logic link, the physical links act as redundancy and dynamic backup of each other, providing higher network connection reliability.

## 25.1.1 Basic Concepts

### Aggregation Group and Member Ports

Multiple physical ports are bound to form an aggregation group, and the physical ports are member ports of the aggregation group.

### Member Port Status

The member ports of an aggregation group have the following two statuses:

- **Selected:** The member ports which are in this status can participate in user service traffic forwarding. The member ports in this status are called "the selected ports".
- **Unselected:** The member ports which are in this status cannot participate in user service traffic forwarding. The member ports in this status are called "the unselected ports".

The rate and duplex mode of an aggregation group is determined by the selected ports in the aggregation group. The rate of an aggregation group is the sum of all selected ports, and the duplex mode of the aggregation group is the same as the duplex mode of the selected ports.

### Operation Key

An operation key is the property configuration of member ports. It consists of the rate, duplex mode, and administrative key (that is, the aggregation group number). In property configuration, change of the duplex mode or rate may cause re-calculation of the operation key.

In one aggregation group, if the duplex modes or rates of member ports are different, then the generated operation keys are different. However, the member ports that are in the selected status must have the same operation key.

### LACP

Link Aggregation Control Protocol (LACP) is a protocol that is based on IEEE802.3ad. In LACP, Link Aggregation Control Protocol Data Units (LACPDU) are used to interchange messages between two ends.

### LACP Priorities

LACP priorities are categorized into two types: system LACP priorities and port LACP priorities.

- **System LACP priorities:** They are used to determine the LACP priority order of the devices at two ends.
- **Port LACP priorities:** They are used to determine the priority order at which the member ports of the local device are selected.

### System ID and Port ID

**System ID:** Aggregation property of a device. It consists of the system LACP priority of the device and the system MAC address. The higher the system LACP priority is, the better the system ID of the device is. If

the system LACP priorities are the same, then the smaller the system MAC address is, the better the system ID of the device is.

Port ID: Aggregation property of a port. It consists of the port LACP priority and the port number. The higher the port LACP priority is, the better the port ID is. If the port LACP priorities are the same, then the smaller the port number is, the better the port ID is.

### Root Port of an Aggregation Group

The protocols that are applied in an aggregation group receive and send protocol packets through the root port of the aggregation group. The root port of an aggregation group is selected from the member ports of the aggregation group. The physical link of the root port must be in the up status.

### 25.1.2 Link Aggregation Modes

Link aggregation modes include the static aggregation mode and the dynamic aggregation mode. Aggregation groups are categorized into static aggregation groups and dynamic aggregation groups.

#### Static Aggregation Mode

In static aggregation mode, the LACP protocol of the member ports of the devices at the two ends is in the disabled status. In the static aggregation group of the local device, set the selected and unselected status for the member ports by following the guidelines as described below:

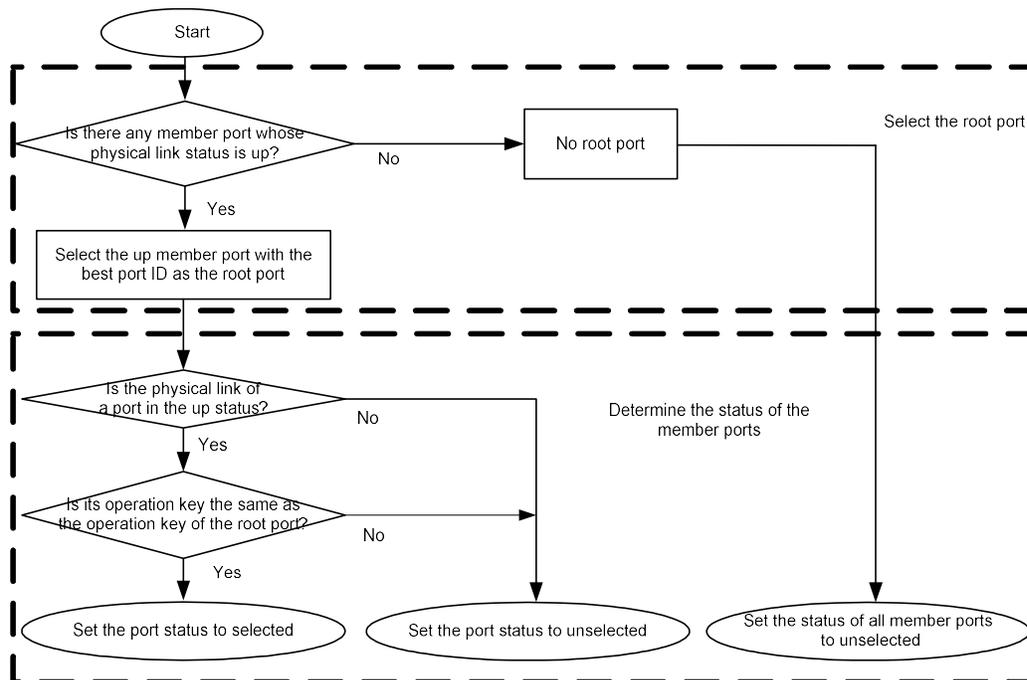

Figure 25 Setting the Status of Member Ports in Static Aggregation Mode

#### Dynamic Aggregation Mode

In dynamic aggregation ports, a port can join in a dynamic aggregation group in two modes, active or passive.

- If the duplex mode of the port is full duplex:

If the port joins in a dynamic aggregation group in active mode, the LACP protocol is enabled for the port.

If the port joins in a dynamic aggregation group in passive mode, the LACP protocol is disabled for the port. After it receives the LACPDU packets from the peer port, the LACP protocol is enabled.

- If the duplex mode of the port is half duplex, no matter the port joins in a dynamic aggregation group in either mode, the LACP protocol is disabled for the port.

In the dynamic aggregation group, set the selected and unselected status for the member ports by following the guidelines as described below:

First determine the device with a better system ID. Then the device determines the statuses of the member ports of the devices at the two ends. The device with the better system ID sets the selected and unselected status for the member ports by following the guidelines as described below:

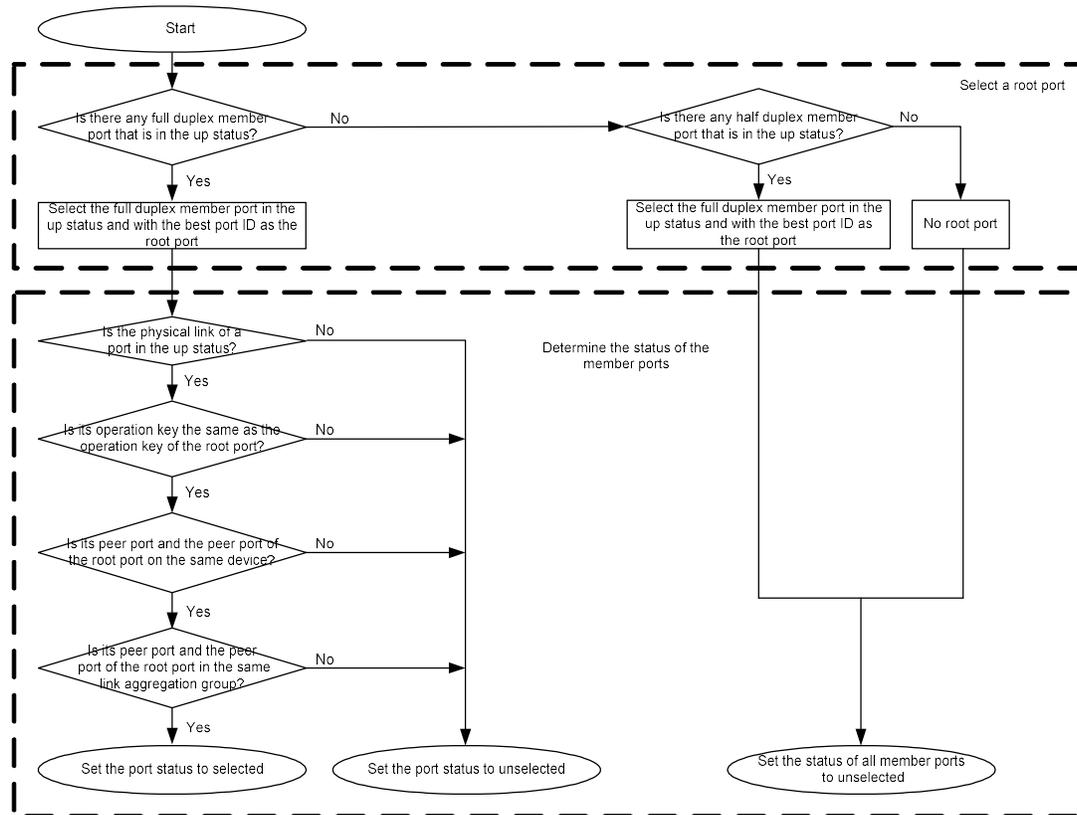

Figure 1 Setting the Status of Member Ports in Dynamic Aggregation Mode

## 25.2 Overview

### 25.2.1 Load balancing

Load balance means when the traffic outlet is an aggregation group/ECMP group, chips can enable traffic to realize load balancing between member ports within the aggregation group/ECMP group according to current HASH configuration conditions to improve the bandwidth availability ratio of aggregation group/ECMP group.

### 25.2.2 HASH KEY

HASH KEY means the KEY value calculated by chips through HASH for port when the traffic selects the specific port of aggregation group/ECMP group. Generally, different packet types and different switching chips support different values of HSAH KEY. The HASH KEYs supported by different packets are shown in Table 1-1.

Table 25 Values of HASH KEY Supported by Different Types of Packet and Their Meanings

Type of HASH KEY	Description
dst-mac	Based on destination MAC address: Realize aggregation load balancing by the destination MAC address of packet.
src-mac	Based on source MAC address: Realize aggregation load balancing by the source MAC address of packet.
src-interface	Based on receiving source interface: Realize aggregation load balancing by the receiving source interface of packet.
vlan	Based on VLAN: Realize aggregation load balancing by the VLAN of packet.
dst-ip	Based on destination IP address: Realize aggregation load balancing by the destination IP address of packet.
l4-dst-port	Based on layer-4 destination port number: Realize aggregation load balancing by the four-layer destination port number of packet.

Type of HASH KEY	Description
protocol	Based on IP protocol: Realize aggregation load balancing by the IP protocol of packet.
src-ip	Based on source IP address: Realize aggregation load balancing by the source IP address of packet.
l4-src-port	Based on layer-4 source port number: Realize aggregation load balancing by the layer-4 source port number of packet.
Top-label	Realize load balancing based on mpls packet header
2nd-label	Realize load balancing based on layer-2 tag of mpls packet
ingress-nickname	Realize aggregation load balancing by the ingress nickname of packet
egress-nickname	Realize aggregation load balancing by the egress nickname of packet

For this device, the HASH KEYS supported by different packets are shown in Table 1-2:

Table 1 HASH KEYS Supported by Different Packets

Type of Packet	HASH KEY Support
Known unicast packet in L2	dst-mac, src-mac, src-interface, vlan
Known unicast packet in L3 (IPv4/IPv6)	dst-ip, l4-dst-port, protocol, src-ip, l4-src-port, src-interface
Other packets in L2	dst-mac, src-mac, src-interface
Other packets in L3 (IPv4/IPv6)	dst-ip, src-ip, src-interface
Mpls packet	Src-ip, dst-ip, top-label, 2nd-label
Vxlan packet	dst-mac, src-mac, vlan, dst-ip, src-ip, protocol, l4-src-port, l4-dst-port

Type of Packet	HASH KEY Support
Trill packet	dst-mac、 src-mac、 vlan、 egress-nickname、 ingress-nickname

---

### Note

- The HASH KEY of known unicast packet in L2 can support a combination of one or more combination HASH KEYs.
  - The HASH KEY of known unicast packet in L3 (IPV4/IPV6) can support a combination of one or more combination HASH KEYs. The HASH KEYs of other L2 packets are fixed and cannot be configured. They use dst-mac, src-mac, and src-interface for load balancing.
  - The HASH KEYs of other L3 (IPv4/IPv6) packets are fixed and cannot be configured. They use dst-ip, src-ip and src-interface for load balancing.
- 

### 25.2.3 Load balancing mode

Load balancing mode is a "user-mode" concept specially introduced to shield the difference of chips from different chip manufacturers. In particular, "user" means to all the services that need to use chip load balancing (i.e., business modules, such as aggregation LAC); "mode" is a reusable HASH configuration plan that abstracts underlying HASH resource.

Load balancing mode is distinguished by mode name which has less than 31 characters. By default, there is a default HASH mode "default" in the system. Besides, there are 6 modes that complete load balancing based on mode name. They can be referenced, but cannot be configured. The "default" mode generally comprises the HASH KEY configuration of L2 packets/L3 packets/MPLS packets/VXLAN packets/TRILL packets. Users may flexibly configure the load balancing mode and the HASH KEY of corresponding mode as needed. Upon completion of the configuration, they can realize load balancing of traffic according to corresponding mode configuration by referring or binding corresponding mode.

---

### Note

- The default load balancing mode name "default" cannot be modified.
  - The default load balancing mode "default" cannot be deleted, but can be configured.
- 

## 25.3 Function configuration of load balancing mode

Table 2 Function Configuration List of Load Balancing Mode

Configuration Task	
Load balancing mode configuration function	Enter the mode configuration mode
	Configure the HASH KEY of load balancing mode
	Configure the load selection of ip tunnel packet
	Configure the load selection of mpls, vxlan and trill packet
	Configure the algorithm selection of LAC load
	Configure the algorithm selection of ECMP load
	Configure the algorithm selection of ipv6 packet address
	Configure the deep analysis algorithm for ip, mpls, and vxlan packet of load balancing mode

### 25.3.1 Enter the load balancing mode

After successfully entering the load balancing mode, you may configure its mode.

#### Note

- Users can create 0 custom mode at most.

#### Configuration Condition

None

#### Create load balancing mode

Table 1-4 Entering Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the load balancing mode	<b>load-balance profile default</b>	Mandatory

---

## Note

- By default, the "default" mode has been created by the system. Users can directly enter the configuration mode of the "default" mode through the creation command.
  -
- 

### 25.3.2 Configure the HASH KEY of load balancing mode

After successfully entering the mode configuration mode, you can configure the HASH KEY value of corresponding load balancing mode.

---

## Note

- The "default" mode created by the system by default will configure a set of default HASH KEY. Users can modify the configuration as needed.
  - The default configurations of the "default" mode are as follows: L2: src-mac, dst-mac; Ipv4/Ipv6: src-ip, dst-ip, l4-src-port, l4-dst-port; mpls: src-ip, dst -ip; vxlan: src-mac, dst-mac, l4-src-port, l4-dst-port; trill: src-mac, dst-mac.
- 

---

## Caution

- The configuration of HASHKEY can become effective only after it is activated by executing active configuration pending.
- 

### Configuration Condition

None

### Configure the HASH KEY of load balancing mode

Table 3 HASH KEY Configuration of Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the load balancing mode configuration mode	<b>load-balance profile</b> default	Mandatory Enter the configuration mode of default mode

Step	Command	Description
Configure the HASH KEY used by L2 known unicast packet load	<b>l2</b> { [ <b>dst-mac</b> ] [ <b>src-mac</b> ] [ <b>src-interface</b> ] [ <b>vlan</b> ] }	Mandatory One or more HASH KEYS can be combined
Configure the HASH KEY used by known unicast packet in L3 (IPV4/IPV6)	<b>Ipv4/Ipv6</b> { [ <b>dst-ip</b> ] [ <b>I4-src-port</b> ] [ <b>I4-dst-port</b> ] [ <b>protocol</b> ] [ <b>src-interface</b> ] [ <b>src-ip</b> ] }	Mandatory One or more HASH KEYS can be combined
Configure the HASH KEY used by mpls packet load	<b>Mpls</b> {[ <b>src-ip</b> ] [ <b>dst-ip</b> ] [ <b>top-label</b> ] [ <b>2nd -label</b> ] }	Mandatory One or more HASH KEYS can be combined
Configure the HASH KEY used by vxlan packet load	<b>Vxlan</b> {[ <b>src-mac</b> ][ <b>dst-mac</b> ][ <b>vlan</b> ] [ <b>src-ip</b> ][ <b>dst-ip</b> ][ <b>protocol</b> ] [ <b>I4-src-port</b> ][ <b>I4-dst-port</b> ] }	Mandatory One or more HASH KEYS can be combined
Configure the HASH KEY used by trill packet load	<b>Trill</b> {[ <b>src-mac</b> ][ <b>dst-mac</b> ][ <b>vlan</b> ] [ <b>sgress-nickname</b> ][ <b>ingress-nickname</b> ] }	Mandatory One or more HASH KEYS can be combined
Activate current HASH KEY configuration	<b>active configuration pending</b>	Mandatory
Cancel current HASH KEY configuration	<b>abort configuration pending</b>	Mandatory

## Note

- Configure HASH KEY value through l2/IPV4/IPV6/MPLS/VXLAN/TRILL command. It cannot not take effect immediately when in pending status. Only active configuration pending can make it effective.
- Configure HASH KEY value through l2/IPV4/IPV6/MPLS/VXLAN/TRILL command. It cannot not take effect immediately when in pending status. Users may cancel the current configuration by using the abort configuration pending command.
- When a new HASH KEY is configured, the original HASH KEY will not be overwritten. The result of activation with the active command combines both the

original HASH KEY and the new one.

- When the HASH KEY in pending status is canceled with the abort command, the original HASH KEY will not be modified.
- When the activation fails, which is generally because the HASH KEY configured doesn't meet the requirements, the pending HASH KEY will not be cleared.
- Requirements for "default" mode: The HASH KEYs of L2 and IPV4/IPV6 shouldn't be empty at the same time, and corresponding HASHKEY shouldn't be empty either when the MPLS/VXLAN/TRILL service is bound to the mode.

### 25.3.3 Configure the deep analysis algorithm for ipv4/ipv6 packet of load balancing mode

After entering the mode configuration mode, you can configure the deep analysis algorithm of corresponding load balancing mode for ipv4/ipv6 packet.

#### Configuration Condition

Under mode configuration mode

#### Configure the deep analysis algorithm for ipv4/ipv6 packet of load balancing mode

Table 4 Configuring Deep Analysis Algorithm for ipv4/ipv6 Packet of Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the load balancing mode configuration mode	<b>load-balance profile default</b>	Mandatory Enter the configuration mode of default mode
Configure the deep analysis algorithm for ipv4/ipv6 packet	<b>hash-control depth-parse ipv4/ipv6</b> { [enable][disable] }	enable: ip packet hash based on ip header disable: ip packet hash based on mac

### 25.3.4 Configure the deep analysis algorithm for mpls and vxlan packet of load balancing mode

After entering the mode configuration mode, you can configure the deep analysis algorithm of corresponding load balancing mode for mpls and vxlan packet.

#### Configuration Condition

Under mode configuration mode

### Configure the deep analysis algorithm for mpls and vxlan packet of load balancing mode

Table 5 Configuring Deep Analysis Algorithm for mpls and vxlan Packet of Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the load balancing mode configuration mode	<b>load-balance profile default</b>	Mandatory Enter the configuration mode of default mode
Configure the deep analysis algorithm for mpls packet	<b>hash-control depth-parse mpls { [enable][disable] }</b>	enable: load balancing for packet based on mpls header  diabile: load balancing for packet based on layer-3 or layer-2 header
Configure the deep analysis algorithm for vxlan packet	<b>hash-control depth-parse vxlan{ [enable][disable] }</b>	enable: load balancing for packet based on vxlan header  diabile: load balancing for packet based on layer-3 or layer-2 header

### 25.3.5 Configure the load selection for ip tunnel packet of load balancing mode

After entering the mode configuration mode, you can configure the load selection of corresponding load balancing mode for ip tunnel packet.

#### Configuration Condition

Under mode configuration mode

#### Configure the load selection for ip tunnel packet of load balancing mode

Table 6 Configuring Load Selection for ip Tunnel Packet of Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the load balancing mode configuration mode	<b>load-balance profile</b> default	Mandatory Enter the configuration mode of default mode
Configure the deep analysis algorithm for v4inv4 packet	<b>hash-control depth-parse v4inv4</b> { [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v4inv4  outer-header: load selection for packet based on the outer layer header of v4inv4
Configure the deep analysis algorithm for v4inv6 packet	<b>hash-control depth-parse v4inv6</b> { [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v4inv6  outer-header: load selection for packet based on the outer layer header of v4inv6
Configure the deep analysis algorithm for v6inv4 packet	<b>hash-control depth-parse v6inv4</b> { [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v6inv4  outer-header: load selection for packet based on the outer layer header of v6inv6
Configure the deep analysis algorithm for v6inv6 packet	<b>hash-control depth-parse v6inv6</b> { [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v6inv6  outer-header: load selection for packet

Step	Command	Description
		based on the outer layer header of v6inv6
Configure the deep analysis algorithm for v4grex4 packet	<b>hash-control depth-parse</b> v4grex4{ [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v4grex4  outer-header: load selection for packet based on the outer layer header of v4grex4
Configure the deep analysis algorithm for v4grex6 packet	<b>hash-control depth-parse</b> v4grex6{ [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v4grex6  outer-header: load selection for packet based on the outer layer header of v4grex6
Configure the deep analysis algorithm for v6grex4 packet	<b>hash-control depth-parse</b> v6grex4{ [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v6grex4  outer-header: load selection for packet based on the outer layer header of v6grex4

Step	Command	Description
Configure the deep analysis algorithm for v6gre6 packet	<b>hash-control depth-parse</b> v6gre6{ [inner-header][ outer-header] }	inner-header: load selection for packet based on the inner layer header of v6gre6  outer-header: load selection for packet based on the outer layer header of v6gre6

### 25.3.6 Configure the load selection for mpls, vxlan and trill packet of load balancing mode

After entering the mode configuration mode, you can configure the load selection of corresponding load balancing mode for mpls, vxlan and trill packet.

#### Configuration Condition

Under mode configuration mode

#### Configure the load selection for mpls, vxlan and trill packet of load balancing mode

Table 7 Configuring Load Selection for mpls, vxlan and trill Packet of Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the load balancing mode configuration mode	<b>load-balance profile</b> default	Mandatory Enter the configuration mode of default mode
Configure the load selection for mpls packet	<b>hash-control mpls field</b> { [inner-l2][inner-l3] }	Inner-l2: load balancing for packet based on inner layer 2 of mpls  Inner-l3: load balancing for packet based on inner layer 3 of mpls

Step	Command	Description
Configure the load selection for vxlan packet	<b>hash-control vxlan field</b> { [inner-l2][inner-l3] }	Inner-l2: load balancing for packet based on inner layer 2 of vxlan  Inner-l3: load balancing for packet based on inner layer 3 of vxlan
Configure the load selection for trill packet	<b>hash-control trill field</b> { [inner-l2][inner-l3] }	Inner-l2: load balancing for packet based on inner layer 2 of trill  Inner-l3: load balancing for packet based on inner layer 3 of trill

### 25.3.7 Configure HASH algorithm selection for LAC and ECMP of load balancing mode

After entering the mode configuration mode, you can configure HASH algorithm selection for LAC and ECMP.

#### Configuration Condition

Under mode configuration mode

#### Configure HASH algorithm selection for LAC and ECMP of load balancing mode

Table 8 Configuring HASH Algorithm Selection for LAC and ECMP of Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the load balancing mode configuration mode	<b>load-balance profile</b> default	Mandatory Enter the configuration mode of default mode
Configure algorithm selection for LAC	<b>hash-control algorithm</b> { XOR16   CRC32-LO   CRC32-HI   CRC16-CCITT	Configure the hash algorithm used when the egress is link aggregation

Step	Command	Description
	<pre> CRC16-BISYNC  CRC16-BISYNC-XOR1  CRC16- BISYNC-XOR2  CRC16-BISYNC- XOR4  CRC16-BISYNC-XOR8 }</pre>	
Configure algorithm selection for ECMP	<pre><b>hash-control algorithm</b> {XOR16  CRC32-LO  CRC32-HI  CRC16-CCITT  CRC16-BISYNC  CRC16-BISYNC-XOR1  CRC16- BISYNC-XOR2  CRC16-BISYNC- XOR4  CRC16-BISYNC-XOR8 }</pre>	Configure the hash algorithm used when the egress is ECMP

### 25.3.8 Configure algorithm selection for ipv6 address compression of load balancing mode

After entering the mode configuration mode, you can configure algorithm selection for ipv6 address compression of corresponding load balancing mode.

#### Configuration Condition

Under mode configuration mode

#### Configure algorithm selection for ipv6 address compression of load balancing mode

Table 9 Configuring Algorithm Selection for ipv6 Address Compression of Load Balancing Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the load balancing mode configuration mode	<b>load-balance profile default</b>	Mandatory Enter the configuration mode of default mode

Step	Command	Description
Configure algorithm selection for ipv6 address compression	<b>hash-control ipv6 collapse</b> { [XOR][LSB] }	Select XOR algorithm by default

## 25.4 Link Aggregation Function Configuration

Table 10 Function Configuration List of Link Aggregation

Configuration Task	
Configure an Aggregation Group	Create an Aggregation Group
	Add Ports into the Aggregation Group
Configure LACP Priorities	Configure the System LACP Priority
	Configure the Port LACP Priority
Configure hot plug for rapid switch of root port	Configure hot plug for rapid switch of root port

### 25.4.1 Configure an Aggregation Group

Configuring the aggregation group can realize centralized management of multiple physical ports. Any configuration of the aggregation group will have an impact on all member ports.

#### Note

- Each aggregation group can support up to 16 ports at the same time.

#### Configuration Condition

None

#### Create an Aggregation Group

The aggregation groups at the two ends of an aggregated link must be configured to the same type. Description can be added to each aggregation group to make it easier for network administrators to distinguish the aggregation groups.

Table 11 Configuring Creation of Aggregation Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create an Aggregation Group	<b>link-aggregation link-aggregation-id mode { manual   lacp }</b>	Mandatory By default, the aggregation group is not created.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation link-aggregation-id</b>	-
Configure aggregation group description information	<b>description description-name</b>	Optional By default, there is no aggregation group description information.
Configure description information for peer port of aggregation group	<b>peer-description description-name</b>	Optional By default, the aggregation group has no peer port description information.

## Caution

- The protocols that are applied in an aggregation group receive and send protocol packets through the root port of the aggregation group. In static aggregation mode, because the member ports between the devices at two ends do not exchange LACPDU packets, the root ports of the two devices may be on different physical links. In this way, other protocol packets on the aggregation group may fail to be received or sent. To prevent this problem, ensure that the root ports of the devices at the two ends are on the same physical link. In dynamic aggregation mode, the member ports of the devices at two ends exchange LACPDU packets. The negotiation between the two member ports ensures that the root ports of the two devices are on the same physical link.
- After an aggregation group is deleted, all the member ports of the aggregation group are removed from the aggregation group, and then all the member ports adopt the default settings. This may result in loops in the network. Therefore, before deleting an aggregation group, ensure that the spanning tree function has been enabled or ensure that no loop may occur in the network.

## Add Ports into the Aggregation Group

When an aggregation group is created, it is only a logic interface which contains no physical port. In this case, the aggregation function does not take effect. The aggregation function takes effect after ports are added to a static aggregation group. The aggregation function takes effect after local or peer ports are added into a dynamic aggregation group.

Table 12 Addition of Ports into Aggregation Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Add Ports into the Aggregation Group	<b>link-aggregation</b> <i>link-aggregation-id</i> { <b>manual</b>   <b>active</b>   <b>passive</b> }	Mandatory By default, the port is not added into any aggregation group.

---

### Note

- Before adding a port into an aggregation group, the aggregation group must have been created; otherwise, an error message is displayed.
  - A port can be added one aggregation group at a time.
  - After a port is added into an aggregation group, the some existing configurations (such as loopback detection and VLAN) will be removed from the port.
  - Some functions (such as loopback detection) cannot be configured on a member port in an aggregation group; otherwise, an error message is displayed.
  - If a port is added into a dynamic aggregation group in passive mode, its peer port must be added into the dynamic aggregation group in active mode. Otherwise, the two ports are both in the unselected status and they cannot participate in user service traffic forwarding.
- 

## 25.4.2 Configure LACP Priorities

### Configuration Condition

None

### Configure the System LACP Priority

Configuration of the system LACP priority may affect the system ID, and finally affect the selected/unselected status of member ports of dynamic aggregation groups.

Table 13 Configuration of System LACP Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the System LACP Priority	<b>lacp system-priority</b> <i>system-priority-value</i>	Mandatory By default, the system LACP priority is 32768.

### Configure the Port LACP Priority

Configuration of the port LACP priority may affect the port ID, and finally affect the selected/unselected status of member ports of aggregation groups.

Table 1-16 Configuration of Port LACP Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	-
Configure the Port LACP Priority	<b>lacp port-priority</b> <i>port-priority-value</i>	Mandatory By default, the port LACP priority is 32768.

### 25.4.3 Configure hot plug for rapid switch of root port

Configure a hot plug for rapid switch of root port so that when the board where the root port is located is hot-plugged, the peer port can be quickly notified to reselect a root port for rapid stabilization and convergence of the aggregation group.

---

 **Note**

- The rapid switch notice will be sent only when the board where the root port is located is pulled out.
  - Static aggregation group will not send rapid switch notice.
- 

**Configuration Condition**

None

**Configure hot plug for rapid switch of root port**

Table 14 Configuration of Hot Plug for Rapid Switch of Root Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure hot plug for rapid switch of root port	<b>link-aggregation hotswap fast-change-rootport</b>	Mandatory By default, hot plug for rapid switch of root port is not configured.

## 25.4.4 Link Aggregation Monitoring and Maintaining

Table 15 Link Aggregation Monitoring and Maintaining

Command	Description
<b>show link-aggregation group</b> [ <i>link-aggregation-id</i> ]	Displays brief information about a specified aggregation group or all existing aggregation groups.
<b>show link-aggregation interface</b> [ <i>interface-name</i> ]	Displays the details of a specified member port of an aggregation group or details of all member ports of the aggregation group.

## 25.5 Typical Configuration Example of Link Aggregation

### 25.5.1 Configure a Static Aggregation Group

#### Network Requirements

- Device1 is connected to PC1, Device2 is connected to PC2 and PC3, and the three PCs are in the same network segment. Device1 and Device2 are interconnected through Trunk ports.
- A static aggregation group is configured between Device1 and Device2 for bandwidth increase, load sharing, and service backup.

#### Network Topology

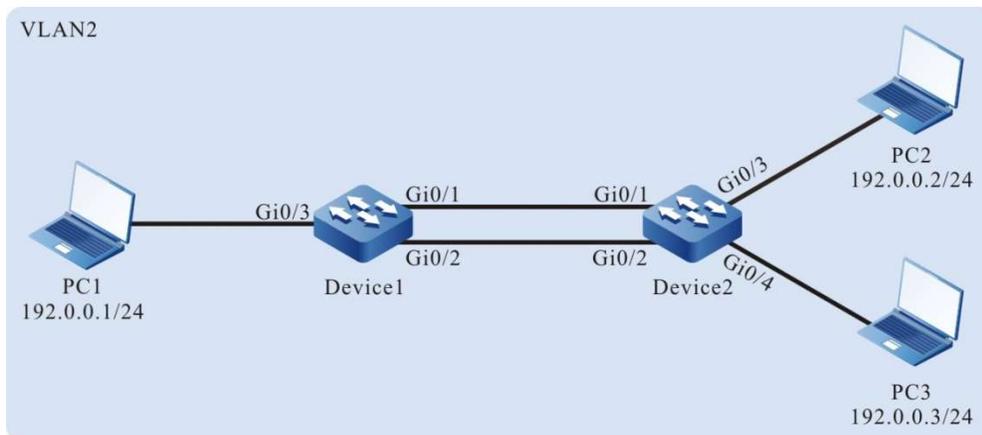

Figure 2 Networking for Configuring a Static Aggregation Group

#### Configuration Steps

*Step 1:* Create a static aggregation group.

#On Device1, create static aggregation group 1.

```
Device1#configure terminal
Device1(config)#link-aggregation 1 mode manual
```

#On Device2, create static aggregation group 2.

```
Device2#configure terminal
Device2(config)#link-aggregation 1 mode manual
```

*Step 2:* Add ports into the aggregation group.

#On Device1, add ports gigabitethernet0/1 and gigabitethernet0/2 into aggregation group 1 in Manual mode.

```
Device1(config)#interface gigabitethernet 0/1,0/2
Device1(config-if-range)#link-aggregation 1 manual
Device1(config-if-range)#exit
```

#On Device2, add ports gigabitethernet0/1 and gigabitethernet0/2 into aggregation group 1 in Manual mode.

```
Device2(config)#interface gigabitethernet 0/1,0/2
Device2(config-if-range)#link-aggregation 1 manual
Device2(config-if-range)#exit
```

#After the configuration is completed, check the status of aggregation group 1 on the devices.

Here takes Device1 for example:

```
Device1#show link-aggregation group 1
Link Aggregation 1
Type: switchport
Mode: Manual
User: LAC
Description:
Peer-description:
Least active-linknumber: 1
Maximal active-linknumber: 16
Load balance profile: default
Number of ports in total: 2
Number of ports attached: 2
Root port: gigabitethernet0/1
gigabitethernet0/1: ATTACHED
gigabitethernet0/2: ATTACHED
```

According to the system display, ports gigabitethernet0/1 and gigabitethernet0/2 are both in the ATTACHED state in aggregation group 1, and aggregation of aggregation group 1 is successful.

---

## Note

- For the method of checking Device2, refer to the method of checking Device1.
- 

*Step*  
3:

Configure the load balancing mode of the aggregation group.

# Enter default of load balancing mode on Device1.

```
Device1(config)#load-balance profile default
```

# Under the default of load balancing mode on Device1, configure the packet load hash-key, make L2 packet loaded by destination MAC, and make IP packet loaded by destination IP.

```
Device1(config-userProfile-default)#l2 dst-mac
Device1(config-userProfile-default)#ip dst-ip
Device1(config-userProfile-default)#active configuration pending
```

*Step* 4: Configure a VLAN, and configure the link type of the aggregation group and ports.

#On Device1, create VLAN2, configure the link type of aggregation group 1 as Trunk, allow services of VLAN2 to pass, and configure PVID as 2.

```
Device1(config)#vlan 2
Device1(config-vlan2)#exit
Device1(config)#interface link-aggregation 1
Device1(config-link-aggregation1)#switchport mode trunk
Device1(config-link-aggregation1)#switchport trunk allowed vlan add 2
Device1(config-link-aggregation1)#switchport trunk pvid vlan 2
Device1(config-link-aggregation1)#exit
```

#On Device1, configure the link type of port gigabitethernet0/3 as Access, and allow services of VLAN2 to pass.

```
Device1(config)#interface gigabitethernet 0/3
Device1(config-if-gigabitethernet0/3)#switchport mode access
Device1(config-if-gigabitethernet0/3)#switchport access vlan 2
Device1(config-if-gigabitethernet0/3)#exit
```

#On Device2, create VLAN2, configure the link type of aggregation group 1 as Trunk, allow services of VLAN2 to pass, and configure PVID as 2. (Omitted)

#On Device2, configure the link type of ports gigabitethernet0/3 and gigabitethernet0/4 as Access, and allow services of VLAN2 to pass. (Omitted)

*Step* 5: Check the result.

#Check the aggregation bandwidth of aggregation group 1 on the devices.

Here takes Device1 for example:

```
Device1#show interface link-aggregation 1
link-aggregation 1 configuration information
  Description      :
  Peer-description :
  Status           : Enabled
  Link             : Up
  Act Speed        : 2000
  Act Duplex       : Full
  Port Type        : Nni
  Pvid             : 2
```

According to the system display, the interface bandwidth of the aggregation group 1 on Device1 is 2000 M.

- 
- For the method of checking Device2, refer to the method of checking Device1.
- 

#During the process of service interaction between PC1 and PC2 and PC3, load balancing of data is achieved on the aggregated links. If a link in the aggregation group becomes faulty, the other links provide service backup.

## 25.5.2 Configure a Dynamic Aggregation Group

### Network Requirements

- Device1 is connected to PC1, Device2 is connected to PC2 and PC3, and the three PCs are in the same network segment. Device1 and Device2 are interconnected through Trunk ports.
- A dynamic aggregation group is configured between Device1 and Device2 for bandwidth increase, load sharing, and service backup.

### Network Topology

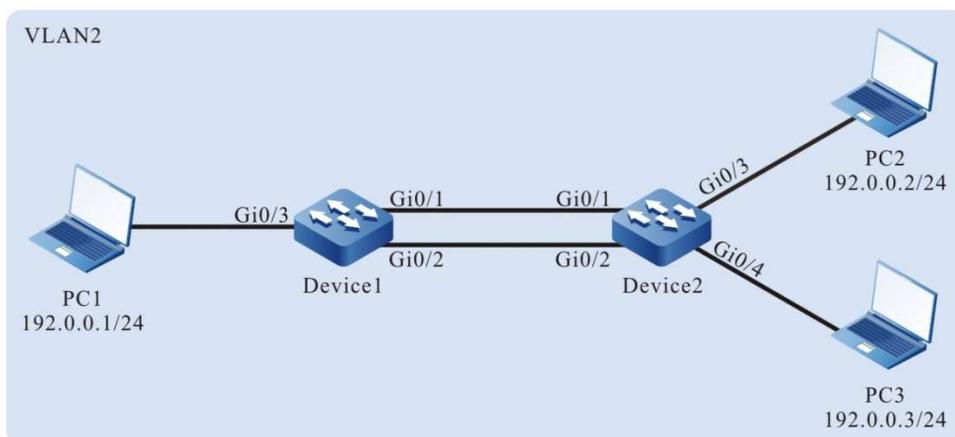

Figure 3 Networking for Configuring a Dynamic Aggregation Group

### Configuration Steps

*Step 1:* Create a dynamic aggregation group.

#On Device1, create dynamic aggregation group 1.

```
Device1#configure terminal
Device1(config)#link-aggregation 1 mode lacp
```

#On Device2, create dynamic aggregation group 1.

```
Device2#configure terminal
Device2(config)#link-aggregation 1 mode lacp
```

*Step*  
2: Add ports into the aggregation group.

#On Device1, add ports gigabitethernet0/1 and gigabitethernet0/2 into aggregation group 1 in Active mode.

```
Device1(config)#interface gigabitethernet 0/1,0/2
Device1(config-if-range)#link-aggregation 1 active
Device1(config-if-range)#exit
```

#On Device2, add ports gigabitethernet0/1 and gigabitethernet0/2 into aggregation group 1 in Active mode.

```
Device2(config)#interface gigabitethernet 0/1,0/2
Device2(config-if-range)#link-aggregation 1 active
Device2(config-if-range)#exit
```

#After the configuration is completed, check the status of aggregation group 1 on the devices.

Here takes Device1 for example:

```
Device1#show link-aggregation group 1
Link Aggregation 1
Type: switchport
Mode: LACP
User: LAC
Description:
Peer-description:
Least active-linknumber: 1
Maximal active-linknumber: 16
Load balance profile: default
Number of ports in total: 2
Number of ports attached: 2
Root port: gigabitethernet0/1
gigabitethernet0/1: ATTACHED
gigabitethernet0/2: ATTACHED
```

According to the system display, ports gigabitethernet0/1 and gigabitethernet0/2 are both in the ATTACHED state in aggregation group 1, and aggregation of aggregation group 1 is successful.

---

### Note

- For the method of checking Device2, refer to the method of checking Device1.
- 

*Step*  
3: Configure the load balancing mode of the aggregation group.

# Enter default of load balancing mode on Device1.

```
Device1(config)#load-balance profile default
```

# Under the default of load balancing mode on Device1, configure the packet load hash-key, make L2 packet loaded by destination MAC, and make IP packet loaded by destination IP.

```
Device1(config-userProfile-default)#l2 dst-mac
Device1(config-userProfile-default)#ip dst-ip
```

Device1(config-userProfile-default)#active configuration pending

*Step*  
4: Configure a VLAN, and configure the link type of the aggregation group and ports.

#On Device1, create VLAN2, configure the link type of aggregation group 1 as Trunk, allow services of VLAN2 to pass, and configure PVID as 2.

```
Device1(config)#vlan 2
Device1(config-vlan2)#exit
Device1(config)#interface link-aggregation 1
Device1(config-link-aggregation1)#switchport mode trunk
Device1(config-link-aggregation1)#switchport trunk allowed vlan add 2
Device1(config-link-aggregation1)#switchport trunk pvid vlan 2
Device1(config-link-aggregation1)#exit
```

#On Device1, configure the link type of port gigabitethernet0/3 as Access, and allow services of VLAN2 to pass.

```
Device1(config)#interface gigabitethernet 0/3
Device1(config-if-gigabitethernet0/3)#switchport mode access
Device1(config-if-gigabitethernet0/3)#switchport access vlan 2
Device1(config-if-gigabitethernet0/3)#exit
```

#On Device2, create VLAN2, configure the link type of aggregation group 1 as Trunk, allow services of VLAN2 to pass, and configure PVID as 2. (Omitted)

#On Device2, configure the link type of ports gigabitethernet0/3 and gigabitethernet0/4 as Access, and allow services of VLAN2 to pass. (Omitted)

*Step*  
5: Check the result.

#Check the aggregation bandwidth of aggregation group 1 on the devices.

Here takes Device1 for example:

```
Device1#show interface link-aggregation 1
link-aggregation 1 configuration information
  Description      :
  Peer-description :
  Status           : Enabled
  Link             : Up
  Act Speed        : 2000
  Act Duplex       : Full
  Port Type        : Nni
  Pvid             : 2
```

According to the system display, the interface bandwidth of the aggregation group on Device1 is 2000 M.

---

 **Note**

- For the method of checking Device2, refer to the method of checking Device1.
- 

#During the process of service interaction between PC1 and PC2 and PC3, load balancing of data is achieved on the aggregated links. If a link in the aggregation group becomes faulty, the other links provide service backup.

# 26 Port Isolation

---

## 26.1 Overview

Port isolation is a security feature that is based on ports. According to the actual requirement, you can configure certain ports to be isolated from a specified port, that is, configure some isolated ports for a specified port. In this way, the packets that are received by the specified port cannot be forwarded to the isolated ports. This enhances the network security, and also provides a flexible networking scheme.

## 26.2 Port Isolation Function Configuration

Table 26 Function Configuration List of Port Isolation

Configuration Task	
Configure the basic function of port isolation.	Configure port isolation.
Configure the isolation function for member ports of the aggregation group.	Configure isolation function for member ports of the aggregation group.

### 26.2.1 Configure the basic function of port isolation.

The port isolation function realizes unidirectional packet isolation. Assuming that port B is configured as the isolated port of port A, then if a packet whose target port is port B enters port A, the port is directly discarded. However, if a packet whose target port is port B enters port B, the port is normally forwarded. The isolated port can be a port or an aggregation group.

Port isolation, configured based on aggregation group.

- Ports in the same isolation group are isolated from each other.
- Ports in the isolation group can be configured as ingress, egress and both. The analysis

is shown below:

Table 26 Configure Mode Forwarding

Packet ingress port mode	Packet egress port mode	Whether it can be normally forwarded
ingress mode	ingress mode	Normal forwarding
ingress mode	egress mode	Locked
ingress mode	both mode	Locked
egress mode	ingress mode	Normal forwarding
egress mode	egress mode	Normal forwarding
egress mode	both mode	Normal forwarding
both mode	ingress mode	Normal forwarding
both mode	egress mode	Locked
both mode	both mode	Locked

- Ports in the isolation group normally communicate with those not in the isolation group
- Ports in different isolation groups can normally communicate with each other

### Configuration Condition

Isolation group has been created

### Configure port isolation.

Table 1 Configuration of Port Isolation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter isolation group configuration mode	<b>isolate group <i>group-id</i></b>	Mandatory

Step	Command	Description
Add ports into the isolation group	<b>interface</b> <i>interface-list</i> [ <b>ingress</b>   <b>egress</b>   <b>both</b> ]	Mandatory  By default, the port is not added into any isolation group.
Add aggregation group into the isolation group.	<b>interface link-aggregation</b> <i>link-aggregation-id</i> [ <b>ingress</b>   <b>egress</b>   <b>both</b> ]	Mandatory  By default, the aggregation group is not added into any isolation group.

---

### Note

- When the port is added into an isolation group, the isolation group needs to be created.
- 

## 26.2.2 Port Isolation Monitoring and Maintaining

Table 26 Port Isolation Monitoring and Maintaining

Command	Description
<b>show isolate</b> { <b>group</b> [ <i>group-id</i> ]   <b>interface</b> <i>interface-list</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> }	Show port isolation information

## 26.3 Typical Configuration Example of Port Isolation

### 26.3.1 Configure port isolation.

#### Network Requirements

- Connect PC1 and PC2 to Device, in the same VLAN2.
- Configure port isolation on Device so that PC1 and PC2 cannot communicate with each other.

## Network Topology

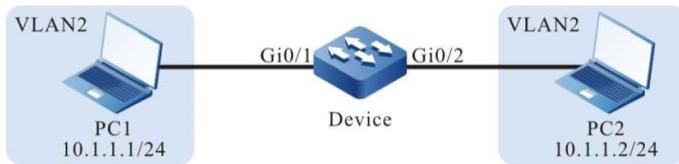

Figure 26 Configuration of Network Topology for Port Isolation

## Configuration Steps

*Step 1:* Configure VLANs and the link type of the ports.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 on Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

*Step 2:* Configure port isolation.

#Configure isolation group on Device

```
Device#config terminal
Device(config)#isolate group 1
Device(config-isolate-group 1)#
Device(config-isolate-group 1)#end
Device#show isolate group 1
```

```
-----
isolate group 1
ingress member:
egress member :
both member  :
```

#Configure mutual isolation for ports gigabitethernet0/1 and gigabitethernet0/2 on Device.

```
Device#config terminal
Device(config)#isolate group 1
Device(config-isolate-group 1)#interface gigabitethernet 0/1-0/2
```

```
Device#show isolate group 1
-----
isolate group 1
ingress member:
egress member :
both members  : gi0/1-0/2
```

#View the information of port isolation on Device.

```
Device#show isolate interface gigabitethernet 0/1-0/2
interface gigabitethernet0/1 isolated information
isolate group 1 mode: both
isolated interface:
    gi0/2
interface gigabitethernet0/2 isolated information
isolate group 1 mode: both
isolated interface:
    gi0/1
```

*Step 3:* Check the result.

#PC1 cannot communicate with PC2.

# 27 VLAN

## 27.1 Overview

In a switched Ethernet, each port in the device is an independent collision domain, but all the ports belong to a broadcast domain. When a terminal device sends broadcast packets, all devices in the Local Area Network (LAN) can receive the packets. This not only wastes network bandwidth, but also brings hidden troubles.

Virtual Local Area Network (VLAN) is a technology through which devices in the same LAN can be divided in a logic manner. The devices in the same VLAN can communicate with each other at layer 2, while the devices from different VLANs are isolated at layer 2. In this way, broadcast packets are limited within a VLAN.

VLANs comply with IEEE 802.1Q. This standard defines a new frame encapsulation format, in which a 4-byte VLAN tag containing VLAN information is added after the source MAC address of a traditional data frame.

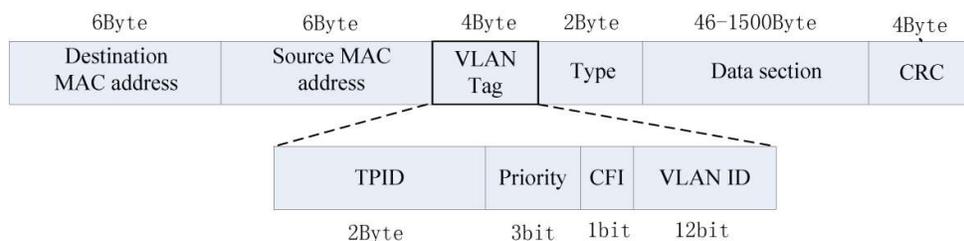

Figure 27 IEEE 802.1Q Frame Encapsulation Format

A VLAN tag contains the following four fields:

- Tag Protocol Identifier (TPID): It is used to determine whether a VLAN tag is carried by the data frame. The length is 2 bytes, and the value is fixed to be 0x8100, indicating a standard 802.1Q tag.
- Priority: It is the 802.1p priority. The length is 3 bits and the value range is 0-7. Packets with different priorities can obtain services of different levels.
- Canonical Format Indicator (CFI): It indicates whether the MAC address is encapsulated in a standard format for transmission in different media. The length is 1 bit. The value 0 indicates that the MAC address is encapsulated in a standard format while the value 1

indicates that the MAC address is encapsulated in a non-standard format.

- VLAN ID: It indicates the VLAN to which the packet belongs. The length is 12 bits, and the value range is 0-4095, where 0 and 4095 are protocol reserved values, and the available VLAN IDs are in the range of 1-4094.

VLANs have the following advantages:

- Establishes virtual workgroups flexibly. Users with the same requirements can be divided into one VLAN, without being limited by their physical locations.
- Limits broadcast domains. A VLAN is a broadcast domain. Layer-2 unicast, multicast, and broadcast frames can be forwarded only within the domain, and they cannot enter other VLANs directly. This prevents broadcast storms.
- Improves the network security. Different VLANs are isolated at layer two, and the VLANs cannot communicate with each other directly.

According to applications, VLANs are categorized into the following four types:

- Port-based VLANs
- MAC address-based VLANs
- IP subnet-based VLANs
- Protocol-based VLANs

By default, in the order of priorities from high to low, the four types of VLANs are: MAC address-based VLANs, IP subnet-based VLANs, protocol-based VLANs, and port-based VLANs. On one port, the VLAN takes effect according to the priority levels, and only one type of VLAN takes effect.

## 27.2 VLAN Function Configuration

Table 27 VLAN Function Configuration List

Configuration Task	
Configure basic attributes for VLAN	Configure VLAN
	Configure VLAN name
Configure a Port-Based VLAN	Configure the Port Link Type
	Add an Access Port into the VLAN
	Configure a Trunk Port to Allow Services of a VLAN to Pass
	Add a Hybrid Port into the VLAN

Configuration Task	
	Configure PVIDs for Ports
Configure a MAC Address-Based VLAN	Configure a MAC Address-Based VLAN
Configure an IP Subnet-Based VLAN	Configure an IP Subnet-Based VLAN
Configure a Protocol-Based VLAN	Configure a Protocol-Based VLAN
Configure the Types of Frames that Can Be Received by the Port	Configure the Types of Frames that Can Be Received by the Port

## 27.2.1 Configure basic attributes for VLAN

### Configuration Condition

None

### Configure VLAN

Each VLAN is an independent broadcast domain. Users within the same VLAN can communicate with each other in Layer 2, while those in different VLANs are isolated from each other in Layer 2.

Table 27-2 Configuring VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create VLAN	<b>vlan</b> <i>vlan-list</i>	Mandatory By default, the system creates VLAN1 automatically. If a single VLAN is created, you will enter the VLAN configuration mode after creation. If multiple VLANs are created, you will

Step	Command	Description
		maintain in current configuration mode after creation.

### Configure VLAN name

For the convenience of memorization and management, VLAN name can be configured according to VLAN service type, function, and connection status.

Table 27-3 Configuring VLAN Name

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure VLAN name	<b>name <i>vlan-name</i></b>	Mandatory  By default, the name of VLAN1 is "DEFAULT", and those of other VLANs are "VLAN <i>vlan-id</i> ", e.g. "VLAN0100".

### 27.2.2 Configure a Port-Based VLAN

A port-based VLAN, also called port VLAN, is a VLAN of the simplest division type. After a port is added into the VLAN, the port can forward packets that belong to the VLAN.

#### Configuration Condition

None

#### Configure the Port Link Type

According to the VLAN tag handling modes, the following three link types are available:

- Access type: The packets that have been forwarded do not carry VLAN tags. Ports of this type are usually connected to user devices.

- Trunk type: The packets from the VLANs in which the PVID is located do not carry VLAN tags, while the packets from other VLANs still carry VLAN tags.
- Hybrid type: The packets from the specified VLAN can be configured not to carry or carry VLAN tags. Ports of the type can be connected to user devices or interconnected with network devices.

The ports of the Trunk type and the ports of the Hybrid type cannot be converted to each other directly. They need to be converted to the Access type before being converted to another type.

Table 27-4 Configuring Link Type of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the Port Link Type	<b>switchport mode { access   hybrid   trunk }</b>	Mandatory  By default, the port link type is the Access type.

### Caution

- Some commands can be configured only on the ports with the specified link type. Therefore, if the port link type is converted to another type, the functions that are configured on the port with the original link type may become invalid.

## Add an Access Port into the VLAN

One Access port can belong to only one VLAN. When an Access port is added into a specified VLAN, it exits from the current VLAN and then enters the specified VLAN. If the VLAN to which the Access port is to be added does not exist, the VLAN is automatically created.

Table 27-5 Add Access Port into VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the port link type as the Access type.	<b>switchport mode access</b>	Mandatory  By default, the port link type is the Access type.
Add an Access port into the specified VLAN.	<b>switchport access vlan</b> <i>vlan-id</i>	Mandatory  By default, the Access port is added into VLAN1.

### Configure a Trunk Port to Allow Services of a VLAN to Pass

If a Trunk port allows services of an existing VLAN to pass, the port allows forwarding packets of the VLAN. If the VLAN that the Trunk port allows to pass does not exist, the VLAN will not be created automatically and you must create the VLAN before the port allows forwarding packets of the VLAN.

Table 27-6 Configuring Trunk Port to Allow VLAN to Pass

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the port link type as the Trunk type.	<b>switchport mode trunk</b>	Mandatory By default, the port link type is the Access type.
Configure a Trunk port to allow a VLAN to pass.	<b>switchport trunk allowed</b> <b>vlan { all   add <i>vlan-list</i> }</b>	Mandatory By default, the Trunk port allows VLAN1 to pass.
Configure the packets from the VLAN in which the PVID is located to be forwarded with VLAN tags reserved.	<b>vlan dot1q tag pvid</b>	Optional By default, the packets from the VLAN in which the PVID is located are forwarded without VLAN tags.

### Add a Hybrid Port into the VLAN

If the VLAN to which the Access port is to be added does not exist, the VLAN is automatically created.

Table 27-7 Add Hybrid Port into VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the port link type as the Hybrid type.	<b>switchport mode hybrid</b>	Mandatory  By default, the port link type is the Access type.
Add a Hybrid port to a specified VLAN in a specified mode.	<b>switchport hybrid</b> { <b>untagged</b>   <b>tagged</b> } <b>vlan</b> <i>vlan-list</i>	Mandatory  By default, the Hybrid port is added into VLAN1 in Untagged mode.

### Configure PVIDs for Ports

Port VLAN ID (PVID) is an important parameter of a port. When a port receives an Untag packet, it adds a VLAN tag to the packet, and the VLAN ID of the VLAN tag is the PVID of the port.

The PVID of an Access port is the ID of the VLAN to which it belongs, so the PVID of the Access port can be configured only by changing the VLAN to which it belongs. The Trunk port and hybrid port can belong to multiple VLANs, and their PVIDs can be configured according to the actual requirement.

The Trunk port and Hybrid port must be added into the VLAN to which their PVIDs belong; otherwise, packets of the VLAN to which their PVIDs belong cannot be forwarded, and the port discards the received Untag packets.

Table 27-8 Configuring PVID of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure PVID of Trunk port	<b>switchport trunk pvid vlan</b> <i>vlan-id</i>	Mandatory, select one according to the link type of port
Configure PVID of Hybrid port	<b>switchport hybrid pvid vlan</b> <i>vlan-id</i>	By default, the port LACP is VLAN1.

---

### Note

- In configuring the PVID for a port, the VLAN to which the PVID belongs must have been created; otherwise, the configuration fails, and an error message is prompted.
- 

### 27.2.3 Configure a MAC Address-Based VLAN

MAC address-based VLANs, also called MAC VLANs, are classified according to the source MAC addresses of the packets. After a MAC VLAN is configured, if the port receives an Untag packet and the source MAC address of the packet matches a MAC VLAN entry, the system adds a VLAN tag for the packet, in which the VLAN ID matches the VLAN ID in the MAC VLAN entry.

After the physical location of the user is changed, if the MAC address of the user is not changed, the VLAN to which the user port belongs need not be re-configured.

## Configuration Condition

None

## Configure a MAC Address-Based VLAN

Table 27-9 Configuring MAC-based VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure a MAC VLAN entry.	<b>mac-vlan mac-address mac-address vlan vlan-id</b>	Mandatory  By default, no MAC VLAN entry is configured.
Enter the layer-2 Ethernet interface configuration mode.	<b>interface interface-name</b>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation link-aggregation-id</b>	
Enable the MAC VLAN function of the port.	<b>mac-vlan enable</b>	Mandatory  By default, the MAC VLAN function is disabled on the port.

---

### Note

- The port on which the MAC VLAN function is enabled must be added into the VLAN that matches the entry; otherwise, the port cannot forward packets of the VLAN, and the packets that match the source MAC address will be discarded.
-

## 27.2.4 Configure an IP Subnet-Based VLAN

IP subnet-based VLANs, also called IP subnet VLANs, are classified according to the source IP addresses of the packets. After an IP subnet VLAN is configured, if the port receives an Untag packet and the source IP address of the packet matches an IP subnet VLAN entry, the system adds a VLAN tag for the packet, in which the VLAN ID matches the VLAN ID in the IP subnet VLAN entry.

After the physical location of the user is changed, if the IP address of the user is not changed, the VLAN to which the user port belongs need not be re-configured.

### Configuration Condition

None

### Configure an IP Subnet-Based VLAN

Table 27-1 Configuring IP Subnet-based VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure an IP subnet-based VLAN entry	<b>ip-subnet-vlan ipv4 ip-address mask mask vlan vlan-id</b>	Mandatory By default, no IP subnet VLAN entry is configured.
Enter the layer-2 Ethernet interface configuration mode.	<b>interface interface-name</b>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation link-aggregation-id</b>	
Enable the IP subnet VLAN function of the port	<b>ip-subnet-vlan enable</b>	Mandatory By default, the IP subnet VLAN function is disabled on the port.

---

 **Note**

- The port on which the IP subnet VLAN function is enabled must be added into the VLAN that matches the entry; otherwise, the port cannot forward packets of the VLAN, and the packets that match the source IP address will be discarded.
- 

## 27.2.5 Configure an IPV6 Subnet-based VLAN

IPV6 subnet-based VLANs, also called IPV6 subnet VLANs, are classified according to the source IPV6 addresses of the packets. After an IPV6 subnet VLAN is configured, if the port receives an Untag packet and the source IPV6 address of the packet matches an IPV6 subnet VLAN entry, the system adds a VLAN Tag for the packet, in which the VLAN ID matches that in the IPV6 subnet VLAN entry.

After the physical location of the user is changed, if the IPV6 address of the user is not changed, the VLAN to which the user port belongs need not be re-configured.

### Configuration Condition

None

### Configure an IPV6 Subnet-based VLAN

Table 27-11 Configuring IPV6 Subnet-based VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure an IPV6 subnet-based VLAN entry	<b>ipv6-subnet-vlan ipv6 prefix-address vlan vlan-id</b>	Mandatory By default, no IPV6 subnet VLAN entry is configured.
Enter the layer-2 Ethernet interface configuration mode.	<b>interface interface-name</b>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation link-aggregation-id</b>	After you enter the aggregation group configuration mode, the subsequent

Step	Command	Description
		configuration takes effect only within the aggregation group.
Enable the IPV6 subnet VLAN function of the port	<b>ipv6-subnet-vlan enable</b>	Mandatory  By default, the IPV6 subnet VLAN function is disabled on the port.

### Note

- The port on which the IPV6 subnet VLAN function is enabled must be added into the VLAN that matches the entry; otherwise, the port cannot forward packets of the VLAN, and the packets that match the source IPV6 address will be discarded.

## 27.2.6 Configure a Protocol-Based VLAN

Protocol-based VLANs, also called protocol VLANs, are classified according to the frame encapsulation formats and protocol types of packets. After a protocol profile is defined, a port is configured to match a protocol profile, and the protocol VLAN function is enabled for the port, if the port receives an Untag packet that matches the protocol profile, the port adds a VLAN tag for the packet. The VLAN ID matches the VLAN ID defined in the profile.

After the physical location of the user is changed, if the frame encapsulation format of the user packets and protocol type are not changed, the VLAN to which the user port belongs need not be re-configured.

### Configuration Condition

None

### Configure a Protocol-Based VLAN

Table 27-12 Configuring Protocol-based VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Define protocol profile	<b>protocol-vlan profile</b> <i>profile-index frame-type</i> <i>frame-type ether-type</i> <i>ether-type</i>	Mandatory  By default, the protocol profile is not defined.
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the protocol profile that matches the port	<b>protocol-vlan profile</b> <i>profile-index vlan</i> <i>vlan-id</i>	Mandatory  By default, the port doesn't match any protocol profile.
Enable the protocol VLAN function of the port	<b>protocol-vlan enable</b>	Mandatory  By default, the protocol VLAN function is disabled on the port.

---

### Note

- The port for which a matching protocol profile has been configured and the protocol VLAN function has been enabled must be added into the VLAN corresponding to the protocol profile that it matches; otherwise, the port cannot forward packets of the VLAN, and the packets matching the protocol will be discarded.
- 

## 27.2.7 Configure the Types of Frames that Can Be Received by the Port

### Configuration Condition

None

### Configure the Types of Frames that Can Be Received by the Port

You can configure the types of frames that can be received by a port so that the port receives only Untag packets, receives only Tag packets, or receives both of them. The packets that fail to meet the requirement will be discarded.

Table 27-13 Configuring the Types of Frames that Can be Received by the Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Types of Frames that Can Be Received by the Port	<b>switchport accept frame-type</b> { <b>all</b>   <b>untag</b>   <b>tag</b> }	Mandatory  By default, the type of frames that can be received by a port is all, that is, receiving both Untag and Tag packets.

## 27.2.8 VLAN Monitoring and Maintaining

Table 27-14 VLAN Monitoring and Maintaining

Command	Description
<b>show ip-subnet-vlan</b>	Show the information of IP subnet VLAN

Command	Description
<b>show ipv6-subnet-vlan</b>	Show the information of IPV6 subnet VLAN
<b>show mac-vlan</b>	Show the information of MAC VLAN
<b>show protocol-vlan [ profile ]</b>	Show the information of protocol VLAN
<b>show running-config vlan</b>	Show the information of VLAN configuration
<b>show vlan [ vlan-id ]</b>	Show the information of specified VLAN or all created VLAN
<b>show vlan statistics</b>	Show the number of created VLANs
<b>show vlan summary</b>	Show the VLAN information of static creation and dynamic learning
<b>show { interface interface-name   interface link-aggregation link-aggregation-id } vlan status</b>	Show the VLAN information of specified port or aggregation group

## 27.3 VLAN Typical Configuration Example

### 27.3.1 Configure a Port-Based VLAN

#### Network Requirements

- Server1 and PC1 are in the office network, while Server2 and PC2 are in the production network.
- You need to configure the port-based VLAN functions to isolate PC1 and PC2 so that PC1 can access only Server1 and PC2 can access only Server2.

#### Network Topology

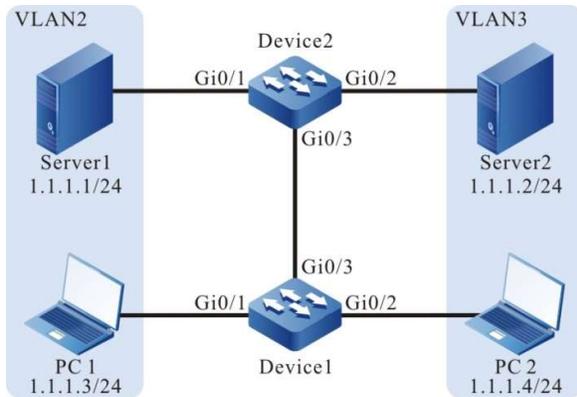

Figure 27 Configuring Network Topology of VLAN based on Port

### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device1.

#Create VLAN2 and VLAN3 on Device1.

```
Device1#configure terminal
Device1(config)#vlan 2-3
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/2 on Device1 as Access. Port gigabitethernet0/1 allows the pass of services of VLAN2 while port gigabitethernet0/2 allows the pass of services of VLAN3.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#switchport mode access
Device1(config-if-gigabitethernet0/1)#switchport access vlan 2
Device1(config-if-gigabitethernet0/1)#exit
Device1(config)#interface gigabitethernet0/2
Device1(config-if-gigabitethernet0/2)#switchport mode access
Device1(config-if-gigabitethernet0/2)#switchport access vlan 3
Device1(config-if-gigabitethernet0/2)#exit
```

#On Device1, configure the link type of port gigabitethernet0/3 as Trunk, and allow the pass of services of VLAN2 and VLAN3.

```
Device1(config)#interface gigabitethernet 0/3
Device1(config-if-gigabitethernet0/3)#switchport mode trunk
Device1(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 2-3
Device1(config-if-gigabitethernet0/3)#exit
```

*Step 2:* Configure VLAN and port link type on Device2.

#Create VLAN2 and VLAN3 on Device2.

```
Device2#configure terminal
Device2(config)#vlan 2-3
```

#Configure the link type of port gigabitethernet0/1 and gigabitethernet0/2 on Device2 as Access. Port gigabitethernet0/1 allows the services of VLAN2 to pass and gigabitethernet0/2 allows the services of VLAN3 to pass.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode access
Device2(config-if-gigabitethernet0/1)#switchport access vlan 2
Device2(config-if-gigabitethernet0/1)#exit
Device2(config)#interface gigabitethernet0/2
Device2(config-if-gigabitethernet0/2)#switchport mode access
Device2(config-if-gigabitethernet0/2)#switchport access vlan 3
Device2(config-if-gigabitethernet0/2)#exit
```

#On Device2, configure the link type of port gigabitethernet0/3 as Trunk, and allow services of VLAN2 and VLAN3 to pass.

```
Device2(config)#interface gigabitethernet 0/3
Device2(config-if-gigabitethernet0/3)#switchport mode trunk
Device2(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 2-3
Device2(config-if-gigabitethernet0/3)#exit
```

*Step*  
3:

Check the result.

#View the information of VLAN on Device1.

```
Device1#show vlan 2
-----
NO. VID VLAN-Name      Owner Mode  Interface
-----
1  2  VLAN0002             static Tagged  gi0/3
                        Untagged gi0/1
Device1#show vlan 3
-----
NO. VID VLAN-Name      Owner Mode  Interface
-----
1  3  VLAN0003             static Tagged  gi0/3
                        Untagged gi0/2
```

#View the information of VLAN on Device2.

```
Device2#show vlan 2
-----
NO. VID VLAN-Name      Owner Mode  Interface
-----
1  2  VLAN0002             static Tagged  gi0/3
                        Untagged gi0/1
Device2#show vlan 3
-----
NO. VID VLAN-Name      Owner Mode  Interface
-----
1  3  VLAN0003             static Tagged  gi0/3
                        Untagged gi0/2
```

# PC1 and PC2 cannot communicate with each other. PC1 can access Server1 only, and PC2 can access Server2 only.

## 27.3.2 Configure a MAC Address-Based VLAN

### Network Requirements

User manual  
Release 1.0 01/2022

- PC1 and PC2 can access the network through different ports of Device.
- The MAC-address based VLAN functions need to be configured so that the PCs with the specified MAC addresses can access the server through different ports. PCs which do not have a specified MAC address can access the server only through a specified port.

## Network Topology

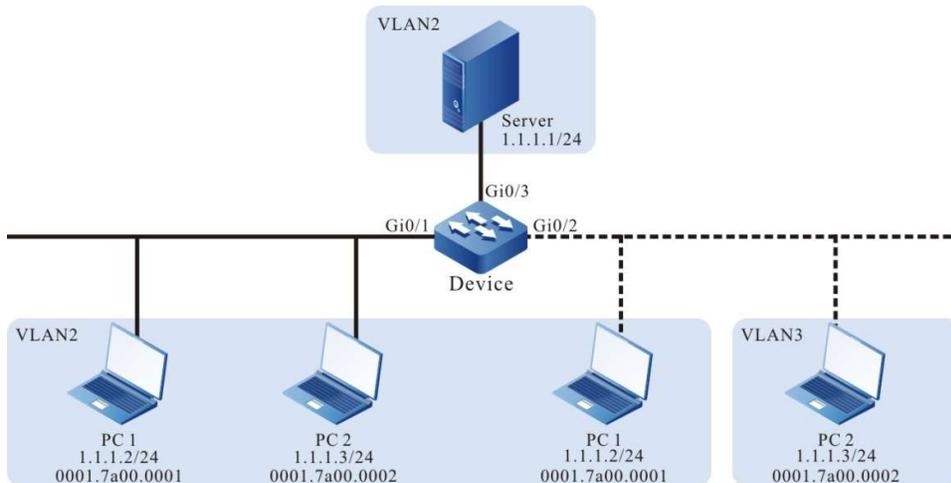

Figure 1 Configure Network Topology of VLAN based on MAC

## Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

Create VLAN2 and VLAN3 on Device.

```
Device#configure terminal
Device(config)#vlan 2-3
```

#Configure the link type of ports gigabitethernet0/1 and gigabitethernet0/3 on Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1,0/3
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

#On Device, configure the link type of port gigabitethernet0/2 as Hybrid, and allow services of VLAN2 and VLAN3 to pass. PVID is 3.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode hybrid
Device(config-if-gigabitethernet0/2)#switchport hybrid untagged vlan 2-3
Device(config-if-gigabitethernet0/2)#switchport hybrid pvid vlan 3
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
*2:*           Configure a MAC-based VLAN function.

#Configure a MAC-based VLAN entry on the Device so that the packet with the source MAC address of 0001.7a00.0001 is forwarded in VLAN 2.

```
Device(config)#mac-vlan mac-address 0001.7a00.0001 vlan 2
```

#On the port gigabitethernet0/2 of the Device, enable MAC-based VLAN functions.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#mac-vlan enable
Device(config-if-gigabitethernet0/2)#exit
```

*Step*  
*3:*           Check the result.

#On the Device, view the information of MAC VLAN entry and the enabling status of port.

```
Device#show mac-vlan
                total 1024,  used 1,  left 1023

-----MAC-VLAN-----
NO.  Mac Address  Dynamic Vlan  Static Vlan  Current Pri  Static Pri
-----
1   0001.7a00.0001  0           2           -           -

-----ENABLE MAC-VLAN-----
gi0/2
```

#PC1 can access the server when connected from port gigabitethernet0/1 or gigabitethernet0/2, and PC2 can access the server only when connected from port gigabitethernet0/1.

### 27.3.3 Configure an IP Subnet-Based VLAN

#### Network Requirements

- Server1 is an office network server, while Server2 is a production network server.
- You need to configure the IP subnet-based VLAN functions so that PC1 can access Server1 only and PC2 can access Server2 only.

#### Network Topology

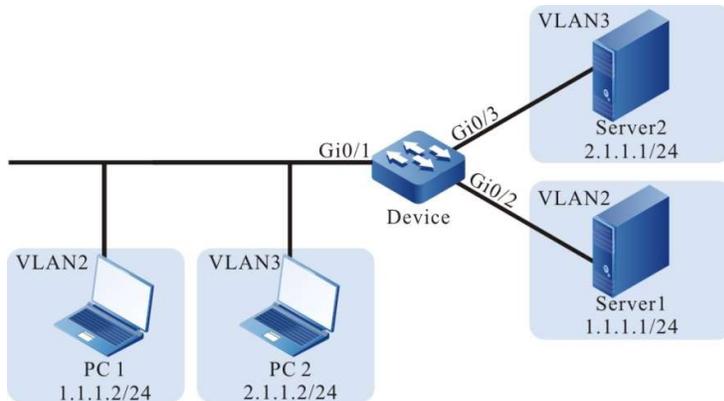

Figure 2 Configure Network Topology for IP Subnet-based VLAN

### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

#Create VLAN2 and VLAN3 on Device.

```
Device#configure terminal
Device(config)#vlan 2-3
```

#On Device, configure the link type of port gigabitethernet0/1 as Hybrid, and allow services of VLAN2 and VLAN3 to pass. PVID is 2.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode hybrid
Device(config-if-gigabitethernet0/1)#switchport hybrid untagged vlan 2-3
Device(config-if-gigabitethernet0/1)#switchport hybrid pvid vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of ports gigabitethernet0/2 and gigabitethernet0/3 on Device as Access. Port gigabitethernet0/2 allows the services of VLAN2 to pass and gigabitethernet0/3 allows the services of VLAN3 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 2
Device(config)#interface gigabitethernet 0/3
Device(config-if-gigabitethernet0/3)#switchport mode access
Device(config-if-gigabitethernet0/3)#switchport access vlan 3
Device(config-if-gigabitethernet0/3)#exit
```

*Step 2:* Configure an IP subnet-based VLAN function.

#Configure an IP subnet-based VLAN entry on the Device so that the packet with the source IP address belonging to the 2.1.1.0/24 network segment is forwarded in VLAN 3.

```
Device(config)#ip-subnet-vlan ipv4 2.1.1.0 mask 255.255.255.0 vlan 3
```

#On the port gigabitethernet0/1 of the Device, enable IP subnet-based VLAN functions.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ip-subnet-vlan enable
Device(config-if-gigabitethernet0/1)#exit
```

Step  
3:

Check the result.

#On the Device, view the information of IP subnet VLAN entry and the enabling status of port.

```
Device(config)#show ip-subnet-vlan
-----IP-SUBNET-VLAN-----
NO.  IP      MASK      VLAN  PRI
-----
1    2.1.1.0  255.255.255.0  3    -

-----Enable SUBNET-VLAN-----
gi0/1

-----Enable SUBNET-VLAN Priority-----
```

# PC1 can access Server1 only, and PC2 can access Server2 only.

## 27.3.4 Configure an IPV6 Subnet-based VLAN

### Network Requirements

- Server1 is an office network server, while Server2 is a production network server.
- You need to configure the IPV6 subnet-based VLAN functions so that PC1 can access Server1 only and PC2 can access Server2 only.

### Network Topology

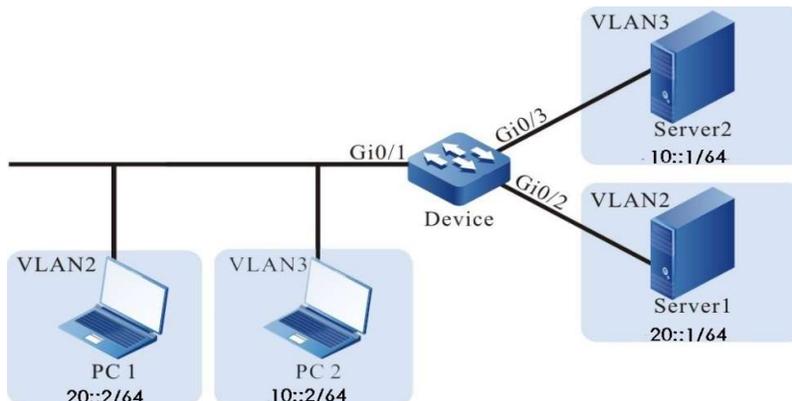

Figure 3 Configuring Network Topology for IPv6 Subnet-based VLAN

### Configuration Steps

*Step*  
*1:*           Configure VLAN and port link type on Device.

#Create VLAN2 and VLAN3 on Device.

```
Device#configure terminal
Device(config)#vlan 2-3
```

#On Device, configure the link type of port gigabitethernet0/1 as Hybrid, and allow services of VLAN2 and VLAN3 to pass. PVID is 2.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode hybrid
Device(config-if-gigabitethernet0/1)#switchport hybrid untagged vlan 2-3
Device(config-if-gigabitethernet0/1)#switchport hybrid pvid vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of ports gigabitethernet0/2 and gigabitethernet0/3 on Device as Access. Port gigabitethernet0/2 allows the services of VLAN2 to pass and gigabitethernet0/3 allows the services of VLAN3 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 2
Device(config)#interface gigabitethernet 0/3
Device(config-if-gigabitethernet0/3)#switchport mode access
Device(config-if-gigabitethernet0/3)#switchport access vlan 3
Device(config-if-gigabitethernet0/3)#exit
```

*Step*  
*2:*           Configure an IPV6 subnet-based VLAN function.

#Configure an IPV6 subnet-based VLAN entry on the Device so that the packet with the source IPV6 address belonging to the 10::1/64 network segment is forwarded in VLAN 3.

```
Device(config)# ipv6-subnet-vlan ipv6 10::1/64 vlan 3
```

#On the port gigabitethernet0/1 of the Device, enable IPV6 subnet-based VLAN functions.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#ipv6-subnet-vlan enable
Device(config-if-gigabitethernet0/1)#exit
```

*Step*  
*3:*           Check the result.

#On the Device, view the information of IPV6 subnet VLAN entry and the enabling status of port.

```
Device(config)#show ipv6-subnet-vlan
-----IPV6-SUBNET-VLAN-----
NO. IPV6                VLAN  PRI
1  10::/64              3     -
-----Enable SUBNET-VLAN-----
gi0/1
```

# PC1 can access Server1 only, and PC2 can access Server2 only.

## 27.3.5 Configure a Protocol-Based VLAN

### Network Requirements

- In Ethernet, PC is a host, while Server1 and Server2 are two servers.
- Configure protocol-based VLAN functions so that when the protocol-based VLAN functions are not enabled by the port on the Device, PC can only access Server1; when the port enables the protocol-based VLAN function, PC can only access Server2.

### Network Topology

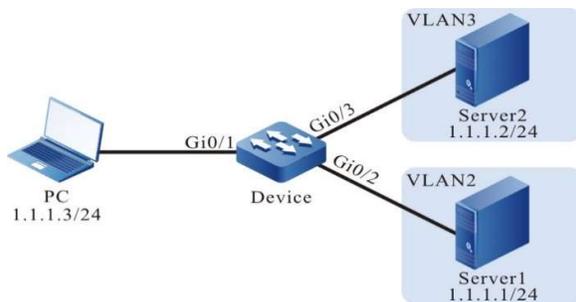

Figure 4 Configuring Network Topology of VLAN based on Protocol

### Configuration Steps

*Step 1:* Configure VLAN and port link type on Device.

#Create VLAN2 and VLAN3 on Device.

```
Device#configure terminal
Device(config)#vlan 2-3
```

#On Device, configure the link type of port gigabitethernet0/1 as Hybrid, and allow services of VLAN2 and VLAN3 to pass. PVID is VLAN 2.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport hybrid untagged vlan 2-3
Device(config-if-gigabitethernet0/1)#switchport hybrid pvid vlan 2
```

#Configure the link type of ports gigabitethernet0/2 and gigabitethernet0/3 on Device as Access. Port gigabitethernet0/2 allows the services of VLAN2 to pass and gigabitethernet0/3 allows the services of VLAN3 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode access
Device(config-if-gigabitethernet0/2)#switchport access vlan 2
Device(config-if-gigabitethernet0/2)#exit
Device(config)#interface gigabitethernet 0/3
Device(config-if-gigabitethernet0/3)#switchport mode access
Device(config-if-gigabitethernet0/3)#switchport access vlan 3
Device(config-if-gigabitethernet0/3)#exit
```

*Step*  
*2:*           Configure a protocol-based VLAN function.

#Configure protocol profile based on the ETHERII encapsulated IP (0x0800) packet on the Device.

```
Device(config)#protocol-vlan profile 1 frame-type ETHERII ether-type 0x0800
```

#Apply the packet matching the protocol profile mentioned above on the port gigabitethernet0/1 of Device to be forwarded in VLAN 3, and enable the protocol VLAN function.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#protocol-vlan profile 1 vlan 3
Device(config-if-gigabitethernet0/1)#protocol-vlan enable
Device(config-if-gigabitethernet0/1)#exit
```

*Step*  
*3:*           Check the result.

#On the Device, view the information of protocol VLAN entry and the enabling status of port.

```
Device#show protocol-vlan profile
-----PROTOCOL-VLAN-TEMPLATE-----
Profile  Frame-type  Ether-type
-----
1      ETHERII      0x800

-----Enable PROTOCOL-VLAN-----
gi0/1

-----Enable PROTOCOL-VLAN Profile-----

-----Enable PROTOCOL-VLAN-----
gi0/1

-----Enable PROTOCOL-VLAN Profile-----
gi0/1: total-profiles 1
      vlan 3, profile 1
```

#When the port gigabitethernet0/1 fails to enable the protocol-based VLAN functions, PC can only access Server1; when the port gigabitethernet0/1 enables the protocol-based VLAN function, PC can only access Server2.

# 28 QinQ and VLAN Mapping

## 28.1 Overview

QinQ (802.1Q in 802.1Q) is the extension based on 802.1Q protocol. It adds a layer of 802.1Q tag (VLAN Tag) to the original 802.1Q packet header to increase the number of VLAN to 4094×4094 through double layers of VLAN Tag. QinQ encapsulates the user's private network VLAN Tag in the public network VLAN Tag so that the packet can transmit in the backbone network (public network) of the operator with double layers of VLAN Tag. In the public network, the packet only spreads according to outer VLAN Tag (i.e. VLAN Tag of public network). Users' private network VLAN Tags are shielded. This saves VLAN ID of public network and provides users with a simple two-payer VPN (Virtual Private Network) tunnel.

QinQ can be divided into the following types according to the rules of adding VLAN Tag:

- Basic QinQ;
- Port-based flexible QinQ.

VLAN mapping is also the extension based on 802.1Q protocol. It is different from QinQ. Instead of encapsulating a layer of VLAN Tag based on the original VLAN Tag of the packet, VLAN mapping replaces the original VLAN Tag of the packet with a new one. This means the packet still has only one layer of VLAN Tag.

VLAN mapping can be divided into the following types by mapping rules:

- 1: 1 VLAN mapping. This means only a private network VLAN is mapped to a public network VLAN;
- N: 1 VLAN mapping. This means one or more private network VLANs can be mapped to a public network VLAN.

The port-based flexible QinQ, 1:1 VLAN mapping and N:1 VLAN mapping all need to be configured with mapping entries from private network VLAN to public network VLAN. Users can configure 4096 mapping entries at most.

## 28.2 QinQ and VLAN mapping function configuration

Table 1 QinQ and VLAN Mapping Function Configuration List

Configuration Task	
Configure basic QinQ function	Enable basic QinQ function

Configuration Task	
Configure port-based flexible QinQ function	Configure port-based flexible QinQ function
Configure 1: 1 VLAN mapping function	Configure 1: 1 VLAN mapping function
Configure N: 1 VLAN mapping function	Configure N: 1 VLAN mapping function
Configure the protocol type of outer VLAN Tag of the port	Configure the protocol type of outer VLAN Tag of the port
Configure QinQ Drop function	Enable QinQ Drop function
Configure QinQ port isolation function	Configure function of QinQ-related mutual isolation of ports

### 28.2.1 Configure basic QinQ function

After the port is configured with the basic QinQ function, the device adds a layer of VLAN tag to the packets received by the port. The VLAN ID of VLAN tag is the PVID of the port.

#### Configuration Condition

Before configuring the basic QinQ function, the following tasks should be completed:

- Configure PVID of port, which is the VLAN ID of outer VLAN Tag added after the port enables basic QinQ.

#### Enable basic QinQ function

Table 4- 2 Enabling Basic QinQ Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the

Step	Command	Description
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation <i>link-aggregation-id</i></b>	subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable basic QinQ function	<b>vlan dot1q-tunnel enable</b>	Mandatory  By default, the basic QinQ function is disabled.

---

### Note

- Under the same port, the basic QinQ function cannot be used with the following functions: QinQ Evc, flexible QINQ, 1:1 VLAN mapping, N:1 VLAN mapping, and configure the protocol type of outer VLAN Tag of the port as a non-default value.
- 

## 28.2.2 Configure port-based flexible QinQ function

After the port is configured with port-based flexible QinQ, if the VLAN ID of the outermost VLAN tag of the packet matches the port-based flexible QinQ entry, the specified outer VLAN tag is added to the packet; if the VLAN ID of the packet's outermost VLAN Tag does not match the port-based flexible QinQ entry, the flexible QINQ will not process this packet.

### Configuration Condition

Before configuring the port-based flexible QinQ function, the following tasks should be completed:

- Configure the port link type as Trunk or Hybrid;
- Configure PVID of port;
- Configure the port with the VLAN of the added outer VLAN Tag to ensure that the packet with outer VLAN Tag can pass.

### Configure port-based flexible QinQ function

Table 28 Configuring Port-based Flexible QinQ Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure port-based flexible QinQ entry	<b>vlan dot1q-tunnel</b> <i>inner-vlan-list outer-vlan-id</i>	Mandatory  By default, the port-based flexible QinQ entry is not configured.

---

### Note

- Under the same port, the port-based flexible QinQ function cannot be used with the following functions: QinQ Evc, basic QINQ, 1:1 VLAN mapping, and N:1 VLAN mapping.
  - When the configured port-based flexible QinQ entry conflicts with the existing one on the port, a prompt of conflict will be given.
-

### 28.2.3 Configure 1:1 VLAN mapping function

For a port, 1:1 VLAN mapping entries only have a one-to-one relationship with each other, which means only one private network VLAN can be mapped to one public network VLAN.

After the port is configured with 1:1 VLAN mapping, if the VLAN ID of the packet's outermost VLAN Tag matches the entry of the 1:1 VLAN mapping, the VLAN ID of the packet's outermost VLAN Tag will be replaced with the specified VLAN ID; otherwise, the 1:1 VLAN mapping will not process the packet.

#### Configuration Condition

Before configuring the 1:1 VLAN mapping function, the following tasks should be completed:

- Configure the port link type as Trunk or Hybrid;
- Configure PVID of port;
- Configure the port with the VLAN of the new outer VLAN Tag to ensure that the packet with outer VLAN Tag being replaced can pass.

#### Configure 1:1 VLAN mapping function

Table 2 Configuring 1:1 VLAN Mapping Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		within the aggregation group.
Configure 1:1 VLAN mapping entry	<b>vlan dot1q-tunnel mapping</b> <i>former-vlan-id mapping-vlan-id</i>	Mandatory  By default, no 1: 1 VLAN mapping entry is configured.

---

### Note

- Under the same port, the 1: 1 VLAN mapping function cannot be used with the following functions: QinQ Evc, basic QINQ, flexible QINQ, and N:1 VLAN mapping.
  - When the configured 1: 1 VLAN mapping entry conflicts with the existing port-based one on the port, a prompt of conflict will be given.
- 

## 28.2.4 Configure N: 1 VLAN mapping function

For a port, multiple N:1 VLAN mapping entries can be configured. They may have a many-to-one relationship with each other, which means one or more private network VLANs can be mapped to one public network VLAN.

After the port is configured with N:1 VLAN mapping, if the VLAN ID of the outermost VLAN tag of the packet matches the N:1 VLAN mapping entry, the VLAN ID of the packet's outermost VLAN Tag is replaced with the specified VLAN ID; otherwise, the N:1 VLAN mapping will not process this packet.

### Configuration Condition

Before configuring the N:1 VLAN mapping function, the following tasks should be completed:

- Configure the port link type as Trunk or Hybrid;
- Configure the port with the VLAN of the new outer VLAN Tag to ensure that the packet with outer VLAN Tag being replaced can pass.

### Configure N: 1 VLAN mapping function

Table 3 Configuring N:1 VLAN Mapping Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable N: 1 VLAN mapping function	<b>vlan dot1q-tunnel mapping n-to-1 enable</b>	Mandatory  By default, the N: 1 VLAN mapping function is not enabled.
Configure N:1 VLAN mapping entry	<b>vlan dot1q-tunnel mapping n-to-1</b> <i>former-vlan-list mapping-vlan-id</i>	Mandatory  By default, no N: 1 VLAN mapping entry is configured.

## Note

- Under the same port, the N: 1 VLAN mapping function cannot be used with the following functions: QinQ Evc, basic QINQ, port-based flexible QinQ, 1:1 VLAN mapping, and

---

configure the protocol type of outer VLAN Tag of the port as a non-default value.

- When the port link type is configured as Trunk, pvid cannot be the public network vlan mapped by N: 1 VLAN mapping.
  - When the port link type is configured as Hybrid, the public network vlan mapped by N: 1 VLAN mapping cannot be added in untag manner.
- 

## 28.2.5 Configure the protocol type of outer VLAN Tag of the port

The port can identify whether the packet carries corresponding VLAN Tag according to the TPID (Tag Protocol Identifier) value: when the port receives the packet, if the TPID value configured for the port is consistent with the corresponding field in the packet, it means that the packet has carried corresponding VLAN Tag; otherwise, the device deems the received packet as Untag.

Some manufacturers' devices may set the TPID field of the outer VLAN Tag of the QinQ packet as 0x9100 or other values. In order to become compatible with these devices, the TPID value of the outer VLAN Tag of this device's port should be configured as an equal value.

### Configuration Condition

None

### Configure the protocol type of outer VLAN Tag of the port

The device supports 2 different TPID configurations. The TPID configured ranging from 0x0001 to 0xffff shall not be reserved protocol fields, such as 0x0806 and 0x0800.

Table 4 Configuring Protocol Type for Outer VLAN Tag of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the protocol type of outer VLAN Tag of the port	<b>frame-tag tpid</b> <i>type-value</i>	Optional By default, the protocol type of outer VLAN Tag of the port is 0x8100.

### Note

- Under the same port, the operation of configuring protocol type for the outer VLAN Tag of port cannot be used with the following functions: QinQ Evc, basic QINQ, flexible QINQ, 1:1 VLAN mapping, and N:1 VLAN mapping.

## 28.2.6 Configure QinQ Drop function

After the port is configured with QinQ Drop function, if the port receives the packet which doesn't match port-based flexible QinQ entry, 1:1 VLAN mapping entry and N:1 mapping entry, it will discard it.

### Configuration Condition

Before configuring the QinQ Drop function, the following tasks should be completed:

- Configure port-based flexible QinQ, 1:1 VLAN mapping, and N:1 VLAN mapping.

### Enable QinQ Drop function

Table 28 Enabling QinQ Drop Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable QinQ Drop function	<b>vlan dot1q-tunnel drop</b>	Mandatory  By default, the QinQ Drop function is disabled.

---

 **Note**

- Under the same port, QinQ Drop shall not be used with QinQ Evc.
- 

## 28.2.7 QinQ and VLAN mapping monitoring and maintaining

Table 28 QinQ and VLAN Mapping Monitoring and Maintaining

Command	Description
<b>show vlan dot1q-tunnel</b>	Show port-based flexible QinQ configuration
<b>show vlan dot1q-tunnel mapping</b>	Show 1: 1 VLAN mapping configuration
<b>show vlan dot1q-tunnel mapping n-to-1 configuration</b>	Show N: 1 VLAN mapping configuration

## 28.3 Example of typical QinQ and VLAN mapping configuration

### 28.3.1 Configure basic QinQ

#### Network Requirements

- Intranet users CE1 and CE2, CE3 and CE4 communicate through the operator's network. CE1 and CE2 use intranet VLAN 10 - VLAN 20, while CE3 and CE4 use intranet VLAN 15 - VLAN 30. PE1 and PE2 are edge devices for the operator's network.
- Configure basic QinQ on PE1 and PE2 so that CE1 and CE2 communicate with each other through the operator's public network VLAN 100, and CE3 and CE4 communicate with each other through VLAN 101. The data has double layers of Tag when transmitting on the operator's network.

#### Network Topology

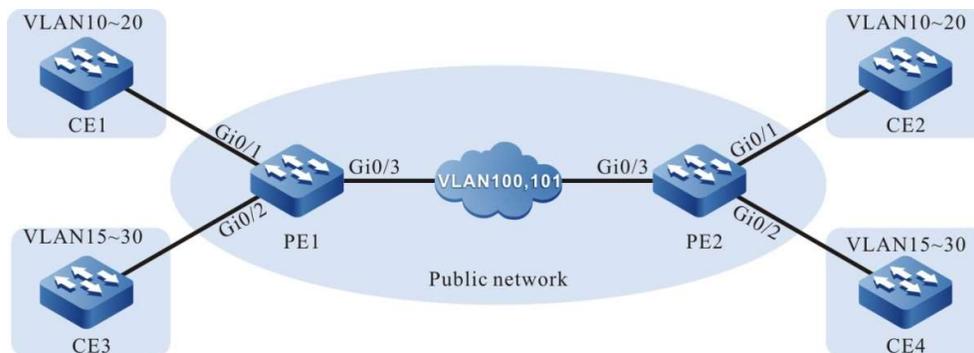

Figure 28 Configuring Network Topology of Basic QinQ

#### Configuration Steps

Step 1: Configure PE1.

#Create VLAN10~VLAN30 and VLAN100~VLAN101 on PE1.

```
PE1#configure terminal
PE1(config)#vlan 10-30,100-101
```

#On PE1, configure the link type of port gigabitethernet0/1 as Trunk, and allow services of VLAN10~VLAN20 and VLAN100 to pass. Configure PVID as 100.

```
PE1(config)#interface gigabitethernet 0/1
PE1(config-if-gigabitethernet0/1)#switchport mode trunk
PE1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 10-20,100
PE1(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 100
PE1(config-if-gigabitethernet0/1)#exit
```

#On PE1, configure the link type of port tengigabitethernet0/2 as Trunk, and allow services of VLAN15~VLAN30 and VLAN101 to pass. Configure PVID as 101.

```
PE1(config)#interface gigabitethernet 0/2
PE1(config-if-gigabitethernet0/2)#switchport mode trunk
PE1(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 15-30,101
PE1(config-if-gigabitethernet0/2)#switchport trunk pvid vlan 101
PE1(config-if-gigabitethernet0/2)#exit
```

#On PE1, configure the link type of port tengigabitethernet0/3 as Trunk, and allow services of VLAN100 and VLAN101 to pass. Configure PVID as 1.

```
PE1(config)#interface gigabitethernet0/3
PE1(config-if-gigabitethernet0/3)#switchport mode trunk
PE1(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 100,101
PE1(config-if-gigabitethernet0/3)#switchport trunk pvid vlan 1
PE1(config-if-gigabitethernet0/3)#exit
```

#On ports gigabitethernet0/1 and gigabitethernet0/2 of PE1, enable basic QinQ function.

```
PE1(config)#interface gigabitethernet 0/1
PE1(config-if-gigabitethernet0/1)#vlan dot1q-tunnel enable
PE1(config-if-gigabitethernet0/1)#exit
PE1(config)#interface gigabitethernet 0/2
PE1(config-if-gigabitethernet0/2)#vlan dot1q-tunnel enable
PE1(config-if-gigabitethernet0/2)#exit
```

Step 2: Configure PE2.

#Create VLAN10~VLAN30 and VLAN100~VLAN101 on PE2.

```
PE2#configure terminal
PE2(config)#vlan 10-30,100-101
```

#On PE2, configure the link type of port gigabitethernet0/1 as Trunk, and allow services of VLAN10~VLAN20 and VLAN100 to pass. Configure PVID as 100.

```
PE2(config)#interface gigabitethernet 0/1
PE2(config-if-gigabitethernet0/1)#switchport mode trunk
PE2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 10-20,100
PE2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 100
PE2(config-if-gigabitethernet0/1)#exit
```

#On PE2, configure the link type of port gigabitethernet0/2 as Trunk, and allow services of VLAN15~VLAN30 and VLAN101 to pass. Configure PVID as 101.

```
PE2(config)#interface gigabitethernet 0/2
PE2(config-if-gigabitethernet0/2)#switchport mode trunk
PE2(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 15-30,101
PE2(config-if-gigabitethernet0/2)#switchport trunk pvid vlan 101
PE2(config-if-gigabitethernet0/2)#exit
```

#On PE2, configure the link type of port gigabitethernet0/3 as Trunk, and allow services of VLAN100 and VLAN101 to pass. Configure PVID as 1.

```
PE2(config)#interface gigabitethernet 0/3
PE2(config-if-gigabitethernet0/3)#switchport mode trunk
PE2(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 100,101
PE2(config-if-gigabitethernet0/3)#switchport trunk pvid vlan 1
PE2(config-if-gigabitethernet0/3)#exit
```

#On ports gigabitethernet0/1 and gigabitethernet0/2 of PE2, enable basic QinQ function.

```
PE2(config)#interface gigabitethernet 0/1
PE2(config-if-gigabitethernet0/1)#vlan dot1q-tunnel enable
PE2(config-if-gigabitethernet0/1)#exit
PE2(config)#interface gigabitethernet 0/2
PE2(config-if-gigabitethernet0/2)#vlan dot1q-tunnel enable
PE2(config-if-gigabitethernet0/2)#exit
```

Step 3: Check the result.

#Services between intranet users CE1 and CE2 can communicate on the operator's network VLAN100 through PE1 and PE2 with double layers of Tag; those between CE3 and CE4 can communicate on the operator's network VLAN101 through PE1 and PE2 with double layers of Tag.

### 28.3.2 Configure flexible QinQ

#### Network Requirements

- Intranet users CE1 and CE2, CE3 and CE4 communicate through the operator's network. CE1 and CE2 use intranet VLAN 10 - VLAN 20, while CE3 and CE4 use intranet VLAN 15 - VLAN 30. PE1 and PE2 are edge devices for the operator's network.
- Configure flexible QinQ rules on PE1 and PE2 so that CE1 and CE2, CE3 and CE4 can communicate with each other through the operator's public network VLAN 100 and VLAN101. The data has double layers of Tag when transmitting on the operator's network.

#### Network Topology

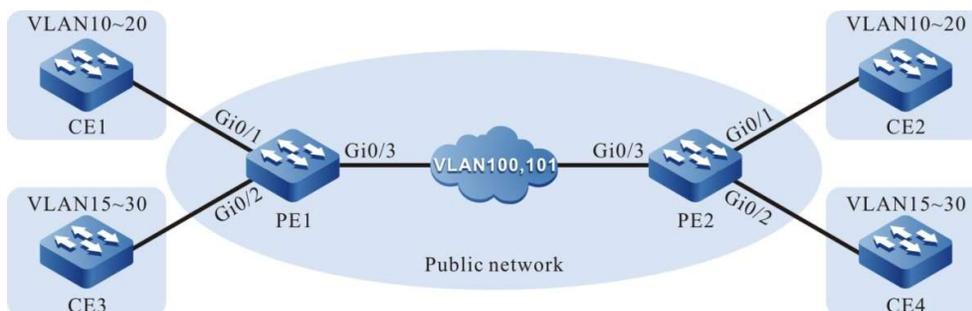

Figure 1 Configuring Network Topology of Flexible QinQ

#### Configuration Steps

**Step 1: Configure PE1.**

**#Create VLAN 10~VLAN30 and VLAN100~VLAN101 on PE1.**

```
PE1#configure terminal
PE1(config)#vlan 10-30,100-101
```

**#On PE1, configure the link type of port gigabitethernet0/1 as Trunk, and allow services of VLAN10~VLAN20 and VLAN100 to pass. Configure PVID as 1.**

```
PE1(config)#interface gigabitethernet 0/1
PE1(config-if-gigabitethernet0/1)#switchport mode trunk
PE1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 10-20,100
PE1(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 100
PE1(config-if-gigabitethernet0/1)#exit
```

**#On PE1, configure the link type of port gigabitethernet0/2 as Trunk, and allow services of VLAN15~VLAN30 and VLAN101 to pass. Configure PVID as 1.**

```
PE1(config)#interface gigabitethernet 0/2
PE1(config-if-gigabitethernet0/2)#switchport mode trunk
PE1(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 15-30,101
PE1(config-if-gigabitethernet0/2)#switchport trunk pvid vlan 101
PE1(config-if-gigabitethernet0/2)#exit
```

**#On PE1, configure the link type of port gigabitethernet0/3 as Trunk, and allow services of VLAN100 and VLAN101 to pass. Configure PVID as 1.**

```
PE1(config)#interface gigabitethernet 0/3
PE1(config-if-gigabitethernet0/3)#switchport mode trunk
PE1(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 100,101
PE1(config-if-gigabitethernet0/3)#switchport trunk pvid vlan 1
PE1(config-if-gigabitethernet0/3)#exit
```

**#Configure flexible QinQ function on the port gigabitethernet0/1 of PE1 so that outer Tag VLAN100 is added to the data of VLAN10~VLAN20.**

```
PE1(config)#interface gigabitethernet 0/1
PE1(config-if-gigabitethernet0/1)#vlan dot1q-tunnel 10-20 100
PE1(config-if-gigabitethernet0/1)#exit
```

**#Configure QinQ function on the port gigabitethernet0/2 of PE1 so that outer Tag VLAN101 is added to the data of VLAN15~VLAN30.**

```
PE1(config)#interface gigabitethernet 0/2
PE1(config-if-gigabitethernet0/2)#vlan dot1q-tunnel 15-30 101
PE1(config-if-gigabitethernet0/2)#exit
```

**#View the information of flexible QinQ entry on PE1.**

```
PE1#show vlan dot1q-tunnel
-----VLAN DOT1Q-TUNNEL-----
Interface      priority-default  Inner VlanId  Outer VlanId  inner-priority-trust  Inner VlanId Count
-----
gi0/1          disable          10-20         100           /                     11
gi0/2          disable          15-30         101           /                     16
```

**Step 2: Configure PE2.**

**#Create VLAN 10~VLAN30 and VLAN100~VLAN101 on PE2.**

```
PE2#configure terminal
PE2(config)#vlan 10-30,100-101
```

#On PE2, configure the link type of port gigabitEthernet0/1 as Trunk, and allow services of VLAN10~VLAN20 and VLAN100 to pass. Configure PVID as configured as 1.

```
PE2(config)#interface gigabitEthernet 0/1
PE2(config-if-gigabitEthernet0/1)#switchport mode trunk
PE2(config-if-gigabitEthernet0/1)#switchport trunk allowed vlan add 10-20,100
PE2(config-if-gigabitEthernet0/1)#switchport trunk pvid vlan 100
PE2(config-if-gigabitEthernet0/1)#exit
```

#On PE2, configure the link type of port gigabitEthernet0/2 as Trunk, and allow services of VLAN15~VLAN30 and VLAN101 to pass. Configure PVID as 1.

```
PE2(config)#interface gigabitEthernet 0/2
PE2(config-if-gigabitEthernet0/2)#switchport mode trunk
PE2(config-if-gigabitEthernet0/2)#switchport trunk allowed vlan add 15-30,101
PE2(config-if-gigabitEthernet0/2)#switchport trunk pvid vlan 101
PE2(config-if-gigabitEthernet0/2)#exit
```

#On PE2, configure the link type of port gigabitEthernet0/3 as Trunk, and allow services of VLAN100 and VLAN101 to pass. Configure PVID as 1.

```
PE2(config)#interface gigabitEthernet 0/3
PE2(config-if-gigabitEthernet0/3)#switchport mode trunk
PE2(config-if-gigabitEthernet0/3)#switchport trunk allowed vlan add 100,101
PE2(config-if-gigabitEthernet0/3)#switchport trunk pvid vlan 1
PE2(config-if-gigabitEthernet0/3)#exit
```

#Configure flexible QinQ function on the port gigabitEthernet0/1 of PE2 so that outer Tag VLAN100 is added to the data of VLAN10~VLAN20.

```
PE2(config)#interface gigabitEthernet 0/1
PE2(config-if-gigabitEthernet0/1)#vlan dot1q-tunnel 10-20 100
PE2(config-if-gigabitEthernet0/1)#exit
```

#Configure flexible QinQ function on the port gigabitEthernet0/2 of PE2 so that outer Tag VLAN101 is added to the data of VLAN15~VLAN30.

```
PE2(config)#interface gigabitEthernet 0/2
PE2(config-if-gigabitEthernet0/2)#vlan dot1q-tunnel 15-30 101
PE2(config-if-gigabitEthernet0/2)#exit
```

#View the information of flexible QinQ entry on PE2.

```
PE2#show vlan dot1q-tunnel
-----VLAN DOT1Q-TUNNEL-----
Interface      priority-default  Inner VlanId  Outer VlanId  inner-priority-trust  Inner VlanId Count
-----
gi0/1          disable          10-20        100           /                     11
gi0/2          disable          15-30        101           /                     16
```

Step 3: Check the result.

#Services between intranet users CE1 and CE2 can communicate on the operator's network VLAN100 through PE1 and PE2 with double layers of Tag; those between CE3 and CE4 can communicate on the operator's network VLAN101 through PE1 and PE2 with double layers of Tag.

### 28.3.3 Configure 1:1 VLAN mapping

#### Network Requirements

- Intranet users CE1 and CE2, CE3 and CE4 communicate through the operator's network. CE1 and CE2 use intranet VLAN2, while CE3 and CE4 use intranet VLAN3. PE1 and PE2 are edge devices for the operator's network.
- Configure 1:1 VLAN rules on PE1 and PE2 so that CE1 and CE2, CE3 and CE4 can communicate with each other through the operator's public network VLAN 100 and VLAN101. The data has a single layer of Tag when transmitting on the operator's network.

#### Network Topology

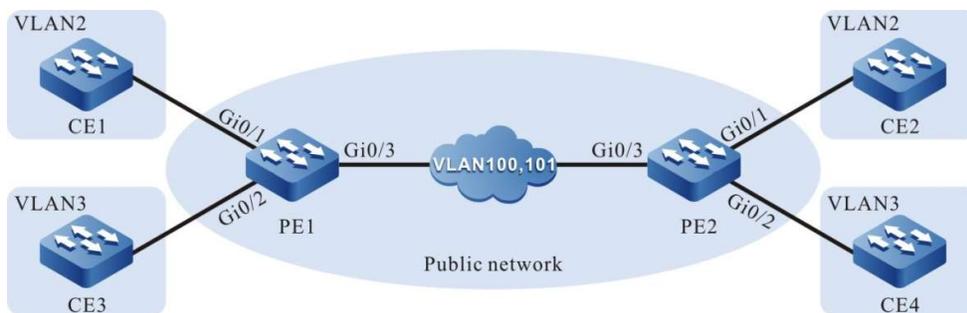

Figure 2 Configuring Network Topology of 1:1 VLAN Mapping

#### Configuration Steps

Step 1: Configure PE1.

#Create VLAN 2~VLAN3 and VLAN100~VLAN101 on PE1.

```
PE1#configure terminal
PE1(config)#vlan 2-3,100-101
```

#On PE1, configure the link type of port gigabitethernet0/1 as Trunk, and allow services of VLAN2 and VLAN100 to pass. Configure PVID as 1.

```
PE1(config)#interface gigabitethernet 0/1
PE1(config-if-gigabitethernet0/1)#switchport mode trunk
PE1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2,100
PE1(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
PE1(config-if-gigabitethernet0/1)#exit
```

#On PE1, configure the link type of port gigabitethernet0/2 as Trunk, and allow services of VLAN3 and VLAN101 to pass. Configure PVID as 1.

```
PE1(config)#interface gigabitethernet 0/2
PE1(config-if-gigabitethernet0/2)#switchport mode trunk
PE1(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 3,101
PE1(config-if-gigabitethernet0/2)#switchport trunk pvid vlan 1
PE1(config-if-gigabitethernet0/2)#exit
```

#On PE1, configure the link type of port gigabitethernet0/3 as Trunk, and allow services of VLAN100 and VLAN101 to pass. Configure PVID as 1.

```
PE1(config)#interface gigabitethernet 0/3
PE1(config-if-gigabitethernet0/3)#switchport mode trunk
PE1(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 100,101
PE1(config-if-gigabitethernet0/3)#switchport trunk pvid vlan 1
PE1(config-if-gigabitethernet0/3)#exit
```

#Configure 1:1 VLAN mapping function on the port gigabitethernet0/1 of PE1 so that the data of VLAN2 is modified into VLAN100.

```
PE1(config)#interface gigabitethernet 0/1
PE1(config-if-gigabitethernet0/1)#vlan dot1q-tunnel mapping 2 100
PE1(config-if-gigabitethernet0/1)#exit
```

#Configure 1:1 VLAN mapping function on the port gigabitethernet0/2 of PE1 so that the data of VLAN3 is modified into VLAN101.

```
PE1(config)#interface gigabitethernet 0/2

PE1(config-if-gigabitethernet0/2)# vlan dot1q-tunnel mapping 3 101
PE1(config-if-gigabitethernet0/2)#exit
```

#View the information of 1:1 VLAN mapping entry on PE1.

```
PE1#show vlan dot1q-tunnel mapping
-----VLAN DOT1Q-TUNNEL MAPPING-----
Interface      priority-default  Former VlanId  Mapping VlanId  inner-priority-trust  Former VlanId Count
-----
gi0/1          disable          2              100              /                      1
gi0/2          disable          3              101              /                      1
```

## Step 2: Configure PE2.

#Create VLAN 2~VLAN3 and VLAN100~VLAN101 on PE2.

```
PE2#configure terminal
PE2(config)#vlan 2-3,100-101
```

#On PE2, configure the link type of port gigabitethernet0/1 as Trunk, and allow services of VLAN2 and VLAN100 to pass. Configure PVID as 1.

```
PE2(config)#interface gigabitethernet 0/1
PE2(config-if-gigabitethernet0/1)#switchport mode trunk
PE2(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2,100
PE2(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
PE2(config-if-gigabitethernet0/1)#exit
```

#On PE2, configure the link type of port gigabitethernet0/2 as Trunk, and allow services of VLAN3 and VLAN101 to pass. Configure PVID as 1.

```
PE2(config)#interface gigabitethernet 0/2
PE2(config-if-gigabitethernet0/2)#switchport mode trunk
PE2(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 3,101
PE2(config-if-gigabitethernet0/2)#switchport trunk pvid vlan 1
PE2(config-if-gigabitethernet0/2)#exit
```

#On PE2, configure the link type of port gigabitethernet0/3 as Trunk, and allow services of VLAN100 and VLAN101 to pass. Configure PVID as 1.

```

PE2(config)#interface gigabitethernet 0/3
PE2(config-if-gigabitethernet0/3)#switchport mode trunk
PE2(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 100,101
PE2(config-if-gigabitethernet0/3)#switchport trunk pvid vlan 1
PE2(config-if-gigabitethernet0/3)#exit

```

#Configure 1:1 VLAN mapping function on the port gigabitethernet0/1 of PE2 so that the data of VLAN2 is modified into VLAN100.

```

PE2(config)#interface gigabitethernet 0/1
PE2(config-if-gigabitethernet0/1)#vlan dot1q-tunnel mapping 2 100
PE2(config-if-gigabitethernet0/1)#exit

```

#Configure 1:1 VLAN mapping function on the port gigabitethernet0/2 of PE2 so that the data of VLAN3 is modified into VLAN101.

```

PE2(config)#interface gigabitethernet 0/2
PE2(config-if-gigabitethernet0/2)#vlan dot1q-tunnel mapping 3 101
PE2(config-if-gigabitethernet0/2)#exit

```

#View the information of 1:1 VLAN mapping entry on PE2.

```

PE2#show vlan dot1q-tunnel mapping
-----VLAN DOT1Q-TUNNEL MAPPING-----
Interface      priority-default  Former VlanId  Mapping VlanId  inner-priority-trust  Former VlanId Count
-----
gi0/1          disable          2              100              /                      1
gi0/2          disable          3              101              /                      1

```

Step 3: Check the result.

#Services between intranet users CE1 and CE2 can communicate on the operator's network VLAN100 through PE1 and PE2 with a single layer of Tag; those between CE3 and CE4 can communicate on the operator's network VLAN101 through PE1 and PE2 with a single layer of Tag.

### 28.3.4 Configure N: 1 VLAN mapping

#### Network Requirements

- On Device2, in different VLANs, services of PC1 and PC2 are isolated from each other.
- Configure N: 1 VLAN mapping function on Device1 so that the service packets of PC1 and PC2 transmit in the same VLAN when passing through Device1 to save VLAN resource.

#### Network Topology

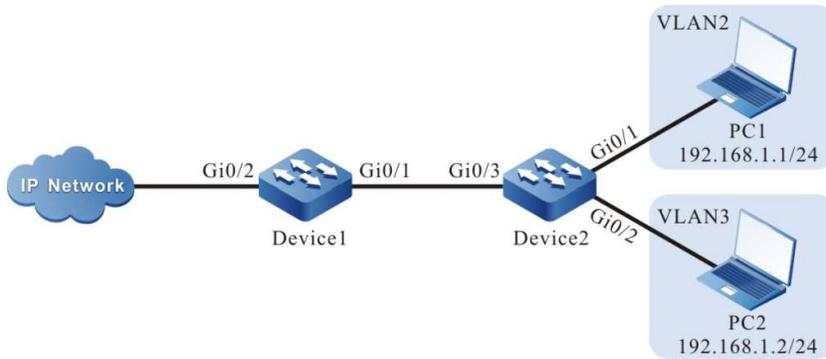

Figure 3 Configuring Network Topology of N:1 VLAN Mapping

### Configuration Steps

Step 1: Configure Device1.

#Create VLAN2~VLAN4 on Device1.

```
Device1#configure terminal
Device1(config)#vlan 2-4
```

#On Device1, configure the link type of port gigabitethernet0/1 as Trunk, and allow services of VLAN2~VLAN4 to pass. Configure PVID as 1.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#switchport mode trunk
Device1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2-4
Device1(config-if-gigabitethernet0/1)#switchport trunk pvid vlan 1
```

#Configure N:1 VLAN mapping function on the port gigabitethernet0/1 of Device1 so that the VLAN2 and VLAN3 are mapped to VLAN4.

```
Device1(config-if-gigabitethernet0/1)#vlan dot1q-tunnel mapping n-to-1 enable
Device1(config-if-gigabitethernet0/1)#vlan dot1q-tunnel mapping n-to-1 2-3 4
Device1(config-if-gigabitethernet0/1)#exit
```

#On Device1, configure the link type of port gigabitethernet0/2 as Trunk, and allow services of VLAN2~VLAN4 to pass. Configure PVID as 1.

```
Device1(config)#interface gigabitethernet 0/2
Device1(config-if-gigabitethernet0/2)#switchport mode trunk
Device1(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2-4
Device1(config-if-gigabitethernet0/2)#switchport trunk pvid vlan 1
Device1(config-if-gigabitethernet0/2)#exit
```

Step 2: Configure Device2.

#Create VLAN2 and VLAN3 on Device2.

```
Device2#configure terminal
Device2(config)#vlan 2-3
```

#Configure the link type of port gigabitethernet0/1 on Device2 as Access, allowing the services of VLAN2 to pass.

```
Device2(config)#interface gigabitethernet 0/1
Device2(config-if-gigabitethernet0/1)#switchport mode access
Device2(config-if-gigabitethernet0/1)#switchport access vlan 2
Device2(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of port gigabitethernet0/2 on Device2 as Access, allowing the services of VLAN3 to pass.

```
Device2(config)#interface gigabitethernet 0/2
Device2(config-if-gigabitethernet0/2)#switchport mode access
Device2(config-if-gigabitethernet0/2)#switchport access vlan 3
Device2(config-if-gigabitethernet0/2)#exit
```

#On Device2, configure the link type of port gigabitethernet0/3 as Trunk, and allow services of VLAN2 and VLAN3 to pass. Configure PVID as 1.

```
Device2(config)#interface gigabitethernet 0/3
Device2(config-if-gigabitethernet0/3)#switchport mode trunk
Device2(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 2-3
Device2(config-if-gigabitethernet0/3)#switchport trunk pvid vlan 1
Device2(config-if-gigabitethernet0/3)#exit
```

*Step*  
3:

Check the result.

#View the information of N:1 VLAN mapping entry on Device1.

```
Device1#show vlan dot1q-tunnel mapping n-to-1 configuration
-----
NO. Name          Status Customer Member          Service VLAN
-----
1  gi0/1          enable 2-3                4
```

#On Device2, services of PC1 and PC2 are isolated from each other. The service packet of PC1 transmits in VLAN2, and that of PC2 in VLAN3.

#The service packets of PC1 and PC2 that access IP Network are forwarded via the VLAN4 of Device1.

# 29 Super-VLAN

---

## 29.1 Overview

Different VLANs are isolated from each other at layer 2. To enable them to communicate with each other, you must configure a VLAN interface and IP address for each VLAN. However, this mode consumes a large number of scarce IP address resources. Super-VLAN, also called VLAN aggregation, can solve this problem effectively. A common VLAN, after being added into a super-VLAN, becomes a sub-VLAN of the super-VLAN. If the Address Resolution Protocol (ARP)/ND proxy function is enabled for the super-VLAN, the super-VLAN shares its VLAN interface with its sub-VLANs. In this way, the sub-VLANs take the VLAN interface IP/IPv6 address of the super-VLAN as the gateway to implement layer-3 communication. This saves IP address resources.

## 29.2 VLAN Function Configuration

Table 29 Super-VLAN Function Configuration List

Configuration Task	
Configure a super VLAN.	Configure a super VLAN.
Configure sub-VLAN members of the super-VLAN.	Configure sub-VLAN members of the super-VLAN.
Enable the ARP proxy function.	Enable the ARP proxy function.
Enable the ND proxy function.	Enable the ND proxy function.

### 29.2.1 Configure a super VLAN.

#### Configuration Condition

None

User manual  
Release 1.0 01/2022

## Configure a super VLAN.

On the Super-VLAN, VLAN can be configured, but port cannot be added. The Super-VLAN shall not be the existing VLAN or Sub-VLAN.

Table 1 Configuring Super-VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create Super-VLAN	<b>super-vlan <i>vlan-id</i></b>	Mandatory  By default, no Super-VLAN is created.  Upon creation of the Super-VLAN, you will enter the Super-VLAN configuration mode automatically.
Configure description for Super-VLAN	<b>description <i>description</i></b>	Optional  By default, Super-VLAN is described as "SuperVLAN <i>vlan-id</i> ", such as "SuperVLAN0100".

### 29.2.2 Configure sub-VLAN members of the super-VLAN.

#### Configuration Condition

None

#### Configure sub-VLAN members of the super-VLAN.

One super-VLAN supports a maximum of 8 sub-VLAN members, and one VLAN can become the sub-VLAN member of only one super-VLAN. On a sub-VLAN, a VLAN interface cannot be configured but a port can be added into it. The method for adding a port into a sub-VLAN is the same as the method for adding a port into a common VLAN. The VLAN ID of a sub-VLAN must not be identical with the VLAN ID of an existing super-VLAN.

Table 29 Configuring Sub-VLAN Members of Super-VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the super-VLAN configuration mode.	<b>super-vlan <i>vlan-id</i></b>	-
Configure sub-VLAN members of the super-VLAN.	<b>sub-vlan <i>vlan-list</i></b>	Mandatory  By default, a super-VLAN is not configured with sub-VLAN members.

---

### Caution

- If Sub-VLAN has been configured, it cannot be configured as an exclusive EIPS control VLAN.
- 

## 29.2.3 Enable the ARP proxy function.

### Configuration Condition

Before enabling the ARP proxy function, ensure that:

- The VLAN interface corresponding to the super-VLAN and the IP address have been configured.

### Configure the ARP Proxy Function

After the ARP proxy function of a super-VLAN is configured, the sub-VLANs can communicate with each other at layer 3 through ARP proxy.

Table 2 Enabling ARP Proxy Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the super-VLAN configuration mode.	<b>super-vlan <i>vlan-id</i></b>	-
Enable the ARP proxy function.	<b>arp proxy enable</b>	Mandatory

Step	Command	Description
		By default, the ARP proxy function is disabled.

### Note

- The ARP proxy function relies on the layer-3 forwarding function. If the device does not support the layer-3 forwarding function, the ARP proxy function does not take effect.

## 29.2.4 Enable the ND proxy function.

### Configuration Condition

Before enabling the ND proxy function, ensure that:

- The VLAN interface corresponding to the super-VLAN and the IPv6 address have been configured.

### Configure the ND Proxy Function

After the ND proxy function of a super-VLAN is configured, the sub-VLANs can communicate with each other at IPv6 layer 3 through ND proxy.

Table 3 Enabling ND Proxy Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the super-VLAN configuration mode.	<b>super-vlan <i>vlan-id</i></b>	-
Enable the ND proxy function.	<b>nd local-proxy enable</b>	Mandatory By default, the ND proxy function is disabled.

### Note

- The ND proxy function relies on the layer 3 forwarding function. If the device does not support the IPv6 layer 3 forwarding function, the ND proxy function does not take effect.

## 29.2.5 VLAN Monitoring and Maintaining

Table 4 Super-VLAN Monitoring and Maintaining

Command	Description
<b>show super-vlan [ <i>vlan-id</i> ]</b>	Displays the information about the specified super-VLAN.
<b>show super-vlan config { <i>vlan-id</i>   all }</b>	Show Super-VLAN configuration information
<b>show super-vlan [ <i>vlan-id</i> ] portlist</b>	Show the information of port under the management of Super-VLAN
<b>show super-vlan <i>vlan-id</i> sub-vlan <i>vlan-id</i> portlist</b>	Show the information of port under the management of Sub-VLAN

## 29.3 Super-VLAN Typical Configuration Example

### 29.3.1 Configure a super VLAN.

#### Network Requirements

- PC1 and PC2 are two hosts in Sub-VLAN2, PC3 is a host in Sub-VLAN3, and Server is a server in VLAN5.
- The super-VLAN function has been configured on Device. Then, PC1 and PC2 can intercommunicate with each other at layer2. PC1 and PC2 can intercommunicate with PC3 at layer3, and they can access the server.

#### Network Topology

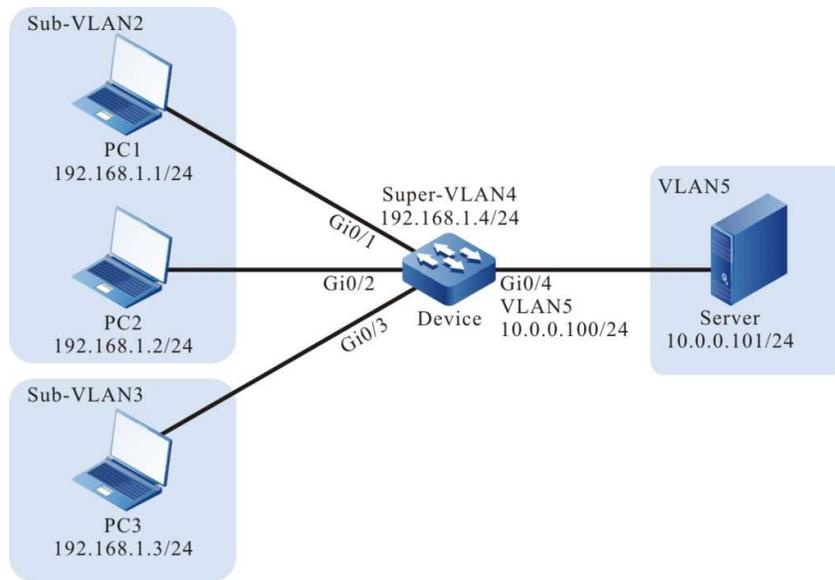

Figure 29 Network Topology for Configuration of Super-VLAN

### Configuration Steps

Step 1: Configure VLAN and port link type on Device.

#Create VLAN2, VLAN3 and VLAN5 on Device.

```
Device#configure terminal
Device(config)#vlan 2-3,5
```

#On the Device, configure the IP address of VLAN interface 4 as 192.168.1.4 and mask as 255.255.255.0; configure the IP address of VLAN interface 5 as 10.0.0.100 and mask as 255.255.255.0.

```
Device(config)#interface vlan 4
Device(config-if-vlan4)#ip address 192.168.1.4 255.255.255.0
Device(config-if-vlan4)#exit
Device(config)#interface vlan 5
Device(config-if-vlan5)#ip address 10.0.0.100 255.255.255.0
Device(config-if-vlan5)#exit
```

#Configure the link type of port gigabitethernet0/1~gigabitethernet0/2 on the Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1,0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

#Configure the link type of port gigabitethernet0/3 on the Device as Access, allowing the services of VLAN3 to pass.

```
Device(config)#interface gigabitethernet 0/3
Device(config-if-gigabitethernet0/3)#switchport mode access
Device(config-if-gigabitethernet0/3)#switchport access vlan 3
Device(config-if-gigabitethernet0/3)#exit
```

#Configure the link type of port gigabitethernet0/4 on the Device as Access, allowing the services of VLAN5 to pass.

```

Device(config)#interface gigabitethernet 0/4
Device(config-if-gigabitethernet0/4)#switchport mode access
Device(config-if-gigabitethernet0/4)#switchport access vlan 5
Device(config-if-gigabitethernet0/4)#exit

```

#View the information of VLAN and port of the Device.

```

Device#show vlan 2
-----
NO. VID VLAN-Name      Owner Mode  Interface
-----
1 2  VLAN0002          static Untagged gi0/1 gi0/2
Device#show vlan 3
-----
NO. VID VLAN-Name      Owner Mode  Interface
-----
1 3  VLAN0003          static Untagged gi0/3
Device#show vlan 5
-----
NO. VID VLAN-Name      Owner Mode  Interface
-----
1 5  VLAN0005          static Untagged gi0/4

```

Step 2: Configure the Super-VLAN function on the Device.

#On the Device, configure VLAN4 as Super-VLAN, VLAN2 and VLAN3 as Sub-VLAN, and enable ARP proxy.

```

Device(config)#super-vlan 4
Device(config-super-vlan4)#sub-vlan 2,3
Device(config-super-vlan4)#arp proxy enable
Device(config-super-vlan4)#exit

```

#View the information of Super-VLAN on the Device.

```

Device#show super-vlan
-----
NO. SuperVlan Description      Arp Proxy SubVlan Member
-----
1 4      SuperVLAN0004          enable    2-3

```

---

## Caution

- To achieve intercommunication between hosts in different Sub-VLANs at layer 3, the ARP proxy function must be enabled.
  - Super-VLAN and Sub-VLAN must be in the same spanning tree instance.
- 

Step 3: Check the result. Use the ping command to check the connectivity between PC1, PC2, PC3 and the server.

#PC1 and PC2 in Sub-VLAN2 can ping each other successfully.

#PC1 and PC2 in Sub-VLAN2 and PC3 in Sub-VLAN3 can ping each other successfully.

#PC1, PC2, and PC3 in Sub-VLANs and the server can ping each other successfully.

# 30 PVLAN

---

## 30.1 Overview

In order to isolate all users from each other and allow them to access common resources, usually each user need to be provided with a VLAN. However, for the application scenarios with many users, since there are only 4,094 VLANs in total, when the number of users exceeds this figure, the number of VLANs will become a bottleneck and make it difficult to conduct configuration, management and maintenance. To cope with this problem, PVLAN (Private VLAN) is born. Through a flexible VLAN configuration mode, it can effectively configure and utilize VLAN and IP address resources, and simplify network configuration.

PVLAN employs a two-layer VLAN structure, i.e. Primary VLAN and Secondary VLAN. Generally, Primary VLAN connects with uplink device, and Secondary VLAN with downlink device. According to the forwarding rules of layer 2, Secondary VLANs are divided into the following two types:

- **Isolated VLAN:** Member ports, whether within the same Isolated VLAN or not, are isolated from each other at layer 2. Users can be isolated from each other only if the ports connecting users are added to the Isolated VLAN;
- **Community VLAN:** The forwarding rules of Community VLAN are the same as those of common VLAN. Member ports in the same Community VLAN can communicate with each other at layer 2, and stay isolated from those of other Community VLAN and Isolated VLAN.

After Primary VLAN and Secondary VLAN are associated with each other, the member ports in Secondary VLAN can directly communicate with those in Primary VLAN at layer 2, and with the outside through the VLAN interface on Primary VLAN at layer 3.

PVLAN has two specific port link types, i.e. Promiscuous and Host. Promiscuous port can only be added to Primary VLAN, and Host port can only be added to Secondary VLAN. The Host port added to the Community VLAN is also called Community port, and the Host port added to the Isolated VLAN is also called Isolated port.

## 30.2 PVLAN function configuration

Table 30 PVLAN Function Configuration List

Configuration Task	
Configure Primary VLAN	Configure Primary VLAN
Add ports into Primary VLAN	Add ports into Primary VLAN
Configure Secondary VLAN	Configure Secondary VLAN
Add ports into Secondary VLAN	Add ports into Secondary VLAN
Configure the association relationship between Primary VLAN and Secondary VLAN	Configure the association relationship between Primary VLAN and Secondary VLAN

### 30.2.1 Configure Primary VLAN

The uplink device recognizes Primary VLAN only. It never cares about its associated Secondary VLAN.

#### Configuration Condition

None

#### Configure Primary VLAN

Table 30 Configuring Primary VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure the VLAN type as Primary VLAN	<b>private-vlan primary</b>	Mandatory By default, all VLANs are common.

## 30.2.2 Add ports into Primary VLAN

Only the ports with link type being Promiscuous can be added into Primary VLAN. The ports added into Primary VLAN can communicate with other member ports in Primary VLAN and the member ports in Secondary VLAN associated with this Primary VLAN at layer 2. Generally, Promiscuous ports are used as uplink ports.

### Configuration Condition

Before adding ports into Primary VLAN, the following tasks should be completed:

- Configure the type of VLAN where ports are added as Primary VLAN.

### Add ports into Primary VLAN

Table 1 Add Ports into Primary VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the port link type as Promiscuous	<b>switchport mode private-vlan promiscuous</b>	Mandatory By default, the port link type is the Access type.
Add Promiscuous ports into Primary VLAN	<b>private-vlan promiscuous</b> <i>vlan-id</i>	Mandatory By default, Promiscuous ports are not added into any VLAN.

---

## Note

- If the port is not added into Primary VLAN when the port link type is configured as Promiscuous, the PVLAN function of the port will not take effect, and the Promiscuous port will be exclusive for PVLAN, which means other functions cannot be applied to the Promiscuous port. Therefore, it is recommended to complete the configuration as per the steps mentioned above.
- 

### 30.2.3 Configure Secondary VLAN

The downlink device recognizes Primary VLAN only. It never cares about its associated Primary VLAN.

#### Configuration Condition

None

#### Configure Secondary VLAN

Table 2 Configuring Secondary VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure the VLAN type as Secondary VLAN	<b>private-vlan { community   isolated }</b>	Mandatory By default, all VLANs are common.

### 30.2.4 Add ports into Secondary VLAN

Only the ports with the link type being Host can be added into Secondary VLAN which has two types: Community VLAN and Isolated VLAN. The ports added into Community VLAN can only communicate with other member ports in this Community VLAN and the member ports in the Primary VLAN associated with this Community VLAN at layer 2. The ports added into Isolated VLAN can only communicate with the member ports in the Primary VLAN associated with this Isolated VLAN at layer 2. Generally, Host ports are used as downlink ports.

#### Configuration Condition

Before adding ports into Secondary VLAN, the following tasks should be completed:

- Configure the type of VLAN where ports are added as Secondary VLAN.

### Add ports into Secondary VLAN

Table 3 Add Ports into Secondary VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the port link type as Host.	<b>switchport mode private-vlan host</b>	Mandatory By default, the link type is Access.
Add Host ports into Secondary VLAN	<b>private-vlan host</b> <i>vlan-id</i>	Mandatory By default, Host ports are not added into any VLAN.

### Note

- The host in Secondary VLAN cannot communicate with the VLAN interface of this device at layer 3.
- If the port is not added into Primary VLAN when the port link type is configured as Host, the PVLAN function of the port will not take effect, and the Host port will be exclusive for PVLAN, which means other functions cannot be applied to the Host port. Therefore, it is recommended to complete the configuration as per the steps mentioned above.

### 30.2.5 Configure the association relationship between Primary VLAN and Secondary VLAN

After association is established, the hosts in Primary VLAN can communicate with those in the associated Secondary VLAN at layer 2. One Primary VLAN can associate with one Isolated VLAN at most and 192 Community VLANs. One Secondary VLAN can associate with one Primary VLAN only.

#### Configuration Condition

Before associating Primary VLAN with Secondary VLAN, the following tasks should be completed:

- Configure the type of VLAN in current VLAN configuration mode as Primary VLAN.

#### Configure the association relationship between Primary VLAN and Secondary VLAN

Table 4 Configuring Association Relationship Between Primary VLAN and Secondary VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Configure the association relationship of Primary VLAN	<b>private-vlan association add <i>vlan-list</i></b>	Mandatory  By default, Primary VLAN doesn't associate with any Secondary VLAN.

---

#### Note

- If the Primary VLAN associates with a common VLAN, the association will not take effect unless the type of common VLAN is changed to Secondary VLAN.
  - If Secondary VLAN is associated with Primary VLAN, then for the MAC address entry dynamically learned through Secondary VLAN, the VLAN recorded in FDB table is the Primary VLAN associated with this Secondary VLAN rather than the Secondary VLAN itself.
- 

### 30.2.6 PVLAN Monitoring and Maintaining

Table 5 PVLAN Monitoring and Maintaining

Command	Description
<b>show private-vlan [ vlan-id ]</b>	Show PVLAN information

## 30.3 Typical PVLAN Configuration Example

### 30.3.1 Configure PVLAN

#### Network Requirements

- PC1 and PC2 belong to Secondary VLAN2; PC3 and PC4 belong to Secondary VLAN3; Server belongs to Primary VLAN4.
- Configure PVLAN on the Device for intercommunication in Secondary VLAN2, mutual isolation in Secondary VLAN3, isolation between Secondary VLAN2 and Secondary VLAN3, and intercommunication of both Secondary VLAN2 and Secondary VLAN3 with Primary VLAN4.

#### Network Topology

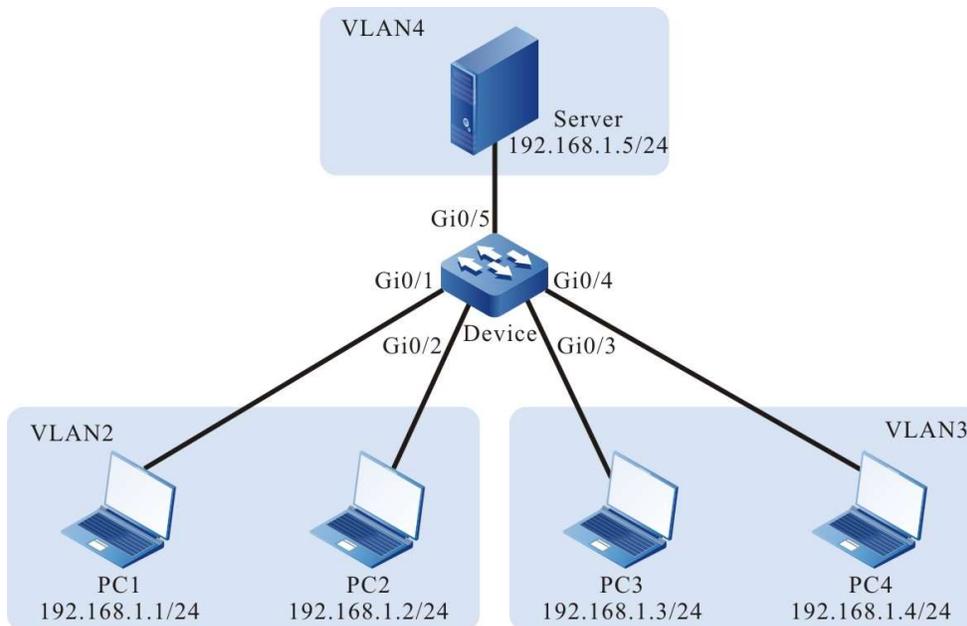

Figure 30 Network Topology for Configuration of PVLAN

#### Configuration Steps

*Step 1:* Configure VLAN on the Device.

#Create VLAN2~VLAN4 on the Device.

```
Device#configure terminal
Device(config)#vlan 2-4
```

*Step*  
*2:* Configure the PVLAN function on the Device.

#On the Device, configure VLAN4 as Primary VLAN, VLAN2 as Community VLAN, and VLAN3 as Isolated VLAN.

```
Device(config)#vlan 4
Device(config-vlan4)#private-vlan primary
Device(config-vlan4)#vlan 2
Device(config-vlan2)#private-vlan community
Device(config-vlan2)#vlan 3
Device(config-vlan3)#private-vlan isolated
Device(config-vlan3)#exit
```

#Associate Primary VLAN4 with Community VLAN2 and Isolated VLAN3 on the Device.

```
Device(config)#vlan 4
Device(config-vlan4)#private-vlan association add 2,3
Device(config-vlan4)#exit
```

#Configure the link type of port gigabitethernet0/1~gigabitethernet0/2 on the Device as Host, and add them into VLAN2.

```
Device(config)#interface gigabitethernet 0/1-0/2
Device(config-if-range)#switchport mode private-vlan host
Device(config-if-range)#private-vlan host 2
Device(config-if-range)#exit
```

#Configure the link type of port gigabitethernet0/3~gigabitethernet0/4 on the Device as Host, and add them into VLAN3.

```
Device(config)#interface gigabitethernet 0/3-0/4
Device(config-if-range)#switchport mode private-vlan host
Device(config-if-range)#private-vlan host 3
Device(config-if-range)#exit
```

#Configure the link type of port gigabitethernet0/5 on the Device as Promiscuous, and add it into VLAN4.

```
Device(config)#interface gigabitethernet 0/5
Device(config-if-gigabitethernet0/5)#switchport mode private-vlan promiscuous
Device(config-if-gigabitethernet0/5)#private-vlan promiscuous 4
Device(config-if-gigabitethernet0/5)#exit
```

*Step*  
*3:* Check the result.

#View the information of PVLAN on the Device.

```
Device#show private-vlan
-----
NO. Primary Secondary Type Interface(Primary) Interface(Secondary)
-----
1 4 3 isolated gi0/5 gi0/3 gi0/4
2 4 2 community gi0/5 gi0/1 gi0/2
```

#The two hosts PC1 and PC2 in Community VLAN2 can ping each other successfully.

#The two hosts PC3 and PC4 in Isolated VLAN3 cannot ping each other successfully.

#The two hosts PC1 and PC2 in Community VLAN2 cannot ping PC3 and PC4 in Isolated VLAN3 successfully.

#Both PC1 and PC2 in Community VLAN2 can ping the Server successfully.

#Both PC3 and PC4 in Isolated VLAN3 can ping the Server successfully.

# 31 Voice-VLAN

## 31.1 Overview

Voice-VLAN is a mechanism that provides security and Quality of Service (QoS) guarantee for voice data flows. In a network, usually two types of traffic coexists, voice data and service data. During transmission, voice data has a higher priority than service data so as to reduce delay and packet loss that may occur during the transmission process. Voice-VLAN can automatically recognize voice traffic and distribute the voice traffic to a specific VLAN with QoS guarantee.

## 31.2 Voice-VLAN Function Configuration

Table 31 Voice-VLAN Function Configuration List

Configuration Task	
Configure a Voice-VLAN	Configure a Voice-VLAN
Configure an OUI Address	Configure an OUI Address
Enable the Voice-VLAN Function of a Port	Enable the Voice-VLAN Function of a Port
Configure the Voice-VLAN Working Mode on the Port	Configure a Voice-VLAN to Automatic Mode
	Configure a Voice-VLAN to Manual Mode
Enable the security mode of Voice-VLAN	Enable the security mode of Voice-VLAN
Enable the Ildp-med authentication mode of Voice-VLAN	Enable the Ildp-med authentication mode of Voice-VLAN

### 31.2.1 Configure a Voice-VLAN

A voice VLAN is used to transmit voice packets. The 802.1p priorities of the recognized voice packets are replaced with the priority of the voice-VLAN. Then the packets are distributed into the voice VLAN for forwarding. A device supports a maximum of one voice-VLAN.

#### Configuration Condition

Before configuring Voice-VLAN, the following tasks should be completed:

- Create the VLAN specified as Voice-VLAN.

#### Configure a Voice-VLAN

Table 31 Configuring Voice-VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Specify a VLAN as Voice-VLAN	<b>voice vlan <i>vlan-id</i> <i>cos</i> <i>priority</i></b>	Mandatory  By default, Voice-VLAN is not configured, i.e. the Voice-VLAN function is not enabled globally.

### 31.2.2 Configure an OUI Address

#### Configuration Condition

Before configuring an OUI address, ensure that:

- The voice-VLAN function is globally enabled.
- The voice-VLAN function is enabled on the port.

#### Configure an OUI Address

Organizationally Unique Identifiers (OUIs) are used to identify voice packets that are sent by voice devices of manufacturers. After a port that works in voice-VLAN automatic mode receives an Untag packet, it takes out the MAC address of the packet and performs the AND operation with the OUI mask. If the obtained address range is the same as the OUI address, it indicates that matching the OUI address succeeds, and the packet is recognized as a voice packet.

Table 1 Configuring OUI Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure an OUI Address	<b>voice vlan oui-mac</b> <i>oui-mac-address</i> <b>mask</b> <i>mask</i> <b>name</b> <i>oui-name</i>	Mandatory  By default, there are 5 default OUI addresses.  The device can support 32 OUI addresses at most.

### 31.2.3 Enable the Voice-VLAN Function of a Port

After the voice-VLAN function is enabled on a port, the port uses a method according to the voice-VLAN working mode to automatically recognize the received packets.

#### Configuration Condition

Before enabling the voice-VLAN function of a port, ensure that:

- The voice-VLAN function is globally enabled.
- The port has been added into the voice-VLAN.

#### Enable the Voice-VLAN Function of a Port

Table 31 Enabling Voice-VLAN Function of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		only within the aggregation group.
Enable the Voice-VLAN Function of a Port	<b>voice vlan enable</b>	Mandatory  By default, the port doesn't enable the Voice-VLAN function.

### Note

- The security mode of Voice-VLAN does not support aggregation group. That is to say, when the device enables the security mode of Voice-VLAN, the aggregation group cannot enable the Voice-VLAN function; or when an aggregation group of the device enables the Voice-VLAN function, the security mode of Voice-VLAN cannot be enabled.
- The lldp-med authentication mode of Voice-VLAN does not support aggregation group. That is to say, when the device enables the lldp-med authentication mode of Voice-VLAN, the aggregation group cannot enable the Voice-VLAN function; or when an aggregation group of the device enables the Voice-VLAN function, the lldp-med authentication mode of Voice-VLAN cannot be enabled.

## 31.2.4 Configure the Voice-VLAN Working Mode on the Port

The voice-VLAN of a port can work in automatic mode or manual mode. The ports working in different voice-VLAN modes recognize voice packets in different ways.

- Automatic mode: If the packets received by the port are Untag packets and the source MAC address of the packets matches an OUI address, the packets are regarded as voice packets.
- Manual mode: If the packets received by the port are Untag packets, or Tag packets with the VLAN ID being the port PVID, the packets are regarded as voice packets.

### Configuration Condition

Before configuring the voice-VLAN working mode of a port, ensure that:

- The voice-VLAN function is globally enabled.
- The voice-VLAN function of the port has been enabled.

### Configure a Voice-VLAN to Automatic Mode

Table 2 Configuring Automatic Mode of Voice-VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	
Make the port work under the automatic mode of Voice-VLAN	<b>voice vlan mode auto</b>	Mandatory  By default, the port works under the automatic mode of Voice-VLAN.

### Configure a Voice-VLAN to Manual Mode

Table 3 Configuring Manual Mode of Voice-VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode,
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		the subsequent configuration takes effect only within the aggregation group.
Make the port work under the manual mode of Voice-VLAN	<b>no voice vlan mode auto</b>	Mandatory  By default, the port works under the automatic mode of Voice-VLAN.

### Note

- If the port is used to transmit Tagged voice data, the port type should be configured as Trunk or Hybrid only, and the PVID shall not be Voice-VLAN.
- If the port under the manual mode of Voice-VLAN is used to transmit untagged voice data, the PVID must be Voice-VLAN.
- The lldp-med authentication mode of Voice-VLAN does not support manual mode of the port. That is to say, when the device enables the lldp-med authentication mode of Voice-VLAN, the port cannot be configured as the manual mode of Voice-VLAN; or when an port is configured as the manual mode of Voice-VLAN, the lldp-med authentication mode of Voice-VLAN cannot be enabled.

## 31.2.5 Enable the security mode of Voice-VLAN

After the Voice-VLAN security mode is enabled, the device will perform source MAC address matching check on each packet that will enter Voice-VLAN for transmission, and discard those that fail to match the OUI address.

### Configuration Condition

Before enabling the security mode of voice-VLAN, the following tasks should be completed:

- The voice-VLAN function is globally enabled.

### Enable the security mode of Voice-VLAN

Table 4 Enabling Security Mode of Voice-VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable the security mode of Voice-VLAN	<b>voice vlan security enable</b>	Mandatory  By default, the security mode of Voice-VLAN is disabled.

### Note

- The security mode of Voice-VLAN does not support aggregation group. That is to say, when the aggregation group of the device enables the function of Voice-VLAN, the security mode of Voice-VLAN cannot be enabled; or when the device enables the security mode of Voice-VLAN, the aggregation group cannot enable the function of Voice-VLAN.

## 31.2.6 Enable the lldp-med authentication mode of Voice-VLAN

After the lldp-med authentication mode of Voice-VLAN is enabled, the device deems the OUI configured by the user or the default OUI as an authentication whitelist, and performs matching check on the source MAC address of the voice device advertised by lldp-med. Only the voice packet sent from the voice device which matches the whitelist can enter the Voice-VLAN for transmission.

### Configuration Condition

Before enabling the lldp-med authentication mode of Voice-VLAN, the following tasks should be completed:

- The voice-VLAN function is globally enabled.

### Enable the lldp-med authentication mode of Voice-VLAN

Table 5 Enabling lldp-med Authentication Mode of Voice-VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the lldp-med authentication mode of Voice-VLAN	<b>voice vlan lldp-med authentication</b>	Mandatory  By default, the lldp-med authentication mode of Voice-VLAN is disabled.

---

## Note

- The lldp-med authentication mode of Voice-VLAN does not support aggregation group. That is to say, when the aggregation group of the device enables the function of Voice-VLAN, the lldp-med authentication mode of Voice-VLAN cannot be enabled; or when the device enables the lldp-med authentication mode of Voice-VLAN, the aggregation group cannot enable the function of Voice-VLAN.
  - The lldp-med authentication mode of Voice-VLAN does not support manual mode of the port. That is to say, when any port is configured as the manual mode of Voice-VLAN, the lldp-med authentication mode of Voice-VLAN cannot be enabled; or when the device enables the lldp-med authentication mode of Voice-VLAN, the port cannot be configured as the manual mode of Voice-VLAN.
  - After the lldp-med authentication mode of Voice-VLAN is enabled, the telephone which doesn't support lldp cannot work under normal conditions.
- 

### 31.2.7 Voice-VLAN Monitoring and Maintaining

Table 31 Voice-VLAN Monitoring and Maintaining

Command	Description
<b>show voice vlan { all   interface [ interface-name ]   link-aggregation [ link-aggregation-id ]   oui   lldp-med authenticated-mac }</b>	Show the information of Voice-VLAN

## 31.3 Voice-VLAN Typical Configuration Example

### 31.3.1 Configure a Voice-VLAN to Manual Mode

#### Network Requirements

- IP Phone and PC can access IP Network through Device.
- The voice-VLAN in manual mode has been configured on Device. If the network is normal, IP Phone and PC can normally access IP Network. If the network is congested, IP Phone has a higher priority than PC in accessing IP Network.

#### Network Topology

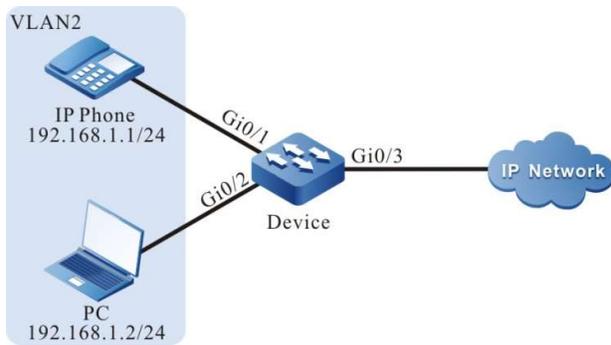

Figure 7-1 Configuration of Network Topology for Manual Mode of Voice-VLAN

### Configuration Steps

**Step 1:** Configure the link type of VLAN and port.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 and gigabitethernet0/2 on Device as Access, permitting the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1,0/2
Device(config-if-range)#switchport mode access
Device(config-if-range)#switchport access vlan 2
Device(config-if-range)#exit
```

#Configure the link type of port gigabitethernet0/3 on the Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/3
Device(config-if-gigabitethernet0/3)#switchport mode trunk
Device(config-if-gigabitethernet0/3)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/3)#exit
```

**Step 2:** Configure Voice-VLAN function.

#Configure VLAN2 as Voice-VLAN on the Device, with the value of Cos being 7.

```
Device(config)#voice vlan 2 cos 7
```

#Configure the manual mode of Voice-VLAN on the port gigabitethernet0/1 of the Device.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#voice vlan enable
Device(config-if-gigabitethernet0/1)#no voice vlan mode auto
Device(config-if-gigabitethernet0/1)#exit
```

#View the information of Voice-VLAN on the Device.

```
Device#show voice vlan all
Voice Vlan Global Information: Voice Vlan enable
Voice Vlan security: disable
```

```
Voice Vlan lldp-med authentication: disable
Voice Vlan VID: 2, Cos: 7
Default OUI number: 5
User config OUI number: 0
```

```
Voice vlan interface information:
Interface      Mode
-----
gi0/1         Manual-Mode
```

```
Voice Vlan OUI information: Total: 5
MacAddr      Mask      Name
-----
0003.6b00.0000 ffff.ff00.0000 Cisco-phone default
006b.e200.0000 ffff.ff00.0000 H3C-Aolynk-phone default
00d0.1e00.0000 ffff.ff00.0000 Pingtel-phone default
00e0.7500.0000 ffff.ff00.0000 Polycom-phone default
00e0.bb00.0000 ffff.ff00.0000 3Com-phone default
```

Step 3: Check the result.

#The 802.1p priority of the packets that are sent to IP Phone is modified to 7, and the 802.1p priority of the packets sent by PC to IP Network is not modified.

#When the network is normal, IP Phone and PC can normally access IP Network.

#If the network is congested, IP Phone can access IP Network with a priority higher than PC.

### 31.3.2 Configure a Voice-VLAN to Automatic Mode

#### Network Requirements

- IP Phone and PC access IP Network through port gigabitethernet0/1 of Device. The MAC address of IP Phone is 0001.0001.0001, and the MAC address of PC is 0002.0002.0002.
- The voice-VLAN in automatic mode has been configured. In this way, if the network is normal, IP Phone and PC can normally access IP network. If the network is congested, IP Phone has a higher priority than PC in accessing IP Network.

#### Network Topology

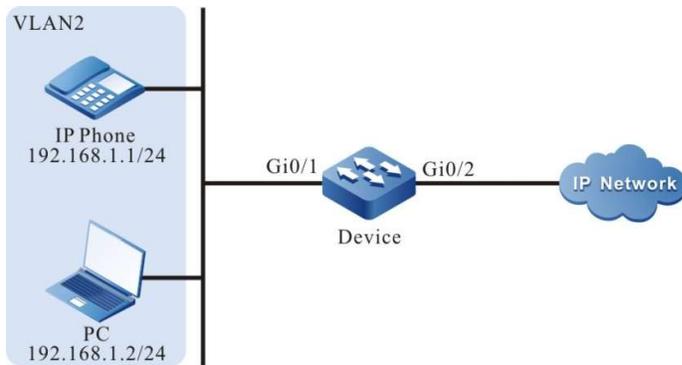

Figure 1 Configuration of Network Topology for Automatic Mode of Voice-VLAN

### Configuration Steps

Step 1: Configure the link type of VLAN and port.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of ports gigabitethernet0/1 on the Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)# switchport mode trunk
Device(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of port gigabitethernet0/2 on the Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

Step 2: Configure Voice-VLAN function.

#Configure VLAN2 as Voice-VLAN on the Device, and change corresponding value of Cos to 7.

```
Device(config)#voice vlan 2 cos 7
```

#Configure the automatic mode of Voice-VLAN on the port gigabitethernet0/1 of the Device.

```
Device(config)# interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#voice vlan enable
Device(config-if-gigabitethernet0/1)#voice vlan mode auto
```

```
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the OUI address which corresponds to the MAC address 0001.0001.0001 of IP Phone on the Device.

```
Device(config)#voice vlan oui-mac 0001.0001.0001 mask ffff.ffff.0000 name voice-vlan
```

#View the information of Voice-VLAN on the Device.

```
Device#show voice vlan all
Voice Vlan Global Information: Voice Vlan enable
Voice Vlan security: disable
Voice Vlan lldp-med authentication: disable
Voice Vlan VID: 2, Cos: 7
Default OUI number: 5
User config OUI number: 1

Voice vlan interface information:
Interface      Mode
-----
gi0/1         Auto-Mode

Voice Vlan OUI information: Total: 6
MacAddr      Mask      Name
-----
0001.0001.0000 ffff.ffff.0000 voice-vlan
0003.6b00.0000 ffff.ff00.0000 Cisco-phone default
006b.e200.0000 ffff.ff00.0000 H3C-Aolynk-phone default
00d0.1e00.0000 ffff.ff00.0000 Pingtel-phone default
00e0.7500.0000 ffff.ff00.0000 Polycom-phone default
00e0.bb00.0000 ffff.ff00.0000 3Com-phone default
```

Step 3: Check the result.

#The 802.1 priority of the packets that are sent to IP Phone is modified to 7, and the 802.1P priority of the packets sent by PC to IP Network is not modified.

#When the network is normal, IP Phone and PC can normally access IP Network.

#If the network is congested, IP Phone can access IP Network with a priority higher than PC.

### 31.3.3 Configure the security mode of Voice-VLAN

#### Network Requirements

- IP Phone and PC access IP Network through port gigabitethernet0/1 of Device. The MAC address of IP Phone is 0001.0001.0001, and the MAC address of PC is 0002.0002.0002.
- Configure the security mode of Voice-VLAN on the Device so that IP Phone rather than PC can normally access IP Network.

#### Network Topology

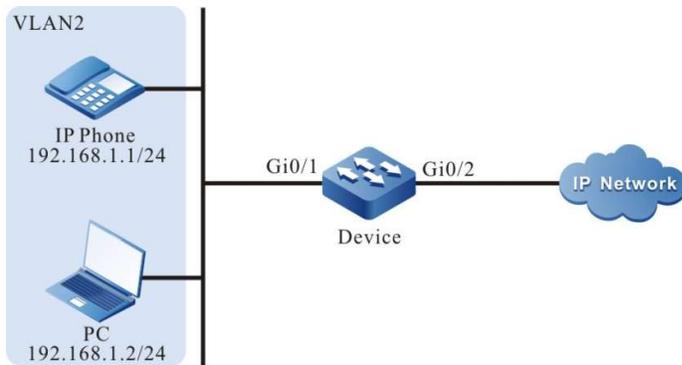

Figure 2 Configuration of Network Topology for Security Mode of Voice-VLAN

### Configuration Steps

Step 1: Configure the link type of VLAN and port.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 on the Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode trunk
Device(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of port gigabitethernet0/2 on the Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

Step 2: Configure Voice-VLAN function.

#Configure VLAN2 as Voice-VLAN on the Device, and change corresponding value of Cos to 7.

```
Device(config)#voice vlan 2 cos 7
```

#Globally enable the security mode of Voice-VLAN on the Device.

```
Device(config)# voice vlan security enable
```

#Configure the automatic mode of Voice-VLAN on the port gigabitethernet0/1 of the Device.

```
Device(config)# interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#voice vlan enable
Device(config-if-gigabitethernet0/1)#voice vlan mode auto
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the OUI address which corresponds to the MAC address 0001.0001.0001 of IP Phone on the Device.

```
Device(config)#voice vlan oui-mac 0001.0001.0001 mask ffff.ffff.0000 name voice-vlan
```

#View the information of Voice-VLAN on the Device.

```
Device#show voice vlan all
Voice Vlan Global Information: Voice Vlan enable
Voice Vlan security: enable
Voice Vlan lldp-med authentication: disable
Voice Vlan VID: 2, Cos: 7
Default OUI number: 5
User config OUI number: 1

Voice vlan interface information:
Interface      Mode
-----
gi0/1         Auto-Mode

Voice Vlan OUI information: Total: 6
MacAddr      Mask      Name
-----
0001.0001.0000 ffff.ffff.0000 voice-vlan
0003.6b00.0000 ffff.ff00.0000 Cisco-phone default
006b.e200.0000 ffff.ff00.0000 H3C-Aolynk-phone default
00d0.1e00.0000 ffff.ff00.0000 Pingtel-phone default
00e0.7500.0000 ffff.ff00.0000 Polycom-phone default
00e0.bb00.0000 ffff.ff00.0000 3Com-phone default
```

Step 3: Check the result.

#The 802.1 priority of the packets that are sent to IP Phone is modified to 7.

#PC shall not access IP Network.

### 31.3.4 Configure the lldp-med authentication mode of Voice-VLAN

#### Network Requirements

- IP Phone (it can send the LLDP packets that carry voice field) and PC access IP Network through port gigabitethernet0/1 of the Device. The MAC address of IP Phone is 0001.0001.0001, and the MAC address of PC is 0002.0002.0002.
- Configure the lldp-med authentication mode of Voice-VLAN on the Device so that IP Phone rather than PC can normally access IP Network.

#### Network Topology

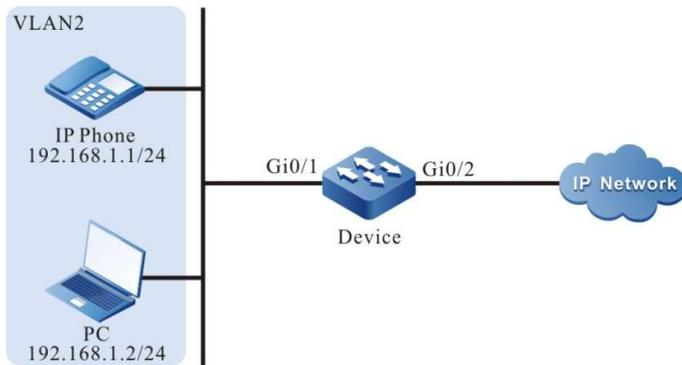

Figure 3 Configuration of Network Topology for Ildp-med Authentication Mode of Voice-VLAN

### Configuration Steps

Step 1: Configure the link type of VLAN and port.

# Create VLAN2 on Device.

```
Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
```

#Configure the link type of port gigabitethernet0/1 on the Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode trunk
Device(config-if-gigabitethernet0/1)# switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the link type of port gigabitethernet0/2 on the Device as Trunk, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/2
Device(config-if-gigabitethernet0/2)#switchport mode trunk
Device(config-if-gigabitethernet0/2)#switchport trunk allowed vlan add 2
Device(config-if-gigabitethernet0/2)#exit
```

Step 2: Configure Voice-VLAN function.

#Configure VLAN2 as Voice-VLAN on the Device, and change corresponding value of Cos to 7.

```
Device(config)#voice vlan 2 cos 7
```

#Globally enable the Ildp-med authentication mode of Voice-VLAN on the Device.

```
Device(config)#voice vlan lldp-med authentication
```

#Configure the automatic mode of Voice-VLAN on the port gigabitethernet0/1 of the Device.

```
Device(config)# interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#voice vlan enable
Device(config-if-gigabitethernet0/1)#voice vlan mode auto
Device(config-if-gigabitethernet0/1)#exit
```

#Configure the OUI address which corresponds to the MAC address 0001.0001.0001 of IP Phone on the Device.

```
Device(config)#voice vlan oui-mac 0001.0001.0001 mask ffff.ffff.0000 name voice-vlan
```

#View the information of Voice-VLAN on the Device.

```
Device#show voice vlan all
Voice Vlan Global Information: Voice Vlan enable
Voice Vlan security: disable
Voice Vlan lldp-med authentication: enable
Voice Vlan VID: 2, Cos: 7
Default OUI number: 5
User config OUI number: 1

Step 3: Check the result.

#The 802.1 priority of the packets that are sent to IP Phone is modified to 7.

#PC shall not access IP Network.

# 32 MAC Address Table Management

---

## 32.1 Overview

A MAC address entry consists of the MAC address of a terminal, the device port that is connected to the terminal, and the ID of the VLAN to which the port belongs. After a device receives a data packet, it matches the destination MAC address of the packet with the MAC address table entries that are saved in the device so as to locate a packet forwarding port efficiently.

MAC addresses are categorized into two types: dynamic MAC addresses and static MAC addresses. Static MAC addresses are categorized into static forwarding MAC addresses and static filtering MAC addresses.

Dynamic MAC address learning is the basic MAC address learning mode of the devices. Each dynamic MAC address entry has aging time. If no packet whose source MAC address matches a MAC address entry is received by the corresponding VLAN and port, the device deletes the MAC address entry.

The dynamic MAC address learning/forwarding process is as follows:

- When a device receives a packet, it searches the MAC address table of the corresponding VLAN for the MAC address entry that matches the source MAC address of the packet. If no corresponding matching entry is available, the source MAC address of the packet is written into the MAC address table, and the aging time timer of the new MAC address entry is started. If a matching MAC address entry is found, the aging time of the MAC address entry is updated.
- In the corresponding VLAN, the device searches the MAC address table for MAC address entry that matches the destination MAC address of the packet. If no matching entry is available, the packet is flooded to the other ports with the same VLAN ID. If a matching MAC address entry is available, the packet is forwarded through the specified port.

Static filtering MAC addresses are used to isolate devices which are aggressive, preventing the devices from communicating with external devices.

The configuration/forwarding process of static filtering MAC addresses is as follows:

- Static filtering MAC addresses can only be configured by users.
- If the source MAC address or destination MAC address of a packet matches a static

filtering MAC address entry in the corresponding VLAN, the packet is discarded.

Static forwarding MAC addresses are used to control the routing principle of packets, and prevent frequent MAC address migration of MAC address entries in the table. MAC address migration means that: A device learns a MAC address from port A, then the device receives packets whose source MAC address is the same as the MAC address from port B, and port B and port A belong to the same VLAN. At this time, the forwarding port saved in the MAC address entry is updated from port A to port B.

The configuration/forwarding process of static forwarding MAC addresses is as follows:

- Static forwarding MAC addresses are configured by users.
- If the destination MAC address of a packet matches a static MAC address entry in the corresponding VLAN, the packet is forwarded through the specified port.

One port can learn the same MAC address from different VLANs, but one MAC address can only be learned by one port in one VLAN.

## 32.2 MAC Address Management Function Configuration

Table 1 MAC Address Management Function Configuration List

Configuration Task	
Configure management properties of MAC addresses.	Configure the MAC address aging time.
	Configure the MAC address learning capability.
Configure limitations on MAC address learning.	Configure limitations on port-based dynamic MAC address learning.
	Configure limitations on VLAN-based dynamic MAC address learning.
	Configure limitations on system-based dynamic MAC address learning.
Configure static MAC addresses.	Configure static filtering MAC addresses.
	Configure static forwarding MAC addresses that are bound to a port.
	Configure static forwarding MAC addresses that are bound to an aggregation group.

### 32.2.1 Configure management properties of MAC addresses.

MAC address management properties include: MAC address aging time, and the MAC address learning capability of ports.

Each dynamic MAC address entry has aging time. If no packet whose source MAC address matches a MAC address entry is received by the specified VLAN, the device deletes the MAC address entry. If the specified VLAN receives a packet whose source MAC address matches a MAC address entry, the device resets the aging time of the MAC address entry.

Static MAC addresses can only be configured and deleted by users, so static MAC addresses cannot age.

If devices in the network have idle ports and the ports do not allow free use, then the MAC address learning capability can be disabled on the port. Then, the packets received by the port will all be discarded. In this way, these ports cannot access the network, and hence the security of the network is improved.

#### Configuration Condition

None

#### Configure the MAC address aging time.

The dynamic MAC address aging time set in a device takes effect globally. The value range of the MAC address aging time is:

- 0: MAC addresses do not age, that is, the learned dynamic MAC addresses do not age.
- 10-1000000: Aging time of dynamic MAC addresses. Unit: second. Default: 300.

If the aging time is configured too long, the MAC address table in the device may contain a large number of MAC address entries that are no long in use. In this way, the large number of invalid entries may use up MAC address resources, and new valid MAC address entries fail to be added to the device. If the aging time is configured too short, the device may frequently delete valid MAC address entries, affecting the device forwarding performance. Therefore, you need to configure a reasonable value for the aging time according to the actual environment.

Table 2 Configuring MAC Address Aging Time

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure the MAC address aging time.	<b>mac-address aging-time</b> <i>aging-time-value</i>	Mandatory By default, the MAC address aging time is set to 300 seconds.

### Configure the MAC address learning capability.

MAC address learning capability can be enabled and disabled only for dynamic MAC address learning. By default, the MAC address learning capability is enabled on a port. Then the port learns MAC address entries and forwards corresponding packets. If the MAC address learning capability is enabled on a port, the port does not learn dynamic MAC addresses, and the received packets are discarded.

Table 32 Configuring MAC Address Learning Capability

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable the MAC address learning capability on a port or aggregation group.	<b>mac-address learning</b>	Mandatory By default, the MAC address learning capability is enabled on a port.

### Configure the MAC address learning function

MAC address learning function can be enabled and disabled for dynamic MAC address learning packet forwarding. By default, the MAC address learning function is enabled on a port. At this moment, the port can learn MAC address entries and forward packets. If the MAC address learning function is disabled on a port, the port does not learn dynamic MAC addresses, but can still forward packets.

Table 3 Configuring MAC Address Learning Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Enable the MAC address learning function on a port or aggregation group	<b>mac-address learning action forward</b>	Mandatory By default, the MAC address learning function is enabled on a port.

### 32.2.2 Configure limitations on MAC address learning.

Limitations on MAC address learning are categorized into three types: limitations on port-based dynamic MAC address learning, limitations on VLAN-based dynamic MAC address learning, and limitations on system-based MAC address learning.

If a large number of dynamic MAC address entries have been learned by the device, it takes a long time for the device to search the MAC address table before forwarding packets, and this may cause degradation of the device performance. Therefore, you can configure limitations on dynamic MAC address learning to improve the device performance. If you configure limitations on dynamic MAC address learning on a port or VLAN, the number of access terminals can be controlled.

#### Configuration Condition

None

#### Configure limitations on port-based dynamic MAC address learning.

If the number of MAC address entries that have been learned by a port has reached the threshold value, the port discards the packets whose source MAC addresses are not in the MAC address forwarding table.

Table 32 Configuring Limitations on Port-based Dynamic MAC Address Learning

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure limitations on port-based dynamic MAC address learning.	<b>mac-address max-mac-count</b> <i>max-mac-count-value</i>	Mandatory  By default, there are no limitations on dynamic MAC address learning on a port.  The value range of the threshold of dynamic MAC address learning is 1-32767.

### Note

- In configuring limitations on port-based dynamic MAC address learning, if the configured threshold value is smaller than the number of existing dynamic MAC address entries on the port, the device prompts to manually clear some existing dynamic MAC address entries. After the MAC addresses are cleared, the configuration takes effect immediately.

### Configure limitations on VLAN-based dynamic MAC address learning.

If the number of MAC address entries that have been learned by a specified VLAN has reached the threshold value, the VLAN discards the packets whose source MAC addresses are not in the MAC address forwarding table.

Table 4 Configuring Limitations on VLAN-based Dynamic MAC Address Learning

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure limitations on VLAN-based dynamic MAC address learning.	<b>mac-address vlan <i>vlan-id</i> max-mac-count <i>max-mac-count-value</i></b>	Mandatory  By default, there are no limitations to the dynamic MAC address learning in VLAN.  The value range of the threshold of dynamic MAC address learning is 1-32767.

### Note

- In configuring limitations on VLAN-based dynamic MAC address learning, if the configured threshold value is smaller than the number of existing dynamic MAC address entries in the current VLAN, the device prompts to manually clear some existing dynamic MAC address entries. After the MAC addresses are cleared, the configuration takes effect immediately.

### Configure limitations on system-based dynamic MAC address learning.

If the number of MAC address entries that have been learned by the system has reached the threshold value, the system discards the packets whose source MAC addresses are not in the MAC address forwarding table.

Table 5 Configuring Limitations on System-based Dynamic MAC Address Learning

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure limitations on system-based dynamic MAC address learning.	<b>mac-address system max-mac-count <i>max-mac-count-value</i></b>	Mandatory  By default, MAC address learning is not limited.  The value range of the upper threshold of dynamic MAC address learning is 1-the maximum number of

Step	Command	Description
		address entries allowed to learn and supported by hardware chip.

### Note

- In configuring limitations on system-based dynamic MAC address learning, if the configured threshold value is smaller than the number of existing dynamic MAC address entries in the current system, the device prompts to manually clear some existing dynamic MAC address entries. After the MAC addresses are cleared, the configuration takes effect immediately.

### 32.2.3 Configure static MAC addresses.

Static MAC addresses are categorized into two types: static forwarding MAC addresses and static filtering MAC addresses.

The configured MAC addresses must be legal unicast MAC addresses instead of broadcast, multicast, or all-0 addresses.

One MAC address can only be configured as a static forwarding MAC address or a static filtering MAC address in a VLAN.

#### Configuration Condition

None

#### Configure static filtering MAC addresses.

After static filtering MAC address entries are configured, if the source or destination MAC addresses of the packets that are received by the corresponding VLAN match static filtering MAC address entries, the packets are discarded. This function prevents trustless devices from accessing the network, and prevents fraud and attacking activities of illegal users.

Table 6 Configuring Static Filtering MAC Address

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Configure static filtering MAC addresses.	<b>mac-address static</b> <i>mac-address-value</i> <b>vlan</b> <i>vlan-id</i> <b>drop</b>	Mandatory  By default, there is no static filtering MAC address in the device.

### Configure static forwarding MAC addresses that are bound to a port.

With static forwarding MAC address entries configured, after the corresponding VLAN receives packets, the port matches the destination MAC addresses of the packets with the static forwarding MAC address entries that are configured on the device. If they match successfully, the device forwards the packets through the specified port. This function helps to control the routing principle of packets more flexibly, and prevents frequent migration of MAC address entries in the table.

Table 7 Configuring Static Forwarding MAC Address Bound to a Port

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure static forwarding MAC addresses that are bound to a port.	<b>mac-address static</b> <i>mac-address-value</i> <b>vlan</b> <i>vlan-id</i> <b>interface</b> <i>interface-name</i>	Mandatory  By default, no static forwarding MAC address is configured in the device.

### Configure static forwarding MAC addresses that are bound to an aggregation group.

With static forwarding MAC address entries configured, after the aggregation group receives packets, the port matches the destination MAC addresses of the packets with the static forwarding MAC address entries that are configured on the device. If they match successfully, the device forwards the packets through the specified aggregation group. This function helps to control the routing principle of packets more flexibly, and prevents frequent migration of MAC address entries in the table.

Table 8 Configuring Static Forwarding MAC Address Bound to an Aggregation Group

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Configure static forwarding MAC addresses that are bound to an aggregation group.	<b>mac-address static</b> <i>mac-address-value</i> <b>vlan</b> <i>vlan-id</i> <b>interface link-aggregation</b> <i>link-aggregation-id</i>	Mandatory  By default, no static forwarding MAC address is configured in the device.

### Note

- Before configuring the command, ensure that the specified aggregation group has been created.

### Configure static BPDU MAC address

After static BPDU MAC address entries are configured, if the destination MAC address values of the packets received match BPDU MAC address entries, the packets are discarded.

Table 9 Configuring Static BPDU MAC Address

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Configure static filtering MAC addresses.	<b>mac-address bpdu</b> <i>mac-address-value</i>	Mandatory  By default, there is no static BPDU MAC address in the device.

### Note

- The following types of BPDU mac are allowed to configure:

(001) 010f-e200-0001	(002) 0180-c200-0000
(003) 0180-c200-0001	(004) 0180-c200-0002
(005) 0180-c200-0003	(006) 0180-c200-0004
(007) 0180-c200-0005	(008) 0180-c200-0006
(009) 0180-c200-0007	(010) 0180-c200-0008

(011) 0180-c200-0009	(012) 0180-c200-000a
(013) 0180-c200-000b	(014) 0180-c200-000c
(015) 0180-c200-000d	(016) 0180-c200-000e
(017) 0180-c200-000f	(018) 0180-c200-0010
(019) 0180-c200-0020/ffff-ffff-fff0	(020) 0180-c200-008a
(021) 0180-c200-8585	

### 32.2.4 MAC Address Management Monitoring and Maintaining

Table 10 MAC Address Management Monitoring and Maintaining

Command	Description
<b>clear mac-address dynamic</b> { <i>mac-address-value</i>   <b>all</b>   <b>interface</b> <i>interface-list</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>vlan</b> <i>vlan-id</i> [ <i>mac-address-value</i>   <b>interface</b> <i>interface-list</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]   <b>trill</b> <i>nickname</i> }	Clear the MAC address entries that are dynamically learned
<b>show mac-address interface</b> <i>interface-list</i> { <b>all</b>   <b>dynamic</b>   <b>static</b> [ <b>config</b> ] }	Show information of the MAC address entries on a port
<b>show mac-address interface link-aggregation</b> <i>link-aggregation-id</i> { <b>all</b>   <b>dynamic</b>   <b>static</b> [ <b>config</b> ] }	Show information of the MAC address entries in an aggregation group
<b>show mac-address vlan</b> <i>vlan-id</i> { <b>all</b>   <b>drop</b>   <b>dynamic</b>   <b>static</b> [ <b>config</b> ] }	Show information of the MAC address entries in VLAN
<b>show mac-address drop</b> [ <i>mac-address-value</i>   <b>config</b> ]	Show information of the static filtering MAC address entries in the system
<b>show mac-address dynamic</b> [ <i>mac-address-value</i> ]	Show information of the dynamic MAC address entries in the system
<b>show mac-address static</b> [ <i>mac-address-value</i>   <b>config</b> ]	Show information of the static forwarding MAC address entries in the system
<b>show mac-address system-mac</b>	Show the MAC address used by the system

Command	Description
<b>show mac-address</b> { <i>mac-address-value</i>   <b>all</b> }	Show information of the MAC address entries in the system or the specified ones
<b>show mac-address aging-time</b>	Show information of the dynamic MAC address entry aging time
<b>show mac-address max-mac-count</b> { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>system</b>   <b>vlan</b> { <i>vlan-id</i>   <b>all</b> } }	Show information of the limitations on dynamic MAC address learning in the system
<b>show mac-address count</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i>   <b>vlan</b> <i>vlan-id</i> ]	Show statistical information of the MAC address entries in the system
<b>show mac-address bpdu</b>	Show the BPDU MAC address configured in the system
<b>show mac-address software-learning</b>	Show current MAC address learning mode of the system is software learning or hardware learning.
<b>show mac-address trill</b> { [ <i>mac-address-value</i>   <b>count</b>   <b>dynamic</b>   <b>nickname</b> [ <i>nickname</i> ]]   <b>static</b>   <b>vlan</b> [ <i>vlan-id</i> ]] }	Show information of the trill mac address entries in the system
<b>show mac-address vxlan</b> [ <i>vxlan-id</i>   <b>count</b>   <b>dynamic</b>   <b>interface</b> <i>interface-list</i>   <b>ip</b> <i>ip-address</i>   <b>static</b> ]	Show information of the MAC address entries of the specified VXLAN.

## 32.3 Function configuration for software learning

### 32.3.1 Function configuration for software learning

After the software learning function is enabled, the MAC address entries are learned through software.

#### Configuration Condition

None

#### Enable software learning function

Table 11 Enabling Software Learning Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enable software learning function	<b>mac-address software-learning enable</b>	Mandatory By default, the software learning function is enabled.

### Disable software learning function

Table 12 Disabling Software Learning Function

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Disable software learning function	<b>no mac-address software-learning enable</b>	After the software learning function is disabled, the MAC address entries are learned through chip.

### Note

- Box standalone mode, hardware learning by default. Using this command to switch to software learning.
- Rack standalone mode, hardware learning by default. Using this command to switch to software learning.
- Box stack mode, software learning by default. Using this command to switch to hardware learning.
- Rack standalone mode, hardware learning by default. Using this command to switch to software learning.
- MLAG function, supporting software learning instead of hardware learning.

## 32.3.2 Monitoring and maintenance of software learning function

Table 13 Software Learning Monitoring and Maintaining

Command	Description
<b>show mac-address software-learning</b>	View whether the status of software learning is enabled or disabled

## 32.4 Configure function of MAC address migration log

### 32.4.1 Configure function of MAC address migration log

The function of MAC address migration log can be manually enabled and disabled. After this function is enabled, when any MAC address entry has address migration, an address migration log is recorded.

#### Configuration Condition

None

#### Enable the function of MAC address migration log

Table 14 Enabling Function of MAC Address Migration Log

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-
Enable the function of address migration log	<b>mac-address move log</b>	Default On

#### Disable the function of MAC address migration log

Table 15 Disabling Function of MAC Address Migration Log

Step	Command	Description
Enter the global configuration mode.	<b>config terminal</b>	-

Step	Command	Description
Disable the function of address migration log	<b>no mac-address move log</b>	After the address migration log function is disabled, the log information is not recorded when the MAC address entries have address migration.

### 32.4.2 Monitoring and maintenance of MAC address migration log function

Table 16 MAC Address Migration Monitoring and Maintaining

Command	Description
<b>clear mac-address move log</b> { <i>mac-address</i> }	Clear MAC address migration log
<b>show mac-address move config</b>	View the information about configuration of MAC address migration log function.
<b>show mac-address move log</b> { <i>mac-address-value</i>   <b>count</b> <i>count</i>   <b>hardlearn</b>   <b>interface</b> <i>interface-after</i> <b>interface</b> <i>interface-before</i>   <b>interface link-aggregation</b> <i>link-aggregation-id-after</i> <b>interface link-aggregation</b> <i>link-aggregation-id-before</i>   <b>softlearn</b>   <b>start-time</b> <i>time</i> <b>end-time</b> <i>time</i> }	View MAC address migration log.

# 33 Spanning Tree

---

## 33.1 Overview

IEEE 802.1D defines the standard Spanning Tree Protocol (STP) to eliminate network loops, preventing data frames from circulating or multiplying in loops, which may result in network congestion and affect normal communication in the network. Through the spanning tree algorithm, STP can determine where loops may exist in a network, block ports on redundant links, and trim the network into a tree structure in which no loops exist to prevent devices from receiving duplicated data frames. When the active path is faulty, STP recovers the connectivity of the blocked redundant links to ensure normal services. On the basis of STP, Rapid Spanning Tree Protocol (RSTP) and Multiple Spanning Tree Protocol (MSTP) are developed. The basic principles of the three protocols are the same, while RSTP and MSTP are improved versions of STP. Our company has implemented the VIST and Rapid-VIST spanning tree protocols that are compatible with Cisco's spanning tree. In particular, while improving the convergence performance, Rapid-VIST inherits the function of VIST loop removal.

In STP, the following basic concepts are defined:

- Root bridge: Root of the finally formed tree structure of a network. The device with the highest priority acts as the root bridge.
- Root Port (RP): The port which is nearest to the root bridge. The port is not on the root bridge, and it communicates with the root bridge.
- Designated bridge: If the device sends Bridge Protocol Data Unit (BPDU) configuration information to a directly connected device or directly connected LAN, the device is regarded as the designated bridge of the directly connected device or directly connected LAN.
- Designated port: The designated bridge forwards BPDU configuration information through the designated port.
- Path cost: It indicates the link quality, and it is related to the link rate. Usually, a higher link rate means a smaller path cost, and the link is better.

The devices that run STP implement calculation of the spanning tree by exchanging BPDU packets, and finally form a stable topology structure. BPDU packets are categorized into the following two types:

- Configuration BPDUs: They are also called BPDU configuration messages which are

used to calculate and maintain the spanning tree topology.

- Topology Change Notification (TCN) BPDUs: When the network topology structure changes, they are used to inform other devices of the change.

BPDUs contain information that is required in spanning tree calculation. The major information includes:

- Root bridge ID: It consists of the root bridge priority and the MAC address.
- Root path cost: It is the minimum path cost to the root bridge.
- Designated bridge ID: It consists of the designated bridge priority and the MAC address.
- Designated port ID: It consists of the designated port priority and port number.
- Message Age: Life cycle of BDU configuration messages while they are broadcast in a network.
- Hello Time: Transmitting cycle of BDU configuration messages.
- Forward Delay: Delay in port status migration.
- Max Age: Maximum life cycle of configuration messages in a device.

The election process of STP is as follows:

- Initial status.

The local device takes itself as the root bridge to generate BDU configuration messages and sends the messages. In the BDU packets, the root bridge ID and designated bridge ID are the local bridge ID, and root path cost is 0, and the specified port is the transmitting port.

Each port of the device generates a port configuration message which is used for spanning tree calculation. In the port configuration message, the root bridge ID and the designated bridge ID are the local bridge ID, the root path cost is 0, and the specified port is the local port.

- Update port configuration messages.

After the local device receives a BDU configuration message from another device, it compares the message with the port configuration message of the receiving port. If the received configuration message is better, the device uses the received BDU configuration message to replace the port configuration message. If the port configuration message is better, the device does not perform any operation.

The principle of comparison is as follows: The root bridge IDs, root path cost, designated bridge IDs, designated port IDs, and receiving port IDs should be compared in order. The smaller value is better. If the values of previous item are the same, compare the next item.

- Select the root bridge.

The device that sends the optimal configuration message in the entire network is selected as the root bridge.

- Select port roles and port status.

All ports of the root bridge are designated ports, and the ports are in the Forwarding status. The designated bridge selects the optimal port configuration message from all ports. The receiving port of the message is selected as the root port, and the root port is in the Forwarding status. The other ports calculate designated port configuration messages according to the root port configuration message.

The calculation method is as follows: The root bridge ID is the route ID of the root port configuration message, the root path cost is the sum of the root path cost of the root port configuration message and the root port path cost, the designated bridge ID is the bridge ID of the local device, and the designated port is the local port.

Based on the port configuration message and the calculated designated port configuration message, determine port rules: If the designated port configuration message is better, the local port is selected as the designated port, and the port is in the Forwarding status. Then, the port configuration message is replaced by the designated port configuration message, and the designated port sends port configuration messages periodically at the interval of Hello Time. If the port configuration message is better, the port is blocked. The port is then in the Discarding status, and the port configuration message is not modified.

After the root bridge, root port, and designated port are selected, the tree structure network topology is set up successfully. Only the root port and the designated port can forward data. The other ports are in the Discarding status. They can only receive configuration messages but cannot send configuration messages or forward data.

If the root port of a non-root bridge fails to receive configuration messages periodically, the active path is regarded as faulty. The device re-generates a BPDU configuration message and TCN BPDU with itself as the root bridge and sends the messages. The messages causes re-calculation of the spanning tree and then a new active path is obtained.

Before receiving new configuration messages, the other devices do not find the network topology change, so their root ports and designated port still forward data through the original path. The newly selected root port and designated port migrate to the Forwarding status after two Forward Delay periods to ensure that the new configuration message has been broadcast to the entire network and prevent occurrence of temporary loops that may be caused if both old and new root ports and designate ports forward data.

RSTP defined in IEEE 802.1w is developed based on STP, and it is the improved version of STP. RSTP realizes fast migration of port status and hence shortens the time required for a network to set up stable topology. RSTP is improved in the following aspects:

- It sets a backup port, that is, alternate port, for the root port. If the root port is blocked, the alternate port can fast switch over to become a new root port.
- It sets a backup port, that is, backup port, for the designated port. If the designated port is blocked, the backup port can fast switch over to become a new designated port.
- In a point-to-point link of two directly-connected devices, the designated port can enter the Forwarding status without delay only after a handshake with the downstream bridge.

- Some ports are not connected to the other bridges or shared links, instead, they are directly connected with user terminals. These ports are defined as edge ports. The status changes of edge ports do not affect the network connectivity, so the ports can enter the Forwarding status without delay.

However, both RSTP and STP form a single spanning tree, which has the following shortages:

- Only one spanning tree is available in the entire network. If the network size is large, the network convergence takes a long time.
- Packets of all VLANs are forwarded through one spanning tree, therefore no load balancing is achieved.

MSTP defined in IEEE 802.1s is an improvement of STP and RSTP, and it is backward compatible with STP and RSTP. MSTP introduces the concept of region and instance. MSTP divides a network into multiple regions. Each region contains multiple instances, one instance can set up mapping with one or more VLANs, and one instance corresponds to one spanning tree. One port may have different port role and status in different instances. In this way, packets of different VLANs are forwarded in their own paths.

In MSTP, definition of the following concepts is added:

- **MST domain:** It consists of multiple devices in the switching network and the network between the devices. The devices in an MST domain must meet the following requirements: The spanning tree function has been enabled on the devices. They have the same MST domain, MSTP level, and VLAN mapping table. They are directly connected physically.
- **Internal Spanning Tree (IST):** It is the spanning tree of instance 0 in each domain.
- **Common Spanning Tree (CST):** If each MST domain is regarded as a device, then the spanning trees that connect MST domains are CSTs.
- **Common and Internal Spanning Tree (CIST):** It consists of the ISTs of MST domains and the CSTs between the MST domains. It is a single spanning tree that connects all devices in the network.
- **Multiple Spanning Tree Instance (MSTI):** Spanning trees in MST domains. Each instance has an independent MSTI.
- **Common root:** CIST root.
- **Domain root:** Root of each IST and MSTI in MST domains. In MST domains, each instance has an independent spanning tree, so the domain roots may be different. The root bridge of instance 0 is the domain root of the domain.
- **Domain edge ports:** They are located at the edge of an MST domain and they are used to connect ports of different MST domains.
- **External path cost:** It is the minimum path cost from a port to the common root.
- **Internal path cost:** It is the minimum path cost from a port to the domain root.
- **Master port:** It is the domain edge port with the minimum path cost to the common

root in an MST domain. The role of a master port in an MSTI is the same as its role in a CIST.

The election rule of MSTP is similar to that of STP, that is, electing the bridge with the highest priority in the network as the root bridge of CIST by comparing configuration messages. Each MST domain calculates its IST, and MST domains calculate CSTs, and all of the constructs CIST in the entire network. Based on mapping between VLANs and spanning tree instances, each MST domain calculates an independent spanning tree MSTI for each instance.

The CISCO's private spanning tree protocol defines two protocols, i.e. PVST and RPVST. Both of them introduce the concept of instance. One VLAN corresponds to one instance. In different instances, ports may have different port roles and statuses. On this basis, different VLAN packets can be forwarded by their own path.

New definitions and precautions of MSTP in an MLAG environment:

- MLAG-MSTI: Instance MSTI corresponding to MLAG-VLAN;
- root priority: Priority of the root bridge specified by MLAG;
- bridge priority: Priority of the bridge specified by MLAG;
- stp-pseudo: Pseudo-information mode;

Restrictions on configuration of pseudo-information mode:

- The root priority (default value 0) of CIST and all MLAG-MSTIs in the pseudo-information must be higher than the bridge priority (default value 32768) of all bridges in the entire network (including MLAG node itself);
- In addition to ensuring that the partner node is the root bridge (optimal in the entire network), it is required to enable the root guard function on the access port of the MLAG node (all non-Peer-Link ports) (VIST mode does not support root guard yet) to prevent from causing errors in spanning tree calculations due to the receipt of BPDUs of higher priority.
- Bridge-Assurance function is required to be configured on the Peer-Link.
- For instances CIST and MLAG-MSTI, the root-priority of the two nodes should be the same, so that the two nodes appear as the same root bridge for both DHD and SD; in order to make the two nodes present as completely independent network bridges to SD for participation in the spanning tree calculation, the root-priority of the two nodes must be different.

## 33.2 Spanning Tree Function Configuration

Table 33 Spanning Tree Function Configuration List

Configuration Task	
Configure Basic Functions of a Spanning Tree	Enable the Spanning Tree Function
	Configure MST Domains
	Configure Spanning Tree Log Output Function
Configure Bridge Properties	Configure the Priority of a Bridge
	Configure Hello Time
	Configure Forward Delay
	Configure Max Age
	Configure the Maximum Number of Hops in an MST Domain
Configure Spanning Tree Port Properties	Configure the Priority of a Port
	Configure the Default Path Cost Standard for a Port
	Configure the Path Cost of a Port
	Configure BPDU Packet Length Check
	Configure the Maximum Length Value of BPDU Packets
	Configure the Maximum Transmitting Rate of BPDU Packets
	Configure Source MAC for BPDU Packets
	Configure Timeout Factor of BPDU Packets
	Configure an Edge Port
	Configure Automatic Detection of Edge Port
	Force Automatic Detection of Edge Port
Configure the Port Link Type	

Configuration Task	
Configure the Working Mode of a Spanning Tree	Configure the Working Mode of a Spanning Tree
Configure the Spanning Tree Protection Function	Configure the BPDU Guard Function
	Configure the BPDU Filter Function
	Configure the Flap Guard Function
	Configure the Loop Guard Function
	Configure the Root Guard Function
	Configure the TC Guard Function
	Configure the TC Protection Function

### 33.2.1 Configure Basic Functions of a Spanning Tree

#### Configuration Condition

None

#### Enable the Spanning Tree Function

After the spanning tree function is enabled, devices start to run the spanning tree protocol. The devices exchange BPDU packets to form a stable tree network topology, and network loops are eliminated.

Table 33 Enabling Spanning Tree Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enabling the spanning tree function globally.	<b>spanning-tree enable</b>	Mandatory By default, the spanning tree function is disabled globally.

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enabling the spanning tree function on a port.	<b>spanning-tree enable</b>	Optional  By default, the spanning tree function is enabled on a port.

### Configure MST Domains

Dividing an entire network into multiple MST domains helps to shorten the network convergence time. VLAN packets are transmitted through the corresponding MSTIs in MST domains and transmitted through CSTs between MST domains.

Table 9-3 Configuring MST Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the MST domain configuration mode.	<b>spanning-tree mst configuration</b>	-
Configure an MST domain name.	<b>region-name</b> <i>region-name</i>	Mandatory  By default, the name of an MST domain is the MAC address of the local device.

Step	Command	Description
Configure the MSTP revision level.	<b>revision-level</b> <i>revision-level</i>	Mandatory By default, the MSTP revision level is 0.
Configure a VLAN mapping table.	<b>instance</b> <i>instance-id</i> <b>vlan</b> <i>vlan-list</i>	Mandatory By default, all VLANs are mapped to instance 0.
Activate MST domain parameter configuration.	<b>active configuration pending</b>	Mandatory By default, MST domain parameters do not take effect immediately after modification.

### Note

- MST domain parameters do not take effect immediately after they are modified. Instead, you need to run the active configuration pending command to activate the parameters and trigger re-calculation of the spanning tree. To cancel MST domain parameter configuration, use the abort configuration pending command.

### Configure Spanning Tree Log Output Function

After the spanning tree log output function is configured, when the port status changes or TC/TCN packets are received, the spanning tree directly outputs prompt logs on the device for users to quickly identify the changes of topology environment.

Table 1 Configuring Spanning Tree Log Output Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the spanning tree log output function	<b>spanning-tree log portstate</b>	Mandatory By default, the spanning tree log output function is disabled.

## 33.2.2 Configure Bridge Properties

### Configuration Condition

None

### Configure the Priority of a Bridge

The bridge priority and MAC address form the bridge ID. A smaller ID indicates a higher priority. The bridge with the highest priority is elected as the root bridge. One device may have different bridge priority in different spanning tree instances.

Table 2 Configuring Priority of a Bridge

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Priority of a Bridge	<b>spanning-tree mst instance <i>instance-id</i> priority <i>priority-value</i></b>	Mandatory By default, the priority of the bridge in all spanning tree instances is 32768.
Configure the priority of a bridge under vist/rapid-vist mode	<b>spanning-tree vlan <i>vlan-id</i> priority <i>priority-value</i></b>	Mandatory By default, the priority of the bridge in all spanning tree instances is 32768.

---

### Note

- The step of bridge priorities is 4096, that is, the valid values include: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28673, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.
- 

### Configure Hello Time

After the network topology becomes stable, the root bridge sends BPDU packets at the interval of Hello Time to inform other bridges of its role as the root bridge so that the other bridges can recognize its role. The designated bridge maintains the existing spanning tree topology according to the BPDU packet, and it forwards the BPDU packet to other devices. Generally, the designated bridge does not receive BPDU packets in a period of time as long as three times timeout period (3\*Hello Time), it regards the link as

faulty. In this way, the spanning tree re-calculates the network topology to obtain a new active path, ensuring the network connectivity.

Table 3 Configuring Hello Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Hello Time	<b>spanning-tree mst hello-time <i>seconds</i></b>	Mandatory By default, Hello Time is 2 seconds.
Configure Hello Time under vist/rapid-vist mode	<b>spanning-tree vlan <i>vlan-id</i> hello-time <i>seconds</i></b>	Mandatory By default, Hello Time is 2 seconds.

### Note

- Forward Delay, Hello Time, and Max Age must meet the following requirement; otherwise, frequent network flapping may be cause.

$$2 \times (\text{Forward\_Delay} - 1.0\text{seconds}) \geq \text{Max\_Age}$$

$$\text{Max\_Age} \geq 2 \times (\text{Hello\_Time} + 1.0\text{seconds})$$

### Configure Forward Delay

In STP, when the root port or designated port migrates from the Discarding status to the Forwarding status, the topology change cannot be learned by the entire network immediately. To prevent temporary loops, the port migrates to the Learning status in the first Forward Delay, and then waits another Forward Delay to migrate to the Forwarding status.

Table 33 Configuring Forward Delay Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Forward Delay	<b>spanning-tree mst forward-time <i>seconds</i></b>	Mandatory

Step	Command	Description
		By default, Forward Delay is 15 seconds.
Configure Forward Delay Time under vist/rapid-vist mode	<b>spanning-tree vlan <i>vlan-id</i> forward-time <i>seconds</i></b>	Mandatory By default, Forward Delay is 15 seconds.

### Configure Max Age

Max Age refers to the life cycle of BPDU configuration messages while they are broadcast in a network. When a configuration message is transmitted crossing domains, after it passes through an MST domain, one is added to Message Age in the configuration message. If the device receives a configuration message and finds that the value of Message Age in the configuration message is larger than the value of Max Age, the device discards the configuration message, and the configuration message is no longer used in spanning tree calculation.

Table 4 Configuring Max Age Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Max Age	<b>spanning-tree mst max-age <i>seconds</i></b>	Mandatory By default, Max Age is 20 seconds.
Configure Max Age Time under vist/rapid-vist mode	<b>spanning-tree vlan <i>vlan-id</i> max-age <i>seconds</i></b>	Mandatory By default, Max Age is 20 seconds.

### Configure the Maximum Number of Hops in an MST Domain

You can limit the size of an MST domain by configuring the maximum number of hops in the MST domain. A larger number of hops in an MST domain mean a larger MST domain. In one MST domain, starting from the domain root, once the configuration message is forwarded by a device, the number of hops is decreased by one. If the number of hops of a configuration message is 0, the device discards the configuration message. Therefore, the device which is beyond the maximum number of hops cannot participate in spanning tree calculation in the domain.

Table 5 Configuring Maximum Number of Hops in an MST Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Maximum Number of Hops in an MST Domain	<b>spanning-tree mst max-hops</b> <i>max-hops-value</i>	Mandatory  By default, the maximum number of hops in an MST domain is 20.

### 33.2.3 Configure Spanning Tree Port Properties

#### Configuration Condition

None

#### Configure the Priority of a Port

A port ID consists of port priority and port index. Port ID affects election of the port role. A smaller port ID indicates a higher priority. One port may have different port priority in different spanning tree instances.

Table 6 Configuring Priority of a Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.

Step	Command	Description
Configure the Priority of a Port	<b>spanning-tree mst instance</b> <i>instance-id</i> <b>port-priority</b> <i>priority-value</i>	Mandatory By default, the priority of the port in all spanning tree instances is 128.
Configure the priority of a port under vist/rapid-vist mode	<b>spanning-tree vlan</b> <i>vlan-id</i> <b>port-priority</b> <i>priority-value</i>	Mandatory By default, the priority of the port in all spanning tree instances is 128.

### Note

- The step of port priorities is 16, that is, the valid values include: 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240.

### Configure the Default Path Cost Standard for a Port

Compared with the path cost calculated based on the IEEE 802.1D-1998 standard, the path cost calculated based on the IEEE 802.1T-2001 is larger. With the increase of the link rate, the path cost value quickly decreases.

Table 7 Configuring Default Path Cost Standard for a Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Default Path Cost Standard for a Port	<b>spanning-tree pathcost</b> <b>method { dot1D-1998   dot1T-2001 }</b>	Mandatory By default, the IEEE 802.1T-2001 standard is used to calculate the default path cost of the port.

### Configure the Path Cost of a Port

The port path cost affects election of the port role. A smaller port path cost means a better link. One port may have different port path cost in different spanning tree instances.

Table 8 Configuring Port Patch Cost

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the path cost of a port.	<b>spanning-tree mst instance</b> <i>instance-id</i> <b>cost</b> <i>cost-value</i>	Mandatory  By default, the path cost is automatically calculated according to the port rate.
Configure the path cost of a port under vist/rapid-vist mode	<b>spanning-tree vlan</b> <i>vlan-id</i> <b>cost</b> <i>cost-value</i>	Mandatory  By default, the path cost is automatically calculated according to the port rate.

### Configure BPDU Packet Length Check

Configure the BPDU packet length check so that the port can check the length of the received BPDU packet to prevent attacks from BPDU packets of illegal length.

Table 9 Configuring BPDU Packet Length Check

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure BPDU Packet Length Check	<b>spanning-tree bpdu length-check</b>	Mandatory  By default, the BPDU packet length check is disabled.

### Configure the Maximum Length Value of BPDU Packets

The maximum length value of a legal BPDU packet when BPDU packet length check is configured.

Table 10 Configuring Maximum BPDU Packet Length

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Maximum Length Value of BPDU Packets	<b>spanning-tree bpdu max-length <i>max-length</i></b>	Mandatory  By default, the maximum length value is 1500 bytes.

### Configure the Maximum Transmitting Rate of BPDU Packets

The maximum transmitting rate of BPDU packets limits the number of BPDU packets that can be transmitted during the Hello Time of a device. This prevents the device from sending too many BPDU packets which may cause frequent spanning tree calculation for other devices.

Table 11 Configuring Maximum BPDU Packet Transmitting Rate

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Maximum Transmitting Rate of BPDU Packets	<b>spanning-tree transmit hold-count <i>hold-count-number</i></b>	By default, the port can send 6 BPDU packets at most in Hello Time.

### Configure source MAC address check for BPDU packet

Configure source MAC address check for BPDU packet so that the port can check the source MAC address of the received BPDU packet to prevent attacks from BPDU packets of illegal device.

Table 12 Configuring Source MAC Check of BPDU Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Source MAC for BPDU Packets	<b>spanning-tree bpdu src-mac-match</b> <i>src-mac</i>	Mandatory  By default, the source MAC address check of BPDU packet is disabled on the port.

### Configure Timeout Factor of BPDU Packets

In a stable network topology, designated port will send a BPDU packet to neighbored device every HELLO TIME. Usually if the device doesn't receive the BPDU packet from upper devices three times beyond HELLO TIME, it is considered that the network topology changes, which will start a spanning tree re-election.

However in a stable network topology, if the upper device can't receive the BPDU packet in the case of busy or any other reason, it will start a spanning tree re-election. In this case, you can configure the timeout factor to avoid such calculation.

Table 13 Configuring Timeout Factor of BPDU Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure time factor of BPDU packets	<b>spanning-tree timer-factor</b> <i>times-number</i>	By default, if the device doesn't receive the BPDU packet from upper devices three times beyond HELLO TIME, it is considered that the network topology changes, which will start a spanning tree re-election. In stacking environment, it is recommended to configure the timeout factor as 6.
Configure time factor of BPDU packet under vist/rapid-vist mode	<b>spanning-tree vlan</b> <i>vlan-id</i> <b>timer-factor</b> <i>times-number</i>	By default, if the device doesn't receive the BPDU packet from upper devices three times beyond HELLO TIME, it is considered that the network topology changes, which will start a spanning tree re-election. In stacking environment, it is recommended to configure the timeout factor as 6.

### Configure an Edge Port

Edge ports are the ports that are directly connected to user terminals. If an edge port is UP/DOWN, it does not cause temporary loops. Therefore, an edge port can quickly migrate from the Discarding status to the Forwarding status without delay time. In addition, if an edge port is UP/DOWN, it does not send TC BPDUs. This prevents unnecessary spanning tree re-calculation.

If an edge port receives BPDU packets, it becomes a non-edge port again. Then, the port can become the edge port again only after it is reset.

Table 14 Configuring Edge Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure an Edge Port	<b>spanning-tree portfast edgeport</b>	Mandatory  By default, a port is a not an edge port.

---

### Note

- Before an edge port is specified, please make sure that the port is directly connected to the user terminal. Otherwise, after an edge port is configured, a temporary loop may be introduced.
- 

### Configure Automatic Detection of Edge Port

Automatic detection of edge port can be configured to automatically identify the port connected to the terminal as an edge port. This can avoid spanning tree recalculation and thus network oscillation when the terminal device goes online and offline.

An edge port will become a non-edge port again after BPDU packets are received.

Table 15 Configuring Automatic Detection of Edge Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure Automatic Detection of Edge Port	<b>spanning-tree portfast autoedge</b>	Mandatory  By default, automatic detection of edge port function is disabled in standalone and stack mode.

### Force Automatic Detection of Edge Port

Affected by the configuration or environment, current port may be identified as an edge port or a non-edge port by mistake. At this moment, users can execute this command to trigger edge port detection so that the port can correctly identify whether it is an edge port.

Table 16 Configuring Function of Forcing Automatic Detection of Edge Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Force Automatic Detection of Edge Port	<b>spanning-tree portfast autoedge force</b>	Mandatory

### Note

- This command can take effect only when the port has enabled automatic edge port detection.

### Configure the Port Link Type

If two devices are directly connected, you can configure the port link type to point-to-point link. The ports of the point-to-point link type can quickly migrate from the Discarding status to the Forwarding status without delay time.

Table 17 Configuring Link Type of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.

Step	Command	Description
Configure the Port Link Type	<b>spanning-tree link-type</b> { <b>point-to-point</b>   <b>shared</b> }	Mandatory By default, the port link type is set according to the port duplex mode. If the port works in the full duplex mode, the port is set to the point-to-point link type. If the port works in the half duplex mode, the port is set to the shared link type.

### Note

- The link type of the port should be configured according to the actual physical link. If the actual physical link of the port is not a point-to-point link, configuration as point-to-point link may bring in temporary loops.
- When the local port has a shared link, it does not support automatic identification of edge port. If automatic identification of edge port is conducted for a peer port, the peer port may be identified as an edge port by mistake.

### Configure Bridge Assurance function of the port

After the Bridge Assurance function is enabled on current port, the port will send BPDUs regardless of the spanning tree role (even if it is AlternatePort or BackupPort). If the port does not receive BPDU from the peer device for a consecutive period of time, the port status will switch to Blocking state and will not participate in the calculation of spanning tree. If BPDUs from the peer device are received later, current port will get back to normal for spanning tree calculation.

Table 18 Configuring Bridge Assurance Function of Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure Bridge Assurance function of the port	<b>spanning-tree bridge-assurance enable</b>	Mandatory  By default, the Bridge Assurance function of the port is disabled.

---

### Note

Restrictions on configuration of Bridge-Assurance:

- It is mutually exclusive with the port's BPDU-Guard, BPDU-Filter, and Port-Fast (adminEdge, autoEdge). If the port is configured with one of these functions, it cannot configure Bridge-Assurance (a print prompt will be given).
  - RP and AP in STP mode cannot send BPDUs at will, so the Bridge-Assurance configuration in STP mode is not effective, but it can be configured.
- 

### 33.2.4 Configure the Working Mode of a Spanning Tree

The working mode of a spanning tree determines the mode in which devices run and determines the encapsulation format of BPDU packets that are sent out. If a port that works in the MSTP mode is found to be connected to a device that runs RSTP, the port automatically migrates to the RSTP mode. If a port that works in the MSTP mode or MSTP mode is found to be connected to a device that runs STP, the port automatically migrates to the STP compatible mode.

#### Configuration Condition

None

#### Configure the Working Mode of a Spanning Tree

Table 19 Configuring Working Mode of a Spanning Tree

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Working Mode of a Spanning Tree	<b>spanning-tree mode { stp   rstp   mstp   vist   rapid-vist}</b>	Mandatory By default, the working mode of spanning tree is MSTP.

### 33.2.5 Configure the Spanning Tree Protection Function

#### Configuration Condition

None

#### Configure the BPDU Guard Function

For an access layer device, the access port is usually directly connected to the user terminal or file server. At this time, the port is set to the edge port to realize fast migration of port statuses. When an edge port receives BPDU packets, it automatically changes to a non-edge port to cause re-generation of the spanning tree. Normally, an edge port does not receive BPDU packets. However, if someone sends faked BPDU packets to attack the device in a malicious manner, network flapping may be caused. The BPDU Guard function is used to prevent such attacks. If an edge port on which the BPDU Guard function is enabled receives BPDU packets, the port is closed.

Table 20 Configuring BPDU Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the

Step	Command	Description
		subsequent configuration takes effect only within the aggregation group.
Configure the BPDU Guard Function	<b>spanning-tree bpdu guard</b>	Mandatory By default, the BPDU Guard function is disabled.

### Configure the BPDU Filter Function

After the BPDU Filter function is enabled on an edge port, the port does not send or receive BPDU packets.

Table 21 Configuring BPDU Filter Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the BPDU Filter Function	<b>spanning-tree bpdu filter</b>	Mandatory By default, the BPDU Filter function is disabled.

### Configure the Flap Guard Function

In a stable topology environment, the root port is usually not changed. However, if the links in the network are not stable or the network experiences attacks with external BPDU packets, frequent switchover of root ports may be caused, and finally network flapping is caused.

The Flap Guard function prevent frequent switchover of root ports. After the Flap Guard function is enabled, if the root port role change frequency of a spanning tree instance exceeds the specified threshold, the root port of the instance enters the Flap Guard status. In this case, the root port is always in the Discarding status, and it starts normal spanning tree calculation only after the recovery time times out.

Table 22 Configuring Flap Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the Flap Guard function	<b>spanning-tree flap-guard enable</b>	Mandatory By default, the Flap Guard function is disabled.
Configure the maximum times of change in root port allowed within the detection cycle	<b>spanning-tree flap-guard max-flaps</b> <i>max-flaps-number time seconds</i>	Optional By default, after the Flap Guard function is enabled, if a certain instance has 5 times of change in root port roles within 10 seconds, it will be under the Flap Guard status.
Configure the Flap Guard recovery time	<b>spanning-tree flap-guard recovery-time</b> <i>seconds</i>	Optional By default, Flap Guard can recover within 30 seconds.

### Configure the Loop Guard Function

The local device maintains the statuses of the root port and other blocked ports according to the BPDU packets that are periodically sent by the upstream device. In the case of link congestion or unidirectional link failure, the ports fail to receive BPDU packets from the upstream device, the spanning tree message on the port times out. Then, the downstream devices re-elect port roles. The downstream device ports that fail to receive BPDU packets change to designated port, while blocked ports migrate to the Forwarding status, resulting in loops in the switching network.

The Loop Guard function can restrain generation of such loops. After the Loop Guard function is enabled on a port, if the port times out owing to the failure to receive BPDU packets from the upstream device, in re-calculating the port role, the port is set to the Discarding status, and the port does not participate in

spanning tree calculation. If an instance on the port receives BPDU packets again, the port participates in spanning tree calculation again.

Table 23 Configuring Loop Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Loop Guard Function	<b>spanning-tree guard</b> { <b>loop</b>   <b>root</b>   <b>none</b> }	Mandatory  By default, the Loop Guard function of the port is disabled.

---

 **Note**

- For Root Guard and Loop Guard of the port, only one function can be enabled.
- 

### Configure the Root Guard Function

The root bridge and backup root bridge of a spanning tree must be in the same domain, especially the CIST root bridge and its backup bridge. In network design, usually the CIST root bridge and its backup bridge are placed in the core domain with high bandwidth. However, owing to incorrect configuration or malicious attacks in the network, the legal root bridge in the network may receive a BPDU packet with a higher priority. In this way, the current legal bridge may lose its role as the root bridge, and improper change of the network topology is caused. The illegal change may lead the traffic that should be transmitted through a high-speed link to a low-speed link, causing network congestion.

The Root Guard function prevents occurrence of such case. If the Root Guard function is enabled on a port, the port can only act as the designated port in all instances. If the port receives a better BPDU configuration message, the port is set to the Discarding status. If it does not receive better BPDU configuration message in a period of time, the port resumes its previous status. It is recommended that you enable the Root Guard function on the specified port of the root bridge.

Table 24 Configuring Root Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the Root Guard Function	<b>spanning-tree guard</b> { <b>loop</b>   <b>root</b>   <b>none</b> }	Mandatory  By default, the Root Guard function of the port is disabled.

---

 **Note**

- For Root Guard and Loop Guard of the port, only one function can be enabled.
- 

### Configure the TC Guard Function

When a device detects a network topology change, a TC packet will be generated to notify other devices in the environment that the network topology has changed. When the device receives the TC packet, it will refresh the address. When the topology is unstable or a TC packet is manually created to launch an attack,

TC will frequently appear on the network, causing repeated address refresh of the device. This affects calculation of the spanning tree and leads to a high CPU occupancy.

TC Guard can effectively prevent this from happening. After the TC Guard is configured on current port, when the device receives the TC packet, it will no longer process the TC flag therein or spread TC, which can effectively prevent the TC packet from impacting the network.

Table 25 Configuring TC Guard Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	
Configure the TC Guard Function	<b>spanning-tree tc-guard enable</b>	Mandatory  By default, the TC Guard function of the port is disabled.

### Configure the TC Protection Function

If the network topology changes, to ensure normal forwarding of service data during the topology change process, when devices handle TC packets, they will refresh the MAC addresses. Attacks with faked TC packets may cause the devices to refresh MAC addresses frequently. This affects calculation of the spanning tree and leads to a high CPU occupancy.

The TC protection function prevents occurrence of such case. After the TC protection function is enabled, once a TC packet is received within the TC protection interval, the TC counter counts one. If the TC counter is equal to or larger than the threshold, it enters a suppressed status. Then, the devices do not refresh MAC addresses in handling later TC packets. After the TC protection interval, the suppressed status is changed to the normal status, and the TC counter is cleared and started again.

Table 26 Configuring TC Protection Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the TC protection function	<b>spanning-tree tc-protection enable</b>	Optional By default, the TC protection function is enabled.
Configure the time interval of TC protection	<b>spanning-tree tc-protection interval</b> <i>seconds</i>	Mandatory By default, the time interval of TC protection is 4 seconds.
Configure the threshold value of TC protection	<b>spanning-tree tc-protection threshold</b> <i>threshold-value</i>	Mandatory By default, the threshold value of TC protection is 1.

### 33.2.6 Configure the function of configuring pseudo-information of spanning tree

#### Configuration Condition

When the pseudo-information of spanning tree is applied in the MLAG environment, on the MLAG virtual node, the conventional priority configuration method of spanning tree will not take effect. The priority of corresponding instance of the MLAG node is modified by configuring pseudo-information of spanning tree. At this moment, the instance priority information of the BPDU sent by MLAG GROUP is the pseudo-information of spanning tree configured. For the two MLAG node devices, it seems the spanning tree calculation for one device. Please note that during configuration, the pseudo-information configuration of the spanning tree on the MLAG master and standby devices should be consistent, and the configured parameters in the pseudo-information configuration mode only take effect in the MLAG environment.

#### Configure specified root bridge priority of the instance

Configure the root bridge priority of the specified spanning tree instance in pseudo-information.

Table 27 Configuring Specified Root Bridge Priority of Instance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure to enter pseudo-information	<b>spanning-tree pseudo-information</b>	Mandatory
Configure the root bridge priority of the specified spanning tree instance	<b>mst instance</b> <i>instance-id</i> <b>root-priority</b> <i>priority-value</i>	Mandatory  By default, the root bridge priority of each spanning tree instance in the pseudo-information is 0 (i.e. highest priority).  <i>instance-id</i> : Spanning tree instance ID, value range 0~63  <i>priority-value</i> : Configure the root bridge priority of the device in the specified spanning tree instance. The smaller the value, the higher the priority will become.

### Note

- The step of root bridge priorities is 4096, that is, the valid values include: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.
- On the MLAG paired device, the two devices must be consistent in terms of the root bridge priorities of all instances configured in the pseudo information.

### Configure specified bridge priority of the instance

Configure the specified bridge priority of the specified spanning tree instance in pseudo-information.

Table 28 Configuring Specified Bridge Priority of Instance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure to enter pseudo-information	<b>spanning-tree pseudo-information</b>	Mandatory
Configure the specified bridge priority of the specified spanning tree instance in pseudo-information	<b>mst instance <i>instance-id</i> designated-priority <i>priority-value</i></b>	<p>Mandatory</p> <p>By default, the specified bridge priority of each spanning tree instance in the pseudo-information is configured as 32768.</p> <p><i>instance-id</i>: Spanning tree instance ID, value range 0~63</p> <p><i>priority-value</i>: Configure the root bridge priority of the device in the specified spanning tree instance. The smaller the value, the higher the priority will become.</p>

---

 **Note**

- The step of the specified bridge priorities is 4096, that is, the valid values include: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.
- 

**Configure the root bridge priority of the specified VLAN list**

Configure the root bridge priority of the device in the specified VLAN list.

Table 29 Configuring Root Bridge Priority of Specified VLAN List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enter pseudo-information	<b>spanning-tree pseudo-information</b>	Mandatory
Configure the root bridge priority of the device in the specified VLAN list	<b>spanning-tree vlan <i>vlan-list</i> root-priority <i>priority-value</i></b>	Mandatory  By default, the root bridge priority of each VLAN in the pseudo-information is 0 (i.e. highest priority).  <i>priority-value:</i> Configure the root bridge priority of the device in the specified spanning tree instance. The smaller the value, the higher the priority will become.

### Note

- The step of root bridge priorities is 4096, that is, the valid values include: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.
- On the MLAG paired device, the two devices must be consistent in terms of the root bridge priorities of all VLANs configured in the pseudo information.

### Configure the bridge priority of the specified VLAN list

Configure the bridge priority of the device in the specified VLAN list.

Table 30 Configuring Bridge Priority of Specified VLAN List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure to enter pseudo-information	<b>spanning-tree pseudo-information</b>	Mandatory
Configure bridge priority of the device in the specified VLAN list	<b>vist vlan <i>vlan-list</i> designated-priority <i>priority-value</i></b>	<p>Mandatory</p> <p>By default, the specified bridge priority of each spanning tree instance in the pseudo-information is configured as 32768.</p> <p><i>priority-value:</i> Configure the root bridge priority of the device in the specified spanning tree instance. The smaller the value, the higher the priority will become.</p>

---

### Note

- The step of the specified bridge priorities is 4096, that is, the valid values include: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

## 33.2.7 Spanning Tree Monitoring and Maintaining

Table 31 Spanning Tree Monitoring and Maintaining

Command	Description
<b>clear spanning-tree detected-protocols</b>	Perform mCheck operation on the global or specified port

Command	Description
<b>clear spanning-tree bpdv statistics</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Clear BPDU-related statistical information on the global or specified port
<b>show spanning-tree</b> [ <b>detail</b> ]	Show basic information of the spanning tree
<b>show spanning-tree guard</b> [ <b>current</b> ] [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Show configuration and status information of the spanning tree protection function on the port
<b>show spanning-tree</b> { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> } [ <b>detail</b> ]	Show spanning tree status information of the specified port or aggregation group
<b>show spanning-tree mst</b> [ <b>configuration</b> ] [ <b>current</b>   <b>pending</b> ]   <b>detail</b>   <b>instance</b> <i>instance-id</i> [ <b>detail</b> ]   { <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> } [ <b>instance</b> <i>instance-id</i> ]	Show spanning tree configuration and status information
<b>show configuration</b> { <b>current</b>   <b>pending</b> }	Show related configuration of MST Domain
<b>show spanning-tree vlan</b> <i>vlan-id</i> [ <b>detail</b> ]	Show spanning tree status information of the specified vlan in vist/rapid-vist mode

## 33.3 Spanning Tree Typical Configuration Example

### 33.3.1 MSTP Typical Application

#### Network Requirements

- Four devices in the network are in the same MST domain. Device1 and Device2 are convergence layer devices, while Device3 and Device4 are access layer devices.
- To reasonably balance traffic on the links to realize load sharing and redundancy backup, configure packets of VLAN2 to be forwarded following instance 1. The root bridge of instance 1 is Device1. Packets of VLAN3 are forwarded following instance 2. The root bridge of instance 2 is Device2. Packets of VLAN4 are forwarded following instance 0.

## Network Topology

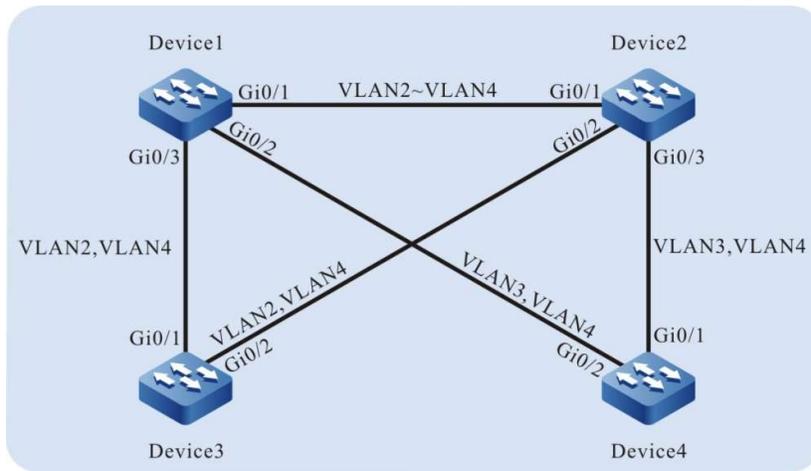

Figure 1 Network Topology for Typical Application of MSTP

### Configuration Steps

*Step 1:* Configure VLANs, and configure the link type of the ports.

#On Device1, create VLAN2-VLAN4, configure the link type of port gigabitethernet0/1 to Trunk and allow services of VLAN2-VLAN4 to pass.

```
Device1(config)#vlan 2-4
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#switchport mode trunk
Device1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2-4
Device1(config-if-gigabitethernet0/1)#exit
```

#On Device1, configure the link type of port gigabitethernet0/2 as Trunk and allow services of VLAN3 and VLAN4 to pass. Configure the link type of port gigabitethernet0/3 as Trunk and allow services of VLAN2 and VLAN4 to pass. (Omitted)

#On Device2, create VLAN2-VLAN4. Configure the link type of ports gigabitethernet0/1-gigabitethernet0/3 to Trunk, configure gigabitethernet0/1 to allow services of VLAN2-VLAN4 to pass, gigabitethernet0/2 to allow services of VLAN2 and VLAN4 to pass, and gigabitethernet0/3 to allow services of VLAN3 and VLAN4 to pass. (Omitted)

#On Device3, create VLAN2 and VLAN4. Configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk, allowing the services of VLAN2 and VLAN4 to pass. (Omitted)

#On Device4, create VLAN3 and VLAN4. Configure the link type of ports gigabitethernet0/1~gigabitethernet0/2 as Trunk and allow services of VLAN3 and VLAN4 to pass. (Omitted)

*Step 2:* Configure an MST domain.

#On Device1, configure an MST domain. Set the domain name to admin, the revision level to 1, map instance 1 to VLAN2, map instance 2 to VLAN3, and activate the MST domain.

```
Device1#configure terminal
Device1(config)#spanning-tree mst configuration
Device1(config-mst)#region-name admin
Device1(config-mst)#revision-level 1
Device1(config-mst)#instance 1 vlan 2
Device1(config-mst)#instance 2 vlan 3
Device1(config-mst)#active configuration pending
Device1(config-mst)#exit
```

---

### Note

- The MST domain configuration of Device2, Device3, and Device 4 is the same as that of Device1. (Omitted)
- 

#On Device1, configure the priority of MSTI 1 to 0. On Device2, configure the priority of MSTI 2 to 0.

```
Device1(config)#spanning-tree mst instance 1 priority 0
Device2(config)#spanning-tree mst instance 2 priority 0
```

#On Device1, enable the spanning tree globally.

```
Device1(config)#spanning-tree enable
```

---

### Note

- The configuration for enabling the spanning tree globally on Device2, Device3, and Device 4 is the same as that on Device1. (Omitted)
- 

*Step*  
3:

Check the result.

#After the network topology is stable, check the calculation result of all spanning tree instances.

```

Based on the spanning tree calculation result of the four devices, the tree diagrams corresponding to MSTI 0 (mapped to VLAN4), MSTI 1 (mapped to VLAN2), and MSTI 2 (mapped to VLAN3) are obtained.

### 33.3.2 Application of basic MSTP functions in the MLAG environment

#### Network Requirements

- The 4 devices on the network are within the same MST domain, with the network

bridge priority of MLAG device being the highest.

## Network Topology

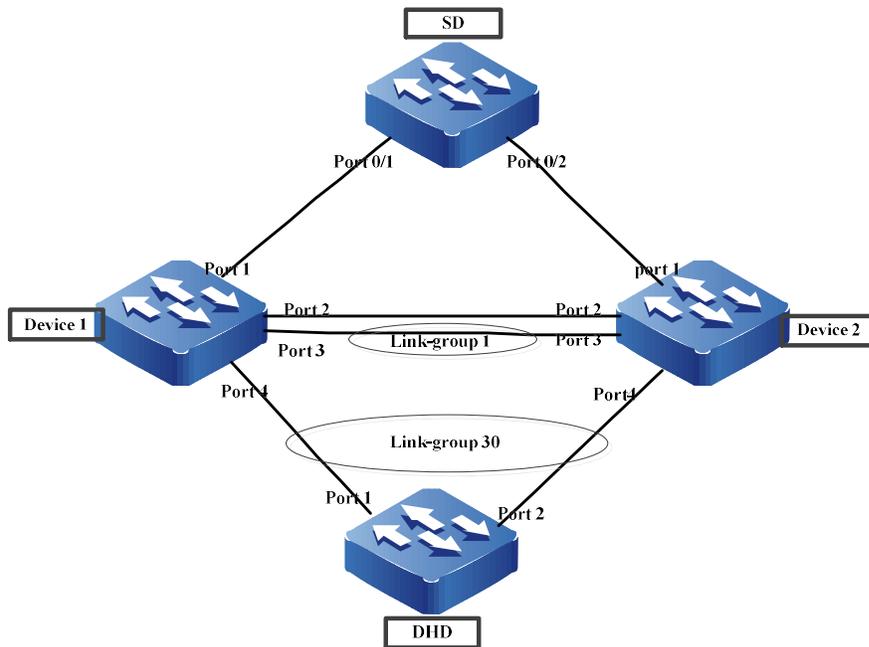

Figure 2 Network Topology for Application of MSTP in MLAG

## Configuration Steps

Step 1: Add the interface into the aggregation group and vlan. (Omitted)

Step 2: Configure MLAG domain. (Omitted)

Step 3: Configure MST domain

#On Device1, configure an MST domain. Set the domain name to admin and revision level to 1, and activate the MST domain.

```
Device1#configure terminal
Device1(config)#spanning-tree mst configuration
Device1(config-mst)#region-name admin
Device1(config-mst)#revision-level 1
Device1(config-mst)#active configuration pending
Device1(config-mst)#exit
```

---

### Note

- The MST domain configuration of Device2, SD, and DHD is the same as that of Device1. (Omitted)
-

Device2(config)#interface link-aggregation 1
Device2(config-if-link-aggregation1)#spanning-tree bridge-assurance enable

```

# 34 Loopback Detection

---

## 34.1 Overview

In the Ethernet, if the destination of some packet fails to be recognized, they will be flooded in a VLAN. If a loop exists in the network, the packets circulate and multiply without limit, and finally they will use up the bandwidth. Then, the network fails to provide normal communication.

There are two types of loops, loop between different ports of a device, and loop on one port of a device. The two types of loops can be detected through loopback detection.

After the loopback detection function is enabled, a port sends loopback detection packets at intervals in the VLAN to which it has been added to check whether a loop exists in the network. When a port receives a loopback detection packet that the local device sent, it determines that a loop exists in the network. Then, the port is disabled to prevent the local loop from affecting the entire network.

## 34.2 Loopback Detection Function Configuration

Table 34 Loopback Detection Function Configuration List

Configuration Task	
Configure basic functions of loopback detection.	Enable the global loopback detection control switch.
	Enable the loopback detection control switch of a port or aggregation group.
Configure basic parameters of loopback detection.	Configure the interval at which loopback detection packets are sent.
	Configure the Error-Disable action on a port.

### 34.2.1 Configure basic functions of loopback detection.

#### Configuration Condition

None

#### Enable the global loopback detection control switch.

The global loopback detection control switch is used to enable the global loopback detection function. The loopback detection configuration of a port takes effect only after the global loopback detection control switch is enabled.

Table 34 Enabling Global Loopback Detection Control Switch

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the global loopback detection control switch.	<b>loopback-detection enable</b>	Mandatory By default, the global loopback detection control switch is disabled.

#### Enable the loopback detection control switch of a port or aggregation group.

After the loopback detection function is enabled, a port sends loopback detection packets at intervals in the VLAN to which it has been added to check whether a loop exists in the network.

Table 34 Enabling Loopback Detection Control Switch of a Port or Aggregation Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2/3 Ethernet interface configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	

Step	Command	Description
		configuration takes effect only on current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enable the loopback detection control switch of a port or aggregation group.	<b>loopback-detection enable</b>	Mandatory  By default, the loopback detection control switch of a port or aggregation group is disabled.

---

 **Note**

- In loopback detection configuration task, you must enable the global loopback detection control switch before the loopback detection configuration on a port takes effect.
- 

### 34.2.2 Configure basic parameters of loopback detection.

#### Configuration Condition

None

#### Configure the interval at which loopback detection packets are sent.

In a loopback detection, loopback detection packets are sent periodically to detect loops in the network. You can modify the interval at which loopback detection packets are sent according to the actual network requirement.

Table 34 Configuring Interval at Which Loopback Detection Packets Are Sent

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2/3 Ethernet interface configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on current port.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the interval at which loopback detection packets are sent.	<b>loopback-detection enable interval-time</b> <i>interval-time-value</i>	Mandatory By default, the interval at which loopback detection packets are sent is 30 seconds.

### Configure the Error-Disable action on a port.

If a port allows the Error-Disable action, the port is controlled. After a port detects a loop, it performs the Error-Disable action to close the port so as to eliminate the loop. If the port is not in the controlled status, the port only prints loop prompt message instead of closing the port. In this case, the loop has not been eliminated.

Table 34 Configuring Error-disable Action on a Port

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2/3 Ethernet interface configuration mode	<b>interface</b> <i>interface-name</i>	At least one option must be selected. After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on current port.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure whether the port allows the Error-Disable function.	<b>loopback-detection enable control</b>	Mandatory By default, after a port detects a loop, it performs the Error-Disable action.

### 34.2.3 Loopback Detection Monitoring and Maintaining

Table 34 Loopback Detection Monitoring and Maintaining

Command	Description
<b>show loopback-detection</b> [ <b>interface</b> <i>interface-name</i>   <b>interface link-aggregation</b> <i>link-aggregation-id</i> ]	Displays the configuration information of all ports or a specified port in loopback detection.

## 34.3 Typical Configuration Example of Loopback Detection

### 34.3.1 Configure Remote Loopback Detection

#### Network Requirements

- Device1 and Device2 are directly connected, and Device2 has two ports which form a self-loop.
- On Device1, loopback detection has been enabled.
- After Device1 detects a loop, it closes the interconnected port to eliminate the loop.

#### Network Topology

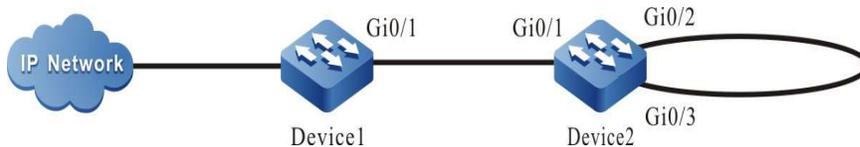

Figure 34 Network Topology for Configuration of Remote Loopback Detection Function

#### Layer-2 Ethernet interface configuration steps

Step 1: Configure the link type of VLAN and layer-2 Ethernet interface.

#Create VLAN2 on Device1.

```
Device1#configure terminal
Device1(config)#vlan 2
Device1(config-vlan2)#exit
```

#Configure the link type of layer-2 Ethernet interface gigabitethernet0/1 on Device1 as Trunk, allowing the services of VLAN2 to pass.

```
Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#switchport mode trunk
Device1(config-if-gigabitethernet0/1)#switchport trunk allowed vlan add 2
Device1(config-if-gigabitethernet0/1)#exit
```

#Create VLAN2 on Device2.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
```

#Configure the link type of layer-2 Ethernet interfaces gigabitethernet0/1, gigabitethernet0/2 and gigabitethernet0/3 on Device2 as Trunk, allowing the services of VLAN2 to pass and the layer-2 Ethernet interfaces gigabitethernet0/2 and gigabitethernet0/3 to disable the spanning tree.

```

Device2(config)#interface gigabitethernet 0/1-0/3
Device2(config-if-range)#switchport mode trunk
Device2(config-if-range)#no switchport trunk allowed vlan 1
Device2(config-if-range)#switchport trunk allowed vlan add 2
Device2(config-if-range)#exit
Device2(config)#interface gigabitethernet 0/2-0/3
Device2(config-if-range)#no spanning-tree enable
Device2(config-if-range)#exit

```

Step 2: Enable the loopback detection function.

#On Device1, globally enable the loopback detection function.

```
Device1(config)#loopback-detection enable
```

#On Device1, view the loopback detection status.

```

Device1#show loopback-detection
-----
Global loopback-detection : ENABLE
-----
Interface      Loopback Time(s) State      Control
-----
gi0/1          DISABLE  30    NORMAL    TRUE
gi0/2          DISABLE  30    NORMAL    TRUE

```

#Enable the loopback detection function on the layer-2 Ethernet interface gigabitethernet0/1 of Device1.

```

Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#loopback-detection enable
Device1(config-if-gigabitethernet0/1)#exit

```

Step 3: Check the result.

#On Device1, view the loopback detection status.

```

After a loop is detected:
Device1#show loopback-detection
-----
Global loopback-detection : ENABLE
-----
Interface      Loopback Time(s) State      Control
-----
gi0/1          ENABLE   30    ERR-DISABLE TRUE
gi0/2          DISABLE  30    NORMAL    TRUE

```

#After Device1 detects a loop, the layer-2 Ethernet interface gigabitethernet0/1 performs close operation, and the following prompt messages are output on the device.

```

Jul 30 2014 03:30:30: %LOOP-BACK-DETECTED : loop-back send tag packet in vlan2 on gigabitethernet0/1, detected in vlan2
from gigabitethernet0/1
Jul 30 2014 03:30:30: %LINK-INTERFACE_DOWN-4: interface gigabitethernet0/1, changed state to down
Jul 30 2014 03:30:30: %LINEPROTO-5-UPDOWN : gigabitethernet0/1 link-status changed to err-disable

```

#Check the status of layer-2 Ethernet interface gigabitethernet0/1 on Device1. The link status of layer-2 Ethernet interface gigabitethernet0/1 becomes Down.

```

Device1#show interface gigabitethernet 0/1
gigabitethernet0/1 configuration information
Description :

```

```

```

### Layer-3 Ethernet interface configuration steps

Step 1: Configure the link type of VLAN and layer-2 Ethernet interface.

#Create VLAN2 on Device2.

```

Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit

```

#Configure the link type of layer-2 Ethernet interfaces gigabitethernet0/1, gigabitethernet0/2 and gigabitethernet0/3 on Device2 as Trunk, allowing the services of VLAN2 to pass and the layer-2 Ethernet interfaces gigabitethernet0/2 and gigabitethernet0/3 to disable the spanning tree.

```

Device2(config)#interface gigabitethernet 0/1-0/3
Device2(config-if-range)#switchport mode trunk
Device2(config-if-range)#no switchport trunk allowed vlan 1
Device2(config-if-range)#switchport trunk allowed vlan add 2
Device2(config-if-range)#switchport trunk pvid vlan 2
Device2(config-if-range)#exit
Device2(config)#interface gigabitethernet 0/2-0/3
Device2(config-if-range)#no spanning-tree enable
Device2(config-if-range)#exit

```

Step 2: Enable the loopback detection function.

#On Device1, globally enable the loopback detection function.

```

Device1(config)#loopback-detection enable

```

#On Device1, view the loopback detection status.

```

Device1#show loopback-detection
-----
Global loopback-detection : ENABLE

```

```

-----
Interface      Loopback Time(s) State      Control
-----
gi0/1         DISABLE  30    NORMAL    TRUE
gi0/2         DISABLE  30    NORMAL    TRUE

```

#On Device1, configure the layer-2 Ethernet interface gigabitethernet0/1 as layer-3 Ethernet interface.

```

Device1(config)#interface gigabitethernet 0/1
Device1(config-if-gigabitethernet0/1)#no switchport

#Enable the loopback detection function on the layer-3 Ethernet interface gigabitethernet0/1 of Device1
Device1(config-if-gigabitethernet0/1)#loopback-detection enable
Device1(config-if-gigabitethernet0/1)#exit

```

Step 3: Check the result.

#On Device1, view the loopback detection status.

After a loop is detected:

```

Device1#show loopback-detection
-----
Global loopback-detection : ENABLE
-----
Interface      Loopback Time(s) State      Control
-----
gi0/1         ENABLE   30    ERR-DISABLE TRUE
gi0/2         DISABLE  30    NORMAL    TRUE

```

#After Device1 detects a loop, the layer-3 Ethernet interface gigabitethernet0/1 performs close operation, and the following prompt messages are output on the device.

```

Jul 31 2014 11:29:30: %LOOP-BACK-DETECTED : loop-back send packet on gigabitethernet0/1, detected from
gigabitethernet0/1
Jul 31 2014 11:29:30: %LINEPROTO-5-UPDOWN : gigabitethernet0/1 link-status changed to err-disable
Jul 31 2014 11:29:30: %LINK-INTERFACE_DOWN-3: Interface gigabitethernet0/1, changed state to down.
Jul 31 2014 11:29:30: %LINK-LINEPROTO_DOWN-3: Line protocol on interface gigabitethernet0/1, changed state to down.

```

#Check the status of layer-3 Ethernet interface gigabitethernet0/1 on Device1. The status of layer-3 Ethernet interface becomes err-disabled.

```

Device1#show interface gigabitethernet 0/1 status err-disabled

-----
gi0/1         err-disabled loopback-detect

```

### 34.3.2 Configure Local Loopback Detection

#### Network Requirements

- Device1 and Device2 form a loop through two links, and all the ports in the loop is in one VLAN.
- On Device1, loopback detection has been enabled.

- After Device1 detects a loop, it closes the interconnected layer-2 port to eliminate the loop.

### Network Topology

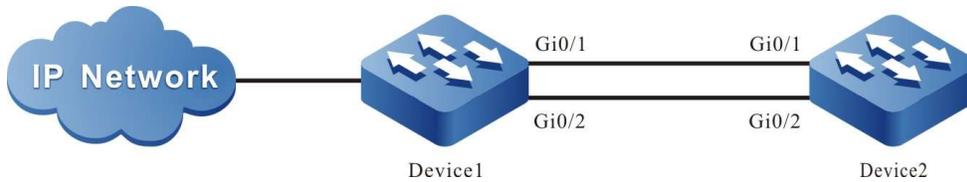

Figure 34 Network Topology for Configuration of Local Port Loopback Detection Function

### Layer-2 Ethernet interface configuration steps

Step 1: Configure the link type of VLAN and layer-2 Ethernet interface.

#Create VLAN2 on Device1.

```
Device1#configure terminal
Device1(config)#vlan 2
Device1(config-vlan2)#exit
```

#Configure the link type of layer-2 Ethernet interfaces gigabitethernet0/1 and gigabitethernet0/2 on Device1 as Trunk, allowing the services of VLAN2 to pass.

```
Device1(config)# interface gigabitethernet 0/1-0/2
Device1(config-if-range)#switchport mode trunk
Device1(config-if-range)#switchport trunk allowed vlan add 2
Device1(config-if-range)#exit
```

#Create VLAN2 on Device2.

```
Device2#configure terminal
Device2(config)#vlan 2
Device2(config-vlan2)#exit
```

#Configure the link type of layer-2 Ethernet interfaces gigabitethernet0/1 and gigabitethernet0/2 as Trunk, allowing the services of VLAN2 to pass and closing the spanning tree.

```
Device2(config)# interface gigabitethernet 0/1-0/2
Device2(config-if-range)#switchport mode trunk
Device2(config-if-range)#no switchport trunk allowed vlan 1
Device2(config-if-range)#switchport trunk allowed vlan add 2
Device2(config-if-range)#no spanning-tree enable
Device2(config-if-range)#exit
```

Step 2: Enable the loopback detection function.

#On Device1, globally enable the loopback detection function.

```
Device1(config)#loopback-detection enable
```

#On Device1, view the loopback detection status.

```
Device1#show loopback-detection
```

```
-----  
Global loopback-detection : ENABLE  
-----
```

Interface	Loopback	Time(s)	State	Control
gi0/1	DISABLE	30	NORMAL	TRUE
gi0/2	DISABLE	30	NORMAL	TRUE

```
#Enable the loopback detection function on the layer-2 Ethernet interface gigabitethernet0/1 of Device1.
```

```
Device1(config)#interface gigabitethernet 0/1  
Device1(config-if-gigabitethernet0/1)#loopback-detection enable  
Device1(config-if-gigabitethernet0/1)#exit
```

Step 3: Check the result.

#On Device1, view the loopback detection status.

```
After a loop is detected:
```

```
Device1#show loopback-detection
```

```
-----  
Global loopback-detection : ENABLE  
-----
```

---

 **Caution**

- When gigabitethernet 0/1 or gigabitethernet 0/2 of Device1 is a layer-3 Ethernet interface, there is no loop in the networking environment.
-

# 35 Error-Disable Management

---

## 35.1 Overview

The Error-Disable function is an error detection and fault recovery mechanism on ports.

Exceptions on ports may degrade the performance of the entire network or bring down the entire network. The Error-Disable function can limit the abnormality within a single device or part of the network, preventing the abnormality from affecting other normal ports and preventing the abnormality from spreading.

If an exception is detected on an open port, the port is automatically closed so that the port will not forward packets. That is, if an error condition is triggered on the port, the port is automatically disabled. This is called the Error-Disable management function, and the port status is called the Error-Disabled status.

Currently, the following functions are supported: storm suppression, port security, link flapping, DHCP rate limit, BPDU Guard, ARP detection, L2 protocol tunnel, loopback detection, OAM, and Monitor Link.

If an exception is detected on a port through the above functions, the port is automatically closed, and it is set to the Error-Disabled status. However, this status cannot continue. After the fault is eliminated, the port needs to be enabled again, and the Error-Disabled status of the port needs to be cleared so that the port can continue to forward packets. Here the automatic recovery mechanism of the Error-Disable management function is involved.

## 35.2 Error-Disable Management Function Configuration

Table 35 Error-disable Management Function Configuration List

Configuration Task	
Configure Error-Disable basic functions.	Configure Error-Disable error detection.
	Configure Error-Disable automatic recovery.

Configuration Task	
Configure Error-Disable automatic recovery.	Configure the interval for Error-Disable automatic discovery.

### 35.2.1 Configure Error-Disable Basic Functions

#### Configuration Condition

None

#### Configure Error-Disable error detection.

After the Error-Disable detection of the specification function is configured, if an exception is detected on the port, the system automatically close the port and set the port to the Error-Disabled status.

Table 35 Configuring Error-disable Error Detection

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Error-Disable error detection.	<b>errdisable detect cause { all   bpduguard   dai   dhcp-snooping   fabric-failure   monitor-link   storm-control   link-flap   l2pt   oam   port-security   loopback-detect   ulfd   transceiver-power-high   transceiver-power-low }</b>	Mandatory  By default, all the listed functions allowed to close the port and set it as Error-Disabled.

### 35.2.2 Configure Error-Disable automatic recovery.

#### Configure Error-Disable automatic recovery.

The Error-Disable error detection mechanism enables specified functions to close a port. To quickly recover the port so that it can continue to forward packets, an automatic recovery mechanism is provided. With the mechanism, the port is automatically re-enabled after a specified interval.

Table 35 Configuring Automatic Recovery of Error-disable

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Error-Disable automatic recovery.	<b>errdisable recovery cause</b> { <b>all</b>   <b>bpdguard</b>   <b>dai</b>   <b>dhcp-snooping</b>   <b>eips-udld</b>   <b>l2pt</b>   <b>link-flap</b>   <b>loopback-detect</b>   <b>oam</b>   <b>port-security</b>   <b>storm-control</b>   <b>transceiver-power-high</b>   <b>transceiver-power-low</b>   <b>ulfd</b> }	Mandatory  By default, a port cannot be automatically enabled, and the Error-Disabled status set by the listed functions cannot be automatically cleared. However, by default, a port can be automatically enabled and the Error-Disabled status can be automatically cleared if its status is set by the Link-Flap function.

### Configure the interval for Error-Disable automatic discovery.

You can configure the interval for a port to automatically recover normal after it port is closed by the Error-Disable error detection mechanism.

Table 35 Configuring Time Interval for Automatic Discovery of Error-disable

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the interval for Error-Disable automatic discovery.	<b>errdisable recovery interval</b> <i>interval-value</i>	Mandatory  By default, the interval at which a port is enabled and its Error-Disabled status is cleared is 300 seconds.

### 35.2.3 Error-Disable Management Monitoring and Maintaining

Table 35 Error-disable Management Monitoring and Maintaining

Command	Description
<b>show errdisable detect</b>	Displays whether it is allowed that all the listed functions close a port and set the port to the Error-Disabled status.
<b>show errdisable recovery</b>	Displays whether a port can be automatically enabled, and whether the Error-Disabled status set by the listed functions can be cleared automatically.
<b>show { interface <i>interface-list</i>   interface link-aggregation <i>link-aggregation-id</i> } status err-disabled</b>	Displays the information about Error-Disabled status setting of a specified port or aggregation group.

## 35.3 Typical Configuration Example of Error-Disable Management

### 35.3.1 Combination of Error-Disable and Storm Suppression

#### Network Requirements

- PC accesses IP Network through Device. On Device, the storm suppression and Error-Disable functions have been enabled.
- If a port of a device receives a large number of broadcast packets and then disabled, Error-Disable can re-enable the port according to the policy.

#### Network Topology

Figure 35 Network Topology for Combination of Error-disable and Storm Suppression

#### Configuration Steps

*Step 1:* Configure the link type of VLAN and port.

# Create VLAN2 on Device.

```

Device#configure terminal
Device(config)#vlan 2
Device(config-vlan2)#exit
  
```

#Configure the link type of port gigabitethernet0/1 of the Device as Access, allowing the services of VLAN2 to pass.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#switchport mode access
Device(config-if-gigabitethernet0/1)#switchport access vlan 2
Device(config-if-gigabitethernet0/1)#exit
```

*Step*  
2:                   Configure the storm suppression function

#Enable the storm suppression function on port gigabitethernet0/1 of the Device, and adopt the pps limitation mode to suppress broadcast packets. The suppression rate is 200pps. When a storm occurs, the port is shutdown.

```
Device(config)#interface gigabitethernet 0/1
Device(config-if-gigabitethernet0/1)#storm-control action shutdown
Device(config-if-gigabitethernet0/1)#storm-control broadcast pps 200
Device(config-if-gigabitethernet0/1)#exit
```

*Step*  
3:                   Configure Error-disable function.

#Enable the storm suppression recovery function in Error-disable, and configure the recovery time as 30 seconds.

```
Device(config)#errdisable recovery cause storm-control
Device(config)#errdisable recovery interval 30
```

*Step*  
4:                   Check the result.

#View related configurations of Error-disable.

```
Device#show errdisable recovery

Error disable auto recovery config
interval:30 seconds
ErrDisable Reason  Timer Status
-----
bpduguard          Disabled
dai                 Disabled

# 36 GVRP

---

## 36.1 Overview

GVRP (GARP VLAN Registration protocol) is an application protocol defined by GARP. It dynamically maintains the VLAN information in the switch based on the GARP protocol mechanism. All switches that support GVRP features can receive VLAN registration information from other switches and dynamically update local VLAN registration information, including current VLAN on the switch and which ports are included in these VLANs. Besides, these switches that support GVRP features can spread local VLAN registration information to other switches so that the VLAN configurations of all devices supporting GVRP features in the same switching network are consistent in interoperability. The VLAN registration information spread through GVRP includes both local static VLAN information manually configured and dynamic VLAN information from other switches. It should be noted that the Leave message of GVRP cannot eliminate the local VLAN manually configured as it has a higher priority than GVRP operation.

GVRP realizes the dynamic registration, maintenance and cancellation of VLAN port member information. If there is no VLAN, a VLAN will be dynamically created; if the number of VLAN port members is 0, the VLAN will be dynamically deleted, i.e. the port will be dynamically added to the VLAN or deleted from the VLAN, realizing dynamic configuration of the VLAN on the switch.

GVRP can dynamically configure VLANs so that it's unnecessary to configure all VLANs of all devices. Instead, only some devices, especially edge devices, and some special VLANs are configured. Other devices will be automatically configured through GVRP. Nowadays, enterprises always have a large network and many VLANs. The GVRP function greatly reduces the workload of administrators in configuration, as well as the possibility of manual errors. Besides, it can automatically configure VLANs when the network topology changes to ensure the connectivity between VLANs.

## 36.2 GVRP function configuration

Table 36 GVRP Function Configuration List

Configuration Task	
Enable GVRP function	Globally enable the GVRP function

Configuration Task	
Configure GVRP port	Configure the port as trunk and the VLAN allowed to pass
	Configure the port to enable GVRP function
	Configure GVRP mode for the port

### 36.2.1 Enable GVRP function

**Configuration Condition:**

None

**Globally enable GVRP function**

Globally enable GVRP function through configuration.

Table 36 Globally Enabling GVRP Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure gvrp enable	<b>gvrp enable</b>	Mandatory

### 36.2.2 Configure GVRP port

**Configuration Condition:**

None

**Configure GVRP port**

Add configuration on the port where GVRP needs to be enabled, including GVRP mode and the VLAN allowed to pass.

Table 36 Enabling GVRP Function for a Port

Step	Command	Description
Enter the global configuration mode.	configure terminal	-

Step	Command	Description
Enter the layer-2 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.
Enter Aggregation Group Configuration Mode	<b>interface link-aggregation</b> <i>link-aggregation-id</i>	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Configure the port as trunk	switchport mode trunk	Mandatory
Allow the port to allow all VLANs	switchport trunk allowed vlan all	Mandatory
Configure the port to enable GVRP	gvrp enable	Mandatory

# 37 MLAG

---

## 37.1 Overview

MLAG is a mechanism which achieves cross-device link aggregation. It combines one device with two other paired devices for cross-device link aggregation to form a dual-active system.

As a weakly correlated horizontal virtualization technology, MLAG has the following advantages in addition to increasing bandwidth, providing link reliability, and load sharing:

- Higher reliability: MLAG improves the link reliability from single-board level to device level. For common cross-board link aggregation, if one board fails, the entire aggregation link can still work normally; for MLAG cross-device link aggregation, if one device fails, the entire aggregation link can still work normally.
- Simplified networking: MLAG, as a horizontal virtualization technology, logically virtualizes two paired devices that are double-homed into one device. MLAG provides a layer-2 topology without loops and realizes redundant backup. Therefore, the access side doesn't need spanning tree protocol, which greatly simplifies the process of networking and configuration.
- Independent upgrading: Two paired devices can be upgraded separately to ensure that one device is working normally. This has no impact on the ongoing business.

Definitions of MLAG-related concepts:

- MLAG (Multi-Chassis Link Aggregation Group) domain: Composed of two MLAG partner nodes, it forms a dual-active system.
- MLAG partner nodes: For the MLAG partner nodes, one serves as \MASTER),and the other as SLAVE.
- Peer-Link: A direct aggregation link between MLAG partner nodes, used to exchange MLAG protocol packets and transmit some data traffic.
- Keepalive: Keepalive detection between MLAG partner nodes, performed through L3 link. It determines whether one of the MLAG partner nodes is still alive when the Peer-Link fails.
- PTS (Peer-Link Transport Server): A reliable packet transmission service based on Peer-Link.
- DHD (Double-Homed Device): A device (or server) which is double-homed to the MLAG dual-active system. DHD itself may be a MLAG dual-active system.
- SD (Single-Homed Device): A device (or server) that is single-homed to the MLAG dual-

active system.

- MLAG-Port: The cross-device aggregation group between DHD and MLAG dual-active system.
- MLAG Member Port: The member port in the cross-device aggregation group between DHD and MLAG dual-active system.
- Orphan-Port: The single-homed port on the MLAG partner nodes, including the single-homed aggregation group. Orphan-Port may or may not belong to MLAG-VLAN.
- MLAG-VLAN: The VLAN where Peer-Link is added. Generally, the VLAN to which MLAG port belongs should be added into MLAG-VLAN.
- Non-MLAG-VLAN: The VLAN that doesn't contain Peer-Link. Generally, non-MLAG-VLAN doesn't contain MLAG port.
- MLAG-VLANIF: VLANIF interface corresponding to MLAG-VLAN.
- Non-MLAG-VLANIF: VLANIF interface corresponding to non-MLAG-VLAN.
- Unpaired: After the Peer-Link port is disconnected, if the Keepalive is normal, it is believed that an Unpaired failure has occurred. This will cause the MLAG port and MLAG-VLANIF on the SLAVE node to Suspend so that the uplink and downlink traffic is forwarded through the MASTER node.
- Up-Delay: When the MLAG partner nodes restart or Peer-Link failure recovers, the MLAG port will be set as UP after a period of delay.
- Auto-Recovery: After a period of time, when the MLAG node of local port believes that it is completely disconnected from the MLAG node of peer port (as a matter of fact, the MLAG node of peer port may have device failure or still be alive), MLAG node of local port deems itself as the only node and becomes a master node to forward traffic.
- Dual-Master: If both Peer-Link and Keepalive fail, when the SLAVE node believes that it is completely disconnected from the MASTER node, the SLAVE node will be upgraded to a MASTER node, and the original MASTER node still exists. Then, there are two MASTER nodes, i.e. Dual-Master. There may be abnormal traffic forwarding in Dual-Master state.
- Control protocol packet (also called PEERING packet): The protocol packet exchanged between MLAG nodes, used for node pairing, role election, etc. It is sent and received via UDP.
- Data synchronization packet (also called SYNC packet): The synchronization packet exchanged between MLAG nodes, used for transmission of control information of each service, relay service protocol packet, synchronization service entries, etc. It is sent and received via TCP after the SYNC packet encapsulates the PTS header.
- Control VLAN: The layer-3 VLAN (interface vlan) used to transmit PTS synchronization

packets. Only Peer-Link can be added into this VLAN. Other ports cannot be added into this VLAN.

- Suspend: Here it means shutdown, i.e. the shutdown of MLAG aggregation group or MLAG-VLANIF interface.

## 37.2 MLAG function configuration

Table 37 MLAG Function Configuration List

Configuration Task	
Create MLAG domain	Create MLAG domain
Configure MLAG parameters	Configure the automatic recovery delay time after the node is restarted
	Configure MLAG node ID
	Configure the role priority of MLAG node
	Configure preemption mode
	Configure the MAC address of MLAG system
	Configure the priority of MLAG system
	Configure the delay time and interval time of UP state
Configure Keepalive parameters	Configure the source and destination addresses of Keepalive packet
	Set the sending interval and receiving timeout of Keepalive packet
	Set the silent period of Keepalive

Configure Peer-Link	Configure the layer-2 aggregation interface as a Peer-Link port
Configure MLAG port	Configure MLAG port
Configure Orphan-Port	Configure the Orphan-Port of the SLAVE node to be set as shutdown when the Peer-Link fails but the Keepalive is normal

---

 **Note**

- MLAG function, supporting software learning instead of hardware learning
- 

### 37.2.1 Create MLAG domain

In MLAG partner nodes, the MLAG domain ID must be consistent.

#### Configuration Condition

Before creating MLAG domain, ensure that:

- On the MLAG partner nodes, there are no other MLAG domains.

#### Create MLAG domain

Create MLAG domain.

Table 37 Creating MLAG Domain

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create MLAG domain	<b>mlag domain <i>domain-id</i></b>	Mandatory  By default, no MLAG domain is created, and the value range of domain ID is 1~255.

## 37.2.2 Configure MLAG parameters

### Configuration Condition

Before configuring MLAG parameters, ensure that:

- Create MLAG domain.

### Configure the automatic recovery delay time after the node is restarted

After the device is started, start the automatic recovery timer with the configured automatic recovery delay time. If no Keepalive or Peering packet is received until the timer times out, and the Peer-Link is always Down, it is believed that there is no peer node, and this node becomes the MASTER.

Table 37 Configuring Automatic Recovery Delay Time After Restarting of Node

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the MLAG domain configuration mode	<b>mlag domain</b> <i>domain-id</i>	-
Configure the automatic recovery delay time after the node is restarted	<b>auto-recovery reload-delay</b> <i>delay_value</i>	Optional By default, the automatic recovery delay time is 240 seconds. It ranges from 240 to 3600 seconds.

### Configure MLAG node ID

In the same MLAG domain, the MLAG node IDs are different and unique.

Table 37 Configuring MLAG Node ID

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enter the MLAG domain configuration mode	<b>mlag domain</b> <i>domain-id</i>	-
Configure MLAG node ID	<b>node id</b> <i>id-number</i>	Mandatory  By default, no MLAG node ID is configured. Its range is 1 and 2.

### Configure the role priority of MLAG node

The node role priority is used for master-slave role election between two nodes in the same MLAG domain. The smaller the value, the higher the priority. The one with a higher priority becomes the Master device. If the nodes have the same priority, compare the bridge MAC addresses of the two devices. The one with a smaller bridge MAC address becomes the Master device.

Table 37 Configuring MLAG Node Role Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the MLAG domain configuration mode	<b>mlag domain</b> <i>domain-id</i>	-
Configure the role priority of MLAG node	<b>node role-priority</b> <i>priority-value</i>	Optional  By default, the MLAG node priority is 100. Its range is 1~ 254.

### Configure preemption mode

If the preemption mode is configured, when the master-slave role is elected, the previous role of the node will be ignored. The node role will be determined according to the node priority and the MAC comparison result: the lower the node priority value, the higher the priority, and the one with higher priority becomes the Master device; if the nodes have the same priority, compare the bridge MAC addresses of the two devices (the one with a smaller bridge MAC address becomes the Master device).

Table 37 Configuring Preemption Mode

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the MLAG domain configuration mode	<b>mlag domain</b> <i>domain-id</i>	-
Configure preemption mode	<b>role preempt</b>	Optional By default, no preemption mode is configured.

### Configure the MAC address of MLAG system

In order to enable the access device to deem the two nodes in MLAG domain as one device, the MAC addresses of the MLAG system of the two nodes must be the same.

Table 37 Configuring MAC Address of MLAG System

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the MLAG domain configuration mode	<b>mlag domain</b> <i>domain-id</i>	-
Configure the MAC address of MLAG system	<b>system-mac</b> <i>mac_address</i>	Optional By default, the MAC address of MLAG system is not configured. The MAC addresses of MLAG systems of the two nodes are the same and automatically generated according to the domain id.

### Configure the priority of MLAG system

In order to enable the access device to deem the two nodes in MLAG domain as one device, the MLAG system priority of the two nodes must be the same.

Table 37 Configuring MLAG System Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the MLAG domain configuration mode	<b>mLAG domain</b> <i>domain-id</i>	-
Configure the priority of MLAG system	<b>system-priority</b> <i>priority_value</i>	Optional By default, the MLAG system priority is 32768. Its range is 1~65535.

#### Configure the delay time and interval time of UP state

When the device is added into the MLAG domain as a SLAVE node, the MLAG interface will be set as UP state after the period of UP state delay. During the period of UP state delay, the MAC address table, ARP table and other information must be synchronized. Therefore, if there are many entries, the local timer can be properly extended to avoid packet loss.

Table 37 Configuring Delay Time and Interval Time of UP State

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the MLAG domain configuration mode	mLAG domain domain-id	-
Configure the delay time and interval time of UP state	up-delay delay_seconds [interval interval_mseconds]	Optional By default, the delay time and interval time of UP state are 90 seconds and 1000 milliseconds, and they range from 1 to 3600

		seconds and from 1 to 300000 milliseconds respectively.
--	--	---

### Configure MLAG graceful restart

After graceful restart is enabled, the local node will notify the peer node to delay the keep-alive time of control protocol and Keepalive. This can avoid traffic interruption due to the timeout of peer node when the MLAG of local node is restarted. It is recommended that this command be configured only before MLAG is restarted. Under normal conditions, configuring this command will make the peer node insensitive to network changes.

By default, MLAG graceful restart is disabled.

Table 37 Configuring MLAG Graceful Restart

Step	Command	Description
Enter the privilege configuration mode	<b>enable</b>	-
Configure MLAG graceful restart and the keep-alive time of peer port control protocol and Keepalive after the restart	<b>mlag graceful-restart [holding-time seconds ]</b>	- Optional By default, the keep-alive time is 300 seconds. Its range is 200-20000 seconds.

### Configure reserved interface

Configure the VLAN interface of the SLAVE node to be set as shutdown when the Peer-Link fails but the Keepalive is normal.

By default, no reserved interface is configured.

Table 37 Configuring Reserved Interface

Step	Command	Description
Enter the interface configuration mode	<b>interface vlan [vlan-id]</b>	-
Configure reserved interface	<b>mlag unpaired reserved</b>	Optional The vlan corresponding to the interface must be MLAG-VLAN. This

		command is not required for non-MLAG-VLANIF interface as it will not be configured as shutdown.
--	--	---

### 37.2.3 Configure Keepalive parameters

#### Configuration Condition

Before configuring Keepalive parameters, ensure that:

- Create MLAG domain.

#### Configure the source and destination addresses of Keepalive packet

To enable the MLAG system to be correctly established, the source and destination addresses of Keepalive packets must be configured, and it is reachable between two nodes at layer 3.

The VLAN corresponding to the layer-3 interface where the source IP address of Keepalive packet belongs shall not be included in the VLAN of Peer-Link port.

Table 37 Configuring Source and Destination Addresses of Keepalive Packet

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the MLAG domain configuration mode	mLAG domain domain-id	-
Configure the source and destination addresses of Keepalive packet	keepalive ip destination ipv4_address source ipv4_address [udp-port udp-number] [vrf vrf_name]	Mandatory By default, udp-port is 53910, VRF name global, and udp-port range 1~65535. VRF name supports 31 characters at most.

#### Configure the sending interval and receiving timeout of Keepalive packet

After the Keepalive receiving timeout timer is enabled, if the next Keepalive packet is not received before this timer expires, it is deemed LOST.

Table 1 Configuring Sending Interval and Receiving Timeout of Keepalive Packet

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the MLAG domain configuration mode	mLAG domain domain-id	-
Configure the sending interval and receiving timeout of Keepalive packet	keepalive interval mseconds [timeout seconds]	Optional By default, the sending interval and receiving timeout of Keepalive packet are 1000 milliseconds and 6s, and they range from 100 to 10000 milliseconds and from 1 to 20 seconds respectively.

### Configure the silent period of Keepalive

After the Peer-Link link becomes DOWN, the SLAVE node enters the silent period. The Keepalive packets received during the silent period will be ignored and will not be processed until the silent period expires. The silent period can be set to allow the Keepalive packets on the link to be received and sent completely so as to avoid false detection caused by packet delay.

Table 37 Configuring Keepalive Silent Period

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the MLAG domain configuration mode	mLAG domain domain-id	-
Configure the silent period of Keepalive	keepalive quiet-time mseconds	Optional By default, the Keepalive silent period is 3000 milliseconds. Its

		range is 1~15000 milliseconds.
--	--	--------------------------------

### 37.2.4 Configure Peer-Link

#### Configuration Condition

Before configuring Peer-Link, ensure that:

- Create MLAG domain.

#### Configure the layer-2 aggregation interface as a Peer-Link port

As a direct aggregation link between two MLAG devices, Peer-Link can be used to exchange MLAG protocol packets and transmit some data traffic.

Table 2 Configuring Layer-2 Aggregation Interface as a Peer-Link Port

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the layer-2 aggregation interface configuration mode	interface link-aggregation link-aggregation-id	-
Configure the layer-2 aggregation interface as a Peer-Link port	m lag peer-link	Mandatory By default, no Peer-Link port is configured.

### 37.2.5 Configure MLAG port

#### Configuration Condition

Before configuring MLAG port, ensure that:

- Create MLAG domain.

#### Configure MLAG port

In order to improve reliability and avoid loops in the process of configuration, on the two MLAG partner nodes, configure the same MLAG port ID for the aggregation groups that are connected to the same aggregation group on the DHD to form a cross-device link aggregation group.

Table 3 Configuring MLAG Port

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the layer-2 aggregation interface configuration mode	interface link-aggregation link-aggregation-id	-
Configure MLAG port	mlag group mlag-id	Mandatory  By default, no MLAG port is configured. The MLAG port ID ranges from 1 to 1000.

---

 **Note**

- It is recommended that the link aggregation group be configured as a dynamic aggregation group.
- 

### 37.2.6 Configure Orphan-Port

#### Configuration Condition

Before configuring Orphan-Port, ensure that:

- Create MLAG domain.

#### **Configure the Orphan-Port of the SLAVE node to be set as shutdown when the Peer-Link fails but the Keepalive is normal**

By default, when the Peer-Link fails but the Keepalive is normal, all the MLAG ports of the SLAVE node will be configured as shutdown, but the Orphan-Port will not be configured as such state. To configure some Orphan-Ports as shutdown, this command needs to be configured for these ports.

Table 13-7 Configuring the Mode of Orphan-Port of SLAVE Node as Shutdown When the Peer-Link Fails but the Keepalive Is Normal

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Layer-2 Ethernet interface configuration mode	interface interface-name	At least one option must be selected.
Enter the layer-2 aggregation interface configuration mode	interface link-aggregation link-aggregation-id	After you enter the layer-2 Ethernet interface configuration mode, the subsequent configuration takes effect only on current port. After you enter the layer-2 aggregation interface configuration mode, the subsequent configuration takes effect only within current aggregation group.
Configure the Orphan-Port of the SLAVE node to be set as shutdown when the Peer-Link fails but the Keepalive is normal	m lag unpaired orphan-port suspend	Optional By default, this command is not configured.

### 37.2.7 MLAG monitoring and maintaining

Table 4 MLAG Monitoring and Maintaining

Command	Description
<b>clear mlag packet keepalive statistics [tx   rx]</b>	Clear statistical information of MLAG Keepalive packets

Command	Description
<b>clear mlag packet peering statistics [tx   rx]</b>	Clear statistical information of MLAG Peering packets
<b>clear mlag packet pts statistics [application <i>app-id</i>] [tx   rx]</b>	Clear statistical information of MLAG PTS packets
<b>clear mlag packet sync statistics [tx   rx]</b>	Clear statistical information of MLAG Sync packets
<b>show mlag pts application</b>	Show information of all MLAG services
<b>show mlag brief</b>	Show summary information of MLAG
<b>show mlag group [<i>mlag-id</i>]</b>	Show information of MLAG aggregation group
<b>show mlag keepalive</b>	Show information of MLAG Keepalive
<b>show mlag node</b>	Show information of MLAG node
<b>show mlag packet pts [application [<i>app-id</i>]] statistics</b>	Show statistical information of PTS packets sending and receiving of MLAG's all services or specified services
<b>show mlag packet keepalive statistics</b>	Show statistical information of MLAG Keepalive packets
<b>show mlag packet peering statistics</b>	Show statistical information of MLAG paired packets
<b>show mlag packet sync statistics</b>	Show statistical information of MLAG synchronous packets
<b>show mlag suspend</b>	Show the Suspended interface
<b>show mlag up-delay</b>	Show the interface waiting for timeout of up-delay timer

## 37.3 Typical MLAG configuration example

### 37.3.1 Configure basic functions of MLAG

#### Network Requirements

- All devices are within the same layer-2 network.

#### Network Topology

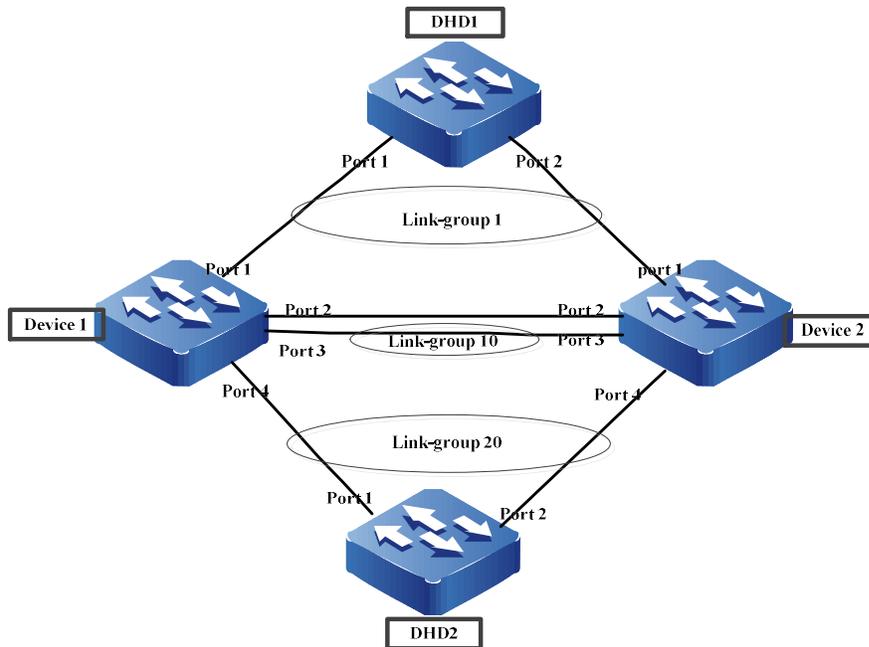

Figure 37 Configuring Basic Functions of MLAG

#### Configuration Steps

Step 1: Add the interface into the aggregation group and vlan. (The addition of interface into the aggregation group is omitted)

#Configure Device1. Add the interface into the peerlink aggregation group, peerlink aggregation into vlan, and keepalive port into vlan.

```
Device1#configure terminal
Device1(config)#vlan 2-4094
Please wait .....
Done.
Device1(config)# link-aggregation 10 mode lacp
Device1(config)# interface port3
Device1(config-if-port3)# link-aggregation 10 active
Device1(config-if-port3)#exit
Device1(config)# interface link-aggregation 10
Device1(config-link-aggregation10)# switchport mode trunk
Device1(config-link-aggregation10)# switchport trunk allowed vlan add 2-4093
Device1(config-link-aggregation10)# no switchport trunk allowed vlan 1
Device1(config-link-aggregation10)# switchport trunk pvid vlan 2
Device1(config-link-aggregation10)#exit
```

```
Device1(config)# interface port2
Device1(config-if-port2)# switchport access vlan 4094
Device1(config-if-port2)#exit
```

#Configure Device2. Add the interface into the peerlink aggregation group, peerlink aggregation into vlan, and keepalive port into vlan.

```
Device2#configure terminal
Device2 (config)#vlan 2-4094
Please wait .....
Done.
Device2 (config)# link-aggregation 10 mode lacp
Device2 (config)# interface port3
Device2 (config-if-port3)# link-aggregation 10 active
Device2 (config-if-port3)#exit
Device2 (config)# interface link-aggregation 10
Device2 (config-link-aggregation10)# switchport mode trunk
Device2 (config-link-aggregation10)# switchport trunk allowed vlan add 2-4093
Device2 (config-link-aggregation10)# no switchport trunk allowed vlan 1
Device2 (config-link-aggregation10)# switchport trunk pvid vlan 2
Device2 (config-link-aggregation10)#exit
Device2 (config)# interface port2
Device2 (config-if-port2)# switchport access vlan 4094
Device2 (config-if-port2)#exit
```

Step 2: Configure MLAG domain.

#Configure Device1. Configure MLAG domain instance.

```
Device1#configure terminal
Device1 (config)#mlag domain 1
Device1 (config-mlag-domain)#node id 1

Device1 (config-mlag-domain)#keepalive ip destination 30.0.0.10 source 30.0.0.20
Device1 (config-mlag-domain)#exit
```

#Configure Device2. Configure MLAG domain instance.

```
Device2#configure terminal
Device2 (config)#mlag domain 1
Device2 (config-mlag-domain)#node id 2
Device2 (config-mlag-domain)#keepalive ip destination 30.0.0.20 source 30.0.0.10
Device2 (config-mlag-domain)#exit
```

**Note:**

The domain IDs of the two MLAG nodes must be the same;

The node IDs of the two MLAG nodes must be different;

Step 3: Configure the keepalive ip interface.

#Configure Device1. Configure keepalive ip interface.

```
Device1(config)#interface vlan 4094
Device1(config-if-vlan4094)#ip address 30.0.0.20 24
Device1(config-if-vlan4094)#exit
Device1(config)#
```

#### #Configure Device2. Configure keepalive ip interface.

```
Device2(config)#interface vlan 4094
Device2(config-if-vlan4094)#ip address 30.0.0.10 24
Device2(config-if-vlan4094)#exit
Device2(config)#
```

#### Step 4: Configure MLAG group and peer-link group.

##### #Configure Device1. Configure MLAG group and peer-link group.

```
Device1(config)#interface link-aggregation 1
Device1(config-link-aggregation1)#mlag group 1
Device1(config-link-aggregation1)#exit
Device1(config)#
Device1(config)# interface link-aggregation 10
Device1(config-link-aggregation10)#mlag peer-link
Device1(config-link-aggregation10)#exit
Device1(config)#
Device1(config)# interface link-aggregation 20
Device1(config-link-aggregation20)#mlag group 20
Device1(config-link-aggregation20)#exit
Device1(config)#
```

##### #Configure Device2. Configure MLAG group and peer-link group.

```
Device2(config)# interface link-aggregation 1
Device2(config-link-aggregation1)#mlag group 1
Device2(config-link-aggregation1)#exit
Device2(config)#
Device2(config)# interface link-aggregation 10
Device2(config-link-aggregation10)#mlag peer-link
Device2(config-link-aggregation10)#exit
Device2(config)#
Device2(config)# interface link-aggregation 20
Device2(config-link-aggregation20)#mlag group 20
Device2(config-link-aggregation20)#exit
Device2(config)#
```

#### #View the MLAG information on Device1

```
Device1#sho mlag brief
MLAG domain id      : 1

### 37.3.2 Configure multi-level MLAG functions

#### Network Requirements

- Deploy a multi-level MLAG environment to create a loop-free network. This environment supports dual-homing access to ensure reliability, and the link supports load to improve link utilization.

#### Network Topology

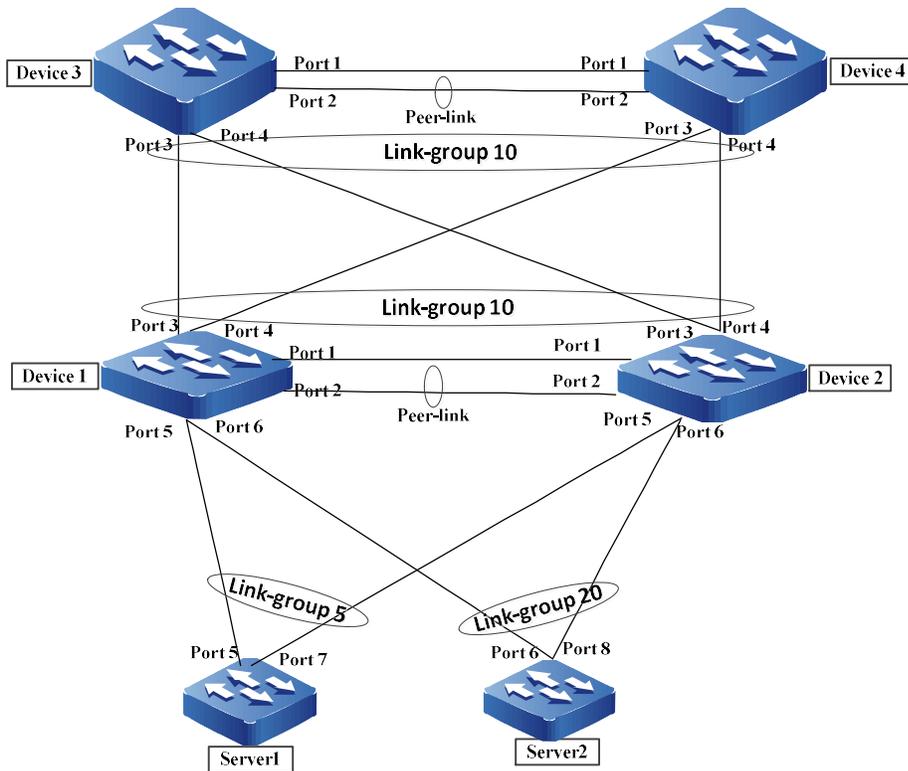

Figure 37 Configuring Level-2 MLAG Functions

#### Configuration idea:

1. MLAG is configured between the aggregation and access switches Device1 and Device2 and between Device3 and Device4 for dual-homing access. Any device failure has no impact on services, which can ensure high service reliability.
2. Aggregation switches Device3 and Device4 are root bridge devices. Root protection is configured on their downlinks to protect the normal forwarding of traffic. The interface which connects the access switches Device1 and Device2 with the terminal is configured with edge ports to ensure network convergence time, and BPDU protection function is configured to improve the stability of network.

3. Aggregation switches Device3 and Device4 are configured with vlan interface and vrrp to make a dual-active gateway.

### Configuration Steps

#### Step 1: Add the port connected to the access device and server into link aggregation

#Configure Device1

Device1#configure terminal

Device1(config)# link-aggregation 5 mode lacp

Device1(config)# link-aggregation 20 mode lacp

Device1(config)# interface port5

Device1(config-if-port5)# link-aggregation 5 active

Device1(config)# interface port6

Device1(config-if-port6)# link-aggregation 20 active

#Configure Device2

Device2#configure terminal

Device2(config)# link-aggregation 5 mode lacp

Device2(config)# link-aggregation 20 mode lacp

Device2(config)# interface port5

Device2(config-if-port5)# link-aggregation 5 active

Device2(config)# interface port6

Device2(config-if-port6)# link-aggregation 20 active

#### Step 2: Configure mstp for Device1, Device2, Device3 and Device4

#Configure the MST domain of Device1, with domain name mlag and version number 1, and activate it.

Device1#configure terminal

Device1(config)#spanning-tree mst configuration

Device1(config-mst)#region-name admin

Device1(config-mst)#revision-level 1

Device1(config-mst)#active configuration pending

Device1(config-mst)#exit

---

 **Note**

The MST domain configuration of Device2, Device3, and Device 4 is the same as that of Device1. (Omitted)

---

#The specified priority of Device3 is 0.

Device3(config)#spanning-tree pseudo-information

Device3 (config-stp-pseudo)#mst instance 0 designated-priority 0

#Enable BA function on the inline port of Device1 & Device2, Device3 & Device4

Device1(config)#interface link-aggregation 1

Device1(config-link-aggregation1)# spanning-tree bridge-assurance enable

Device2(config)#interface link-aggregation 1

Device2(config-link-aggregation1)# spanning-tree bridge-assurance enable

Device3(config)#interface link-aggregation 1

Device3(config-link-aggregation1)# spanning-tree bridge-assurance enable

Device4(config)#interface link-aggregation 1

Device4(config-link-aggregation1)# spanning-tree bridge-assurance enable

#Globally enable spanning tree for Device1 & Device2, Device3 & Device4

Device1(config)# spanning-tree enable

Device2(config)# spanning-tree enable

Device3(config)# spanning-tree enable

Device4(config)# spanning-tree enable

### **Step 3: Configure mlag domain, peer-link, mlag group, and mlag interface**

Device1#configure terminal

Device1(config)# link-aggregation 1 mode lacp

Device1(config)# link-aggregation 10 mode lacp

Device1(config)# interface port2

Device1(config-if-port2)# link-aggregation 1 active

Device1(config)# interface port1

Device1(config-if-port1)# switchport access vlan 10

```
Device1(config)# interface port1,3
Device1 (config-if-range)# link-aggregation 10 active
#Configure mlag domain
Device1#configure terminal
Device1(config)#mlag domain 1
Device1(config-mlag-domain)#node id 1
Device1(config-mlag-domain)#keepalive ip destination 12.1.1.2 source 12.1.1.1
Device1(config-mlag-domain)#exit
#Configure peer-link and mlag group
Device1(config)#interface link-aggregation 1
Device1(config-link-aggregation1)# mlag peer-link
Device1(config-link-aggregation1)#exit
Device1(config)# interface link-aggregation 5
Device1(config-link-aggregation5)# mlag group 5
Device1(config-link-aggregation5)#exit
Device1(config)# interface link-aggregation 10
Device1(config-link-aggregation10)# mlag group 10
Device1(config-link-aggregation10)#exit
Device1(config)# interface link-aggregation 20
Device1(config-link-aggregation20)#mlag group 20
Device1(config-link-aggregation20)#exit
#Configure keepalive interface address
Device1(config)#interface vlan 10
Device1(config-if-vlan10)#ip address 12.1.1.1 24
Device1(config-if-vlan10)#exit
Device1(config)# interface link-aggregation 1
Device1(config-link-aggregation1)# switchport mode trunk
Device1(config-link-aggregation1)# switchport trunk allowed vlan add 20,30,40
Device1(config-link-aggregation1)# exit
```

```
Device1(config)# interface link-aggregation 5
Device1(config-link-aggregation5)# switchport mode trunk
Device1(config-link-aggregation5)# switchport trunk allowed vlan add 20,30,40
Device1(config-link-aggregation5)# exit
Device1(config)# interface link-aggregation 10
Device1(config-link-aggregation10)# switchport mode trunk
Device1(config-link-aggregation10)# switchport trunk allowed vlan add 20,30,40
Device1(config-link-aggregation10)# exit
Device1(config)# interface link-aggregation 20
Device1(config-link-aggregation20)# switchport mode trunk
Device1(config-link-aggregation20)# switchport trunk allowed vlan add 20,30,40
Device1(config-link-aggregation20)# exit
```

---

 **Note**

The configuration of Device2 is the same as that of Device1, except for the following:

---

```
#Configure mlag domain
Device2#configure terminal
Device2(config)#mlag domain 1
Device2(config-mlag-domain)#node id 2
Device2(config-mlag-domain)#keepalive ip destination 12.1.1.1 source 12.1.1.2
Device2(config-mlag-domain)#exit
#Configure keepalive interface address
Device2(config)#interface vlan 10
Device2(config-if-vlan10)#ip address 12.1.1.2 24
Device2(config-if-vlan10)#exit
#Configure Device3
Device3#configure terminal
```

```
Device3(config)# link-aggregation 1 mode lacp

# 38 VLAN Isolation

## 38.1 Overview

In the users' access network, in order to realize mutual isolation between different user groups, different user groups need to be divided into different VLANs. When users in the same user group intend to be isolated from other users, they can use the port isolation technology. But if this technology is used, the administrator needs to know the location of the port of the users' access network. It will lead to inconvenient configuration, management and maintenance. VLAN isolation technology can solve this problem. The administrator simply needs to configure VLAN isolation for the VLAN where the user group is located. Then, users in the user group are isolated from each other. By configuring the uplink port of VLAN isolation, users in the user group can access public network through the uplink port. This technology provides a safer and more flexible solution for networking.

## 38.2 VLAN isolation function configuration

Table 38 VLAN Global Function Configuration List

Configuration Task	
Configure VLAN isolation	Enable the VLAN isolation function
	Configure the uplink port of VLAN isolation

### 38.2.1 Configure VLAN isolation

#### Configuration Condition

None

#### Enable the VLAN isolation function

By enabling the VLAN isolation function, you can realize mutual isolation between the member ports in VLAN.

Table 38 Enabling Global VLAN Isolation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan <i>vlan-id</i></b>	-
Enable the VLAN isolation function	<b>vlanisolat enable</b>	Mandatory  By default, the VLAN isolation function is disabled.

#### Configure the uplink port of VLAN isolation

After the uplink ports of VLAN isolation are configured, the downlink ports in the VLAN are still isolated from each other. However, intercommunications between uplink ports and downlink ports are possible.

Table 38 Configuring Uplink Port of VLAN Global Isolation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the layer-2 Ethernet interface configuration mode.	<b>interface <i>interface-name</i></b>	-
Configure the uplink port of VLAN global isolation	<b>vlanisolate uplink-port vlan <i>vlan-id</i></b>	Mandatory  By default, no uplink port of VLAN isolation is configured.

#### Note

- After the VLAN global isolation function is disabled, the configured uplink port of VLAN isolation is automatically cancelled, VLAN isolation is enabled, and all ports in the VLAN

---

are downlink ports by default.

---

### 38.2.2 VLAN isolation monitoring and maintaining

Table 38 VLAN Global Isolation Monitoring and Maintaining

Command	Description
<b>show vlan-isolate( [ vlan <i>vlan-id</i> ])</b>	Show the information of VLAN isolation

# 39 ARP

---

## 39.1 Overview

Address Resolution Protocol (ARP) provides dynamic mapping from IP addresses to MAC addresses. The Ethernet frames to be transmitted in the Ethernet can be encapsulated properly only after MAC addresses are specified. The ARP protocol is used to obtain MAC addresses that correspond to IP addresses.

## 39.2 ARP Function Configuration

Table 39-1 ARP Function Configuration List

Configuration Task	
Configure Basic Functions of ARP	Configure static ARP
	Configure local ARP advertisement

Configuration Task	
	Configure the maximum number of dynamic ARP entries
	Configure the dynamic ARP aging time
	Enable dynamic ARP learning
	Enable Dynamic ARP Learning
	Configure ARP Receive Queue Depth
	Configure ARP Proxy
	Enable ARP fast response

### 39.2.1 Configure Basic Functions of ARP

#### Configuration Condition

None

#### Configure static ARP

Configuring static ARP means that the user manually specifies the mapping relationship between IP addresses and MAC addresses.

Table 39-2 Configuring Static ARP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure static ARP	<b>arp [ vrf vrf-name ] { ip-address   host-name } mac-address [ alias [ advertise ]   advertise [ alias ] ] [ vlan vlan-id ] [ interface if-name ]  </b>	Mandatory

Step	Command	Description
	{ <b>link-aggregation</b> <i>link-aggregation-id</i> }}	

## Note

- When the configured static ARP entry contains an alias option, if an ARP request for this IP address is received, the MAC address in the static ARP entry is used for response.
- When the configured static ARP entry contains an advertise option, the static ARP will be regularly advertised when the static ARP advertisement is enabled.
- When static ARP is bound to a specific port or aggregation group, the static ARP takes effect only on that port or aggregation group.

### Configure local ARP advertisement

ARP request packets are broadcast packets. When there are a large number of ARP requests in the network, it is easy to cause a broadcast storm in the network, which can result in normal ARP request packets being overwhelmed and ARP unable to be learned. In this case, you can reduce the possibility of broadcast storms by configuring the local ARP advertisement feature to reduce ARP requests.

Table 39-3 Configuring Local ARP Advertisement

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure local ARP advertisement	<b>arp local-announce enable</b>	Mandatory
Configure local ARP advertisement interval.	<b>arp local-announce interval</b> <i>seconds</i>	Optional The default value is 10 seconds.
Configure local ARP advertisement rate.	<b>arp local-announce rate</b> <i>speed</i>	Optional

Step	Command	Description
		The default value is 1 packet per second.

### Configure the maximum number of dynamic ARP entries

The maximum number of dynamic ARP entries is configured to avoid dynamically learned ARP from taking up too many system resources.

Table 39-4 Configuring the Maximum Number of Dynamic ARP Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum number of dynamic ARP entries	<b>arp limited</b> <i>max-entries</i>	Mandatory The default maximum number of entries is 8000.

### Configure the dynamic ARP aging time

There is a survival period, or aging time, for dynamically learned ARPs. During the aging time, the device will send ARP requests periodically, reset the aging time if an ARP response is received, and delete the dynamic ARP table entry when the aging time expires.

Table 39-5 Configuring Dynamic ARP Aging Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the dynamic ARP aging time	<b>arp timeout</b> { <i>second</i> / <b>disable</b> }	Mandatory

Step	Command	Description
		The default aging time is 1200 seconds.

### Enable Dynamic ARP Learning

By default, a dynamic ARP learning is enabled on a device. To prevent dynamic learning from occupying too many system resources, you can disable the dynamic ARP learning function. After dynamic ARP learning is disabled, after the local device receives an ARP request for the MAC address of the local device, it sends an ARP response but does not generate any related ARP entry. An ARP entry is generated only when the local device requests for the MAC address of a peer device.

Table 39-6 Enabling Dynamic ARP Learning

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable Dynamic ARP Learning	<b>arp learn-active</b>	Mandatory  By default, the dynamic ARP passive learning function is enabled.

### Enables Interface Dynamic ARP Learning

An interface can perform dynamic ARP learning by default. To increase reliability and security, users can disable the interface dynamic ARP learning function and use static ARP, which can effectively prevent ARP spoofing.

Table 39-7 Enabling Dynamic ARP Learning Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Enable dynamic ARP learning	<b>arp dynamic-learn</b>	Mandatory By default, the dynamic ARP learning function is enabled.

### Configure ARP Receive Queue Depth

The ARP packets received by the device will be first cached to the ARP receive queue. The system will read the packets from the queue in order and then handle the packets. When the cached ARP packets reach the queue depth, the subsequently received APR packets will be dropped. The user can adjust the ARP receive queue depth based on the network ARP emergency.

Table 39-8 Configuring ARP Packet Receive Queue Depth

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure ARP Receive Queue Depth	<b>arp queue-length <i>length</i></b>	Mandatory The default ARP packet receive queue depth is 200.

### Configure ARP Proxy

An ARP request is sent by the host of one network to another network, and the intermediate device between the two networks can respond to the ARP request. This process is called ARP proxy.

Table 39-9 Configuring ARP Proxy

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure ARP Proxy	<b>ip proxy-arp</b>	Mandatory By default, the ARP proxy function is enabled.

### Configure ARP Fast Response

By default, after receiving the ARP packets, the device will send the packets to the MPU to learn and respond. After enabling the ARP fast response function, the device can give fast responses to the packets in the LPU.

Table 39-10 Configuring ARP Fast Response

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure ARP Fast Response	<b>arp fast-response</b>	Mandatory By default, the global ARP fast response function is disabled.

## 39.2.2 ARP monitoring and maintaining

Table 39-11 ARP Monitoring and Maintaining

Command	Description
<b>show arp</b> [ <i>vrf vrf-name</i> ]	View ARP table
<b>show arp attack-detection</b>	View information about suspected hosts of ARP attacks
<b>show arp statistic</b>	View ARP statistics

## 39.3 Typical Configuration Example of ARP

### 39.3.1 Configure ARP Proxy

#### Network Requirements

- Device is directly connected to PC1 and PC2 respectively. The network number of the LAN where PC1 and PC2 are located is the same, both are 10.0.0.0/16.
- The MAC address of Device's interface VLAN2 is 0001.7a13.0102.
- Through the ARP proxy of Device, PC1 is able to ping through to PC2, and PC1 can learn the MAC address of PC2.

#### Network Topology

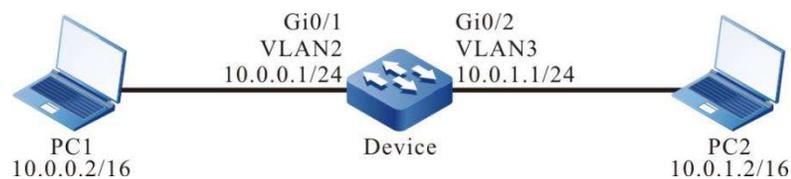

Figure 39-1 Network Topology for Configuring ARP Proxy

#### Configuration Steps

- Step 1: Configure Virtual Local Area Networks (VLANs), and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Check the result.

# PC1 ping PC2 at the address 10.0.1.2.

```
C:\Documents and Settings>ping 10.0.1.2

Pinging 10.0.1.2 with 32 bytes of data:

Reply from 10.0.1.2: bytes=32 time<1ms TTL=255

Ping statistics for 10.0.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

# View Device's ARP table entries.

```
Device#show arp

# PC1 is able to ping through to PC2, and PC1 can learn the MAC address of PC2.

---

## Note

- The device has ARP proxy enabled by default.
- 

## 39.3.2 Configure static ARP

### Network Requirements

- Device is directly connected to the PC.
- The MAC address of the PC is 4437.e603.0d63.
- Bind the IP address and MAC address of PC on Device.
- PC is able to ping through to the address of the interface VLAN2 of Device.

### Network Topology

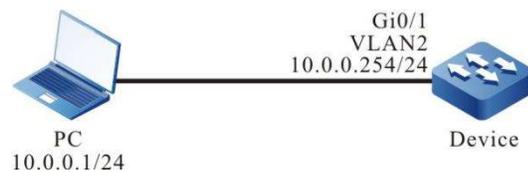

Figure 39-2 Network Topology for Configuring Static ARP

### Configuration Steps

Step 1: Configure VLAN, and add ports to the corresponding VLAN. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Bind the IP address and MAC address of PC on Device.

#Configure Device.

Bind the IP address and MAC address of PC to Device.

```
Device(config)#arp 10.0.0.1 4437.e603.0d63
```

Step 4: Check the result.

# View Device's ARP table entries.

```
Device1#show arp
Protocol Address Age (min) Hardware Addr Type Interface Switchport
Internet 10.0.0.1 - 4437.e603.0d63 ARPA vlan2 gigabitethernet0/1
Internet 10.0.0.254 - 0001.7a13.0102 ARPA vlan2 ---
```

#The PC is able to ping through to the address of the interface VLAN2 of Device 10.0.0.254.

```
C:\Documents and Settings>ping 10.0.0.254

Pinging 10.0.0.254 with 32 bytes of data:

Reply from 10.0.0.254: bytes=32 time<1ms TTL=255

Ping statistics for 10.0.0.254:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

#The PC is able to ping through to the address of the interface VLAN2 of Device 10.0.0.254.

# 40 IP Basics

---

## 40.1 Overview

The Internet Protocol (IP) is based on data packets. It is used in data exchange between computer networks. The protocols that are supported by the device include: IP, Internet Control Message Protocol (ICMP), Transfer Control Protocol (TCP), User Datagram Protocol (UDP), and Socket.

Among them, IP packets are the base of the TCP/IP protocol stack. The IP layer is responsible for addressing, fragmentation, reassembly, and protocol information partitioning. As the network layer protocol, the IP protocol performs route addressing and control packet transmission.

The UDP protocol and the TCP protocol is set up based on the IP protocol. They provide connection-based reliable data transmission services and non-connection-based unreliable data transmission services respectively.

ICMP is mainly used to provide network detection services. It also provides an error report if the network layer or transmission layer protocol becomes abnormal, and it informs the related device of the abnormality to facilitate network control management.

## 40.2 IP Basic Function Configuration

Table 40-1 IP Basic Function Configuration List

Configuration Task	
Configure an IP address.	Configure an IP address for an interface.
	Configure an unnumbered IP address for an interface.
Configure basic functions of the IP protocol.	Configure the depth of the IP packet receiving queue.
	Configure the Time To Live (TTL) of transmitted IP packets.

Configuration Task	
	Configure timeout for packet reassembly.
	Enable IP packet receiving verification and check.
	Configure transmitted IP packets to calculate a checksum.
	Enable IP routing cache.
Configure basic functions of the ICMP protocol.	Enable global ICMP redirection.
	Enable global ICMP redirection.
	Enable ICMP destination unreachable.
	Configure ICMP rate limit.
Configure basic functions of the TCP protocol.	Configure the size of the TCP receiving cache.
	Configure the size of the TCP transmitting cache.
	Configure the maximum number of TCP retransmissions.
	Configure the maximum length of TCP packets.
	Configure the maximum TCP round-trip time.
	Configure the TCP connection idle time.
	Configure TCP connection setup waiting time.
	Configure the maximum number of TCP keep-alive times.
	Enable the TCP timestamp.
Enable TCP selective retransmission.	
Configure basic functions of the UDP protocol.	Configure TTL of UDP packets.
	Configure the size of the UDP receiving cache.
	Configure the size of the UDP transmitting cache.

Configuration Task	
	Enable UDP verification and check.
	Fill in UDP packet checksum.

### 40.2.1 Configure an IP address.

An IP address is a 32-bit number which uniquely identifies a network device that runs the IP protocol on the Internet.

An IP address consists of the following two parts:

- Network number (Net-id): It identifies the network in which the device is located.
- Host number (Host-id): It specifies the host number in the device network.

To facilitate IP address management, IP addresses are categorized into five classes, and each IP address class has its own functions. IP addresses of classes A to C are used for address allocation, IP addresses of class D is used in multicast applications, and IP addresses of class E are used for test purpose. The following table shows the IP addresses classes and their ranges.

Table 40-2 IP Address Classes and Their Ranges

Address Type	Available Network Address Range	Description
A	1.0.0.0 ~ 127.0.0.0	Network number 127 is used for loopback interfaces.
B	128.0.0.0 ~ 191.255.0.0	-
C	192.0.0.0 ~ 223.255.255.0	-
D	224.0.0.0 ~ 239.255.255.255	Class D addresses are used for multicast.
E	240.0.0.0 ~ 255.255.255.254	Class E addresses are used for test purpose.

With the development of the Internet, IP address resources have gradually been consumed up. Address allocation based on classes causes address waste, so the concept of "subnet" is introduced. "Subnet" takes some host numbers in the IP addresses as subnet numbers. In this way, a large network is divided into multiple subnets. This facilitates network planning and deployment.

The three address segments, 10.0.0.0-10.255.255.255, 172.16.0.0-172.16.255.255, and 192.168.0.0-192.168.255.255 are private and reserved addresses, and they cannot be allocated to the public network.

This section describes how to configure an interface IP address and how to configure an unnumbered interface IP address.

### Configuration Condition

None

### Configure an IP address for an interface.

An IP address can only be configured for an interface that supports the IP protocol. One interface can only be configured with one primary IP address but it can be configured with multiple secondary IP addresses.

Table 40-3 Configuring an IP Address for an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure an IP address for an interface.	<b>ip address</b> <i>ip-address</i> { <i>network-mask</i>   <i>mask-len</i> } [ <b>secondary</b> ]	Mandatory

---

### Note

- One interface can only be configured with one primary IP address, therefore, the newly configured primary IP address replaces the original primary IP address.
  - Before an interface is configured with secondary IP addresses, the interface must be configured a primary IP address. An interface can be configured with a maximum of 100 secondary IP addresses.
  - The IP addresses of different interfaces must not in the same network segment, but the primary and secondary IP addresses of one interface can be in the same network segment.
- 

### Configure an unnumbered IP address for an interface.

Unnumbered IP addresses save IP addresses. In the case of unnumbered IP addresses, the IP addresses of other interfaces can be borrowed instead of allocated independently. If an unnumbered interface generates an IP packet, the source IP address of the packet is the primary IP address of a borrowed

interface. In configuring an unnumbered IP address for an interface, the interface to be borrowed must be specified, so that the IP address of the interface can be borrowed.

Table 40-4 Configuring an Unnumbered IP Address for an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure an unnumbered IP address for an interface.	<b>ip unnumbered</b> <i>reference-interface</i>	Mandatory

---

 **Note**

- The borrowed interface must be configured with the primary IP address, and the interface must not be configured with an unnumbered IP address.
  - The primary IP address of an interface can be borrowed by multiple interfaces, but only the primary IP address of the interface can be borrowed.
- 

## 40.2.2 Configure basic functions of the IP protocol.

In the TCP/IP protocol stack, the IP protocol is the network layer core protocol that is responsible for network interconnection. The IP protocol is a connectionless protocol. Before transmitting data, you need not set up a connection. The IP protocol tries best to deliver packets, but it does not ensure that all packets can reach the destination orderly.

### Configuration Condition

None

### Configure the depth of the IP packet receiving queue.

The IP packets received by a device are first cached in the IP packet receiving queue of an interface. The system reads packets orderly in the queue for processing. If the cached IP packets reach the specified queue depth, the later IP packets are discarded. You can adjust the depth of the IP packet receiving queue according to burst of IP packets in the network.

Table 40-5 Configuring the Depth of the IP Packet Receiving Queue

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the depth of the IP packet receiving queue to a specified value.	<b>ip option queue-length</b> <i>queue-size</i>	Mandatory  By default, the depth of the IP packet receiving queue is 200.
Configure the depth of the IP packet receiving queue to the default value.	<b>default ip option queue-length</b>	Optional

### Configure the Time To Live (TTL) of transmitted IP packets.

The header of an IP packet contains the Time-To-Live (TTL) field, which is decreased by 1 once the IP packet passes a routing device. When the TTL is zero, the device discards the IP packet. By default, the TTL of IP packets transmitted by the device is 255, that is, the packet can only be transmitted for up to 255 times. If you want to limit the number of packet forwarding times, adjust the TTL value for the transmitted IP packets.

Table 40-40 Configuring the TTL of Transmitted IP Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the TTL of transmitted IP packets to a specified value.	<b>ip option default-ttl</b> <i>ttl - value</i>	Mandatory  By default, the TTL of transmitted IP packets is 255.
Configure the TTL of transmitted IP packets to a default value.	<b>default ip option default-ttl</b>	Optional

### Configure timeout for packet reassembly.

If an IP packet is fragmented during the transmission, after the fragments reach the destination, they need to be reassembled to form a complete IP packet. Before all fragments are received, the received fragments

are cached temporarily. If reassembly times out before all fragments reach the destination, the received fragments are discarded.

Table 6-7 Configuring Timeout for Packet Reassembly

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configuring timeout for packet reassembly to a specified value.	<b>ip option fragment-ttl</b> <i>ttl-value</i>	Mandatory  By default, the timeout for packet reassembly is 60, and the unit is 0.5 second.
Configuring timeout for packet reassembly to the default value.	<b>default ip option fragment-ttl</b>	Optional

---

 **Note**

- The unit for timeout of packet reassembly is 0.5 second.
- 

### Enable IP Packet Receiving Verification and Check

You can enable this function to verify and check the received IP packets. If the checksum is incorrect, the packet will be discarded.

Table 40-40 Enabling IP Packet Verification and Check

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IP packet receiving verification and check.	<b>ip option recv-checksum</b>	Mandatory  By default, the function is enabled.
Configure the method for verifying and checking the	<b>default ip option recv-checksum</b>	Optional

Step	Command	Description
received IP packets to the default value.		

**Enable IP routing cache.**

After a packet is sent from socket to the IP layer, if the destination address is the same as the previous packet and the route is valid, the packet directly use the route in the cache without the need of searching for another route.

Table 40-8 Enabling IP Routing Cache

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IP routing cache.	<b>ip upper-cache</b>	Mandatory By default, the IP routing cache function is enabled.

**40.2.3 Configure basic functions of the ICMP protocol.**

In the TCP/IP protocol stack, ICMP is mainly used to provide network detection services. It also provides an error report if the network layer or transmission layer protocol becomes abnormal, and it informs the related device of the abnormality to facilitate network control management.

**Configuration Condition**

None

**Enable global ICMP redirection.**

After a device receives an IP packet to be forwarded, if it is found that the receiving interface of the packet and the transmitting interface of the packet are the same through route selection, the device forwards the packet and sends back an ICMP redirection packet to the source end, requesting the source end to reselect the correct next hop for transmission of later packets. By default, a device can send ICMP redirection packets. In some special cases, you can prohibit a device from sending ICMP redirection packets.

Table 40-9 Enabling Global ICMP Redirection

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable global ICMP redirection.	<b>ip redirect</b>	Mandatory  By default, the global ICMP redirection function is enabled.

### Enable global ICMP redirection.

In sending ICMP redirection packets, if you need to send ICMP redirection packets, you need to enable the ICMP redirection function on the interface.

Table 40-10 Enabling Global ICMP Redirection

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable global ICMP redirection.	<b>ip redirects</b>	Mandatory  By default, the ICMP redirection function is enabled on an interface.

### Note

- You can send ICMP redirection packets only when the ICMP redirection function is enabled globally and on the interface.

### Enable Global ICMP Destination Unreachable

After a device receives IP data packets, if the destination is unreachable, the packet is discarded and the ICMP destination unreachable error packet is sent back to the source end.

- If route selection of a forwarded IP packet fails, the network unreachable ICMP error packet is sent back to the source end.

Table 40-11 Enabling ICMP Destination Unreachable

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable ICMP Destination Unreachable	<b>ip network unreachable reply</b>	Optional By default, the ICMP destination unreachable function is disabled.

**Enable ICMP destination unreachable.**

After a device receives IP data packets, if the destination is unreachable, the packet is discarded and the ICMP destination unreachable error packet is sent back to the source end.

- If route selection of a forwarded IP packet fails, the network unreachable ICMP error packet is sent back to the source end.
- For an IP packet that can be forwarded, if you need to fragment the IP packet but a Don't Fragment (DF) bit is set in the packet, an ICMP error packet indicating that "segmentation is required but a DF bit is set" is sent to the source end.
- For an IP packet whose destination address is the local device, if the device does not support the upper-layer protocol of the device, it sends a "protocol unreachable" ICMP error packet to the source end.
- For an IP packet whose destination address is the local device, if the transport layer port of the packet of the packet does not match the port that the device process monitors, the device sends back a "port unreachable" ICMP error packet to the source end.

If a device encounters a malicious attack by a large number of ICMP destination unreachable packets, the device performance is degraded, and network traffic is increased. To prevent such case, you can disable the function of sending ICMP destination unreachable packets.

Table 40-12 Enabling ICMP Destination Unreachable

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	-

Step	Command	Description
Enable ICMP destination unreachable.	<b>ip unreachable</b>	Optional By default, the ICMP destination unreachable function is enabled.

### Configure ICMP rate limit.

If a device encounters a malicious attack by a large number of ICMP error packets, the device performance is degraded, and network traffic is increased. To prevent such case, you can configure ICMP packet rate limit. The types of ICMP error packets include: unreachable packets, redirection packets, TTL timeout packets, and parameter error packets. The default rate limit of the packets is 10pps, while the transmitting rate of the other types of packets is 0, that is, no rate limit. In addition, you can configure the transmitting rates for different types of packets independently. If no rate is configured for a type of packets, the default value is used.

Table 40-13 Configuring ICMP Rate Limit

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable ICMP rate limit.	<b>ip icmp ratelimit enable</b>	Mandatory By default, the function is enabled.
Configure ICMP rate limit.	<b>ip icmp ratelimit</b> { <b>default</b> <i>pps</i> / <b>echo-reply</b> { <i>pps</i>   <b>unlimit</b> }   <b>mask-reply</b> { <i>pps</i>   <b>unlimit</b> }   <b>param-problem</b> { <i>pps</i>   <b>unlimit</b> }   <b>redirect</b> { <i>pps</i>   <b>unlimit</b> }   <b>time-exceed</b> { <i>pps</i>   <b>unlimit</b> }   <b>time-stamp-reply</b> { <i>pps</i>   <b>unlimit</b> }   <b>unreach</b> { <i>pps</i>   <b>unlimit</b> } }	Mandatory By default, the ICMP rate limit function is enabled.

## 40.2.4 Configure basic functions of the TCP protocol.

In the TCP/IP protocol stack, TCP is a connection-oriented transport layer protocol. Before sending data through the TCP protocol, you must first set up a connection. The TCP protocol provides congestion control and ensures reliable data transmission.

## Configuration Condition

None

### Configure the size of the TCP receiving cache.

In some special network environment, you can configure both the size of receiving cache and the size of transmitting cache of a TCP connection so that the network can reach the optimal performance. If the TCP connection receiving cache is not configured, the size of the receiving cache is the default value.

Table 40-14 Configuring the Size of the TCP Receiving Cache

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the size of the TCP receiving cache.	<b>ip tcp rcvbufs</b> <i>buff-size</i>	Mandatory By default, the size of the receiving cache is 8192 bytes.

### Configure the size of the TCP transmitting cache.

In some special network environment, you can configure both the size of receiving cache and the size of transmitting cache of a TCP connection so that the network can reach the optimal performance. If the TCP connection transmitting cache is not configured, the size of the transmitting cache is the default value.

Table 40-15 Configuring the Size of the TCP Transmitting Cache

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the size of the TCP transmitting cache.	<b>ip tcp sendbufs</b> <i>buff-size</i>	Optional By default, the size of the transmitting cache is 8192 bytes.

### Configure the maximum number of TCP retransmissions.

After the server sends a SYN-ACK packet, if it does not receive a response packet from the client, the server retransmits the packet. If the number of retransmissions exceeds the maximum number of retransmissions defined by the system, the system disconnects the TCP connection.

Table 40-16 Configuring the Maximum Number of TCP Retransmissions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum number of TCP retransmissions.	<b>ip tcp retransmits</b> <i>retransmits-count</i>	Mandatory  By default, the maximum number of TCP retransmissions is 3.

#### Configure the maximum length of TCP packets.

The maximum length of TCP packets is the maximum length of data blocks that are sent by the transmitting end of a TCP connection to the receiving end. When a connection is set up, the smaller maximum packet length of the two ends is used as the maximum packet length in sending TCP packets by the two ends. If a TCP packet exceeds the maximum packet length, the transmitting ends fragments the packet before sending it.

Table 40-17 Configuring the Maximum Length of TCP Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum length of TCP packets.	<b>ip tcp segment-size</b> <i>seg-size</i>	Optional  By default, the maximum length of TCP packets is 512 bytes.

#### Configure the maximum TCP round-trip time.

The TCP round trip time refers to the time between the timepoint at which the transmitting end sends a TCP packet and the timepoint at which the transmitting end receives the response packet. The maximum TCP round-trip time that is configured during TCP connection setup is taken as the initial value of the TCP round-trip time. The later TCP round-trip time is calculated according to the actual round-trip time. By default, the maximum TCP round-trip time is 3 seconds.

Table 40-18 Configuring the Maximum TCP Round-Trip Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum TCP round-trip time.	<b>ip tcp round-trip</b> <i>round-trip-time</i>	Mandatory  By default, the maximum TCP round-trip time is 3 seconds.

**Configure the TCP connection idle time.**

After a TCP connection is set up, if no data is exchanged, the TCP connection idle time times out. Then TCP performs a keep-alive test. After the maximum number of keep-alive times is reached, the TCP connection is disconnected. By default, the TCP connection idle time is 2 hours.

Table 40-19 Configuring the TCP Connection Idle Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the TCP connection idle time.	<b>ip tcp idle-timeout</b> <i>idle-time</i>	Mandatory  By default, the TCP connection idle time is 14400, and the unit is 0.5 second.

---

 **Note**

- The unit of the TCP connection idle time is 0.5 second.
- 

**Configure TCP connection setup waiting time.**

The setup of a TCP connection requires three handshakes. After a TCP client sends a connection request packet, it waits for the response from the TCP server before completing connection setup. After the time

for waiting for connection setup timeout before a response is received, connection setup is terminated. By default, the time for waiting for setting up a TCP connection is 75 seconds.

Table 40-20 Configuring TCP Connection Setup Waiting Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TCP connection setup waiting time.	<b>ip tcp init-timeout</b> <i>init-time</i>	Mandatory  By default, the time for waiting for setting up a TCP connection is 150 seconds, and the unit is 0.5 second.

### Note

- The unit of the TCP connection setup waiting time is 0.5 second.

### Configure the maximum number of TCP keep-alive times.

If no data is exchanged on a TCP connection for TCP connection idle time, a TCP keep-alive packet is sent for keep-alive test. If the keep-alive test fails, a keep-alive test is performed again. If the maximum number of TCP keep-alive times exceeds the threshold, the TCP connection will be disconnected. By default, the maximum number of TCP keep-alive times is 3.

Table 40-21 Configuring the Maximum Number of TCP Keep-Alive Times

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum number of TCP keep-alive times.	<b>ip tcp keep-count</b> <i>keep-count</i>	Mandatory  By default, the maximum number of TCP keep-alive times is 3.

### Enable the TCP timestamp.

TCP automatically calculates the packet round-trip time according to the serial number of the request packet and that of the response packet. However, the calculation is not accurate. Use of TCP timestamps can revise the problem. The transmitting end adds a timestamp into a packet, and the receiving end sends back the timestamp in the response packet. The transmitting end calculates the packet round-trip time according to the returned timestamp. By default, the function is disabled.

Table 40-22 Enabling the TCP Timestamp

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the TCP timestamp.	<b>ip tcp timestamp</b>	Mandatory By default, the function is disabled.

**Enable TCP selective retransmission.**

After TCP sends a series of packets, if the transmission of one packet fails, the series of packets need to be retransmitted. After TCP selective transmission is enabled, then only the packet that fails to be transmitted needs to be retransmitted. By default, the function is disabled.

Table 40-23 Enabling TCP Selective Retransmission

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TCP selective retransmission.	<b>ip tcp selective-ack</b>	Mandatory By default, the function is disabled.

**40.2.5 Configure TCP Protocol Anti-Attack Function**

The TCP server receives a large number of SYN packets but the peer end does not respond to the SYN-ACK response from the server. This can cause the server's memory to be consumed heavily, taking up the server's syn queue and causing the TCP server unable to service normal requests. Such attacks can be avoided by configuring TCP anti-attack function.

**Configuration Condition**

None

### Enable TCP Syncache Function

This function does not rush to allocate the TCB when a SYN data packet is received, but first responds with a SYN ACK packet and stores this half-open connection information in a dedicated HASH table (Cache) until a correct response ACK packet is received before allocating the TCB.

Table 40-24 Enabling TCP Syncache Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TCP syncache function	<b>ip tcp syncache</b>	Mandatory By default, the function is disabled.

### Enable TCP Syncookies Function

This function does not use any storage resources at all, it uses a special algorithm to generate Sequence Number. The algorithm takes into account fixed information including the other party's IP, port, its own IP and port, and other fixed information of its own, such as MSS, time, etc. After receiving the other party's ACK packet, the algorithm will recalculate it to see if it is the same as the other party's response packet (Sequence Number-1), so as to decide whether to allocate TCB resources.

Table 40-25 Enabling TCP Syncookies Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the TCP syncookies function.	<b>ip tcp syncookies</b>	Mandatory By default, the function is disabled.

## 40.2.6 Configure basic functions of the UDP protocol.

In the TCP/IP protocol stack, UDP is a connectionless-oriented transport layer protocol. Before sending data through the TCP protocol, you need not set up a connection. The UDP protocol provides unreliable data transmission without congestion control.

### Configuration Condition

None

### Configure TTL of UDP packets.

Configuring TTL of UDP packets means to fill in the TTL value in the IP header of UDP packets. The header of an IP packet contains the Time-To-Live (TTL) field, which is decreased by 1 once the IP packet passes a routing device. When the TTL is zero, the device discards the IP packet. By default, the TTL value of the IP packet of a UDP packet is 64.

Table 40-26 Configuring TTL of UDP Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure TTL of UDP packets.	<b>ip udp default-ttl</b> <i>time-to-live</i>	Mandatory By default, the TTL value of the IP packet of a UDP packet is 64.

### Configure the size of the UDP receiving cache.

In some special network environment, you can configure both the size of receiving cache and the size of transmitting cache of a UDP connection so that the network can reach the optimal performance. If the UDP connection receiving cache is not configured, the size of the receiving cache is the default value, 41600 bytes.

Table 40-278 Configuring the Size of the UDP Receiving Cache

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the size of the UDP receiving cache.	<b>ip udp recvbuffers</b> <i>buffer-size</i>	Mandatory By default, the size of the UDP receiving cache is 41600 bytes.

### Configure the size of the UDP transmitting cache.

In some special network environment, you can configure both the size of receiving cache and the size of transmitting cache of a UDP connection so that the network can reach the optimal performance. If the UDP connection transmitting cache is not configured, the size of the transmitting cache is the default value, 9216 bytes.

Table 40-28 Configuring the Size of the UDP Transmitting Cache

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the size of the UDP transmitting cache.	<b>ip udp sendbuffers</b> <i>buffer-size</i>	Mandatory By default, the size of the UDP transmitting cache is 9216 bytes.

#### Enable UDP verification and check.

To prevent errors that occur during transmission of UDP packets, after UDP packets are received, UDP verification and check need to be performed. The system compares the UDP packet verification field calculated by the receiving end and the UDP packet header checksum field. If the two values are different, the system determines that a transmission error has occurred, and then discards the packet. By default, the function is enabled.

Table 40-29 Enabling UDP Verification and Check

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable UDP verification and check.	<b>ip udp recv-checksum</b>	Mandatory By default, the function is enabled.

#### Fill in UDP packet checksum.

To prevent UDP packets from encountering transmission errors, in transmitting UDP packets, the transmitting end fills in the UDP packet checksum to be calculated into the UDP packet header checksum field for the receiving end to perform checksum check. By default, the function is enabled.

Table 40-30 Filling in UDP Packet Checksum

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to fill in packet checksum in transmitting UDP packets.	<b>ip udp send-checksum</b>	Mandatory By default, the function is enabled.

## 40.2.7 IP Basics Monitoring and Maintaining

Table 40-31 IP Basics Monitoring and Maintaining

Command	Description
<b>clear ip icmpstat</b>	Clears ICMP protocol statistics.
<b>clear ip statistics</b>	Clears IP protocol statistics.
<b>clear ip tcp syncache statistics</b>	Clears TCP protocol syncache statistics.
<b>clear ip tcpstat</b>	Clears TCP protocol statistics.
<b>clear ip udpstat</b>	Clears UDP protocol statistics.
<b>show ip icmpstat</b>	Displaying ICMP protocol statistics.
<b>show ip interface</b> [ <i>interface-name</i>   <b>brief</b> ]	Displaying the interface IP address.
<b>show ip sockets</b>	Displaying the Socket details.
<b>show ip statistics</b>	Displaying IP protocol statistics.
<b>show ip tcpstat</b>	Displaying TCP protocol statistics.
<b>show ip tcp syncache statistics</b>	Displaying TCP syncache statistics.
<b>show ip udpstat</b>	Displaying UDP protocol statistics.
<b>show ip tcp syncache detail</b>	Displaying TCP protocol syncache entry details.

Command	Description
<b>show tcp tcb [ detail ]</b>	Displaying TCP protocol control block details.

# 41 DHCP

---

## 41.1 Overview

It is hard to manage a large network. For example, in a network in which IP addresses are manually allocated, IP address conflicts are common. The only way of solving the problem is to dynamically allocate IP addresses to the hosts. The Dynamic Host Configuration Protocol (DHCP) allocates IP address to requesting hosts from an IP address pool. DHCP also provides other information, such as gateway IP and DNS server address. DHCP reduces the workload of the administrator in recording and tracking manually allocated IP addresses.

DHCP is a protocol that is based on UDP broadcast. The process for a DHCP client to obtain an IP address and other configuration information from a DHCP server contains four phases:

**DISCOVER phase.** When the DHCP client accesses the network for the first time, it sends a DHCP DISCOVER packet with the source address 0.0.0.0 and destination address 255.255.255.255 to the network.

**OFFER phase.** After the DHCP server receives the DHCP DISCOVER broadcast packet sent by the client, it selects an IP address from the corresponding IP address pool according to the policy, and sends the IP address and other parameters to the client in a DHCP OFFER packet.

**REQUEST phase.** If the DHCP client receives response messages from multiple DHCP servers on the network, it selects one DHCP OFFER (usually the one that arrives first). Then it sends a DHCP REQUEST packet to the network, telling all DHCP servers the IP address of which server it will accept.

**ACK phase.** After the DHCP server receives the DHCP REQUEST packet from the DHCP server, it sends a DHCP ACK message containing the provided IP address and other configuration to the DHCP client, telling the DHCP client that the DHCP client can use the provided IP address.

The IP address that the DHCP server allocates to the DHCP client has a lease. After the lease expires, the server will take back the allocated IP address. When the lease term of the IP address of the DHCP client has passed half time, the DHCP client sends a DHCP REQUEST packet to the DHCP server requesting to update its IP address lease. If the DHCP server allows the DHCP client to use its IP address, the DHCP server responds with a DHCP ACK packet, requesting the DHCP client to update the lease. If the DHCP server does not allow the DHCP client to continue to use the IP address, the DHCP server responds with a DHCP NAK packet.

During dynamic IP address acquisition, request packets are sent in broadcast mode; therefore, DHCP is applied only when the DHCP client and server are in the same subnet. If multiple subnets exist in a network and the hosts of the subnets need to obtain configuration information such as IP address through the DHCP server, the hosts of the subnets communicate with the DHCP server through a DHCP relay to obtain IP addresses and other configuration information.

## 41.2 DHCP Function Configuration

Table 41-1 DHCP Function Configuration List

Configuration Task	
Configure a DHCP Address Pool	Creating the DHCP address pool to allow VRF attributes specification.
	Configure an IP address range.
	Configure a DNS server address.
	Configure the default route.
	Configure the lease of an IP address.
	Bind an IP address and a MAC address.
	Configure user-defined options.
	Configure the IP address pool of a specified vender.
Configure other parameters of a DHCP server.	Configure DHCP server.
	Configure the ranges of reserved IP addresses.
	Configure the DHCP ping probe parameters.
	Configure DHCP data logging function.
Configure the functions of a DHCP client.	Configure a DHCP client.
	Configure vendor ID.
	Configure DHCP routing distance.
	Configure DHCP option 60 function.

	Configure the DHCP client not to request the default route option.
Configure the Function of a DHCP Relay	Configure interface DHCP relay.
	Configure functions of Option 82.
	Configure interface DHCP relay packets source address.
	Configure a DHCP server address.

### 41.2.1 Configure a DHCP Address Pool

#### Configuration Condition

None

#### Create a DHCP Address Pool

A DHCP server needs to select and allocate IP addresses and other parameters from a DHCP address pool. Therefore, a DHCP address pool must be created for the DHCP server.

Table 41-2 Creating a DHCP Address Pool

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create a DHCP address pool and enter the DHCP configuration mode.	<b>ip dhcp pool <i>pool-name</i></b> <b>[ vrf <i>vrf-name</i> ]</b>	Mandatory By default, no DHCP address pool has been created by the system.

#### Note

- Address pools fall into two types: Network and Range. The two types of address pools can be configured respectively through the network and range commands.

### Configure an IP address range.

On a DHCP server, each DHCP address pool must be configured with an IP address range to allocate IP addresses to DHCP clients.

Table 41-41 Configuring an IP Address Range

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCP configuration mode.	<b>ip dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure an IP address range for an address pool of the Network type.	<b>network</b> <i>ip-address</i> [ <i>network-mask</i>   <i>mask-len</i> ]	Optional By default, an IP address range is not configured for an address pool.
Configure an IP address range for an address pool of the Range type.	<b>range</b> <i>low-ip-address</i> <i>high-ip-address</i> [ <i>network-mask</i>   <i>mask-len</i> ]	Optional By default, an IP address range is not configured for an address pool.

---

### Note

- After an IP address range is configured for an address pool by using the network or range command, if you run the network or range command again, the new IP address range configuration overwrites the existing configuration.
  - Change the type of the address pool from network to range (or vice versa). If the address range of the new configuration and the address range of the old configuration intersect, the command line will prompt the user whether to perform this operation, if yes, all address configurations (static binding, vendor sub-pool) and dynamic leases under the address pool will be deleted; if the actual effective address range of the new configuration covers the actual effective address range of the old configuration, the address pool will keep all the address configurations under the address pool (static binding, vendor sub-pool), and delete the ip range and dynamic lease of the vendor sub-pool configuration.
- 

### Configure a DNS server address.

On a DHCP server, you can configure the DNS server address respectively for each DHCP address pool. When a DHCP server allocates an IP address for a DHCP client, it also sends the DNS server address to the client.

When the DHCP client starts dynamic domain name resolution, it queries the DNS server.

Table 41-3 Configuring a DNS Server Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCP configuration mode.	<b>ip dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure a DNS server address.	<b>dns-server</b> { <i>ip-address</i> &<1-8> / <b>autoconfig</b> }	Mandatory By default, the DNS server address is not configured.

#### Configure the default route.

On a DHCP server, you can specify the address of a gateway corresponding to clients for each DHCP address pool. When the server allocates an IP address to a client, it also sends the gateway address to the client.

When a DHCP client accesses a server or host that is not in the network segment, its data is forwarded through the gateway.

Table 41-4 Configuring the Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCP configuration mode.	<b>ip dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure the default route.	<b>default-router</b> <i>ip-address</i> &<1-8>	Mandatory By default, no default route is configured.

#### Configure the lease of an IP address.

The IP address that the DHCP server allocates to the DHCP client has a lease. After the lease expires, the server will take back the allocated IP address. If the DHCP client wants to continue to use the IP address, it must have the IP address lease updated.

On the DHCP server, you can configure an IP address lease for each DHCP address pool.

Table 41-5 Configuring the Lease of an IP Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCP configuration mode.	<b>ip dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure the lease of an IP address.	<b>lease</b> <i>days</i> [ <i>hours</i> [ <i>minutes</i> ] ]	Mandatory  By default, the value of <i>days</i> is 1, the value of <i>hours</i> is 6, and the value of <i>minutes</i> is 0.

**Bind an IP address and a MAC address.**

After IP addresses and MAC addresses are bound, when the client with a specified MAC address sends an IP address request to the DHCP server, the DHCP server allocates the IP address that is bound to the IP address to the client. In this way, as long as the MAC address of the client is not changed (e.g., by replacing the network interface card), the client will obtain the same IP address from the server each time.

Table 41-6 Binding IP Addresses and MAC Addresses

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCP configuration mode.	<b>ip dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Bind an IP address and a MAC address.	<b>bind</b> { <i>ip-address mac-address</i>   <b>automatic</b> }	Mandatory  By default, no IP address and MAC address binding is configured.

**Configure user-defined options.**

For some options, RFC does not give specifications; therefore, you can define these options according to the actual requirement.

Table 41-7 Configuring User-Defined Options

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCP configuration mode.	<b>ip dhcp pool</b> <i>pool-name</i> <b>[ vrf</b> <i>vrf-name</i> <b>]</b>	-
Configure user-defined options.	<b>option</b> <i>option-code</i> { <b>ascii</b> <i>ascii-string</i>   <b>hex</b> <i>hex-string</i>   <b>ip</b> <i>ip-address</i> &<1-8> }	Mandatory By default, user-defined options are not configured.

### Configure a DHCP Vendor Address Pool

When the client requests an IP address, it may carry the option 60, which specifies the vendor ID. Users can specify different IP address segments for different vendors.

Table 41-8 Configuring a DHCP Vendor Address Pool

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCP configuration mode.	<b>ip dhcp pool</b> <i>pool-name</i> <b>[ vrf</b> <i>vrf-name</i> <b>]</b>	-
Configure the vendor address pool and enter DHCP vendor address pool configuration mode.	<b>vendor-class-identifier</b> <i>vendor_id</i>	By default, no vendor address pool is configured.
Configure the vendor address pool range.	<b>ip range</b> <i>low-ip-address</i> <i>high-ip-address</i>	No range is configured by default.
Configure the contents of option 43 to be returned by the specified vendor.	<b>option 43</b> { <b>ascii</b> <i>ascii-string</i>   <b>hex</b> <i>hex-string</i>   <b>ip</b> <i>ip-address</i> &<1-8> }	No configured by default.

## 41.2.2 Configure other parameters of a DHCP server.

### Configuration Condition

None

### Configure DHCP server.

After configuring the interface to work in DHCP server mode, when the interface receives DHCP request packets from DHCP clients, the DHCP server allocates IP addresses and other network parameters for the clients.

Table 41-9 Configuring a DHCP Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the functions of the DHCP server.	<b>ip dhcp server</b>	Mandatory By default, no DHCP server function is configured.

### Configure the ranges of reserved IP addresses.

In the DHCP address pool, some IP addresses are reserved for specific devices, and some conflict with the IP addresses of other hosts on the network. These IP addresses cannot be used for dynamic allocation.

Table 41-10 Configuring the Range of Reserved IP Addresses

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the ranges of reserved IP addresses.	<b>ip dhcp excluded-address</b> <i>low-ip-address</i> [ <i>high-ip-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory By default, the range of reserved IP addresses is not configured.

		The IP addresses in the reserved IP address range will not be allocated.
--	--	--

### Configure DHCP Ping Probe Parameters

To prevent an IP address conflict, before dynamically allocating an IP address to a DHCP client, a DHCP server must detect the IP address. The detection operation is performed with the ping operation. The DHCP server determines whether an IP address conflict exists by checking and whether an ICMP echo response packet is received within the specified time.

Table 41-11 Configuring DHCP Ping Probe Parameters

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the DHCP ping probe parameters.	<b>ip dhcp ping { packets packet-num   timeout milliseconds }</b>	Mandatory By default, the number of ping packets is 1, and the timeout time is 500 ms.

### Configure DHCP data logging function.

When the data log function of a DHCP server is enabled, the address pool allocation on the DHCP server will be recorded to the data log.

Table 41-12 Configuring the DHCP Service Switch

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the DHCP server data logging service switch.	<b>ip dhcp logging security-data</b>	Mandatory By default, the data logging function is not enabled.

### 41.2.3 Configure the functions of a DHCP client.

#### Configuration Condition

None

### Configure a DHCP client.

A DHCP client interface obtains an IP address and other parameters through DHCP.

Table 41-13 Configuring a DHCP Client

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the DHCP client to obtain an IP address.	<b>ip address dhcp [ request-ip-address ip-address ]</b>	Mandatory By default, the DHCP client is not configured to obtain an IP address.

### Configure DHCP routing distance.

Each protocol in the IP routing table has an administrative distance, or routing distance, that controls routing. Routing distance is used to make routing decisions for the same network segment routes from different protocols, and routes with small routing distance take precedence.

Table 41-14 Configuring DHCP Routing Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure DHCP routing distance.	<b>ip dhcp route-distance</b> <i>distance</i>	Mandatory By default, the DHCP routing distance is 254.

### Configure the Option 60 Function

The content of DHCP option 60 is vendor ID, and the option 60 content can be carried during DHCP client request. The server can set the IP address allocation policy based on this option.

Table 41-15 Configuring DHCP Option 60 Function

Step	Command	Description
------	---------	-------------

Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the option 60 function.	<b>ip dhcp vendor-class-identifier {disable   content hex-string}</b>	The option 60 content is carried by default.

#### Configure the DHCP client not to request the default route option.

In the process of requesting IP address, the DHCP client, will request the default route by default, users can specify the DHCP client not to request default route so as to configure the route by themselves.

Table 41-16 Configuring the DHCP Client Not to Request the Default Route Option

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the DHCP client not to request the default route option.	<b>ip dhcp router-option disable</b>	Mandatory By default, the DHCP client will request the default route option.

### 41.2.4 Configure the Function of a DHCP Relay

#### Configuration Condition

None

#### Configure a DHCP Relay

If multiple subnets exist in a network and the hosts of the subnets need to obtain configuration information such as IP address through the DHCP server, the hosts of the subnets communicate with the DHCP server through a DHCP relay to obtain IP addresses and other configuration information. If an interface is configured to work in DHCP relay mode, after the interface receives DHCP packets from a DHCP client, it relays the packet to the specified DHCP server. The DHCP server then allocates an IP address.

Table 41-17 Configure a DHCP Relay

Step	Command	Description
------	---------	-------------

Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the Function of a DHCP Relay	<b>ip dhcp relay</b>	Mandatory  By default, the DHCP relay function is not configured.

### Configure Functions of Option 82

Option 82 is a relay information option, which records the location of a DHCP client. If the DHCP relay is enabled to support Option 82 through configuration, a DHCP relay receives a request packet sent by a DHCP client to a DHCP server and the request packet does not contain the Option 82 option, it adds Option 82 into the request packet and sends the packet to the DHCP server. If the DHCP relay is enabled to support Option 82 through configuration and the request packet carries Option 82, it will proceed to the next step according to the action configured by the **ip dhcp relay information strategy** command, and then forward the packet to the server. If the DHCP relay receives a DHCP response packet which contains Option 82, it deletes Option 82 and forwards the packet to the DHCP client.

Table 41-18 Configuring the Option 82 Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the DHCP relay to support Option 82	<b>ip dhcp relay information option</b>	Mandatory  By default, the DHCP relay is not enabled to support Option 82.
Configure the processing policy when a DHCP relay receives a request packet with Option 82 from a client.	<b>ip dhcp relay information strategy{drop   keep   replace}</b>	Optional  Use the REPLACE action for packets carrying Option 82.
Configure functions of Option 82.	<b>ip dhcp relay information option   remote-id { ascii <i>ascii-string</i>   hex <i>hex-string</i> }   circuit-id { ascii</b>	Mandatory  By default, the Option 82 function is not configured.

	<i>ascii-string</i>   <b>hex</b> <i>hex-string</i> }	
--	--	--

### Configure DHCP Relay Packets Source Address

The source address used by DHCP relay when forwarding DHCP client-originated packets to a DHCP server is, by default, the output interface address of the route to the DHCP server. In some environments, the DHCP server cannot communicate with this address, therefore users are allowed to configure the source address of the packets forwarded by the DHCP relay to the DHCP server and the `giaddr` field in the packets via the **ip dhcp relay source-address** command. Also users are allowed to configure the DHCP relay source address as the address of the interface that receives DHCP client packets via the **ip dhcp relay source-address relay-address** command.

Table 41-19 Configuring DHCP Relay Packets Source Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure DHCP Relay Packets Source Address	<b>ip dhcp relay source-address relay-address</b>	Mandatory By default, the DHCP relay packets source address is the output interface address of the route to the DHCP server.
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure DHCP Relay Packets Source Address	<b>ip dhcp relay source-address</b> <i>ip-address</i>	Mandatory By default, the DHCP relay packets source address is the output interface address of the route to the DHCP server.

### Note

- The source address of the **ip dhcp relay source-address** *ip-address* configuration must be the interface address of this device, and the interface address must belong to the same vrf

---

as the relay interface, otherwise the relay packets will fail to be sent.

- If the **ip dhcp relay source-address** *ip-address* command is configured in interface mode and the **ip dhcp relay source-address relay-address** command is configured in global mode, the former has a higher priority than the latter, and the DHCP relay will fill the configured *ip-address* with the source address of DHCP relay packets sent to the DHCP server.
- 

### Configure a DHCP server address.

After the interface receives DHCP packets from a DHCP client, it relays the packet to the specified DHCP server. The DHCP server then allocates an IP address.

Table 41-20 Configuring a DHCP Server Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure a DHCP server address.	<b>ip dhcp relay server - address</b> <i>ip-address</i>	Mandatory By default, no DHCP server address is configured.

## 41.2.5 DHCP Monitoring and Maintaining

Table 41-21 DHCP Monitoring and Maintaining

Command	Description
<b>clear ip dhcp pool</b> <i>pool-name</i> { <b>lease</b>   <b>conflict</b> [ <i>ip-address</i> ] }	Clears dynamic lease information from the address pool or address information with conflicting addresses.
<b>clear ip dhcp server interface</b> [ <i>interface-name</i> ] <b>statistics</b>	Clears the key statistics when the DHCP server interacts with clients or relays for packets.
<b>clear ip dhcp relay statistics</b>	Clears the statistics on the DHCP relay device.

<pre><b>show ip dhcp server interface</b> <i>interface-name</i> [<b>statistics</b>]</pre>	<p>Displaying the address pool information associated with the specified interface or displaying the key statistics when the DHCP server engages in packet interactions with clients or relays under the specified interface.</p>
<pre><b>show ip dhcp pool</b> <i>pool-name</i> { <b>summary</b>   <b>ping_list</b>   <b>offer_list</b>   <b>excluded_list</b>   <b>conflict_list</b>   <b>lease</b>   <b>binding</b> }</pre>	<p>Displaying the summary information of the specified address pool or the information of the address that is doing ping check or the address that has sent the OFFER packet and is waiting for the DHCP client to respond to the REQUEST packet or the information of the excluded address in the address pool or the information of the address that has address conflict in the address pool or the information of dynamic lease in the address pool or the information of static binding in the address pool.</p>
<pre><b>show ip dhcp pool</b> <i>pool-name</i> <b>specific</b> { <b>ip-address</b> <i>ip-address</i>   <b>mac-address</b> <i>mac-address</i> }</pre>	<p>Displaying information about the specified IP address or mac address in the address pool.</p>
<pre><b>show ip dhcp relay</b> [<b>interface</b> <i>interface-name</i> ]</pre>	<p>Displaying the packet statistics on the DHCP relay device.</p>

## 41.3 Typical Configuration Example of DHCP

### 41.3.1 Configure a DHCP Server to Statically Allocate IP Addresses

#### Network Requirements

- Device2 acts as a DHCP server to allocate IP addresses, gateway IP addresses, and DNS server IP addresses in a static manner.
- The DHCP server allocates an IP address to PC in MAC binding mode.

#### Network Topology

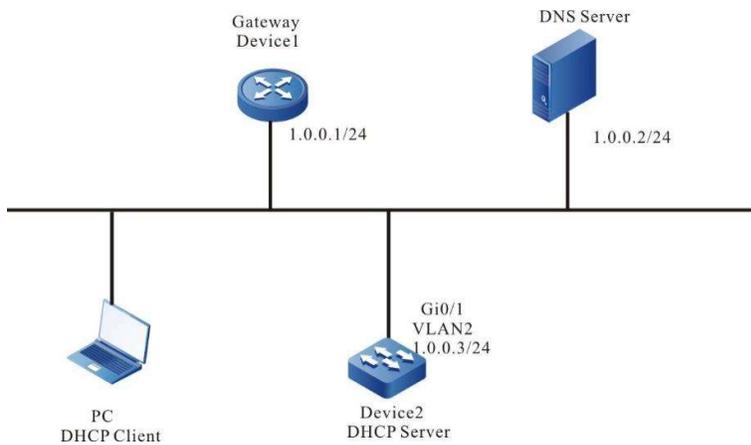

Figure 41-1 Network Topology for Configuring DHCP Server to Statically Allocate IP Addresses

### Configuration Steps

Step 1: Configure Device2 interface IP addresses and enable it to work in DHCP server mode.

```
Device2#configure terminal
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip address 1.0.0.3 255.255.255.0
Device2(config-if-vlan2)#ip dhcp server
Device2(config-if-vlan2)#exit
```

Step 2: Configure statically bound address pools and parameters.

#Configure the address pool mac-binding, and allocate an IP address to PC in static MAC binding mode.

```
Device2(config)#ip dhcp pool mac-binding
Device2(dhcp-config)#range 1.0.0.4 1.0.0.254 255.255.255.0
Device2(dhcp-config)#bind 1.0.0.11 00e0.00e1.013d
Device2(dhcp-config)#default-router 1.0.0.1
Device2(dhcp-config)#dns-server 1.0.0.2
Device2(dhcp-config)#exit
```

Step 3: Check the result.

#On Device2, use the show ip dhcp server interface vlan2 command to check the address pool associated with the interface.

```
Device2(config)#exit
Device2#show ip dhcp server interface vlan2
DHCP server status information:
DHCP server is enabled on interface: vlan2
Vrf: global
DHCP server pool information:
Available directly-connected pool:
Interface IP    Pool name    Pool Range    Pool utilization
-----
1.0.0.3/24    mac-binding  1.0.0.4 – 1.0.0.254  0.00%
```

#On Device2, use the show show ip dhcp pool mac-binding binding command to check the IP addresses allocated

to the PC.

```
Device2#show ip dhcp pool mac-binding binding
IP Address    MAC Address    Vendor Id    Type    Time Left(s)
-----
```

```
1.0.0.11 00e0.00c1.013d Global Binding NA
```

#On Device2, use the show show ip dhcp pool mac-binding lease command to check the addresses allocated to the PC.

```
Device#show ip dhcp pool danymic-pool2 lease
IP Address      MAC Address      Vendor Id      Type   Time Left(s)
-----
1.0.0.11        00e0.00c1.013d  Global        Lease  107980
```

On the PC, check whether the obtained IP addresses, gateway IP addresses, and DNS server IP addresses are correct.

### 41.3.2 Configure a DHCP Server to Dynamically Allocate IP Addresses

#### Network Requirements

- Two interface VLANs of Device, VLAN2 and VLAN3, are respectively configured with IP addresses in the 1.0.0.3/24 and 2.0.0.3/24 network segments.
- The DHCP server Device dynamically allocates IP addresses in the 1.0.0.0/24 and 2.0.0.0/24 network segments to the two clients in the directly-connected physical network.
- The addresses in network segment 1.0.0.0/24 have a one-day lease, the gateway address is 1.0.0.3, the DNS server address is 2.0.0.4. The addresses in network segment 2.0.0.0/24 have a three-day lease, the gateway address is 2.0.0.3, and the DNS server address is 2.0.0.4.
- The first 10 IP addresses in network segments 1.0.0.0/24 and 2.0.0.0/24 are reserved and cannot be allocated.

#### Network Topology

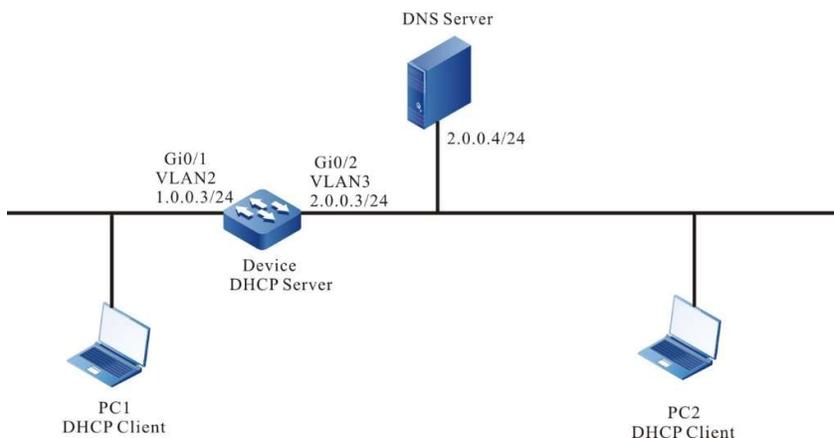

Figure 41-2 Network Topology for Configuring DHCP to Dynamically Allocate IP Addresses

#### Configuration Steps

Step 1: Configure Device interface IP addresses and enable it to work in DHCP server mode.

```
Device(config)#interface vlan2
Device(config-if- vlan2)#ip address 1.0.0.3 255.255.255.0
Device(config-if- vlan2)#ip dhcp server
Device(config-if- vlan2)#exit
Device(config)#interface vlan3
Device(config-if- vlan3)#ip address 2.0.0.3 255.255.255.0
Device(config-if- vlan3)#ip dhcp server
Device(config-if- vlan3)#exit
```

Step 2: On the DHCP server Device, configure two dynamic address pools and their parameters.

#Configure the first 10 IP addresses in the two address pools to be reserved.

```
Device(config)#ip dhcp excluded-address 1.0.0.1 1.0.0.10
Device(config)#ip dhcp excluded-address 2.0.0.1 2.0.0.10
```

#Configure address pool dynamic-pool1 and its parameters (including address range, gateway, DNS, address lease, and local domain name).

```
Device(config)#ip dhcp pool dynamic-pool1
Device(dhcp-config)#network 1.0.0.0 255.255.255.0
Device(dhcp-config)#default-router 1.0.0.3
Device(dhcp-config)#dns-server 2.0.0.4
Device(dhcp-config)#lease 1 0 0
Device(dhcp-config)#exit
```

#Configure address pool dynamic-pool2 and its parameters (including address range, gateway, DNS address, address lease, Wins server address, and local domain name).

```
Device(config)#ip dhcp pool dynamic-pool2
Device(dhcp-config)#network 2.0.0.0 255.255.255.0
Device(dhcp-config)#default-router 2.0.0.3
Device(dhcp-config)#dns-server 2.0.0.4
Device(dhcp-config)#lease 3 0 0
Device(dhcp-config)#exit
```

Step 3: Check the result.

#View information about the server-associated address pool on Device.

```
Device(config)#exit

On the DHCP clients, query whether the IP addresses have been obtained properly.

---

## Caution

- The IP addresses in the address pool must be within the network segment range of the interface that provides the service.
- 

### 41.3.3 Configure a DHCP Relay

#### Network Requirements

- Device1 is the DHCP server and Device2 interface is enabled for DHCP relay function.
- The DHCP server serves clients in the 1.0.0.0/24 network segment, and the first 10 IP addresses are reserved.
- DHCP client obtains IP address through DHCP relay.

#### Network Topology

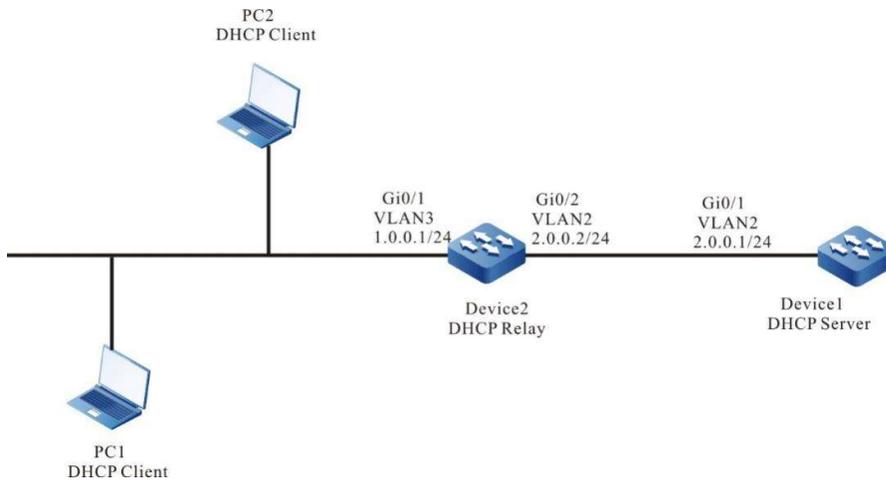

Figure 41-3 Network Topology for Configuring DHCP Relay

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. Configure IP addresses for the ports. (Omitted)

Step 2: Configure the IP address pool and the reserved IP addresses of Device1, and enable it to work in the DHCP server mode.

#Configure the DHCP server.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip dhcp server
Device1(config-if-vlan2)#exit
```

#Configure IP addresses which are from 1.0.0.1 to 1.0.0.10 not to be allocated.

```
Device1#configure terminal
Device1(config)#ip dhcp excluded-address 1.0.0.1 1.0.0.10
```

#Configure IP address pool dynamic-pool for Device1.

```
Device1(config)#ip dhcp pool dynamic-pool
Device1(dhcp-config)#network 1.0.0.0 255.255.255.0
Device1(dhcp-config)#default-router 1.0.0.1
Device1(dhcp-config)#lease 1 0 0
Device1(dhcp-config)#exit
```

#Configure a static route to network segment 1.0.0.0/24.

```
Device1(config)#ip route 1.0.0.0 255.255.255.0 2.0.0.2
```

Step 3: On the vlan3 interface of Device2, configure the IP address of the DHCP server to be 2.0.0.1, and enable the interface to work in relay mode.

```
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip dhcp relay
Device2(config-if-vlan3)#ip dhcp relay server-address 2.0.0.1
Device2(config-if-vlan3)#exit
```

Step 4: Check the result.

#On Device1, check the IP addresses that have been allocated.

```

Device1#show ip dhcp pool dynamic-pool lease
IP Address      MAC Address      Vendor Id      Type      Time Left(s)
-----
1.0.0.11       0001.7a6a.0268  Global        Lease     86387

```

Use the `show ip dhcp pool dynamic-pool lease` command to query the IP addresses that have been allocated to clients.

The result shows that a client has obtained the IP address 1.0.0.11.

### 41.3.4 Configure the DHCP Relay to Support Option 82.

#### Network Requirements

- On the DHCP relay device, Option 82 is enabled.
- Specify the content of Option 82 sub-option Remote ID as 0102030405.
- The DHCP relay Device2 adds Option 82 in a request packet and forwards the request to DHCP server. The DHCP server then allocates IP addresses in the 1.0.0.0/24 network segment to the client.

#### Network Topology

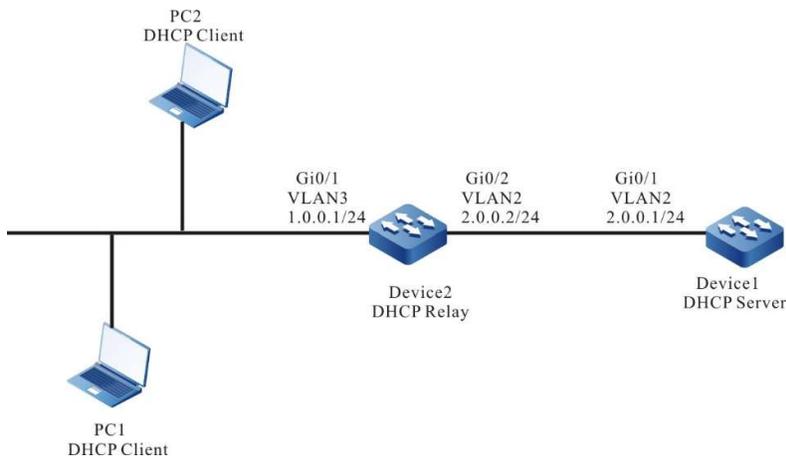

Figure 41-4 Network Topology for Configuring DHCP Relay to Support Option 82

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. Configure IP addresses for the ports. (Omitted)

Step 2: Configure the DHCP server.

```

Device1# configure terminal
Device1(config)#interface vlan2

```

```
Device1(config-if-vlan2)#ip dhcp server
Device1(config-if-vlan2)#exit
Device1(config)#ip dhcp pool dynamic-pool
Device1(dhcp-config)#network 1.0.0.0 255.255.255.0
Device1(dhcp-config)#default-router 1.0.0.1
Device1(dhcp-config)#exit
```

#Configure a static route to network segment 1.0.0.0/24.

```
Device1(config)#ip route 1.0.0.0 255.255.255.0 2.0.0.2
```

Step 3: Configure the DHCP relay Device2 and Option 82 parameters.

#Configure the IP address of the DHCP relay server to 2.0.0.1.

```
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip dhcp relay
Device2(config-if-vlan3)#ip dhcp relay server-address 2.0.0.1
```

#Enable Option 82, and configure the sub-option Remote-ID to 0102030405.

```
Device2(config)#ip dhcp relay information option
Device2(config)#ip dhcp relay information remote-id hex 0102030405
```

Step 4: Check the result.

#On Device1, query the IP addresses allocated to clients.

```
Device1#show ip dhcp pool danymic-pool1 lease
IP Address      MAC Address      Vendor Id      Type      Time Left(s)
-----
1.0.0.2        0001.7a6a.0268   Global         Lease     107992
```

On the DHCP client, query the IP address that the network adapter has obtained from network segment 1.0.0.0/24.

Packet capture on the DHCP server end can verify that the padding value of the remote-id of option 82 in the discover packets received by the server is

0102030405.

---

## Note

- After Option 82 is enabled, its sub-option Circuit ID is filled with the receiving interface index and the system ID of the relay device.
-

# 42 DNS

---

## 42.1 Overview

Domain Name System (DNS) is a distributed database that maps domain names and IP addresses. It provides conversion between domain names and IP addresses. With the use of DNS, when users access the Internet, they can use easy-to-memory and meaningful domain names. Then the domain name server in the network resolves the domain names into correct IP addresses. DNS is categorized into static DNS and dynamic DNS.

Static domain name resolution is conducted through a static DNS table. In the static DNS table, domain names and IP addresses are mapped, and some frequently used domain names are added. When a client requests for the IP address of a domain name, the DNS server first searches static DNS table for the corresponding IP address. This improves the efficiency of domain name resolution.

Dynamic domain name resolution is implemented by querying the DNS. A DNS client sends a domain name resolution request to a DNS server. After the DNS server receives the domain name resolution request, it first determines whether the requested domain name is located in its authorized management sub-domain. If yes, it searches the database for the required IP address and then sends the query result to the client. If the domain name is not in the authorized management sub-domain, the DNS server starts a recursive resolution with other DNS server, and then it sends the resolution result to the client. Alternatively, it specifies the address of the next DNS server in the response packet to the DNS client. Then, the client sends another domain name resolution request to the domain name server. This is so called iterative resolution mode.

## 42.2 DNS Function Configuration

Table 42-1 DNS Function Configuration List

Configuration Task	
Configure DNS cache specifications.	Configure the maximum number of static cache.
	Configure the maximum number of dynamic cache.

Configuration Task	
Configure the DNS client function.	Configure static domain name resolution.
	Configure dynamic domain name resolution.
Configure DNS probe function.	Configure domain name list.
	Detect domain name resolution.

### 42.2.1 Configure DNS cache specifications.

#### Configuration Condition

None

#### Configure DNS specifications

Modify the maximum number of entries supported by DNS specification, if the current specification is M, the current number is n; the configured specification is N; the two scenarios are as follows

1. For static specification, if  $N > M$  or  $n < N < M$ ; the configuration takes effect immediately; if  $N < n$ ; the configuration is prompted to have failed.
2. For dynamic specification, if  $N > M$  or  $n < N < M$ ; the configuration takes effect immediately; if  $N < n$ ; the configuration takes effect, wait for the aging of dynamic DNS.

Table 42-2 List for Configuring Privileged Mode Authentication Methods

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum number of configurable specifications supported by static dns.	<b>dns static max-count</b> <i>number</i>	Optional By default, the maximum number supported by static cache is 64.
Configure the maximum number supported by dynamic dns for configuration.	<b>dns dynamic max-count</b> <i>number</i>	Optional By default, the maximum number supported by dynamic cache is 10k.

## 42.2.2 Configure the DNS client function.

### Configuration Condition

None

### Configure static domain name resolution.

Configuring static domain name resolution is to configure a domain name to map an IPv4 address and an IPv6 address.

Table 42-3 Configuring Static Domain Name Resolution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure a domain name and its corresponding IPv4 address.	<b>ip host [ vrf vrf-name ] domain-name ip-address</b>	Mandatory  By default, no domain name and its corresponding IPv4 address are configured.
Configure a domain name and its corresponding IPv6 address.	<b>ipv6 host [ vrf vrf-name ] domain-name ipv6-address</b>	Mandatory  By default, no domain name and its corresponding IPv6 address are configured.

### Configure dynamic domain name resolution.

In configuring dynamic domain name resolution, you need to configure the IP address of a domain name server. Then, domain resolution requests can be sent to the proper domain server for resolution.

Users can pre-configure a domain suffix. Then, when the users use a domain name, they can input only part fields of the domain name, and the system automatically adds pre-configured domain suffix for resolution.

Table 42-4 Configuring Dynamic Domain Name Resolution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure a domain suffix.	<b>ip domain-name</b> [ <b>vrf vrf-name</b> ] <i>domain-name</i>	Mandatory  By default, no domain suffix is configured.
Configure a DNS server address.	<b>ip name-server</b> [ <b>vrf vrf-name</b> ] <i>ip-address</i>	Mandatory  By default, the DNS server address is not configured.

### 42.2.3 Configure DNS probe function.

#### Configuration Condition

None

#### Configure domain name list.

By configuring the domain name list, you can add some commonly used domain names to the domain name list and save them, and when you need to use them, you can directly specify the name of the domain name list.

Table 42-5 Configuring the Domain Name List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create a domain list and enter domain list configuration mode.	<b>dns domain-list</b> <i>list-name</i>	Mandatory  By default, no domain name list is configured.
Configure domain name.	<b>domain</b> <i>domain-name</i>	Mandatory  By default, no domain name is configured from the domain name list.

#### Detect domain name resolution.

By detecting domain name resolution, you can check whether the DNS server can correctly resolve the specified domain name.

Table 42-6 Detecting Domain Name Resolution

Step	Command	Description
Detect domain name resolution.	<b>dns query</b> [ <b>vrf</b> <i>vrf-name</i> ] <i>ip-address</i> [ <b>name</b> <i>domain-name</i>   <b>name-list</b> <i>list-name</i> ] [ <b>timeout</b> <i>time</i> ]	Mandatory  By default, domain name resolution is not detected.

## 42.2.4 DNS Monitoring and Maintaining

Table 42-7 DNS Monitoring And Maintaining

Command	Description
<b>debug dns</b> { <b>all</b>   <b>config</b>   <b>event</b>   <b>mpos</b>   <b>packet</b>   <b>timer</b> }	Turn on the DNS debugging information switch.
<b>show dns domain-list</b> [ <i>list-name</i> ]	Displaying domain name list.
<b>show hosts</b>	Displaying domain name resolution table entries.
<b>show name-server</b> [ <i>vrf vrf-name</i> ]	Displaying DNS server information.

## 42.3 Typical Configuration Example of DNS

### 42.3.1 Configure static domain name resolution.

#### Network Requirements

- Device and PC are interconnected, and the route is reachable.
- The host name of PC is host.xxyyz.com, and the IP address is 1.0.0.2/24.
- On Device, access the host host.xxyyz.com through static domain name resolution.

#### Network Topology

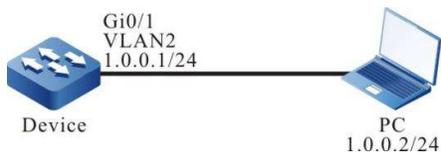

Figure 42-1 Network Topology for Configuring Static Domain Name Resolution

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure a static domain name.

#On Device, configure the host name host.xxyzz.com to correspond to IP address 1.0.0.2.

```
Device#configure terminal
Device(config)#ip host host.xxyzz.com 1.0.0.2
Device(config)#exit
```

Step 4: Check the result.

#On Device, ping host host.xxyzz.com. Device obtains the IP address 1.0.0.2 that corresponds to the host name through local domain name resolution.

```
Device#ping host.xxyzz.com

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to 1.0.0.2 , timeout is 2 seconds:
!!!!
Success rate is 100% (5/5). Round-trip min/avg/max = 0/6/16 ms.
```

---

#### 说明:

- In pinging a host name, the IPv6 address corresponding to the host name is first resolved, and then the IPv4 address.
- 

## 42.3.2 Configure dynamic domain name resolution.

### Network Requirements

- The IP address of the DNS server is 1.0.0.3/24, the IP address of Device is 1.0.0.1/24, and the IP address of PC is 1.0.0.2/24.
- The DNS server, Device, and PC are interconnected through a LAN, and the route is

reachable. On the DNS server, the DNS record of host.xxyzz.com and 1.0.0.2 exists.

- Device access PC through dynamic resolution of host.xxyzz.com through the DNS server.

### Network Topology

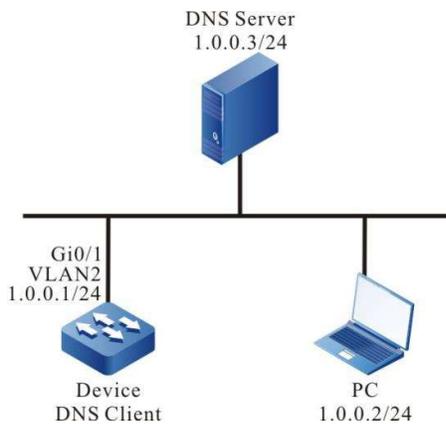

Figure 42-2 Network Topology for Configuring Dynamic Domain Name Resolution

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure the DNS server. (Omitted)

Step 4: Configure the DNS client.

#Specify a DNS server for the client, and the IP address is 1.0.0.3.

```
Device#configure terminal
Device(config)#ip name-server 1.0.0.3
Device(config)#exit
```

Step 5: Check the result.

#On Device, ping host host.xxyzz.com. Device obtains the IP address 1.0.0.2 that corresponds to the host name through the DNS server.

```
Device#ping host.xxyzz.com

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to 1.0.0.2 , timeout is 2 seconds:
!!!!
Success rate is 100% (5/5). Round-trip min/avg/max = 0/6/16 ms.
```

# 43 IPv6 Basics

## 43.1 Overview

IPv6 (Internet Protocol Version 6) is the second generation standard protocol for network layer protocols, also known as IPng (IP Next Generation), which is a set of specifications designed by the IETF (Internet Engineering Task Force) and is an upgraded version of IPv4.

### L3 Interface ND Proxy

The L3 interface ND proxy is used to enable communication between different network segments connected via two interfaces. Normally, the device will not respond to NS requests whose target is not the corresponding network segment of the packet-receiving interface, so different network segments cannot communicate directly. When the ND proxy function is enabled for a L3 interface, the device is also able to answer NA if it receives NS requests from that interface that belongs to another interface network segment. This allows hosts belonging to different network segments to establish neighbor table entries and communicate normally with each other. The typical application scenario is small and large network segment networking.

## 43.2 IPv6 Basic Function Configuration

Table 43-1 IPv6 Basic Function Configuration List

Configuration Task	
Configure IPv6 address.	Configure IPv6 addresses for the ports.
Configure the basic functions of IPv6.	Enable IPv6 unicast forwarding function.
	Enable interface IPv6 function.
	Configure IPv6 packet hop limit value.
	Configure IPv6 MTU for the interface.
Configure IPv6 Neighbor Discovery Protocol.	Configure IPv6 Static Neighbors.
	Configure the aging time of IPv6 neighbor table entries in STALE state.
	Configure the retransmission interval of NS packets.

Configuration Task	
	Configure the attempts to send an NS packet during the IPv6 duplicate address detection.
	Configure the relevant parameters of RA packets.
	Enables the interface to send redirected packets.
Configure to enable the ND fast response function.	Configure to enable the ND fast response function.
Configure L3 interface ND proxy function.	Configure to enable ND proxy function for L3 interface.
Configure ICMPv6 functions.	Configure ICMPv6 error packets transmitting rate.
	Enable transmission of ICMPv6 destination unreachable packets.
Configure TCP anti-attack function for IPv6.	Enable TCP syncache function.
	Enable TCP syncookies function.

### 43.2.1 Configure IPv6 addresses for the ports.

The most significant difference between IPv6 and IPv4 is: the length of IP addresses increases from 32 bits to 128 bits. IPv6 addresses are represented as a series of 16-bit hexadecimal numbers separated by a colon (:). Each IPv6 address is divided into 8 groups, with each group of 16 bits represented by 4 hexadecimal numbers, separated by colons between the groups, e.g. 2000:0000:240F:0000:0000:0CB0:123A:15AB.

To simplify the representation of IPv6 addresses, the "0" in an IPv6 address can be handled in the following way:

The leading "0" in each group can be omitted, i.e. the above address can be expressed as 2000:0:240F:0:0:CB0:123A:15AB.

If the address contains two or more consecutive groups that are all zeros, a double colon "::" can be used instead, i.e. the above address can be expressed as 2000:0:240F::CB0:123A:15AB.

The double colon "::" can only be used once in an IPv6 address, otherwise when the device transforms "::" to 0 to recover the 128-bit address, it will not be able to determine the number of zeros "::" represented.

An IPv6 address consists of two parts: the address prefix and the interface identifier. The address prefix is equivalent to the network number field in an IPv4 address and the interface identifier is equivalent to the host number field in an IPv4 address.

The IPv6 address prefix is expressed as: IPv6 address/prefix length. The IPv6 address is either of the forms listed earlier, and the prefix length is a decimal number indicating the number of bits precede the IPv6 address as the address prefix.

There are three types of IPv6 addresses: unicast addresses, multicast addresses, and anycast addresses.

**Unicast address:** Used to uniquely identify an interface, similar to the unicast address of IPv4. Data packets sent to a unicast address will be delivered to the interface identified by this address.

**Multicast address:** Used to identify a group of interfaces, similar to the multicast address of IPv4. Data packets sent to a multicast address are delivered to all interfaces identified by this address.

**Anycast address:** Used to identify a group of interfaces. A packet destined for an anycast address will only be delivered to one interface in that group. According to the routing protocol, the interface that receives the packet is the interface closest to the source.

The IPv6 address type is specified by the first few bits of the address, called the format prefix. The correspondence between the main address types and the format prefix is shown in Table 5-2.

Table 43-2 Correspondence between IPv6 address types and format prefixes

Address Type		Format prefix (binary)	Prefix identifier
Unicast address	Unallocated address	00...0 (128 bits)	::/128
	Loopback address	00...1 (128 bits)	::1/128
	Link-local address	1111111010	FE80::/10
	Site-local address	1111111011	FEC0::/10
	Global unicast address	Other forms	-
Multicast address		11111111	FF00::/8
Anycast address		Allocate from the unicast address space, using the unicast address format.	

There can be various types of IPv6 unicast addresses, including global unicast addresses, link-local addresses, and site-local addresses.

Global unicast addresses are equivalent to IPv4 public network addresses and are provided to network service providers. This type of address allows aggregation of routing prefixes, thus limiting the number of global routing table entries.

The link-local address is used for communication between nodes on the link-local in the Neighbor Discovery Protocol and Stateless Auto-configuration. Data packets that use link-local addresses as source or destination addresses are not forwarded to other links.

The site-local address is similar to the private address in IPv4. Data packets that use the site-local address as the source or destination address are not forwarded to other sites outside this site.

Loopback address: The unicast address 0:0:0:0:0:0:1 (simplified as ::1) is called a loopback address and cannot be allocated to any physical interface. It serves the same purpose as the loopback address in IPv4, which is used by the node to send IPv6 packets to itself.

Unallocated address: The address ":::" is called an unallocated address and cannot be allocated to any node. Until a node obtains a valid IPv6 address, it can fill in the source address field of a sent IPv6 packet, but it cannot be used as the destination address in an IPv6 packet.

The special-purpose multicast addresses reserved for IPv6 are shown in Table 5-3.

Table 43-3 List of IPv6 Special Purpose Multicast Addresses

Address	Use
FF01::1	Indicates the multicast address of all nodes in the local range of the node.
FF02::1	Indicates the multicast address of all nodes in the local range of the link.
FF01::2	Indicates the multicast address of all routers in the local range of the node.
FF02::2	Indicates the multicast address of all routers in the local range of the link.
FF05::2	Indicates the multicast address of all routers in the local range of the site.

**Configuration Condition**

None

**Configure IPv6 addresses for the ports.**

Table 43-4 Configuring Interface IPv6 Addresses

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure IPv6 addresses for the ports.	<b>ipv6 address</b> { <i>linklocal-address link-local</i>   <i>prefix-address [ anycast   eui-64 ]</i>   <b>autoconfig</b> }	Mandatory By default, the interface is not configured with IPv6 address.

 **Note**

- The interface can be configured with multiple IPv6 addresses.

- After the interface is configured with an IPv6 address, the IPv6 function is automatically enabled.

### 43.2.2 Configure the basic functions of IPv6.

#### Configuration Condition

None

#### Enable IPv6 unicast forwarding function.

By default, the IPv6 unicast forwarding function is enabled. In some specific cases, users can turn off the IPv6 unicast forwarding feature, and when the feature is turned off, no IPv6 packets are forwarded.

Table 43-5 Enabling IPv6 Unicast Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable IPv6 unicast forwarding function.	<b>ipv6 unicast-routing</b>	Mandatory By default, the IPv6 unicast forwarding function is enabled.

#### Enable interface IPv6 function.

Before making IPv6-related configurations on the interface, you must enable the IPv6 function first, otherwise it may cause some configurations fail to take effect.

Table 43-6 Enabling Interface IPv6 Functions

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	-

Enable interface IPv6 function.	<b>ipv6 enable</b>	Mandatory By default, the interface IPv6 function is disabled.
---------------------------------	--------------------	---

### Configure IPv6 packet hop limit value.

The IPv6 packet header contains the Hop Limit field, which serves the same purpose as the TTL field in the IPv4 header, indicating the number of times the packet can be forwarded by the router in the network.

The value of the hop limit in the header of IPv6 packet generated by the device can be configured by a command.

Table 43-7 Configuring IPv6 Packet Hop Limit Value

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv6 packet hop limit value.	<b>ipv6 hop-limit <i>value</i></b>	Mandatory By default, the number of hops a device can send IPv6 packets is limited to 64.

### Configure IPv6 MTU for the interface.

Table 8-9 Configuring IPv6 MTU for an Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	-
Configure IPv6 MTU for the interface.	<b>ipv6 mtu <i>value</i></b>	Mandatory By default, the IPv6 MTU of an interface is not configured.

---

### 43.2.3 Configure IPv6 Neighbor Discovery Protocol.

The IPv6 Neighbor Discovery (ND: Neighbor Discovery) protocol includes the following functions: address resolution, neighbor un-reachability detection, duplicate address detection, router discovery/prefix discovery, address auto-configuration, and redirection.

The types of ICMPv6 packet used by the ND protocol and their functions are shown in Table 5-9 below.

Table 43-10 ICMPv6 Packet Types Used by ND Protocol and Their Functions

Types of ICMPv6 Packets	Type No.	effect
Router Solicitation packet (RS)	133	After the node starts, it sends a request to the router via RS packet to request the prefix and other configuration information for the automatic configuration of the node.
Router Advertisement packet (RA)	134	Responding to a RS packet Under the condition that RA packets are not suppressed, the router periodically sends RA packets, which include prefix information options and flag bits information.
Neighbor Solicitation packet (NS)	135	Obtain the link layer address of a neighbor. Verify if the neighbor is reachable. Perform duplicate address detection.
Neighbor Advertisement packet (NA)	136	Respond to NS packets. The node actively sends out NA packets when the link layer changes to notify neighbor nodes of the changes in this node.
Redirect packets (Redirect).	137	When certain conditions are met, the default gateway redirects the host to reselect the correct next-hop address for subsequent packets by sending a redirect packet to the source host.

#### Address resolution

Obtain the link layer address of neighboring nodes on the same link, which is achieved by NS packets and NA packets.

### **Neighbor Un-reachability Detection**

After obtaining the link layer address of the neighbor node, the NS packets and NA packets can be used to verify the reachability of the neighbor node.

- 1) The node sends an NS packet, where the destination address is the IPv6 address of a neighbor node.
- 2) If an acknowledgment packet is received from a neighbor node, the neighbor is considered reachable; otherwise, the neighbor is considered unreachable.

### **Duplicate Address Detection**

When a node acquires an IPv6 address, it needs to use the duplicate address detection function to determine whether the address is already in use by another node.

### **Router Discovery/Prefix Discovery and Address Auto-Configuration**

Router discovery/prefix discovery means that the node obtains the prefixes of neighbor routers and their networks, as well as other configuration parameters, from the RA packets it receives.

Address stateless auto-configuration means that the node automatically configures IPv6 addresses based on the information obtained by router discovery/prefix discovery.

Router discovery/prefix discovery is achieved through RS packets and RA packets.

### **Redirection**

When a host starts up, it may have only one default route to the default gateway in its routing table. When certain conditions are met, the default gateway sends an ICMPv6 redirect packet to the source host, notifying the host to choose a better next-hop for subsequent packets.

### **Configuration Condition**

None

### **Configure IPv6 Static Neighbors.**

Resolving the IPv6 addresses of neighbor nodes to link layer addresses can be achieved either through the address resolution function in the IPv6 ND protocol or by manually configuring static neighbors.

An IPv6 neighbor is uniquely identified by the IPv6 address of the neighbor node and the L3 interface connected to this neighbor node.

Table 43-11 Configuring IPv6 Static Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv6 Static Neighbors.	<b>ipv6 neighbor</b> <i>ipv6-address interface-name mac-address</i>	Mandatory By default, no IPv6 static neighbor is configured.

**Configure the Aging Time of IPv6 Neighbor Table Entries in STALE State**

IPv6 neighbor table entries have five reachability states: INCOMPLETE, REACHABLE, STALE, DELAY and PROBE, where the STALE state indicates that it does not know whether the neighbor is reachable or not. The neighbor table entries in the STALE state have an aging time, which will migrate to the DELAY state when reach their aging time.

Table 43-12 Configuring the Aging Time of IPv6 Neighbor Table Entries in STALE State

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the Aging Time of IPv6 Neighbor Table Entries in STALE State	<b>ipv6 neighbor stale-aging</b> <i>aging-time</i>	Optional By default, the aging time of IPv6 neighbor table entry in STALE state is 7200 seconds.

**Configure the retransmission interval of NS packets.**

After the device sends an NS packet, if it does not receive a response within the specified time interval, it will resend the NS packet. The following command allows you to configure the time interval for NS packets retransmission.

Table 43-13 Configuring Time Interval for NS Packets Retransmission

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure time interval for NS packets retransmission.	<b>ipv6 nd ns-interval</b> <i>value</i>	Mandatory  By default, the interface sends NS packets at an interval of 1000 milliseconds.

### Configure the Attempts to Send an NS Packet during the IPv6 Duplicate Address Detection

After the interface is configured with an IPv6 address, it sends a NS packet to request duplicate address detection. If no response is received within a certain period of time, it will keep sending NS packets. When the number of NS packets sent reaches the set value and no response is received, the address is considered available.

Table 43-14 Configuring the Attempts to Send an NS Packet during the IPv6 Duplicate Address Detection

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the Attempts to Send an NS Packet during the IPv6 Duplicate Address Detection	<b>ipv6 nd dad attempts</b> <i>value</i>	Mandatory  By default, the number of attempts to send an NS packet during the IPv6 duplicate address detection is 1.

### Configure the relevant parameters of RA packets.

Users can configure whether the interface sends RA packets and the time interval for sending RA packets according to the actual situation, and can also configure the relevant parameters in RA packets to notify the host. When the host receives the RA packet, it can use these parameters to operate accordingly.

Table 43-15 Parameters and Descriptions in RA Packets

Parameter	Description
Hop Limit	The host will use the value of this parameter to fill the Hop Limit field in the IPv6 packet header when sending an IPv6 packet. The value of this parameter is also used as the value of the Hop Limit field in the response packet.
MTU	Distributing the link MTU can be used to ensure that all nodes on the same link share the same MTU value.
Router Lifetime	It is used to set the time duration during which the router sending RA packets acts as the default router for the host. Based on the value of the router lifetime parameter in the received RA packet, the host can determine whether to use the router that sent the RA packet as the default router.
Neighbor Reachable Time	When the neighbor reachability is confirmed by neighbor unreachability detection, the device considers the neighbor reachable within the set reachability time. If the device needs to send packets to the neighbor after the set time, it will reconfirm whether the neighbor is reachable.

Table 43-16 Relevant Parameters of RA Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure prefix option information in RA packets.	<b>ipv6 nd prefix</b> { <i>ipv6-prefix</i>   <b>default</b> } [ <i>valid-lifetime</i>   <b>infinite</b>   <b>no-advertise</b>   <b>no-autoconfig</b>   <b>off-link</b> ] [ <i>prefered-lifetime</i>   <b>infinite</b> ]	Mandatory By default, no prefix option information is configured.
Configure the value of the Hop Limit field in the RA packets sent by the interface to be obtained	<b>ipv6 nd ra hop-limit</b>	Optional By default, the value of the Hop Limit field in the RA packets sent by un-

from the global configuration.		configured interfaces is obtained globally, and the value of the Hop Limit field is 0.
Configure the maximum time interval and minimum time interval for sending RA packets.	<b>ipv6 nd ra interval</b> <i>max-value [ min-value ]</i>	Optional By default, the maximum time interval for sending RA packets is 600 seconds and the minimum time interval is 198 seconds.
Configure to enable RA packets to carry the MTU option.	<b>ipv6 nd ra mtu</b>	Optional By default, the RA packets do not carry the MTU option.
Configure router lifetime in the RA packets.	<b>ipv6 nd ra-lifetime</b> <i>value</i>	Optional By default, router lifetime in the RA packets is 1800 seconds.
Forbid the interface from sending RA packets periodically.	<b>ipv6 nd suppress-ra period</b>	Optional By default, RA packets are not sent periodically on the interface.
Forbid the interface from responding to RS packets.	<b>ipv6 nd suppress-ra response</b>	Optional By default, the interface receives RS packets and does not respond to RA packets.

#### Enables the interface to send redirected packets.

After receiving an IPv6 packet that needs forwarding, the device discovers through routing that the receiving interface of the packet is the same as the sending interface, then the device forwards the packet and sends a redirect packet back to the source, notifying the source to re-select the correct next-hop for subsequent packet delivery. By default, the device is able to send redirect packets, but in some specific cases, users can disable the device from sending redirect packets.

Table 43-17 Enable Interface to Send Redirect Packet

Step	Command	Description
------	---------	-------------

Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enables the interface to send redirected packets.	<b>ipv6 redirects</b>	Optional By default, the interface is enabled to send redirected packets.

#### 43.2.4 Configure to enable the ND fast response function.

##### Configuration Condition

None

##### Configure to Enable the ND Fast Response Function

Table 43-18 Configuring to Enable the ND Fast Response Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure to enable the ND fast response function.	<b>nd fast-response</b>	Mandatory By default, the global ND fast response function is enabled.

#### 43.2.5 Configure L3 Interface ND Proxy.

##### Configuration Condition

None

##### Configure L3 Interface ND Proxy.

Table 43-19 Configuring the L3 ND Proxy Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter L3 interface configuration mode.	<b>interface</b> <i>interface-name</i>	Mandatory After entering the L3 interface configuration mode, subsequent configurations only take effect on the current interface.
Configure L3 interface ND proxy function.	<b>nd proxy enable</b>	Mandatory By default, the proxy function is not enabled on the interface.

### 43.2.6 Configure ICMPv6 functions.

In the IPv6 protocol stack, Internet Control Message Protocol (ICMP) is mainly used to provide network detection services. It also provides an error report if the network layer or transmission layer protocol becomes abnormal, and it informs the related device of the abnormality to facilitate network control management.

#### Configuration Condition

None

#### Configure ICMPv6 error packets transmitting rate.

If an excessive number of ICMPv6 error packets are sent in a short period of time in the network, it may lead to network congestion. To avoid this, users can configure the maximum number of ICMPv6 error packets to be sent within a specified time.

Table 43-20 ICMPv6 Error Packets Transmitting Rate

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure ICMPv6 packets transmitting rate.	<b>ipv6 icmp error-interval</b> <i>interval [ buckets ]</i>	Optional By default, the period for calculating the transmitting rate of ICMPv6 error packets is 100 milliseconds,

		and the maximum number of ICMPv6 error packets sent in the period is 10.
--	--	--

### Enable transmission of ICMPv6 destination unreachable packets.

The ICMPv6 destination unreachable packet sending function allows to discard the IPv6 data packet and send an ICMPv6 destination unreachable error packet to the source if the destination is unreachable after the device receives the IPv6 data packet.

A device sends an ICMPv6 destination unreachable error packet when the following conditions are met:

When forwarding a packet, the device sends a "no route to destination" ICMPv6 error packet to the source if it fails to find a route.

When the device forwards a packet, if the packet cannot be sent because of an administrative policy (e.g., firewall, ACL, etc.), it sends an ICMPv6 error packet that says "Communication with the destination address is prohibited by the administrative policy" to the source.

When the device forwards a packet, if the destination IPv6 address of the packet is out of the range of the source IPv6 address (for example, the source IPv6 address of the packet is a link-local address and the destination IPv6 address of the packet is a global unicast address), the packet will not reach the destination, and an "out of range" ICMPv6 error packet will be sent to the source.

If the device cannot resolve the link layer address corresponding to the destination IPv6 address when forwarding the packet, it sends an "address unreachable" ICMPv6 error packet to the source.

When the device receives an IPv6 packet with a local destination address and UDP transport layer protocol, if the destination port number of the packet does not match the process in use, it sends a "port unreachable" ICMPv6 error packet to the source.

Since the information delivered to the user process by the ICMPv6 destination unreachable error packet is unreachable, it may affect the normal use of the end user if there is a malicious attack. To avoid the above situation, users can disable the ICMPv6 destination unreachable error packet sending function of the device.

Table 43-21 Enable Transmission of ICMPv6 Destination Unreachable Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enable transmission of ICMPv6 destination unreachable packets.	<b>ipv6 unreachable</b>	Optional  By default, the function of sending ICMPv6 destination unreachable packet is enabled.
--	-------------------------	---

### 43.2.7 Configure TCP anti-attack function for IPv6.

The IPv6 TCP server receives a large number of SYN packets but the peer end does not respond to the SYN-ACK response from the server. This can cause the server's memory to be consumed heavily, taking up the server's syn queue and causing the IPv6 TCP server unable to service normal requests. Such attacks can be avoided by configuring IPv6 TCP anti-attack function.

#### Configuration Condition

None

#### Enable the IPv6 TCP Syncache Function

This function does not rush to allocate the TCB when a SYN data packet is received, but first responds with a SYN+ACK packet and stores this half-open connection information in a dedicated cache until a correct response ACK packet is received before allocating the TCB.

Table 43-22 Enable the IPv6 TCP Syncache Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the IPv6 TCP Syncache Function	<b>ipv6 tcp syncache</b>	Mandatory  By default, the IPv6 TCP syncache function is disabled.

#### Enable the IPv6 TCP Syncookies Function

This function does not use any storage resources at all, it uses a special algorithm to generate Sequence Number. The algorithm takes into account fixed information including the other party's IPv6, port, its own IPv6 and port, and other fixed information of its own, such as MSS, time, etc. After receiving the other party's ACK packet, the algorithm will recalculate it to see if it is the same as the other party's response packet (Sequence Number-1), so as to decide whether to allocate TCB resources.

Table 43-23 Enable the IPv6 TCP Syncookies Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the IPv6 TCP Syncookies Function	<b>ipv6 tcp syncookies</b>	Mandatory  By default, the IPv6 TCP syncookies function is disabled.

### 43.2.8 IPv6 Basic Monitoring and Maintaining

Table 43-24 IPv6 Basic Monitoring and Maintaining

Command	Description
<b>clear nd fast-response statistics</b>	The command is used to clear the ND fast response statistics.
<b>clear ipv6 icmp6stat</b>	Clears the ICMPv6 statistics.
<b>clear ipv6 interface statistics</b>	Clears the interface IPv6 packet statistics.
<b>clear ipv6 mtu</b>	Clears the IPv6 path MTU information.
<b>clear ipv6 neighbors</b>	Clears the IPv6 dynamic neighbor table entries.
<b>clear ipv6 statistics</b>	Clears the IPv6 basic statistics.
<b>clear ipv6 tcp syncache statistics</b>	Clears the IPv6 TCP protocol syncache statistics.
<b>clear ipv6 tcp6stat</b>	Clears the IPv6 TCP statistics.
<b>clear ipv6 udp6stat</b>	Clears the IPv6 UDP statistics.
<b>show nd fast-response statistics</b>	The command is used to display the ND fast response statistics.
<b>show ipv6 hop-limit</b>	Displaying the IPv6 global Hop Limit values.

Command	Description
<b>show ipv6 frag-queue</b>	Displaying the cached IPv6 fragment packets.
<b>show ipv6 icmp6state</b>	Displaying the ICMPv6 statistics.
<b>show ipv6 interface</b>	Displaying the interface IPv6 information.
<b>show ipv6 interface statistics</b>	Displaying the interface IPv6 statistics.
<b>show ipv6 max-mtu</b>	Displaying the maximum value of IPv6 MTU currently supported by the system.
<b>show ipv6 mtu</b>	Displaying the IPv6 path MTU information.
<b>show ipv6 neighbors</b>	Displaying the IPv6 neighbor information.
<b>show ipv6 prefix</b>	Displaying the IPv6 address prefix information.
<b>show ipv6 sockets</b>	Displaying the IPv6 socket information.
<b>show ipv6 statistics</b>	Displaying the basic IPv6 statistics.
<b>show ipv6 tcp syncache detail</b>	Displaying the IPv6 TCP protocol syncache table entry information.
<b>show ipv6 tcp syncache statistics</b>	Displaying the IPv6 TCP protocol syncache statistics.
<b>show ipv6 tcp6state</b>	Displaying the IPv6 TCP statistics.
<b>show ipv6 udp6state</b>	Displaying the IPv6 UDP statistics.

## 43.3 Basic Configuration Example of IPv6

### 43.3.1 Configure the IPv6 Address of an Interface

#### Network Requirements

- The two devices are connected via Ethernet interfaces, and the interfaces are configured with IPv6 global unicast addresses to verify Interoperability between them.

#### Network Topology

Figure 43-1 Network Topology for Configuring the IPv6 Address of an Interface

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Enable the IPv6 forwarding function of the device.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 unicast-routing
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 unicast-routing
```

Step 3: Configure the global unicast address of the interface.

#### #Configure the global unicast address of Device1 interface vlan 2 as 2001:1::1/64.

```
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 address 2001:1::1/64
Device1(config-if-vlan2)#exit
```

#### #Configure the global unicast address of Device2 interface vlan 2 as 2001:1::2/64.

```
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 address 2001:1::2/64
Device2(config-if-vlan2)#exit
```

Step 4: Check the result.

#### #Check the interface details of Device1.

```
Device1#show ipv6 interface vlan 2
vlan2 is up
VRF: global
IPv6 is enable, link-local address is fe80::201:7aff:fe46:a64d
Global unicast address(es):
  2001:1::1, subnet is 2001:1::/64
Joined group address(es):
  ff02::1:ff00:1
  ff02::1:ff00:0
  ff02::2
  ff02::1
  ff02::1:ff46:a64d
ND control flags: 0x1
MTU is 1500 bytes
ICMP redirects are enabled
ICMP unreachable are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 (unspecified)
ND advertised retransmit interval is 0 (unspecified)
ND MaxRtrAdvInterval is 600
ND MinRtrAdvInterval is 198
ND AdvDefaultLifetime is 1800
```

After the IPv6 address is configured, the IPv6 protocol function is automatically enabled on the interface, and the link-local address is automatically generated and added to the corresponding multicast group.

#### #Check the interface details of Device2.

```
Device2#show ipv6 interface vlan 2
vlan2 is up
VRF: global
IPv6 is enable, link-local address is fe80::201:7aff:fe22:e222
Global unicast address(es):
  2001:1::2, subnet is 2001:1::/64
Joined group address(es):
  ff02::1:ff00:2
  ff02::1:ff00:0
  ff02::2
  ff02::1
  ff02::1:ff22:e222
ND control flags: 0x1
MTU is 1500 bytes
ICMP redirects are enabled
ICMP unreachable are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 (unspecified)
ND advertised retransmit interval is 0 (unspecified)
ND MaxRtrAdvInterval is 600
ND MinRtrAdvInterval is 198
ND AdvDefaultLifetime is 1800
```

#### #On Device1, Ping the link-local address fe80::0201:7aff:fe22:e222 of Device2.

```
Device1#ping fe80::0201:7aff:fe22:e222

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to fe80::201:7aff:fe22:e222 , timeout is 2 seconds:

Output Interface: vlan 2
!!!!
Success rate is 100% (5/5). Round-trip min/avg/max = 0/96/483 ms.
```

---

### Note

- When pinging the link-local address, you need to specify the output interface, which is an interface on the same link as the pinged link-local address.
- 

#### #On Device1, Ping the global unicast address 2001:1::2 of Device2.

```
Device1#ping 2001:1::2

Press key (ctrl + shift + 6) interrupt it.
Sending 5, 76-byte ICMP Echos to 2001:1::2 , timeout is 2 seconds:
!!!!
Success rate is 100% (5/5). Round-trip min/avg/max = 0/36/183 ms.
```

Device1 and Device2 can communicate with each other.

---

## 43.3.2 Configuring IPv6 Neighbor Discovery

### Network Requirements

- Device and the PC belong to the same LAN.
- Interface VLAN2 of Device is configured with EUI-64 address.
- The PC obtains an IPv6 address prefix through the IPv6 neighbor discovery protocol and automatically configures an IPv6 address based on the obtained address prefix. Implement IPv6 protocol communication between the PC and Device.

### Network Topology

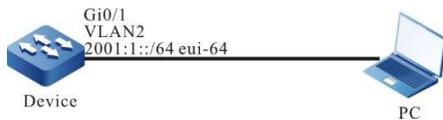

Figure 43-2 Network Topology for Configuring IPv6 Neighbor Discovery

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Enable the IPv6 forwarding function of the device.

```
Device#configure terminal
Device(config)#ipv6 unicast-routing
```

Step 3: Configure EUI-64 unicast address and enable RA advertisement function.

#Device's vlan2 is configured with EUI-64 address to enable the RA advertisement function of vlan2.

```
Device(config)#interface vlan 2
Device(config-if-vlan 2)#ipv6 address 2001:1::/64 eui-64
Device(config-if-vlan 2)#no ipv6 nd suppress-ra period
Device(config-if-vlan 2)#no ipv6 nd suppress-ra response
Device(config-if-vlan 2)#exit
```

---

### Note

- By default, the RA advertisement function is disabled.
- 

#Check the interface details of Device.

```
Device#show ipv6 interface vlan 2
vlan2 is up
VRF: global
IPv6 is enable, link-local address is fe80::201:7aff:fe5d:e7d3
```

```

Global unicast address(es):
  2001:1::201:7aff:fe5d:e7d3, subnet is 2001:1::/64 [EUI]
Joined group address(es):
  ff02::1:ff00:0
  ff02::2
  ff02::1
  ff02::1:ff5d:e7d3
ND control flags: 0x85
MTU is 1500 bytes
ICMP redirects are enabled
ICMP unreachables are enabled
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds
ND advertised reachable time is 0 (unspecified)
ND advertised retransmit interval is 0 (unspecified)
ND MaxRtrAdvInterval is 600
ND MinRtrAdvInterval is 198
ND AdvDefaultLifetime is 1800

```

#### Step 4: Configure the PC.

#IPv6 protocol is installed on the PC. The configuration of IPv6 varies by operating system, and the Windows XP is used here as an example.

```

C:\>ipv6 install
Installing...
Succeeded.

```

#### Step 5: Check the result.

#Check the interface details of PC.

```

C:\>ipconfig
..... (omitted)
Ethernet adapter 130:

    Connection-specific DNS Suffix  . :
    IP Address. . . . . : 130.255.128.100
    Subnet Mask . . . . . : 255.255.0.0
    IP Address. . . . . : 2001:1::15b3:d4:f13d:c3da
    IP Address. . . . . : 2001:1::3a83:45ff:feef:c724
    IP Address. . . . . : fe80::3a83:45ff:feef:c724%6
    Default Gateway . . . . . : fe80::201:7aff:fe5e:cfc1%6

```

It can be seen that after the PC obtains the IPv6 address prefix 2001:1::/64, and the global unicast address is automatically generated according to this prefix.

---

### Note

- The Windows XP host obtains the address prefix and generates two global unicast addresses, one of which has an interface ID generated based on the MAC address of the interface, and the other has a randomly generated interface ID.
- 

#On Device, ping the link-local address fe80::3a83:45ff:feef:c724 of the PC.

```
Device#ping fe80::3a83:45ff:feef:c724
```

Press key (ctrl + shift + 6) interrupt it.

---

Sending 5, 76-byte ICMP Echos to fe80::3a83:45ff:feef:c724 , timeout is 2 seconds:

Output Interface: vlan2  
!!!!  
Success rate is 100% (5/5). Round-trip min/avg/max = 0/29/149 ms.

#On Device, ping the global unicast address 2001:1::15b3:d4:f13d:c3da and 2001:1::3a83:45ff:feef:c724 automatically generated on the PC.

Device#ping 2001:1::15b3:d4:f13d:c3da  
  
Press key (ctrl + shift + 6) interrupt it.  
Sending 5, 76-byte ICMP Echos to 2001:1::15b3:d4:f13d:c3da , timeout is 2 seconds:  
!!!!  
Success rate is 100% (5/5). Round-trip min/avg/max = 0/36/183 ms.

Device#ping 2001:1::3a83:45ff:feef:c724  
  
Press key (ctrl + shift + 6) interrupt it.  
Sending 5, 76-byte ICMP Echos to 2001:1::3a83:45ff:feef:c724 , timeout is 2 seconds:  
!!!!  
Success rate is 100% (5/5). Round-trip min/avg/max = 0/26/133 ms.

The PC and Device can communicate with each other.

---

## Note

- When pinging the link-local address, you need to specify the output interface, which is an interface on the same link as the pinged link-local address.
- 

### 43.3.3 Configure L3 ND Proxy

#### Network Requirements

- Device is directly connected to PC1 and PC2 respectively. The network prefixes where PC1 and PC2 are located are the same, both are 2001:1:1::/48.
- The interface VLAN2 of Device has a MAC address of 0001.7a6a.01f0.
- Through the L3 ND proxy of Device, PC1 is able to ping through to PC2, and PC1 can learn PC2's MAC address.

#### Network Topology

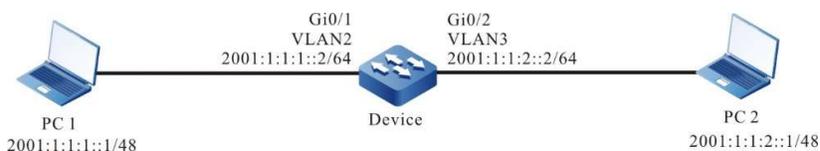

Figure 43-3 Network Topology for Configuring L3 ND Proxy

#### Configuration Steps

Step 1: Configure Virtual Local Area Networks (VLANs), and add ports to the required VLANs.  
(Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure L3 ND Proxy.

#Enable L3 ND proxy under the L3 interface VLAN2 of Device.

```
Device(config)#interface vlan 2
Device(config-if-vlan2)#nd proxy enable
Device(config-if-vlan2)#exit
```

#Enable L3 ND proxy under the L3 interface VLAN3 of Device.

```
Device(config)#interface vlan 3
Device(config-if-vlan3)#nd proxy enable
Device(config-if-vlan3)#exit
```

Step 4: Check the results.

#PC1 ping PC2 with the address 2001:1:1:2::1.

```
C:\Documents and Settings>ping 2001:1:1:2::1
```

```
Pinging 2001:1:1:2::1 with 32 bytes of data:
Reply from 2001:1:1:2::1: bytes=32 time=9971ms TTL=255
Reply from 2001:1:1:2::1: bytes=32 time<1ms TTL=255
Reply from 2001:1:1:2::1: bytes=32 time<1ms TTL=255
Reply from 2001:1:1:2::1: bytes=32 time<1ms TTL=255
Ping statistics for 2001:1:1:2::1
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 997ms, Average = 249ms
```

#Check the neighbor table entries of Device.

```
Device#sh ipv6 neighbors
IPv6 Address      Age Link-layer Addr  flags  State Interface
2001:1:1:1::1    0  00e0.4c6b.f753  405   STALE  vlan2
2001:1:1:2::1    1  0857.00da.4715  405   STALE  vlan3
```

#Check the neighbor table entries of PC1.

```
C:\Documents and Settings>netsh interface ipv6 show neighbors
Internet Address      Physical Address  Type
-----
2001:1:1:1::2        00-01-7a-6a-01-f0 Stale (Router)
2001:1:1:2::1        00-01-7a-6a-01-f0 Stale (Router)
```

#PC1 is able to ping through to PC2, and PC1 learns the neighbor table entry of PC2. The MAC address in the neighbor table entry is the MAC address of VLAN2 0001.7a6a.01f0.

---

---

The device does not have L3 ND proxy enabled by default.

---

# 44 DHCPv6

---

## 44.1 Overview

It is hard to manage a large network. For example, in a network in which IPv6 addresses are manually allocated, IPv6 address conflicts are common. The only way of solving the problem is to dynamically allocate IPv6 addresses to the hosts. The Dynamic Host Configuration Protocol version 6 (DHCPv6) allocates the IPv6 address to requesting hosts from an address pool. DHCPv6 also provides other information, such as DNS server address. DHCPv6 reduces the workload of the administrator in recording and tracking manually allocated IPv6 addresses.

DHCPv6 is a protocol that is based on UDP broadcast. The process for a DHCPv6 client to obtain an IPv6 address and other configuration information from the DHCPv6 server contains four phases.

**SOLICIT phase.** When the DHCPv6 client accesses the network for the first time, it sends a DHCP SOLICIT packet with the source address as the client's linklocal address and the destination address as ff02::1:2.

**ADVERTISE phase.** When the DHCPv6 server receives the DHCP SOLICIT broadcast packet from the client, it will select an IPv6 address from the corresponding address pool according to the policy and send it to the client together with other parameters via the DHCP ADVERTISE packet.

**REQUEST phase.** If the DHCPv6 client receives responses from multiple DHCPv6 servers on the network, it will pick only one of them, i.e. DHCP ADVERTISE, (usually the first one to arrive), and will send a DHCP REQUEST packet to the network, telling all DHCPv6 servers which server it will accept the IPv6 address from.

In the **REPLY phase**, when the DHCPv6 server receives a DHCP REQUEST packet from a DHCPv6 client, it sends a DHCP REPLY acknowledgment packet to the DHCPv6 client containing its provided IPv6 address and other configurations, telling the DHCPv6 client that it can use the IPv6 address it provided.

The IPv6 addresses allocated by DHCPv6 server to DHCPv6 clients have a lease, and the DHCPv6 server will take back the allocated IPv6 addresses after it expires. When the IPv6 address lease of a DHCPv6 client is half remaining, the DHCPv6 client sends a DHCP ENEW packet to the DHCPv6 server to renew its IPv6 lease. If the DHCPv6 client can continue to use the IPv6 address, the DHCPv6 server responds to the DHCP REPLY packet to notify the DHCPv6 client to renew the lease; if the DHCPv6 client cannot continue to use the IPv6 address, the DHCPv6 server does not respond.

Since the request packet is sent in multicast mode during the dynamic acquisition of IPv6 address, DHCPv6 is only applicable when the DHCPv6 client and DHCPv6 server are in the same subnet. If there are multiple subnets in a network and the hosts of multiple subnets need to provide IPv6 addresses and other configuration information through DHCPv6 servers, the hosts of these subnets can communicate with DHCPv6 servers through DHCPv6 relay devices to obtain IPv6 addresses and other configuration information.

## 44.2 DHCPv6 Function Configuration

Table 44-1 DHCPv6 Function Configuration List

Configuration Task	
Configure a DHCPv6 address pool	Create a DHCPv6 address pool that allows you to specify VRF attributes.
	Configure the IPv6 address range
	Configure a DNS server address.
	Configure the IPv6 address lease
	Configure to bind IPv6 with DUID and IAID.
Configure other parameters of the DHCPv6 server.	Configure the DHCPv6 Server.
	Configure the ranges of the reserved IPv6 address.
	Configure the DHCPv6 ping probe parameters.
	Configure the data logging function of the DHCPv6 server.
Configure the function of DHCPv6 client	Configure DHCPv6 client
	Configure the function of DHCPv6 Option 16
Configure the function of DHCPv6 relay	Configure DHCPv6 relay.
	Configure the source address of DHCPv6 relay packet.
	Configure DHCPv6 server address

	Configure DHCPv6 interface-id option
--	--------------------------------------

## 44.2.1 Configure a DHCPv6 address pool

### Configuration Condition

None

### Create a DHCPv6 Address Pool

The DHCPv6 server selects and allocates IPv6 addresses and other related parameters for clients from the DHCPv6 address pool, therefore, the DHCPv6 server must first create a DHCPv6 address pool.

Table 44-2 Creating a DHCPv6 Address Pool

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create a DHCPv6 address pool and enter the DHCPv6 configuration mode.	<b>ipv6 dhcp pool <i>pool-name</i> [ vrf <i>vrf-name</i> ]</b>	Mandatory By default, the DHCPv6 address pool is not created by the system.

### Note

- Address pools fall into two types: Network and Range. The two types of address pools can be configured respectively through the network and range commands.

### Configure the IPv6 address range

On the DHCPv6 server, each DHCPv6 address pool should be configured with the corresponding IPv6 address range to allocate IPv6 addresses to DHCPv6 clients.

Table 44-3 Configuring IPv6 Address Ranges

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enter the DHCPv6 configuration mode.	<b>ipv6 dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure the ranges of Network-type IPv6 addresses.	<b>network</b> <i>ipv6-address/prefix-length</i>	Optional By default, the address pool is not configured with an IPv6 address range.
Configure the ranges of Range-type IPv6 addresses.	<b>range</b> <i>low-ipv6-address high-ipv6-address prefix-length</i>	Optional By default, the address pool is not configured with an IPv6 address range.

### Note

- Change the type of the address pool from network to range (or vice versa). If the address range of the new configuration and the address range of the old configuration intersect, the command line will prompt the user whether to perform this operation, if yes, any relevant address configurations (static binding) and dynamic leases under the address pool will be deleted; if the actual effective address range of the new configuration covers the actual effective address range of the old configuration, the address pool will keep all relevant address configurations under the address pool (static binding). However, it will delete the dynamic lease.

### Configure a DNS server address.

On a DHCPv6 server, you can configure the DNS server address respectively for each DHCPv6 address pool. When a DHCPv6 server allocates an IPv6 address for a DHCPv6 client, it also sends the DNS server address to the client.

When the DHCPv6 client starts dynamic domain name resolution, it queries the DNS server.

Table 44-4 Configuring a DNS Server Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCPv6 configuration mode.	<b>ipv6 dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-

Configure a DNS server address.	<b>dns-server</b> { <i>ipv6-address</i> &<1-8> / <b>autoconfig</b> }	Mandatory  By default, the DNS server address is not configured.
---------------------------------	--	--

### Configure the IPv6 address lease

The IPv6 address that the DHCPv6 server allocates to the DHCPv6 client has a lease. After the lease expires, the server will take back the allocated IPv6 address. If the DHCPv6 client wants to continue to use the address, it must have the IPv6 address lease updated.

On the DHCPv6 server, you can configure the IPv6 address lease time for each DHCPv6 address pool separately.

Table 44-5 Configuring Ipv6 Address Lease Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the DHCPv6 configuration mode.	<b>ipv6 dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure the IPv6 address lease	<b>lease preferred-lifetime</b> <i>preferred-lifetime</i> <b>valid-lifetime</b> <i>valid-lifetime</i>	Mandatory  By default, the <b>preferred-lifetime</b> is 604800 seconds (7 days) and the <b>valid-lifetime</b> is 2592000 seconds (30 days).

### Configure to bind IPv6 with DUID and IAID.

Configure to bind IPv6 with the client's DUID and IAID. When the client with specified DUID and IAID requests the DHCPv6 server to allocate IPv6 address, the DHCPv6 server will assign its bound IPv6 address. As long as the DUID and IAID of this client remain unchanged, the IPv6 address the client obtains from the server will remain the same every time.

Table 44-6 Configuring to Bind IPv6 with DUID and IAID

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enter the DHCPv6 configuration mode.	<b>ipv6 dhcp pool</b> <i>pool-name</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure to bind IPv6 with DUID and IAID.	<b>bind</b> <i>ipv6-address</i> <b>duid</b> <i>duid</i> [ <b>iaid</b> { <i>iaid</i>   <b>decimal</b> <i>iaid</i> } ]	Mandatory By default, IPv6 is not configured to bind with DUID and IAID.

### Note

- This command is valid only for Range-type and Network-type address pools.
- When configuring static binding for the same DUID and IAID, the address pool allows binding of five IPv6 addresses.
- The configured static binding specifies only the DUID, and when the IAID is not specified, the address pool allows only one IPv6 address to be bound.

## 44.2.2 Configure other parameters of the DHCPv6 server.

### Configuration Condition

None

### Configure the DHCPv6 Server.

After configuring the interface to work in DHCPv6 server mode, when the interface receives DHCPv6 request packets from DHCPv6 clients, the DHCPv6 server allocates IPv6 addresses and other network parameters for the clients.

Table 44-7 Configuring DHCPv6 Server

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure DHCPv6 server function.	<b>ipv6 dhcp server</b>	Mandatory By default, the DHCPv6 server

		function is not configured.
--	--	-----------------------------

### Configure the ranges of the reserved IPv6 address.

In the DHCPv6 address pool, some IPv6 addresses are reserved for specific devices, and some are in conflict with other host IPv6 addresses on the network. Therefore, these IPv6 addresses cannot be used for dynamic allocation.

Table 44-8 Configuring the Ranges of Reserved IPv6 Addresses

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the ranges of the reserved IPv6 address.	<b>ipv6 dhcp excluded-address</b> <i>low-ipv6-address</i> [ <i>high-ipv6-address</i> ] [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory  By default, the range of the reserved IPv6 address is not configured.  The IPv6 addresses within the reserved IPv6 address ranges do not participate in address allocation.

### Configure DHCPv6 Ping Probe Parameters

To prevent IPv6 address conflict, the DHCPv6 server needs to detect the IPv6 address before dynamically allocating it to the DHCPv6 client. The detection is performed by a ping operation, which determines whether there is an IPv6 address conflict based on the detection of whether an ICMPv6 echo response packet can be received within a specified time.

Table 44-9 Configuring DHCPv6 Ping Probe Parameters

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the DHCPv6 ping probe parameters.	<b>ipv6 dhcp ping</b> { <b>packets</b> <i>packet-num</i>   <b>timeout</b> <i>milliseconds</i> }	Mandatory  By default, the number of ping packets is 1, and the timeout time is 500 ms.

### Configure the Data Logging Function of the DHCPv6 Server

When the data log function of a DHCPv6 server is enabled, the address pool allocation on the DHCPv6 server will be recorded to the data log.

Table 44-10 Configuring DHCPv6 Server Data Logging Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the data logging function switch of DHCPv6 server.	<b>ipv6 dhcp logging security-data</b>	Mandatory By default, the data logging function is not enabled.

### 44.2.3 Configure the function of DHCPv6 client

#### Configuration Condition

None

#### Configure DHCPv6 client

The interface of DHCPv6 client can obtain IPv6 address and other parameters through DHCPv6.

Table 44-11 Configuring DHCPv6 Clients

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	-
Configure DHCPv6 Clients to Obtain IPv6 Addresses.	<b>ipv6 dhcp client address [ rapid-commit ]</b>	Mandatory By default, the DHCPv6 client request for IPv6 address is not configured.
Configure DHCPv6 clients to obtain IPv6 prefixes.	<b>ipv6 dhcp client pd <i>pool-name</i> [ rapid-commit ]</b>	Mandatory By default, the DHCPv6 client request for IPv6 prefix is not configured.

---

## 44.2.4 Configure the function of DHCPv6 relay

### Configuration Condition

None

### Configure DHCPv6 relay.

If there are multiple subnets in a network and the hosts of multiple subnets need to provide IPv6 addresses and other configuration information through DHCPv6 servers, the hosts of these subnets can communicate with DHCPv6 servers through DHCPv6 relay devices to obtain IPv6 addresses and other configuration information. If an interface is configured to work in DHCPv6 relay mode, after the interface receives DHCPv6 packets from a DHCPv6 client, it relays the packet to the specified DHCPv6 server. The DHCPv6 server then allocates an IPv6 address.

Table 44-12 Configuring DHCPv6 Relay

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the function of DHCPv6 relay	<b>ipv6 dhcp relay</b>	Mandatory By default, the DHCPv6 relay function is not configured.

### Configure the source address of DHCPv6 relay packet.

The source address used by DHCPv6 relay when forwarding DHCPv6 client-originated packets to a DHCPv6 server is, by default, the output interface address of the route to the DHCPv6 server. In some environments, the DHCPv6 server cannot communicate with this address, therefore users are allowed to configure the source address of the packets forwarded by the DHCPv6 relay to the DHCPv6 server and the LinkAddr field in the packets via the **ipv6 dhcp relay source-address** command.

Table 44-13 Configuring DHCPv6 Relay Packets Source Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the source address of DHCPv6 relay packet.	<b>ipv6 dhcp relay source-address</b> <i>ipv6-address</i>	Mandatory By default, the DHCPv6 relay packet source address is not configured.

### Configure DHCPv6 server address

After the interface receives DHCPv6 packets from a DHCPv6 client, it relays the packet to the specified DHCPv6 server. The DHCPv6 server then allocates an IPv6 address.

Table 44-14 Configuring DHCPv6 Server Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure DHCPv6 server address	<b>ipv6 dhcp relay server -address</b> <i>ipv6-address</i>	Mandatory By default, the DHCPv6 server address is not configured.

### Configure DHCPv6 interface-id option

This command is used to configure the interface-id option fill mode supported by DHCPv6 relay.

Table 44-15 Configuring DHCPv6 Server Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure DHCPv6 interface-id option	<b>ipv6 dhcp relay interface -id [ interface   user-define</b> <i>defined-string</i> <b>]</b>	Mandatory By default, the interface-id option fill mode is not configured.

---

## Configure DHCPv6 Remote-id Option

This command is used to configure the fill mode of the remote-id option supported by DHCPv6 relay.

Table 44-16 Configuring DHCPv6 Server Address

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure DHCPv6 Remote-id Option	<b>ipv6 dhcp relay remote-id user-define</b> <i>defined-string</i>	Mandatory By default, the fill mode of the remote-id option is not configured.

## 44.2.5 DHCPv6 Monitoring and Maintaining

Table 44-17 DHCPv6 Monitoring and Maintaining

Command	Description
<b>clear ipv6 dhcp pool</b> <i>pool-name</i> { <b>lease</b>   <b>conflict</b> [ <i>ipv6-address</i> ] }	Clears dynamic lease information from the address pool or address information with conflicting addresses.
<b>clear ipv6 dhcp server interface</b> [ <i>interface-name</i> ] <b>statistics</b>	Clears the key statistics when the DHCPv6 server interacts with clients or relays for packets.
<b>clear ipv6 dhcp relay statistics</b>	Clear the statistics on the DHCPv6 relay device.
<b>show ipv6 dhcp server interface</b> <i>interface-name</i> [ <b>statistics</b> ]	Displaying the address pool information associated with the specified interface or display the key statistics when the DHCPv6 server engages in packet interactions with clients or relays under the specified interface.
<b>show ipv6 dhcp pool</b> <i>pool-name</i> { <b>summary</b>   <b>ping_list</b>   <b>offer_list</b>	Displaying the summary information of the specified address pool or the information of

<b>excluded_list   conflict_list   lease   binding }</b>	the address that is doing ping check or the address that has sent the OFFER packet and is waiting for the DHCPv6 client to respond to the REQUEST packet or the information of the excluded address in the address pool or the information of the address that has address conflict in the address pool or the information of dynamic lease in the address pool or the information of static binding in the address pool.
<b>show ipv6 dhcp pool <i>pool-name</i> specific { ipv6-address <i>ipv6-address</i>   duid <i>duid</i> }</b>	Displaying information about the specified ip address or client DUID in the address pool.
<b>show ipv6 dhcp relay [interface <i>interface-name</i> ]</b>	Displaying the packet statistics on the DHCPv6 relay device.

## 44.3 Typical Configuration Example of DHCPv6

### 44.3.1 Configure the DHCPv6 server to statically allocate IPv6 addresses.

#### Network Requirements

- Device2 acts as the DHCPv6 server and statically allocates the IPv6 address and DNS server IPv6 address to the client.
- The DHCPv6 server allocates IPv6 address to PC1 with DUID binding and PC2 with DUID+IAID binding.

#### Network Topology

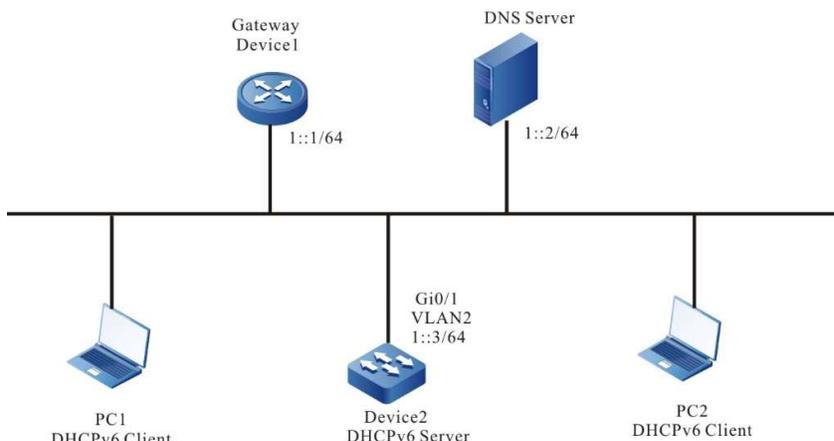

Figure 44-1 Network Topology for Configuring DHCPv6 Server to Statically Allocate IPv6 Addresses

### Configuration Steps

Step 1: Configure the IPv6 address for the Device2 interface and the DHCPv6 server.

```
Device2#configure terminal
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 address 1::3/64
Device2(config-if-vlan2)#ipv6 dhcp server
Device2(config-if-vlan2)#exit
```

Step 2: Configure statically bound address pools and parameters.

#Configure address pool binding and uses static DUID binding to allocate IPv6 address to PC1. Use static DUID+IAID binding to allocate IPv6 address to PC2.

```
Device2(config)#ipv6 dhcp pool binding
Device2(dhcp6-config)#bind 1::11 duid 000200001613303030313761636635646634
Device2(dhcp6-config)#bind 1::12 duid 000200001613636364383166313037616239 iaid 00010071
Device2(dhcp6-config)#dns-server 1::2
Device2(dhcp6-config)#exit
```

Step 3: Check the result.

#Check the association of the server interfaces and the addresses.

```
Device2#show ipv6 dhcp server interface vlan2
DHCPv6 server status information:
DHCP server is enabled on interface: vlan2
Vrf : global
```

```
DHCPv6 server pool information:
Available directly-connected pool:
  Interface IP: 1::1/64
  Pool name: binding
  Range:
    min: 101::
    max: 101::ffff:ffff:ffff:ffff
  utilization: 0.00%
```

#Check the static binding of the server.

```
Device2#show ipv6 dhcp pool binding binding
IPv6 Address      Duid              Iaid  Type  Time Left(s)
-----
1::11  000200001613303030313761636635646634  00000000  Binding  NA
1::12  000200001613636364383166313037616239  00010071  Binding  NA
```

#Check the IPv6 addresses allocated to PC1 and PC2 on Device2 with the show ipv6 dhcp pool binding lease command.

```
Device2#show ipv6 dhcp pool mac-binding lease
IPv6 Address      Duid              Iaid  Type  Time Left(s)
-----
1::11  000200001613303030313761636635646634  00000000  Lease  2591974
1::12  000200001613636364383166313037616239  00010071  Lease  2591974
```

Check on PC1 and PC2 that the obtained IPv6 address, and the DNS server IPv6 address is correct.

### 44.3.2 Configure DHCPv6 server to dynamically allocate IPv6 addresses.

#### Network Requirements

- The two interfaces vlan2 and vlan3 of Device are configured with IPv6 addresses 1::3/64 and 2::3/64 respectively.
- The DHCPv6 server Device dynamically allocates IPv6 addresses to the 1::/64 and 2::/64 network segments for clients within each of the two directly connected physical networks.
- Addresses within network segment 1::/64 are leased for 1 day with a DNS server address of 2::4; addresses within network segment 2::/64 are leased for 3 days with a gateway address of 2::3 and a DNS server address of 2::4.
- The first 10 IPv6 addresses in network segment 1::/64 and network segment 2::/64 are reserved and cannot be allocated.

#### Network Topology

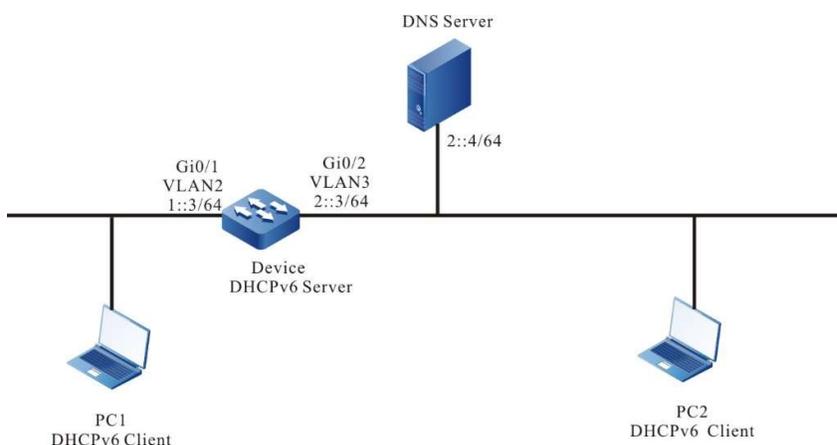

Figure 44-2 Network Topology for Configuring DHCPv6 to Dynamically Allocate IPv6 Addresses

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. Configure IPv6 addresses for the ports. (Omitted)
- Step 2: On the DHCPv6 server Device1, configure two dynamic address pools and their parameters.

#Configure the DHCPv6 server.

```
Device(config)#interface vlan2
Device(config-if-vlan2)#ipv6 dhcp server
Device(config-if-vlan2)#exit
Device(config)#interface vlan3
Device(config-if-vlan3)#ipv6 dhcp server
Device(config-if-vlan3)#exit
```

---

#Configure the first 10 IPv6 addresses in the two address pools to be reserved.

```
Device(config)#ipv6 dhcp excluded-address 1::0 1::9
Device(config)#ipv6 dhcp excluded-address 2::0 2::9
```

#Configure address pool dynamic-pool1 and its parameters (including address range, DNS, address lease, and local domain name).

```
Device(config)#ipv6 dhcp pool dynamic-pool1
Device(dhcp6-config)#network 1::/64
Device(dhcp6-config)#dns-server 2::4
Device(dhcp6-config)#lease preferred-lifetime 86300 valid-lifetime 86400
Device(dhcp6-config)#exit
```

#Configure address pool dynamic-pool2 and its parameters (including address range, DNS address, address lease, Wins server address, and local domain name).

```
Device(config)#ip DHCPv6 pool dynamic-pool2
Device(dhcp6-config)#network 2::/64
Device(dhcp6-config)#dns-server 2::4
Device(dhcp6-config)#lease preferred-lifetime 259100 valid-lifetime 259200
Device(dhcp6-config)#exit
```

Step 3: Check the result.

#Check the IPv6 address information allocated to the client on the Device.

```
Device#show ipv6 dhcp pool dynamic-pool1 lease
IPv6 Address      Duid              Iaid  Type    Time Left(s)
-----
1::a      000200001613303030313761636635646634  00000000 Lease    86390
Device2#show ipv6 dhcp pool dynamic-pool2 lease
IPv6 Address      Duid              Iaid  Type    Time Left(s)
-----
2::a      000200001613303030313761636635646634  00000000 Lease    2591974
```

Check if the IPv6 address is obtained correctly on the DHCPv6 client.

---

注意：

- The IPv6 addresses in the address pool must be within the network segment range of the interface that provides the service.
- 

### 44.3.3 Configure DHCPv6 relay.

#### Network Requirements

- Device1 is the DHCPv6 server and Device2 interface is enabled for DHCPv6 relay function.
- The DHCPv6 server serves clients in the 1::/64 network segment, and the first 10 IPv6 addresses are reserved.
- The DHCPv6 client obtains IPv6 addresses through the DHCPv6 relay.

#### Network Topology

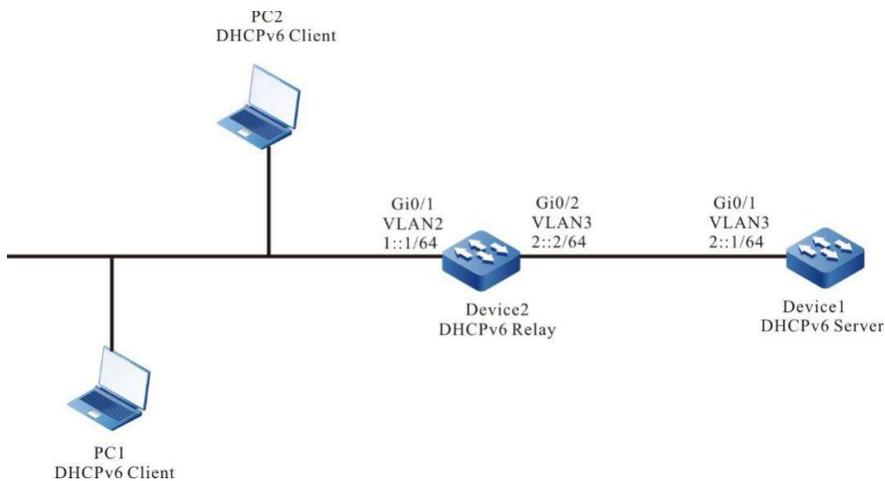

Figure 44-3 Network Topology for Configuring DHCPv6 Relay

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. Configure the IPv6 address of each interface (omitted).

Step 2: Configure Device1's IPv6 address pool and reserved IPv6 addresses.

#Configure Device1 as the DHCPv6 server.

```
Device1#configure terminal
Device1(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 dhcp server
Device2(config-if-vlan3)#exit
```

#Configure to ensure the IPv6 addresses from 1::0 to 1::9 cannot be allocated.

```
Device1(config)#ipv6 dhcp excluded-address 1::0 1::9
```

# Configure the IPv6 address pool dynamic-pool of Device1.

```
Device1(config)#ipv6 dhcp pool dynamic-pool
Device1(dhcp6-config)#network 1::/64
Device1(dhcp6-config)#lease preferred-lifetime 300 valid-lifetime 600
Device1(dhcp6-config)#exit
```

#Configure a static route to network segment 1::/64.

```
Device1(config)#ipv6 route 1::0/64 2::2
```

Step 3: Enable the DHCPv6 relay and configure DHCPv6 server address 2::1 on the vlan2 interface of Device2.

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 dhcp relay
Device2(config-if-vlan2)#ipv6 dhcp relay server-address 2::1
Device2(config-if-vlan2)#exit
```

Step 4: Check the result.

#Check the IPv6 address information allocated on Device1.

```
Device1#show ipv6 dhcp pool dynamic-pool lease
IPv6 Address      Duid              Iaid  Type  Time Left(s)
-----
```

Using the `show ipv6 dhcp pool dynamic-pool lease` command to view information about the IPv6 address allocated to the client, indicating that the client has acquired IPv6 address 1::0.

# 45 GRE

---

## 45.1 Overview

GRE (Generic Routing Encapsulation), is a generic tunnel encapsulation protocol that specifies how one network protocol can be used to encapsulate another network protocol.

GRE tunneling, one of many tunneling technologies, requires manual configuration of the start and end points of the tunnel, which is a virtual point-to-point connection that provides a transmission channel for encapsulated packets, with encapsulation and decapsulation of data packets at each end of the tunnel.

- Generic Routing Encapsulation

When a data packet is to be sent through a GRE tunnel, the tunnel adds a GRE header to its header, and an IP header before the GRE header. The protocol number in the IP header is set to 47 (the protocol number of the GRE protocol in the IP header), the source address in the IP header is set as the source address of the tunnel, and the destination address in the IP header is set as the destination address of the tunnel.

- GRE Packet Structure

**Payload packet:** Refers to the network layer packet (e.g. IP packets) before entering the tunnel. As the payload of tunnel packets, the protocol of this packet is called the passenger protocol of the GRE tunnel.

**GRE header:** Refers to the GRE header added after the Payload packet enters the tunnel, which contains the GRE protocol itself and some information related to the passenger protocol.

**Delivery header:** The encapsulated external protocol header (e.g., IP header), i.e., the protocol header of the network in which the tunnel is located, is the transmission tool that enables packets of one protocol to traverse another protocol network.

- GRE Packet Forwarding

After the packet is encapsulated at the start of the GRE tunnel, it is routed according to the encapsulated destination address and then sent out from the corresponding network interface. The intermediate device forwards it as a normal packet until it reaches the end of the tunnel.

- Generic Routing Decapsulation

The decapsulation process is the opposite of the encapsulation process. The tunnel endpoint receives the packet and analyzes the delivery header first. If the destination address is its own address, the protocol field in the IP header will be checked, and if the protocol field is 47 (GRE protocol number), the packet is handed over to the GRE tunnel for processing. The tunnel first removes the delivery header, then checks the GRE header for protocol number, checksum, keywords, etc. After completing the corresponding processing, the GRE header is removed, and then the Payload packet is handed over to the passenger protocol for subsequent processing to complete the decapsulation.

## 45.2 GRE Function Configuration

Table 45-1 GRE Function Configuration List

Configuration Task	
Configure GRE tunnels.	Configuring GRE over IPv4 tunnels.
	Configuring GRE over IPv6 tunnels.

### 45.2.1 Configure GRE tunnels.

#### Configuration Condition

Before configuring GRE tunnels, ensure that

- Configuring the interface IP address to make it reachable at the network layer of adjacent nodes.
- Create the tunnel interface and configure the basic parameters (refer to the tunnel interface configuration manual).
- Configure any unicast routing protocol to make routes reachable at both ends of the tunnel.

#### Configure GRE tunnels.

Table 45-2 Configuring GRE Tunnels

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the tunnel interface configuration mode.	<b>interface tunnel</b> <i>tunnel-number</i>	-
Configure tunnel interface addresses.	Configure IPv4 unicast addresses. <b>ip address</b> <i>ip-address</i> { <i>mask</i>   <i>mask-length</i> }	Mandatory  By default, the tunnel interface address is not configured.
	Configure an IPv6 global unicast address or anycast address or site-local address or auto-acquire address. <b>ipv6 address</b> { <i>ipv6-address/prefix-length</i> [ <i>anycast</i>   <i>eui-64</i> ]   <b>autoconfig</b> }	
	Configure IPv6 link-local addresses. <b>ipv6 address</b> <i>IPv6-address</i> <b>link-local</b>	Optional  By default, the link-local address is automatically generated when IPv6 is enabled on the interface.
Configure the tunnel interface mode as GRE over IPv4 or GRE over IPv6.	<b>tunnel mode gre</b> [ <b>ip</b>   <b>ipv6</b> ]	Optional  By default, the tunnel interface mode is GRE over IPv4.
Configure the tunnel interface source address or interface name.	<b>tunnel source</b> { <i>ip-address</i>   <i>ipv6-address</i>   <i>interface-name</i> }	Mandatory  By default, the tunnel interface is not configured with source address and interface name.
Configure the destination address or host name of the tunnel interface.	<b>tunnel destination</b> { <i>ip-address</i>   <i>ipv6-address</i> }	Mandatory

Step	Command	Description
		By default, the tunnel interface is not configured with destination address.

### Note

- The source and destination addresses must be configured on both ends of the tunnel, and the addresses on both ends must be the source and destination addresses of each other.
- When configuring the tunnel source, if the interface method is used, the primary address of the source interface is taken as the source address of the tunnel.
- Both ends of the tunnel should be configured to the same tunnel mode, otherwise transmission through the tunnel will fail.
- Two or more tunnels with the same tunnel mode, source address, and destination address cannot be configured at the same time on the same device.

## 45.2.2 GRE Monitoring and Maintaining

Table 45-3 GRE Monitoring and Maintaining

Command	Description
<b>enable</b>	Privileged mode
<b>debug tunnel {all   config   event   forward   packet }</b>	Enable the Tunnel debugging information switch
<b>show tunnel [tunnel-id] [slot slot-num]</b>	Displaying tunnel information

## 45.3 Typical Configuration Example of GRE

### 45.3.1 Configure Basic Functions of GRE

#### Network Requirements

- IP Network1 and IP Network2 are the two private networks of Device1 and Device3 respectively.

- IP Network1 and IP Network2 communicate through a GRE tunnel between Device1 and Device3.

## Network Topology

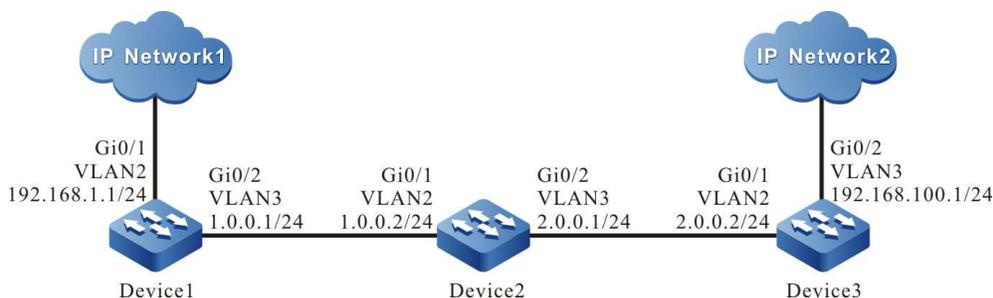

Figure 45-1 Network Topology for Configuring Basic Functions of GRE

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS
```

Gateway of last resort is not set

```
O 1.0.0.0/24 [110/65536] via 2.0.0.1, 00:18:40, vlan2
C 2.0.0.0/24 is directly connected, 00:22:27, vlan2
C 192.168.100.0/24 is directly connected, 00:00:28, vlan3
```

---

 **Note**

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 4: Configure GRE tunnels.

#Configure GRE tunnel1 on Device1 with source address 1.0.0.1, destination address 2.0.0.2 and IP address 10.0.0.1.

```
Device1(config)#interface tunnel 1
Device1(config-if-tunnel1)#tunnel source 1.0.0.1
Device1(config-if-tunnel1)#tunnel destination 2.0.0.2
Device1(config-if-tunnel1)#ip address 10.0.0.1 255.255.255.0
Device1(config-if-tunnel1)#exit
```

#Configure GRE tunnel1 on Device3 with source address 2.0.0.2, destination address 1.0.0.1 and IP address 10.0.0.2.

```
Device3(config)#interface tunnel 1
Device3(config-if-tunnel1)#tunnel source 2.0.0.2
Device3(config-if-tunnel1)#tunnel destination 1.0.0.1
Device3(config-if-tunnel1)#ip address 10.0.0.2 255.255.255.0
Device3(config-if-tunnel1)#exit
```

#Check information about the GRE tunnel on Device3.

```
Device3#show tunnel 1
Tunnel 1:
  Tunnel mode is gre ip
    Gre checksum validation is disabled
    Gre key is not set
    Gre keepalive is disabled
  Source ipv4 address is 2.0.0.2(Source ipv4 address is up on source interface vlan2)
  Destination ipv4 address is 1.0.0.1
  Tunnel state is up
  Encapsulation vrf is global(0x0)
  TTL(time-to-live) is 255
  TOS(type of service) is not set
total(1)
```

---

 **Note**

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
  - When the tunnels are not in the same network segment, you need to configure static routes on the devices at both ends of a local tunnel to reach a peer tunnel, and the output interface is configured as the interface of the local tunnel.
-

---

Step 5: Configure static routes.

#On Device1, configure a static route to the IP Network2 with the output interface as tunnel1.

```
Device1(config)#ip route 192.168.100.0 255.255.255.0 tunnel1
```

#On Device3, configure a static route to the IP Network1 with the output interface as tunnel1.

```
Device3(config)#ip route 192.168.1.0 255.255.255.0 tunnel1
```

#Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

O  1.0.0.0/24 [110/65536] via 2.0.0.1, 00:43:30, vlan2
C  2.0.0.0/24 is directly connected, 00:47:17, vlan2
C  10.0.0.0/24 is directly connected, 00:17:12, tunnel1
S  192.168.1.0/24 [1/100000] is directly connected, 00:00:10, tunnel1
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
- 

## 45.3.2 Configure Basic Functions of GRE Over IPv6

### Network Requirements

- IP Network1 and IP Network2 are the private IP networks of Device1 and Device3 respectively.
- IPv6 Network1 and IPv6 Network2 are the private IPv6 networks of Device1 and Device3 respectively.
- IP Network1 and IP Network2 communicate through a GRE over IPv6 tunnel between Device1 and Device3.
- IPv6 Network1 and IPv6 Network2 communicate through a GRE over IPv6 tunnel between Device1 and Device3.

### Network Topology

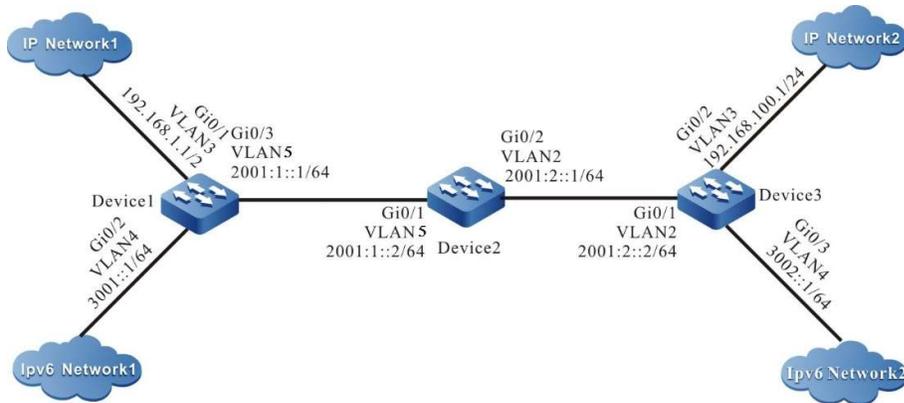

Figure 45-2 Network Topology for Configuring Basic Functions of GRE

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure OSPFv3 to enable communication between Device1, Device2, and Device3.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.75.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan5
Device1(config-if-vlan5)#ipv6 router ospf tag 100 area 0
Device1(config-if-vlan5)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 1.2.75.1
Device2(config-ospf6)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ipv6 router ospf tag 100 area 0
Device2(config-if-vlan5)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf tag 100 area 0
Device2(config-if-vlan2)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 1.1.73.1
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf tag 100 area 0
Device3(config-if-vlan2)#exit
```

#### # Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management
```

---

```
L ::1/128 [0/0]
  via ::, 6w0d:23:09:31, lo0
O 2001:1::/64 [110/2]
  via fe80::508b:fff:fee4:ff6, 00:08:37, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:15:51, vlan2
L 2001:2::2/128 [0/0]
  via ::, 00:15:50, lo0
C 3002::/64 [0/0]
  via ::, 00:15:06, vlan4
L 3002::1/128 [0/0]
  via ::, 00:15:04, lo0
```

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 3: Configure GRE over IPv6 tunnels.

#Configure GRE over IPv6 tunnel1 on Device1, with the source address 2001:1::1, destination address 2001:2::2, IP address 10.0.0.1, and IPv6 address 10::1.

```
Device1(config)#interface tunnel 1
Device1(config-if-tunnel1)#tunnel mode gre ipv6
Device1(config-if-tunnel1)#tunnel source 2001:1::1
Device1(config-if-tunnel1)#tunnel destination 2001:2::2
Device1(config-if-tunnel1)#ip address 10.0.0.1 255.255.255.0
Device1(config-if-tunnel1)#ipv6 address 10::1/64
Device1(config-if-tunnel1)#exit
```

#Configure GRE over IPv6 tunnel1 on Device3, with the source address 2001:2::2, destination address 2001:1::1, IP address 10.0.0.2, and IPv6 address 10::2.

```
Device3(config)#interface tunnel 1
Device3(config-if-tunnel1)#tunnel mode gre ipv6
Device3(config-if-tunnel1)#tunnel source 2001:2::2
Device3(config-if-tunnel1)#tunnel destination 2001:1::1
Device3(config-if-tunnel1)#ip address 10.0.0.2 255.255.255.0
Device3(config-if-tunnel1)#ipv6 address 10::2/64
Device3(config-if-tunnel1)#exit
```

#Check information about the GRE tunnel on Device3.

```
Device3#show tunnel 1
```

```
Tunnel 1:
  Tunnel mode is gre ipv6
  Gre checksum validation is disabled
  Gre key is not set
  Source ipv6 address is 2001:2::2(Source ipv6 address is up on source interface gigabitethernet0/2/0)
  Destination ipv6 address is 2001:1::1
  Tunnel state is up
  Encapsulation vrf is global(0x0)
  TTL(time-to-live) is 255
  TOS(type of service) is not set
total(1)
```

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
- When the tunnels are not in the same network segment, you need to configure static routes on the devices at both ends of a local tunnel to reach a peer tunnel, and the output interface is configured as the interface of the local tunnel.

Step 4: Configure static routes.

#On Device1, configure a static route to the IP Network2 with the output interface as tunnel1.

```
Device1(config)#ip route 192.168.100.0 255.255.255.0 tunnel1
```

#On Device1, configure a static route to the IPv6 Network2 with the output interface as tunnel1.

```
Device1(config)#IPv6 route 3002::/64 tunnel1
```

#On Device3, configure a static route to the IP Network1 with the output interface as tunnel1.

```
Device3(config)#ip route 192.168.1.0 255.255.255.0 tunnel1
```

#On Device3, configure a static route to the IPv6 Network1 with the output interface as tunnel1.

```
Device3(config)#IPv6 route 3001::/64 tunnel1
```

#Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS
```

Gateway of last resort is not set

```
C 10.0.0.0/24 is directly connected, 00:17:12, tunnel1
S 192.168.1.0/24 [1/100000] is directly connected, 00:00:10, tunnel1
C 192.168.100.0/24 is directly connected, 00:00:28, vlan3
```

# Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
```

```
L ::1/128 [0/0]
   via ::, 6w0d:23:50:28, lo0

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
-

# 46 IPIP Tunnel

---

## 46.1 Overview

IPIP (IPv4 over IPv4) tunneling, one of many tunneling technologies, is similar to GRE (Generic Routing Encapsulation) tunneling in that the start and end points of the tunnel need to be manually configured. It is a virtual point-to-point connection that provides a transmission channel for encapsulated packets, with encapsulation and decapsulation of data packets at each end of the tunnel. IPIP tunnels, which encapsulate only IPv4 data packets so that these encapsulated data packets can be transmitted in another IPv4 network.

- IPIP Encapsulation

When an IP data packet is to be sent through an IPIP tunnel, the tunnel adds an IP packet header with the protocol number set to 4 in the IP packet header, the source address in the IP packet header is set to the source address of the tunnel, and the destination address in the IP packet header is set to the destination address of the tunnel.

- IPIP Packet Structure

**IP Payload:** The IP packet load before entering the tunnel, as the payload of the tunnel packet.

**IP header:** the first part of the IP packet before entering the tunnel.

**Outer IP header:** The encapsulated external IP packet header, which is a transport tool to enable IP packets to traverse another IP network.

- IPIP Packet Forwarding

After the packet is encapsulated at the start of the IPIP tunnel, it is routed according to the encapsulated destination address and then sent out from the corresponding network interface. The intermediate device forwards it as a regular IP packet until it reaches the end of the tunnel.

- IPIP Decapsulation

The decapsulation process is the opposite of the encapsulation process. The tunnel endpoint receives the packet and analyzes the outer IP header first. If the destination address is its own address, the protocol field in the IP header will be checked, and if the protocol field is 4, the packet is handed over to the IPIP tunnel for processing. After the tunnel removes the Outer IP header of the packet, it performs routing based on the destination address of the decapsulated packet and performs subsequent processing based on the routing result.

## 46.2 IPIP Function Configuration

Table 46-1 IPIP Function Configuration List

Configuration Task	
Configure IPIP tunnels.	Configure IPIP tunnels.

### 46.2.1 Configure IPIP tunnels.

#### Configuration Condition

Before configuring IPIP tunnels, ensure that

- Configuring the interface IP address to make it reachable at the network layer of adjacent nodes.
- Create the tunnel interface and configure the basic parameters (refer to the tunnel interface configuration manual).
- Configure any unicast routing protocol or static route to make both ends of the tunnel reachable via route.

#### Configure IPIP tunnels.

Table 46-2 Configuring IPIP Tunnels

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the tunnel interface configuration mode.	<b>interface tunnel <i>tunnel-number</i></b>	-

Step	Command	Description
Configure tunnel interface addresses.	<b>ip address</b> <i>ip-address</i> { <i>mask</i>   <i>mask-length</i> }	Mandatory By default, the tunnel interface address is not configured.
Configure the tunnel interface mode as IPv4 over IPv4.	<b>tunnel mode ipip</b>	Mandatory By default, the tunnel interface mode is GRE over IPv4.
Configure the tunnel interface source address or interface name.	<b>tunnel source</b> { <i>ip-address</i>   <i>interface-name</i> }	Mandatory By default, the tunnel interface is not configured with source address and interface name.
Configure the destination address or host name of the tunnel interface.	<b>tunnel destination</b> { <i>ip-address</i> }	Mandatory By default, the tunnel interface is not configured with destination address.

## Note

- The tunnel interface address needs to be configured with an IPv4 address, and the passenger protocol can only be an IPv4 protocol.
- The source and destination addresses must be configured on both ends of the tunnel, and the addresses on both ends must be the source and destination addresses of each other.
- When configuring the tunnel source, if the interface method is used, the primary address of the source interface is taken as the source address of the tunnel.
- Both ends of the tunnel should be configured to the same tunnel mode, otherwise transmission through the tunnel will fail.
- Two or more tunnels with the same tunnel mode, source address, and destination address cannot be configured at the same time on the same device.

## 46.2.2 IPIP Monitoring and Maintaining

Refer to GRE Monitoring and Maintenance in Section 7.2.2 of the GRE Configuration Manual.

## 46.3 Typical Configuration Example of IPIP Tunnel

### 46.3.1 Configure IPIP Basic Functions

#### Network Requirements

- IP Network1 and IP Network2 are the two private networks of Device1 and Device3 respectively.
- IP Network1 and IP Network2 communicate through a IPIP tunnel between Device1 and Device3.

#### Network Topology

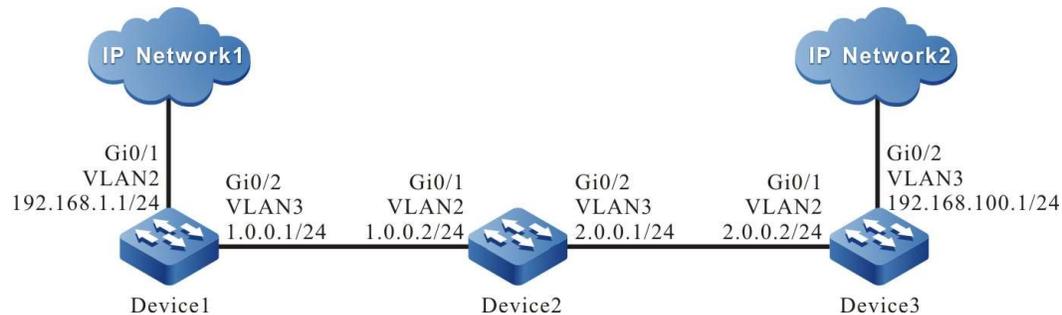

Figure 8-1 Network Topology for Configuring Basic Functions of IPIP

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
```

```
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS
```

Gateway of last resort is not set

```
O 1.0.0.0/24 [110/65536] via 2.0.0.1, 00:18:40, v1an2
C 2.0.0.0/24 is directly connected, 00:22:27, v1an2
C 192.168.100.0/24 is directly connected, 00:00:28, v1an3
```

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

### Step 4: Configure IPIP tunnels.

#### #Configure IPIP tunnel1 on Device1 with source address 1.0.0.1, destination address 2.0.0.2 and IP address 10.0.0.1.

```
Device1(config)#interface tunnel 1
Device1(config-if-tunnel1)#tunnel mode ipip
Device1(config-if-tunnel1)#tunnel source 1.0.0.1
Device1(config-if-tunnel1)#tunnel destination 2.0.0.2
Device1(config-if-tunnel1)#ip address 10.0.0.1 255.255.255.0
Device1(config-if-tunnel1)#exit
```

#### #Configure IPIP tunnel1 on Device3 with source address 2.0.0.2, destination address 1.0.0.1 and IP address 10.0.0.2.

```
Device3(config)#interface tunnel 1
Device3(config-if-tunnel1)#tunnel mode ipip
Device3(config-if-tunnel1)#tunnel source 2.0.0.2
Device3(config-if-tunnel1)#tunnel destination 1.0.0.1
Device3(config-if-tunnel1)#ip address 10.0.0.2 255.255.255.0
Device3(config-if-tunnel1)#exit
```

#### #Check information about the IPIP tunnel on Device3.

```
Device3#show tunnel 1
Tunnel 1:
Tunnel mode is ipip
```

```
Source ipv4 address is 2.0.0.2(Source ipv4 address is up on source interface vlan2)
Destination ipv4 address is 1.0.0.1
Tunnel state is up
Encapsulation vrf is global(0x0)
TTL(time-to-live) is 255
TOS(type of service) is not set
total(1)
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
  - When the tunnels are not in the same network segment, you need to configure static routes on the devices at both ends of a local tunnel to reach a peer tunnel, and the output interface is configured as the interface of the local tunnel.
- 

Step 5: Configure static routes.

#On Device1, configure a static route to the IP Network2 with the output interface as tunnel1.

```
Device1(config)#ip route 192.168.100.0 255.255.255.0 tunnel1
```

#On Device3, configure a static route to the IP Network1 with the output interface as tunnel1.

```
Device3(config)#ip route 192.168.1.0 255.255.255.0 tunnel1
```

#Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

O  1.0.0.0/24 [110/65536] via 2.0.0.1, 00:43:30, vlan2
C  2.0.0.0/24 is directly connected, 00:47:17, vlan2
C  10.0.0.0/24 is directly connected, 00:17:12, tunnel1
S  192.168.1.0/24 [1/100000] is directly connected, 00:00:10, tunnel1
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
-

# 47 Transition Tunnel

## 47.1 Overview

Transition tunneling (IPv6 over IPv4) technology provides a way to deliver IPv6 data with the existing IPv4 routing system: IPv6 packets are encapsulated in IPv4 packets as unstructured meaningful data for transmission over IPv4 networks. Depending on the creation method, transition tunnels can be divided into two categories: manually configured tunnels and automatically configured tunnels. The transition tunneling technique makes clever use of existing IPv4 networks, and is significant in that it provides a way to enable communication between IPv6 nodes during the transition, however it does not solve the problem of interoperability between IPv6 and IPv4 nodes. Transition tunnels are divided into two types, i.e. manual and automatic. The correspondences between its types and modes are shown in the following table.

Table 47-1 Transition Tunnel Modes

Tunnel types	Tunnel modes	Tunnel source/destination address	Tunnel interface address
Manually configured tunnels	Manually configured IPv6 over IPv4 tunnels	The source/destination address is a manually configured IPv4 address.	IPv6 address
Automatically configured tunnels	6to4 tunnels		6to4 address in the format: 2002:a.b.c.d::/48
	ISATAP tunnels		ISATAP address in the format: Prefix:0:5EFE:a.b.c.d/64

- Manually configured IPv6 over IPv4 tunnels

This type of tunnel is established by manual configuration, and the endpoint address of the tunnel is determined by the configuration without allocating a

special IPv6 address to the node, and is suitable for use between IPv6 nodes that communicate frequently.

- 6to4 tunnels

The 6to4 tunnel is a point-to-multipoint tunnel. Both ends of the tunnel require a special IPv6 address in the format: 2002:a.b.c.d::/48, where 2002 indicates a fixed IPv6 address prefix and a.b.c.d indicates the globally unique 32-bit IPv4 address corresponding to the 6to4 tunnel. The tunnel encapsulation process automatically uses this embedded IPv4 address as the end point of the tunnel, which largely simplifies the creation of tunnels. Therefore, nodes using the 6to4 mechanism must have at least one globally unique IPv4 address, and this mechanism is suitable for communication between nodes running IPv6. Since the first 48 bits of the 6to4 IPv6 address prefix are already determined by a fixed value and the IPv4 address, the remaining 16 bits of the subnet number can be defined by the user, which allows more flexibility in interconnecting IPv6 networks using IPv4 networks. The 6to4 tunnels overcome the limitations of using automatically configured IPv4 over IPv6 tunnels.

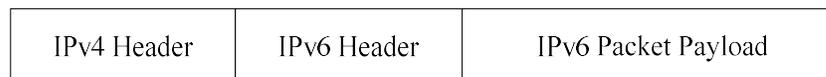

- ISATAP tunnels

ISATAP (Intra-Site Automatic Tunnel Addressing Protocol) tunnels are point-to-multipoint automatic tunnels that require a special IPv6 address at both ends of the tunnel in the format of Prefix:0:5EFE:a.b.c.d/64, where Prefix stands for any legal IPv6 unicast address prefix, and a.b.c.d stands for a 32-bit IPv4 address (not required to be globally unique). This embedded IPv4 address is automatically used as the endpoint of the tunnel during tunnel encapsulation. Therefore, the ISATAP tunnel is also automatically created.

- Transition Tunnel Encapsulation

When an IPv6 data packet is to be sent through an transition tunnel, the tunnel adds an IP packet header with the protocol number set to 41 in the IP packet header, the source address in the IP packet header is set to the source address of the tunnel, and the destination address in the IP packet header is set according to the tunnel type: if it is a manually configured tunnel it is set to the configured tunnel destination address, if it is an automatically configured tunnel it uses the IPv4 address embedded in the IPv6 address.

- Transition Tunnel Packet Structure

IPv6 Packet Payload: The IPv6 packet load before entering the tunnel, acting as the payload of the tunnel packet.

IPv6 Header: The header of the IPv6 packet before entering the tunnel.

IPv4 Header: The encapsulated outer IPv4 header, which is the transport tool that enables IPv6 packets to traverse the IPv4 network.

- Transition Tunnel Packet Forwarding

After the packet is encapsulated at the start of the transition tunnel, it is routed according to the encapsulated destination address and then sent out from the corresponding network interface. The intermediate device forwards it as a regular IP packet until it reaches the end of the tunnel.

- Transition Tunnel Decapsulation

The decapsulation process is the opposite of the encapsulation process. The tunnel endpoint receives the packet and analyzes the IPv4 header first. If the destination address is its own address, the protocol field in the IP header will be checked, and if the protocol field is 41, the packet is handed over to the transition tunnel for processing. After the tunnel removes the IPv4 IP header of the packet, it performs routing based on the destination address of the decapsulated packet and performs subsequent processing based on the routing result.

## 47.2 Transition Tunnels Function Configuration

Table 47-2 Transition Tunnels Function Configuration List

Configuration Task	
Transition tunnels configuration	Manually configure IPv6 over IPv4 tunnels
	Configure 6to4 tunnels
	Configure ISATAP tunnels

### Note

- For configuration commands related to transition tunnels, refer to the IP Tunnels chapter in the User Manual.

### 47.2.1 Manually configure IPv6 over IPv4 tunnels

#### Configuration Condition

Before manually configuring IPv6 over IPv4 tunnels, ensure that

- Configure the physical interface IP address so that adjacent nodes are reachable at the network layer.
- Create the tunnel interface and configure the basic parameters (refer to the tunnel interface configuration manual).
- Configure any unicast routing protocol to make routes reachable at both ends of the tunnel.

### Manually configure IPv6 over IPv4 tunnels

Table 47-3 Manually Configure IPv6 Over IPv4 Tunnels

Step	Command	Description	
Enter the global configuration mode.	<b>configure terminal</b>	-	
Enter the tunnel interface configuration mode.	<b>interface tunnel <i>tunnel-number</i></b>	-	
Configure tunnel interface addresses.	Configure an IPv6 global unicast address or anycast address or site-local address or auto-acquire address.	<b>ipv6 address { <i>ipv6-address/prefix-length</i> [ <i>anycast</i>   <i>eui-64</i> ]   <i>autoconfig</i> }</b>	Mandatory By default, the tunnel interface is not configured with IPv6 address.
	Configure IPv6 link-local addresses.	<b>ipv6 address <i>ipv6-address</i> link-local</b>	Optional By default, the link-local address is automatically generated when IPv6 is enabled on the interface.
Configure the tunnel interface mode as manually configured IPv6 over IPv4 tunnels.	<b>tunnel mode ipv6ip</b>	Mandatory By default, the tunnel interface mode is GRE over IPv4.	

Step	Command	Description
Configure the tunnel interface source address or interface name.	<b>tunnel source</b> { <i>ip-address</i>   <i>interface-name</i> }	Mandatory By default, the tunnel interface is not configured with source address and interface name.
Configure the destination address or host name of the tunnel interface.	<b>tunnel destination</b> { <i>ip-address</i>   <i>hostname</i> }	Mandatory By default, the tunnel interface is not configured with destination address and host name.

---

### Note

- The source and destination addresses must be configured on both ends of the tunnel, and the addresses on both ends must be the source and destination addresses of each other.
  - When configuring the tunnel source, if the interface method is used, the primary address of the source interface is taken as the source address of the tunnel.
  - Both ends of the tunnel should be configured to the same tunnel mode, otherwise transmission through the tunnel will fail.
  - Multiple tunnels with the same tunnel mode, source address and destination address cannot be configured at the same time on the same device.
- 

## 47.2.2 Configure 6to4 tunnels

### Configuration Condition

Before configuring 6to4 tunnels, ensure that

- Configure the physical interface IP address so that adjacent nodes are reachable at the network layer.
- Create the tunnel interface and configure the basic parameters (refer to the tunnel interface configuration manual).
- Configure any unicast routing protocol to make routes reachable at both ends of the

tunnel.

## Configure 6to4 tunnels

Table 47-4 Configuring 6to4 Tunnels

Step	Command	Description	
Enter the global configuration mode.	<b>configure terminal</b>	-	
Enter the tunnel interface configuration mode.	<b>interface tunnel <i>tunnel-number</i></b>	-	
Configure tunnel interface addresses.	Configure an IPv6 global unicast address or anycast address or site-local address or auto-acquire address.	<b>ipv6 address { <i>ipv6-address/prefix-length</i> [ <i>anycast</i>   <i>eui-64</i> ]   <i>autoconfig</i> }</b>	Mandatory  By default, the tunnel interface is not configured with IPv6 address.
	Configure IPv6 link-local addresses.	<b>ipv6 address <i>ipv6-address</i> link-local</b>	Optional  By default, the link-local address is automatically generated when IPv6 is enabled on the interface.
Configure the tunnel interface mode as 6to4.	<b>tunnel mode ipv6ip 6to4</b>	Mandatory  By default, the tunnel interface mode is GRE over IPv4.	
Configure the tunnel interface source address or interface name.	<b>tunnel source { <i>ip-address</i>   <i>interface-name</i> }</b>	Mandatory  By default, the tunnel interface is not configured with source address and interface name.	

Step	Command	Description
Configure the tunnel interface to reference the reflection group.	<b>tunnel service-loop</b> <i>service-loop-id</i>	Mandatory  By default, the tunnel interface does not reference the reflection group.

---

### Note

- The 6to4 tunnel does not need to be configured with a destination break address; the destination address used for tunnel encapsulation is automatically obtained from the IPv4 address embedded in the IPv6 address of the 6to4 tunnel.
  - When configuring the tunnel source, if the interface method is used, the primary address of the source interface is taken as the source address of the tunnel.
  - Both ends of the tunnel should be configured to the same tunnel mode, otherwise transmission through the tunnel will fail.
  - Only one 6to4 tunnel can be configured on the device.
- 

## 47.2.3 Configure ISATAP tunnels

### Configuration Condition

Before configuring the ISATAP tunnel, ensure that

- Configure the physical interface IP address so that adjacent nodes are reachable at the network layer.
- Create the tunnel interface and configure the basic parameters (refer to the tunnel interface configuration manual).
- Configure any unicast routing protocol to make routes reachable at both ends of the tunnel.

### Configure ISATAP tunnels

Table 47-5 Configuring ISATAP Tunnels

Step	Command	Description	
Enter the global configuration mode.	<b>configure terminal</b>	-	
Enter the tunnel interface configuration mode.	<b>interface tunnel</b> <i>tunnel-number</i>	-	
Configure tunnel interface addresses.	Configure an IPv6 global unicast address or anycast address or site-local address or auto-acquire address.	<b>ipv6 address</b> { <i>ipv6-address/prefix-length</i> [ <b>anycast</b>   <b>eui-64</b> ]   <b>autoconfig</b> }	Mandatory  By default, the tunnel interface is not configured with IPv6 address.
	Configure IPv6 link-local addresses.	<b>ipv6 address</b> <i>ipv6-address</i> <b>link-local</b>	Optional  By default, the link-local address is automatically generated when IPv6 is enabled on the interface.
Configure tunnel interface mode as automatically configured IPv4 over IPv6 tunnels.	<b>tunnel mode ipv6ip isatap</b>	Mandatory  By default, the tunnel interface mode is GRE over IPv4.	
Configure the tunnel interface source address or interface name.	<b>tunnel source</b> { <i>ip-address</i>   <i>interface-name</i> }	Mandatory  By default, the tunnel interface is not configured with source address and interface name.	
Configure the tunnel interface to reference the reflection group.	<b>tunnel service-loop</b> <i>service-loop-id</i>	Mandatory  By default, the tunnel interface does not	

Step	Command	Description
		reference the reflection group.

---

### Note

- The ISATAP tunnel does not need to be configured with a destination break address; the destination address used for tunnel encapsulation is automatically obtained from the IPv4 address embedded in the IPv6 address of the ISATAP tunnel.
  - When configuring the tunnel source, if the interface method is used, the primary address of the source interface is taken as the source address of the tunnel.
  - Both ends of the tunnel should be configured to the same tunnel mode, otherwise transmission through the tunnel will fail.
  - Multiple ISATAP tunnels with identical source addresses cannot be configured at the same time on the same device.
- 

#### 47.2.4 Transition Tunnel Monitoring and Maintaining

Refer to GRE Monitoring and Maintenance in Section 7.2.2 of the GRE Configuration Manual.

### 47.3 Typical Configuration Example of Transition Tunnel

#### 47.3.1 Configure basic functions of manually configured IPv6 over IPv4 tunnels.

##### Network Requirements

- IPv6 Network1 and IPv6 Network2 are the private IPv6 networks of Device1 and Device3 respectively.
- IPv6 Network1 and IPv6 Network2 communicate through a IPv6 over IPv4 tunnel between Device1 and Device3.

##### Network Topology

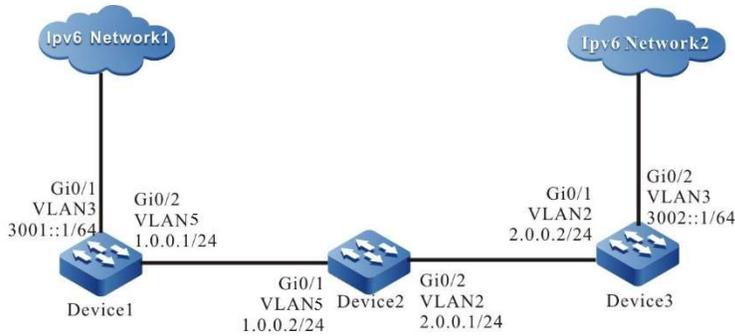

Figure 47-1 Network Topology for Configuring Basic Functions of Manually Configured IPv6 over IPv4 Tunnels

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure OSPF to enable communication between Device1, Device2, and Device3.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

O 1.0.0.0/24 [110/65536] via 2.0.0.1, 00:18:40, vlan2
C 2.0.0.0/24 is directly connected, 00:22:27, vlan2
```

---

 **Note**

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 3: Manually configure IPv6 over IPv4 tunnels.

#Manually configure IPv6 over IPv4 tunnel1 on Device1 with the source address 1.0.0.1, destination address 2.0.0.2, and IPv6 address 10::1.

```
Device1(config)#interface tunnel 1
Device1(config-if-tunnel1)#tunnel mode ipv6ip
Device1(config-if-tunnel1)#tunnel source 1.0.0.1
Device1(config-if-tunnel1)#tunnel destination 2.0.0.2
Device1(config-if-tunnel1)#ipv6 address 10::1/64
Device1(config-if-tunnel1)#exit
```

#Manually configure IPv6 over IPv4 tunnel1 on Device3 with the source address 2.0.0.2, destination address 1.0.0.1, and IPv6 address 10::2.

```
Device3(config)#interface tunnel 1
Device3(config-if-tunnel1)#tunnel mode ipv6ip
Device3(config-if-tunnel1)#tunnel source 2.0.0.2
Device3(config-if-tunnel1)#tunnel destination 1.0.0.1
Device3(config-if-tunnel1)#ipv6 address 10::2/64
Device3(config-if-tunnel1)#exit
```

#Check information about the manually configured IPv6 over IPv4 tunnels of Device3.

```
Device3#show tunnel 1

Tunnel 1:
  Tunnel mode is ipv6ip
  Source ipv4 address is 2.0.0.2 (Source ipv4 address is up on source interface vlan2)
  Destination ipv4 address is 1.0.0.1
  Tunnel state is up
  Encapsulation vrf is global(0x0)
  TTL(time-to-live) is 255
  TOS(type of service) is not set
total(1)
```

---

 **Note**

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
  - When the tunnels are not in the same network segment, you need to configure static routes on the devices at both ends of a local tunnel to reach a peer tunnel, and the output interface is configured as the interface of the local tunnel.
-

Step 4: Configure static routes.

#On Device1, configure a static route to the IPv6 Network2 with the output interface as tunnel1.

```
Device1(config)#ipv6 route 3002::/64 tunnel1
```

#On Device3, configure a static route to the IPv6 Network1 with the output interface as tunnel1.

```
Device3(config)#ipv6 route 3001::/64 tunnel1
```

# Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w6d:20:35:50, lo0
C 10::/64 [0/0]
  via ::, 00:03:31, tunnel1
L 10::2/128 [0/0]
  via ::, 00:03:29, lo0
S 3001::/64 [1/100000]
  via ::, 00:00:01, tunnel1
C 3002::/64 [0/0]
  via ::, 00:00:06, vlan3
L 3002::1/128 [0/0]
  via ::, 00:00:04, lo0
```

---

### Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
- 

## 47.3.2 Configure Basic Functions of 6to4 Tunnels

### Network Requirements

- IPv6 Network1 and IPv6 Network2 are the private IPv6 networks of Device1 and Device3 respectively.
- PC1 in IPv6 Network1 and PC2 in IPv6 Network2 communicate through a 6to4 tunnel between Device1 and Device3.

### Network Topology

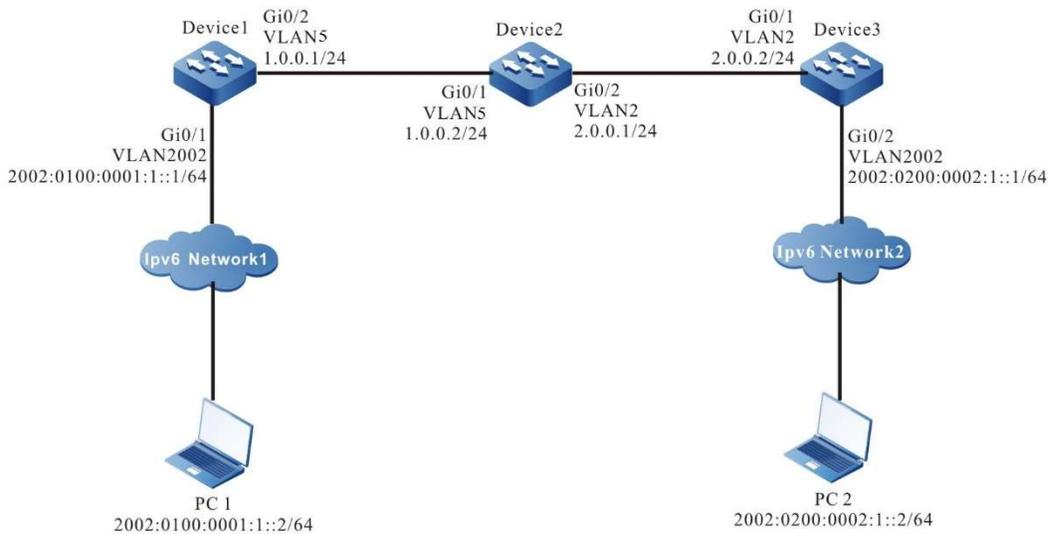

Figure 47-2 Network Topology for Configuring Basic Functions of 6to4 Tunnels

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure OSPF to enable communication between Device1, Device2, and Device3.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management
       D - Redirect, E - IRMP, EX - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is not set

O 1.0.0.0/24 [110/65536] via 2.0.0.1, 00:18:40, vlan2
```

C 2.0.0.0/24 is directly connected, 00:22:27, vlan2

---

 **Note**

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

Step 3: Create a reflection group, and reference the reflection group on a down port of the device.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#serviceloop-group 1
Device1(config)#inter g0/1
Device1(config-if-gigabitethernet0/1)#serviceloop-group 1 active
This command will clear all config in the interface, Please make sure the interface in default state. Do you want to proceed?
(yes|no)?yes
Device1(config-if-gigabitethernet0/1)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#serviceloop-group 1
Device3(config)#inter g0/1
Device3(config-if-gigabitethernet0/1)#serviceloop-group 1 active
This command will clear all config in the interface, Please make sure the interface in default state. Do you want to proceed?
(yes|no)?yes
Device3(config-if-gigabitethernet0/1)#exit
```

Step 4: Configure 6to4 tunnels.

#Configure 6to4 tunnel1 on Device1 with the source address 1.0.0.1, and the tunnel interface referencing a reflection group with the IPv6 address 2002:100:1::1.

```
Device1(config)#interface tunnel 1
Device1(config-if-tunnel1)#tunnel mode ipv6ip 6to4
Device1(config-if-tunnel1)#tunnel source 1.0.0.1
Device1(config-if-tunnel1)#tunnel service-loop 1
Device1(config-if-tunnel1)#ipv6 address 2002:100:1::1/64
Device1(config-if-tunnel1)#exit
```

#Configure 6to4 tunnel1 on Device3 with the source address 2.0.0.2, and the tunnel interface referencing a reflection group with the IPv6 address 2002:200:2::1.

```
Device3(config)#interface tunnel 1
Device3(config-if-tunnel1)#tunnel mode ipv6ip 6to4
Device3(config-if-tunnel1)#tunnel source 2.0.0.2
Device3(config-if-tunnel1)#tunnel service-loop 1
Device3(config-if-tunnel1)#ipv6 address 2002:200:2::1/64
Device3(config-if-tunnel1)#exit
```

#Check information about the 6to4 tunnel on Device3.

```
Device3# show tunnel 1
```

```
Tunnel 1:
```

```
Tunnel mode is ipv6ip 6to4
```

```
Source ipv4 address is 2.0.0.2(Source ipv4 address is up on source interface vlan2)
```

```
Tunnel state is up
```

```
Encapsulation vrf is global(0x0)
```

```
TTL(time-to-live) is 255
```

```
TOS(type of service) is not set
```

```
total(1)
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
  - When the tunnels are not in the same network segment, you need to configure static routes on the devices at both ends of a local tunnel to reach a peer tunnel, and the output interface is configured as the interface of the local tunnel.
- 

Step 5: Configure static routes.

#On Device1, configure a static route to the network segment 2002::/16 with the output interface as tunnel1.

```
Device1(config)#ipv6 route 2002::/16 tunnel1
```

#On Device3, configure a static route to the network segment 2002::/16 with the output interface as tunnel1.

```
Device3(config)#ipv6 route 2002::/16 tunnel1
```

# Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management
```

```
L ::1/128 [0/0]
```

```
via ::, 6w1d:02:11:13, lo0
```

```

```

```
L 2002:200:2::1/128 [0/0]
```

```
via ::, 00:12:49, lo0
```

```
C 2002:200:2:1::/64 [0/0]
```

```
via ::, 00:12:15, vlan2002
```

```
L 2002:200:2:1::1/128 [0/0]
```

```
via ::, 00:12:13, lo0
```

---

 **Note**

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
- 

Step 6: Check the result.

#PC1 pings PC2 at address 2002:200:2:1::2.

```
C:\>ping6 2002:200:2:1::2 -s 2002:0100:0001:1::2
```

```
Pinging 2002:200:2:1::2 with 32 bytes of data:
```

```
Reply from 2002:200:2:1::2: time<1ms
Reply from 2002:200:2:1::2: time<1ms
Reply from 2002:200:2:1::2: time<1ms
Reply from 2002:200:2:1::2: time<1ms
```

```
Ping statistics for 2002:200:2:1::2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

#PC1 is able to ping through to PC2 at address 2002:200:2:1::2.

### 47.3.3 Configure Basic Functions of ISATAP Tunnels

#### Network Requirements

- Device and PC2 can communicate with each other over IPv4 network.
- PC2 acts as the ISATAP host and establishes an ISATAP tunnel with the Device.
- PC1 in the IPv6 Network and PC2 in the IP Network engage in IPv6 communication with each other over the ISATAP tunnel.

#### Network Topology

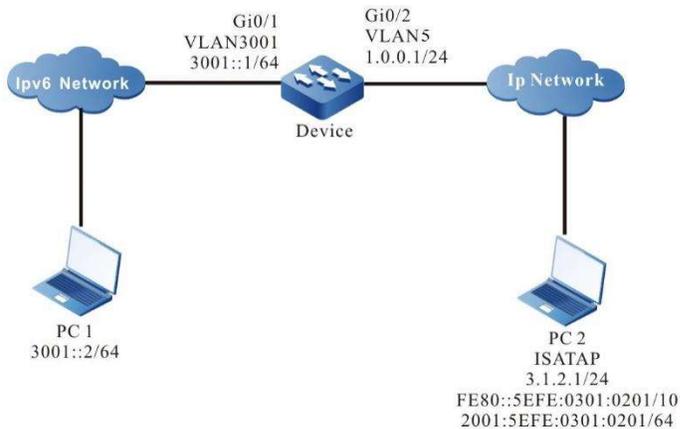

Figure 47-3 Network Topology for Configuring Basic Functions of ISATAP Tunnels

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Create a reflection group, and reference the reflection group on a down port of the device.

```
Device#configure terminal
Device(config)#serviceloop-group 1
Device(config)#inter g0/1
Device(config-if-gigabitethernet0/1)#serviceloop-group 1 active
This command will clear all config in the interface, Please make sure the interface in default state. Do you want to proceed?
(yes/no)?yes
Device(config-if-gigabitethernet0/1)#exit
```

Step 3: Configure ISATAP tunnels on Device.

#Configure ISATAP tunnel1 on Device with the source address 1.0.0.1, and the tunnel interface referencing a reflection group with the IPv6 address 2001::5efe:100:1.

```
Device#configure terminal
Device(config)#interface tunnel 1
Device(config-if-tunnel1)#tunnel mode ipv6ip isatap
Device(config-if-tunnel1)#tunnel source 1.0.0.1
Device(config-if-tunnel1)#tunnel service-loop 1
Device(config-if-tunnel1)#ipv6 address 2001::5efe:100:1/64
Device(config-if-tunnel1)#exit
```

#Check the IPv6 routing table of Device.

```
Device#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
via ::, 6d:05:16:46, lo0
C 2001::/64 [0/0]
via ::, 00:07:56, tunnel1
L 2001::5efe:100:1/128 [0/0]
via ::, 00:07:54, lo0
```

```
C 3001::/64 [0/0]
  via ::, 02:42:37, vlan3001
L 3001::1/128 [0/0]
  via ::, 02:42:36, lo0
```

#Check information about the ISATAP tunnel on Device.

```
Device#show tunnel 1

Tunnel 1:
  Tunnel mode is ipv6ip isatap
  Source ipv4 address is 1.0.0.1(Source ipv4 address is up on source interface vlan5)
  Tunnel state is up
  Encapsulation vrf is global(0x0)
  TTL(time-to-live) is 255
  TOS(type of service) is not set
total(1)
```

Step 4: Disable the RA response suppression function of tunnel1 on Device.

#Disable the RA response suppression function of tunnel1 on Device.

```
Device(config)#interface tunnel 1
Device(config-if-tunnel1)#no ipv6 nd suppress-ra response
Device(config-if-tunnel1)#exit
```

Step 5: Configure ISATAP host PC2.

#The configuration of ISATAP tunnels on hosts varies by operating system, and the Windows XP is used here as an example. #IPv6 protocol is installed on the PC2.

```
C:\>ipv6 install
```

#Normally, when Windows XP installs the IPv6 protocol successfully, the IPv6 interface 2 is taken as the ISATAP interface. Check the information about IPv6 interface 2 on PC2.

```
C:\>ipv6 if 2

```

The IPv6 interface 2 of PC2 automatically generates the link-local address fe80::5efe:3.1.2.1 in ISATAP format without obtaining the address prefix.

#Configure the destination address of the ISATAP tunnel as 1.0.0.1 on IPv6 interface 2 of PC2.

```
C:\>ipv6 rlu 2 1.0.0.1
```

#Check information about IPv6 interface 2 on PC2.

```
C:\>ipv6 if 2
Interface 2: Automatic Tunneling Pseudo-Interface
Guid {48FCE3FC-EC30-E50E-F1A7-71172AEEE3AE}
does not use Neighbor Discovery
uses Router Discovery
routing preference 1
EUI-64 embedded IPv4 address: 3.1.2.1
router link-layer address: 1.0.0.1
preferred global 2001::5efe:3.1.2.1, life 29d23h59m46s/6d23h59m46s (public)
preferred link-local fe80::5efe:3.1.2.1, life infinite
link MTU 1500 (true link MTU 65515)
current hop limit 255
reachable time 42500ms (base 30000ms)
retransmission interval 1000ms
DAD transmits 0
default site prefix length 48
```

The ipv6 interface 2 of PC2 obtains the address prefix 2001::/64 and generates the global unicast address 2001::5efe:3.1.2.1.

Step 6: Check the result.

#Ping the IPv6 interface 2 of PC2 on PC1 at address 2001::5efe:3.1.2.1.

```
C:\>ping 2001::5efe:3.1.2.1
Pinging 2001::5efe:3.1.2.1 with 32 bytes of data:
Reply from 2001::5efe:3.1.2.1: time<1ms
Reply from 2001::5efe:3.1.2.1: time<1ms
Reply from 2001::5efe:3.1.2.1 :time<1ms
```

```
Reply from 2001::5efe:3.1.2.1: time<1ms

Ping statistics for 2001::5efe:3.1.2.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

#PC1 is able to ping through to the IPv6 interface 2 of PC2 at address 2001::5efe:3.1.2.1.

# 48 IPv6 Tunnel

---

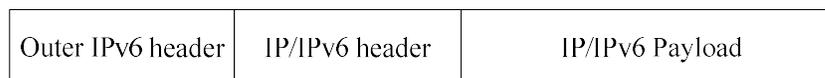

## 48.1 Overview

IPv6 (IPv4 over IPv6/IPv6 over IPv6) tunneling, one of many tunneling technologies, is similar to GRE (Generic Routing Encapsulation) tunneling in that the start and end points of the tunnel need to be manually configured. It is a virtual point-to-point connection that provides a transmission channel for encapsulated packets, with encapsulation and decapsulation of data packets at each end of the tunnel. IPv6 tunnels, which encapsulate both IPv4 data packets and IPv6 packets, enable these encapsulated data packets to be transmitted in IPv6 networks. When the data packet is an IPv4 packet, it is called an IPv4 over IPv6 tunnel, and when the data packet is an IPv6 packet, it is called an IPv6 over IPv6 tunnel, or if it does not distinguish whether the data packet is an IPv4 packet or an IPv6 packet, it is called an IPv6 tunnel.

- IPv4 Over IPv6/IPv6 Over IPv6 Tunnel Encapsulation

When an IPv6/IPv4 data packet is to be sent through an IPv6 tunnel, the tunnel adds an IPv6 packet header with the protocol number set to 4 in the IPv6 packet header, the source address in the IPv6 packet header is set to the source address of the tunnel, and the destination address in the IPv6 packet header is set to the destination address of the tunnel.

- IPv4 Over IPv6/IPv6 Over IPv6 Packet Structure

IP/IPv6 Payload: The IP/IPv6 packet load before entering the tunnel, acting as the payload of the tunnel packet.

IP/IPv6 Header: The header of the IP/IPv6 packet before entering the tunnel.

Outer IPv6 header: The encapsulated external IP packet header, which is a transport tool to enable IP/IPv6 packets to traverse another IPv6 network.

- IPv4 Over IPv6/IPv6 Over IPv6 Packet Forwarding

After the packet is encapsulated at the start of the IPv4 over IPv6/IPv6 over IPv6 tunnel, it is routed according to the encapsulated destination address and then sent out from the corresponding network interface. The intermediate device forwards it as a regular IPv6 packet until it reaches the end of the tunnel.

- IPv4 Over IPv6/IPv6 Over IPv6 Tunnel Decapsulation

The decapsulation process is the opposite of the encapsulation process. The tunnel endpoint receives the packet and analyzes the outer IP header first. If the destination address is its own address, the protocol field in the IPv6 header will be checked, and if the protocol field is 41, the packet is handed over to the IPv4 over IPv6/IPv6 over IPv6 tunnel for processing. After the tunnel removes the Outer IPv6 header of the packet, it performs routing based on the destination address of the decapsulated packet and performs subsequent processing based on the routing result.

## 48.2 IPv6 Tunnel Function Configuration

Table 48-1 IPv6 Tunnel Function Configuration List

Configuration Task	
Configure IPv6 tunnels.	Configure IPv4 over IPv6 tunnels.
	Configure IPv6 over IPv6 tunnels.

### 48.2.1 Configure IPv4 over IPv6 tunnels.

#### Configuration Condition

Before configuring IPv4 over IPv6 tunnels, ensure that

- Configuring the interface IPv4 address to make it reachable at the network layer of adjacent nodes.
- Create the tunnel interface and configure the basic parameters (refer to the tunnel interface configuration manual).
- Configure any unicast routing protocol or static route to make both ends of the tunnel reachable via route.

#### Configure IPv4 Over IPv6 Tunnels

Table 48-1 Configuring IPv4 Over IPv6 Tunnels

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the tunnel interface configuration mode.	interface tunnel tunnel-number	-
Configure tunnel interface addresses.	ip address ip-address { mask   mask-length }	Mandatory  By default, the tunnel interface address is not configured.
Configure the tunnel interface mode as IPv4 over IPv6.	tunnel mode ipipv6	Optional  By default, the tunnel interface mode is GRE over IPv4.
Configure the tunnel interface source address or interface name.	tunnel source { ipv6-address   interface-name }	Mandatory  By default, the tunnel interface is not configured with source address and interface name.
Configure the destination address of the tunnel interface.	tunnel destination { ipv6-address }	Mandatory  By default, the tunnel interface is not configured with destination address.

---

 **Note**

- The tunnel interface address needs to be configured with an IPv4 address, and the passenger protocol can only be an IPv4 protocol.
  - The source and destination addresses must be configured on both ends of the tunnel, and the addresses on both ends must be the source and destination addresses of each other.
-

- 
- When configuring the tunnel source, if the interface method is used, the first IPv6 address of the source interface is taken as the source address of the tunnel (not the linklocal address).
  - Both ends of the tunnel should be configured to the same tunnel mode, otherwise transmission through the tunnel will fail.
- 

## 48.2.2 Configure IPv6 over IPv6 tunnels.

### Configuration Condition

Before configuring IPv6 over IPv6 tunnels, ensure that

- Configuring the interface IPv6 address to make it reachable at the network layer of adjacent nodes.
- Create the tunnel interface and configure the basic parameters (refer to the tunnel interface configuration manual).
- Configure any unicast routing protocol or static route to make both ends of the tunnel reachable via route.

### Configure IPv6 Over IPv6 Tunnels

Table 48-2 Configuring IPv6 Over IPv6 Tunnels

Step	Command	Description
Enter the global configuration mode.	configure terminal	-
Enter the tunnel interface configuration mode.	interface tunnel tunnel-number	-
Configure tunnel interface addresses.	ipv6 address ipv6-address { mask   mask-length }	Mandatory By default, no address is configured on the tunnel interface.
Configure the tunnel interface mode as IPv6 over IPv6.	tunnel mode ipv6ipv6	Optional By default, the tunnel interface mode is GRE over IPv4.

Step	Command	Description
Configure the tunnel interface source address or interface name.	tunnel source { ipv6-address   interface-name }	Mandatory By default, the tunnel interface is not configured with source address and interface name.
Configure the destination address or host name of the tunnel interface.	tunnel destination { ipv6-address }	Mandatory By default, the tunnel interface is not configured with destination address.

---

### Note

- The tunnel interface address needs to be configured with an IPv6 address, and the passenger protocol can only be an IPv6 protocol.
  - The source and destination addresses must be configured on both ends of the tunnel, and the addresses on both ends must be the source and destination addresses of each other.
  - When configuring the tunnel source, if the interface method is used, the first IPv6 address of the source interface is taken as the source address of the tunnel (not the linklocal address).
  - Both ends of the tunnel should be configured to the same tunnel mode, otherwise transmission through the tunnel will fail.
- 

### 48.2.3 IPv6 Tunnel Monitoring and Maintaining

Refer to GRE Monitoring and Maintenance in Section 7.2.2 of the GRE Configuration Manual.

## 48.3 Typical Configuration Example of IPv6 Tunnel

### 48.3.1 Configure Basic Functions of IPv4 Over IPv6

#### Network Requirements

- IP Network1 and IP Network2 are the private IP networks of Device1 and Device3 respectively.
- IP Network1 and IP Network2 communicate through a IPv6 tunnel between Device1

and Device3.

## Network Topology

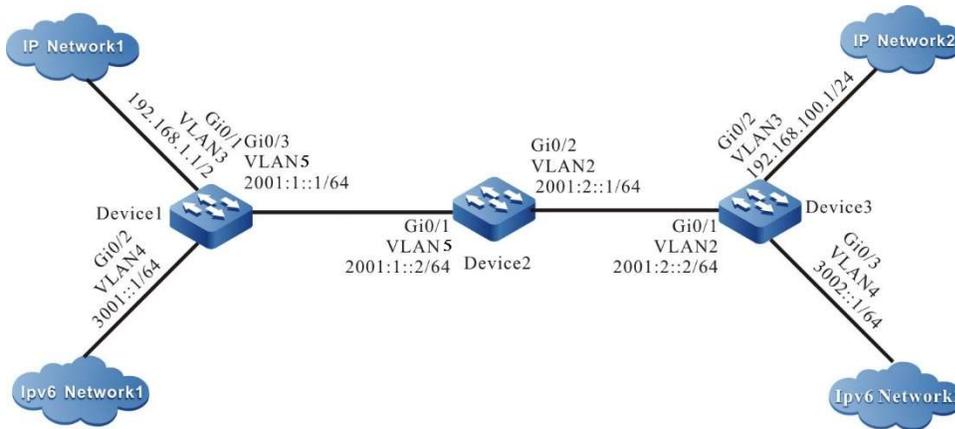

Figure 48-2 Network Topology for Configuring Basic Functions of IPv6 Tunnels

## Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure OSPFv3 to enable communication between Device1, Device2, and Device3.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.75.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan5
Device1(config-if-vlan5)#ipv6 router ospf tag 100 area 0
Device1(config-if-vlan5)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 1.2.75.1
Device2(config-ospf6)#exit
Device2(config)#interface vlan5
Device2(config-if-vlan5)#ipv6 router ospf tag 100 area 0
Device2(config-if-vlan5)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf tag 100 area 0
Device2(config-if-vlan2)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 1.1.73.1
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf tag 100 area 0
```

```
Device3(config-if-vlan2)#exit
```

### # Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
```

```
L ::1/128 [0/0]
   via ::, 6w0d:23:09:31, lo0
O 2001:1::/64 [110/2]
   via fe80::508b:fff:fee4:ff6, 00:08:37, vlan2
C 2001:2::/64 [0/0]
   via ::, 00:15:51, vlan2
L 2001:2::2/128 [0/0]
   via ::, 00:15:50, lo0
C 3002::/64 [0/0]
   via ::, 00:15:06, vlan4
L 3002::1/128 [0/0]
   via ::, 00:15:04, lo0
```

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

### Step 3: Configure IPv6 tunnels.

#Configure IPv6 tunnel1 on Device1, with the source address 2001:1::1, destination address 2001:2::2, IP address 10.0.0.1, and IPv6 address 10::1.

```
Device1(config)#interface tunnel 1
Device1(config-if-tunnel1)#tunnel mode ipv6
Device1(config-if-tunnel1)#tunnel source 2001:1::1
Device1(config-if-tunnel1)#tunnel destination 2001:2::2
Device1(config-if-tunnel1)#ip address 10.0.0.1 255.255.255.0
Device1(config-if-tunnel1)#ipv6 address 10::1/64
Device1(config-if-tunnel1)#exit
```

#Configure IPv6 tunnel1 on Device3, with the source address 2001:2::2, destination address 2001:1::1, IP address 10.0.0.2, and IPv6 address 10::2.

```
Device3(config)#interface tunnel 1
Device3(config-if-tunnel1)#tunnel mode ipv6
Device3(config-if-tunnel1)#tunnel source 2001:2::2
Device3(config-if-tunnel1)#tunnel destination 2001:1::1
Device3(config-if-tunnel1)#ip address 10.0.0.2 255.255.255.0
Device3(config-if-tunnel1)#ipv6 address 10::2/64
Device3(config-if-tunnel1)#exit
```

#Check information about IPv6 tunnel of Device3.

```
Device3#show tunnel 1
```

```
Tunnel 1:
```

```
Tunnel mode is ipipv6  
Source ipv6 address is 2001:2::2(Source ipv6 address is up on source interface vlan2)  
Destination ipv6 address is 2001:1::1  
Tunnel state is up  
Encapsulation vrf is global(0x0)  
TTL(time-to-live) is 255  
TOS(type of service) is not set
```

```
total(1)
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
  - When the tunnels are not in the same network segment, you need to configure static routes on the devices at both ends of a local tunnel to reach a peer tunnel, and the output interface is configured as the interface of the local tunnel.
- 

Step 4: Configure static routes.

#On Device1, configure a static route to the IP Network2 with the output interface as tunnel1.

```
Device1(config)#ip route 192.168.100.0 255.255.255.0 tunnel1
```

#On Device3, configure a static route to the IP Network1 with the output interface as tunnel1.

```
Device3(config)#ip route 192.168.1.0 255.255.255.0 tunnel1
```

#Check the routing table of Device3.

```
Device3#show ip route  
Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management  
D - Redirect, E - IRMP, EX - IRMP external, o - SNRP, B - BGP, i-ISIS
```

```
Gateway of last resort is not set
```

```
C 10.0.0.0/24 is directly connected, 00:17:12, tunnel1  
S 192.168.1.0/24 [1/100000] is directly connected, 00:00:10, tunnel1  
C 192.168.100.0/24 is directly connected, 00:00:28, vlan3
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
-

## 48.3.2 Configure Basic Functions of IPv6 Over IPv6

### Network Requirements

- IPv6 Network1 and IPv6 Network2 are the private IPv6 networks of Device1 and Device3 respectively.
- IPv6 Network1 and IPv6 Network2 communicate through a IPv6 tunnel between Device1 and Device3.

### Network Topology

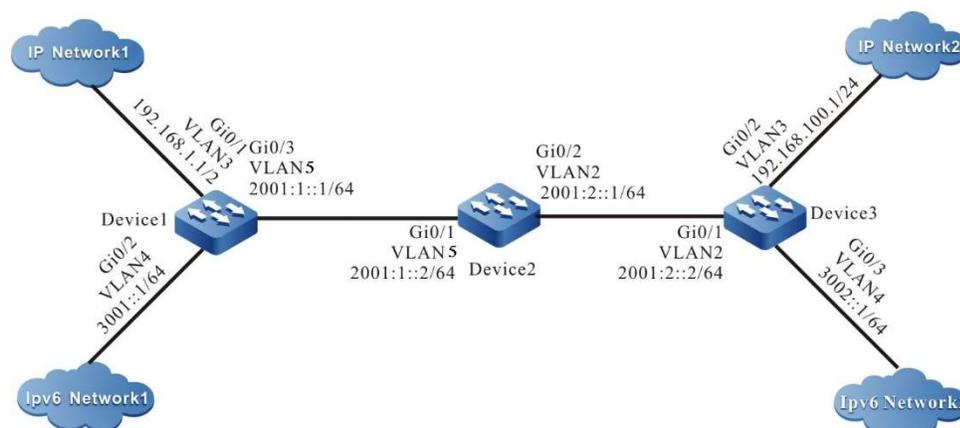

Figure 48-3 Network Topology for Configuring Basic Functions of IPv6 Tunnels

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure OSPFv3 to enable communication between Device1, Device2, and Device3.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.75.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan5
Device1(config-if-vlan5)#ipv6 router ospf tag 100 area 0
Device1(config-if-vlan5)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 1.2.75.1
Device2(config-ospf6)#exit
Device2(config)#interface vlan5
```

```
Device2(config-if-vlan5)#ipv6 router ospf tag 100 area 0
Device2(config-if-vlan5)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf tag 100 area 0
Device2(config-if-vlan2)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 1.1.73.1
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf tag 100 area 0
Device3(config-if-vlan2)#exit
```

### # Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
   via ::, 6w0d:23:09:31, lo0
O 2001:1::/64 [110/2]
   via fe80::508b:fff:fee4:ff6, 00:08:37, vlan2
C 2001:2::/64 [0/0]
   via ::, 00:15:51, vlan2
L 2001:2::2/128 [0/0]
   via ::, 00:15:50, lo0
C 3002::/64 [0/0]
   via ::, 00:15:06, vlan4
L 3002::1/128 [0/0]
   via ::, 00:15:04, lo0
```

---

## Note

- Device1 and Device2 are checked in the same way as Device3, the process of which is omitted.
- 

### Step 3: Configure IPv6 tunnels.

#Configure IPv6 tunnel1 on Device1, with the source address 2001:1::1, destination address 2001:2::2, IP address 10.0.0.1, and IPv6 address 10::1.

```
Device1(config)#interface tunnel 1
Device1(config-if-tunnel1)#tunnel mode ipv6ip6
Device1(config-if-tunnel1)#tunnel source 2001:1::1
Device1(config-if-tunnel1)#tunnel destination 2001:2::2
Device1(config-if-tunnel1)#ip address 10.0.0.1 255.255.255.0
Device1(config-if-tunnel1)#ipv6 address 10::1/64
Device1(config-if-tunnel1)#exit
```

#Configure IPv6 tunnel1 on Device3, with the source address 2001:2::2, destination address 2001:1::1, IP address 10.0.0.2, and IPv6 address 10::2.

```
Device3(config)#interface tunnel 1
Device3(config-if-tunnel1)#tunnel mode ipv6ip6
Device3(config-if-tunnel1)#tunnel source 2001:2::2
Device3(config-if-tunnel1)#tunnel destination 2001:1::1
Device3(config-if-tunnel1)#ip address 10.0.0.2 255.255.255.0
Device3(config-if-tunnel1)#ipv6 address 10::2/64
Device3(config-if-tunnel1)#exit
```

#Check information about IPv6 tunnel of Device3.

```
Device3#show tunnel 1

Tunnel 1:
  Tunnel mode is ipv6ip6
  Source ipv6 address is 2001:2::2(Source ipv6 address is up on source interface vlan2)
  Destination ipv6 address is 2001:1::1
  Tunnel state is up
  Encapsulation vrf is global(0x0)
  TTL(time-to-live) is 255
  TOS(type of service) is not set

total(1)
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
  - When the tunnels are not in the same network segment, you need to configure static routes on the devices at both ends of a local tunnel to reach a peer tunnel, and the output interface is configured as the interface of the local tunnel.
- 

Step 4: Configure static routes.

#On Device1, configure a static route to the IPv6 Network2 with the output interface as tunnel1.

```
Device1(config)#ipv6 route 3002::/64 tunnel1
```

#On Device3, configure a static route to the IPv6 Network1 with the output interface as tunnel1.

```
Device3(config)# ipv6 route 3001::/64 tunnel1
```

# Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L  ::1/128 [0/0]
   via ::, 6w0d:23:50:28, lo0
```

```
C 10::/64 [0/0]
  via ::, 00:12:23, tunnel1
L 10::2/128 [0/0]
  via ::, 00:12:22, lo0
O 2001:1::/64 [110/2]
  via fe80::508b:fff:fee4:ff6, 00:49:34, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:56:48, vlan2
L 2001:2::2/128 [0/0]
  via ::, 00:56:46, lo0
S 3001::/64 [1/100000]
  via ::, 00:00:14, tunnel1
C 3002::/64 [0/0]
  via ::, 00:56:02, vlan4
L 3002::1/128 [0/0]
  via ::, 00:56:01, lo0
```

---

## Note

- Device1 is checked in the same way as that of Device3, the process of which is omitted.
- 

# 49 Routing Basics

---

## 49.1 Overview

After a device receives a packet through an interface, the device selects a route according to the destination of the route and then forwards the packet to another interface. This process is called routing. In network devices, routes are stored in a routing table database. The packets search the routing table to determine the next hop and output interface according to the destination of the packets. Routes are categorized into three types according to their sources.

- Direct route: The route is generated based on the interface address. After a user configures the IP address of an interface, the device generates a direct route of the

network segment according to the IP address and mask.

- Static route: The route is manually configured by the user.
- Dynamic route: The route is discovered through the dynamic route discovery protocol. Based on whether the dynamic routing protocol is used within an autonomous domain, two types of dynamic routing protocols are available: Interior Gateway Protocol (IGP) and Exterior Gateway Protocol (EGP). Here an autonomous domain refers to a network which has a unified management organization and unified routing policy. A routing protocol that is used within an autonomous domain is an IGP. Common IGPs include Routing Information Protocol (RIP) and Open Shortest Path First (OSPF). EGPs are usually used for routing among multiple autonomous domains. A common EGP is BGP.

Routing supports load balancing, that is, multiple routes to the same destination. In forwarding packets, a device transmits packets in load balancing mode according to the routing table search result.

## 49.2 Routing Basic Function Configuration

Table 49 Routing Basic Function Configuration List

Configuration Task	
Configure load balancing for routing.	Configure the maximum number of load balancing entries.
	Configure the load balancing calculation method
Configure the capacity of routes for Virtual Route Forwarding (VRF) routes.	Configure the capacity of routes for Virtual Route Forwarding (VRF) routes.

### 49.2.1 Configure load balancing for routing.

#### Configuration Condition

None

#### Configure the maximum number of load balancing entries.

If the costs of several paths to one destination are the same, the paths form load balancing. Configuring the maximum number of load balancing entries helps to improve the link utility rate and reduce the load of links.

Table 1 Configuring Maximum Number of Load Balancing Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the maximum number of load balancing entries.	<b>route path-limit</b> <i>max-number</i>	Optional By default, the maximum number of load balancing entries for routing is 4.

### Configure the load balancing calculation method

There are three load balancing calculation methods:

- Based on source and destination address: Identify a flow with source address and a destination address. The packets of the same flow follow the same path to keep in order. When the loads of each flow are not balanced, the unbalancing of line loads may be caused.
- Based on source address: Identify a flow with source address only. The packets of the same flow use the same path so that the same flow follows the same path to keep in order. When the loads of each flow are not balanced, the unbalancing of line loads may be caused.
- Based on packets: The packets going to the same destination follow different paths to achieve load balancing on each path as much as possible. But they may be out of order.

Table 1-3 Configuring Load Balancing Calculation Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv4 packet load balancing method	<b>ip load-sharing { per-destination   per-packet   per-source }</b>	Optional By default, the calculation method based on source and address address is used.

## 49.2.2 Configure the capacity of routes for Virtual Route Forwarding (VRF) routes.

### Configuration Condition

None

### Configure the capacity of routes for Virtual Route Forwarding (VRF) routes.

To ensure normal use of devices and prevents a large number of routes from consuming too many resources, you can use the routing-table limit command to limit the capacity of routes for each Virtual Route Forwarding (VRF). When the capacity of routes reaches the threshold, an alarm is generated.

Table 2 Configuring Capacity of VRF Routes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VRF configuration mode	<b>ip vrf</b> <i>vrf-name</i>	-
Configure the capacity of routes for Virtual Route Forwarding (VRF) routes.	<b>routing-table limit</b> <i>limit-value</i> { <i>threshold-value</i>   <b>syslog-alert</b> }	Optional By default, the route capacity is 880000. When the number of routes reaches 80% of the capacity, warning information is printed.

---

### Note

- This command cannot limit the route capacity under global VRF.
  - If the routing entries exceed the capacity, the new routing information will be lost.
-

### 49.2.3 Routing Basic Monitoring and Maintaining

Table 3 Routing Basic Monitoring and Maintaining

Command	Description
<b>clear ip route</b> [ <i>vrf vrf-name</i> ] { <i>ip-address mask</i>   <b>all</b> }	Clear the specified IP routes in the routing table
<b>show ip route</b> [ <i>vrf vrf-name</i> ] [ <b>bgp</b>   <b>connected</b>   <b>irmp</b>   <b>isis</b>   <b>ospf</b>   <b>rip</b>   <b>static</b>   <b>statistic</b> [ <b>all</b> ]   <i>ip-address</i> { <i>mask</i>   <i>mask-len</i> } ]	Show the information of IP routes

# 50 IPv6 Routing Basics

---

## 50.1 Overview

After a device receives an IPv6 packet through an interface, the device selects a route according to the destination of the IPv6 packet and then forwards it to another interface. This process is called routing. In network devices, routes are stored in a routing table database. The packets search the routing table to determine the next hop and output interface according to the destination of the packets. Routes are categorized into three types according to their sources.

- Direct route: The route is generated based on the interface address. After a user configures the IPv6 address of an interface, the device generates a direct route of the network segment according to the this address and mask.
- Static route: The route is manually configured by the user.
- Dynamic route: The route is discovered through the dynamic route discovery protocol. Based on whether the dynamic routing protocol is used within an autonomous domain, two types of dynamic routing protocols are available: Interior Gateway Protocol (IGP) and Exterior Gateway Protocol (EGP). Here an autonomous domain refers to a network which has a unified management organization and unified routing policy. A routing protocol that is used within an autonomous domain is an IGP. Common IGPs include RIPng and OSPFv6. Exterior Gateway Protocols (EGPs) are usually used for routing among multiple autonomous domains. A common EGP is IPv6 BGP.

Routing supports load balancing, that is, multiple routes to the same destination. In forwarding packets, a device transmits packets in load balancing mode according to the routing table search result.

## 50.2 IPv6 routing basic function configuration

Table 50 IPv6 Routing Basic Function Configuration List

Configuration Task	
Configure IPv6 routing load balancing	Configure IPv6 load balancing calculation method

## 50.2.1 Configure IPv6 routing load balancing

### Configuration Condition

None

### Configure IPv6 load balancing calculation method

There are three load balancing calculation methods:

- Based on source and destination address: Identify a flow with source address and a destination address. The packets of the same flow follow the same path to keep in order. When the loads of each flow are not balanced, the unbalancing of line loads may be caused.
- Based on source address: Identify a flow with source address only. The packets of the same flow use the same path so that the same flow follows the same path to keep in order. When the loads of each flow are not balanced, the unbalancing of line loads may be caused.
- Based on packets: The packets going to the same destination follow different paths to achieve load balancing on each path as much as possible. But they may be out of order.

Table 50 Configuring IPv6 Load Balancing Calculation Method

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv6 packet load balancing method	<b>ipv6 load-sharing { per-destination   per-packet   per-source }</b>	Optional By default, the calculation method based on source and address address is used.

## 50.2.2 IPv6 routing basic monitoring and maintaining

Table 1 IPv6 Routing Basic Monitoring and Maintaining

Command	Description
<b>clear ipv6 route</b> { <i>ipv6-address</i>   <i>ipv6-prefix</i>   <b>all</b> }	Clear the specified IPv6 routes in the routing table
<b>show ipv6 route</b> [ <b>vrf</b> <i>vrf-name</i> ] [ <i>ipv6-address</i>   <i>ipv6-prefix</i>   <b>bgp</b>   <b>brief</b>   <b>connected</b>   <b>isis</b>   <b>linklocal</b>   <b>local</b>   <b>ospf</b>   <b>rip</b>   <b>static</b>   <b>statistic</b>   <b>all</b> ]	Show the information of IPv6 routes

# 51 Static Routes

---

## 51.1 Overview

A static route is a self-defined route which is manually configured by a user. It specifies a path for transmitting IP packets which are targeted at a specified destination.

Compared with dynamic routing, static routing has higher security and lower device resource occupancy. The disadvantage is that when the network topology changes, manual configuration is required, and there is no automatic re-configuration mechanism.

Static routes do not occupy line bandwidth or occupy CPU to calculate and advertise routes periodically, improving the device and network performance.

Static routes can be used to ensure the security of a small-scale network, for example, in a network where there is only one path connecting to an external network. In a large-scale network, static routes can implement security control on services or links of certain types. A majority of networks adopt dynamic routing protocols but you can still configure some static routes for special purposes.

Static routes can be re-distributed to a dynamic routing protocol, but dynamic routes cannot be re-distributed to static routes. Note that improper static route configuration may cause routing loops.

The default route is a special route which can be a static route. In a routing table, the default route is a route to network 0.0.0.0 with the mask 0.0.0.0. You can use the `show ip route` command to check whether the route is valid. When the destination address of a received packet does not match any entry in the routing table, the packet takes the default route. If no default route is available and the destination is not in the routing table, the packet is discarded, and an ICMP packet is returned to the source end reporting that the destination address or network is not reachable. To prevent the routing table from becoming too large, you can set a default route. The packet that fails to find a matching routing table entry takes the default route for forwarding.

Null0 route is a special route with an Null0 interface. Null0 interface is always UP, though it cannot forward data packets. The data packets sent to this interface are all discarded. When a static route is configured to reach the output interface Null0 of a certain network segment, any packet sent to that network segment will be discarded. Therefore, the packet filtering function can be implemented by configuring a Null0 static route.

## 51.2 Static Routing Function Configuration

Table 51 Static Routing Function Configuration List

Configuration Task	
Configure a Static Route	Configure a Static Route
Configure the Default Administrative Distance	Configure the Default Administrative Distance
Configure the Recursive Function	Configure the Recursive Function
Configure Load Balancing Routes	Configure Load Balancing Routes
Configure a Floating Route	Configure a Floating Route
Configure a Static Route to Coordinate with BFD	Configure a Static Route to Coordinate with BFD
Configure a Static Route to Coordinate with Track	Configure a Static Route to Coordinate with Track

### 51.2.1 Configure a Static Route

#### Configuration Condition

Before configuring a static route, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.

#### Configure a Static Route

According to the parameters that have been specified, static routes are categorized into the following three types:

- Interface route: For an interface route, only the output interface is specified.
- Gateway route: For a gateway route, only the gateway address is specified.
- Interface gateway route: For an interface gateway route, both the output interface and the gateway address are specified.

Configured static routes become invalid if some of the following conditions are met:

- 1) The destination address is the local interface address.
- 2) The destination address is the network of the local direct interface.
- 3) The administrative distance of the route is 255.
- 4) The output interface of the route is DOWN.
- 5) No IP address has been configured for the output interface of the route.
- 6) The gateway address is not reachable.
- 7) The output interface and the gateway of the route conflict.
- 8) The output interface of the route does not exist.
- 9) The TRACK object that is associated with the route is "fake".
- 10) The status of the Bidirectional Forwarding Detection (BFD) session that is associated with the route is DOWN.

If an interface route meets any one condition among 1), 2), 3), 4), 5), 8), and 10), the route is invalid. If a gateway route meets any one condition among 1), 2), 3), 4), 6), 8), 9), and 10), the route is invalid. If an interface gateway route meets any of the above conditions, the route is invalid.

Table 51 Configuring Static Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure a Static Route	<b>ip route [ vrf vrf-name1 destination-ip-address destination-mask { interface-name / [ nexthop-ip-address [ vrf vrf-name2 ] ] } [ name nexthop-name ] [ tag tag-value ] [ track track-id ] [ administrative-distance ]</b>	Mandatory  <i>Administrative-distance</i> is the administrative distance of the static route. When it is not specified, the default value is used.

### Note

- When configuring the default route, both destination network and mask should be 0.0.0.0.
- The output interface of Null0 route should be configured as Null0.
- No IP address is required for the output interface of Null0 route.

## 51.2.2 Configure the Default Administrative Distance

### Configuration Condition

None

### Configure the Default Administrative Distance

The smaller the administrative distance that is specified for a static route in configuring the static route is, the higher the priority of the route is. If the administrative distance is not specified, the default administrative distance is used. You can modify the default administrative distance dynamically. After the default administrative distance is re-configured, the new default administrative distance is valid only for new static routes.

Table 1 Configuring Default Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enters the static route configuration mode.	<b>router static</b>	-
Configure the Default Administrative Distance	<b>distance</b> <i>administration-distance</i>	Optional The value of default administrative distance is 1.

---

### Note

- When using the **ip route** command to configure a static route, you can specify the administrative distance separately (*administrative-distance* parameter). If the administrative distance is not specified, use the default administrative distance.
- 

## 51.2.3 Configure the Recursive Function

### Configuration Condition

None

## Configure the Recursive Function

If the gateway address that is configured for a route is valid only when a route to the gateway is reachable, you must enable the recursive function of the static route to validate the route. By default, the recursive function is enabled for a static route.

Table 2 Configuring Recursive Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enters the static route configuration mode.	<b>router static</b>	-
Configure a static route to support the recursive function.	<b>recursion</b>	Optional By default, a static route supports the recursive function for routing.

## 51.2.4 Configure Load Balancing Routes

### Configuration Condition

None

### Configure Load Balancing Routes

Load balancing routes means that multiple routes are configured to the same destination network. The output interfaces and the gateway addresses of the routes are different, but the administrative distances (priorities) of the routes are the same. Load balancing routes help to improve the link utility rate.

Table 3 Configuring Load Balancing Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the first load balancing route	<b>ip route</b> <i>destination-ip-address destination-mask interface-name1 distance</i>	Mandatory The output interface is interface-name1.

Step	Command	Description
Configure the second load balancing route	<b>ip route</b> <i>destination-ip-address destination-mask interface-name2 distance</i>	Mandatory The output interface is <i>interface-name2</i> .

### Note

- When configuring the load balancing route, the *distance* values should be equal.

## 51.2.5 Configure a Floating Route

### Configuration Condition

None

### Configure a Floating Route

Multiple routes are available to the same destination network. The output interfaces or gateway addresses of the routes are different, and the priorities of the routes are also different. The route with the higher priority becomes the primary route while the route with the lower priority becomes the floating route. In the routing table, only the primary route is visible. The floating table appears in the routing table only when the primary route becomes invalid. Therefore, the floating route is usually used as a backup route.

Table 4 Configuring Floating Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure the preferred route	<b>ip route</b> <i>destination-ip-address destination-mask interface-name1 distance1</i>	Mandatory The output interface of preferred route is <i>interface-name1</i> , and the priority is <i>distance1</i> .
Configure a Floating Route	<b>ip route</b> <i>destination-ip-address destination-mask interface-name2 distance2</i>	Mandatory The output interface of the floating route is <i>interface-name2</i> , and the

Step	Command	Description
		priority is <i>distance2</i> . The value of <i>distance2</i> should be greater than <i>distance1</i> .

### Note

- For the priority of the specified route, the smaller the *distance* value, the higher the priority.

## 51.2.6 Configure a Static Route to Coordinate with BFD

### Configuration Condition

None

### Configure a Static Route to Coordinate with BFD

The BFD (Bidirectional Forwarding Detection) protocol can quickly detect the connection status of the forwarding path between two adjacent routers under a light load. By using this method, the protocol neighbor can quickly identify the connection failure of the forwarding path. Unlike other dynamic protocol routing, static routing cannot detect communication link failures. BFD enables static routing to quickly detect these communication link failures. By making static routing coordinate with BFD, you can realize fast switch between routes. Currently, static routing only allows to establish an asynchronous BFD detection mode, so it is necessary to coordinate with BFD on the devices at both ends of the link.

When the BFD status associated with static route is DOWN, the static route configured will become invalid.

Table 51 Configuring Coordination of Static Route with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure a static route	<b>ip route</b> <i>destination-ip-address destination-mask interface-name nexthop-ip-address</i>	Mandatory Only the static route with the output interface and gateway address specified at the same

Step	Command	Description
		time can coordinate with BFD
Configure the output interface and next hop address of the route associated with BFD	<b>ip route static bfd</b> <i>interface-name nexthop-ip-address</i>	Mandatory <i>nexthop-ip-address</i> is the next hop address of direct route

---

### Note

- For bfd introduction and its basic function configuration, refer to the bfd-related section in the User Manual;
- 

## 51.2.7 Configure a Static Route to Coordinate with Track

### Configuration Condition

None

### Configure a Static Route to Coordinate with Track

Some modules in the system need to monitor some system information and then determine their working modes based on the information. The objects that are monitored by the other modules are called monitoring objects. To simplify the relations between the modules and monitoring objects, Track objects are used. A Track object can contain multiple monitoring objects, and it displays the comprehensive status of the monitoring object to external modules. The external modules are associated only with Track objects and they do not care about monitoring objects contained in the Track objects any more. A Track object has two statuses, "true" and "false". The external modules that are associated with the Track object determine its working modes according to the Track object status.

A static route can associate with a Track object to monitor system information and determine whether the route is valid according to the status reported by the Track object. If the Track object reports "true", the conditions required by the static route are satisfied, and the route is added to the routing table. If the Track object reports "false", the route is deleted from the routing table.

Table 5 Configuring a Static Route to Coordinate with TRACK

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create Track object and enter its configuration mode	<b>track track-id</b>	Mandatory
Configure the link status of the specified interface for Track object monitoring	<b>interface interface-name line-protocol</b>	Optional
Return to the global configuration mode	<b>exit</b>	-
Configure a static route and associate with Track	<b>ip route destination-ip-address destination-mask interface-name track track-id</b>	Mandatory When the link layer of the monitoring interface is UP, the route takes effect; otherwise, it becomes invalid.

## 51.2.8 Configure static route FRR

### Configuration Condition

Before configuring static route FRR, ensure that:

- Use a routing map to specify the output interface and next hop address of the backup route;

### Configure static route FRR

In the network using static route, the traffic interruption caused by link or device failure will continue until the protocol detects the link failure. It recovers only after the floating route takes effect in several seconds. Static route FRR can reduce the time of traffic interruption. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic passing through the main link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 51 Configuring Static Route FRR

To...	Command	Description
Enter the system	<b>configure terminal</b>	-

To...	Command	Description
configuration mode		
Configure static route FRR	<b>ip route static fast-reroute route-map <i>map-name</i></b>	Mandatory By default, the FRR is disabled.
Configure automatic FRR of static route	<b>ip route static pic</b>	Mandatory By default, the automatic FRR is disabled.

---

 **Note**

- FRR is applicable to the static route with the output interface and gateway address specified at the same time only;
  - When the FRR based on route-map set fast-reroute backup-nexthop is auto, the protocol enables automatic FRR.
  - When pic method is used, the protocol enables automatic FRR.
  - The methods of enabling FRR are mutually exclusive.
- 

### 51.2.9 Static route monitoring and maintaining

Table 6 Static Route Monitoring and Maintaining

Command	Description
<b>show ip route [ vrf <i>vrf-name</i> ] static</b>	Show the static route in the routing table
<b>show running-config ip route</b>	Show the configuration information of static route

## 51.3 Typical configuration example of static route

### 51.3.1 Configure basic functions of static route

#### Network Requirements

- Configure static routes for Device1, Device2 and Device3 to achieve intercommunication between PC1 and PC2.

#### Network Topology

Figure 51 Network Topology for Configuring Basic Functions of Static Route

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure static routes.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ip route 20.1.1.0 255.255.255.0 10.1.1.2
Device1(config)#ip route 100.1.1.0 255.255.255.0 10.1.1.2
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ip route 110.1.1.0 255.255.255.0 10.1.1.1
Device2(config)#ip route 100.1.1.0 255.255.255.0 20.1.1.2
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ip route 0.0.0.0 0.0.0.0 20.1.1.1
```

#### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.1.1.0/24 is directly connected, 00:06:47, vlan3
S 20.1.1.0/24 [1/100] via 10.1.1.2, 00:00:13, vlan3
S 100.1.1.0/24 [1/100] via 10.1.1.2, 00:00:05, vlan3
C 110.1.1.0/24 is directly connected, 00:08:21, vlan2
C 127.0.0.0/8 is directly connected, 28:48:33, lo0
```

#### #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 00:00:37, vlan2
C 20.1.1.0/24 is directly connected, 00:00:27, vlan3
S 100.1.1.0/24 [1/100] via 20.1.1.2, 00:00:05, vlan3
S 110.1.1.0/24 [1/100] via 10.1.1.1, 00:00:13, vlan2
C 127.0.0.0/8 is directly connected, 30:13:18, lo0
```

#### #Check the routing table of Device3.

```
Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

S 0.0.0.0/0 [1/100] via 20.1.1.1, 00:00:07, vlan2
C 20.1.1.0/24 is directly connected, 00:00:08, vlan2
C 100.1.1.0/24 is directly connected, 00:00:13, vlan3
C 127.0.0.0/8 is directly connected, 29:17:19, lo0
```

Step 4: Check the result. Use the **ping** command to check the connectivity between PC1 and PC2.

#### #Use the **ping** command to check connectivity on PC1.

```
C:\Documents and Settings\Administrator>ping 100.1.1.2

Pinging 100.1.1.2 with 32 bytes of data:

Reply from 100.1.1.2: bytes=32 time<1ms TTL=125

Ping statistics for 100.1.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

PC1 and PC2 can communicate with each other.

### 51.3.2 Configure static floating route

#### Network Requirements

- On Device1, configure two static routes leading to the network segment 192.168.1.0/24, one through Device2 and the other through Device3.
- Device1 prefers to use the line between it and Device2 to forward packets; when this line fails, it will switch to Device3 for communication.

## Network Topology

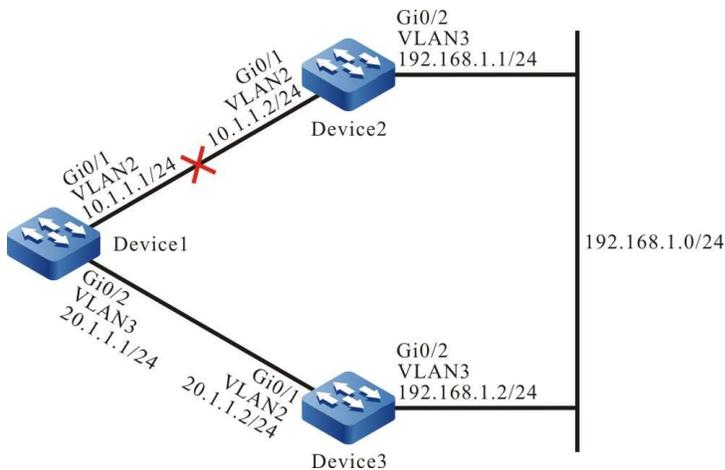

Figure 51 Network Topology for Configuring Static Floating Route

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure static routes.

#Enable Device1 to pass through Device2 and Device3 towards the network segment 192.168.1.0/24.

```
Device1#configure terminal
Device1(config)#ip route 192.168.1.0 255.255.255.0 10.1.1.2
Device1(config)#ip route 192.168.1.0 255.255.255.0 20.1.1.2
```

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 02:16:43, vlan2
C 20.1.1.0/24 is directly connected, 03:04:15, vlan3
C 127.0.0.0/8 is directly connected, 14:53:00, lo0
S 192.168.1.0/24 [1/100] via 10.1.1.2, 00:00:05, vlan2
  [1/100] via 20.1.1.2, 00:00:02, vlan3
```

It can be seen that there are two routes that can get to the network segment 192.168.1.0/24 on Device1, reaching load balancing.

Step 4: Configure floating route.

#Configure Device1. Modify the gateway as 20.1.1.2 and make the administrative distance of the route 15 so that it can become a floating route.

```
Device1(config)#ip route 192.168.1.0 255.255.255.0 20.1.1.2 15
```

Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 02:28:25, vlan2
C 20.1.1.0/24 is directly connected, 03:15:58, vlan3
C 127.0.0.0/8 is directly connected, 15:04:42, lo0
S 192.168.1.0/24 [1/100] via 10.1.1.2, 00:11:47, vlan2
```

According to the routing table, since the route with an administrative distance of 1 comes before the route with an administrative distance of 15, the route with a gateway of 20.1.1.2 is deleted.

#When the lines between Device1 and Device2 fail, view the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 20.1.1.0/24 is directly connected, 03:23:44, vlan3
C 127.0.0.0/8 is directly connected, 15:12:28, lo0
S 192.168.1.0/24 [15/100] via 20.1.1.2, 00:00:02, vlan3
```

The routing table indicates that the route with a larger administrative distance will be added into the routing table to be forwarded by Device3.

---

## Note

- Route backup is the most important feature of static floating route.
- 

### 51.3.3 Configure static Null0 interface route

#### Network Requirements

- Configure a static default route on Device1 and Device2 respectively. The gateway address is the address of the interface address of the peer ports of the 2 devices. Configure a static Null0 interface route for Device1 to filter the data leading to PC2 only.

#### Network Topology

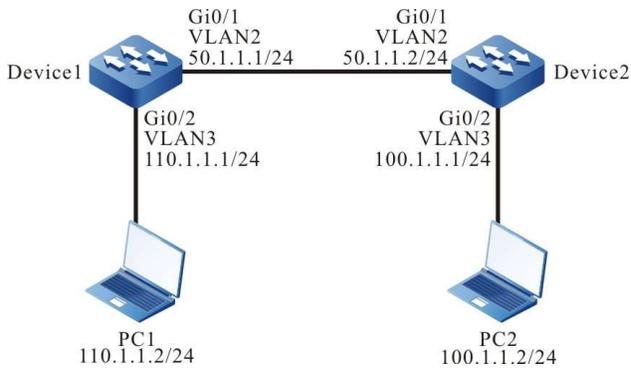

Figure 1 Network Topology for Configuring Static Null0 Interface Route

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure static routes.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ip route 0.0.0.0 0.0.0.0 50.1.1.2
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ip route 0.0.0.0 0.0.0.0 50.1.1.1
```

#### #On PC1, use the **ping** command to verify the connectivity with PC2.

```
C:\Documents and Settings\Administrator>ping 100.1.1.2

Pinging 100.1.1.2 with 32 bytes of data:

Reply from 100.1.1.2: bytes=32 time<1ms TTL=126

Ping statistics for 100.1.1.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

Step 4: Configure static Null0 interface route.

#### #Configure Device1.

```
Device1(config)#ip route 100.1.1.2 255.255.255.255 null0
```

Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

S 0.0.0.0/0 [1/100] via 50.1.1.2, 00:07:28, vlan2
C 50.1.1.0/24 is directly connected, 00:07:34, vlan2
C 110.1.1.0/24 is directly connected, 00:00:08, vlan3
C 127.0.0.0/8 is directly connected, 11:46:35, lo0
S 100.1.1.2/32 [1/1] is directly connected, 00:02:31, null0
```

The static Null0 interface route has been added to the routing table.

#On PC1, use the ping command to verify the connectivity with PC2.

```
C:\Documents and Settings\Administrator>ping 100.1.1.2

Pinging 100.1.1.2 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 100.1.1.2:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss)
```

After looking up in the routing table on Device1, the ICMP packet sent by PC1 which finds that the output interface is Null0 will be directly discarded. Therefore, PC1 cannot communicate with PC2.

---

## Note

- Static Null0 interface route is a special route. The data packets sent to this Null0 interface are all discarded. Therefore, configuring static Null0 interface route can realize packet filtering.
- 

### 51.3.4 Configure static recursive route

#### Network Requirements

- On Device1, configure two static routes leading to the network segment 192.168.1.1/32, one through Device2 and the other through Device3. Device1 prefers to use the lines between it and Device3 to forward packets.
- On Device1, configure a static recursive route leading to the network segment 200.0.0.0/24. The gateway address is the loopback interface address 192.168.1.1 of Device3. After the lines between Device1 and Device3 fail, this route will switch to Device2 for communication.

## Network Topology

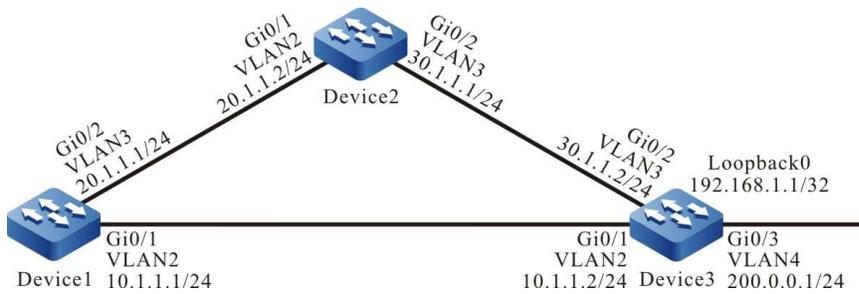

Figure 2 Network Topology for Configuring Static Recursive Route

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure static routes.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ip route 192.168.1.1 255.255.255.255 10.1.1.2
Device1(config)#ip route 192.168.1.1 255.255.255.255 20.1.1.2 10
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ip route 192.168.1.1 255.255.255.255 30.1.1.2
```

Step 4: Configure static recursive route.

#### #Configure Device1.

```
Device1(config)#ip route 200.0.0.0 255.255.255.0 192.168.1.1
```

#### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 00:04:07, vlan2
C 20.1.1.0/24 is directly connected, 00:03:58, vlan3
C 127.0.0.0/8 is directly connected, 73:10:12, lo0
S 200.0.0.0/24 [1/100] via 192.168.1.1, 00:00:08, vlan2
S 192.168.1.1/32 [1/100] via 10.1.1.2, 00:01:46, vlan2
```

The routing table indicates that the gateway address of the route 200.0.0.0/24 is 192.168.1.1, and the output interface is VLAN2. This route depends on the route 192.168.1.1/32.

Step 5: Check the result.

#When the lines between Device1 and Device3 fail, view the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 20.1.1.0/24 is directly connected, 00:09:04, vlan3
C 127.0.0.0/8 is directly connected, 73:15:18, lo0
S 200.0.0.0/24 [1/100] via 192.168.1.1, 00:00:02, vlan3
S 192.168.1.1/32 [10/100] via 20.1.1.2, 00:00:02, vlan3
```

By comparing with the routing table mentioned in step 3, you will find that the output interface of the route 200.0.0.0/24 is VLAN3, which means it has switched to Device2 for communication.

### 51.3.5 Configure a Static Route to Coordinate with BFD

#### Network Requirements

- On Device1, configure two static routes leading to the network segment 201.0.0.0/24, one through Device2 and the other through Device3. Device1 prefers to use the lines between it and Device3 to forward packets. Likewise, configure two static routes leading to the network segment 200.0.0.0/24 on Device3 which prefers to use the lines between it and Device1 to forward packets.
- Configure static route on Device1 and Device3 to coordinate with BFD. When the lines between Device1 and Device3 fail, it will quickly switch to Device2 for communication.

#### Network Topology

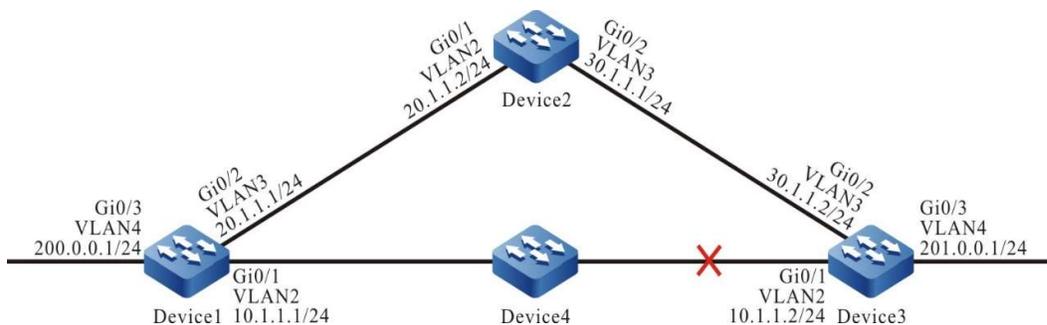

Figure 3 Network Topology for Configuring Coordination of Static Route with BFD

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure static routes.

#On Device1, configure two static routes leading to the network segment 201.0.0.0/24.

```
Device1#configure terminal
Device1(config)#ip route 201.0.0.0 255.255.255.0 vlan2 10.1.1.2
Device1(config)#ip route 201.0.0.0 255.255.255.0 vlan3 20.1.1.2 10
```

#On Device2, configure static route leading to network segments 200.0.0.0/24 and 201.0.0.0/24.

```
Device2#configure terminal
Device2(config)#ip route 200.0.0.0 255.255.255.0 20.1.1.1
Device2(config)#ip route 201.0.0.0 255.255.255.0 30.1.1.2
```

#On Device3, configure two static routes leading to the network segment 200.0.0.0/24.

```
Device3#configure terminal
Device3(config)#ip route 200.0.0.0 255.255.255.0 vlan2 10.1.1.1
Device3(config)#ip route 200.0.0.0 255.255.255.0 vlan3 30.1.1.1 10
```

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 00:07:41, vlan2
C 20.1.1.0/24 is directly connected, 00:07:29, vlan3
C 127.0.0.0/8 is directly connected, 101:56:14, lo0
C 200.0.0.0/24 is directly connected, 00:15:33, vlan4
S 201.0.0.0/24 [1/100] via 10.1.1.2, 00:02:23, vlan2
```

#Check the routing table of Device3.

```
Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 00:10:21, vlan2
C 30.1.1.0/24 is directly connected, 00:10:09, vlan3
C 127.0.0.0/8 is directly connected, 126:44:08, lo0
S 200.0.0.0/24 [1/100] via 10.1.1.1, 00:06:12, vlan2
C 201.0.0.0/24 is directly connected, 00:20:37, vlan4
```

Step 4: Configure static route to coordinate with BFD.

#Configure Device1.

```
Device1(config)#bfd fast-detect
Device1(config)#ip route static bfd vlan2 10.1.1.2
```

#Configure Device3.

```
Device3(config)#bfd fast-detect
Device3(config)#ip route static bfd vlan2 10.1.1.1
```

Step 5: Check the result.

#View the BFD session of Device1.

```
Device1#show bfd session
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.1.1.1      10.1.1.2      15/22      UP          5000          vlan2
```

#View the BFD session of Device3.

```
Device3#show bfd session
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.1.1.2      10.1.1.1      22/15      UP          5000          vlan2
```

The BFD sessions on Device1 and Device3 are properly established, which means the static route has been successively coordinate with BFD.

#When the lines between Device1 and Device3 fail, the BFD will quickly identify these failures and switch to Device2 for communication. View the BFD session and routing table of Device1.

```
Device1#show bfd session
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.1.1.1      10.1.1.2      15/0          DOWN          5000          vlan2
```

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.1.1.0/24 is directly connected, 00:29:07, vlan2
C 20.1.1.0/24 is directly connected, 00:28:55, vlan3
C 127.0.0.0/8 is directly connected, 102:17:40, lo0
C 200.0.0.0/24 is directly connected, 00:36:58, vlan4
S 201.0.0.0/24 [10/100] via 20.1.1.2, 00:00:09, vlan3
```

On Device3, the BFD is processed in a manner which is similar to that on Device1.

### 51.3.6 Configure static route FRR

#### Network Requirements

- On Device1, configure two static routes leading to the network segment 192.168.1.1/32, one through Device2 and the other through Device3. Device1 prefers to use the lines between it and Device3 to forward packets. Likewise, configure two static routes leading to the network segment 100.1.1.1/32 on Device3 which prefers to use the lines between it and Device1 to forward packets.
- Enable static route FRR on Device1 and Device3. When the lines between Device1 and Device3 fail, the service can quickly switch to Device2 for communication.

#### Network Topology

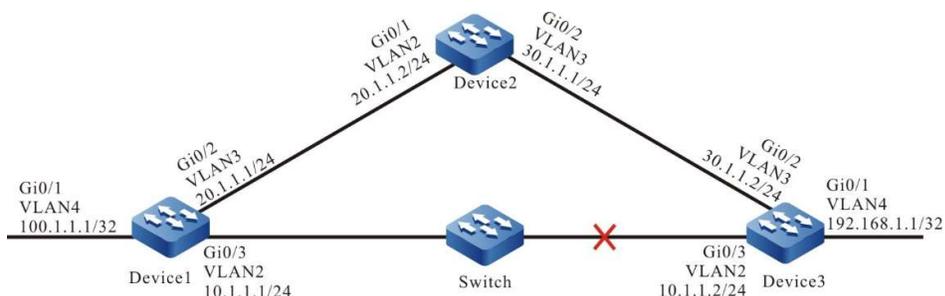

Figure 4 Network Topology for Configuring Static Route FRR

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IP address of each interface (Omitted).

Step 2: Configure static routes.

#On Device1, configure two static routes leading to 192.168.1.1/32. In particular, the administrative distance of the route with a gateway of 20.1.1.2 is 10 so that it can become a floating route.

```
Device1#configure terminal
Device1(config)#ip route 192.168.1.1 255.255.255.255 vlan 2 10.1.1.2
Device1(config)#ip route 192.168.1.1 255.255.255.255 vlan 3 20.1.1.2 10
```

#On Device2, configure the static routes leading to 100.1.1.1/32 and 192.168.1.1/32.

```
Device2#configure terminal
Device2(config)#ip route 192.168.1.1 255.255.255.255 30.1.1.2
Device2(config)#ip route 100.1.1.1 255.255.255.255 20.1.1.1
```

#On Device3, configure two static routes leading to 100.1.1.1/32. In particular, the administrative distance of the route with a gateway of 30.1.1.1 is 10 so that it can become a floating route.

```
Device3#configure terminal
Device3(config)#ip route 100.1.1.1 255.255.255.255 vlan 2 10.1.1.1
Device3(config)#ip route 100.1.1.1 255.255.255.255 vlan 3 30.1.1.1 10
```

Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 192.168.1.1/32 only, and filter other networks. The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 20.1.1.2.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 192.168.1.1 0.0.0.0
Device1(config-std-nacl)#exit
Device1(config)#route-map ipfir_static
Device1(config-route-map)#match ip address 1
Device1(config-route-map)#set fast-reroute backup-interface vlan3 backup-nexthop 20.1.1.2
Device1(config-route-map)#exit
```

#On Device3, configure route-map to invoke ACL to match 100.1.1.1/32 only, and filter other networks. The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 30.1.1.1.

```
Device3(config)#ip access-list standard 1
Device3(config-std-nacl)#permit 100.1.1.1 0.0.0.0
Device3(config-std-nacl)#exit
Device3(config)#route-map ipfir_static
Device3(config-route-map)#match ip address 1
Device3(config-route-map)#set fast-reroute backup-interface vlan3 backup-nexthop 30.1.1.1
Device3(config-route-map)#exit
```

Step 4: Configure FRR.

#On Device1, enable static route FRR.

```
Device1(config)#ip route static fast-reroute route-map ipfrr_static
```

#On Device3, enable static route FRR.

```
Device3(config)#ip route static fast-reroute route-map ipfrr_static
```

Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
C 10.1.1.0/24 is directly connected, 00:31:17, vlan2
L 10.1.1.1/32 is directly connected, 00:31:17, vlan2
C 20.1.1.0/24 is directly connected, 00:08:43, vlan3
L 20.1.1.1/32 is directly connected, 00:08:43, vlan3
C 127.0.0.0/8 is directly connected, 24:43:25, lo0
L 127.0.0.1/32 is directly connected, 24:43:25, lo0
LC 100.1.1.1/32 is directly connected, 00:00:03, vlan 4
S 192.168.1.1/32 [1/10] via 10.1.1.2, 00:19:12, vlan2
```

#The FRR table of Device1 shows the route of network 192.168.1.1/32. The next hop interface is gigabitethernet0/2/1.

```
Device1#show ip frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
S 192.168.1.1/32 [1/10] via 20.1.1.2, 00:00:10, vlan3
```

#According to the backup next hop information of Device1, the backup interface of FRR is vlan3.

```
Device1#show nexthop frr detail

Index          : 223

```

On Device3, it is processed in a manner which is similar to that on Device1.

# 52 IPv6 Static Route

## 52.1 Overview

The IPv6 static routing protocol has the same protocol behaviors as the static routing protocol except for the IP address structure in the packet. For details, see the overview of static route.

## 52.2 IPv6 static routing function configuration

Table 52 IPv6 Static Routing Function Configuration List

Configuration Task	
Configure IPv6 static route	Configure IPv6 static route
Configure IPv6 load balancing route	Configure IPv6 load balancing route
Configure IPv6 floating route	Configure IPv6 floating route

Configuration Task	
Configure IPv6 static route to coordinate with Track	Configure IPv6 static route to coordinate with Track
Configure IPv6 static route FRR	Configure IPv6 static route FRR

### 52.2.1 Configure IPv6 static route

#### Configuration Condition

Before configuring IPv6 static route, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.

#### Configure IPv6 static route

According to the parameters that have been specified, IPv6 static routes are categorized into the following three types:

- Interface route: For an interface route, only the output interface is specified.
- Gateway route: For a gateway route, only the gateway address is specified.
- Interface gateway route: For an interface gateway route, both the output interface and the gateway address are specified.

Configured IPv6 static routes become invalid if some of the following conditions are met:

- 1) The destination address is the local interface address.
- 2) The administrative distance of the route is 255;
- 3) The output interface of the route is DOWN;
- 4) The output interface of the route doesn't enable IPv6;
- 5) The gateway address is not reachable;
- 6) The gateway address conflicts with local address;
- 7) The output interface and the gateway of the route conflict.
- 8) The output interface of the route does not exist.
- 9) The TRACK object that is associated with the route is "fake".
- 10) The status of the BFDv6 session that is associated with the route is DOWN.

If an interface route meets any one condition among 1), 2), 3), 4), 8), 9), and 10), the route is invalid. If a gateway route meets any one condition among 1), 2), 5), 6), 9), and 10), the route is invalid. If an interface gateway route meets any of the above conditions, the route is invalid.

Table 52 Configuring IPv6 Static Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv6 static route	<b>ipv6 route destination-ipv6-address/destination-mask { interface-name / [ nexthop-ipv6-address ] } [ name nexthop-name ] [ tag tag-value ] [ track track-id ] [ administrative-distance ]</b>	Mandatory  <i>Administrative-distance</i> is the administrative distance of the static route. When it is not specified, the default value is used.

### Note

- When configuring the default route, both destination network and mask should be 0::/0.
- The output interface of Null0 route should be configured as Null0.
- No IPv6 address is required for the output interface of Null0 route.

## 52.2.2 Configure IPv6 load balancing route

### Configuration Condition

None

### Configure IPv6 load balancing route

IPv6 load balancing route means that multiple routes are configured to the same destination network. The output interfaces and the gateway addresses of the routes are different, but the administrative distances (priorities) of the routes are the same. Load balancing routes help to improve the link utility rate.

Table 1 Configuring IPv6 Load Balancing Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure the first IPv6 load balancing route	<b>ipv6 route</b> <i>destination-ipv6-address/destination-mask interface-name1 distance</i>	Mandatory The output interface is <i>interface-name1</i> .
Configure the second IPv6 load balancing route	<b>ipv6 route</b> <i>destination-ipv6-address/destination-mask interface-name2 distance</i>	Mandatory The output interface is <i>interface-name2</i> .

### Note

- When configuring the load balancing route, the distance values should be equal.

## 52.2.3 Configure IPv6 floating route

### Configuration Condition

None

### Configure IPv6 floating route

IPv6 floating static route means that multiple routes are available to the same destination network. The output interfaces or gateway addresses of the routes are different, and the priorities of the routes are also different. The route with the higher priority becomes the primary route while the route with the lower priority becomes the floating route. In the routing table, only the primary route is visible. The floating table appears in the routing table only when the primary route becomes invalid. Therefore, the floating route is usually used as a backup route.

Table 2 Configuring Floating Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv6 preferred route	<b>ipv6 route</b> <i>destination-ipv6-address/destination-mask interface-name1 distance1</i>	Mandatory The output interface of preferred route is <i>interface-name1</i> , and the priority is <i>distance1</i> .

Step	Command	Description
Configure IPv6 floating route	<b>ipv6 route</b> <i>destination-ipv6-address/destination-mask interface-name2 distance2</i>	Mandatory  The output interface of the floating route is <i>interface-name2</i> , and the priority is <i>distance2</i> . The value of <i>distance2</i> should be greater than <i>distance1</i> .

---

### Note

- For the priority of the specified route, the smaller the distance value, the higher the priority.
- 

## 52.2.4 Configure IPv6 static route to coordinate with Track

### Configuration Condition

None

### Configure IPv6 static route to coordinate with Track

Some modules in the system need to monitor some system information and then determine their working modes based on the information. The objects that are monitored by the other modules are called monitoring objects. To simplify the relations between the modules and monitoring objects, Track objects are used. A Track object can contain multiple monitoring objects, and it displays the comprehensive status of the monitoring object to external modules. The external modules are associated only with Track objects and they do not care about monitoring objects contained in the Track objects any more. A Track object has two statuses, "true" and "false". The external modules that are associated with the Track object determine its working modes according to the Track object status.

A static route can associate with a Track object to monitor system information and determine whether the route is valid according to the status reported by the Track object. If the Track object reports "true", the conditions required by the static route are satisfied, and the route is added to the routing table. If the Track object reports "false", the route is deleted from the routing table.

Table 3 Configuring Coordination of IPv6 Static Route with TRACK

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Create Track object and enter its configuration mode	<b>track</b> <i>track-id</i>	Mandatory
Configure the link status of the specified interface for Track object monitoring	<b>interface</b> <i>interface-name</i> <b>line-protocol</b>	Optional
Return to the global configuration mode	<b>exit</b>	-
Configure a IPv6 static route and associate with Track	<b>ipv6 route</b> <i>destination-ipv6-address/destination-mask interface-name</i> <b>track</b> <i>track-id</i>	Mandatory When the link layer of the monitoring interface is UP, the route takes effect; otherwise, it becomes invalid.

### 52.2.5 Configure IPv6 static route FRR

#### Configuration Condition

Before configuring IPv6 static route FRR, ensure that:

- When the FRR based on route-map is configured, the associated route-map has been configured.

#### Configure static route FRR

In the network using IPv6 static route, the traffic interruption caused by link or device failure will continue until the protocol detects the link failure. It recovers only after the floating route takes effect in several seconds. Static route FRR can reduce the time of traffic interruption. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic passing through the main link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 4 Configuring IPv6 Static Route FRR

To...	Command	Description
Enter the system	<b>configure terminal</b>	-

To...	Command	Description
configuration mode		
Configure the route-map-based FRR of static route	<b>ipv6 route static fast-reroute route-map <i>map-name</i></b>	Mandatory By default, the FRR is disabled.
Configure automatic FRR of static route	<b>ipv6 route static pic</b>	Mandatory By default, the automatic FRR is disabled.

---

### Note

- FRR is applicable to the static route with the output interface and gateway address specified at the same time only.
  - When the FRR based on route-map set backup-nexthop is auto, the protocol enables automatic FRR.
  - When pic method is used, the protocol enables automatic FRR.
  - The methods of enabling FRR are mutually exclusive.
- 

## 52.2.6 IPv6 static route monitoring and maintaining

Table 52 IPv6 Static Routing Monitoring and Maintaining

Command	Description
<b>show ipv6 route [ vrf vrf-name] static</b>	Show the static route in the IPv6 routing table
<b>show ipv6 static route [ipv6-address/mask-length]</b>	Show the IPv6 static route
<b>show running-config ipv6 route</b>	Show the configuration information of IPv6 static route

## 52.3 Typical configuration example of IPv6 static route

### 52.3.1 Configure basic functions of IPv6 static route

#### Network Requirements

- Configure IPv6 static routes for Device1, Device2 and Device3 to achieve intercommunication between PC1 and PC2.

#### Network Topology

Figure 52 Network Topology for Configuring Basic Functions of IPv6 Static Route

#### Configuration Steps

- Step 1: Configure VLAN. And add ports to the required VLAN. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure IPv6 static route.

#### #Configure IPv6 route on Device1.

```
Device1#configure terminal
Device1(config)#ipv6 route 2001:4::/64 2001:2::2
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 route 2001:1::/64 2001:2::1
Device2(config)#ipv6 route 2001:4::/64 2001:3::2
```

#### #Configure IPv6 route on Device3.

```
Device3#configure terminal
Device3(config)#ipv6 route 2001:1::/64 2001:3::1
```

#### #View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

S 2001:4::/64 [1/10]
  via 2001:2::2, 00:03:14, vlan3
```

```

L ::1/128 [0/0]
  via ::, 2w0d:01:09:06, lo0
C 2001:1::/64 [0/0]
  via ::, 00:25:55, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:25:53, lo0
C 2001:2::/64 [0/0]
  via ::, 04:01:46, vlan3
L 2001:2::1/128 [0/0]
  via ::, 04:01:45, lo0

```

#### #View the IPv6 routing table of Device 2.

```

Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 5w2d:23:52:04, lo0
S 2001:1::/64 [1/10]
  via 2001:2::1, 00:02:56, vlan2
C 2001:2::/64 [0/0]
  via ::, 04:00:52, vlan2
L 2001:2::2/128 [0/0]
  via ::, 04:00:50, lo0
C 2001:3::/64 [0/0]
  via ::, 04:00:20, vlan3
L 2001:3::1/128 [0/0]
  via ::, 04:00:19, lo0
S 2001:4::/64 [1/10]
  via 2001:3::2, 00:02:36, vlan3

```

#### # Check the IPv6 routing table of Device3.

```

Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

S 2001:1::/64 [1/10]
  via 2001:3::1, 00:00:08, vlan2
L ::1/128 [0/0]
  via ::, 1w2d:20:54:36, lo0
C 2001:3::/64 [0/0]
  via ::, 03:58:28, vlan2
L 2001:3::2/128 [0/0]
  via ::, 03:58:26, lo0
C 2001:4::/64 [0/0]
  via ::, 00:11:13, vlan3
L 2001:4::1/128 [0/0]
  via ::, 00:11:12, lo0

```

Step 4: Check the result. Use the ping command to check the connectivity between PC1 and PC2.

#### #Use the ping command to check connectivity on PC1.

```

C:\Documents and Settings\Administrator>ping 2001:4::2

Pinging 2001:4::2 with 32 bytes of data:

Reply from 2001:4::2: bytes=32 time<1ms TTL=128

Ping statistics for 2001:4::2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms

```

PC1 and PC2 can communicate with each other.

### 52.3.2 Configure IPv6 static floating route

#### Network Requirements

- On Device1, configure two static routes leading to the network segment 2001:3::/64, one through Device2 and the other through Device3.
- Device1 prefers to use the line between it and Device2 to forward packets; when this line fails, it will switch to Device3 for communication.

#### Network Topology

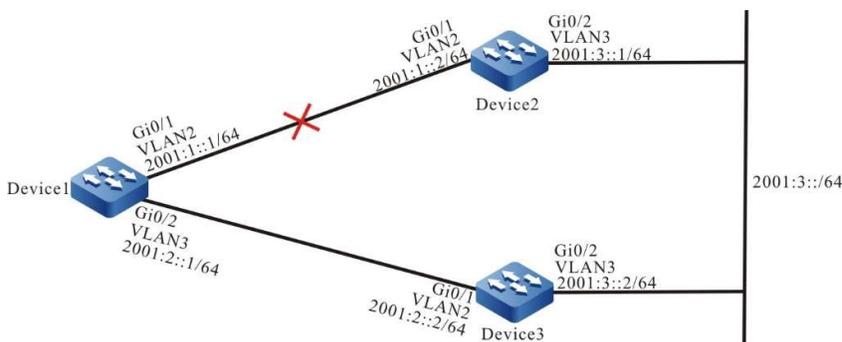

Figure 52 Network Topology for Configuring IPv6 Static Floating Route

#### Configuration Steps

- Step 1: Configure VLAN. And add ports to the required VLAN. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure IPv6 static route.

#Enable Device1 to pass through Device2 and Device3 towards the network segment 2001:3::/64.

```
Device1#configure terminal
Device1(config)#ipv6 route 2001:3::/64 2001:1::2
Device1(config)#ipv6 route 2001:3::/64 2001:2::2
```

#View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w0d:02:13:16, lo0
C 2001:1::/64 [0/0]
  via ::, 00:22:33, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:22:32, lo0
C 2001:2::/64 [0/0]
  via ::, 00:17:47, vlan3
```

```
L 2001:2::1/128 [0/0]
  via ::, 00:17:46, lo0
S 2001:3::/64 [1/10]
  via 2001:1::2, 00:01:47, vlan2
  [1/10]
  via 2001:2::2, 00:01:36, vlan3
```

According to the result, there are two routes that can get to the network segment 2001:3::/64 on Device1, reaching load balancing.

Step 4: Configure IPv6 floating route.

#Configure Device1. Modify the gateway as 2001:2::2 and make the administrative distance of the route 15 so that it can become a floating route.

```
Device1(config)#ipv6 route 2001:3::/64 2001:2::2 15
```

Step 5: Check the result.

#View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w0d:02:16:38, lo0
C 2001:1::/64 [0/0]
  via ::, 00:25:56, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:25:55, lo0
C 2001:2::/64 [0/0]
  via ::, 00:21:10, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:21:09, lo0
S 2001:3::/64 [1/10]
  via 2001:1::2, 00:05:10, vlan2
```

According to the IPv6 routing table, since the route with an administrative distance of 1 comes before the route with an administrative distance of 15, the route with a gateway of 2001:2::2 is deleted.

#When the lines between Device1 and Device2 fail, view the routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w0d:02:21:06, lo0
C 2001:2::/64 [0/0]
  via ::, 00:25:38, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:25:37, lo0
S 2001:3::/64 [15/10]
  via 2001:2::2, 00:00:05, vlan3
```

According to the IPv6 routing table, the route with a larger administrative distance will be added into the routing table to be forwarded by Device3.

---

## Note

- Route backup is the most important feature of static floating route.
- 

### 52.3.3 Configure IPv6 static NULL0 interface route

#### Network Requirements

- Configure a static default route on Device1 and Device2 respectively. The gateway address is the address of the interface address of the peer ports of the 2 devices. Configure a static Null0 interface route for Device1 to filter the data leading to PC2.

#### Network Topology

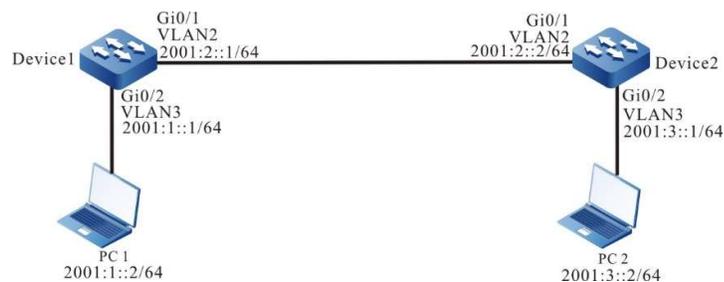

Figure 1 Network Topology for Configuring IPv6 Static NULL0 Interface Route

#### Configuration Steps

- Step 1: Configure VLAN. And add ports to the required VLAN. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure IPv6 static route.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 route ::0 2001:2::2
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 route ::0 2001:2::1
```

#### #Use the ping command to check connectivity on PC1.

```
C:\Documents and Settings\Administrator>ping 2001:3::2

Pinging 2001:3::2 with 32 bytes of data:

Reply from 2001:3::2: bytes=32 time<1ms TTL=128
Reply from 2001:3::2: bytes=32 time<1ms TTL=128
Reply from 2001:3::2: bytes=32 time<1ms TTL=128
```

```
Reply from 2001:3::2: bytes=32 time<1ms TTL=128
```

```
Ping statistics for 2001:3::2:  
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),  
Approximate round trip times in milli-seconds:  
Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

Step 4: Configure IPv6 static Null0 interface route.

#Configure Device1.

```
Device1(config)#ipv6 route 2001:3::2/128 null0
```

Step 5: Check the result.

#View the IPv6 routing table of Device1.

```
Device1#show ipv6 route  
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS  
U - Per-user Static route  
O - OSPF, OE-OSPF External, M - Management  
  
S ::0 [1/10]  
via 2001:1::2, 00:04:55, vlan2  
L ::1/128 [0/0]  
via ::, 2w0d:03:36:10, lo0  
C 2001:1::/64 [0/0]  
via ::, 00:08:54, vlan3  
L 2001:1::1/128 [0/0]  
via ::, 00:08:53, lo0  
C 2001:2::/64 [0/0]  
via ::, 00:08:32, vlan2  
L 2001:2::1/128 [0/0]  
via ::, 00:08:30, lo0  
S 2001:3::2/128 [1/1]  
via ::, 00:00:34, null0
```

The IPv6 static Null0 interface route has been added to the IPv6 routing table.

#On PC1, use the ping command to verify the connectivity with PC2.

```
C:\Documents and Settings\Administrator>ping 2001:3::2  
Pinging 2001:3::2 with 32 bytes of data:  
Request timed out.  
Ping statistics for 2001:3::2:  
Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

After looking up in the routing table on Device1, the ICMP packet sent by PC1 which finds that the output interface is Null0 will be directly discarded. Therefore, PC1 cannot communicate with PC2.

---

## Note

- Static Null0 interface route is a special route. The data packets sent to this Null0 interface are all discarded. Therefore, configuring static Null0 interface route can realize packet filtering.
-

## 52.3.4 Configure IPv6 static recursive route

### Network Requirements

- On Device1, configure two static routes leading to the network segment 192::3/128, one through Device2 and the other through Device3. Device1 prefers to use the lines between it and Device3 to forward packets.
- On Device1, configure a static recursive route leading to the network segment 2001:4::/64. The gateway address is the loopback interface address 192::3 of Device3. After the lines between Device1 and Device3 fail, this route can switch to Device2 for communication.

### Network Topology

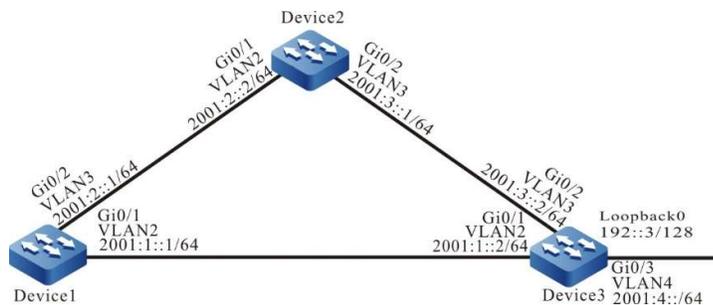

Figure 2 Network Topology for Configuring IPv6 Static Recursive Route

### Configuration Steps

- Step 1: Configure VLAN. And add ports to the required VLAN. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure IPv6 static route.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 route 192::3/128 2001:1::2
Device1(config)#ipv6 route 192::3/128 2001:2::2 10
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 route 192::3/128 2001:3::2
```

- Step 4: Configure IPv6 static recursive route.

#### #Configure Device1.

```
Device1(config)#ipv6 route 2001:4::/64 192::3
```

#### #View the IPv6 routing table of Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w0d:03:12:46, lo0
S 192::3/128 [1/10]
  via 2001:1::2, 00:04:54, vlan2
C 2001:1::/64 [0/0]
  via ::, 00:22:47, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:22:45, lo0
C 2001:2::/64 [0/0]
  via ::, 00:16:16, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:16:15, lo0
S 2001:4::/64 [1/10]
  via 192::3, 00:00:43, vlan2

```

According to the IPv6 routing table, the gateway address of the route 2001:4::/64 is 192::3, and the output interface is VLAN2. This route depends on the route 192::3/128.

Step 5: Check the result.

#When the lines between Device1 and Device3 fail, view the IPv6 routing table of Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w0d:03:17:48, lo0
S 192::3/128 [10/10]
  via 2001:2::2, 00:00:06, vlan3
C 2001:2::/64 [0/0]
  via ::, 00:21:18, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:21:17, lo0
S 2001:4::/64 [1/10]
  via 192::3, 00:00:06, vlan3

```

According to the routing table mentioned in step 3, the output interface of the route 2001:4::/64 is VLAN3, which means it has switched to Device2 for communication.

### 52.3.5 Configure static FRR for IPv6 static route

#### Network Requirements

- On Device1, configure two static routes leading to the network segment 1001:2::1/64, one through Device2 and the other through Device3. Device1 prefers to use the lines between it and Device2 to forward packets.
- Enable static FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

#### Network Topology

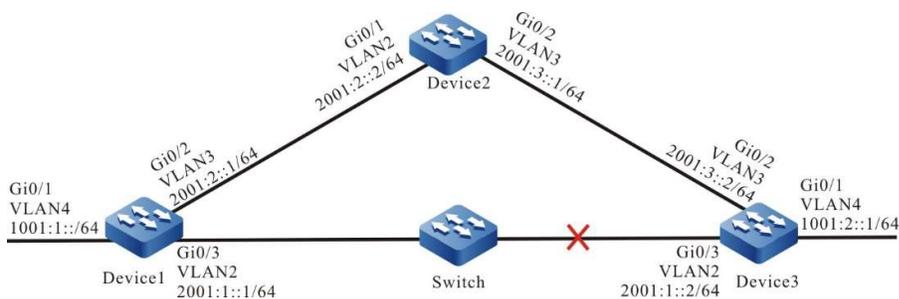

Figure 3 Network Topology for Configuring Static FRR of IPv6 Static Route

### Configuration Steps

- Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface (Omitted).
- Step 2: Configure IPv6 static route.

#On Device1, configure two static routes leading to the network 1001:2::/64.

```
Device1#configure terminal
Device1(config)#ipv6 route 1001:2::/64 vlan2 2001:1::2
Device1(config)#ipv6 route 1001:2::/64 vlan3 2001:2::2 10
```

#On Device2, configure a static route leading to the network 1001:2::1/64.

```
Device2#configure terminal
Device2(config)#ipv6 route 1001:2::/64 vlan3 2001:3::2
```

- Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 1001:2::1/64 only, and filter other network segments. The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 2001:2::2.

```
Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 1001:2::1/64 any
Device1(config-v6-list)#exit
Device1(config)#route-map ipv6frr_st
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#set ipv6 fast-reroute backup-interface vlan3 backup-nexthop 2001:2::2
Device1(config-route-map)#exit
```

- Step 4: Configure static FRR.

```
Device1(config)#ipv6 route static fast-reroute route-map ipv6frr_st
```

- Step 5: Check the results.

```
#View the IPv6 static routing table of Device1.
Device1#show ipv6 route
```

```

Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 04:26:25, lo0
C 1001:1::/64 [0/0]
  via ::, 04:21:32, vlan4
L 1001:1::1/128 [0/0]
  via ::, 04:21:32, vlan4
S 1001:2::/64 [1/10]
  via 2001:1::2, 00:03:00, vlan2
C 2001:1::/64 [0/0]
  via ::, 04:22:11, vlan2
L 2001:1::1/128 [0/0]
  via ::, 04:22:11, vlan2
C 2001:2::/64 [0/0]
  via ::, 04:20:50, vlan3
L 2001:2::1/128 [0/0]
  via ::, 04:20:50, vlan3

```

According to the routing table, the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View the IPv6 frr routing table of Device1.

```

Device1#show ipv6 frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
S 1001:2::/64 [1/4294967295]
  via 2001:2::2, 00:04:32, vlan3

```

According to the result, the next hop and output interface of the frr route 1001:2::/64 are 2001:2::2 and vlan3 respectively.

#View the BFD session information of Device1.

```

Device1#show bfd session ipv6 2001:1::2 detail
Total ipv6 session number: 1
OurAddr      NeighAddr    LD/RD        State  Holddown  Interface
2001:1::1    2001:1::1    1015/1015    UP     500       vlan2
Type:ipv6 direct Mode:echo
Local Discriminator:67 Remote Discriminator:67
Local State:UP Remote State:UP Up for: 0h:30m:28s Number of times UP:1
Send Interval:100ms Detection time:500ms(100ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
Registered modules:FIB_MGR

```

According to the result, FIB\_MGR has been successfully coordinated with BFD. The session is established normally in the mode of echo.

#When the lines between Device1 and Device3 fail, it can quickly identify the failures and switch to Device2 for communication. The routing table of Device1 shows that the output interface of the destination network 1001:2::/64 has switched to the backup interface vlan3.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 04:56:34, lo0
C 1001:1::/64 [0/0]
  via ::, 04:51:41, vlan4
L 1001:1::1/128 [0/0]
  via ::, 04:51:41, vlan4
S 1001:2::/64 [10/10]

```

```

via 2001:2::2, 00:00:08, vlan3
C 2001:2::/64 [0/0]
via ::, 04:50:59, vlan3
L 2001:2::1/128 [0/0]
via ::, 04:50:59, vlan3

```

### 52.3.6 Configure dynamic FRR for IPv6 static route

#### Network Requirements

- On Device1, configure two static routes leading to the network segment 1001:2::1/64, one through Device2 and the other through Device3. Device1 prefers to use the lines between it and Device2 to forward packets.
- Enable dynamic FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

#### Network Topology

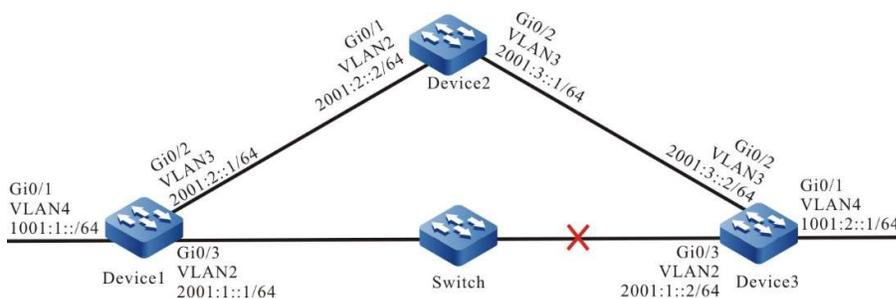

Figure 4 Network Topology for Configuring Dynamic FRR of IPv6 Static Route

#### Configuration Steps

- Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface (Omitted).
- Step 2: Configure IPv6 static route.

#On Device1, configure two static routes leading to the network 1001:2::/64.

```

Device1#configure terminal
Device1(config)#ipv6 route 1001:2::/64 vlan2 2001:1::2
Device1(config)#ipv6 route 1001:2::/64 vlan3 2001:2::2 10

```

#On Device2, configure a static route leading to the network 1001:2::1/64.

```

Device2#configure terminal
Device2(config)#ipv6 route 1001:2::/64 vlan3 2001:3::2

```

- Step Configure routing policy

3:

#On Device1, configure route-map to invoke ACL to match 1001:2::1/64 only, and filter other network segments. The route matching the match rule applies the backup next hop interface vlan3. The next hop address is auto.

```
Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 1001:2::1/64 any
Device1(config-v6-list)#exit
Device1(config)#route-map ipv6frr_st
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#set ipv6 fast-reroute backup-nexthop auto
Device1(config-route-map)#exit
```

Step 4: Configure dynamic FRR.

```
Device1(config)#ipv6 route static fast-reroute route-map ipv6frr_st
```

Step 5: Check the results.

#View the IPv6 static routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 04:26:25, lo0
C 1001:1::/64 [0/0]
  via ::, 04:21:32, vlan4

```

# 53 RIP

---

## 53.1 Overview

On the current Internet, it is impossible to run only one gateway protocol. You can divide it into multiple Autonomous Systems (ASs), each of which has its own routing technology. The internal routing protocols within an AS are Interior Gateway Protocols (IGPs). Routing Information Protocol (RIP) is one type of IGP. RIP adopts the Vector-Distance algorithm. RIP features simple and easy-to-use, so it is widely used in numerous small-sized networks.

RIP has two versions: RIPv1 and RIPv2. RIPv1 does not support classless routing, and RIPv2 supports classless routing. Usually, RIPv2 is used.

RIP is a simple protocol which provides simple configuration. However, the number of routes to be advertised by RIP is directly proportional to the number of routes in the routing table. If the number of routes is large, a lot of device resources and network resources are consumed. In addition, RIP specifies that the maximum number of hops that a routing path that passes routers is 15, so RIP is applicable only to simple small and medium-sized network. RIP is applicable for most campus networks and LANs with a simple structure and strong continuity. For a more complex environment, RIP is not recommended.

RIPv1 was introduced earlier in RFC1058, but it has many deficiencies. To improve the deficiencies of RIPv1, RFC1388 introduced RIPv2, which was then revised in RFC 1723 and RFC 2453.

## 53.2 RIP function configuration

Table 53 RIP Function Configuration List

Configuration Task	
Configure RIP Basic Functions	Globally Enable RIP
	Enable RIP via VRF
	Configure RIP Version

Configuration Task	
Configure RIP Route Generation	Configure RIP to Distribute Default Route
	Configure RIP Route Redistribution
Configure RIP Route Control	Configure RIP Administrative Distance
	Configure RIP Route Summarization
	Configure the RIP Metric Offset
	Configure RIP Route Filtration
	Configure the Metric of the RIP Interface
	Configure the Routing Flag for an RIP Interface
Configure RIP Network Authentication	Configure the Maximum Load Balancing
	Configure RIP Network Authentication
Configure RIP Network Optimization	Configure RIP Timers
	Configure Split Horizon and Toxicity Reverse of RIP
	Configure Source Address Check
	Configure a Static RIP Neighbor
	Configure a Passive RIP Interface
	Configure RIP to Trigger Updates
	Configure an RIP Standby Interface
Configure RIP to Coordinate with BFD	Configure RIP to Coordinate with BFD

### 53.2.1 Configure RIP Basic Functions

#### Configuration Condition

Before configuring the basic functions of RIP, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.

### Globally Enable RIP

To use RIP, the following configurations are required:

- Create RIP process;
- Configure RIP to cover direct network or an interface.

Table 53 Globally Enabling RIP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create RIP process and enter RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Cover the specified network segment or interface	<b>network</b> { <i>ip-address</i>   <i>interface-name</i> }	Mandatory By default, no direct network or interface is covered.

---

### Note

- The network segment configured to cover will be automatically classified as classful address.
  - **network** *ip-address* cannot cover supernet address, but this can be done through **network** *interface-name*.
- 

### Enable RIP via VRF

RIP supports VRF function. The following configurations are required:

- Configure a VRF, and specify an interface to add into this VRF;
- Specify to enable RIP function in the address family of this VRF;

- Configure RIP to cover a VRF direct network or the interface where it belongs.

Table 1 Enabling RIP via VRF

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create RIP process and enter RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Enter the RIP VRF address family configuration mode	<b>address-family { ipv4 vrf vrf-name }</b>	Mandatory By default, the VRF address family mode is disabled.
Cover the specified network segment or interface	<b>network { ip-address   interface-name }</b>	Mandatory By default, no direct network or interface is covered.

### Note

- To enable RIP in VRF mode, VRF-related configurations must be created first.

### Configure RIP Version

RIP supports two versions, i.e. RIPv1 and RIPv2. It can be configured in three modes: global, VRF, and interface:

- By default, the RIPv1 version is enabled in global and VRF mode, and it is not configured in interface mode;
- The priority of the version command configured in interface mode is higher than that in global or VRF mode;
- When the version command is not configured in interface mode, that in VRF or global mode where the interface is located will be used;
- In interface mode, the RIP receiving and sending version can be configured separately;
- After a version is configured, RIP will implement strict packet receiving and sending rules: When RIPv1 is configured, only RIPv1 broadcast or unicast packets are sent and received; when RIPv2 is configured, RIPv2 unicast, multicast or broadcast packets are sent and

received; in RIPv1 compatible mode, RIPv2 unicast and broadcast packets are sent.

Table 53 Configuring RIP Version

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create RIP process and enter RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure global RIP version	<b>version { 1   2 }</b>	Mandatory By default, RIPv1 is enabled.
Enter the RIP VRF configuration mode	<b>address-family { ipv4 vrf vrf-name }</b>	Mandatory By default, the VRF address family is disabled.
Configure the RIP version in RIP VRF configuration mode	<b>version { 1 / 2 }</b>	Mandatory By default, RIPv1 is enabled.
Return to RIP configuration mode	<b>exit-address-family</b>	-
Return to global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface interface_name</b>	-
Configure the interface to send RIP version	<b>ip rip send version {{ 1 / 2 }   1-compatible }</b>	Optional By default, the packets are sent based on the RIP global version.
Configure the interface to receive RIP Version	<b>ip rip receive version { 1 / 2 }</b>	Optional By default, the packets are received based on the RIP global version.

## 53.2.2 Configure RIP Route Generation

### Configuration Condition

Before configuring RIP route generation, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- RIP is enabled.

### Configure RIP to Distribute Default Route

Through configuration, the device sends default routes under all RIP interfaces and sets itself as the default gateway of other adjacent devices.

Table 53 Configuring RIP to Distribute Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure RIP to Distribute Default Route	<b>default-information originate {only   originate [metric value] }</b>	Mandatory By default, RIP doesn't distribute default route.

### Note

- If a default route (0.0.0.0/0) is learned, it will replace the default route (0.0.0.0/0) distributed by the device. When there is loop in the network, route oscillation may be caused. Thus, when using this command, be sure that several other devices in the same routing domain are not enabling it at the same time.

### Configure RIP Route Redistribution

The routes generated by other protocols can be imported into RIP by configuring route redistribution.

Table 2 Configuring RIP Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure the default metric value of importing other routing protocol by RIP	<b>default-metric</b> <i>metric-value</i>	Optional By default, the default metric value of importing other routing protocol is 1.
Configure RIP Route Redistribution	<b>redistribute</b> <i>protocol</i> [ <i>protocol-id</i> ] [ <b>metric</b> <i>metric-value</i> ] [ <b>route-map</b> <i>route-map-name</i> ] [ <b>match</b> <i>route-sub-type</i> ]	Mandatory By default, no route redistribution is configured.

---

### Note

- In case of redistribution, after the metric command option is specified, the route redistributed will adopt this metric value.
  - For RIP, when configuring route redistribution application routing policies, the match options supported include ip address, route type, and tag, and the set options supported include interface, ip next-hop, route source, and metric.
- 

## 53.2.3 Configure RIP Route Control

### Configuration Condition

Before configuring RIP route control, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- RIP is enabled.

### Configure RIP Administrative Distance

Multiple routing protocols can run in the device at the same time. The device selects the routes learned by each protocol through administrative distance. The smaller the administrative distance, the more like the route is selected.

Table3 Configuring RIP Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	-
Configure RIP Administrative Distance	<b>distance</b> <i>distance-value</i>	Mandatory By default, RIP administrative distance is 120.

### Configure RIP Route Summarization

RIP route summarization means the device summarizes the subnet routes in the same natural network segment into one route. The route generated by summarization and the original subnet routes are listed in the RIP routing table at the same time.

After RIP route summarization is configured, the device only advertises the summarized routes. This can significantly reduce the scale of adjacent RIP routing tables in large and medium-sized networks and the consumption of network bandwidth by routing protocol packets.

The metric of the summarized route will be the minimum metric value among all subnet routes.

RIPv1 supports automatic route summarization, and RIPv2 supports both automatic and manual route summarization.

#### 1. RIP automatic route summarization

Automatic route summarization is different from manual route summarization. It automatically generates a natural mask route according to the subnet routes within the same natural network segment.

Table 4 Configuring Automatic Route Summarization Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure automatic route summarization function	<b>auto-summary</b>	Mandatory By default, the automatic route summarization function is disabled.

## Note

- RIPv1 does not allow route summarization through commands.
- The tag of the summarized route is 0, and the metric value of the route is the minimum value among the detail routes. When the automatic summarization function is configured, automatic summarization occurs first.
- For RIPv2, be careful to use the automatic route summarization function. Make ensure that automatic route summarization is necessary in the network, otherwise routing loops may be produced.
- If the automatic route summarization is enabled in RIPv2, when the interface advertises the route is in the same natural network segment as the route, the update packet sent from this interface will not summarize all the subnet routes in this natural network segment. Otherwise, the routes will be summarized into natural network segment for advertisement.

## 2. Manual route summarization

For manual route summarization, a pair of destination address and mask combination need to be configured. They will summarize the routes in the covered network segment.

Table 5 Configuring Manual Route Summarization Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure the manual route summarization function of RIPv2 on the interface	<b>ip summary-address rip</b> <i>prefix-address</i>	-

### Configure the RIP Metric Offset

By default, RIP applies the route metric advertised by the neighbor device to the received routes. To modify the metric in some special application scenarios, you can configure the RIP metric offset to correct the metric of the specified route.

If the metric in the incoming direction is configured, RIP modifies the metric of the received routes and saves the routes into the routing table. When RIP advertises a metric to the neighbor devices, it advertises the new metric. If the metric in the outgoing direction is configured, the metric is modified only when RIP advertises a metric to the neighbor devices.

Table 6 Configuring RIP Metric Offset

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure RIP to modify the metric of the specified route	<b>offset-list</b> <i>access-list-name</i> { <b>in</b>   <b>out</b> } <i>metric-offset</i> [ <i>interface-name</i> ]	Mandatory By default, no metric value of interface is configured.

### Note

- Route metric offset supports the standard access list only.

### Configure RIP Route Filtration

A router can filter the received or advertised routes by configuring an Access Control List (ACL) or prefix list. In receiving RIP routes, you can filter some learnt routes; or in announcing RIP routes, you can filter some routes that are advertised to neighbor devices.

Table 5-11 Configuring RIP Route Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure RIP route filtration function	<b>distribute-list</b> { <i>access-list-name</i>   <b>prefix</b> <i>prefix-list-name</i> } { <b>in</b>   <b>out</b> } [ <i>interface-name</i> ]	Mandatory By default, no route filtration function is configured. When the route filtration function is configured, if an interface is not specified, route filtration will be enabled for all RIP covered interfaces during the receiving or sending process.

### Note

- When using ACL filtration, only standard ACL is supported.

### Configure the Metric of the RIP Interface

If an interface is overwritten by an RIP process, the corresponding direct route is generated in the database, with the default metric 1. When the route is in the RIP database or it is advertised to neighbor devices, if the interface is configured with a metric, the interface metric is used as the metric of the route.

If the interface metric is changed, the RIP database immediately updates the corresponding direct route of RIP and advertises the new metric to the neighbor devices.

Table 7 Configuring Metric Value of RIP Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the metric of the RIP interface	<b>ip rip metric</b> <i>metric-value</i>	Mandatory By default, the matrix value of the RIP interface is 1.

### Note

- When the matrix value of the RIP interface is configured, the matrix of the direct subnet on the interface instead of that of route learning will be affected.

### Configure the Routing Flag for an RIP Interface

The network administrator can attach tags to some routes. Then, in applying a routing policy, the network administrator can perform route filtration or route property advertisement based on the tags.

Only the routing tags of RIPv2 are supported.

Table 8 Configuring Routing Flag for RIP interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the routing tag on the direct subnet on the interface of RIP	<b>ip rip tag</b> <i>tag-value</i>	-

### Configure the Maximum Number of RIP Load Balancing Entries

This command helps you to control the number of RIP load balancing entries for routing.

Table 9 Configuring Maximum Number of Load Balancing Entries of RIP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure the Maximum Number of RIP Load Balancing Entries	<b>maximum-paths</b> <i>max-number</i>	Optional By default, the maximum number of load balancing entries of RIP is 4.

### 53.2.4 Configure RIP Network Authentication

RIPv2 supports protocol packet authentication, therefore, it can satisfy the high security requirement of some networks. Currently, plain text authentication and Message Digest 5 (MD5) authentication are supported. Plain text authentication features low security because it transmits plain text. MD5 converts an authentication code into the MD5 code for transmission, ensuring higher security.

Owing to the limit of RIPv2 packets, a packet that advertises a route contains only 16 bytes. Therefore, the length of a plain text authentication string must not exceed 16 bytes. Meanwhile, the MD5 code that is converted from any character string is a standard 16-byte code, meeting the requirement on the string length.

Table 10 Configuring RIP Network Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure RIPv2 network authentication	<b>ip rip authentication</b> { { <b>key</b> { 0   7 } <i>key-string</i> }   { <b>key-chain</b> <i>key-chain-name</i> } 	Mandatory By default, no RIPv2 authentication function is configured.

Step	Command	Description
	<code>{ mode { text   md5   sm3 } }</code>	

## Note

- Before implementing MD5 authentication, pay attention to the following points:
- RIPv1 does not support network authentication.
- RIPv2 supports one authentication mode at a time.
- Key ID must be carried in the MD5 authentication information. If you use the `ip rip authentication key` command to configure a password, the key ID is 1. If you use the `ip rip authentication key-chain` command to configure a password, the key ID is the key ID in Key-chain.
- In obtaining a packet transmit authentication password from Key-chain, select a Key ID in the sequence of from small to large. Therefore, the Key ID with the smallest valid transmit password will be selected.
- In obtaining a packet receive authentication password from Key-chain, select the first valid receive password whose Key ID is equal to or larger than the packet receive Key ID. Therefore, if Key IDs are different for the two ends of authentication, the end with the larger Key ID can pass the authentication while the end with the smaller Key ID fails in the authentication.

### 53.2.5 Configure RIP Network Optimization

#### Configuration Condition

Before configuring RIP network optimization, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- RIP is enabled.

#### Configure RIP Timers

RIP does not maintain neighbor relations and it does not support route withdrawn; therefore, the protocol provides four configurable timers to control the network convergence speed. The four timers are: route update timer, router timeout timer, route dampening update timer, and route clear timer.

The route timeout time must be at least three times of the route update time. If no route update packet is received within the route timeout time, the route becomes invalid and it enters a dampening cycle. The length of the dampening cycle is determined by the dampening update time. During the cycle, the route will not be cleared. After the dampening cycle is completed, the route enters the clear cycle. During the

cycle, the route can be updated. However, if no route update packet is received during the cycle, the route will be deleted.

Table 11 Configuring RIP Timer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure the time of RIP timer	<b>timers basic update-interval invalid-interval holddown-interval flush-interval</b>	Optional By default, the RIP update interval is 30 seconds, the effective time of advertisement 180 seconds, the suppression time 180 seconds, and the clearing time 240 seconds.

---

### Caution

- In the same RIP routing domain, the **timer basic** configurations on all devices must be consistent to avoid network flapping.
- 

### Configure RIP Split Horizon and Toxicity Reverse of RIP

Split horizon and toxicity reverse are mechanisms that are used to prevent route loops.

1. Configure split horizon.

RIP does not advertise routes that it has learnt from an interface to the interface, preventing routing loops.

Table 12 Configuring RIP Split Horizon

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure RIP split horizon	<b>ip split-horizon</b>	Mandatory By default, the split horizon function is disabled.

## 2. Configure toxicity reverse.

RIP announces routes that have been learnt from an interface to the interface, but the route metric is the maximum number of hops, 16, preventing routing loops.

Table 13 Configuring Toxicity Reverse

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure RIP toxicity reverse	<b>ip split-horizon poisoned</b>	Optional By default, the toxicity reverse function is enabled.

### Note

- The split horizon and toxicity reverse functions are valid only for the learnt routes, direct routes in the network covered by RIP, and the redistributed direct and static routes.
- The split horizon function and the toxicity reversion function cannot be used at the same time.

## Configure RIP Source Address Check

Through source address check, RIP checks the source addresses of the received packets. RIP processes only the packets whose source addresses meet the requirements. The check items include: the packet source

address is in the same network segment as the input interface address; the packet source address matches the peer end address of the Point-to-Point (P2P) interface.

By default, RIP is enabled to check whether the source addresses received through the Ethernet port are in the same network segment as the address of the interface, and this function cannot be cancelled.

Table 14 Configuring RIP Source Address Check

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure RIP source address check on the interface of P2P	<b>validate-update-source check-p2p-destination</b>	Mandatory By default, address of peer port is not checked for P2P interface.

### Configure a Static RIP Neighbor

RIP does not maintain neighbor relations, so it does not have the concept of neighbor. Here the neighbor refers to the neighbor RIP routing device. After a static RIP neighbor is specified, RIP sends RIP packets to the neighbor in unicast mode. The configuration is applied to a network that does not support broadcast or multicast, such as point-to-point links. If the configuration is applied to a broadcast or multicast network, it may cause repeated RIP packets in the network.

Table 15 Configuring Static RIP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure the neighbor which advertises routing	<b>neighbor ip-address</b>	Mandatory

Step	Command	Description
information in the form of unicast		The parameter ip-address is the ip address of the direct interface of the peer port.

## Note

- The advertisement of routing information to static neighbors occurs only on the interfaces covered by RIP, and "**passive-interface**" cannot prevent them from sending packets to static neighbors.

### Configure a Passive RIP Interface

To decrease the network bandwidth consumed by the routing protocol, the dynamic routing protocol uses the passive interface function. RIP receives only route update packets on a passive interface, and it does not send route update packets on the passive interface. In a low-speed network with small bandwidth, the passive interface function and the neighbor function cooperate to effectively reduce interactions of RIP routes.

Table 16 Configuring Passive RIP Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory By default, RIP process is disabled.
Configure a Passive RIP Interface	<b>passive-interface { default   interface-name }</b>	Mandatory By default, no passive interface is configured.

## Note

- The passive interface function does not restrain an interface from sending unicast route updates to its neighbor devices. When the passive interface function is used with the neighbor command, the function does not restrain an interface from sending unicast route updates to

---

its neighbor devices. This application mode controls a router so that it sends route updates only to some neighbor devices in unicast mode instead of sending route updates to all neighbor devices in broadcast mode (or multicast mode in the case of RIPv2).

---

### Configure RIP to Trigger Updates

After a device receives an RIP update packet, to reduce the possibility of introducing loops owing to routing table differences, the device advertises the update packet of the route to its neighbor devices immediately instead of waiting for the update timer to time out before an update. The update trigger mechanism speeds up network convergence.

Table 17 Configuring RIP to Trigger Updates

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure RIP to trigger updates on the interface	<b>ip rip triggered</b>	Optional By default, the trigger updates function is disabled.

### Configure an RIP Standby Interface

To speed up backup route convergence, RIP newly supports a backup interface (standby interface) function. On the main route interface of RIP, specify a backup interface for the main interface. In a specific application environment, RIP learns RIP routes only from one line, and the backup line does not provide routing information interaction. If the main interface gets offline, RIP sends Request packets to the peer end through the backup interface periodically (Default: 1s) to request for all routes. If the backup interface receives a Response packet from the peer route, RIP cancels sending of Request packets. It updates the local routing table, and advertises the local routing table to the backup interface. If the backup interface fails to receive a Response packet from the peer end before timeout, RIP cancels sending of Request packets.

Table 18 Configuring RIP Backup Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure an RIP Standby Interface	<b>ip rip standby</b> <i>interface-name</i> [ <b>timeout</b> <i>timeout-value</i> ]	Optional  By default, the backup interface function is disabled, and the default value of <i>timeout-value</i> is 300s.

### 53.2.6 Configure RIP to Coordinate with BFD

The backup interface can be used in specific application environments only. It cannot meet the requirements of real-time backup. The BFD (Bidirectional Forwarding Detection) function of RIP which provides end-to-end protection can achieve rapid route convergence and switch. BFD can rapidly detect the status of the lines between two devices. When BFD detection is enabled between two adjacent RIP devices, if there is a line failure between the devices, BFD can quickly detect the failure and notify the RIP protocol. RIP will delete the RIP routes associated on the BFD interface. If these routes have backups, they will switch to the backup route in a very short time (affected by the BFD configuration). Currently, RIP supports BFD single-hop bidirectional detection only.

Table 19 Configuring RIP to Coordinate with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the RIP configuration mode	<b>router rip</b>	Mandatory  By default, RIP process is disabled.
Make all the interfaces covered by RIP process enable BFD function	<b>bfd all-interfaces</b>	Mandatory  By default, the BFD function of the interfaces covered by RIP is disabled.
Return to the global configuration mode	<b>exit</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable the BFD function on the interface	<b>ip rip bfd</b>	Mandatory By default, the BFD function of interface is disabled.

### Note

- For the BFD-related configurations, please see the Reliability Technology - BFD Technical Manual.

## 53.2.7 RIP monitoring and maintaining

Table 20 Configuring RIP Monitoring and Maintaining

Command	Description
<b>show ip rip</b> [ <i>vrf vrf-name</i> ]	Show the basic information of RIP
<b>show ip rip</b> [ <i>vrf vrf-name</i> ] <b>database</b> [ <b>detail</b>   <i>prefix/mask</i> [ [ <b>detail</b>   <b>longer-prefixes</b> [ <b>detail</b> ] ] ] ]	Show the RIP routing database information
<b>show ip rip</b> [ <i>vrf vrf-name</i> ] <b>statistics</b>	Show the statistical information of RIP
<b>show ip rip interface</b> [ <i>interface-name</i> ]	Show the RIP interface information
<b>clear ip rip</b> [ <i>vrf vrf-name</i> ] { <b>process</b>   <b>statistics</b> }	Clear the RIP process and statistical information

## 53.3 RIP typical configuration example

### 53.3.1 Configure RIP version

#### Network Requirements

- Run RIPv2 between Device1 and Device2 for route interaction.

#### Network Topology

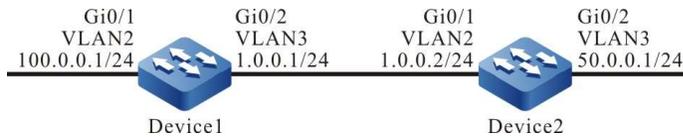

Figure 53 Network Topology for Configuring RIP Version

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure RIP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router rip
Device1(config-rip)#network 1.0.0.0
Device1(config-rip)#network 100.0.0.0
Device1(config-rip)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router rip
Device2(config-rip)#network 1.0.0.0
Device2(config-rip)#network 50.0.0.0
Device2(config-rip)#exit
```

#### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan3
R 50.0.0.0/8 [120/1] via 1.0.0.2, 00:13:26, vlan3
C 100.0.0.0/24 is directly connected, 00:23:06, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

#### #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```

U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
C 50.0.0/24 is directly connected, 00:23:06, vlan3
R 100.0.0.0/8 [120/1] via 1.0.0.1, 00:13:26, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0

```

According to the routing table, the routing information advertised by the device uses 8-bit natural mask.

Step 4: Configure RIP version.

#Configure Device1.

```

Device1(config)#router rip
Device1(config-rip)#version 2
Device1(config-rip)#exit

```

#Configure Device2.

```

Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#exit

```

Step 5: Check the result.

#View the routing table of Device1.

```

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan3
R 50.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan3
C 100.0.0.0/24 is directly connected, 00:23:06, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0

```

#View the routing table of Device 2.

```

Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
C 50.0.0/24 is directly connected, 00:23:06, vlan3
R 100.0.0.0/24 [120/1] via 1.0.0.1, 00:13:26, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0

```

According to the routing table, the routing information advertised by the device uses 24-bit accurate mask.

### 53.3.2 Configure RIP Route Redistribution

#### Network Requirements

- Run the OSPF protocol between Device1 and Device2. Device2 learns the OSPF routes 100.0.0.0/24 and 200.0.0.0/24 distributed by Device1.

- Run the RIPv2 protocol between Device2 and Device3. Device2 only redistributes the OSPF route 100.0.0.0/24 into RIP, and advertises such route to Device3.

### Network Topology

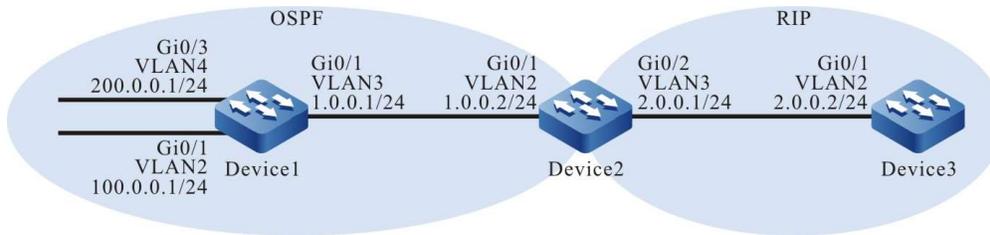

Figure 1 Network Topology for Configuring RIP Route Redistribution

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 100.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 200.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
C 2.0.0.0/24 is directly connected, 00:13:06, vlan3
O 100.0.0.0/24 [110/2] via 1.0.0.1, 00:04:12, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
O 200.0.0.0/24 [110/2] via 1.0.0.1, 00:04:12, vlan2
```

According to the routing table, Device2 learns the OSPF route advertised by Device1.

Step 4: Configure RIP.

#### #Configure Device2.

```
Device2(config)#router rip
Device2(config-rip)#version 2
```

```
Device2(config-rip)#network 2.0.0.0
Device2(config-rip)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 2.0.0.0
Device3(config-rip)#exit
```

### Step 5: Configure routing policy.

#### #On Device2, configure route-map to invoke ACL to match 100.0.0.0/24 and filter 200.0.0.0/24.

```
Device2(config)#ip access-list standard 1
Device2(config-std-nacl)#permit 100.0.0.0 0.0.0.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#route-map OSPFtoRIP
Device2(config-route-map)#match ip address 1
Device2(config-route-map)#exit
```

---

## Note

- When configuring a routing policy, both the prefix list and ACL can create filtering rules. The difference is that the prefix list can exactly match the routing mask.
- 

### Step 6: Configure RIP to redistribute OSPF routes.

#### #Configure Device2.

```
Device2(config)#router rip
Device2(config-rip)#redistribute ospf 100 route-map OSPFtoRIP
Device2(config-rip)#exit
```

### Step 7: Check the result.

#### #View the RIP routing table of Device 2.

```
Device2#show ip rip database
Types: N - Network, L - Learn, R - Redistribute, D - Default config, S - Static config
Proto: C - connected, S - static, R - RIP, O - OSPF, E - IRMP,
       o - SNSP, B - BGP, i-ISIS

RIP routing database in VRF kernel (Counter 3):
T/P Network      ProID Metric Next-Hop   From      Time Tag  Interface
N/C 2.0.0.0/24   none 1    --      --      0    vlan3
R/O 100.0.0.0/24  1    1    1.0.0.1 --      --      0    vlan2
```

#### #Check the routing table of Device3.

```

Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 00:23:06, vlan2
R 100.0.0.0/24 [120/1] via 2.0.0.1, 00:13:26, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0

```

After checking the RIP routing tables of Device2 and Device3, you will find that the route 100.0.0.0/24 on Device2 has been redistributed to RIP and successfully advertised to Device3, while the route 200.0.0.0/24 has been successfully filtered.

---

## ⚠ Caution

- In practical applications, if the autonomous system has 2 or more edge routers, directly redistributing routes between different routing protocols is not recommended. When configuration is necessary, routing control policies such as filtering and summarization are required on the edge routers of the autonomous system to avoid routing loops.
- 

### 53.3.3 Configure the RIP Metric Offset

#### Network Requirements

- Run RIPv2 between Device1, Device2, Device3 and Device4 for interaction.
- Device1 learns the route 200.0.0.0/24 from both Device2 and Device3 at the same time.
- It is required to configure the routing metric offset in the receiving direction on Device1 to make Device1 first select the route advertised by Device2.

#### Network Topology

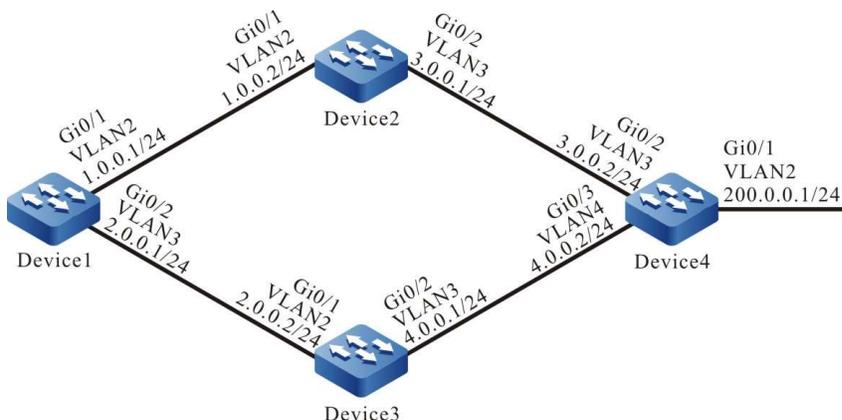

Figure 2 Network Topology for Configuring RIP Metric Offset

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure RIP.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router rip
Device1(config-rip)#version 2
Device1(config-rip)#network 1.0.0.0
Device1(config-rip)#network 2.0.0.0
Device1(config-rip)#exit
```

#Configure Device2.

```
Device2#configure terminal
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 1.0.0.0
Device2(config-rip)#network 3.0.0.0
Device2(config-rip)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 2.0.0.0
Device3(config-rip)#network 4.0.0.0
Device3(config-rip)#exit
```

#Configure Device4.

```
Device4#configure terminal
Device4(config)#router rip
Device4(config-rip)#version 2
Device4(config-rip)#network 3.0.0.0
Device4(config-rip)#network 4.0.0.0
Device4(config-rip)#network 200.0.0.0
Device4(config-rip)#exit
```

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
C 2.0.0.0/24 is directly connected, 00:22:56, vlan3
R 3.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan2
R 4.0.0.0/24 [120/1] via 2.0.0.2, 00:11:04, vlan3
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
R 200.0.0.0/24 [120/2] via 1.0.0.2, 00:08:31, vlan2
   [120/2] via 2.0.0.2, 00:08:31, vlan3
```

According to the routing table of Device1, there are two routes leading to 200.0.0.0/24.

Step 4: Configure access lists.

#Configure Device1.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 200.0.0.0 0.0.0.255
Device1(config-std-nacl)#commit
Device1(config-std-nacl)#exit
```

Step 5: Configure metric offset.

#Configure offset list on Device1 to increase the metric value of the route which is learned from interface VLAN3 and matches ACL by 3.

```
Device1(config)#router rip
Device1(config-rip)#offset-list 1 in 3 vlan3
Device1(config-rip)#exit
```

Step 6: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:33:59, vlan2
C 2.0.0.0/24 is directly connected, 00:33:50, vlan3
R 3.0.0.0/24 [120/1] via 1.0.0.2, 00:24:20, vlan2
R 4.0.0.0/24 [120/1] via 2.0.0.2, 00:21:57, vlan3
C 127.0.0.0/8 is directly connected, 77:01:54, lo0
R 200.0.0.0/24 [120/2] via 1.0.0.2, 00:19:25, vlan2
```

According to the routing table of Device1, the next hop output interface of route 200.0.0.0/24 is only VLAN2, which means that Device1 selects the route advertised by Device2.

- The route offset list can be used on all interfaces or specified interfaces, and in the receiving or advertising direction of the device.
- 

### 53.3.4 Configure RIP Route Filtration

#### Network Requirements

- Run RIPv2 between Device1 and Device2 for route interaction.
- The two routes 2.0.0.0/24 and 3.0.0.0/24 that are advertised by Device2 are learned on Device1, and then the latter route is filtered in the advertising direction of Device2.

## Network Topology

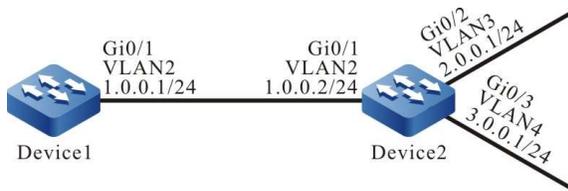

Figure 3 Network Topology for Configuring RIP Route Filtration

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure RIP.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router rip
Device1(config-rip)#version 2
Device1(config-rip)#network 1.0.0.0
Device1(config-rip)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 1.0.0.0
Device2(config-rip)#network 2.0.0.0
Device2(config-rip)#network 3.0.0.0
Device2(config-rip)#exit
```

### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
R 2.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan2
R 3.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

According to the result, Device1 learns two routes distributed by Device2.

Step 4: Configure access lists.

### #Configure Device2.

```
Device2(config)#ip access-list standard 1
Device2(config-std-nacl)#permit 2.0.0.0 0.0.0.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
```

---

## Note

- When configuring route filtration, both the prefix list and ACL can create filtering rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 5: Configure route filtration.

#Configure route filtration in the outgoing direction of the interface VLAN2 of Device2.

```
Device2(config)#router rip
Device2(config-rip)#distribute-list 1 out vlan2
Device2(config-rip)#exit
```

Step 6: Check the result.

#View the routing information of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
R 2.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

According to the result, Device2 will not advertise the route 3.0.0.0/24 to Device1. It is cleared from the routing table of Device1 only after timeout of the route.

---

## Note

- The distribute-list can be used on all interfaces or specified interfaces, and in the receiving or advertising direction of the device.
- 

### 53.3.5 Configure RIP Route Summarization

#### Network Requirements

- Run RIPv2 between Device1, Device2, Device3 and Device4 for route interaction.
- Device1 learns two routes, i.e. 100.1.0.0/24 and 100.2.0.0/24, from Device2. In order to reduce the size of the routing table of Device1, Device2 needs to distribute the summarized route of these two routes only to Device1.

## Network Topology

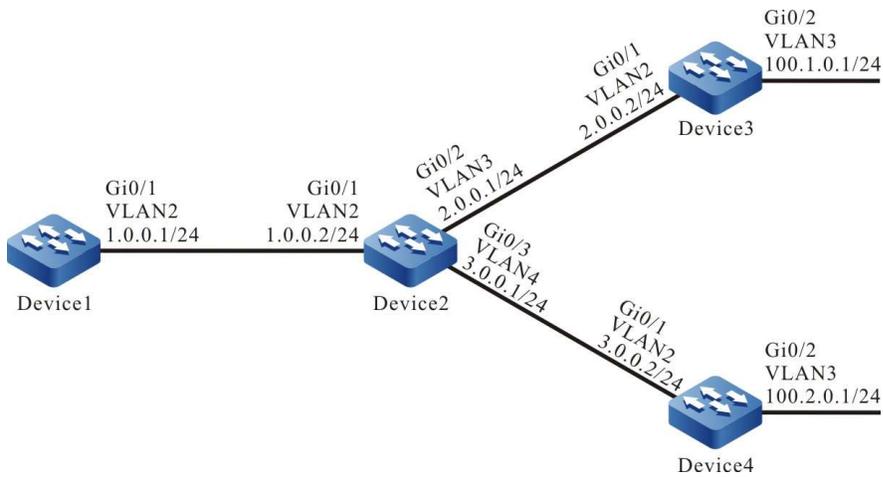

Figure 4 Network Topology for Configuring RIP Route Summarization

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure RIP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router rip
Device1(config-rip)#version 2
Device1(config-rip)#network 1.0.0.0
Device1(config-rip)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 1.0.0.0
Device2(config-rip)#network 2.0.0.0
Device2(config-rip)#network 3.0.0.0
Device2(config-rip)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 2.0.0.0
Device3(config-rip)#network 100.0.0.0
Device3(config-rip)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router rip
Device4(config-rip)#version 2
Device4(config-rip)#network 3.0.0.0
Device4(config-rip)#network 100.0.0.0
```

```
Device4(config-rip)#exit
```

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
R 2.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan2
R 3.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan2
R 100.1.0.0/24 [120/2] via 1.0.0.2, 00:08:31, vlan2
R 100.2.0.0/24 [120/2] via 1.0.0.2, 00:08:31, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

Step 4: Configure interface route summarization.

#Configure the summarized route 100.0.0.0/8 on Device2.

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip summary-address rip 100.0.0.0/8
Device2(config-if-vlan2)#exit
```

Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:24:06, vlan2
R 2.0.0.0/24 [120/1] via 1.0.0.2, 00:14:26, vlan2
R 3.0.0.0/24 [120/1] via 1.0.0.2, 00:14:26, vlan2
R 100.0.0.0/8 [120/2] via 1.0.0.2, 00:00:31, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

According to the result, Device1 learns the summarized route 100.0.0.0/8 distributed by Device2. The two detail routes are cleared from the routing table only after time out.

---

## Note

- RIP supports global automatic summarization and manual interface summarization. The global automatic summarization of RIPv2 is disabled by default.
-

### 53.3.6 Configure RIP to Coordinate with BFD

#### Network Requirements

- Run RIPv2 between Device1, Device2 and Device3 for route interaction.
- Device1 learns the route 3.0.0.0/24 from both Device2 and Device3. By configuring route offset, it makes Device1 first select the route advertised by Device2. Then, the route from Device1 to Device2 is its main line; the route from Device1 to Device3 is its backup line.
- Configure BFD between Device1 and Device2. When the line between Device1 and Device2 fails, configure RIP to associate with BFD between Device1 and Device2 to quickly detect the line failure. When BFD identifies the main line failure, it will trigger RIP for route update, and the route 3.0.0.0/24 will be switched to the backup line.

#### Network Topology

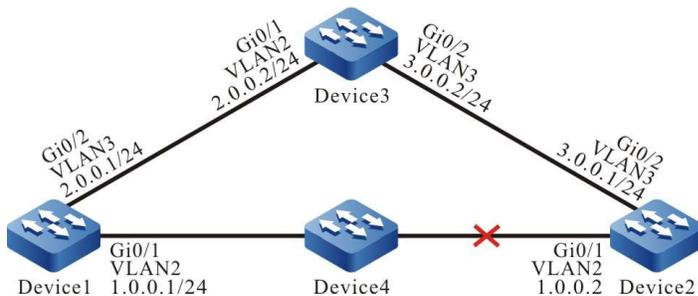

Figure 5 Network Topology for Configuring Coordination of RIP with BFD

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure RIP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router rip
Device1(config-rip)#version 2
Device1(config-rip)#network 1.0.0.0
Device1(config-rip)#network 2.0.0.0
Device1(config-rip)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 1.0.0.0
Device2(config-rip)#network 3.0.0.0
Device2(config-rip)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 2.0.0.0
Device3(config-rip)#network 3.0.0.0
Device3(config-rip)#exit
```

### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 01:30:23, vlan2
C 2.0.0.0/24 is directly connected, 01:30:14, vlan3
R 3.0.0.0/24 [120/1] via 1.0.0.2, 01:20:44, vlan2
   [120/1] via 2.0.0.2, 00:00:02, vlan3
C 127.0.0.0/8 is directly connected, 77:58:18, lo0
```

According to the result, Device1 learns the route 3.0.0.0/24 from both Device2 and Device3 at the same time.

### Step 4: Configure route offset.

#Configure offset list in the incoming direction of interface VLAN3 on Device1 to increase the metric value of the route which matches ACL by 3.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 3.0.0.0 0.0.0.255
Device1(config-std-nacl)#commit
Device1(config)#exit
Device1(config)#router rip
Device1(config-rip)#offset-list 1 in 3 vlan3
Device1(config-rip)#exit
```

### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 01:30:23, vlan2
C 2.0.0.0/24 is directly connected, 01:30:14, vlan3
R 3.0.0.0/24 [120/1] via 1.0.0.2, 01:20:44, vlan2
C 127.0.0.0/8 is directly connected, 77:58:18, lo0
```

According to the result, after configuring route offset, Device1 selects the route 3.0.0.0/24 advertised by Device2.

### Step 5: Configure BFD.

### #Configure Device1.

```
Device1(config)#bfd fast-detect
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip rip bfd
Device1(config-if-vlan2)#exit
```

### #Configure Device2.

```

Device2(config)#bfd fast-detect
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip rip bfd
Device2(config-if-vlan2)#exit

```

Step 6: Check the result.

#View the BFD information on Device1.

```

Device1#show bfd session
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
1.0.0.1      1.0.0.2      2/4      UP      5000      vlan2

```

#When the lines between Device1 and Device2 fail, the route can quickly switch to the backup line.

#View the routing information on Device1.

```

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 02:07:47, vlan3
R 3.0.0.0/24 [120/4] via 2.0.0.2, 00:01:14, vlan3
C 127.0.0.0/8 is directly connected, 78:35:51, lo0

```

### 53.3.7 Configure an RIP Standby Interface

#### Network Requirements

- Run RIPv2 between Device1, Device2 and Device3 for route interaction.
- Device1 learns the route 3.0.0.0/24 from both Device2 and Device3. By configuring route offset, it makes Device1 first select the route advertised by Device2. Then, the line between Device1 and Device2 is its main line; the line between Device1 and Device3 is its backup line.
- Configure RIP backup interface on Device1. When the main line is normal, if the main line through which the route passes fails, the route can quickly switch to the backup line.

#### Network Topology

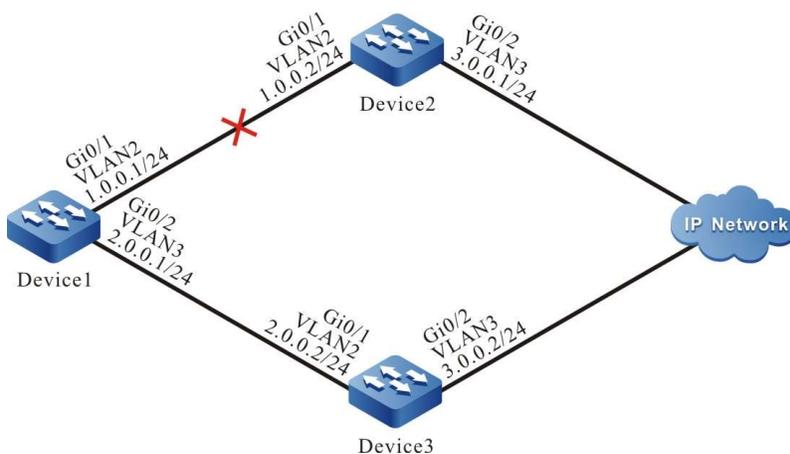

Figure 6 Network Topology for Configuring RIP Backup Interface

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure RIP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router rip
Device1(config-rip)#version 2
Device1(config-rip)#network 1.0.0.0
Device1(config-rip)#network 2.0.0.0
Device1(config-rip)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 1.0.0.0
Device2(config-rip)#network 3.0.0.0
Device2(config-rip)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 2.0.0.0
Device3(config-rip)#network 3.0.0.0
Device3(config-rip)#exit
```

#### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 01:30:23, vlan2
C 2.0.0.0/24 is directly connected, 01:30:14, vlan3
R 3.0.0.0/24 [120/1] via 1.0.0.2, 01:20:44, vlan2
               [120/1] via 2.0.0.2, 00:00:02, vlan3
C 127.0.0.0/8 is directly connected, 77:58:18, lo0
```

According to the result, Device1 learns the route 3.0.0.0/24 from both Device2 and Device3 at the same time.

Step 4: Configure route offset.

#Configure offset list in the incoming direction of interface VLAN3 on Device1 to increase the metric value of the route which matches ACL by 3.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 3.0.0.0 0.0.0.255
Device1(config-std-nacl)#commit
```

```
Device1(config)#exit
Device1(config)#router rip
Device1(config-rip)#offset-list 1 in 3 vlan3
Device1(config-rip)#exit
```

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 01:30:23, vlan2
C 2.0.0.0/24 is directly connected, 01:30:14, vlan3
R 3.0.0.0/24 [120/1] via 1.0.0.2, 01:20:44, vlan2
C 127.0.0.0/8 is directly connected, 77:58:18, lo0
```

According to the result, after configuring route offset, Device1 selects the route 3.0.0.0/24 advertised by Device2.

Step 5: Configure backup interface.

#On Device1, configure the interface VLAN3 as the RIP backup interface of VLAN2.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip rip standby vlan3
Device1(config-if-vlan2)#exit
```

Step 6: Check the result.

#When the lines between Device1 and Device2 fail, the route can quickly switch to the backup line between Device1 and Device3.

#View the routing information on Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 2.0.0.0/24 is directly connected, 02:07:47, vlan3
R 3.0.0.0/24 [120/4] via 2.0.0.2, 00:01:14, vlan3
C 127.0.0.0/8 is directly connected, 78:35:51, lo0
```

## 53.3.8 Configure a Passive RIP Interface

### Network Requirements

- Run RIPv2 between Device1 and Device2 for route interaction.
- Configure passive interface on Device1 so that it doesn't send update packets to Device2.

### Network Topology

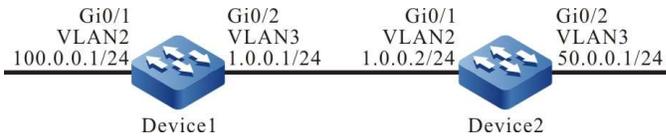

Figure 7 Network Topology for Configuring Passive RIP Interface

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure RIP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router rip
Device1(config-rip)#version 2
Device1(config-rip)#network 1.0.0.0
Device1(config-rip)#network 100.0.0.0
Device1(config-rip)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 1.0.0.0
Device2(config-rip)#network 50.0.0.0
Device2(config-rip)#exit
```

#### #View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan3
R 50.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan3
C 100.0.0.0/24 is directly connected, 00:23:06, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

#### #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan2
C 50.0.0.0/24 is directly connected, 00:23:06, vlan3
R 100.0.0.0/24 [120/1] via 1.0.0.1, 00:13:26, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

Step 4: Configure a passive interface.

#Configure Device1.

```
Device1(config)#router rip
Device1(config-rip)#passive-interface vlan3
Device1(config-rip)#exit
```

Configure VLAN3 as a passive interface on Device1 so that it doesn't send update packets to Device2, though it can still receive such packets.

Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:23:06, vlan3
R 50.0.0.0/24 [120/1] via 1.0.0.2, 00:13:26, vlan3
C 100.0.0.0/24 is directly connected, 00:23:06, vlan2
C 127.0.0.0/8 is directly connected, 76:51:00, lo0
```

The routing information of 50.0.0.0/24 will still be saved on Device1. For Device2, the routing information of 100.0.0.0/24 will be removed from the routing table after the RIP route is deleted for time out.

#View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:25:06, vlan2
C 50.0.0.0/24 is directly connected, 00:25:06, vlan3
C 127.0.0.0/8 is directly connected, 77:51:00, lo0
```

# 54 RIPng

---

## 54.1 Overview

RIPng, also known as the next generation of RIP protocol (RIP next generation), is a dynamic routing protocol used in IPv6 networks to provide routing information for IPv6 packet forwarding. RIPng is the result of extending RIP-2. Its working principle almost the same as RIP. In order to adapt to the IPv6 network, RIPng is different from the original RIP in the following aspects:

- UDP port number: RIPng uses the port number 521 of UDP to send and receive protocol packets;
- Multicast address: RIPng protocol uses FF02::9 as the multicast address of the RIPng router within the local scope of the link. It does not support broadcast;
- Prefix length: The RIPng protocol routing destination address has a 128-bit prefix length;
- Next hop address: RIPng uses a 128-bit IPv6 address;
- Source address: RIPng uses the local address FE80::/10 of the link as the source address to send RIPng packets.

The RIPng-related protocol specifications include RFC2080 and RFC2081.

## 54.2 RIPng function configuration

Table 54 RIPng Function Configuration List

Configuration Task	
Configure RIPng Basic Functions	Globally Enable RIPng
Configure RIPng Route Generation	Configure RIPng to Distribute Default Route
	Configure RIPng Route Redistribution
Configure RIPng Route Control	Configure the RIPng Administrative Distance
	Configure RIPng Route Summarization
	Configure RIPng Metric Offset
	Configure RIPng Route Filtration
	Configure Metric Value of RIPng Interface
	Configure the Routing Flag for an RIPng Interface
	Configure the Maximum Load Balancing of RIPng
Configure RIPng Network Optimization	Configure RIPng Timers
	Configure Split Horizon and Toxicity Reverse of RIPng
	Configure a Static RIPng Neighbor
	Configure Passive RIPng Interface

## 54.2.1 Configure RIPng Basic Functions

### Configuration Condition

Before configuring the basic functions of RIPng, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Enable the IPv6 capability of the interface.

### Globally Enable RIPng

To use RIPng, the following configurations are required:

- Create RIPng process;
- Configure the interface to enable RIPng.

Table 54-2 Globally Enabling RIPng

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create RIPng process and enter RIPng configuration mode	<b>ipv6 router rip</b> <i>process-id</i>	Mandatory By default, RIPng process is disabled.
Return to global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Globally enable RIPng for the interface	<b>ipv6 rip enable</b> <i>process-id</i>	Mandatory By default, RIPng is disabled on the interface.

## 54.2.2 Configure RIPng Route Generation

### Configuration Condition

Before configuring RIPng route generation, ensure that:

- Enable the IPv6 capability of the interface;
- Enable RIPng.

## Configure RIPng to Distribute Default Route

Through configuration, the device sends default routes under all RIPng interfaces and sets itself as the default gateway of other adjacent devices.

Table 541 Configuring RIPng to Distribute Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter RIPng configuration mode	<b>ipv6 router rip <i>process-id</i></b>	Mandatory By default, RIPng process is disabled.
Configure RIPng to Distribute Default Route	<b>default-information originate [ <i>metric value</i> ]</b>	Mandatory By default, RIPng doesn't distribute default route.

---

### Note

- If a default route (0::/0) is learned, it will replace the default route (::/0) distributed by the device. When there is loop in the network, route oscillation may be caused. Thus, when using this command, be sure that several other devices in the same routing domain are not enabling it at the same time.
- 

## Configure RIPng Route Redistribution

The routes generated by other protocols can be imported into RIPng by configuring route redistribution.

Table 54-2 Configuring RIPng Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter RIPng configuration mode	<b>ipv6 router rip <i>process-id</i></b>	Mandatory By default, RIPng process is disabled.

Step	Command	Description
Configure the default metric value of importing other routing protocol by RIPng	<b>default-metric</b> <i>metric-value</i>	Optional By default, the default metric value of importing other routing protocol is 1.
Configure RIPng Route Redistribution	<b>redistribute</b> <i>protocol</i> [ <i>protocol-id</i> ] [ <b>metric</b> <i>metric-value</i> ] [ <b>route-map</b> <i>route-map-name</i> ] [ <b>match</b> <i>route-sub-type</i> ]	Mandatory By default, no route redistribution is configured.

### Note

- In case of redistribution, after the metric command option is specified, the route redistributed will adopt this metric value.
- For RIPng, when configuring route redistribution application routing map, the match options supported include ipv6 address, route type, tag, interface, ipv6 nexthop, ipv6 route-source and metric, and the set options supported include metric and tag.

## 54.2.3 Configure RIPng Route Control

### Configuration Condition

Before configuring RIPng route control, ensure that:

- Enable the IPv6 capability of the interface;
- Enable RIPng.

### Configure the RIPng Administrative Distance

Multiple routing protocols can run in the device at the same time. The device selects the routes learned by each protocol through administrative distance. The smaller the administrative distance, the more like the route is selected.

Table 54-3 Configuring RIPng Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter RIPng configuration mode	<b>ipv6 router rip</b> <i>process-id</i>	-
Configure the RIPng Administrative Distance	<b>distance</b> <i>distance-value</i>	Mandatory By default, RIPng administrative distance is 120.

### Configure RIPng Route Summarization

RIPng route summarization means to configure a pair of destination address and mask combination, which will summarize the routes in the covered network segment.

After RIPng route summarization is configured, the device only advertises the summarized routes. This can significantly reduce the scale of adjacent RIPng routing tables in large and medium-sized networks and the consumption of network bandwidth by routing protocol packets.

The metric of the summarized route will be the minimum metric value among all subnet routes.

Table 54-4 Configuring RIPng Route Summarization Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the route summarization function of RIPng on the interface	<b>ipv6 rip summary-address</b> <i>prefix-address</i>	Mandatory By default, no route summarization function is configured.

### Configure RIPng Metric Offset

By default, RIPng applies the route metric advertised by the neighbor device to the received routes. To modify the metric in some special application scenarios, you can configure the RIPng metric offset to correct the metric of the specified route.

If the metric in the incoming direction is configured, RIPng modifies the metric of the received routes and saves the routes into the routing table. When RIP advertises a metric to the neighbor devices, it uses the

new metric. If the metric in the outgoing direction is configured, the metric is modified only when RIP advertises a metric to the neighbor devices.

Table 54-5 Configuring RIPng Matrix Offset

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter RIPng configuration mode	<b>ipv6 router rip</b> <i>process-id</i>	Mandatory By default, RIPng process is disabled.
Configure RIPng to modify the metric of the specified route	<b>offset-list</b> <i>access-list-name</i> { <b>in</b>   <b>out</b> } <i>metric-offset</i> [ <i>interface-name</i> ]	Mandatory By default, no metric value of interface is configured.

### Configure RIPng Route Filtration

A router can filter the received or advertised routes by configuring an Access Control List (ACL), prefix list or routing map. In receiving RIPng routes, you can filter some learnt routes; or in advertising RIPng routes, you can filter some routes that are advertised to neighbor devices.

Table 54-6 Configuring RIPng Route Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter RIPng configuration mode	<b>ipv6 router rip</b> <i>process-id</i>	Mandatory By default, RIPng process is disabled.
Configure RIPng route filtration function	<b>distribute-list</b> { <i>access-list-name</i>   <b>prefix</b> <i>prefix-list-name</i>   <b>route-map</b> <i>route-map-name</i> } { <b>in</b>   <b>out</b> } [ <i>interface-name</i> ]	Mandatory By default, no route filtration function is configured. When the route filtration function is configured, if an interface is not specified, route filtration will be enabled for all RIPng interfaces.

### Configure Metric Value of RIPng Interface

After RIPng is enabled for an interface, the corresponding direct route is generated in the database, with the default metric being 1. When the route is in the RIPng database or it is advertised to neighbor devices, if the interface is configured with a metric, the interface metric is used as the metric of the route.

If the interface metric is changed, the RIPng database immediately updates the corresponding direct route of RIPng and advertises the new metric to the neighbor devices.

Table 54-7 Configuring RIPng Interface Matrix

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure RIPng interface metric	<b>ipv6 rip metric</b> <i>metric-value</i>	Mandatory By default, the matrix value of the RIPng interface is 1.

### Note

- When the matrix value of the RIPng interface is configured, the matrix of the direct subnet on the interface instead of that of route learning will be affected.

### Configure the Routing Flag for an RIPng Interface

The network administrator can attach tags to some routes. Then, in applying a routing policy, the network administrator can perform route filtration or route property advertisement based on the tags.

Table 54-8 Configuring RIPng Interface Routing Tag

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure the routing tag on the direct subnet on the interface of RIPng	<b>ipv6 rip tag tag-value</b>	Mandatory By default, no routing tag is configured.

### Configure the maximum number of load balancing entries of RIPng

This command helps you to control the number of RIPng load balancing entries for routing.

Table 54-11 Configuring Maximum Number of Load Balancing Entries of RIPng

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter RIPng configuration mode	<b>ipv6 router rip process-id</b>	Mandatory By default, RIPng process is disabled.
Configure the maximum number of load balancing entries of RIPng	<b>maximum-paths max-number</b>	Optional By default, the maximum number of load balancing entries of RIPng is 4.

## 54.2.4 Configure RIPng Network Optimization

### Configuration Condition

Before configuring RIPng network optimization, ensure that:

- Enable the IPv6 capability of the interface;
- Enable RIPng.

### Configure RIPng Timers

RIPng does not maintain neighbor relations and it does not support route withdrawn; therefore, the protocol provides four configurable timers to control the network convergence speed. The four timers are: route update timer, route timeout timer, route dampening update timer, and route clear timer.

The route timeout time must be at least three times of the route update time. If no route update packet is received within the route timeout time, the route becomes invalid and it enters a dampening cycle. The length of the dampening cycle is determined by the dampening update time. During the cycle, the route

will not be cleared. After the dampening cycle is completed, the route enters the clear cycle. During the cycle, the route can be updated. However, if no route update packet is received during the cycle, the route will be deleted.

Table 54-12 Configuring RIPng Timer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter RIPng configuration mode	<b>ipv6 router rip <i>process-id</i></b>	Mandatory By default, RIPng process is disabled.
Configure the time of RIPng timer	<b>timers <i>update-interval</i> <i>invalid-interval</i> <i>holddown-interval</i> <i>flush-interval</i></b>	Optional By default, the RIPng update interval is 30 seconds, the effective time of advertisement 180 seconds, the suppression time 0 seconds, and the clearing time 120 seconds.

---

 **Caution**

- In the same RIPng routing domain, the **timer** configurations on all devices must be consistent to avoid network flapping.
- 

### Configure Split Horizon and Toxicity Reverse of RIPng

Split horizon and toxicity reverse are mechanisms that are used to prevent route loops.

1. Configure split horizon.

RIPng does not advertise routes that it has learnt from an interface to the interface, preventing routing loops.

Table 54-13 Configuring RIPng Split Horizon

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure RIPng split horizon	<b>no ipv6 split-horizon</b> [ <b>disable</b> ]	Optional By default, the split horizon function is enabled.

## 2. Configure toxicity reverse.

RIPng announces routes that have been learnt from an interface to the interface, but the route metric is the maximum number of hops, 16, preventing routing loops.

Table 54-14 Configuring RIPng Toxicity Reverse

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure RIPng toxicity reverse	<b>ipv6 split-horizon poison-reverse</b>	Mandatory By default, the toxicity reverse function is disabled.

### Note

- The split horizon and toxicity reverse functions are valid only for the learnt routes, direct routes on the RIPng, and the redistributed direct and static routes.
- The split horizon function and the toxicity reversion function cannot be used at the same time.

## Configure a Static RIPng Neighbor

RIPng does not maintain neighbor relations, so it does not have the concept of neighbor. Here the neighbor refers to the neighbor RIPng routing device. After a static RIPng neighbor is specified, RIPng sends RIPng packets to the neighbor in unicast mode. The configuration is applied to a network that does not support broadcast or multicast, such as point-to-point links. If the configuration is applied to a multicast network, it may cause repeated RIPng packets in the network.

Table 54-15 Configuring Static RIPng Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the neighbor which advertises routing information in the form of unicast	<b>ipv6 rip neighbor</b> <i>ipv6-address</i>	Mandatory The parameter <i>ipv6-address</i> is the ipv6 address of the direct interface on the peer port.

### Note

- The advertisement of routing information to static neighbors occurs only on the RIPng interface, and "**pv6 rip passive**" cannot prevent them from sending packets to static neighbors.

### Configure Passive RIPng Interface

To decrease the network bandwidth consumed by the routing protocol, the dynamic routing protocol uses the passive interface function. RIPng receives only route update packets on a passive interface, and it does not send route update packets on the passive interface. In a low-speed network with small bandwidth, the passive interface function and the neighbor function cooperate to effectively reduce interactions of RIPng routes.

Table 54-16 Configuring Passive RIPng Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Passive RIPng Interface	<b>ipv6 rip passive</b>	Mandatory By default, no passive interface is configured.

### Note

- The **ipv6 rip passive** function does not restrain an interface from sending unicast route updates to its neighbor devices. When the passive interface function is used with the **neighbor** command, the function does not restrain an interface from sending unicast route updates to its neighbor devices. This application mode controls a router so that it sends route updates only to some neighbor devices in unicast mode instead of sending route updates to all neighbor devices in multicast mode.

## 54.2.5 Configure RIPng to Coordinate with BFD

The backup interface can be used in specific application environments only. It cannot meet the requirements of real-time backup. The BFD (Bidirectional Forwarding Detection) function of RIPng which provides end-to-end protection can achieve rapid route convergence and switch. BFD can rapidly detect the status of the lines between two devices. When BFD detection is enabled between two adjacent RIPng devices, if there is a line failure between the devices, BFD can quickly detect the failure and notify the RIPng protocol. RIP will delete the RIPng routes associated on the BFD interface. If these routes have backups, they will switch to the backup route in a very short time (affected by the BFD configuration). Currently, RIPng supports BFD single-hop bidirectional detection only.

Table 54-17 Configuring RIPng to Coordinate with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter RIPng configuration mode	<b>ipv6 router rip 100</b>	Mandatory By default, RIPng process is disabled.

Step	Command	Description
Make all the interfaces covered by RIPng process enable BFD function	<b>bfd all-interfaces</b>	Mandatory By default, the BFD function of all interfaces covered by RIPng is disabled.
Return to the global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable the BFD function on the interface	<b>ipv6 rip bfd</b>	Mandatory By default, the BFD function of interface is disabled.

### Note

- For the BFD-related configurations, please see the Reliability Technology - BFD Technical Manual.

## 54.2.6 PIM-DM monitoring and maintaining

Table 54-18 Configuring RIPng Monitoring and Maintaining

Command	Description
<b>clear ipv6 rip</b> [ <i>process-id</i> ] { <b>process</b>   <b>statistics</b> }	Clear the RIPng process and statistical information
<b>show ipv6 rip</b> [ <i>process-id</i> ]	Show the basic information of RIPng
<b>show ipv6 rip</b> [ <i>process-id</i> ] <b>database</b> [ <b>detail</b>   <i>ipv6-address/mask-length</i> [ <b>detail</b>   <b>longer-prefixes</b> ] ]	Show the RIPng routing database information
<b>show ipv6 rip</b> [ <i>process-id</i> ] <b>statistics</b> [ <i>interface-name</i> ]	Show the statistical information of RIPng interface

Command	Description
<b>show ipv6 rip interface</b> [ <i>interface-name</i> ]	Show RIPng interface information

## 54.3 RIPng Typical Configuration Example

### 54.3.1 Configure RIPng Basic Functions

#### Network Requirements

- Run RIPng between Device1 and Device2 for route interaction.

#### Network Topology

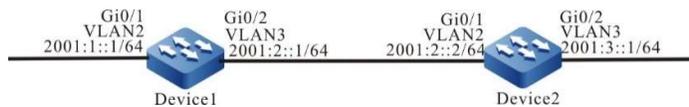

Figure 54 Network Topology for Configuring Basic Functions of RIPng

#### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN. (Omitted)

Step 2: Configure IPv6 addresses for the ports. (Omitted)

Step 3: Configure RIPng.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router rip 100
Device1(config-ripng)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 rip enable 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ipv6 rip enable 100
Device1(config-if-vlan3)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 rip enable 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 rip enable 100
Device2(config-if-vlan3)#exit
```

Step 4: Check the result.

#View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w4d:19:31:05, lo0
C 2001:1::/64 [0/0]
  via ::, 00:21:42, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:21:40, lo0
C 2001:2::/64 [0/0]
  via ::, 00:21:34, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:21:33, lo0
R 2001:3::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:11:19, vlan3
```

#View the IPv6 routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 3d:22:39:31, lo0
R 2001:1::/64 [120/2]
  via fe80::201:7aff:fe01:204, 00:12:00, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:30:46, vlan2
L 2001:2::2/128 [0/0]
  via ::, 00:30:45, lo0
C 2001:3::/64 [0/0]
  via ::, 00:29:12, vlan3
L 2001:3::1/128 [0/0]
  via ::, 00:29:11, lo0
```

According to the routing table, the routing information advertised by the device uses 64-bit accurate mask.

## 54.3.2 Configure RIPng Route Redistribution

### Network Requirements

- Run the IPv6 OSPF protocol between Device1 and Device2. Device2 learns the IPv6 OSPF routes 2001:1::/64 and 2001:2::/64 distributed by Device1.
- Run the RIPng protocol between Device2 and Device3. Device2 only redistributes the IPv6 OSPF route 2001:1::/64 into RIPng, and advertises such route to Device3.

### Network Topology

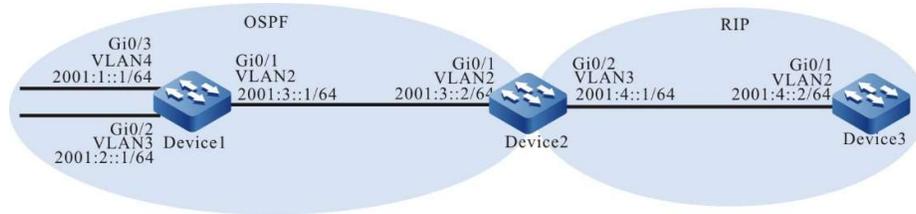

Figure 54 Network Topology for Configuring RIPng Route Redistribution

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN. (Omitted)

Step 2: Configure IPv6 addresses for the ports. (Omitted)

Step 3: Configure IPv6 OSPF.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)# router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 router ospf tag 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ipv6 router ospf tag 100 area 0
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan 4
Device1(config-if-vlan4)#ipv6 router ospf tag 100 area 0
Device1(config-if-vlan4)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 router ospf tag 100 area 0
Device2(config-if-vlan2)#exit
```

#### #View the IPv6 routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 4d:00:09:49, lo0
O 2001:1::/64 [110/2]
  via fe80::201:7aff:fe01:204, 00:12:16, vlan2
O 2001:2::/64 [110/2]
  via fe80::201:7aff:fe01:204, 00:12:16, vlan2
C 2001:3::/64 [0/0]
  via ::, 00:19:51, vlan2
L 2001:3::2/128 [0/0]
  via ::, 00:19:50, lo0
C 2001:4::/64 [0/0]
  via ::, 00:45:13, vlan3
L 2001:4::1/128 [0/0]
```

```
via ::, 00:45:12, lo0
```

According to the routing table, Device2 learns the IPv6 OSPF route advertised by Device1.

Step 4: Configure RIPng.

#Configure Device2.

```
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 rip enable 100
Device2(config-if-vlan3)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router rip 100
Device3(config-ripng)#exit
Device3(config)#interface vlan 2
Device3(config-if-vlan2)#ipv6 rip enable 100
Device3(config-if-vlan2)#exit
```

Step 5: Configure routing policy.

#On Device2, configure route-map to invoke the prefix list to match 2001:1::/64 and filter 2001:2::/64.

```
Device2(config)#ipv6 prefix-list OSPF permit 2001:1::/64
Device2(config)#route-map OSPFtoRIP
Device2(config-route-map)#match ipv6 address prefix-list OSPF
Device2(config-route-map)#exit
```

---

### Note

- When configuring a routing policy, both the prefix list and ACL can create filtering rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 6: Configure RIPng redistribution of IPv6 OSPF route.

#Configure RIPng redistribution of IPv6 OSPF route.

```
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#redistribute ospf 100 route-map OSPFtoRIP
Device2(config-ripng)#exit
```

Step 7: Check the result.

#View the RIPng database on Device2.

```
Device2#show ipv6 rip database
Type : N - Network interface, L - Learn, R - Redistribute, D - Default config,
      S - Static config
Proto: C - connected, S - static, R - RIP, O - OSPF, E - IRMP,
      o - SNSP, B - BGP, i-ISIS

RIPng process 100 routing database (VRF Kernel, Counter 2):
[Type/Proto]
[R/O] 2001:1::/64 metric 1
```

```
via vlan2, fe80::201:7aff:fe01:204, no expires
[N/C] 2001:4::/64 metric 1, installed
via vlan3, ::, no expires
```

### # Check the IPv6 routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
via ::, 2w0d:20:00:11, lo0
R 2001:1::/64 [120/2]
via fe80::201:7aff:fec3:38a5, 02:50:14, vlan2
C 2001:4::/64 [0/0]
via ::, 03:56:24, vlan2
L 2001:4::2/128 [0/0]
via ::, 03:56:23, lo0
```

After checking the database of Device2 and routing table of Device3, you will find that the route 2001:1::/64 on Device2 has been redistributed to RIPng and successfully advertised to Device3, while the route 2001:2::/64 has been successfully filtered.

---

### Note

- In practical applications, if the autonomous system has 2 or more edge routers, directly redistributing routes between different routing protocols is not recommended. When configuration is necessary, routing control policies such as filtering and summarization are required on the edge routers of the autonomous system to avoid routing loops.
- 

## 54.3.3 Configure RIPng Metric Offset

### Network Requirements

- Run RIPng between Device1, Device2, Device3 and Device4 for interaction.
- Device1 learns the route 2001:5::/64 from both Device2 and Device3 at the same time.
- It is required to configure the routing metric offset in the receiving direction on Device1 to make Device1 first select the route advertised by Device2.

### Network Topology

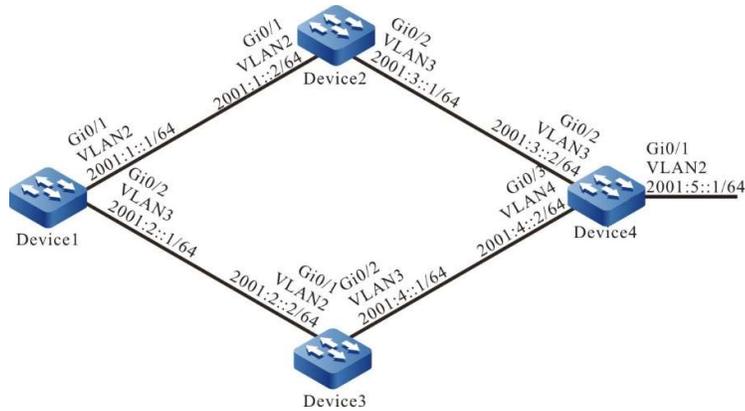

Figure 54 Network Topology for Configuring RIPng Metric Offset

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure RIPng.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router rip 100
Device1(config-ripng)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 rip enable 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ipv6 rip enable 100
Device1(config-if-vlan3)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 rip enable 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 rip enable 100
Device2(config-if-vlan3)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router rip 100
Device3(config-ripng)#exit
Device3(config)#interface vlan 2
Device3(config-if-vlan2)#ipv6 rip enable 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan 3
Device3(config-if-vlan3)#ipv6 rip enable 100
Device3(config-if-vlan3)#exit
```

#### #Configure Device4.

```

Device4#configure terminal
Device4(config)#ipv6 router rip 100
Device4(config-ripng)#exit
Device4(config)#interface vlan 2
Device4(config-if-vlan2)#ipv6 rip enable 100
Device4(config-if-vlan2)#exit
Device4(config)#interface vlan 3
Device4(config-if-vlan3)#ipv6 rip enable 100
Device4(config-if-vlan3)#exit
Device4(config)#interface vlan 4
Device4(config-if-vlan4)#ipv6 rip enable 100
Device4(config-if-vlan4)#exit

```

#View the IPv6 routing table of Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w5d:06:21:24, lo0
C 2001:1::/64 [0/0]
  via ::, 00:02:05, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:02:04, lo0
C 2001:2::/64 [0/0]
  via ::, 00:02:02, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:02:01, lo0
R 2001:3::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:02:03, vlan2
R 2001:4::/64 [120/2]
  via fe80::201:7aff:fe11:2214, 00:00:48, vlan3
R 2001:5::/64 [120/3]
  via fe80::201:7aff:fec3:38a4, 00:02:03, vlan2
  [120/3]
  via fe80::201:7aff:fe11:2214, 00:00:48, vlan3

```

According to the routing table of Device1, there are two routes leading to 2001:5::/64.

Step 4: Configure access lists.

```

Device1(config)#ipv6 access-list extended RIPng
Device1(config-v6-list)#permit 10 2001:5::/64 any
Device1(config-v6-list)#commit
Device1(config-v6-list)#exit

```

Step 5: Configure metric offset.

#Configure offset list on Device1 to increase the metric value of the route which is learned from interface VLAN3 and matches ACL by 3.

```

Device1(config)# ipv6 router rip 100
Device1(config-ripng)#offset-list RIPng in 3 vlan 3
Device1(config-ripng)#exit

```

Step 6: Check the result.

#View the IPv6 routing table of Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]

```

```

via ::, 2w5d:06:34:28, lo0
C 2001:1::/64 [0/0]
via ::, 00:15:09, vlan2
L 2001:1::1/128 [0/0]
via ::, 00:15:08, lo0
C 2001:2::/64 [0/0]
via ::, 00:15:06, vlan3
L 2001:2::1/128 [0/0]
via ::, 00:15:05, lo0
R 2001:3::/64 [120/2]
via fe80::201:7aff:fec3:38a4, 00:03:10, vlan2
R 2001:4::/64 [120/2]
via fe80::201:7aff:fe11:2214, 00:03:10, vlan3
R 2001:5::/64 [120/3]
via fe80::201:7aff:fec3:38a4, 00:03:10, vlan2

```

According to the routing table of Device1, the next hop output interface of route 2001:5::/64 is only VLAN2, which means that Device1 selects the route advertised by Device2.

---

### Note

- The route offset list can be used on all interfaces or specified interfaces, and in the receiving or advertising direction of the device.
- 

## 54.3.4 Configure RIPng Route Filtration

### Network Requirements

- Run RIPng between Device1 and Device2 for route interaction.
- The two routes 2001:2::/64 and 2001:3::/64 that are advertised by Device2 are learned on Device1, and then the latter route is filtered in the advertising direction of Device2.

### Network Topology

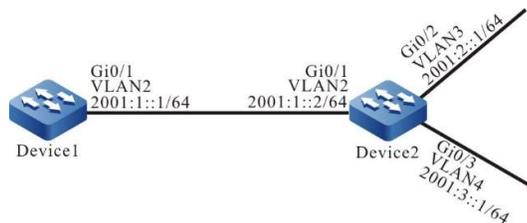

Figure 54 Network Topology for Configuring RIPng Route Filtration

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure RIPng.

## #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router rip 100
Device1(config-ripng)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 rip enable 100
Device1(config-if-vlan2)#exit
```

## #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 rip enable 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 rip enable 100
Device2(config-if-vlan3)#exit
Device2(config)#interface vlan 4
Device2(config-if-vlan4)#ipv6 rip enable 100
Device2(config-if-vlan4)#exit
```

## #View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w5d:02:47:44, lo0
C 2001:1::/64 [0/0]
  via ::, 00:56:34, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:56:32, lo0
R 2001:2::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:27:11, vlan2
R 2001:3::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:27:11, vlan2
```

According to the result, Device1 learns two routes distributed by Device2.

### Step 4: Configure IPv6 prefix list.

```
Device2(config)#ipv6 prefix-list RIPng deny 2001:3::/64
```

### Step 5: Configure route filtration.

## #Configure route filtration in the outgoing direction of the interface VLAN2 of Device2.

```
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#distribute-list prefix RIPng out vlan 2
Device2(config-ripng)#exit
```

### Step 6: Check the result.

## #View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w5d:03:03:49, lo0
```

```

C 2001:1::/64 [0/0]
  via ::, 01:12:39, vlan2
L 2001:1::1/128 [0/0]
  via ::, 01:12:38, lo0
R 2001:2::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:43:16, vlan2

```

According to the result, Device2 will not advertise the route 2001:3::/64 to Device1. It is cleared from the routing table of Device1 only after timeout of the route.

---

## Note

- The distribute-list can be used on all interfaces or specified interfaces, and in the receiving or advertising direction of the device.
- 

### 54.3.5 Configure RIPng Route Summarization

#### Network Requirements

- Run RIPng between Device1, Device2, Device3 and Device4 for route interaction.
- Device1 learns two routes, i.e. 2001:4:1:1::/64 and 2001:4:1:2::/64, from Device2. In order to reduce the size of the routing table of Device1, Device2 needs to distribute the summarized route of these two routes only to Device1.

#### Network Topology

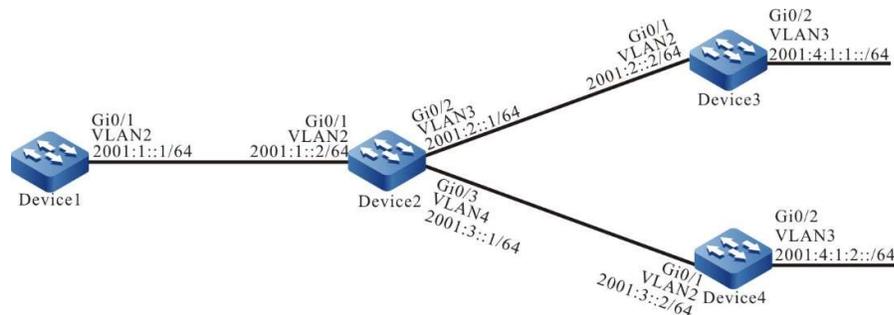

Figure 1 Network Topology for Configuring RIPng Route Summarization

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure RIPng.

#### #Configure Device1.

```

Device1#configure terminal
Device1(config)#ipv6 router rip 100
Device1(config-ripng)#exit
Device1(config)#interface vlan 2

```

```
Device1(config-if-vlan2)#ipv6 rip enable 100
Device1(config-if-vlan2)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 rip enable 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 rip enable 100
Device2(config-if-vlan3)#exit
Device2(config)#interface vlan 4
Device2(config-if-vlan4)#ipv6 rip enable 100
Device2(config-if-vlan4)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router rip 100
Device3(config-ripng)#exit
Device3(config)#interface vlan 2
Device3(config-if-vlan2)#ipv6 rip enable 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan 3
Device3(config-if-vlan3)#ipv6 rip enable 100
Device3(config-if-vlan3)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#ipv6 router rip 100
Device4(config-ripng)#exit
Device4(config)#interface vlan 2
Device4(config-if-vlan2)#ipv6 rip enable 100
Device4(config-if-vlan2)#exit
Device4(config)#interface vlan 3
Device4(config-if-vlan3)#ipv6 rip enable 100
Device4(config-if-vlan3)#exit
```

#### #View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w5d:02:27:40, lo0
C 2001:1::/64 [0/0]
  via ::, 00:36:29, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:36:28, lo0
R 2001:2::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:07:06, vlan2
R 2001:3::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:07:06, vlan2
R 2001:4:1:1::/64 [120/3]
  via fe80::201:7aff:fec3:38a4, 00:07:06, vlan2
R 2001:4:1:2::/64 [120/3]
  via fe80::201:7aff:fec3:38a4, 00:06:55, vlan2
```

Step 4: Configure interface route summarization.

#### #Configure the summarized route 2001:4:1::/48 on Device2.

```
Device2(config)#interface vlan 2
```

```
Device2(config-if-vlan2)#ipv6 rip summary-address 2001:4:1::/48
Device2(config-if-vlan2)#exit
```

Step 5: Check the result.

#View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w5d:02:35:44, lo0
C 2001:1::/64 [0/0]
  via ::, 00:44:33, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:44:32, lo0
R 2001:2::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:15:10, vlan2
R 2001:3::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:15:10, vlan2
R 2001:4:1::/48 [120/3]
  via fe80::201:7aff:fec3:38a4, 00:05:19, vlan2
```

According to the result, Device1 learns the summarized route 2001:4:1::/48 distributed by Device2. The two detail routes are cleared from the routing table only after time out.

### 54.3.6 Configure Passive RIPng Interface

#### Network Requirements

- Run RIPng between Device1 and Device2 for route interaction.
- Configure passive interface on Device1 so that it doesn't send update packets to Device2.

#### Network Topology

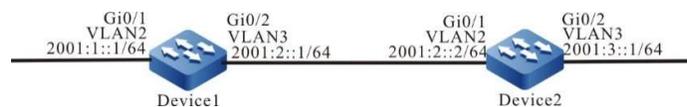

Figure 2 Network Topology for Configuring Passive RIPng Interface

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure RIPng.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router rip 100
Device1(config-ripng)#exit
Device1(config)#interface vlan 2
```

```
Device1(config-if-vlan2)#ipv6 rip enable 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ipv6 rip enable 100
Device1(config-if-vlan3)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router rip 100
Device2(config-ripng)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 rip enable 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 rip enable 100
Device2(config-if-vlan3)#exit
```

#### #View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w4d:19:31:05, lo0
C 2001:1::/64 [0/0]
  via ::, 00:21:42, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:21:40, lo0
C 2001:2::/64 [0/0]
  via ::, 00:21:34, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:21:33, lo0
R 2001:3::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:11:19, vlan3
```

#### #View the IPv6 routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 3d:22:39:31, lo0
R 2001:1::/64 [120/2]
  via fe80::201:7aff:fe01:204, 00:12:00, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:30:46, vlan2
L 2001:2::2/128 [0/0]
  via ::, 00:30:45, lo0
C 2001:3::/64 [0/0]
  via ::, 00:29:12, vlan3
L 2001:3::1/128 [0/0]
  via ::, 00:29:11, lo0
```

#### Step 4: Configure a passive interface.

#### #Configure Device1.

```
Device1(config)#interface vlan 3
Device1(config-if-vlan3)#ipv6 rip passive
Device1(config-if-vlan3)#exit
```

Configure vlan 3 as a passive interface on Device1 so that it doesn't send update packets to Device2, though it can still receive such packets.

Step 5: Check the result.

#View the IPv6 routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 2w4d:19:55:37, lo0
C 2001:1::/64 [0/0]
  via ::, 00:46:14, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:46:12, lo0
C 2001:2::/64 [0/0]
  via ::, 00:46:06, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:46:05, lo0
R 2001:3::/64 [120/2]
  via fe80::201:7aff:fec3:38a4, 00:35:51, vlan3
```

The routing information of 2001:3::/64 will still be saved on Device1. For Device2, the routing information of 2001:1::/64 will be removed from the routing table after the RIPng route is deleted for time out.

#View the IPv6 routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 3d:23:05:24, lo0
C 2001:2::/64 [0/0]
  via ::, 00:56:39, vlan2
L 2001:2::2/128 [0/0]
  via ::, 00:56:38, lo0
C 2001:3::/64 [0/0]
  via ::, 00:55:05, vlan3
L 2001:3::1/128 [0/0]
  via ::, 00:55:04, lo0
```

### 54.3.7 Configure RIPng to use IPSec encryption & authentication

#### Network Requirements

- Run RIPng between Device1 and Device2.
- Device1 and Device2 use IPSec tunnels for encryption & authentication of RIPng packets.
- Upon completion of the configuration, the device can normally conduct route interaction.

#### Network Topology

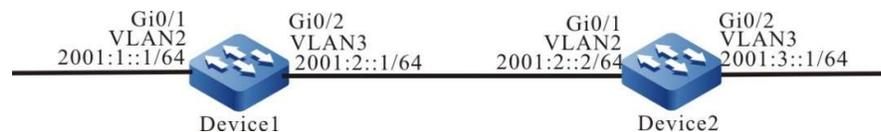

Figure 3 Network Topology for Configuring RIPng Authentication Function

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface. (Omitted)

Step 2: Configure RIPng process and enable the RIPng function on the interface.

```
#Configure Device1.  
Device1#configure terminal  
Device1(config)#ipv6 router rip 100  
Device1(config-ripng)#exit  
Device1(config)#interface vlan2  
Device1(config-if-vlan2)#ipv6 rip enable 100  
Device1(config-if-vlan2)#exit  
Device1(config)#interface vlan3  
Device1(config-if-vlan3)#ipv6 rip enable 100  
Device1(config-if-vlan3)#exit
```

#Configure Device2.

```
Device2#configure terminal  
Device2(config)#ipv6 router rip 100  
Device2(config-ripng)#exit  
Device2(config)#interface vlan2  
Device2(config-if-vlan2)#ipv6 rip enable 100  
Device2(config-if-vlan2)#exit  
Device2(config)#interface vlan3  
Device2(config-if-vlan3)#ipv6 rip enable 100  
Device2(config-if-vlan3)#exit
```

Step 3: Configure IPsec proposal and manual tunnel.

#On Device1, create IPsec proposal a, use ESP transmission & encapsulation mode (encryption algorithm 3des, authentication algorithm sha1), create IPsec manual tunnel a, and configure SPI and key.

```
Device1(config)#crypto ipsec proposal a  
Device1(config-ipsec-prop)#mode transport  
Device1(config-ipsec-prop)#esp 3des sha1  
Device1(config-ipsec-prop)#exit  
Device1(config)#crypto ipv6-tunnel a manual  
Device1(config-manual-tunnel)#set ipsec proposal a  
Device1(config-manual-tunnel)#set inbound esp 1000 encryption 0 11111111111111111111111111111111 authentication 0 aaaaaaaaaa  
aaaaaaaaa  
Device1(config-manual-tunnel)#set outbound esp 1001 encryption 0 aaaaaaaaaaaaaaaaaaaaaaa authentication 0 111111111111  
11111111  
Device1(config-manual-tunnel)#exit
```

#On Device2, create IPsec proposal a, use ESP transmission & encapsulation mode (encryption algorithm 3des, authentication algorithm sha1), create IPsec manual tunnel a, and configure SPI and key.

```
Device2(config)#crypto ipsec proposal a  
Device2(config-ipsec-prop)#mode transport  
Device2(config-ipsec-prop)#esp 3des sha1  
Device2(config-ipsec-prop)#exit  
Device2(config)#crypto ipv6-tunnel a manual  
Device2(config-manual-tunnel)#set ipsec proposal a  
Device2(config-manual-tunnel)#set inbound esp 1001 encryption 0 aaaaaaaaaaaaaaaaaaaaaaa authentication 0 111111111111  
11111111  
Device2(config-manual-tunnel)#set outbound esp 1000 encryption 0 11111111111111111111111111111111 authentication 0 aaaaaaaaaa
```

```
aaaaaaaaa
Device2(config-manual-tunnel)#exit
```

Step 4: In the RIPng process, bind corresponding IPsec tunnel to each interface.

**#Bind IPsec tunnel a to the interface Vlan3 of Device1**

```
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 rip ipsec-tunnel a
Device1(config-if-vlan3)#exit
```

**#Bind IPsec tunnel a to the interface Vlan2 of Device2**

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 rip ipsec-tunnel a
Device2(config-if-vlan2)#exit
```

Step 5: Check the result.

**#View the RIPng interface information of Vlan3 on Device1.**

```
Device1#show ipv6 rip interface vlan3
vlan3 is up, line protocol is up
RIPng enable status   : Enable on process 100
RIPng running status  : Up
VPN Routing/Forwarding : Kernel
Passive interface     : Disabled
Split horizon         : enable
Packet MTU            : 1500
Joined RIPng multicast : Yes
IPv6 interface address :
2001:2::1/64
fe80::201:7aff:fe74:55e7/10
RIPng bfd interface   : Enable
RIPng bfd function open : OFF
RIPng bfd interface state : DOWN
RIPng ipsec-tunnel info:
Bind to ipsec-tunnel :a
Tunnel-id: 0
```

**#View the IPv6 routing table of Device1.**

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
via ::, 2w4d:19:31:05, lo0
C 2001:1::/64 [0/0]
via ::, 00:21:42, vlan2
L 2001:1::1/128 [0/0]
via ::, 00:21:40, vlan2
C 2001:2::/64 [0/0]
via ::, 00:21:34, vlan3
L 2001:2::1/128 [0/0]
via ::, 00:21:33, vlan3
R 2001:3::/64 [120/2]
via fe80::201:7aff:fec3:38a4, 00:11:19, vlan3
```

**#View the IPv6 routing table of Device 2.**

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 3d:22:39:31, lo0
R 2001:1::/64 [120/2]
  via fe80::201:7aff:fe01:204, 00:12:00, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:30:46, vlan2
L 2001:2::2/128 [0/0]
  via ::, 00:30:45, vlan2
C 2001:3::/64 [0/0]
  via ::, 00:29:12, vlan3
L 2001:3::1/128 [0/0]
  via ::, 00:29:11, vlan3
```

According to the routing table, the IPsec tunnel has been successfully bound, and the packets are sent and received normally so that the routes can be learnt from each other.

---

 说明:

- When configuring RIPng to bind an IPsec tunnel, you can configure process binding or interface binding only, or configure both process and interface binding.
  - When IPsec tunnel is configured for process binding and interface binding at the same time, the latter takes effect first.
-

# 55 OSPF

---

## 55.1 Overview

OSPF protocol (Open Shortest Path First) is a dynamic routing protocol based on link status. It uses Dijkstra's shortest path precedence algorithm SPF to calculate routes in a single autonomous system (Autonomous System, hereinafter referred to as AS).

The OSPF protocol, developed by IETF, is mainly used to solve problems like slow convergence and loop formation in distance vector routing. It can be applied in large and medium-sized networks. The OSPF version 2 currently implemented complies with RFC2328 and supports the OSPF extended functions defined by other related RFCs.

In OSPF protocol, each device maintains a link status database which describes the AS network. Devices in the same area have the same database. After the database is fully synchronized, each device deems itself as the root and uses the SPF algorithm to calculate a loop-free shortest path tree to describe the shortest path it knows to reach each destination. Finally, each device builds its own routing table according to the SPF tree.

OSPF has the following characteristics:

- Fast convergence: Send update packets immediately after the topological structure of the network changes, and synchronize this change in the AS;
- No self-loop: OSPF runs SPF to calculate routes based on the link status database, which ensures that no routing loops will be formed through the algorithm itself;
- Division of areas: OSPF allows the AS to be divided into multiple areas, which reduces the occupation of network bandwidth and makes it possible to build a hierarchical network;
- Support authentication: Every time the OSPF device receives a routing protocol packet, it will verify the authentication information in the packet to avoid information leakage or malicious attacks in the network;
- Support subnets of different lengths: The route advertised by OSPF carries network masks to support subnets of different lengths;
- Support load balancing: Support multiple equal-cost routes leading to the same

destination address.

## 55.2 OSPF function configuration

Table 1 OSPF Function Configuration List

Configuration Task	
Configure OSPF Basic Functions	Configure OSPF Protocol
Configure OSPF Area	Configure OSPF NSSA
	Configure OSPF Stub Area
	Configure OSPF Virtual Link
Configure OSPF Network Type	Configure Network Type of OSPF Interface as Broadcast
	Configure Network Type of OSPF Interface as P2P
	Configure Network Type of OSPF Interface as NBMA
	Configure Network Type of OSPF Interface as P2MP
Configure OSPF Network Authentication	Configure OSPF Area Authentication
	Configure OSPF Interface Authentication
Configure OSPF Route Generation	Configure OSPF Route Redistribution
	Configure OSPF Default Route
	Configure OSPF Host Route
Configure OSPF Route Control	Configure OSPF Inter-area Summarization
	Configure OSPF External Route Summarization
	Configure OSPF Inter-area Route Filtration
	Configure OSPF External Route Filtration
	Configure OSPF Route Installation Filtration

Configuration Task	
	Configure Cost Value of OSPF Interface
	Configure OSPF Reference Bandwidth
	Configure OSPF Administrative Distance
	Configure the Maximum Number of Load Balancing Entries of OSPF
	Configure OSPF to be Compatible with RFC1583
Configure OSPF Network Optimization	Configure Keepalive Time of OSPF Neighbors
	Configure Passive OSPF Interface
	Configure OSPF Demand Circuit
	Configure OSPF Interface Priority
	Configure OSPF Interface MTU

	Configure OSPF to Prohibit LSA Diffusion
	Configure OSPF SPF Calculation Time
	Configure OSPF Database Overflow
Configure OSPF to Coordinate with BFD	Configure OSPF to Coordinate with BFD
Configure OSPF GR	Configure OSPF GR Restarter
	Configure OSPF GR Helper

## 55.2.1 Configure OSPF Basic Functions

In the various configuration tasks of OSPF, you must first enable the OSPF protocol so that the configuration of the other function features can take effect.

### Configuration Condition

Before configuring basic functions of OSPF, first complete the following tasks:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.

### Configure OSPF Protocol

To enable the OSPF function, you need to create an OSPF process first, specify the network address scope associated with this process and the area to which the address scope belongs; if an interface IP address is within the network segment of a certain area, the interface belongs to this area and enables the OSPF function, and OSPF will advertise the direct route of this interface.

The device where OSPF protocol is running must have a Router ID, which is used to uniquely identify a device in an OSPF AS. The uniqueness of the Router ID in the AS must be guaranteed. Otherwise, it will influence the neighbor establishment and route learning. A Router ID may be specified in the process of creating OSPF process. If no Router ID is specified, election will be conducted according to the following rules:

- Firstly, select the largest IP address from the Loopback interface as Router ID;
- If no Loopback interface is configured for IP address, select the largest IP addresses from other interfaces as Router ID;
- Only when the interface is UP can the interface address be selected as Router ID.

OSPF supports multiple processes that are identified with process number, and different processes are independent of each other.

Table 2 Enabling OSPF Procotol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create OSPF process and enter OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	Mandatory Enable the OSPF process directly or from VRF. By

Step	Command	Description
		<p>default, the OSPF protocol is disabled in the system.</p> <p>When OSPF is enabled from VRF, the OSPF process belonging to a certain VRF can manage the interfaces belonging to this VRF only.</p>
Configure the network segment covered by OSPF area	<b>network</b> <i>ip-address wildcard-mask</i> <b>area</b> <i>area-id</i>	<p>Mandatory</p> <p>By default, interface doesn't belong to any OSPF process or area.</p> <p>One interface can only belong to one OSPF process and area.</p>
Configure Router ID of OSPF process	<b>router-id</b> <i>ip-address</i>	<p>Optional</p> <p>By default, it is generated according to the electing rules of Router ID.</p> <p>Modifying the Router ID will not cause the OSPF neighbors to become invalid. To enable the newly configured Router ID to take effect, manual resetting of the process is required.</p>

### 55.2.2 Configure OSPF Area

In order to reduce the CPU and memory usage by a large amount of database information, the OSPF AS is divided into multiple areas. The area is identified by a 32-bit area ID, which can be represented by a decimal number ranging from 0 to 4294967295 or an IP address within 0.0.0.0 - 255.255.255.255. Area 0 or 0.0.0.0 means the backbone area of OSPF, and others are non-backbone areas. All the inter-area routing information needs to be forwarded through backbone areas. Routing information cannot be directly exchanged between non-backbone areas.

OSPF defines several types of routers:

- Internal Router: The device whose all interfaces belong to the same area;

- Area Border Router (ABR): The device connecting to multiple areas;
- Autonomous System Boundary Router (ASBR): The device which imports external route for OSPF AS.

### Configuration Condition

Before configuring OSPF area, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable OSPF protocol.

### Configure OSPF NSSA

Type-7 LSA instead of Type-5 LSA is allowed to be injected into the Not-So-Stub-Area (NSSA). By configuring redistribution to import external routes to the NSSA area. The ASBR in the NSSA area generates Type-7 LSA and floods it to the NSSA area. The ABR in the NSSA area will convert Type-7 LSAs into Type-5 LSAs, and then flood these Type-5 LSAs to the entire AS.

The OSPF NSSA area configured through the **area area-id nssa no-summary** command is called a totally NSSA area. The OSPF totally NSSA area prohibits inter-area routes from flooding. At this time, ABR will generate a default route and flood it into the NSSA area. Devices in the NSSA area will access the networks outside the area through this default route.

Table 3 Configuring OSPF NSSA Area

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf process-id [ vrf vrf-name ]</b>	-
Configure NSSA area	<b>area area-id nssa [ [ default-information-originate [ metric metric-value / metric-type type-value ] / no-redistribution / no-summary / suppress-fa / translator-role { always   candidate   never } ]   [ translate-always   translate-candidate   translate-never ] ]</b>	Mandatory  By default, it is not a NSSA area.

**Note**

- Backbone areas cannot be configured as NSSA areas.
- All devices in the same NSSA area must be configured as NSSA areas. Neighbor relations cannot be formed between the devices with inconsistent area types.

### Configure OSPF Stub Area

The Stub area does not allow AS external routes to flood. This can reduce the size of the link status database. After an area is configured as Stub, the ABR on the border of Stub will generate a default route and flood it into the Stub area. Devices in the Stub area will access the networks outside the AS through this default route.

The OSPF Stub area configured through the **area area-id stub no-summary** command is called a totally Stub area. The OSPF totally Stub area prohibits inter-area routes or external routes from flooding. Devices in the area will access the networks outside the area and the OSPF AS through the default route.

Table 4 Configuring OSPF Stub Area

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf process-id [ vrf vrf-name ]</b>	-
Configure Stub area	<b>area area-id stub [ no-summary ]</b>	Mandatory By default, it is not a Stub area.
Configure ABR in the Stub area to generate the cost value of default route	<b>area area-id default-cost cost-value</b>	Optional By default, the cost value of the default route generated by ABR in the Stub area is 1.

### Note

- Backbone areas cannot be configured as Stub areas.
- All devices in the same Stub area must be configured as Stub areas. Neighbor relations cannot be formed between the devices with inconsistent area types.

## Configure OSPF Virtual Link

In OSPF, non-backbone areas must complete database synchronization and data interaction through backbone areas. Therefore, all non-backbone areas must connect with backbone areas.

When this requirement cannot be satisfied in some circumstances, you may configure a virtual link. After a virtual link is configured, you can configure authentication method and modify Hello time interval for the virtual link. Meanings of these parameters are consistent with those of general OSPF interface parameters.

Table 5 Configuring OSPF Virtual Link

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf process-id [ vrf vrf-name ]</b>	-
Configure OSPF Virtual Link	<b>area transit-area-id virtual-link neighbor-id [ [ authentication [ key-chain   message-digest   null ] key-chain keychain-name   authentication-key key   message-digest-key key-id { md5   sm3 } key ] / dead-interval seconds hello-interval seconds / retransmit-interval seconds / transmit-delay seconds ]</b>	Mandatory By default, no virtual link is created.

---

### Note

- Virtual link must be configured between two ABRs.
  - The two ABRs configured with virtual links must be within the same common area, which is called the Transit Area of the virtual link.
  - This Transit Area shall not be a Stub or NSSA area.
- 

## 55.2.3 Configure OSPF Network Type

Depending on the link protocol type, OSPF divides networks into four types:

- Broadcast Networks - When the link protocol is Ethernet or FDDI, the OSPF network

type is broadcast by default;

- P2P (Point To Point Network) - When the link protocol is PPP, LAPB or HDLC, the OSPF network type is P2P by default;
- NBMA (Non-Broadcast Multi-Access Network) - When the link protocol is ATM, frame relay or X.25, the OSPF network type is NBMA by default;
- P2MP (Point To Multi-Point Network) - No link protocol will be deemed as P2MP by OSPF by default. Generally, the NBMA network which is not fully connected is configured as an OSPF P2MP.

The network type of OSPF interface can be modified as needed. The network types of the interfaces that establish OSPF neighbors must be consistent, or the normal learning of routes will be affected.

### Configuration Condition

Before configuring OSPF network type, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable OSPF protocol.

### Configure Network Type of OSPF Interface as Broadcast

Broadcast network supports multiple (more than two) devices that can exchange information with all the devices on the network. OSPF uses Hello packets to dynamically find neighbors.

Table 6 Configuring Network Type of OSPF Interface as Broadcast

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Network Type of OSPF Interface as Broadcast	<b>ip ospf network broadcast</b>	Mandatory  By default, the network type of OSPF interface depends on the protocol in link layer.

### Configure Network Type of OSPF Interface as P2P

Point-to-point network is the network composed of two devices, each of which is located at an end of the point-to-point link. OSPF uses Hello packets to dynamically find neighbors.

Table 55 Configuring Network Type of OSPF Interface as P2P

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure network type of OSPF as P2P	<b>ip ospf network point-to-point</b>	Mandatory  By default, the network type of OSPF interface depends on the protocol in link layer.

#### Configure Network Type of OSPF Interface as NBMA

NBMA network supports multiple (more than two) devices. Yet it cannot broadcast, and neighbors need to be manually specified.

Table 7 Configuring Network Type of OSPF Interface as NBMA

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure network type of OSPF as NBMA	<b>ip ospf network non-broadcast</b>	Mandatory  By default, the network type of OSPF interface depends on the protocol in link layer.
Enter the global configuration mode.	<b>exit</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure NBMA network neighbors	<b>neighbor</b> <i>neighbor-ip-address</i> [ <b>cost</b> <i>cost-value</i> / <b>priority</b> ]	Mandatory

Step	Command	Description
	<i>priority-value / poll-interval interval-value ]</i>	In NBMA network, neighbors need to be manually specified.

### Configure Network Type of OSPF Interface as P2MP

When NBMA is not fully connected, the network type can be configured as P2MP to save network cost. When the network type is configured as P2MP unicast, neighbors need to be manually specified.

Table 8 Configuring Network Type of OSPF Interface as P2MP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPF network type as P2MP	<b>ip ospf network point-to-multipoint [ non-broadcast ]</b>	Mandatory By default, the network type of OSPF interface depends on the protocol in link layer.
Enter the global configuration mode.	<b>exit</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure P2MP unicast network neighbors	<b>neighbor</b> <i>neighbor-ip-address</i> [ <b>cost</b> <i>cost-value</i> / <b>priority</b> <i>priority-value</i> / <b>poll-interval</b> <i>interval-value</i> ]	If the network type of interface is configured as P2MP, it is mandatory

### 55.2.4 Configure OSPF Network Authentication

In order to avoid information leakage or malicious attacks on OSPF devices, all packet interactions between OSPF neighbors can realize authentication. The authentication type can be NULL (no authentication), simple text authentication, MD5 authentication, SM3 authentication, or key-chain authentication.

After authentication is configured, when the OSPF interface receives OSPF protocol packets, authentication is required first. These packets can be received only when they pass the authentication. Therefore, for the OSPF interfaces that establish neighbor relations, their authentication method, Key ID, and authentication password must be consistent.

Authentication method and password are configured separately.

The OSPF authentication method can be configured on area, interface or interface address. In particular, area authentication has a lower priority than interface authentication which is followed by interface address authentication. That is to say, you are required to first use interface address authentication and then interface authentication and area authentication.

### Configuration Condition

Before configuring OSPF authentication, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable OSPF protocol.

### Configure OSPF Area Authentication

OSPF area authentication simply configures the authentication method. It will completely take effect only after configuring corresponding authentication password under the interface.

Table 9 Configuring OSPF Area Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure area authentication	<b>area</b> <i>area-id</i> <b>authentication</b> [ <b>message-digest</b>   <b>key-chain</b> ]	Mandatory  By default, area authentication is not configured.  In this command, configure the keyword <b>message-digest</b> which means MD5 authentication or SM3 authentication, or <b>key-chain</b> which means key-chain authentication. Otherwise, it will be

Step	Command	Description
		simple text authentication.
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure simple text authentication password	<b>ip ospf</b> [ <i>ip-address</i> ] <b>authentication-key</b> { <b>0</b>   <b>7</b> } <i>password</i>	Mandatory  By default, the simple text authentication password is not configured.
Configure MD5/SM3 authentication password	<b>ip ospf</b> [ <i>ip-address</i> ] <b>message-digest-key</b> <i>key-id</i> { <b>md5</b>   <b>sm3</b> } { <b>0</b>   <b>7</b> } <i>password</i>	Mandatory  By default, the MD5/SM3 authentication password is not configured.
Configure key-chain authentication	<b>ip ospf</b> [ <i>ip-address</i> ] <b>key-chain</b> <i>key-chain name</i>	Mandatory  By default, <b>key-chain</b> authentication is not configured.

### Configure OSPF Interface Authentication

When an OSPF interface has multiple IP addresses, you can separately specify authentication method or authentication password for an interface address. When no interface address is specified, all the addresses under the interface use the authentication method or authentication password configured.

Table 10 Configuring OSPF Interface Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure interface authentication method	<b>ip ospf</b> [ <i>ip-address</i> ] <b>authentication</b>	Mandatory

Step	Command	Description
	[ <b>key-chain</b>   <b>message-digest</b>   <b>null</b> ]	By default, no interface authentication method is configured.  In this command, configure the keyword <b>message-digest</b> which means MD5 authentication or SM3 authentication, <b>key-chain</b> which means key-chain authentication, or <b>null</b> which means no authentication. Otherwise, it will be simple text authentication.
Configure simple text authentication password	<b>ip ospf</b> [ <i>ip-address</i> ] <b>authentication-key</b> { <b>0</b>   <b>7</b> } <i>password</i>	Mandatory  By default, the simple text authentication password is not configured.
Configure MD5/SM3 authentication password	<b>ip ospf</b> [ <i>ip-address</i> ] <b>message-digest-key</b> <i>key-id</i> { <b>md5</b>   <b>sm3</b> } { <b>0</b>   <b>7</b> } <i>password</i>	Mandatory  By default, the MD5/SM3 authentication password is not configured.
Configure key-chain authentication	<b>ip ospf</b> [ <i>ip-address</i> ] <b>key-chain</b> <i>key-chain name</i>	Mandatory  By default, <b>key-chain</b> authentication is not configured.

### 55.2.5 Configure OSPF Route Generation

In OSPF, the routes in direct network segment are covered via the command **network**, external routes can be redistributed, or host routes can be added through the command **host**.

#### Configuration Condition

Before configuring OSPF route generation, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable OSPF protocol.

### Configure OSPF Route Redistribution

When multiple routing protocols are running on a device, routes of other protocols are imported into OSPF through redistribution to generate OSPF external type-2 routes by default, with the routing metric value being 20. When external routes are imported through redistribution, you can modify the type of external route, metric, and Tag fields, and specify corresponding routing policy for route control and management.

Table 11 Configuring OSPF Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF Route Redistribution	<b>redistribute</b> <i>protocol</i> [ <i>protocol-id</i> ] [ <b>metric</b> <i>metric-value</i> / <b>metric-type</b> <i>metric-type</i> / <b>tag</b> <i>tag-value</i> / <b>route-map</b> <i>route-map-name</i> / <b>match</b> <i>route-type</i> ]	Mandatory By default, no OSPF route redistribution is configured.
Configure the metric value of OSPF external route	<b>default-metric</b> <i>metric-value</i>	Optional
Configure the restriction on the number of external routes redistributed by OSPF	<b>redistribute maximum-prefix</b> <b>maximum-prefix-value</b> <b>[threshold-value [warning-only] / warning-only]</b>	Optional By default, there is no restriction on the number of external routes redistributed by OSPF.

### Note

- When **redistribute** *protocol* [ *protocol-id* ] **metric** and **default-metric** are both configured to set the metric value of external route, the former has a higher priority.

## Configure OSPF Default Route

After the OSPF Stub area and totally NSSA area are configured, a Type-3 default route will be automatically generated. Default route cannot be automatically generated in NSSA area. But a Type-7 default route can be imported to this area through the command **area *area-id* nssa default-information-originate**.

OSPF cannot import Type-5 default route through the **redistribute** command. When necessary, the **default-information originate [always]** command can be used to achieve this purpose.

Table 12 Configuring OSPF Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf <i>process-id</i></b> <b>[ vrf <i>vrf-name</i> ]</b>	-
Configure OSPF to import default route	<b>default-information originate [ always / metric <i>metric-value</i> / metric-type <i>metric-type</i> / route-map <i>route-map-name</i> ]</b>	Mandatory  By default, no external default route will be imported into OSPF AS.  For the default route imported, the default metric value is 1, and the type is external type-2.  <b>always</b> means that the default route is required to be generated in OSPF AS. Otherwise, it will be generated only when there is a default route in the local routing table.

## Configure OSPF Host Route

Table 13 Configuring OSPF Host Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF Host Route	<b>host</b> <i>ip-address area area-id</i> [ <b>cost</b> <i>cost</i> ]	Mandatory  By default, host route is not generated.

## 55.2.6 Configure OSPF Route Control

### Configuration Condition

Before configuring OSPF route control, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable OSPF protocol.

### Configure OSPF Inter-area Summarization

When the ABR in OSPF advertises inter-area routes to other areas, each route is advertised separately as Type-3 LSAs. You may use the inter-area route summarization function to summarize some contiguous network segments in the area into one route to advertise the summarized route only. This can reduce the size of the OSPF database.

Table 14 Configuring OSPF Inter-area Route Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF Inter-area Summarization	<b>area</b> <i>area-id range</i> <i>ip-address/mask-length</i> [ <b>advertise</b> [ <b>cost</b> <i>cost</i> ]   <b>cost</b> <i>cost</i>   <b>not-advertise</b> ]	Mandatory  By default, ABR doesn't conduct inter-area route summarization.

---

 **Note**

- The OSPF inter-area route summarization function takes effect on ABR only.
  - By default, the minimum cost value of detail routes is selected as the cost value of summarized route.
- 

### Configure OSPF External Route Summarization

When OSPF redistributes external routes, each route is advertised separately in external link status advertisement. You may use the external route summarization function to summarize some contiguous network segments outside the AS into one route to advertise the summarized route only. This can reduce the size of the OSPF database.

After configuring the command **summary-address** on ASBR, you can summarize the Type-5 LSA and Type-7 LSA within the scope of summarized address.

Table 15 Configuring OSPF External Route Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF External Route Summarization	<b>summary-address</b> <i>ip-address mask</i> [ <b>not-advertise</b>   <b>tag</b> <i>tag-value</i> ]	Mandatory By default, ABR doesn't conduct external route summarization.

---

 **Note**

- The OSPF external route summarization function takes effect on ASBR only.
- 

### Configure OSPF Inter-area Route Filtration

When ABR is receiving inter-area route, ACL or prefix list is used for filtration in the incoming function; when it is advertising inter-area route, ACL or prefix list is used for filtration in the outgoing function.

Table16 Configuring OSPF Inter-area Route Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF Inter-area Route Filtration	<b>area</b> <i>area-id</i> <b>filter-list</b> { <b>access</b> { <i>access-list-name</i>   <i>access-list-number</i> }   <b>prefix</b> <i>prefix-list-name</i> } { <b>in</b>   <b>out</b> }	Mandatory  By default, ABR doesn't conduct inter-area route filtration.

### Note

- When matching ACL filtration, only standard ACL is supported.
- The OSPF inter-area route filtration function takes effect on ABR only.

### Configure OSPF External Route Filtration

Configure external route filtration, i.e. apply ACL or prefix list to allow or prohibit the flooding of routes into OSPF AS from outside.

Table 17 Configuring OSPF External Route Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure distribution list to filter external routes	<b>distribute-list</b> { <i>access-list-name</i>   <i>access-list-number</i>   <b>prefix</b> <i>prefix-list-name</i> } <b>out</b> [ <i>routing-protocol</i> [ <i>process-id</i> ] ]	Mandatory  By default, ASBR doesn't conduct external route filtration.

---

 **Note**

- When matching ACL filtration, only standard ACL is supported.
  - The OSPF external route filtration function takes effect on ASBR only.
- 

### Configure OSPF Route Installation Filtration

After OSPF calculates routes through LSA, the calculated OSPF protocol routing information can be filtered to prevent certain routes from being added to the routing table.

There are three ways of filtration:

- Based on prefix filtration, use ACL and prefix list to filter the destination address of route;
- Based on the next hop filtration, use prefix list to filter the next hop of route. The prefix list can also be used to filter both destination address and next hop of route at the same time;
- Based on routing policy, filter routes.

Table 18 Configuring OSPF Route Installation Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF to prohibit installation of routes	<b>distribute-list</b> { <i>access-list-name</i>   <i>access-list-number</i>   <b>gateway</b> <i>prefix-list-name1</i>   <b>prefix</b> <i>prefix-list-name2</i> [ <b>gateway</b> <i>prefix-list-name3</i> ]   <b>route-map</b> <i>route-map-name</i> } <b>in</b> [ <i>interface-name</i> ]	Mandatory By default, the routes installed are not filtered.

---

 **Note**

- Make **prefix**, **gateway** and **route-map** filtration and ACL filtration mutually exclusive. For example, if **prefix** filtration has been configured, ACL filtration cannot be configured.
-

- Make **route-map** and **prefix** filtration and **gateway** filtration mutually exclusive.
- Make **prefix** filtration and **gateway** filtration cover each other.

### Configure Cost Value of OSPF Interface

By default, the OSPF interface cost is calculated with the following methods: reference bandwidth/interface bandwidth.

Table 19 Configuring OSPF Interface Cost Value

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Cost Value of OSPF Interface	<b>ip ospf</b> [ <i>ip-address</i> ] <b>cost</b> <i>cost-value</i>	Optional By default, the calculation is conducted according to the reference bandwidth/interface bandwidth.

### Configure OSPF Reference Bandwidth

The reference bandwidth of interface is mainly used to calculate interface cost value which is 100Mbit/s by default. The OSPF interface cost is calculated with the following methods: reference bandwidth/interface bandwidth. When the calculation result is greater than 1, take the integer part; when it is less than 1, take 1. Therefore, in a network with a bandwidth higher than 100Mbit/s, the optimal route cannot be correctly selected. To solve this problem, the **auto-cost reference-bandwidth** command can be used to configure appropriate reference bandwidth.

Table 20 Configuring OSPF Reference Bandwidth

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure reference bandwidth of OSPF interface	<b>auto-cost reference-bandwidth</b> <i>reference-bandwidth</i>	Optional By default, the reference bandwidth is 100Mbit/s.

### Configure OSPF Administrative Distance

Administrative distance indicates the reliability of routing protocol. When the routes that reach the same destination network are learned from different routing protocols, they are selected according to the administrative distance. Those with a small administrative distance are selected first.

Table 21 Configuring OSPF Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF Administrative Distance	<b>distance</b> { <i>distance</i> [ <i>ip-address wildcard-mask</i> ] [ <i>access-list-name</i>   <i>access-list-number</i> ]   <b>ospf</b> { <b>external</b> <i>distance</i>   <b>inter-area</b> <i>distance</i>   <b>intra-area</b> <i>distance</i> } }	Optional By default, the administrative distance of intra-area and inter-area routes of OSPF is 110, and that of external routes is 150.

### Configure the Maximum Number of Load Balancing Entries of OSPF

If there are multiple equal-cost paths leading to the same destination address, the paths form load balancing, which can improve the link utility rate and reduce the load of links.

Table 22 Configuring Maximum Number of OSPF Load Balancing Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure the Maximum Number of Load Balancing Entries of OSPF	<b>maximum-path</b> <i>max-number</i>	Optional By default, the maximum number of OSPF load balancing entries is 4.

### Configure OSPF to be Compatible with RFC1583

When there are multiple paths that reach ASBR or external route forwarding address, RFC1583 and RFC2328 define different routing rules. To be compatible with RFC1583, first select the intra-area or inter-area paths within the backbone area; to be incompatible with RFC1583, first select the intra-area paths within the non-backbone area.

Table 23 Configuring OSPF Compatible with RFC1583

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF to be Compatible with RFC1583	<b>compatible rfc1583</b>	Mandatory By default, it is incompatible with RFC1583.

### Note

- In OSFP AS, all devices must have the same routing rules. Namely, they shall all be either compatible with or incompatible with RFC1583 to avoid routing loops.

## 55.2.7 Configure OSPF Network Optimization

### Configuration Condition

Before configuring OSPF network optimization, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable OSPF protocol.

### Configure Keepalive Time of OSPF Neighbors

OSPF Hello packets are used to establish and keep alive neighbor relations. The default time interval of sending Hello packets depends on the network type. In broadcast and P2P networks, it is 10 seconds, and in P2MP and NBMA networks, it is 30 seconds.

The failure time of neighbor is used to identify the validity of the neighbor. By default, it is 4 times the Hello time interval. If the OSPF device does not receive the Hello packets from the neighbor after time out of its failure time, the neighbor is considered invalid and deleted.

Table 24 Configuring OSPF Neighbor Keepalive Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPF Hello interval	<b>ip ospf</b> [ <i>ip-address</i> ] <b>hello-interval</b> <i>interval-value</i>	Optional The default value is determined based on network class. For broadcast and P2P networks, it's 10 seconds; for P2MP and NBMA networks, it's 30 seconds.
Configure failure time of OSPF neighbors	<b>ip ospf</b> [ <i>ip-address</i> ] <b>dead-interval</b> <i>interval-value</i>	Optional The default value is 4 times the Hello interval.

---

## Note

- The Hello interval between adjacent OSPF devices must be the same as the failure time of neighbor. Otherwise, neighbor relation cannot be established.
  - When modifying Hello interval, if the failure time of current neighbor is 4 times the Hello interval, the failure time of neighbor will also be automatically modified so that it is 4 times the Hello interval; if the failure time of current neighbor is not 4 times the Hello interval, the failure time of neighbor will remain unchanged.
  - Modifying the failure time of neighbor will not affect the Hello interval.
- 

### Configure Passive OSPF Interface

Dynamic routing protocol uses passive interface, which can effectively reduce the consumption of network bandwidth by routing protocol. Configure passive OSPF interface to advertise the route of the direct network segment where the interface is located through the command **network**. But it will suppress the receiving and sending of OSPF protocol packets on this interface.

Table 25 Configuring Passive OSPF Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure Passive OSPF Interface	<b>passive-interface</b> { <i>interface-name</i> [ <i>ip-address</i> ]   <b>default</b> }	Mandatory By default, no passive OSPF interface is configured.

### Configure OSPF Demand Circuit

On P2P and P2MP links, to reduce line costs, you can configure OSPF demand circuit to suppress the periodic sending of Hello packets and periodic refresh of LSA packets. It is mainly applied in paid links, such as ISDN, SVC and X.25.

Table 26 Configuring OSPF Demand Circuit

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPF Demand Circuit	<b>ip ospf</b> [ <i>ip-address</i> ] <b>demand-circuit</b>	Mandatory  By default, the OSPF demand circuit is disabled.

### Configure OSPF Interface Priority

Interface priority is mainly applied in the election of DR (Designed Router) and BDR (Backup Designed Router) in broadcast and NBMA networks. The value ranges from 0 to 255. The larger the value, the higher the priority. The default value is 1.

DR and BDR are elected by all the devices in the same network segment according to interface priority and Router ID through Hello packets. The rules are shown below:

- Firstly, the device with the highest interface priority is elected as the DR, and that with the second interface priority as the BDR. The device with the priority of 0 does not participate in the election;
- If the interface priorities are the same, the device with the highest router ID is elected as the DR, and that with the second router ID as the BDR;
- After the DR fails, BRD will become a DR immediately, and a new BDR will be elected.

Table 27 Configuring OSPF Interface Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPF Interface Priority	<b>ip ospf priority</b> <i>priority-value</i>	Optional  By default, the OSPF interface priority is 1.

---

 **Note**

- Priority affects the election process only. When DR and BDR have been elected in the network, modifying interface priority will affect the next election result only. Therefore, DR is not necessarily the device with the highest interface priority, and DBR is not necessarily the device with the second high interface priority.
- 

### Configure OSPF Interface MTU

When encapsulating OSPF packets, to avoid fragmentation, the packet size must be no more than the MTU value of interface. When adjacent OSPF devices exchange DD packets with each other, they will check whether the MTUs are the same by default. If different, a neighbor relation cannot be established. After OSPF is configured to ignore interface MTU check, even if the MTUs are different, the neighbor relation can be established.

Table 28 Configuring OSPF Interface MTU

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPF Interface MTU	<b>ip ospf mtu</b> <i>mtu-value</i>	Optional
Configure OSPF Interface to ignore MTU consistency check	<b>ip ospf</b> [ <i>ip-address</i> ] <b>mtu-ignore</b>	Mandatory By default, MTU check will be conducted. consistency check

### Configure Transfer Delay of OSPF Interface

LSA transfer delay means the period during which LSA floods to other devices. The device sending LSA will add the interface transfer delay time to the aging time of the LSA to be sent. By default, when the flooded LSA passes through a device, the aging time increases by 1. The transfer delay of LSA can be configured according to network conditions, from 1 to 840. It is generally used on low-speed links.

Table 29 Configuring OSPF Interface LSA Transfer Delay

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Transfer Delay of OSPF Interface	<b>ip ospf transmit-delay</b> <i>delay-value</i>	Optional By default, the LSA transfer delay is 1 second.

### Configure OSPF LSA Retransmission

In order to ensure the reliability of data interaction, OSPF uses the acknowledgement mechanism. When an LSA is flooded on the device interface, it will be added to the neighbor's retransmission list. If confirmation is not received from the neighbor after the retransmission time expires, this LSA will be retransmitted until the confirmation is received.

Table 30 Configuring OSPF LSA Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPF LSA retransmission interval	<b>ip ospf retransmit-interval</b> <i>interval-value</i>	Optional By default, the retransmission interval is 5 seconds.
Enter the global configuration mode.	<b>exit</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF LSA retransmission queue scanning interval	<b>timers lsa retransmission scan-time</b>	Optional By default, the retransmission queue

Step	Command	Description
		scanning interval is 1250 milliseconds.

### Configure OSPF to Prohibit LSA Diffusion

In practical network applications, redundant links are used between OSPF neighbors sometimes. This configuration can reduce the spreading of OSPF update packets on redundant links.

Table 31 Configuring OSPF to Prohibit LSA Diffusion

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPF interface to prohibit LS-UPD diffusion	<b>ip ospf database-filter all out</b>	Mandatory By default, OSPF interface doesn't prohibit LSA diffusion.

### Note

- Configuring OSPF to prohibit LSA diffusion may result in loss of some routing information.

### Configure OSPF SPF Calculation Time

When the OSPF network topology changes, recalculation of routes is required. When the network keeps changing, frequent routing calculation will occupy a large amount of system resources. The consumption of system resources by frequent network changes can be suppressed by adjusting the time parameters of SPF calculation.

Table 32 Configuring OSPF SPF Calculation Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF SPF Calculation Time	<b>timers throttle spf</b> <i>delay-time</i> <i>hold-time</i> <i>max-time</i>	Optional  By default, the delay-time, hold-time and max-time are 5000 ms, 10000 ms, and 10000 ms, respectively.

## Note

- *Delay-time* means the initial calculation delay, *hold-time* the suppression time, and *max-time* the maximum waiting time for two SPF calculations. When there are infrequent network changes, the continuous route calculation interval is decreased to *delay-time*. In the case of frequent network changes, adjustment should be made accordingly by increasing the *hold-time* × 2<sup>n-2</sup> (n is the times of continuously triggering route calculation) to prolong the waiting time by the increment of the *hold-time* configured, *max-time* at most.

## Configure OSPF Database Overflow

OSPF database overflow is used to restrict the number of Type-5 LSA in the database.

Table 33 Configuring OSPF Database Overflow

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF Database Overflow	<b>overflow database external</b> <i>max-number</i> <i>seconds</i>	Mandatory  By default, the OSPF database overflow function is disabled.

---

## Caution

- Enabling the database overflow function may cause inconsistency between the databases in the OSPF area and loss of some routes.
- 

### 55.2.8 Configure OSPF to Coordinate with BFD

#### Configuration Condition

Before configuring the coordination of OSPF with BFD, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable OSPF protocol.

#### Configure OSPF to Coordinate with BFD

BFD (Bidirectional Forwarding Detection) provides a method to quickly detect the status of lines between two devices. When BFD detection is enabled between two adjacent OSPF devices, if there is a line failure between the devices, BFD can quickly detect the failure and notify the OSPF protocol to trigger OSPF for route calculation and switch to the backup route. In this way, it can reach the purpose of fast route switch.

Table 34 Configuring OSPF to Coordinate with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the specified OSPF interface to enable or disable BFD	<b>ip ospf bfd</b> [ <i>ip-address</i> / <b>disable</b> ]	Mandatory By default, the BFD function is not enabled.
Enter the global configuration mode.	<b>exit</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-

Step	Command	Description
Configure all interfaces of OSPF process to enable BFD	<b>bfd all-interfaces</b>	Optional

## Note

- When BFD is configured in OSPF configuration mode and interface configuration mode at the same time, the latter has a higher priority.

### 55.2.9 Configure OSPF FRR

#### Configuration Condition

Before configuring OSPF FRR, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable OSPF protocol.

#### Configure OSPF FRR

In the OSPF network, as a result of link or device failure, the packets passing the point of failure will be discarded or loops will be produced. The traffic interruption caused thereby will continue until the protocol reconverges after several seconds. In order to reduce the time of traffic interruption, OSPF FRR can be configured. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic passing through the failed link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 35 Configuring OSPF FRR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF process to enable the FRR function	<b>fast-reroute route-map</b> <i>route-map-name</i>	Mandatory By default, the OSPF FRR function is disabled.

Step	Command	Description
Configure OSPF process to enable the dynamic FRR function	<b>fast-reroute loop-free-alternate</b> [route-map <i>route-map-name</i> ]	Mandatory By default, the OSPF dynamic FRR function is disabled.
Configure OSPF process to enable the pic function	<b>pic</b>	Mandatory After the pic function is enabled, the auto FRR function is enabled.  By default, the OSPF pic function is disabled.

---

### Note

- The OSPF FRR function has two types, i.e. static FRR and dynamic FRR.
  - Static FRR needs to associate route-map where the next hop interface and address of back-up route are set.
  - Currently, dynamic FRR supports point-to-point network only, i.e. all the output interfaces of the device have a network type of point-to-point. After dynamic FRR is configured, the device automatically calculates and sets back-up next hop interface and address. Dynamic FRR can also associate route-map to set back-up next hop interface and address for the route which matches the route-map only.
  - The methods of enabling route redistribution are mutually exclusive.
- 

## 55.2.10 Configure OSPF GR

GR (Graceful Restart) is used to keep the routing information in the forwarding layer of this device and neighbor device unchanged during the switch between host and standby devices to ensure the forwarding process is not affected; after the device is switched for re-running, the two devices synchronize routing information and update forwarding layer in the protocol layer so that the data can keep forwarding during the process of device switch.

There are two types of roles in the GR process:

- GR Restarter end: The device for graceful restart of protocol.
- GR Helper end: The device which helps with the graceful restart of protocol.

The distributed device can act as GR Restarter and GR Helper, while the centralized device only serves as GR Helper to help the Restarter complete GR.

### Configuration Condition

Before configuring OSPF GR, ensure that:

- Configure interface IP addresses so that neighbor nodes are reachable.
- Enable OSPF protocol.

### Configure OSPF GR Restarter

Table 36 Configuring OSPF GR Restarter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF GR	<b>nsf ietf</b>	Mandatory By default, the GR function is disabled. After this function takes effect, the protocol needs to support the Opaque-LSA function, and it supports the Opaque-LSA function by default.
Configure OSPF GR period	<b>nsf interval</b> <i>grace-period</i>	Optional By default, the GR period is 95 seconds.
Configure OSPF GR proxy	<b>graceful-restart proxy</b>	Optional By default, the OSPF GR proxy is enabled. GR Proxy means that GR packets are prepared before switching, and you don't have to wait for OSPF to start after switching before sending

Step	Command	Description
		GR packets to keep OSPF neighbors alive.

## Note

- The OSPF GR function can only be used in the stacking environment or a dual-master environment.

### Configure OSPF GR Helper

GR Helper can help the Restarter end complete GR. By default, the device enables this function. Users can disable this function via the command **nsf ietf helper disable**. The command **nsf ietf helper strict-lsa-checking** is used to enable the Helper end to strictly check LSA in the GR process. If any change of LSA is found, the GR Helper mode will be exited.

Table 37 Configuring OSPF GR Helper

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the OSPF configuration mode	<b>router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPF GR Helper	<b>nsf ietf helper</b> [ <b>disable</b>   <b>strict-lsa-checking</b> ]	Optional By default, the Helper function is enabled, but it doesn't check LSA.

### 55.2.11 OSPF monitoring and maintaining

Table 38 OSPF Monitoring and Maintaining

Command	Description
<b>clear ip ospf</b> [ <i>process-id</i> ] <b>process</b>	Reset OSPF process

Command	Description
<b>clear ip ospf process-id neighbor neighbor-ip-address [ neighbor-router-id ]</b>	Reset OSPF neighbors
<b>clear ip ospf statistics [ interface-name ]</b>	Clear interface statistics of OSPF
<b>clear ip ospf [ process-id ] redistribution</b>	Re-advertise external route
<b>clear ip ospf [ process-id ] route</b>	Recalculate OSPF route
<b>show ip ospf [ process-id ]</b>	Show basic information of OSPF
<b>show ip ospf [ process-id ] border-routers</b>	Show information of the route reaching edge device in OSPF
<b>show ip ospf [ process-id ] buffers</b>	Show size of OSPF packet sending and receiving cache
<b>show ip ospf [ process-id ] database [ adv-router router-id   database-summary   max-age   [ asbr-summary   external   network   nssa-external   opaque-area   opaque-as   opaque-link   router   self-originate   summary ] [ [ link-state-id ] [ adv-router advertising-router-id ]   self-originate   summary ] ]</b>	Show the information of OSPF database
<b>show ip ospf interface [ interface-name [ detail ] ]</b>	Show OSPF interface information
<b>show ip ospf [ process-id ] neighbor [ neighbor-id   all   detail [ all ]   interface ip-address [ detail ]   statistic ]</b>	Show the information of OSPF neighbors
<b>show ip ospf [ process-id ] route [ ip-address mask   ip-address/mask-length   external   inter-area   intra-area   statistic ]</b>	Show the routing information of OSPF protocol
<b>show ip ospf [ process-id ] virtual-links</b>	Show the information of OSPF virtual link
<b>show ip ospf [ process-id ] sham-links</b>	Show the OSPF pseudo-class link interface information configured, including interface status, cost value, and neighbor status

## 55.3 Typical configuration example of OSPF

### 55.3.1 Configure OSPF Basic Functions

#### Network Requirements

- All devices are configured with OSPF protocol, and there are three areas, i.e. area 0, 1 and 2. Upon completion of the configuration, all the devices can learn routes from each other.
- On the back-to-back Ethernet interface, in order to speed up the the process of establishing OSPF neighbors, the network type of OSPF interface can be changed to point-to-point. Modify the network type of the interface in area 2 as point-to-point. Upon completion of the configuration, all the devices can learn routes from each other.

#### Network Topology

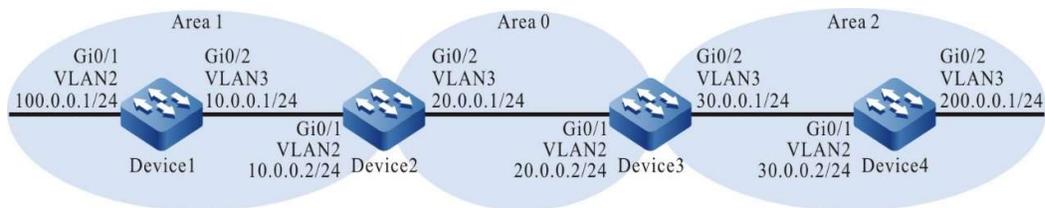

Figure 55-1 Network Topology for Configuring Basic Functions of OSPF

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF process and make different areas cover corresponding interfaces.

#On Device1, configure OSPF process and make area 1 cover the interface.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 1
Device1(config-ospf)#network 100.0.0.0 0.0.0.255 area 1
Device1(config-ospf)#exit
```

#On Device2, configure OSPF process and make area 0 and 1 cover corresponding interfaces.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 10.0.0.0 0.0.0.255 area 1
Device2(config-ospf)#exit
```

#On Device3, configure OSPF process and make area 0 and 2 cover corresponding interfaces.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.0 0.0.0.255 area 2
Device3(config-ospf)#exit
```

#On Device4, configure OSPF process and make area 2 cover the interface.

```
Device4#configure terminal
Device4(config)#router ospf 100
Device4(config-ospf)#router-id 4.4.4.4
Device4(config-ospf)#network 30.0.0.0 0.0.0.255 area 2
Device4(config-ospf)#network 200.0.0.0 0.0.0.255 area 2
Device4(config-ospf)#exit
```

---

## Note

- Router ID can be manually configured or automatically generated. If the Router ID is not manually configured, the device will automatically select it. The largest IP address in Loopback interfaces is first selected as Router ID; if no Loopback interface address is configured on the device, the largest IP address in general interfaces is selected as Router ID. Only when the interface is up can the interface address be selected as Router ID.
  - When using the command **network**, the reverse mask doesn't have to accurately match the length of the interface IP address mask. The network segment **network** simply needs to cover the interface IP address. For example, **network 0.0.0.0 255.255.255.255** means all the interfaces are covered.
- 

#View OSPF neighbors' information and routing table on Device1.

```
Device1#show ip ospf neighbor

2.2.2.2        2.2.2.2      1737 0x80000008 0x2dd5 1

      Net Link States (Area 1)

Link ID        ADV Router    Age Seq#      CkSum
10.0.0.2       2.2.2.2      34 0x80000006 0x39db

      Summary Link States (Area 1)

Link ID        ADV Router    Age Seq#      CkSum Route
20.0.0.0       2.2.2.2      144 0x80000006 0x48d2 20.0.0.0/24
30.0.0.0       2.2.2.2      1186 0x80000005 0xd13f 30.0.0.0/24
200.0.0.0      2.2.2.2      14 0x80000006 0x2f35 200.0.0.0/24
```

For Device2, both 30.0.0.0/24 and 200.0.0.0/24 are inter-area routes. LSA information of relevant routes can be seen from Summary Link States (Area 0). For intra-area route, **show ip ospf database router** is required to see the LSA information of relevant routes.

Step 4: Configure the network type of OSPF interface as point-to-point.

#On Device3, change the OSPF network type of VLAN3 to point-to-point.

```
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip ospf network point-to-point
Device3(config-if-vlan3)#exit
```

#On Device4, change the OSPF network type of VLAN2 to point-to-point.

```
Device4(config)#interface vlan2
Device4(config-if-vlan2)#ip ospf network point-to-point
Device4(config-if-vlan2)#exit
```

Step 5: Check the result.

#View the OSPF neighbors and routing table on Device3.

```
Device3#show ip ospf neighbor
OSPF process 100:
Neighbor ID  Pri  State      Dead Time  Address    Interface
2.2.2.2      1  Full/Backup  00:00:36  20.0.0.1  vlan2
4.4.4.4      1  Full/-      00:00:39  30.0.0.2  vlan3

Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 10.0.0.0/24 [110/2] via 20.0.0.1, 00:02:53, vlan2
C 20.0.0.0/24 is directly connected, 03:20:36, vlan2
C 30.0.0.0/24 is directly connected, 03:20:26, vlan3
O 100.0.0.0/24 [110/3] via 20.0.0.1, 00:01:51, vlan2
C 127.0.0.0/8 is directly connected, 262:01:24, lo0
O 200.0.0.0/24 [110/2] via 30.0.0.2, 00:00:11, vlan3
```

---

## Note

- When OSPF neighbor relations are established in point-to-point networks, there is no DR or BDR election.
- 

#View the OSPF neighbors and routing table on Device4.

```
Device4#show ip ospf neighbor
OSPF process 100:
Neighbor ID  Pri  State      Dead Time  Address    Interface
3.3.3.3      1  Full/-      00:00:39  30.0.0.1  vlan2

Device4#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 10.0.0.0/24 [110/3] via 30.0.0.1, 00:01:04, vlan2
O 20.0.0.0/24 [110/2] via 30.0.0.1, 00:01:04, vlan2
C 30.0.0.0/24 is directly connected, 03:20:25, vlan2
O 100.0.0.0/24 [110/4] via 30.0.0.1, 00:01:04, vlan2
C 127.0.0.0/8 is directly connected, 22:52:36, lo0
C 200.0.0.0/24 is directly connected, 03:20:13, vlan3
```

According to the result, after the network type of OSPF interface is changed to point-to-point, neighbors can be normally established, and routes can be learned normally.

---

## Note

- When the network type of OSPF interface is configured, the network type of OSPF interfaces at both sides of the neighbor must be consistent. Otherwise, it will affect the normal learning and flooding of route. By default, the network type of OSPF interface depends on the network type of physical interface.
- 

### 55.3.2 Configure OSPF authentication

#### Network Requirements

- OSPF is running on all devices that are configured with area authentication. Area 0 is configured with simple text authentication, and area 1 with MD5 authentication.
- Configure OSPF interface authentication: simple text authentication for area 0 and MD5 authentication for area 1.
- Upon completion of the configuration, the device can normally establish neighbors and learn routes from each other.

#### Network Topology

Figure 55-2 Network Topology for Configuring OSPF Authentication

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF process, make different areas cover corresponding interfaces, and enable area authentication. In particular, area 0 uses simple text authentication, and area 1 MD5 authentication.

#On Device1, configure OSPF process and area authentication function.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#area 0 authentication
```

```
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#On Device2, configure OSPF process and area authentication function.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#area 0 authentication
Device2(config-ospf)#area 1 authentication message-digest
Device2(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.0.0.0 0.0.0.255 area 1
Device2(config-ospf)#exit
```

#On Device3, configure OSPF process and area authentication function.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#area 1 authentication message-digest
Device3(config-ospf)#network 20.0.0.0 0.0.0.255 area 1
Device3(config-ospf)#exit
```

#View the information of OSPF process on Device1.

```
Device1#show ip ospf 100
Routing Process "ospf 100" with ID 1.1.1.1
Process bound to VRF default

    Not Support Demand Circuit lsa number is 0,
    Indication lsa (by other routers) number is: 0,
    Area support flood DoNotAge Lsa

```

According to the result, area authentication is a MD5 authentication method.

#View OSPF neighbors' information and routing table on Device3.

```

Device3#show ip ospf neighbor
OSPF process 100:
Neighbor ID  Pri  State      Dead Time  Address    Interface
2.2.2.2      1  Full/Backup  00:00:33  20.0.0.1  vlan2

Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 10.0.0.0/24 [110/2] via 20.0.0.1, 00:09:31, vlan2
C 20.0.0.0/24 is directly connected, 00:20:36, vlan2
C 127.0.0.0/8 is directly connected, 24:00:06, lo0

```

On Device3, neighbors are normally established, and route learning is normal.

Step 4: Configure OSPF interface authentication.

#On Device1, the interface VLAN2 uses simple text authentication, with the password being admin.

```

Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip ospf authentication

```

```
Device1(config-if-vlan2)#ip ospf authentication-key 0 admin
Device1(config-if-vlan2)#exit
```

#On Device2, the interface VLAN2 uses simple text authentication, with the password being admin; the interface VLAN3 uses MD5 authentication, with the Key ID being 1 and the password being admin.

```
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip ospf authentication
Device2(config-if-vlan2)#ip ospf authentication-key 0 admin
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip ospf authentication message-digest
Device2(config-if-vlan3)#ip ospf message-digest-key 1 md5 0 admin
Device2(config-if-vlan3)#exit
```

#On Device3, the interface VLAN2 uses MD5 authentication, with the Key ID being 1 and the password being admin.

```
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip ospf authentication message-digest
Device3(config-if-vlan2)#ip ospf message-digest-key 1 md5 0 admin
Device3(config-if-vlan2)#exit
```

Step 5: Check the result.

#View the information of OSPF neighbors on Device2.

```
Device2#show ip ospf neighbor
OSPF process 100:
Neighbor ID  Pri  State      Dead Time  Address      Interface
1.1.1.1      1  Full/Backup  00:00:33  10.0.0.1    vlan2
3.3.3.3      1  Full/DR     00:00:39  20.0.0.2    vlan3
```

#View the information of OSPF interface on Device2.

```
Device2#show ip ospf interface vlan2
vlan2 is up, line protocol is up
Internet Address 10.0.0.2, 10.0.0.255( a[10.0.0.2] d[10.0.0.255]) Area 0, MTU 1500
Process ID 100, Router ID 2.2.2.2, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State DR, Priority 1, TE Metric 0
Designated Router (ID) 2.2.2.2, Interface Address 10.0.0.2
Backup Designated Router (ID) 1.1.1.1, Interface Address 10.0.0.1
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:04
Neighbor Count is 1, Adjacent neighbor count is 1
Crypt Sequence Number is 0
Graceful restart proxy id is 0x0
Hello received 406 sent 454, DD received 8 sent 6
LS-Req received 2 sent 2, LS-Upd received 11(LSA: 15) sent 10(LSA: 14)
LS-Ack received 10 sent 0, Discarded 0
```

```
Device2#show ip ospf interface vlan3
vlan3 is up, line protocol is up
Internet Address 20.0.0.1, 20.0.0.255( a[20.0.0.1] d[20.0.0.255]) Area 1, MTU 1500
Process ID 100, Router ID 2.2.2.2, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State Backup, Priority 1, TE Metric 0
Designated Router (ID) 3.3.3.3, Interface Address 20.0.0.2
Backup Designated Router (ID) 2.2.2.2, Interface Address 20.0.0.1
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:00
Neighbor Count is 1, Adjacent neighbor count is 1
Crypt Sequence Number is 485
Graceful restart proxy id is 0x0
Hello received 412 sent 454, DD received 9 sent 12
LS-Req received 3 sent 3, LS-Upd received 9(LSA: 10) sent 13(LSA: 16)
```

Crypt Sequence Number will be generated after configuring MD5 authentication; simple text authentication doesn't generate this sequence number.

---

## Note

- When configuring OSPF authentication, you can configure area authentication or interface authentication only, or configure both area and interface authentication.
  - When area authentication and interface authentication are configured at the same time, the latter takes effect first.
- 

### 55.3.3 Configure OSPF Route Redistribution

#### Network Requirements

- OSPF protocol is run between Device1 and Device2, and RIPv2 protocol is run between Device2 and Device3.
- Device2 redistributes RIP route to OSPF, and uses routing policy control to redistribute the route 100.0.0.0/24 only.

#### Network Topology

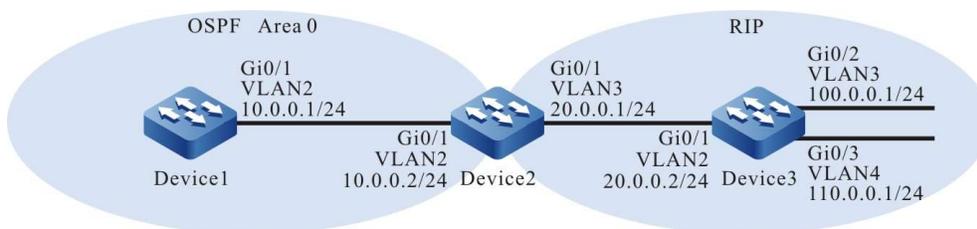

Figure 55-1 Network Topology for Configuring OSPF Route Redistribution

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure the OSPF protocol of Device1 and Device2; configure the RIPv2 protocol of Device2 and Device3.

#Configure the OSPF protocol of Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure the OSPF and RIPv2 protocols of Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 20.0.0.0
Device2(config-rip)#exit
```

#### #Configure the RIPv2 protocol of Device3.

```
Device3#configure terminal
Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 20.0.0.0
Device3(config-rip)#network 100.0.0.0
Device3(config-rip)#network 110.0.0.0
Device3(config-rip)#exit
```

#### #View the information of OSPF neighbors on Device1.

```
Device1#show ip ospf neighbor
OSPF process 100:
Neighbor ID  Pri  State      Dead Time  Address      Interface
2.2.2.2      1  Full/DR    00:00:32  10.0.0.2    vlan2
```

#### #View the information of OSPF neighbors on Device2.

```
Device2#show ip ospf neighbor
OSPF process 100:
Neighbor ID  Pri  State      Dead Time  Address      Interface
1.1.1.1      1  Full/Backup 00:00:32  10.0.0.1    vlan2
```

#### #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:21:17, vlan2
C 20.0.0.0/24 is directly connected, 00:21:33, vlan3
R 100.0.0.0/24 [120/1] via 20.0.0.2, 00:10:58, vlan3
R 110.0.0.0/24 [120/1] via 20.0.0.2, 00:10:58, vlan3
C 127.0.0.0/8 is directly connected, 30:20:17, lo0
```

Device2 learns RIP routes.

#### Step 4: Configure routing policy.

#### #Configure Device2.

```
Device2(config)#ip access-list standard 1
Device2(config-std-nacl)#permit 100.0.0.0 0.0.0.255
Device2(config-std-nacl)#exit
Device2(config)#route-map RIPtoOSPF
Device2(config-route-map)#match ip address 1
Device2(config-route-map)#exit
```

Configure route-map to invoke ACL to match 100.0.0.0/24 only, and filter other network segments, such as 20.0.0.0/24 and 110.0.0.0/24.

Step 5: Configure OSPF to redistribute RIP routes and associate routing policy.

#Configure Device2.

```
Device2(config)#router ospf 100
Device2(config-ospf)#redistribute rip route-map RIPtoOSPF
Device2(config-ospf)#exit
```

When redistributing RIP routes, invoke the match rules of route-map for filtration.

Step 6: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:47:27, vlan2
OE 100.0.0.0/24 [150/20] via 10.0.0.2, 00:21:39, vlan2
C 127.0.0.0/8 is directly connected, 21:40:06, lo0
```

The routing table of Device1 only learns 100.0.0.0/24, an OSPF external route. The two routes 20.0.0.0/24 and 110.0.0.0/24 are filtered out.

#View the information of OSPF process and database on Device2.

```
Device2#show ip ospf 100
Routing Process "ospf 100" with ID 2.2.2.2
Process bound to VRF default
Process uptime is 1 hour 4 minutes
IETF NSF restarter support disabled
IETF NSF helper support enabled
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Graceful Restart
This router is an ASBR (injecting external routing information)
Initial SPF schedule delay 5000 msec
Minimum hold time between two consecutive SPF's 10000 msec
Maximum wait time between two consecutive SPF's 10000 msec
Refresh timer 10 secs
Number of external LSA 2. Checksum Sum 0x0161F5
Number of opaque AS LSA 0. Checksum Sum 0x000000
Number of non-default external LSA is 2
External LSA database is unlimited.
Not Support Demand Circuit lsa number is 0, autonomy system support flood DoNotAge Lsa
Number of areas attached to this router: 1
Area 0 (BACKBONE) Number of interfaces in this area is 1(1)
Number of fully adjacent neighbors in this area is 1
Number of fully adjacent sham-link neighbors in this area is 0
Area has no authentication
SPF algorithm last executed 00:37:52.833 ago
SPF algorithm executed 3 times
Number of LSA 3. Checksum Sum 0x00e746
Not Support Demand Circuit lsa number is 0,
Indication lsa (by other routers) number is: 0,
Area support flood DoNotAge Lsa

Device2#show ip ospf 100 database
```

OSPF Router with ID (2.2.2.2) (Process ID 100)

Router Link States (Area 0)

Link ID	ADV Router	Age	Seq#	CkSum	Link count
1.1.1.1	1.1.1.1	191	0x80000004	0x70a0	1
2.2.2.2	2.2.2.2	537	0x80000005	0x36ce	1

Net Link States (Area 0)

Link ID	ADV Router	Age	Seq#	CkSum
10.0.0.2	2.2.2.2	818	0x80000003	0x3fd8

AS External Link States

Link ID	ADV Router	Age	Seq#	CkSum	Route
100.0.0.0	2.2.2.2	718	0x80000002	0x72be	E2 100.0.0.0/24 [0x0]

According to the information of OSPF 100 process, Device2 has become an ASBR, and only an external LSA is generated in the database.

---

## Note

- In practical applications, if the autonomous system has 2 or more edge routers, directly redistributing routes between different routing protocols is not recommended. When necessary, routing policy needs to be configured to avoid routing loops.
- 

### 55.3.4 Configure OSPF multiprocess

#### Network Requirements

- All devices run OSPF protocol. Two OSPF processes are enabled on Device2. Neighbors are established between the OSPF 100 processes of Device1 and Device2, and between the OSPF 200 processes of Device3 and Device2.
- The two OSPF processes on Device2 redistribute routes to each other. OSPF 100 process uses routing policy control to redistribute the route 110.0.0.0/24 only; OSPF 200 process uses routing policy control to redistribute the route 100.0.0.0/24 only.

#### Network Topology

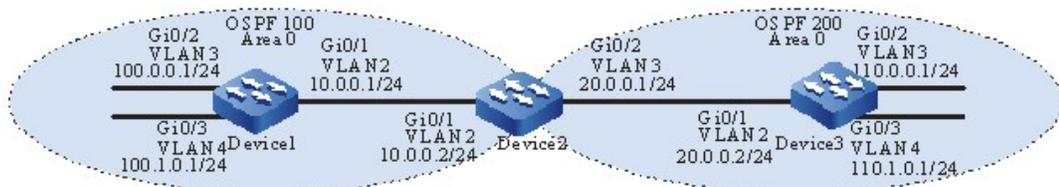

Figure 55-4 Network Topology for Configuring OSPF Multiprocess

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure OSPF protocol.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 100.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 100.1.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

### #On Device2, create 2 OSPF processes, i.e. process 100 and process 200.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
Device2(config)#router ospf 200
Device2(config-ospf)#router-id 2.2.2.3
Device2(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 200
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 110.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 110.1.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

---

## Note

- When there are multiple OSPF processes, it is recommended to configure different Router IDs between OSPF processes to avoid Router ID conflict.
- 

### #View the information of LSDB and neighbors on Device2.

```
Device2#show ip ospf neighbor
OSPF process 100:
Neighbor ID Pri State Dead Time Address Interface
1.1.1.1 1 Full/Backup 00:00:30 10.0.0.1 vlan2

2.2.2.2	2.2.2.2	15	0x80000010	0x1ae1	1

```
Net Link States (Area 0)
```

Link ID	ADV Router	Age	Seq#	CkSum
10.0.0.2	2.2.2.2	21	0x80000001	0x43d6

```
OSPF Router with ID (2.2.2.3) (Process ID 200)
```

```
Router Link States (Area 0)
```

Link ID	ADV Router	Age	Seq#	CkSum	Link count
2.2.2.3	2.2.2.3	14	0x8000000f	0xb235	1
3.3.3.3	3.3.3.3	15	0x8000001b	0x696b	3

```
Net Link States (Area 0)
```

Link ID	ADV Router	Age	Seq#	CkSum
20.0.0.2	3.3.3.3	15	0x80000002	0x03fe

On Device2 which owns the OSPF database by itself, the OSPF process 100 establishes neighbor relation with the process 200.

#View the OSPF routing table of Device2.

```
Device2#show ip ospf route
```

```
OSPF process 100:
```

```
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area  
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2  
E1 - OSPF external type 1, E2 - OSPF external type 2
```

```
O 10.0.0.0/24 [1] is directly connected, vlan2, Area 0  
O 100.0.0.0/24 [2] via 10.0.0.1, vlan2, Area 0  
O 100.1.0.0/24 [2] via 10.0.0.1, vlan2, Area 0
```

```
OSPF process 200:
```

```
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area  
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2  
E1 - OSPF external type 1, E2 - OSPF external type 2
```

```
O 20.0.0.0/24 [1] is directly connected, vlan3, Area 0  
O 110.0.0.0/24 [2] via 20.0.0.2, vlan3, Area 0  
O 110.1.0.0/24 [2] via 20.0.0.2, vlan3, Area 0
```

The OSPF process 100 and 200 calculate their respective routes.

#View the routing table of Device 2.

```
Device2#show ip route
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.0.0.0/24 is directly connected, 00:05:34, vlan2  
C 20.0.0.0/24 is directly connected, 00:05:28, vlan3  
O 100.0.0.0/24 [110/2] via 10.0.0.1, 00:04:42, vlan2  
O 100.1.0.0/24 [110/2] via 10.0.0.1, 00:04:42, vlan2  
O 110.0.0.0/24 [110/2] via 20.0.0.2, 00:04:41, vlan3  
O 110.1.0.0/24 [110/2] via 20.0.0.2, 00:04:41, vlan3  
C 127.0.0.0/8 is directly connected, 48:40:33, lo0
```

Step 4: Configure routing policy.

#Configure Device2.

```
Device2(config)#ip prefix-list 1 permit 110.0.0.0/24
Device2(config)#ip prefix-list 2 permit 100.0.0.0/24
Device2(config)#route-map OSPF200to100
Device2(config-route-map)#match ip address prefix-list 1
Device2(config-route-map)#exit
Device2(config)#route-map OSPF100to200
Device2(config-route-map)#match ip address prefix-list 2
Device2(config-route-map)#exit
```

Configure route-map to invoke prefix list 1 and 2 to match the network segment 110.0.0.0/24 and 100.0.0.0/24.

---

 **Note**

- When configuring a routing policy, both the prefix list and ACL can create filtering rules. The difference is that the prefix list can accurately match the routing mask.
- 

Step 5: Configure to redistribute routes between OSPF processes and associate routing policy.

#Configure Device2.

```
Device2(config)#router ospf 100
Device2(config-ospf)#redistribute ospf 200 route-map OSPF200to100
Device2(config-ospf)#exit
Device2(config)#router ospf 200
Device2(config-ospf)#redistribute ospf 100 route-map OSPF100to200
Device2(config-ospf)#exit
```

Step 6: Check the result.

#View the OSPF LSDB of Device2.

```
Device2#show ip ospf database

      OSPF Router with ID (2.2.2.2) (Process ID 100)

      Router Link States (Area 0)

C 20.0.0.0/24 is directly connected, 00:42:44, vlan2
OE 100.0.0.0/24 [150/2] via 20.0.0.1, 00:17:45, vlan2
C 110.0.0.0/24 is directly connected, 01:02:03, vlan3
C 110.1.0.0/24 is directly connected, 01:02:14, vlan4
C 127.0.0.0/8 is directly connected, 41:02:01, lo0

```

Device3 learns the route 100.0.0.0/24 only.

---

## Note

- In practical applications, if the autonomous system has 2 or more edge routers, directly redistributing routes between different OSPF processes is not recommended. When
-

---

necessary, route filtration policy needs to be configured to avoid routing loops.

---

### 55.3.5 Configure OSPF External Route Summarization

#### Network Requirements

- OSPF protocol is run between Device1 and Device2, and RIPv2 protocol is run between Device2 and Device3.
- Device2 redistributes RIP routes to OSPF. In order to reduce the number of routes on Device1, the RIP routes redistributed on ASBR are summarized as 20.0.0.0/16.

#### Network Topology

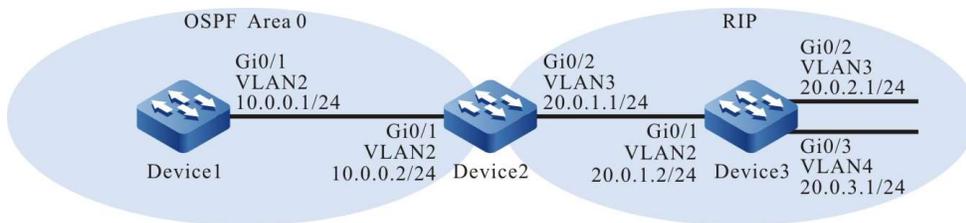

Figure 55-5 Network Topology for Configuring OSPF External Route Summarization

#### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure OSPF and RIPv2 protocols.

#Configure the OSPF protocol of Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#Configure the OSPF and RIPv2 protocols of Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
Device2(config)#router rip
Device2(config-rip)#version 2
Device2(config-rip)#network 20.0.0.0
Device2(config-rip)#exit
```

#Configure the RIPv2 protocol of Device3.

```
Device3#configure terminal
```

```

Device3(config)#router rip
Device3(config-rip)#version 2
Device3(config-rip)#network 20.0.0.0
Device3(config-rip)#exit

```

#### #View the routing table of Device 2.

```

Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:15:46, vlan2
C 20.0.1.0/24 is directly connected, 00:15:23, vlan3
R 20.0.2.0/24 [120/1] via 20.0.1.2, 00:12:17, vlan3
R 20.0.3.0/24 [120/1] via 20.0.1.2, 00:12:06, vlan3
C 127.0.0.0/8 is directly connected, 03:34:27, lo0

```

#### Step 4: Configure OSPF to redistribute RIP routes.

#### #Configure Device2.

```

Device2(config)#router ospf 100
Device2(config-ospf)#redistribute rip
Device2(config-ospf)#exit

```

#### #View the OSPF LSDB of Device2.

```

Device2#show ip ospf database

OSPF Router with ID (2.2.2.2) (Process ID 100)

Router Link States (Area 0)

Link ID      ADV Router   Age Seq#     CkSum Link count
1.1.1.1      1.1.1.1     1071 0x80000003 0x729f 1
2.2.2.2      2.2.2.2     873 0x80000004 0x38cd 1

AS External Link States

Link ID      ADV Router   Age Seq#     CkSum Route
20.0.1.0     2.2.2.2     365 0x80000001 0x7d04 E2 20.0.1.0/24 [0x0]
20.0.2.0     2.2.2.2     365 0x80000001 0x720e E2 20.0.2.0/24 [0x0]
20.0.3.0     2.2.2.2     365 0x80000001 0x6718 E2 20.0.3.0/24 [0x0]

```

According to the OSPF database, 3 external LSAs have been generated. This indicates that RIP routes have been redistributed to OSPF.

#### #View the routing table of Device1.

```

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:56:40, vlan2
OE 20.0.1.0/24 [150/20] via 10.0.0.2, 00:02:40, vlan2
OE 20.0.2.0/24 [150/20] via 10.0.0.2, 00:02:40, vlan2
OE 20.0.3.0/24 [150/20] via 10.0.0.2, 00:02:40, vlan2
C 127.0.0.0/8 is directly connected, 115:12:28, lo0

```

Device1 learns the RIP route redistributed by Device1.

Step 5: OSPF external route summarization is configured on ASBR. At this moment, Device2 acts as an ASBR.

#On Device2, summarize the RIP routes redistributed as 20.0.0.0/16.

```
Device2(config)#router ospf 100
Device2(config-ospf)#summary-address 20.0.0.0 255.255.0.0
Device2(config-ospf)#exit
```

Step 6: Check the result.

#View the OSPF LSDB of Device2.

```
Device2#show ip ospf database

        OSPF Router with ID (2.2.2.2) (Process ID 100)

        Router Link States (Area 0)

Link ID  ADV Router  Age Seq#    CkSum Link count
1.1.1.1  1.1.1.1    1437 0x80000003 0x729f 1
2.2.2.2  2.2.2.2    1240 0x80000004 0x38ed 1

        Net Link States (Area 0)

Link ID  ADV Router  Age Seq#    CkSum
10.0.0.2 2.2.2.2    144 0x80000002 0x41d7

        AS External Link States

Link ID  ADV Router  Age Seq#    CkSum Route
20.0.0.0 2.2.2.2    84 0x80000001 0x88f9 E2 20.0.0.0/16 [0x0]
```

By comparing to step 3, you can see that the original 3 external LSAs in the database have been deleted, and a summarized external LSA is generated.

#View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:28:03, vlan2
O 20.0.0.0/16 [110/1] is directly connected, 00:04:48, null0
C 20.0.1.0/24 is directly connected, 00:27:40, vlan3
R 20.0.2.0/24 [120/1] via 20.0.1.2, 00:24:34, vlan3
R 20.0.3.0/24 [120/1] via 20.0.1.2, 00:24:23, vlan3
C 127.0.0.0/8 is directly connected, 03:46:44, lo0
```

---

## Note

- A summarized route 20.0.0.0/16 which has an output interface pointing to Null0 will be automatically added in the routing table of Device2. This route can prevent loops from
-

---

being produced.

---

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:58:40, vlan2
OE 20.0.0.0/16 [150/20] via 10.0.0.2, 00:15:26, vlan2
C 127.0.0.0/8 is directly connected, 115:17:28, lo0
```

The routing table of Device1 learns the summarized route 20.0.0.0/16 only.

### 55.3.6 Configure OSPF Inter-area Summarization

#### Network Requirements

- All devices are configured with OSPF protocol, and there are two areas, i.e. area 0 and 1.
- In order to reduce the number of inter-area routes, inter-area summarization should be done on ABR to summarize the routes in area 0 as 10.0.0.0/16 and those in area 1 as 20.0.0.0/16.

#### Network Topology

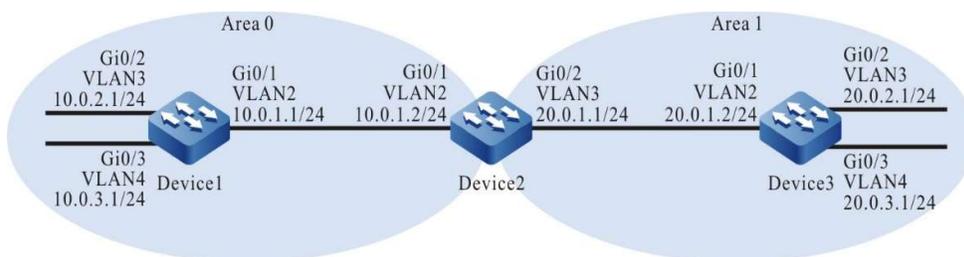

Figure 55-6 Network Topology for Configuring OSPF Inter-area Route Summarization

#### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF process and make different areas cover corresponding interfaces.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.0.2.0 0.0.0.255 area 0
```

```
Device1(config-ospf)#network 10.0.3.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 10.0.1.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.0.1.0 0.0.0.255 area 1
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 20.0.1.0 0.0.0.255 area 1
Device3(config-ospf)#network 20.0.2.0 0.0.0.255 area 1
Device3(config-ospf)#network 20.0.3.0 0.0.0.255 area 1
Device3(config-ospf)#exit
```

### #View the OSPF LSDB and routing table on Device2.

```
Device2#show ip ospf database
```

```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.0.1.0/24 is directly connected, 00:40:11, vlan2
C 10.0.2.0/24 is directly connected, 00:39:58, vlan3
C 10.0.3.0/24 is directly connected, 00:39:44, vlan4
O 20.0.0.0/16 [110/2] via 10.0.1.2, 00:02:18, vlan2
C 127.0.0.0/8 is directly connected, 116:44:42, lo0
```

According to the Device1, there is summarized inter-area LSA only in the OSPF database, and the routing table can only learn the route 20.0.0.0/16 summarized in area 1; Device3 can also learn the route 10.0.0.0/16 summarized in area 0.

## 55.3.7 Configure OSPF Inter-area Route Filtration

### Network Requirements

- All devices are configured with OSPF protocol, and there are two areas, i.e. area 0 and 1.
- Filter inter-area routes on ABR. The route 20.0.3.0/24 is not allowed to be injected into area 0, and the route 10.0.3.0/24 is not allowed to flood to other areas.

### Network Topology

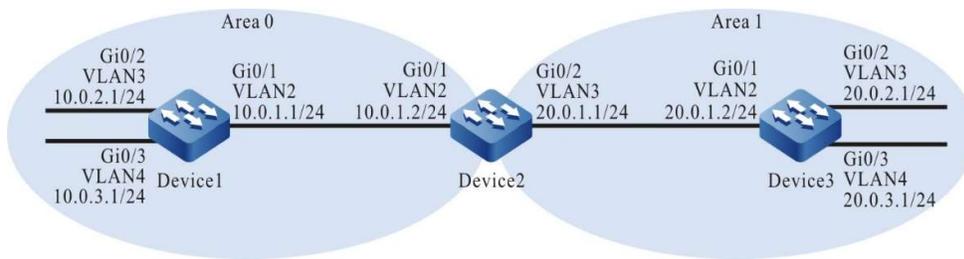

Figure 55-7 Network Topology for Configuring Filtration of OSPF Inter-area Routes

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF process and make different areas cover corresponding interfaces.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.0.2.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.0.3.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 10.0.1.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.0.1.0 0.0.0.255 area 1
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 20.0.1.0 0.0.0.255 area 1
Device3(config-ospf)#network 20.0.2.0 0.0.0.255 area 1
Device3(config-ospf)#network 20.0.3.0 0.0.0.255 area 1
```

```
Device3(config-ospf)#exit
```

## #View the OSPF LSDB and routing table on Device2.

```
Device2#show ip ospf database
```

```

```

```
O 20.0.2.0/24 [110/2] via 20.0.1.2, 00:05:32, vlan3
```

```
O 20.0.3.0/24 [110/2] via 20.0.1.2, 00:05:32, vlan3
```

```
C 127.0.0.0/8 is directly connected, 94:42:22, lo0
```

3 inter-area LSAs are generated in area 0 and 1 of OSPF database on Device2. The routes in each area are also added to the routing table.

## #View the routing table of Device1.

```
Device1#show ip route
```

```
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

```
U - Per-user Static route
```

```
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
C 10.0.1.0/24 is directly connected, 00:08:41, vlan2
```

```
C 10.0.2.0/24 is directly connected, 37:59:10, vlan3
```

```

C 10.0.3.0/24 is directly connected, 38:05:36, vlan4
O 20.0.1.0/24 [110/2] via 10.0.1.2, 00:07:55, vlan2
O 20.0.2.0/24 [110/3] via 10.0.1.2, 00:07:55, vlan2
O 20.0.3.0/24 [110/3] via 10.0.1.2, 00:06:50, vlan2
C 127.0.0.0/8 is directly connected, 70:07:32, lo0

```

Device1 learns the routes in area 1 only.

#Check the routing table of Device3.

```

Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 10.0.1.0/24 [110/2] via 20.0.1.1, 00:08:44, vlan2
O 10.0.2.0/24 [110/3] via 20.0.1.1, 00:08:33, vlan2
O 10.0.3.0/24 [110/3] via 20.0.1.1, 00:07:30, vlan2
C 20.0.1.0/24 is directly connected, 00:09:31, vlan2
C 20.0.2.0/24 is directly connected, 37:59:57, vlan3
C 20.0.3.0/24 is directly connected, 38:03:35, vlan4
C 127.0.0.0/8 is directly connected, 61:26:38, lo0

```

Device3 learns the routes in area 0 only.

Step 4: Configure route filtration policy.

#Configure Device2.

```

Device2(config)#ip prefix-list 1 deny 10.0.3.0/24
Device2(config)#ip prefix-list 1 permit 0.0.0.0/0 le 32
Device2(config)#ip prefix-list 2 deny 20.0.3.0/24
Device2(config)#ip prefix-list 2 permit 0.0.0.0/0 le 32
Device2(config)#exit

```

Prefix list 1 means to filter the network 10.0.3.0/24 and allow all the other networks; 2 means to filter the network 20.0.3.0/24 and allow all the other networks.

Step 5: Configure inter-area route filtration on ASBR, and invoke the match rules of prefix list.

#Configure Device2.

```

Device2(config)#router ospf 100
Device2(config-ospf)#area 0 filter-list prefix 1 out
Device2(config-ospf)#area 0 filter-list prefix 2 in
Device2(config-ospf)#exit

```

Step 6: Check the result.

#View the OSPF LSDB of Device2.

```

Device2#show ip ospf database

OSPF Router with ID (2.2.2.2) (Process ID 100)

Router Link States (Area 0)

Link ID      ADV Router   Age Seq#      CkSum Link count
1.1.1.1      1.1.1.1     679 0x8000005b 0xa6d5 3
2.2.2.2      2.2.2.2     673 0x80000051 0xb007 1

```

Net Link States (Area 0)

Link ID	ADV Router	Age	Seq#	CkSum
10.0.1.2	2.2.2.2	673	0x8000004e	0x9d2e

Summary Link States (Area 0)

Link ID	ADV Router	Age	Seq#	CkSum	Route
20.0.1.0	2.2.2.2	673	0x8000004e	0xac25	20.0.1.0/24
20.0.2.0	2.2.2.2	673	0x8000004d	0xad23	20.0.2.0/24

Router Link States (Area 1)

Link ID	ADV Router	Age	Seq#	CkSum	Link count
2.2.2.2	2.2.2.2	683	0x80000055	0x4f51	1
3.3.3.3	3.3.3.3	684	0x80000059	0xca7a	3

Net Link States (Area 1)

Link ID	ADV Router	Age	Seq#	CkSum
20.0.1.2	3.3.3.3	689	0x80000001	0xeb17

Summary Link States (Area 1)

Link ID	ADV Router	Age	Seq#	CkSum	Route
10.0.1.0	2.2.2.2	714	0x80000001	0xc95f	10.0.1.0/24
10.0.2.0	2.2.2.2	668	0x80000001	0xc85e	10.0.2.0/24

By comparing to the result of step 2, you can see that the LSAs of the networks 20.0.3.0/24 and 10.0.3.0/24 in OSPF database have been deleted from area 0 and 1.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i - ISIS
U - Per-user Static route
O - OSPF, OE - OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.1.0/24 is directly connected, 00:12:57, vlan2
C 10.0.2.0/24 is directly connected, 38:03:25, vlan3
C 10.0.3.0/24 is directly connected, 38:09:52, vlan4
O 20.0.1.0/24 [110/2] via 10.0.1.2, 00:12:11, vlan2
O 20.0.2.0/24 [110/3] via 10.0.1.2, 00:12:11, vlan2
C 127.0.0.0/8 is directly connected, 70:11:48, lo0
```

There has been no 20.0.3.0/24 in the routing table of Device1.

#Check the routing table of Device3.

```
Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i - ISIS
U - Per-user Static route
O - OSPF, OE - OSPF External, M - Management, E - IRMP, EX - IRMP external

O 10.0.1.0/24 [110/2] via 20.0.1.1, 00:13:09, vlan2
O 10.0.2.0/24 [110/3] via 20.0.1.1, 00:12:58, vlan2
C 20.0.1.0/24 is directly connected, 00:13:56, vlan2
C 20.0.2.0/24 is directly connected, 38:04:22, vlan3
C 20.0.3.0/24 is directly connected, 38:08:00, vlan4
C 127.0.0.0/8 is directly connected, 64:31:03, lo0
```

There has been no 10.0.3.0/24 in the routing table of Device3 either.

## 55.3.8 Configure OSPF totally Stub area

### Network Requirements

- All devices are configured with OSPF protocol, and there are three areas, i.e. area 0, 1 and 2. In particular, area 1 is a totally Stub area.
- On Device4, redistribute a static route to OSPF. Upon completion of the configuration, the totally Stub area cannot learn inter-area and external routes, those devices in other areas can learn them.

### Network Topology

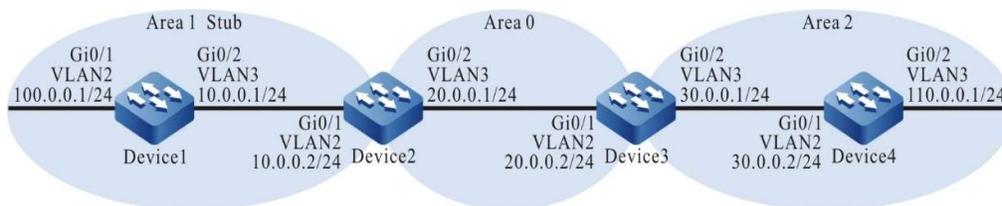

Figure 55-8 Network Topology for Configuring OSPF Totally Stub Area

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF process and make areas cover corresponding interfaces.

#On Device1, configure area 1 as Stub area.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#area 1 stub
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 1
Device1(config-ospf)#network 100.0.0.0 0.0.0.255 area 1
Device1(config-ospf)#exit
```

#On Device2, configure area 1 as a totally Stub area. Device2 as an ABR. No-summary cannot take effect unless it is configured on ABR.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#area 1 stub no-summary
Device2(config-ospf)#network 10.0.0.0 0.0.0.255 area 1
Device2(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
```

```
Device3(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.0 0.0.0.255 area 2
Device3(config-ospf)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router ospf 100
Device4(config-ospf)#router-id 4.4.4.4
Device4(config-ospf)#network 30.0.0.0 0.0.0.255 area 2
Device4(config-ospf)#network 110.0.0.0 0.0.0.255 area 2
Device4(config-ospf)#exit
```

Step 4: Configure a static route for Device4 and redistribute it to OSPF.

#### #Configure Device4.

```
Device4(config)#ip route 200.1.1.0 255.255.255.0 110.0.0.2
Device4(config)#router ospf 100
Device4(config-ospf)#redistribute static
Device4(config-ospf)#exit
```

Step 5: Check the result.

#### #View the OSPF LSDB and routing table on Device1.

```
Device1#show ip ospf database

        OSPF Router with ID (1.1.1.1) (Process ID 100)

        Router Link States (Area 1 [Stub])

Link ID      ADV Router   Age Seq#     CkSum Link count
1.1.1.1     1.1.1.1     19 0x80000009 0x8513 2
2.2.2.2     2.2.2.2     22 0x80000005 0x51b6 1

        Net Link States (Area 1 [Stub])

Link ID      ADV Router   Age Seq#     CkSum
10.0.0.2    2.2.2.2     22 0x80000001 0x61ba

        Summary Link States (Area 1 [Stub])

Link ID      ADV Router   Age Seq#     CkSum Route
0.0.0.0     2.2.2.2     55 0x80000002 0x73c1 0.0.0.0/0

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 0.0.0.0/0 [110/2] via 10.0.0.2, 00:00:19, vlan3
C 10.0.0.0/24 is directly connected, 00:01:04, vlan3
C 100.0.0.0/24 is directly connected, 00:11:55, vlan2
C 127.0.0.0/8 is directly connected, 30:46:57, lo0
```

According to the OSPF database, there are no inter-area LSA or external route LSA except for an inter-area LSA of 0.0.0.0/0 in area 1. The ABR in Stub area will generate an inter-area route of 0.0.0.0/0 which floods in the totally Stub area. The data leading to the outside of area and AS are all forwarded through this default route.

## #View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:01:02, vlan2
C 20.0.0.0/24 is directly connected, 00:00:59, vlan3
O 30.0.0.0/24 [110/2] via 20.0.0.2, 00:00:17, vlan3
O 100.0.0.0/24 [110/2] via 10.0.0.1, 00:00:10, vlan2
O 110.0.0.0/24 [110/3] via 20.0.0.2, 00:00:17, vlan3
C 127.0.0.0/8 is directly connected, 56:07:04, lo0
OE 200.1.1.0/24 [150/20] via 20.0.0.2, 00:00:16, vlan3
```

According to the result, Device2 can learn inter-area routes and external routes.

---

### Note

- When the command **area area-id stub** is configured on the ABR of the Stub area only without adding **no-summary**, the devices in this area can learn inter-area routes instead of external routes, and they still access the network outside the AS through the default route.
- 

## 55.3.9 Configure OSPF NSSA

### Network Requirements

- All devices are configured with OSPF protocol, and there are three areas, i.e. area 0, 1 and 2. In particular, area 1 and 2 are NSSA areas.
- On Device4, redistribute a static route to OSPF. Upon completion of the configuration, all devices can learn intra-area and inter-area routes, yet external routes cannot be injected to area 1.
- Import a default route on the ABR of area 1 so that Device1 can access external network through the default route.

### Network Topology

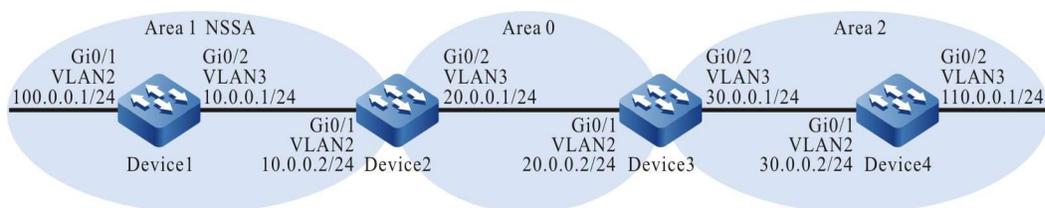

Figure 55-2 Network Topology for Configuring OSPF NSSA Area

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure OSPF process and make areas cover corresponding interfaces.

#On Device1, configure area 1 as NSSA area.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#area 1 nssa
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 1
Device1(config-ospf)#network 100.0.0.0 0.0.0.255 area 1
Device1(config-ospf)#exit
```

#On Device2, configure area 1 as NSSA area.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#area 1 nssa
Device2(config-ospf)#network 10.0.0.0 0.0.0.255 area 1
Device2(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#On Device3, configure area 2 as NSSA area.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#area 2 nssa
Device3(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.0 0.0.0.255 area 2
Device3(config-ospf)#exit
```

#On Device4, configure area 2 as NSSA area.

```
Device4#configure terminal
Device4(config)#router ospf 100
Device4(config-ospf)#router-id 4.4.4.4
Device4(config-ospf)#area 2 nssa
Device4(config-ospf)#network 30.0.0.0 0.0.0.255 area 2
Device4(config-ospf)#network 110.0.0.0 0.0.0.255 area 2
Device4(config-ospf)#exit
```

Step 4: Configure a static route for Device4 and redistribute it to OSPF.

#Configure Device4.

```
Device4(config)#ip route 200.1.1.0 255.255.255.0 110.0.0.2
Device4(config)#router ospf 100
Device4(config-ospf)#redistribute static
Device4(config-ospf)#exit
```

200.1.1.0	4.4.4.4	247	0x80000001	0x6cde	N2 200.1.1.0/24 [0x0]

AS External Link States

Link ID	ADV Router	Age	Seq#	CkSum	Route
200.1.1.0	3.3.3.3	176	0x80000001	0x0156	E2 200.1.1.0/24 [0x0]

According to the OSPF database, the NSSA-external LSA can be transformed into AS External LSA on the ABR of NSSA area (area 2) so that other areas can normally learn the external routes redistributed from NSSA area (area 2).

#View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:02:53, vlan2
C 20.0.0.0/24 is directly connected, 00:02:51, vlan3
O 30.0.0.0/24 [110/2] via 20.0.0.2, 00:02:04, vlan3
O 100.0.0.0/24 [110/2] via 10.0.0.1, 00:02:04, vlan2
O 110.0.0.0/24 [110/3] via 20.0.0.2, 00:02:02, vlan3
C 127.0.0.0/8 is directly connected, 06:47:22, lo0
```

OE 200.1.1.0/24 [150/20] via 20.0.0.2, 00:02:02, vlan3

Device2 has learned the external routes redistributed from NSSA area (area 2).

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:02:29, vlan3
O 20.0.0.0/24 [110/2] via 10.0.0.2, 00:01:44, vlan3
O 30.0.0.0/24 [110/3] via 10.0.0.2, 00:01:41, vlan3
C 100.0.0.0/24 is directly connected, 01:53:00, vlan2
O 110.0.0.0/24 [110/4] via 10.0.0.2, 00:01:40, vlan3
C 127.0.0.0/8 is directly connected, 383:45:55, lo0
```

According to the result, there is no 200.1.1.0/24 in the routing table of Device1. This indicates that the external routes redistributed from Device4 are not injected into the NSSA area (area 1), and other inter-area routes have been added into the routing table.

Step 5: Configure Device2 to import default route to area 1.

#Configure Device2 which is the ABR of area 1.

```
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#area 1 nssa default-information-originate
Device2(config-ospf)#exit
```

---

## Note

- After the command **area *area-id* nssa no-summary** is configured on the ABR of NSSA area, this area is also called a totally NSSA area. At this moment, ABR also generates a default route and floods to the NSSA area. Configuring this command can further reduce summary LSA and corresponding inter-area routes. Then the networks outside the area and AS are accessed through this default route.
- 

Step 6: Check the result.

#View the OSPF LSDB of Device2.

```
Device2#show ip ospf database

Link ID	ADV Router	Age	Seq#	CkSum	Route
200.1.1.0	3.3.3.3	454	0x80000001	0x0156	E2 200.1.1.0/24 [0x0]

OSPF generates a NSSA-external LSA for the default route.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

OE 0.0.0.0/0 [150/1] via 10.0.0.2, 00:00:22, vlan3
C 10.0.0.0/24 is directly connected, 00:07:29, vlan3
O 20.0.0.0/24 [110/2] via 10.0.0.2, 00:06:44, vlan3
O 30.0.0.0/24 [110/3] via 10.0.0.2, 00:06:41, vlan3
C 100.0.0.0/24 is directly connected, 01:58:00, vlan2
O 110.0.0.0/24 [110/4] via 10.0.0.2, 00:06:40, vlan3
C 127.0.0.0/8 is directly connected, 383:50:55, lo0
```

The routing table of Device1 also learns the default route 0.0.0.0/0. The communication with the external routes of AS is achieved through this default route.

## 55.3.10 Configure OSPF to Coordinate with BFD

### Network Requirements

- Configure OSPF protocol for all the devices.
- Enable BFD detection function for the lines between Device1 and Device3. When the lines fail, BFD will quickly identify these failures and notify OSPF which will switch route to Device2 for communication.

### Network Topology

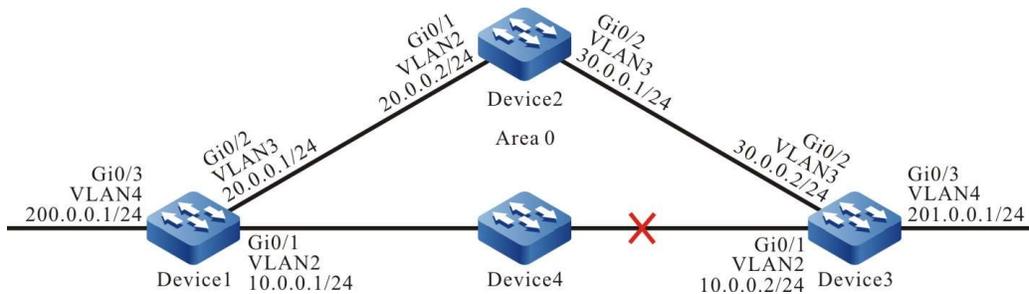

Figure 55-10 Network Topology for Configuring Coordination of OSPF with BFD

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configures IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF process.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 200.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 20.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 30.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 10.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 201.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

Step 4: Configure coordination of OSPF with BFD.

#Configure Device1.

```
Device1(config)#bfd fast-detect
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip ospf bfd
Device1(config-if-vlan2)#exit
```

#Configure Device3.

```
Device3(config)#bfd fast-detect
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip ospf bfd
Device3(config-if-vlan2)#exit
```

Step 5: Check the result.

#View OSPF neighbors' information and routing table on Device1.

```
Device1#show ip ospf neighbor 3.3.3.3

OSPF process 100:
Neighbor 3.3.3.3, interface address 10.0.0.2
  In the area 0 via interface vlan2, BFD enabled
  Neighbor priority is 1, State is Full, 5 state changes
  DR is 10.0.0.2, BDR is 10.0.0.1
  Options is 0x42 (-|O|-|E|-)
  Dead timer due in 00:00:31
  Neighbor is up for 00:02:46
  Database Summary List 0
  Link State Request List 0
  Link State Retransmission List 0
  Crypt Sequence Number is 0
  Graceful restart proxy id is 0x0
  Thread Inactivity Timer on
  Thread Database Description Retransmission off, 0 times
  Thread Link State Request Retransmission off, 0 times
  Thread Link State Update Retransmission off, 0 times

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:01:09, vlan2
C 20.0.0.0/24 is directly connected, 00:55:37, vlan3
O 30.0.0.0/24 [110/2] via 20.0.0.2, 00:02:50, vlan3
  [110/2] via 10.0.0.2, 00:01:30, vlan2
C 127.0.0.0/8 is directly connected, 05:51:09, lo0
C 200.0.0.0/24 is directly connected, 00:55:12, vlan4
O 201.0.0.0/24 [110/2] via 10.0.0.2, 00:01:30, vlan2
```

According to the information of OSPF neighbors, BFD has been enabled, and the route 201.0.0.0/24 prefers the lines between Device1 and Device3 for communication.

#View the BFD session information of Device1.

```
Device1#show bfd session detail
Total session number: 1
OurAddr      NeighAddr      LD/RD      State      Holddown      interface
10.0.0.1     10.0.0.2       7/14       UP         5000          vlan2
Type:direct
```

```

Local State:UP Remote State:UP Up for: 0h:2m:37s Number of times UP:1
Send Interval:1000ms Detection time:5000ms(1000ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
MinTxInt:1000 MinRxInt:1000 Multiplier:5
Remote MinTxInt:1000 Remote MinRxInt:1000 Remote Multiplier:5
Registered modules:Registered modules:OSPF

```

According to the result, OSPF has been successfully coordinated with BFD, and the session is established normally.

#When the lines between Device1 and Device3 fail, BFD can quickly identify these failures and notify OSPF which will switch route to Device2 for communication and view the routing table on Device1.

```

%BFD-5-Session [10.0.0.2,10.0.0.1,vlan2,10] DOWN (Detection time expired)
%OSPF-5-ADJCHG: Process 100 Nbr [vlan2:10.0.0.1-3.3.3.3] from Full to Down,KillNbr: BFD session down

```

```

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.0.0.0/24 is directly connected, 00:01:59, vlan2
C 20.0.0.0/24 is directly connected, 00:56:13, vlan3
O 30.0.0.0/24 [110/2] via 20.0.0.2, 00:03:40, vlan3
C 127.0.0.0/8 is directly connected, 05:52:41, lo0
C 200.0.0.0/24 is directly connected, 00:56:02, vlan4
O 201.0.0.0/24 [110/3] via 20.0.0.2, 00:00:06, vlan3

```

Device3 has similar behaviors to Device1.

### 55.3.11 Configure OSPF FRR

#### Network Requirements

- Configure OSPF protocol for all the devices.
- Device1 learns the OSPF route 192.168.1.1/32 from Device2 and Device3 at the same time, and first uses the lines between it and Device3 to forward packets. Likewise, Device3 learns the OSPF route 100.1.1.1/32 from Device1 and Device2, and prefers to use the lines between it and Device1 to forward packets.
- Enable OSPF FRR on Device1 and Device3. When the lines between Device1 and Device3 fail, the service can quickly switch to Device2 for communication.

#### Network Topology

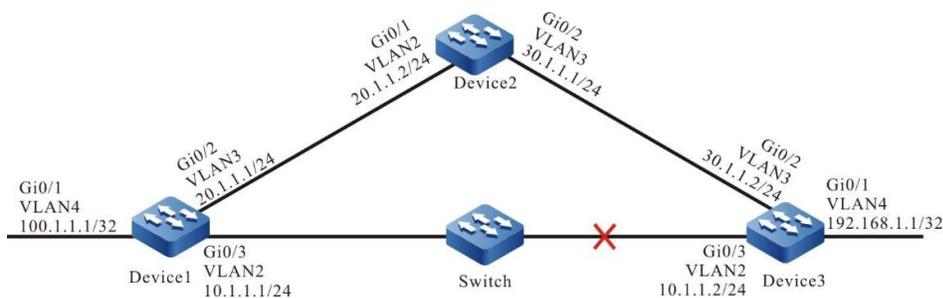

Figure 55-11 Network Topology for Configuring OSPF FRR

## Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IP address of each interface (Omitted).

Step 2: Configure OSPF.

#On Device1, configure OSPF process and make area 0 cover the interface.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#router-id 1.1.1.1
Device1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 20.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 100.1.1.1 0.0.0.0 area 0
Device1(config-ospf)#exit
```

#On Device2, configure OSPF process and make area 0 cover the interface.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#router-id 2.2.2.2
Device2(config-ospf)#network 20.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#network 30.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#On Device3, configure OSPF process and make area 0 cover the interface.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#router-id 3.3.3.3
Device3(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.1.1.0 0.0.0.255 area 0
Device3(config-ospf)#network 192.168.1.1 0.0.0.0 area 0
Device3(config-ospf)#exit
```

Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 192.168.1.1/32 only, and filter other networks.

The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 20.1.1.2.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 192.168.1.1 0.0.0.0
Device1(config-std-nacl)#exit
Device1(config)#route-map ipfir_ospf
Device1(config-route-map)#match ip address 1
Device1(config-route-map)#set fast-reroute backup-interface vlan3 backup-nexthop 20.1.1.2
Device1(config-route-map)#exit
```

#On Device3, configure route-map to invoke ACL to match 100.1.1.1/32 only, and filter other networks.

The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 30.1.1.1.

```
Device3(config)#ip access-list standard 1
Device3(config-std-nacl)#permit 100.1.1.1 0.0.0.0
Device3(config-std-nacl)#exit
Device3(config)#route-map ipfir_ospf
Device3(config-route-map)#match ip address 1
Device3(config-route-map)#set fast-reroute backup-interface vlan3 backup-nexthop 30.1.1.1
```

```
Device3(config-route-map)#exit
```

#### Step 4: Configure FRR.

#On Device1, enable OSPF FRR.

```
Device1(config)#router ospf 100
Device1(config-ospf)#fast-reroute route-map ipfrr_ospf
Device1(config-ospf)#exit
```

#On Device3, enable OSPF FRR.

```
Device3(config)#router ospf 100
Device3(config-ospf)#fast-reroute route-map ipfrr_ospf
Device3(config-ospf)#exit
```

#### Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 00:22:44, vlan2
L 10.1.1.1/32 is directly connected, 00:22:44, vlan2
C 20.1.1.0/24 is directly connected, 06:39:56, vlan3
L 20.1.1.1/32 is directly connected, 06:39:56, vlan3
O 30.1.1.0/24 [110/2] via 20.1.1.2, 00:01:51, vlan3
   [110/2] via 10.1.1.2, 00:00:16, vlan2
C 127.0.0.0/8 is directly connected, 31:14:38, lo0
L 127.0.0.1/32 is directly connected, 31:14:38, lo0
LC 100.1.1.1/32 is directly connected, 03:14:47, vlan4
O 192.168.1.1/32 [110/2] via 10.1.1.2, 00:00:04, vlan2
```

#The FRR table of Device1 shows the route of network 192.168.1.1/32. The next hop interface is vlan3.

```
Device1#show ip frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 192.168.1.1/32 [110/0] via 20.1.1.2, 00:00:08, vlan3
```

#According to the backup next hop information of Device1, the backup interface of FRR is vlan3.

```
Device1#show nexthop frr detail

```

BK Slot : 0

Total 1 entries.

#When the lines between Device1 and Device3 fail, it will quickly identify the failures and switch to Device2 for communication. It can be seen from the routing table and FRR table of Device1 that the output interface of the destination network 192.168.1.1/32 in the routing table has switched to the backup interface vlan3.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 00:22:44, vlan2
L 10.1.1.1/32 is directly connected, 00:22:44, vlan2
C 20.1.1.0/24 is directly connected, 06:39:56, vlan3
L 20.1.1.1/32 is directly connected, 06:39:56, vlan3
O 30.1.1.0/24 [110/2] via 20.1.1.2, 00:01:51, vlan3
   [110/2] via 10.1.1.2, 00:00:16, vlan2
C 127.0.0.0/8 is directly connected, 31:14:38, lo0
L 127.0.0.1/32 is directly connected, 31:14:38, lo0
LC 100.1.1.1/32 is directly connected, 03:14:47, vlan4
O 192.168.1.1/32 [110/3] via 20.1.1.2, 00:00:04, vlan3
```

On Device3, it is processed in a manner which is similar to that on Device1.

# 56 OSPFv3

## 56.1 Overview

OSPFv3 is the shortened form of OSPF (Open Shortest Path First) version 3. Supporting IPv6, it follows RFC2328 and RFC2740, and allows the OSPF extension defined by other relevant RFC.

The principle of OSPFv3 is almost the same as that of OSPFv2. It simply modifies some different IP protocols and address families. Their differences are shown below:

- OSPFv3 runs based on link, while OSPFv2 runs based on network segment;
- Each link of OSPFv3 supports multiple instances;
- OSPFv3 identifies neighbors with Router ID, while OSPFv2 identifies neighbors with IP address;

## 56.2 OSPFv3 function configuration

Table 56 OSPFv3 Function Configuration List

Configuration Task	
Configure Basic Functions of OSPFv3	Enable OSPFv3 Protocol
Configure OSPFv3 Area	Configure OSPFv3 NSSA Area
	Configure OSPFv3 Stub Area
	Configure OSPFv3 Virtual Link
Configure Network Type of OSPFv3	Configure Network Type of OSPFv3 Interface as Broadcast
	Configure Network Type of OSPFv3 Interface as P2P
	Configure Network Type of OSPFv3 Interface as NBMA

Configuration Task	
	Configure Network Type of OSPFv3 Interface as P2MP
Configure OSPFv3 Network Authentication	Configure OSPFv3 Area Authentication
	Configure OSPFv3 Interface Authentication
Configure OSPFv3 Route Generation	Configure OSPFv3 Route Redistribution
	Configure OSPFv3 Default Route
Configure OSPFv3 Route Control	Configure OSPFv3 Inter-area Route Summarization
	Configure OSPFv3 External Route Summarization
	Configure OSPFv3 Inter-area Route Filtration
	Configure OSPFv3 External Route Filtration
	Configure OSPFv3 Route Installation Filtration
	Configure OSPFv3 Interface Cost Value
	Configure OSPFv3 Reference Bandwidth
	Configure OSPFv3 Administrative Distance
Configure OSPFv3 Network Optimization	Configure the Maximum Number of OSPFv3 Load Balancing Entries
	Configure Keepalive Time of OSPFv3 Neighbors
	Configure Passive OSPFv3 Interface
	Configure OSPFv3 Demand Circuit
	Configure OSPFv3 Interface Priority
	Configure OSPFv3 Interface to Ignore MTU

Configuration Task	
	Configure LSA Transfer Delay of OSPFv3 Interface
	Configure OSPFv3 LSA retransmission
	Configure OSPFv3 SPF Calculation Time
Configure OSPFv3 GR	Configure OSPFv3 GR Restarter
	Configure OSPFv3 GR Helper
Configure Coordination of OSPFv3 with BFD	Configure Coordination of OSPFv3 with BFD

### 56.2.1 Configure Basic Functions of OSPFv3

In the various configuration tasks of OSPFv3, you must first enable the OSPFv3 protocol so that the configuration of the other function features can take effect.

#### Configuration Condition

Before configuring the basic OSPFv3 functions, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Enable the IPv6 forwarding function.

#### Enable OSPFv3 Protocol

To enable the OSPFv3 function, first create an OSPFv3 process, specify the router ID of this process, and enable the OSPFv3 protocol on the interface.

The device where OSPFv3 protocol is running must have a Router ID, which is used to uniquely identify a device in an OSPFv3 AS. The uniqueness of the Router ID in the AS must be guaranteed. Otherwise, it will influence the neighbor establishment and route learning. In OSPFv3, an IPv4 address format and Router ID are required to be manually configured.

OSPFv3 supports multiple processes that are identified with process number, and different processes are independent of each other.

Table 1 Enabling OSPFv3 Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create OSPFv3 process and enter OSPF configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <i>vrf vrf-name</i> ]	Mandatory  Enable the OSPFv3 process directly or from VRF. By default, the OSPFv3 protocol is disabled in the system.  When OSPFv3 is enabled from VRF, the OSPFv3 process belonging to a certain VRF can manage the interfaces belonging to this VRF only.
Configure the Router ID of OSPFv3 process	<b>router-id</b> <i>ipv4-address</i>	Mandatory
Return to the global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable the OSPFv3 protocol on the interface	<b>ipv6 router ospf</b> <i>process-id</i> <b>area</b> <i>area-id</i> [ <b>instance-id</b> <i>instance-id</i> ]	Mandatory  By default, the OSPFv3 protocol is disabled on the interface.

### 56.2.2 Configure OSPFv3 Area

In order to reduce the CPU and memory usage by a large amount of database information, the OSPFv3 AS is divided into multiple areas. The area is identified by a 32-bit area ID, which can be represented by a decimal number ranging from 0 to 4294967295 or an IP address within 0.0.0.0 - 255.255.255.255. Area 0 or 0.0.0.0 means the backbone area of OSPFv3, and others are non-backbone areas. All the inter-area routing information needs to be forwarded through backbone areas. Routing information cannot be directly exchanged between non-backbone areas.

OSPFv3 defines several types of routers:

- Internal Router: The device whose all interfaces belong to the same area;

- Area Border Router (ABR): The device connecting to multiple areas;
- Autonomous System Boundary Router (ASBR): The device which imports external route for OSPFv3 AS.

### Configuration Condition

Before configuring OSPFv3 area, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

### Configure OSPFv3 NSSA Area

Type-7 LSA instead of Type-5 LSA is allowed to be injected into the Not-So-Stub-Area (NSSA). By configuring redistribution to import external routes to the NSSA area. The ASBR in the NSSA area generates Type-7 LSA and floods it to the NSSA area. The ABR in the NSSA area will convert Type-7 LSAs into Type-5 LSAs, and then flood these Type-5 LSAs to the entire AS.

The OSPFv3 NSSA area configured through the command **area area-id nssa no-summary** is called a totally NSSA area. The OSPFv3 totally NSSA area prohibits inter-area routes from flooding. At this time, ABR will generate a default route and flood it into the NSSA area. Devices in the NSSA area will access the networks outside the area through this default route.

Table 2 Configuring OSPFv3 NSSA Area

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf process-id [vrf vrf-name ]</b>	-
Configure NSSA area	<b>area area-id nssa [ no-redistribution / no-summary / default-information-originate [ metric metric-value / metric-type type-value ] ]</b>	Mandatory  By default, OSPFv3 area is not a NSSA area.

---

### Note

- Backbone areas cannot be configured as NSSA areas.
  - All devices in the same NSSA area must be configured as NSSA areas. Neighbor relations cannot be formed between the devices with inconsistent area types.
-

## Configure OSPFv3 Stub Area

The Stub area does not allow AS external routes to flood. This can reduce the size of the link status database. After an area is configured as Stub, the ABR on the border of Stub will generate a default route and flood it into the Stub area. Devices in the Stub area will access the networks outside the AS through this default route.

The OSPFv3 Stub area configured through the command **area area-id stub no-summary** is called a totally Stub area. The OSPFv3 totally Stub area prohibits inter-area routes or external routes from flooding. Devices in the area will access the networks outside the area and the OSPFv3 AS through the default route.

Table 56 Configuring OSPFv3 Stub Area

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf process-id [vrf vrf-name ]</b>	-
Configure Stub area	<b>area area-id stub [ no-summary ]</b>	Mandatory  By default, OSPFv3 area is not a Stub area.

---

### Note

- Backbone areas cannot be configured as Stub areas.
  - All devices in the same Stub area must be configured as Stub areas. Neighbor relations cannot be formed between the devices with inconsistent area types.
- 

## Configure OSPFv3 Virtual Link

In OSPFv3, non-backbone areas must complete database synchronization and data interaction through backbone areas. Therefore, all non-backbone areas must connect with backbone areas.

When this requirement cannot be satisfied in some circumstances, you may configure a virtual link. After a virtual link is configured, you can configure authentication method and modify Hello time interval for the virtual link. Meanings of these parameters are consistent with those of general OSPFv3 interface parameters.

Table 3 Configuring OSPFv3 Virtual Link

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf <i>process-id</i> [vrf <i>vrf-name</i> ]</b>	-
Configure virtual link	<b>area <i>transit-area-id</i> virtual-link <i>neighbor-id</i> [ <b>dead-interval <i>seconds</i> / hello-interval <i>seconds</i> / retransmit-interval <i>seconds</i> / transmit-delay <i>seconds</i> ]</b></b>	Mandatory  By default, no virtual link is created.

---

### Note

- Virtual link must be configured between two ABRs.
  - The two ABRs configured with virtual links must be within the same common area, which is called the Transit Area of the virtual link.
  - This Transit Area shall not be a Stub or NSSA area.
- 

### 56.2.3 Configure Network Type of OSPFv3

Depending on the link protocol type, OSPFv3 divides networks into four types:

- Broadcast Networks - When the link protocol is Ethernet or FDDI, the OSPFv3 network type is broadcast by default.
- P2P (Point To Point Network) - When the link protocol is PPP, LAPB or HDLC, the OSPFv3 network type is P2P by default.
- NBMA (Non-Broadcast Multi-Access Network) - When the link protocol is ATM, frame relay or X.25, the OSPFv3 network type is NBMA by default.
- P2MP (Point To Multi-Point Network) - No link protocol will be deemed as P2MP by OSPFv3 by default. Generally, the NBMA network which is not fully connected is configured as an OSPFv3 P2MP.

The network type of OSPFv3 interface can be modified as needed. The network types of the interfaces that establish OSPFv3 neighbors must be consistent, or the normal learning of routes will be affected.

#### Configuration Condition

Before configuring OSPFv3 network type, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

### Configure Network Type of OSPFv3 Interface as Broadcast

Broadcast network supports multiple (more than two) devices that can exchange information with all the devices on the network. OSPFv3 uses Hello packets to dynamically find neighbors.

Table 56 Configuring Network Type of OSPFv3 Interface as Broadcast

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Network Type of OSPFv3 Interface as Broadcast	<b>ipv6 ospf network broadcast</b>	Mandatory By default, the network type of OSPFv3 interface depends on the protocol in link layer.

### Configure Network Type of OSPFv3 Interface as P2P

Point-to-point network is the network composed of two devices, each of which is located at an end of the point-to-point link. OSPFv3 uses Hello packets to dynamically find neighbors.

Table 56 Configuring Network Type of OSPFv3 Interface as P2P

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Network Type of OSPFv3 Interface as P2P	<b>ipv6 ospf network point-to-point</b>	Mandatory By default, the network type of OSPFv3 interface depends on the protocol in link layer.

### Configure Network Type of OSPFv3 Interface as NBMA

NBMA network supports multiple (more than two) devices. Yet it cannot broadcast, and neighbors need to be manually specified.

Table 4 Configuring Network Type of OSPFv3 Interface as NBMA

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Network Type of OSPFv3 Interface as NBMA	<b>ipv6 ospf network non-broadcast</b>	Mandatory  By default, the network type of OSPFv3 interface depends on the protocol in link layer.
Configure NBMA network neighbors	<b>ipv6 ospf neighbor</b> <i>neighbor-ipv6-address</i> [ <b>priority</b> <i>priority-value</i> / <b>poll-interval</b> <i>interval-value</i> / <b>cost</b> <i>cost-value</i> ] [ <b>instance-id</b> <i>instance-id</i> ]	Mandatory  In NBMA network, neighbors need to be manually specified.

#### Configure Network Type of OSPFv3 Interface as P2MP

When NBMA is not fully connected, the network type can be configured as P2MP to save network cost. When the network type is configured as P2MP unicast, neighbors need to be manually specified.

Table 5 Configuring Network Type of OSPFv3 Interface as P2MP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Network Type of OSPFv3 Interface as P2MP	<b>ipv6 ospf network point-to-multipoint</b> [ <b>non-broadcast</b> ]	Mandatory  By default, the network type of OSPFv3 interface depends on the protocol in link layer.

Step	Command	Description
Configure P2MP unicast network neighbors	<b>ipv6 ospf neighbor</b> <i>neighbor-ipv6-address</i> [ <b>priority</b> <i>priority-value</i> / <b>poll-interval</b> <i>interval-value</i> / <b>cost</b> <i>cost-value</i> ] [ <b>instance-id</b> <i>instance-id</i> ]	If the network type of interface is configured as P2MP, it is mandatory

#### 56.2.4 Configure OSPFv3 Network Authentication

In order to avoid information leakage or malicious attacks on OSPFv3 devices, all packet interactions between OSPFv3 neighbors can realize encryption and authentication. The encryption & authentication type and algorithm can be NULL (no authentication), SHA1 authentication, and MD5 authentication specified by the IPsec encryption & authentication policy.

After authentication is configured, the IPsec security feature can encrypt and authenticate OSPFv3 protocol packets. The OSPFv3 protocol can receive packets only when they pass decryption and authentication. Therefore, for the OSPFv3 interfaces that establish neighbor relations, their authentication method, Spi ID, and the IPsec encryption & authentication policy configured for authentication password must be consistent. The OSPFv3 authentication method can be configured on areas and interfaces. In particular, area authentication has a lower priority than interface authentication. That is to say, you are required to first use interface authentication and then area authentication.

##### Configuration Condition

Before configuring OSPFv3 network authentication, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

##### Configure OSPFv3 Area Authentication

Configuring area authentication in the OSPFv3 process area can make all interfaces in the area use area authentication. This can effectively avoid repeated configuration of the same network authentication method for the interface.

Table 6 Configuring OSPFv3 Area Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-

Configure area authentication	<b>area <i>area-id</i> ipsec-tunnel <i>tunnel-name</i></b>	Mandatory  By default, no OSPFv3 area authentication is configured.
-------------------------------	--	---

### Configure OSPFv3 Interface Authentication

When an interface has multiple OSPFv3 instances, you can specify authentication method and password for an instance separately. The authentication method specified under the area is applicable to the instances where interface authentication is not specified under the interface.

Table 7 Configuring OSPFv3 Interface Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	-
Configure interface authentication method	<b>ipv6 ospf ipsec-tunnel <i>tunnel-name</i>{<i>instance-id</i> <i>instance-id</i>}</b>	Mandatory  By default, no OSPFv3 interface authentication is configured.

## 56.2.5 Configure OSPFv3 Route Generation

### Configuration Condition

Before configuring OSPFv3 route generation, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

### Configure OSPFv3 Route Redistribution

When multiple routing protocols are running on a device, routes of other protocols are imported into OSPFv3 through redistribution to generate OSPFv3 external type-2 routes by default, with the routing metric value being 20. When external routes are imported through redistribution, you can modify the type of external route, metric, and Tag fields, and associate the specified routing policy for route control and management.

Table 8 Configuring OSPFv3 Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <i>vrf vrf-name</i> ]	-
Configure OSPFv3 Route Redistribution	<b>redistribute</b> <i>routing-protocol</i> [ <i>protocol-id-or-name</i> ] [ <b>metric</b> <i>metric-value</i> / <b>metric-type</b> <i>type-value</i> / <b>tag</b> <i>tag-value</i> / <b>route-map</b> <i>map-name</i> / <b>match</b> <i>route-type</i> ]	Mandatory  By default, no OSPFv3 route redistribution is configured.
Configure the metric value of OSPFv3 external route	<b>default-metric</b> <i>metric-value</i>	Optional

## Note

- When redistribute protocol [*protocol-id*] metric and default-metric are both configured to set the metric value of external route, the former has a higher priority.

### Configure OSPFv3 Default Route

After the OSPFv3 Stub area and totally NSSA area are configured, a Type-3 default route will be automatically generated. Default route cannot be automatically generated in NSSA area. But a Type-7 default route can be imported to this area through the command **area** *area-id* **nssa default-information-originate**.

OSPFv3 cannot import Type-5 default route through the **redistribute** command. When necessary, the **default-information originate [always]** command can be used to achieve this purpose.

Table 9 Configuring OSPFv3 Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <i>vrf vrf-name</i> ]	-

Step	Command	Description
Configure OSPFv3 Default Route	<b>default-information originate</b> [ <b>always</b> / <b>metric</b> <i>metric-value</i> / <b>metric-type</b> <i>metric-type</i> / <b>route-map</b> <i>route-map-name</i> ]	<p>Mandatory</p> <p>By default, no external default route will be imported into OSPFv3 AS.</p> <p>For the default route imported, the default metric value is 1, and the type is external type-2.</p> <p><b>always</b> means that the default route is required to be generated in OSPFv3 AS. Otherwise, it will be generated only when there is a default route in the local routing table.</p>

## 56.2.6 Configure OSPFv3 Route Control

### Configuration Condition

Before configuring OSPFv3 route control, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

### Configure OSPFv3 Inter-area Route Summarization

When the ABR in OSPFv3 advertises inter-area routes to other areas, each route is advertised separately as Type-3 LSAs. You may use the inter-area route summarization function to summarize some contiguous network segments in the area into one route to advertise the summarized route only. This can reduce the size of the OSPFv3 database.

Table 10 Configuring OSPFv3 Inter-area Route Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-

Step	Command	Description
Configure OSPFv3 Inter-area Route Summarization	<b>area area-id range</b> ipv6-prefix/prefix-length [ <b>advertise</b>   <b>not-advertise</b> ]	Mandatory By default, ABR doesn't conduct inter-area route summarization.

### Note

- The OSPFv3 inter-area route summarization function takes effect on ABR only.
- By default, the minimum cost value of detail routes is selected as the cost value of summarized route.

### Configure OSPFv3 External Route Summarization

When OSPFv3 redistributes external routes, each route is advertised separately in external link status advertisement. You may use the external route summarization function to summarize some contiguous network segments outside the AS into one route to advertise the summarized route only. This can reduce the size of the OSPFv3 database.

After configuring the command **summary-address** on ASBR, you can summarize the Type-5 LSA and Type-7 LSA within the scope of summarized address.

Table 11 Configuring OSPFv3 External Route Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf process-id [vrf vrf-name ]</b>	-
Configure OSPFv3 External Route Summarization	<b>summary-prefix</b> ipv6-prefix/prefix-length [ <b>not-advertise</b>   <b>tag tag-value</b> ]	Mandatory By default, ABR doesn't conduct external route summarization.

### Note

- The OSPFv3 external route summarization function takes effect on ASBR only.

### Configure OSPFv3 Inter-area Route Filtration

When ABR is receiving inter-area route, ACL or prefix list is used for filtration in the incoming function; when it is advertising inter-area route, ACL or prefix list is used for filtration in the outgoing function.

Table 12 Configuring OSPFv3 Inter-area Route Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf process-id [vrf vrf-name ]</b>	-
Configure OSPFv3 Inter-area Route Filtration	<b>area area-id filter-list { access { access-list-name / access-list-number }   prefix prefix-list-name } { in   out }</b>	Mandatory By default, ABR doesn't conduct inter-area route filtration.

### Note

- The OSPFv3 inter-area route filtration function takes effect on ABR only.

### Configure OSPFv3 External Route Filtration

Configure external route filtration, i.e. apply ACL or prefix list to allow or prohibit the flooding of routes into OSPFv3 AS from outside.

Table 13 Configuring OSPFv3 External Route Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf process-id [vrf vrf-name ]</b>	-
Configure OSPFv3 External Route Filtration	<b>distribute-list { access { access-list-name / access-list-number }   prefix prefix-</b>	Mandatory

Step	Command	Description
	<i>list-name</i> } <b>out</b> [ <i>routing-protocol</i> [ <i>process-id</i> ] ]	By default, ASBR doesn't conduct external route filtration.

---

## Note

- The OSPFv3 external route filtration function takes effect on ASBR only.
- 

### Configure OSPFv3 Route Installation Filtration

After OSPFv3 calculates routes through LSA, the calculated OSPFv3 protocol routing information can be filtered to prevent certain routes from being added to the routing table.

Table 14 Configuring OSPFv3 Route Installation Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <i>vrf vrf-name</i> ]	-
Configure OSPFv3 Route Installation Filtration	<b>distribute-list</b> { <b>access</b> { <i>access-list-name</i>   <i>access-list-number</i> }   <b>gateway</b> <i>prefix-list-name1</i>   <b>prefix</b> <i>prefix-list-name2</i> [ <b>gateway</b> <i>prefix-list-name3</i> ]   <b>route-map</b> <i>route-map-name</i> } <b>in</b> [ <i>interface-name</i> ]	Mandatory By default, no OSPFv3 route installation filtration is configured.

---

## Note

- Make prefix, gateway and route-map filtration and ACL filtration mutually exclusive. For example, if prefix filtration has been configured, ACL filtration cannot be configured.
  - Make route-map and prefix filtration and gateway filtration mutually exclusive.
  - Make prefix filtration and gateway filtration cover each other.
-

### Configure OSPFv3 Interface Cost Value

By default, the OSPFv3 interface cost is calculated with the following methods: reference bandwidth/interface bandwidth.

Table 15 Configuring OSPFv3 Interface Cost Value

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPFv3 Interface Cost Value	<b>ipv6 ospf cost</b> <i>cost</i> [ <b>instance-id</b> <i>instance-id</i> ]	Optional By default, the calculation is conducted according to the reference bandwidth/interface bandwidth.

### Configure OSPFv3 Reference Bandwidth

The reference bandwidth of interface is mainly used to calculate interface cost value which is 100Mbit/s by default. The OSPFv3 interface cost is calculated with the following methods: reference bandwidth/interface bandwidth. When the calculation result is greater than 1, take the integer part; when it is less than 1, take 1. Therefore, in a network with a bandwidth higher than 100Mbit/s, the optimal route cannot be correctly selected. To solve this problem, the **auto-cost reference-bandwidth** command can be used to configure appropriate reference bandwidth.

Table 16 Configuring OSPFv3 Reference Bandwidth

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPFv3 Reference Bandwidth	<b>auto-cost reference-bandwidth</b> <i>reference-bandwidth</i>	Optional By default, the reference bandwidth is 100Mbit/s.

### Configure OSPFv3 Administrative Distance

Administrative distance indicates the reliability of routing protocol. When the routes that reach the same destination network are learned from different routing protocols, they are selected according to the administrative distance. Those with a small administrative distance are selected first.

Table 17 Configuring OSPFv3 Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPFv3 Administrative Distance	<b>distance [ ospf { external distance / inter-area distance / intra-area distance }   distance ]</b>	Optional By default, the administrative distance of intra-area and inter-area routes of OSPFv3 is 110, and that of external routes is 150.

#### Configure the Maximum Number of OSPFv3 Load Balancing Entries

If there are multiple equal-cost paths leading to the same destination address, the paths form load balancing, which can improve the link utility rate and reduce the load of links.

Table 18 Configuring Maximum Number of Load Balancing Entries of OSPFv3

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure the Maximum Number of OSPFv3 Load Balancing Entries	<b>maximum-paths</b> <i>max-number</i>	Optional By default, the maximum number of load balancing entries of OSPFv3 is 4.

## 56.2.7 Configure OSPFv3 Network Optimization

### Configuration Condition

Before configuring OSPFv3 network optimization, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

### Configure Keepalive Time of OSPFv3 Neighbors

OSPFv3 Hello packets are used to establish and keep alive neighbor relationships. The default time interval of sending Hello packets depends on the network type. In broadcast and P2P networks, it is 10 seconds, and in P2MP and NBMA networks, it is 30 seconds.

The failure time of neighbor is used to identify the validity of the neighbor. By default, it is 4 times the Hello time interval. If the OSPFv3 device does not receive the Hello packets from the neighbor after time out of its failure time, the neighbor is considered invalid and deleted.

Table 19 Configuring Keepalive Time of OSPFv3 Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPFv3 Hello time interval	<b>ipv6 ospf hello-interval</b> <i>interval-value</i> [ <b>instance-id</b> <i>instance-id</i> ]	Optional The default value is determined based on network class. For broadcast and P2P networks, it's 10 seconds; for P2MP and NBMA networks, it's 30 seconds.
Configure failure time interval of OSPFv3 neighbors	<b>ipv6 ospf dead-interval</b> <i>interval-value</i> [ <b>instance-id</b> <i>instance-id</i> ]	Optional The default value is 4 times the Hello interval.

- The Hello interval between adjacent OSPFv3 devices must be the same as the failure time of neighbor. Otherwise, the neighbor relationship cannot be established.
- When modifying Hello interval, if the failure time of current neighbor is 4 times the Hello interval, the failure time of neighbor will also be automatically modified so that it is 4 times the Hello interval; if the failure time of current neighbor is not 4 times the Hello interval, the failure time of neighbor will remain unchanged.
- Modifying the failure time of neighbor will not affect the Hello interval.

### Configure Passive OSPFv3 Interface

Dynamic routing protocol uses passive interface, which can effectively reduce the consumption of network bandwidth by routing protocol. Configure passive OSPFv3 interface to enable the command to advertise the route of the direct network segment where the interface is located. But it will suppress the receiving and sending of OSPFv3 protocol packets on this interface.

Table 20 Configuring Passive OSPFv3 Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> <b>[vrf</b> <i>vrf-name</i> <b>]</b>	-
Configure Passive OSPFv3 Interface	<b>passive-interface</b> <i>{interface-name   default}</i>	Mandatory By default, no passive OSPF interface is configured.

### Configure OSPFv3 Demand Circuit

On P2P and P2MP links, to reduce line costs, you can configure OSPFv3 demand circuit to suppress the periodic sending of Hello packets and periodic refresh of LSA packets. It is mainly applied in paid links, such as ISDN, SVC and X.25.

Table 21 Configuring OSPFv3 Demand Circuit

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure OSPFv3 Demand Circuit	<b>ipv6 ospf demand-circuit</b> [ <b>instance-id</b> <i>instance-id</i> ]	Mandatory  By default, the OSPFv3 demand circuit is disabled.

### Configure OSPFv3 Interface Priority

Interface priority is mainly applied in the election of DR (Designed Router) and BDR (Backup Designed Router) in broadcast and NBMA networks. The value ranges from 0 to 255. The larger the value, the higher the priority. The default value is 1.

DR and BDR are elected by all the devices in the same network segment according to interface priority and Router ID through Hello packets. The rules are shown below:

- Firstly, the device with the highest interface priority is elected as the DR, and that with the second interface priority as the BDR. The device with the priority of 0 does not participate in the election.
- If the interface priorities are the same, the device with the highest router ID is elected as the DR, and that with the second router ID as the BDR.

After the DR fails, BRD will become a DR immediately, and a new BDR will be elected.

Table 22 Configuring OSPFv3 Interface Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPFv3 Interface Priority	<b>ipv6 ospf priority</b> <i>priority-value</i> [ <b>instance-id</b> <i>instance-id</i> ]	Optional  By default, the OSPFv3 interface priority is 1.

### Note

- Priority affects the election process only. When DR and BDR have been elected in the network, modifying interface priority will affect the next election result only. Therefore, DR is not necessarily the device with the highest interface priority, and DBR is not necessarily the device with the second high interface priority.

### Configure OSPFv3 Interface to Ignore MTU

When adjacent OSPFv3 devices exchange DD packets with each other, they will check whether the MTUs are the same by default. If different, a neighbor relation cannot be established. After OSPFv3 is configured to ignore interface MTU check, even if the MTUs are different, the neighbor relation can be established.

Table 23 Configuring OSPFv3 Interface to Ignore MTU

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPFv3 Interface to Ignore MTU	<b>ipv6 ospf mtu-ignore</b> [ <b>instance-id</b> <i>instance-id</i> ]	Mandatory By default, MTU check will be conducted. consistency check

### Configure LSA Transfer Delay of OSPFv3 Interface

LSA transfer delay means the period during which LSA floods to other devices. The device sending LSA will add the interface transfer delay time to the aging time of the LSA to be sent. By default, when the flooded LSA passes through a device, the aging time increases by 1. The transfer delay of LSA can be configured according to network conditions, from 1 to 840. It is generally used on low-speed links.

Table 24 Configuring OSPFv3 Interface LSA Transfer Delay

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure LSA Transfer Delay of OSPFv3 Interface	<b>ipv6 ospf transmit-delay</b> <i>delay-value</i> <b>instance-id</b> [ <i>instance-id</i> ]	Optional By default, the LSA transfer delay is 1 second.

### Configure OSPFv3 LSA retransmission

In order to ensure the reliability of data interaction, OSPFv3 uses the acknowledgement mechanism. When an LSA is flooded on the device interface, it will be added to the neighbor's retransmission list. If

confirmation is not received from the neighbor after the retransmission time expires, this LSA will be retransmitted until the confirmation is received.

Table 25 Configuring OSPFv3 LSA Retransmission

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure OSPFv3 LSA retransmission interval	<b>ipv6 ospf retransmit-interval</b> <i>interval-value</i> [ <b>instance-id</b> <i>instance-id</i> ]	Optional By default, the LSA retransmission interval is 5 seconds.

#### Configure OSPFv3 SPF Calculation Time

When the OSPFv3 network topology changes, recalculation of routes is required. When the network keeps changing, frequent routing calculation will occupy a large amount of system resources. The consumption of system resources by frequent network changes can be suppressed by adjusting the time parameters of SPF calculation.

Table 26 Configuring OSPFv3 SPF Calculation Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> [ <b>vrf</b> <i>vrf-name</i> ]	-
Configure OSPFv3 SPF Calculation Time	<b>timers throttle spf</b> <i>delay-time</i> <i>hold-time</i> <i>max-time</i>	Optional By default, the <i>delay-time</i> , <i>hold-time</i> and <i>max-time</i> are 5000 milliseconds, 10000 milliseconds, and 10000 milliseconds, respectively.

**Note**

- Delay-time means the initial calculation delay, hold-time the suppression time, and max-time the maximum waiting time for two SPF calculations. When there are infrequent network changes, the continuous route calculation interval is decreased to delay-time. In the case of frequent network changes, adjustment should be made accordingly by increasing the hold-time $\times 2^{n-2}$  (n is the times of continuously triggering route calculation) to prolong the waiting time by the increment of the hold-time configured, max-time at most.

## 56.2.8 Configure OSPFv3 FRR

### Configuration Condition

Before configuring OSPFv3 FRR, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

### Configure OSPFv3 FRR

In the OSPFv3 network, as a result of link or device failure, the packets passing the point of failure will be discarded or loops will be produced. The traffic interruption caused thereby will continue until the protocol reconverges after several seconds. In order to reduce the time of traffic interruption, OSPFv3 FRR can be configured. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic passing through the failed link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 27 Configuring OSPFv3 FRR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf process-id [vrf vrf-name ]</b>	-
Configure OSPFv3 process to enable the static FRR function	<b>fast-reroute route-map route-map-name</b>	Mandatory By default, the OSPFv3 static FRR function is disabled.
Configure OSPFv3 process to enable the dynamic FRR function	<b>fast-reroute loop-free-alternate [route-map route-map-name]</b>	Mandatory By default, the OSPFv3 dynamic FRR function is disabled.

Step	Command	Description
Configure OSPFv3 process to enable the pic function	<b>pic</b>	<p>Mandatory</p> <p>After the pic function is enabled, the auto FRR function is enabled.</p> <p>By default, the OSPFv3 function is disabled.</p>

---

### Note

- The OSPFv3 FRR function has two types, i.e. static FRR and dynamic FRR.
  - Static FRR needs to associate route-map where the next hop interface and address of back-up route are set.
  - Currently, dynamic FRR supports point-to-point network only, i.e. all the output interfaces of the device have a network type of point-to-point. After dynamic FRR is configured, the device automatically calculates and sets back-up next hop interface and address. Dynamic FRR can also associate route-map to set back-up next hop interface and address for the route which matches the route-map only.
  - The methods of enabling route redistribution are mutually exclusive.
- 

## 56.2.9 Configure OSPFv3 GR

GR (Graceful Restart) is used to keep the routing information in the forwarding layer of this device and neighbor device unchanged during the switch between host and standby devices to ensure the forwarding process is not affected; after the device is switched for re-running, the two devices synchronize routing information and update forwarding layer in the protocol layer so that the data can keep forwarding during the process of device switch.

There are two types of roles in the GR process:

- GR Restarter end: The device for graceful restart of protocol.
- GR Helper end: The device which helps with the graceful restart of protocol.

The distributed device can act as GR Restarter and GR Helper, while the centralized device only serves as GR Helper to help the Restarter complete GR.

### Configuration Condition

Before configuring OSPFv3 GR, ensure that:

- Enable the IPv6 forwarding function.

- Enable the OSPFv3 protocol.

### Configure OSPFv3 GR Restarter

Table 28 Configuring OSPFv3 GR Restarter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf <i>process-id</i> [ vrf <i>vrf-name</i> ]</b>	-
Configure OSPFv3 GR	<b>nsf ietf</b>	Mandatory  By default, the GR function is disabled.  After this function takes effect, the protocol needs to support the Opaque-LSA function, and it supports the Opaque-LSA function by default.
Configure OSPFv3 GR period	<b>nsf interval <i>grace-period</i></b>	Optional  By default, the GR period is 120 seconds.

#### Note

- The OSPFv3 GR function can only be used in the stacking environment or a dual-master environment.

### Configure OSPFv3 GR Helper

GR Helper can help the Restarter end complete GR. By default, the device enables this function. Users can disable this function via the command **nsf ietf helper disable**. The command **nsf ietf helper strict-lsa-checking** is used to enable the Helper end to strictly check LSA in the GR process. If any change of LSA is found, the GR Helper mode will be exited.

Table 29 Configuring OSPFv3 GR Helper

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf process-id [ vrf vrf-name ]</b>	-
Configure OSPFv3 GR Helper	<b>nsf ietf helper [ disable   strict-lsa-checking ]</b>	Optional By default, the Helper function is enabled, but it doesn't check LSA.

## 56.2.10 Configure Coordination of OSPFv3 with BFD

### Configuration Condition

Before configuring the coordination of OSPFv3 with BFD, ensure that:

- Enable the IPv6 forwarding function.
- Enable the OSPFv3 protocol.

### Configure Coordination of OSPFv3 with BFD

BFD (Bidirectional Forwarding Detection) provides a method to quickly detect the status of lines between two devices. When BFD detection is enabled between two adjacent OSPFv3 devices, if there is a line failure between the devices, BFD can quickly detect the failure and notify the OSPFv3 protocol to trigger OSPFv3 for route calculation and switch to the backup route. In this way, it can reach the purpose of fast route switch.

Table 30 Configuring Coordination of OSPFv3 with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface interface-name</b>	-
Configure the specified OSPFv3 interface to enable or disable BFD	<b>ipv6 ospf bfd [disable] [instance-id instance-id]</b>	Mandatory By default, the BFD function is not enabled.

Step	Command	Description
Enter the global configuration mode.	<b>exit</b>	-
Enter OSPFv3 configuration mode	<b>ipv6 router ospf</b> <i>process-id</i> <b>[vrf vrf-name ]</b>	-
Configure all interfaces of OSPFv3 process to enable BFD	<b>bfd all-interfaces</b>	Optional

### Note

- When BFD is configured in OSPFv3 configuration mode and interface configuration mode at the same time, the latter has a higher priority.

## 56.2.11 OSPFv3 monitoring and maintaining

Table 31 OSPFv3 Monitoring and Maintaining

Command	Description
<b>clear ipv6 ospf err-statistic</b>	Clear error statistics of OSPFv3
<b>clear ipv6 ospf</b> [ <i>process-id</i> ] <b>process</b>	Reset OSPFv3 process
<b>clear ipv6 ospf</b> [ <i>process-id</i> ] <b>redistribution</b>	Re-advertise external route
<b>clear ipv6 ospf</b> [ <i>process-id</i> ] <b>route</b>	Recalculate OSPFv3 route
<b>clear ipv6 ospf statistics</b> [ <i>interface-name</i> ]	Clear interface statistics of OSPFv3
<b>show ipv6 ospf</b> [ <i>process-id</i> ]	Show basic information of OSPFv3
<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>border-routers</b>	Show information of the route reaching edge device in OSPFv3
<b>show ipv6 ospf core-info</b>	Show core information of OSPFv3 process
<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <b>database-summary</b>   <b>external</b> / inter-prefix   <b>inter-router</b>   <b>intra-prefix</b>   <b>link</b>	Show database information of OSPFv3

Command	Description
<b>network</b>   <b>nssa-external</b>   <b>grace</b>   <b>router</b>   <b>adv-router</b> <i>router-id</i>   <b>age</b> <i>lsa_age</i>   <b>max-age</b>   <b>self-originate</b> ]	
<b>show ipv6 ospf error-statistic</b>	Show error statistics of OSPFv3
<b>show ipv6 ospf event-list</b>	Show OSPFv3 packet receive queue information
<b>show ipv6 ospf interface</b> [ <i>interface-name</i> [ <b>detail</b> ] ]	Show information of OSPFv3 interface
<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>neighbor</b> [ <i>neighbor-id</i>   <b>all</b>   <b>detail</b> [ <b>all</b> ]   <b>interface</b> <i>interface-name</i> [ <b>detail</b> ]   <b>statistics</b> ]	Show information of OSPFv3 neighbor
<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>route</b> [ <i>ipv6-prefix/prefix-length</i>   <b>connected</b>   <b>external</b> / <b>inter-area</b>   <b>intra-area</b>   <b>statistic</b> ]	Show information of OSPFv3 route
<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>sham-link</b>	Show the OSPFv3 pseudo-class link interface information configured, including interface status, cost value, and neighbor status
<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>topology area</b> [ <i>area-id</i> ]	Show information of OSPFv3 topology area
<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>virtual-links</b>	Show information of OSPFv3 virtual link
<b>show ipv6 ospf</b> [ <i>vrf vrf-name</i> ]	Show all OSPFv3 process information and parameters in the specified vrf
<b>show running-config ipv6 router ospf</b>	Show current running configuration of OSPFv3

## 56.3 Typical configuration example of OSPFv3

### 56.3.1 Configure Basic Functions of OSPFv3

#### Network Requirements

- All devices are configured with OSPFv3 protocol, and there are three areas, i.e. area 0, 1 and 2. Upon completion of the configuration, all the devices can learn routes from

each other.

- On the back-to-back Ethernet interface, in order to speed up the the process of establishing OSPF neighbors, the network type of OSPFv3 interface can be changed to point-to-point. Modify the network type of the interface in area 2 as point-to-point. Upon completion of the configuration, all the devices can learn routes from each other.

### Network Topology

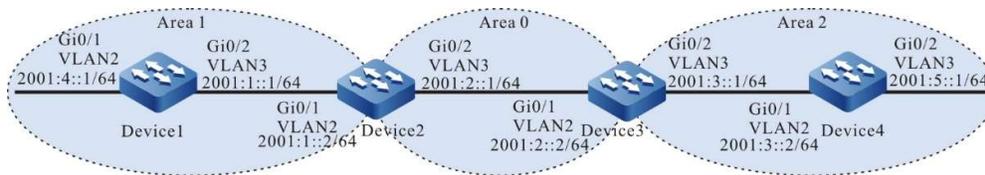

Figure 56 Network Topology for Configuring Basic Functions of OSPFv3

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IPv6 addresses for the ports. (Omitted)
- Step 3: Configure OSPFv3 process and make different areas cover corresponding interfaces.

#On Device1, configure OSPFv3 process and make area 1 cover the interface.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 1
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 1
Device1(config-if-vlan3)#exit
```

#On Device2, configure OSPFv3 process and make area 0 and 1 cover corresponding interfaces.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf 100 area 1
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router ospf 100 area 0
Device2(config-if-vlan3)#exit
```

#On Device3, configure OSPFv3 process and make area 0 and 2 cover corresponding interfaces.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
```

```
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 2
Device3(config-if-vlan3)#exit
```

#On Device4, configure OSPFv3 process and make area 2 cover the interface.

```
Device4#configure terminal
Device4(config)#ipv6 router ospf 100
Device4(config-ospf6)#router-id 4.4.4.4
Device4(config-ospf6)#exit
Device4(config)#interface vlan2
Device4(config-if-vlan2)#ipv6 router ospf 100 area 2
Device4(config-if-vlan2)#exit
Device4(config)#interface vlan3
Device4(config-if-vlan3)#ipv6 router ospf 100 area 2
Device4(config-if-vlan3)#exit
```

---

## Note

- In OSPFv3, Router ID must be manually configured, and the Router IDs of any routers in the AS must be different.
  - When the interface is enabled to OSPFv3, it's necessary to specify which interface instance is enabled to the OSPFv3 process, and the instance numbers on both sides must be the same, in instance 0 by default.
- 

#View OSPFv3 neighbors' information and routing table on Device1.

```

0.0.0.3 2.2.2.2 41 0x80000001 0x8807 1 Network-LSA
```

For Device2, both 2001:3::/64 and 2001:5::/64 are inter-area routes. Relevant routing LSA information can be seen from Inter-Area-Prefix-LSA (Area 0.0.0.0). For intra-area route, show ipv6 ospf database intra-prefix is required to see relevant routing LSA information.

Step 4: Configure the network type of OSPFv3 interface as point-to-point.

#On Device3, change the OSPFv3 network type of vlan3 to point-to-point.

```
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 ospf network point-to-point
Device3(config-if-vlan3)#exit
```

#On Device4, change the OSPFv3 network type of vlan2 to point-to-point.

```
Device4(config)#interface vlan2
Device4(config-if-vlan2)#ipv6 ospf network point-to-point
Device4(config-if-vlan2)#exit
```

Step 5: Check the result.

#View the OSPFv3 neighbors and routing table on Device3.

```
Device3#show ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID Pri State Dead Time Interface Instance ID
2.2.2.2 1 Full/Backup 00:00:39 vlan2 0
4.4.4.4 1 Full/- 00:00:39 vlan3 0
```

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management
```

```

L 2001:5::1/128 [0/0]
via ::, 00:03:13, lo0
```

According to the result, after the network type of OSPFv3 interface is changed to point-to-point, neighbors can be normally established, and routes can be learned normally.

## 56.3.2 Configure OSPFv3 to use IPSec encryption & authentication

### Network Requirements

- All routers run OSPFv3, and the entire AS is divided into 2 areas.
- Device1, Device2, and Device3 use IPSec tunnels to encrypt and authenticate OSPFv3 protocol packets. Device1 and Device2 adopt ESP transmission and encapsulation, with the encryption algorithm being 3des and authentication algorithm sha1. Device2 and Device3 also use ESP transmission and encapsulation, but the encryption algorithm is aes128 and ESP authentication algorithm is sm3.

- Upon completion of the configuration, the device can normally establish neighbors and learn routes from each other.

### Network Topology

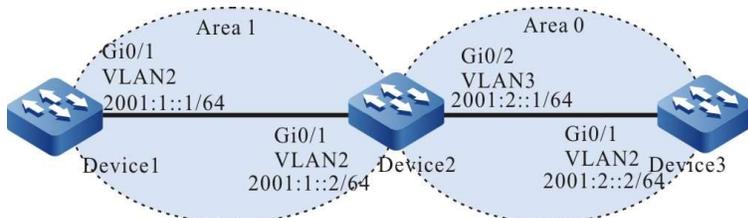

Figure 56 Network Topology for Configuring OSPFv3 to Use IPsec Encryption & Authentication

### Configuration Steps

Step 1: Configure IPv6 addresses for the ports. (Omitted)

Step 2: Configure OSPFv3 process and enable OSPFv3 function on corresponding interface.

#On Device1, Device2 and Device3, configure OSPFv3 process and enable OSPFv3 on the interface.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 1
Device1(config-if-vlan2)#exit

Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf 100 area 1
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router ospf 100 area 0
Device2(config-if-vlan3)#exit

Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
Device3(config-if-vlan2)#exit
```

Step 3: Configure IPsec proposal and manual tunnel.

#On Device1, create IPsec proposal a, use ESP transmission & encapsulation mode (encryption algorithm 3des, authentication algorithm sha1), create IPsec manual tunnel a, and configure SPI and key.

```
Device1(config)#crypto ipsec proposal a
Device1(config-ipsec-prop)#mode transport
Device1(config-ipsec-prop)#esp 3des sha1
```

```
Device2(config-ospf6)#area 0 ipsec-tunnel b
Device1(config-ospf6)#exit
```

#In the OSPFv3 process of Device3, bind IPsec tunnel b to area 0.

```
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#area 0 ipsec-tunnel b
Device3(config-ospf6)#exit
```

Step 5: Check the result.

#View OSPFv3 process information on Device1.

```
Device1#show ipv6 ospf 100
Routing Process "OSPFv3 (100)" with ID 1.1.1.1
Process bound to VRF default
IETF graceful-restarter support disabled
IETF gr helper support enabled
Initial SPF schedule delay 5000 msecs

```

On Device3, route learning is normal.

---

### Note

- When configuring OSPFv3 to bind an IPSec tunnel, you can configure area binding or interface binding only, or configure both area and interface binding.
  - When IPSec tunnel is configured for area binding and interface binding at the same time, the latter takes effect first.
- 

## 56.3.3 Configure coordination of OSPFv3 with BFD

### Network Requirements

- All devices are configured with OSPFv3 protocol.
- Enable BFD detection function for the lines between Device1 and Device3. When the lines fail, BFD will quickly identify these failures and notify OSPFv3 which will switch route to Device2 for communication.

## Network Topology

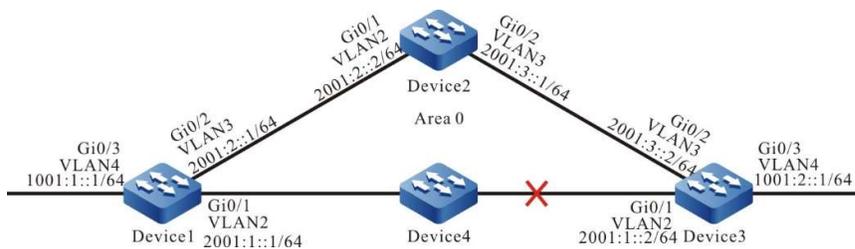

Figure 56 Network Topology for Configuring Coordination of OSPFv3 with BFD

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IPv6 addresses for the ports. (Omitted)

Step 3: Configure OSPFv3 process.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 0
Device1(config-if-vlan3)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ipv6 router ospf 100 area 0
Device1(config-if-vlan4)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf 100 area 0
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router ospf 100 area 0
Device2(config-if-vlan3)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)#exit
```

```
Device3(config)#interface vlan4
Device3(config-if-vlan4)#ipv6 router ospf 100 area 0
Device3(config-if-vlan4)#exit
```

Step 4: Configure coordination of OSPFv3 with BFD.

#Configure Device1.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 ospf bfd
Device1(config-if-vlan2)#exit
```

#Configure Device3.

```
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 ospf bfd
Device3(config-if-vlan2)#exit
```

Step 5: Check the result.

#View OSPFv3 neighbors' information and routing table on Device1.

```
Device1#show ipv6 ospf neighbor 3.3.3.3
OSPFv3 Process (100)

Neighbor 3.3.3.3,interface address fe80::2212:1ff:fe01:104
  In the area 0.0.0.0 via interface vlan4, BFD enabled
  DR is 3.3.3.3 BDR is 1.1.1.1
  Neighbor priority is 1, State is Full, 6 state changes
  Options is 0x13 (-R|-|E|V6)
  Dead timer due in 00:00:37
  Neighbor is up for 00:01:31
  Database Summary List 0
  Link State Request List 0
  Link State Retransmission List 0
  Thread Inactivity Timer on
  Thread Database Description Retransmission off, 0 times
  Thread Link State Request Retransmission off, 0 times
  Thread Link State Update Retransmission off, 0 times

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 01:15:27, lo0
C 1001:1::/64 [0/0]
  via ::, 01:15:27, vlan4
L 1001:1::1/128 [0/0]
  via ::, 01:15:27, lo0
O 1001:2::/64 [110/2]
  via fe80::2212:1ff:fe01:104, 00:02:40, vlan2
C 2001:1::/64 [0/0]
  via ::, 01:15:27, vlan2
L 2001:1::1/128 [0/0]
  via ::, 01:15:27, lo0
C 2001:2::/64 [0/0]
  via ::, 01:15:27, vlan3
L 2001:2::1/128 [0/0]
  via ::, 01:15:27, lo0
O 2001:3::/64 [110/2]
  via fe80::201:7aff:fe5e:6d45, 00:02:40, vlan3
  [110/2]
  via fe80::2212:1ff:fe01:104, 00:02:40, vlan2
```

According to the information of OSPFv3 neighbors, BFD has been enabled, and the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View the BFD session information of Device1.

```
Device1#show bfd session ipv6 detail
Total ipv6 session number: 1
OurAddr          NeighAddr          State   Holddown  Interface
fe80::201:7aff:fe61:7a25    fe80::2212:1ff:fe01:104    UP      5000     vlan2
Type:ipv6 direct
Local State:UP Remote State:UP Up for: 0h:0m:4s Number of times UP:1
Local Discriminator:5 Remote Discriminator:95
Send Interval:1000ms Detection time:5000ms(1000ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
MinTxInt:1000 MinRxInt:1000 Multiplier:5
Remote MinTxInt:1000 Remote MinRxInt:1000 Remote Multiplier:5
Registered modules:OSPFv3
```

According to the result, OSPFv3 has been successfully coordinated with BFD, and the session is established normally.

#When the lines between Device1 and Device3 fail, BFD can quickly identify these failures and notify OSPFv3 which will switch route to Device2 for communication and view the routing table on Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

  via ::, 01:16:10, lo0
O 2001:3::/64 [110/2]
  via fe80::201:7aff:fe5e:6d45, 00:03:22, vlan3
```

Device3 has similar behaviors to Device1.

### 56.3.4 Configure OSPFv3 static FRR

#### Network Requirements

- All devices are configured with OSPFv3 protocol.
- Enable static FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

#### Network Topology

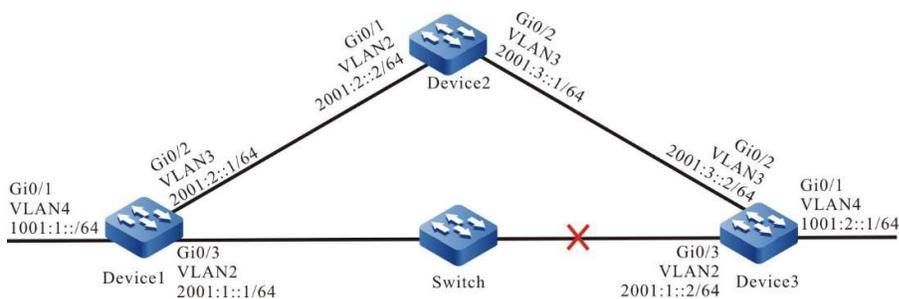

Figure 1 Network Topology for Configuring OSPFv3 Static FRR

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface (Omitted).

Step 2: Configure OSPFv3 process.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 0
Device1(config-if-vlan3)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf 100 area 0
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router ospf 100 area 0
Device2(config-if-vlan3)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan4
Device3(config-if-vlan4)#ipv6 router ospf 100 area 0
Device3(config-if-vlan4)#exit
```

Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 1001:2::1/64 only, and filter other network segments. The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 2001:2::2.

```
Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 1001:2::1/64 any
Device1(config-v6-list)#exit
Device1(config)#route-map ipv6frr_ospf
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#set ipv6 fast-reroute backup-interface vlan3 backup-nextthop 2001:2::2
Device1(config-route-map)#exit
```

Step 4: Configure static FRR.

```
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#fast-reroute route-map ipv6frr_ospf
Device1(config-ospf6)#exit
```

Step 5: Check the results.

#View OSPFv3 routing table on Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 00:31:05, lo0
C 1001:1::/64 [0/0]
  via ::, 00:26:12, vlan4
L 1001:1::1/128 [0/0]
  via ::, 00:26:12, vlan4
O 1001:2::/64 [110/2]
  via fe80::201:7aff:fe92:e6b6, 00:22:11, vlan2
C 2001:1::/64 [0/0]
  via ::, 00:26:51, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:26:51, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:25:30, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:25:30, vlan3
O 2001:3::/64 [110/2]
  via fe80::201:7aff:fe92:e6b6, 00:20:53, vlan2
  via fe80::ced8:1fff:fe10:7aae, 00:21:06, vlan3
```

According to the routing table, the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View IPv6 FRR routing table on Device1.

```
Device1#show ipv6 frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
O 1001:2::/64 [110/4294967295]
  via 2001:2::2, 00:03:16, vlan3
```

According to the result, the next hop and output interface of the frr route 1001:2::/64 are 2001:2::2 and vlan3 respectively.

#View the BFD session information of Device1.

```
Device1#show bfd session ipv6 2001:1::1 detail
Total ipv6 session number: 1
OurAddr           NeighAddr      LD/RD      State   Holddown  Interface
2001:1::1         2001:1::1     1017/1017  UP      500       vlan2
Type:ipv6 direct  Mode:echo
Local Discriminator:65 Remote Discriminator:65
Local State:UP Remote State:UP Up for: 0h:9m:11s Number of times UP:1
Send Interval:100ms Detection time:500ms(100ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
Registered modules:FIB_MGR
```

According to the result, FIB\_MGR has been successfully coordinated with BFD. The session is established normally in the mode of echo.

#When the lines between Device1 and Device3 fail, it can quickly identify the failures and switch to Device2 for communication. The routing table of Device1 shows that the output interface of the destination network 1001:2::/64 has switched to the backup interface vlan3.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 03:03:45, lo0
C 1001:1::/64 [0/0]
  via ::, 02:58:52, vlan4
L 1001:1::1/128 [0/0]
  via ::, 02:58:52, vlan4
O 1001:2::/64 [110/3]
  via fe80::ced8:1fff:fe10:7aae, 00:00:11, vlan3
C 2001:1::/64 [0/0]
  via ::, 02:59:31, vlan2
L 2001:1::1/128 [0/0]
  via ::, 02:59:31, vlan2
C 2001:2::/64 [0/0]
  via ::, 02:58:10, vlan3
L 2001:2::1/128 [0/0]
  via ::, 02:58:10, vlan3
O 2001:3::/64 [110/2]
  via fe80::ced8:1fff:fe10:7aae, 02:53:45, vlan3
```

### 56.3.5 Configure OSPFv3 dynamic FRR

#### Network Requirements

- All devices are configured with OSPFv3 protocol.
- Enable dynamic FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

#### Network Topology

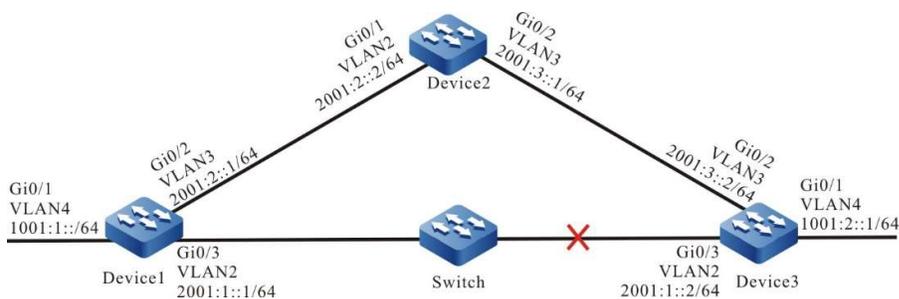

Figure 2 Network Topology for Configuring OSPFv3 Dynamic FRR

### Configuration Steps

- Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface (Omitted).
- Step 2: Configure OSPFv3 process and the network type of interface as point-to-point.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)# ipv6 ospf network point-to-point
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router ospf 100 area 0
Device1(config-if-vlan3)# ipv6 ospf network point-to-point
Device1(config-if-vlan3)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router ospf 100 area 0
Device2(config-if-vlan2)# ipv6 ospf network point-to-point
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router ospf 100 area 0
Device2(config-if-vlan3)# ipv6 ospf network point-to-point
Device2(config-if-vlan3)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
Device3(config-if-vlan2)# ipv6 ospf network point-to-point
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)# ipv6 ospf network point-to-point
Device3(config-if-vlan3)#exit
```

```

Device3(config)#interface vlan4
Device3(config-if-vlan4)#ipv6 router ospf 100 area 0
Device3(config-if-vlan4)# ipv6 ospf network point-to-point
Device3(config-if-vlan4)#exit

```

Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 1001:2::1/64 only, and filter other network segments.

```

Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 1001:2::1/64 any
Device1(config-v6-list)#exit
Device1(config)#route-map ipv6frr_ospf
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#exit

```

Step 4: Configure dynamic FRR.

```

Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)# fast-reroute loop-free-alternate route-map ipv6frr_ospf
Device1(config-ospf6)#exit

```

Step 5: Check the results.

#View OSPFv3 routing table on Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 03:21:35, lo0
C 1001:1::/64 [0/0]
  via ::, 03:16:42, vlan4
L 1001:1::1/128 [0/0]
  via ::, 03:16:42, vlan4
O 1001:2::/64 [110/2]
  via fe80::201:7aff:fe92:e6b6, 00:01:35, vlan2
C 2001:1::/64 [0/0]
  via ::, 03:17:21, vlan2
L 2001:1::1/128 [0/0]
  via ::, 03:17:21, vlan2
C 2001:2::/64 [0/0]
  via ::, 03:16:00, vlan3
L 2001:2::1/128 [0/0]
  via ::, 03:16:00, vlan3
O 2001:3::/64 [110/2]
  via fe80::ced8:1fff:fe10:7aae, 00:07:50, vlan3

```

According to the routing table, the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View IPv6 FRR routing table on Device1.

```

Device1#show ipv6 frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
O 1001:2::/64 [110/4294967295]
  via fe80::ced8:1fff:fe10:7aae, 00:01:58, vlan3

```

According to the result, the next hop of FRR route 1001:2::/64 is the linklocal address fe80::ced8:1fff:fe10:7aae, and the output interface is vlan3.

#View the BFD session information of Device1.

```
Device1#show bfd session ipv6 2001:1::1 detail
Total ipv6 session number: 1
OurAddr      NeighAddr  LD/RD      State  Holddown  Interface
2001:1::1    2001:1::1  1024/1024  UP     500       vlan2
Type:ipv6 direct Mode:echo
Local Discriminator:66 Remote Discriminator:66
Local State:UP Remote State:UP Up for: 0h:4m:15s Number of times UP:1
Send Interval:100ms Detection time:500ms(100ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
Registered modules:FIB_MGR
```

According to the result, FIB\_MGR has been successfully coordinated with BFD. The session is established normally in the mode of echo.

#When the lines between Device1 and Device3 fail, it can quickly identify the failures and switch to Device2 for communication. The routing table of Device1 shows that the output interface of the destination network 1001:2::/64 has switched to the backup interface vlan3.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 03:03:45, lo0
C 1001:1::/64 [0/0]

  via fe80::ced8:1fff:fe10:7aae, 02:53:45, vlan3
```

# 57 IS-IS

---

## 57.1 Overview

IS-IS (Intermediate System to Intermediate System) is an internal gateway protocol (IGP) based on SPF algorithm. The basic design idea and algorithm of IS-IS protocol is almost the same as OSPF. As a routing protocol based on the link layer, IS-IS protocol is not related to or restricted by the network layer (IPv4, IPv6, OSI), so it has good scalability.

IS-IS protocol can support routing of multiple protocol stacks at the same time, including IPv4, IPv6, and OSI. At first, IS-IS protocol was applied in the OSI protocol stack (ISO10589), and then expanded to be used in the routing of IPv4 protocol stack (RFC1195) and IPv6 protocol stack (RFC5308). After expanding, it can support the CSPF calculation of MPLS-TE (RFC3784).

IS-IS protocol is featured by good compatibility (even the extended functions implemented by different devices are inconsistent), large network capacity, simultaneous support of multiple protocol stacks, smooth upgrade, and simpler than OSPF so that it has few problems. Therefore, IS-IS is applicable to large core backbone networks. This section describes how to configure IS-IS dynamic routing protocol on the device for network interconnection.

## 57.2 IS-IS function configuration

Table 57 IS-IS Function Configuration List

Configuration Task	
Configure Basic Functions of IS-IS	Enable IS-IS Protocol
	Configure IS-IS VRF Attributes
Configure Attributes of IS-IS Layer	Configure Attributes of IS-IS Layer
Configure IS-IS Route Generation	Configure IS-IS Default Route
	Configure IS-IS Route Redistribution
Configure IS-IS Route Control	Configure Metric Type of IS-IS
	Configure Metric Value of IS-IS Interface
	Configure IS-IS Administrative Distance
	Configure IS-IS Route Summarization
	Configure the Maximum Number of IS-IS Load Balancing Entries
	Configure IS-IS Inter-area Route Leak
	Configure IS-IS ATT Bit
Configure IS-IS Network Optimization	Configure IS-IS Interface Priority
	Configure Passive IS-IS Interface

Configuration Task	
	Configure Parameters of IS-IS Hello Packets
	Configure Parameters of IS-IS LSP Packets
	Configure Parameters of IS-IS SNP Packets
	Configure IS-IS SPF Calculation Interval
	Configure the Maximum Number of IS-IS Areas
	Configure IS-IS Host Name Mapping
	Add IS-IS Interface to Mesh Group
	Configure IS-IS Network Authentication
Configure IS-IS Network Authentication	Configure IS-IS Neighbor Authentication
	Configure IS-IS Route Authentication
Configure Coordination of IS-IS with BFD	Configure Coordination of IS-IS with BFD
Configure IS-IS GR	Configure IS-IS GR

## 57.2.1 Configure Basic Functions of IS-IS

### Configuration Condition

Before using the IS-IS protocol, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.

### Enable IS-IS Protocol

Multiple IS-IS processes can run in the system, and each of them is distinguished by process name.

Table 57 Enabling IS-IS Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Create IS-IS process and enter IS-IS configuration mode	<b>router</b> isis [ <i>area-tag</i> ]	Mandatory By default, there is no IS-IS process running in the system, and <i>area-tag</i> is a process name.
Configure network entity title for IS-IS	<b>net</b> <i>entry-title</i>	Mandatory By default, IS-IS doesn't have network entity title.
Return to the global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable IS-IS protocol for the interface	<b>ip router</b> isis [ <i>area-tag</i> ]	Mandatory By default, IS-IS protocol is disabled on the interface.

### Note

- IS-IS cannot be run if there is no network entity title.

### Configure IS-IS VRF Attributes

Table 1 Configuring IS-IS VRF Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router</b> isis [ <i>area-tag</i> ]	-
Configure IS-IS VRF attributes	<b>vrf</b> <i>vrf-name</i>	Optional By default, the IS-IS process is within the global VRF.

## 57.2.2 Configure Attributes of IS-IS Layer

### Configuration Condition

Before configuring attributes of IS-IS layer, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

### Configure Attributes of IS-IS Layer

Attributes of IS-IS layer have two types, i.e. global layer attributes and interface layer attributes. Global layer attributes are the categories of IS-IS intermediate system. They are divided into the following three categories:

- Level-1 intermediate system: It has Level-1 link status database only, and can advertise and learn routes in Level-1 area only;
- Level-2 intermediate system: It has Level-2 link status database only, and can advertise and learn routes in Level-2 area only;
- Level-1-2 intermediate system: It has both Level-1 and Level-2 link status databases, and can advertise and learn both Level-1 and Level-2 routes. It is an interconnecting device in Level-1 and Level-2 area.

The IS-IS interface layer attributes also have three types:

- Level-1 interface: It can send and receive Level-1 packets of IS-IS protocol only, and can establish Level-1 neighbors only;
- Level-2 interface: It can send and receive Level-2 packets of IS-IS protocol only, and can establish Level-2 neighbors only;
- Level-1-2 interface: It can send and receive both Level-1 and Level-2 packets of IS-IS protocol, and can establish both Level-1 and Level-2 neighbors.

IS-IS interface layer attributes relay on IS-IS global layer attributes. Level-1 intermediate system can own Level-1 interface only, Level-2 intermediate system can own Level-2 interface only, and Level-1-2 intermediate system can own all interfaces at the same time.

Table 2 Configuring IS-IS Global Layer Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> <i>[area-tag]</i>	-

Step	Command	Description
Configure IS-IS global layer attributes	<b>is-type { level-1   level-1-2   level-2-only }</b>	Optional By default, the IS-IS global layer attribute is Level-1-2.

Table 3 Configuring IS-IS Interface Layer Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface <i>interface-name</i></b>	-
Configure interface layer attributes	<b>isis circuit-type [ level-1   level-1-2   level-2 ]</b>	Optional By default, when the interface layer attributes are not specified, they are consistent with global layer attributes.

### 57.2.3 Configure IS-IS Route Generation

#### Configuration Condition

Before configuring IS-IS route generation, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

#### Configure IS-IS Default Route

The Level-2 area of IS-IS protocol cannot generate a default route during operation. You may add the default route (with the destination address 0.0.0.0/0) information in the Level-2 LSP and send it. After this information is received by the areas of the same level of other intermediate systems, they will add a default route to the routing table.

Table 4 Configuring IS-IS Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-
Enter the IS-IS IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure IS-IS to distribute default route	<b>default-information originate</b>	Mandatory By default, the default route is not advertised.

### Configure IS-IS Route Redistribution

The routing information of other routing protocols can be imported into the IS-IS protocol through route redistribution so that the AS where IS-IS protocol is running is interconnected with the AS or routing domain where other routing protocol is running. When importing external route, you may specify the route importing policy and the layer attributes after the route is imported.

Table 57 Configuring IS-IS Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-
Enter the IS-IS IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure IS-IS Route Redistribution	<b>redistribute protocol [ protocol-id ] [ level-1 / level-1-2 / level-2 / metric metric-value / metric-type { external   internal } / route-map route-map-name / match route-sub-type ]</b>	Mandatory By default, the information of other routing protocol is not redistributed.

## 57.2.4 Configure IS-IS Route Control

### Configuration Condition

Before configuring IS-IS routing features, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

### Configure Metric Type of IS-IS

The initial IS-IS only has a narrow metric. When narrow metric is used, the maximum metric value of the interface is 63. With the gradual expansion of the network size, narrow metric is far from meeting the demand. Therefore, the metric type is expanded later to include wide metric which can reach 16777214. Devices using different metric types cannot advertise and learn routing information from each other. In order to achieve the transition between the two metric types, a configuration method for transiting metric type is provided.

Wide metric is recommended.

Table 5 Configuring IS-IS Metric Type

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [area-tag]</b>	-
Configure the metric type of interface	<b>metric-style {narrow   narrow transition   wide   wide transition} [level-1   level-1-2   level-2]</b>	Optional By default, narrow metric is used.

### Configure Metric Value of IS-IS Interface

After IS-IS protocol is enabled on the interface, the metric of IS-IS route is the global metric value, which can be separately specified for each interface through command.

Table 6 Configuring Metric Value of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS global metric value	<b>metric</b> <i>metric-value</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the global metric value is 10.
Return to the global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the metric value of interface	isis <b>ipv4 metric</b> { <i>metric-value</i>   <b>maximum</b> } [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the global metric value is used.

### Configure IS-IS Administrative Distance

The system selects routes according to the administrative distance. The smaller the administrative distance, the higher the route priority.

Table 7 Configuring IS-IS Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure the administrative distance of IS-IS route	<b>distance</b> <i>distance-value</i>	Optional By default, the administrative distance is 115.

### Configure IS-IS Route Summarization

Route summarization can summarize multiple pieces of routing information into one piece of routing information. After IS-IS is configured with route summarization, it can effectively reduce the number of subnet information reachable through advertisement, and reduce the size of the link status database and routing table, so as to effectively save memory and CPU resources. This configuration is generally used on Level-1-2 edge devices to reduce the routing information advertised between layers.

Table 8 Configuring IS-IS Route Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [area-tag]</b>	-
Enter the IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure IS-IS Route Summarization	<b>summary-prefix prefix-value [ metric metric-value / route-type {internal   external} / metric-type {internal   external} / tag tag-value / not-advertise / level-1 / level-2 / level-1-2 ]</b>	Mandatory By default, route summarization is disabled.

### Configure the Maximum Number of IS-IS Load Balancing Entries

There may be multiple paths with the same cost that lead to the same destination address. These equal-cost paths can improve link utilization rate. Users can control the maximum number of IS-IS equal-cost routes.

Table 9 Configuring Maximum Number of IS-IS Load Balancing Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [area-tag]</b>	-
Enter the IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-

Step	Command	Description
Configure the Maximum Number of IS-IS Load Balancing Entries	<b>maximum-paths</b> <i>max-number</i>	Optional By default, the maximum number of load balancing entries is 4.

### Configure IS-IS Inter-area Route Leak

By default, IS-IS only leaks Level-1 routes to Level-2, and Level-1 areas cannot know the routes in Level-2 area. You can import Level-2 routes to Level-1 by configuring inter-layer route leak. When configuring inter-layer route leak, you can specify a routing policy to only leak the route which match the conditions.

Table 10 Configuring IS-IS Inter-layer Route Leak

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure IS-IS Inter-area Route Leak	<b>propagate { level-1 into level-2   level-2 into level-1 } [ distribute-list <i>access-list-name</i>   route-map <i>route-map-name</i> ]</b>	Mandatory By default, Level-1 leaks routes to Level-2.

### Configure IS-IS ATT Bit

In Level-1-2 devices, ATT bit is used to advertise other nodes whether this node has connections with other areas. If yes, ATT bit will be set as 1 automatically, and other nodes will produce a default route towards this node. This will increase the business burden of this node. To change this situation, you can set ATT bit as 0.

Table 11 Configuring IS-IS ATT Bit

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the IS-IS configuration mode	<b>router</b> isis [ <i>area-tag</i> ]	-
Enter the IS-IS IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure IS-IS ATT Bit	<b>set-attached-bit { on   off }</b>	Mandatory By default, ATT bit is set based on whether a node has connected with other areas.

## 57.2.5 Configure IS-IS Network Optimization

### Configuration Condition

Before configuring IS-IS adjustment and optimization, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

### Configure IS-IS Interface Priority

On the broadcast link, IS-IS needs to elect a node as DIS. DIS nodes send CSNP packets on a regular basis to synchronize the link status database across the network. The Level-1 and Level-2 DIS nodes are separately elected. Those with the highest interface priority are elected as DIS nodes. When the priority is the same, those with a large MAC address as DIS nodes.

Table 12 Configuring IS-IS Interface Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure IS-IS Interface Priority	isis <b>priority</b> <i>priority-value</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the interface priority is 64.

## Configure Passive IS-IS Interface

Passive interface means the interface where no IS-IS protocol packets will be sent or received, though its direct network routing information is distributed; configuring passive IS-IS interface can save both bandwidth and the processing time of CPU; on this basis, IS-IS can also be specified to distribute direct network routing information of passive interface rather than of non-passive interface.

Table 13 Configuring Passive IS-IS Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure Passive IS-IS Interface	<b>passive-interface</b> <i>interface-name</i>	Mandatory By default, there is no passive interface in IS-IS.
Configure IS-IS to distribute the routing information of passive interface only	<b>advertise-passive-only</b>	Optional By default, all the information of direct network routes that have enabled IS-IS protocol interface is distributed.

## Configure Parameters of IS-IS Hello Packets

1. Configure Hello packet sending interval

After the IS-IS protocol interface is enabled, Hello packets will be periodically sent to maintain neighbor relations. The smaller the Hello packet sending interval, the larger the network convergence and the bandwidth occupied.

Table 14 Configuring Hello Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure Hello packet sending interval for the interface	isis <b>hello-interval</b> { <i>interval</i>   <b>minimal</b> } [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the Hello packet sending interval is 10 seconds.

## 2. Configure the number of invalid Hello packets

S-IS calculates the time of maintaining neighbor relations according to the number of invalid Hello packets, and advertise such time to neighbor devices. If the neighbor device fails to receive the Hello packets from this device during this time, it is believed the neighbor relation has become invalid, and routing calculation will be done anew.

Table 15 Configuring Number of Invalid Hello Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the number of invalid Hello packets on the interface	isis <b>hello-multiplier</b> <i>multiplier</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the number of invalid Hello packets is 3.

## 3. Cancel Hello packet filling

If the MTU values of the interfaces at both ends of the link are inconsistent, large packets will not be able to pass through. To avoid this situation, IS-IS fills Hello packets to the MTU value of interface so that neighbor relation cannot be established. However, this method causes a waste of bandwidth. In actual applications, you can cancel Hello packet filling to send small Hello packets.

Table 16 Configuring Function of Cancelling Hello Packet Filling

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Cancel Hello packet filling	<b>no isis hello padding</b>	Mandatory By default, the Hello packet filling function is enabled.

### Configure Parameters of IS-IS LSP Packets

1. Configure the maximum Time-To-Live of LSP packets

Each LSP packet has a maximum Time-To-Live. After decreasing to zero, the Time-To-Live of LSP packets will be deleted from the link status database. The maximum Time-To-Live of LSP packets shall be greater than their refresh interval.

Table 17 Configuring Parameters of IS-IS LSP Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [area-tag]</b>	-
Configure the maximum Time-To-Live of LSP packets	<b>max-lsp-lifetime</b> <i>life-time</i>	Optional By default, the maximum Time-To-Live of LSP packets is 1200 seconds.

2. Configure LSP packet refresh interval

The IS-IS protocol advertises and learns routes by interacting with their respective LSP packets. The node stores the LSP packets received in its own link state database. Each LSP packet has a maximum Time-To-Live, so all nodes need to update their LSP packets on a regular basis to prevent the maximum Time-To-Live of LSP packets from reducing to zero, and to keep the LSP packets in the entire area synchronized. Reducing the periodic LSP packet sending interval can accelerate network convergence, though it will occupy a larger bandwidth.

Table 18 Configuring LSP Packet Refresh Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the IS-IS configuration mode	<b>router</b> isis [ <i>area-tag</i> ]	-
Configure LSP packet refresh interval	<b>lsp-refresh-interval</b> <i>refresh-interval</i>	Optional By default, the period sending interval is 900 seconds.

### 3. Configure LSP packet generation interval

In addition to periodic update, change of interface and network status can trigger generation of new LSP packets. To avoid frequent generation of LSP packets to occupy a large amount of CPU resources, users can configure the minimum LSP packet generation interval.

Table 19 Configuring LSP Packet Generation Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router</b> isis [ <i>area-tag</i> ]	-
Configure LSP packet generation interval	<b>lsp-gen-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>max-interval</i> [ <i>initial-interval</i> [ <i>secondary-interval</i> ] ]	Optional By default, the upper limit and lower limit of LSP packet generation interval are 10 seconds and 50 milliseconds.

### 4. Configure LSP packet sending interval

Whenever LSP packets are generated, they are sent on the interface. To avoid frequent generation of LSP packets to occupy massive interface bandwidth, you can configure the minimum LSP packet sending interval for each interface.

Table 20 Configuring LSP Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure LSP packet sending interval	isis <b>lsp-interval</b> <i>min-interval</i>	Optional By default, the LSP packet sending interval is 33 milliseconds.

#### 5. Configure LSP packet retransmission time

On the point-to-point link, IS-IS needs to send a PSNP confirmation message from the peer port after sending LSP packet. If the confirmation message from the peer port fails to be received, the LSP packet will be resent. The time of waiting for confirmation, i.e. the LSP packet retransmission time, can be configured by users to prevent LSP packets from being retransmitted because the confirmation is not received when there is a long time delay.

Table 21 Configuring LSP Packet Retransmission Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure LSP packet retransmission time	isis <b>retransmit-interval</b> <i>interval [ level-1   level-2 ]</i>	Optional By default, the retransmission time is 5 seconds.

#### 6. Configure LSP MTU value

IS-IS protocol packets cannot be automatically fragmented. To ensure normal diffusion of LSP packets, the maximum length of LSP packets in a routing domain shall not exceed the minimum MTU value of the IS-IS interface of all devices; when the MTU values of the device interfaces in the routing domain are inconsistent, uniform setting of the maximum LSP packet length is recommended.

Table 22 Configuring LSP MTU Value

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router</b> isis [ <i>area-tag</i> ]	-
Configure MTU value of LSP packet	<b>lsp-mtu</b> <i>mtu-size</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the MTU value of LSP packet is 1492 bytes.

### Configure Parameters of IS-IS SNP Packets

#### 1. Configure CSNP packet sending interval

The broadcast link election node needs to periodically send CSNP packets to synchronize the link status database of the entire network. The periodic sending interval of CSNP packets can be adjusted based on the actual situation.

Table 23 Configuring CSNP Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure CSNP packet sending interval	isis <b>csnp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the periodic CSNP packet sending interval is 10 seconds.

#### 2. Configure PSNP packet sending interval

On the broadcast link, PSNP packets are used to synchronize the link status database of the entire network; on the point-to-point link, PSNP packets are used to confirm the received LSP packets. In order to prevent a large number of PSNP packets from being sent on the interface, a minimum sending time interval is set for PSNP packets. Users can dynamically modify this interval. A very large PSNP packet sending interval is not recommended. For broadcast links, it will affect the synchronization of the link status database of the entire network. For point-to-point links, it will cause the retransmission of LSP packets due to late receipt of confirmation.

Table 24 Configuring PSNP Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure PSNP packet sending interval	<b>isis psnp-interval</b> <i>min-interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the PSNP packet sending interval is 2 seconds.

### Configure IS-IS SPF Calculation Interval

The change of IS-IS link status database will trigger SPF routing calculation. Frequent SPF calculation consumes a great many CUP resources. Users may configure the SPF calculation interval.

Table 25 Configuring IS-IS SPF Calculation Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure IS-IS SPF calculation interval	<b>spf-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>maximum-interval</i> [ <i>min-initial-delay</i> [ <i>min-second-delay</i> ] ]	Optional

### Configure the Maximum Number of IS-IS Areas

An IS-IS process can be configured with multiple area addresses that are mainly used for the smooth transition of merging multiple Level-1 areas into one Level-1 area, or dividing a Level-1 area into multiple Level-1 areas.

Table 26 Configuring Maximum Number of Areas for IS-IS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure the Maximum Number of IS-IS Areas	<b>max-area-addresses</b> <i>max-number</i>	Optional By default, the maximum number of area addresses is 3.

### Note

- This requires consistent configuration in the entire IS-IS Level-1 routing domain. Otherwise, Level-1 neighbors cannot be normally established. This is not the case for Level-2 neighbors.

### Configure IS-IS Host Name Mapping

IS-IS can uniquely identify an intermediate system through system ID. The fixed length of the system ID is 6 bytes. When viewing system information (e.g. neighbor relation, and link status database), users cannot link the system ID with host name; IS-IS supports the mapping of system ID and host name for intuitive and convenient viewing of system information by users. There are two ways to configure IS-IS host name mapping:

1. Configure IS-IS static host name mapping

IS-IS static host name mapping means the mapping that users manually establish system ID and host name for remote devices.

Table 27 Configuring IS-IS Static Host Name Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS static host name mapping	<b>hostname static</b> <i>system-id</i> <i>host-name</i>	Mandatory

2. Configure IS-IS dynamic host name mapping

Static host name mapping requires users to configure system ID and host name mapping of other devices for each device in the network, which is a heavy workload; for dynamic host name mapping, other devices in the network can learn the host name of the device after configuring host name for each device and enabling the host name advertisement function.

Table 28 Configuring IS-IS Dynamic Host Name Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS dynamic host name mapping	<b>hostname dynamic</b> { <i>host-name</i>   <b>area-tag</b>   <b>recv-only</b>   <b>system-name</b> }	Mandatory By default, only the host name advertised by other devices is learned.

#### Add IS-IS Interface to Mesh Group

Without being added into the Mesh group, the IS-IS interface will send the LSP packet received from an interface via all the other IS-IS interfaces. This causes a huge waste of bandwidth in the fully meshed network. You may add several IS-IS interfaces into the same Mesh group. After receiving the LSP packet, the interfaces only send this packet to the interfaces in other Mesh group.

Table 29 Adding IS-IS Interface into Mesh Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Add IS-IS Interface to Mesh Group	isis <b>mesh-group</b> { <i>group-number</i>   <b>blocked</b> }	Mandatory By default, it is not added into any Mesh group.

#### Note

- **isis mesh-group blocked** sets the interface as a blocking interface. The blocking interface

---

will not actively send LSP packets. It does so only when LSP request is received.

---

## 57.2.6 Configure IS-IS Network Authentication

### Configuration Condition

Before configuring IS-IS network authentication, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

### Configure IS-IS Neighbor Authentication

After configuring IS-IS to enable neighbor relation authentication, an authentication message will be added into the Hello packet sent, and the Hello packet received will be authenticated. If the authentication fails, a neighbor relation cannot be formed. This will prevent the establishment of neighbor relation with the device which cannot be trusted.

Table 30 Configuring IS-IS Neighbor Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Hello packet authentication mode	<b>isis authentication mode</b> { <b>md5</b>   <b>sm3</b>   <b>text</b> } [ <b>level-1</b>   <b>level-2</b> ]	Mandatory  By default, the authentication function is disabled.
Configure the authentication password of Hello packet	<b>isis authentication key</b> { <b>0</b>   <b>7</b> } <i>password</i> [ <b>level-1</b>   <b>level-2</b> ]	Either-or  By default, there is no authentication password; authentication password can be configured with a coding strand. For the configuration of coding strand, see the coding strand configuration section in the User Manual.
	<b>isis authentication key-chain</b> <i>key-chain-name</i> [ <b>level-1</b>   <b>level-2</b> ]	

### Configure IS-IS Route Authentication

After configuring IS-IS routing information authentication, an authentication message will be added into the LSP and SNP packet, and the LSP and SNP packet received will be authenticated. If the authentication fails, the packet will be directly discarded. This will prevent the routing information which cannot be trusted from diffusing into the IS-IS network.

Table 31 Configuring IS-IS Route Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure the authentication mode of routing information packet	<b>authentication mode</b> { <b>md5</b>   <b>sm3</b>   <b>text</b> } [ <b>level-1</b>   <b>level-2</b> ]	Mandatory  By default, the authentication function is disabled.
Configure the authentication password of routing information packet	<b>authentication key</b> { <b>0</b>   <b>7</b> } <i>password</i> [ <b>level-1</b>   <b>level-2</b> ]	Either-or  By default, there is no authentication password; authentication password can be configured with a coding strand. For the configuration of coding strand, see the coding strand configuration section in the User Manual.
	<b>authentication key-chain</b> <i>key-chain-name</i> [ <b>level-1</b>   <b>level-2</b> ]	

### 57.2.7 Configure Coordination of IS-IS with BFD

Configuring the coordination of IS-IS with BFD can quickly detect link failures so as to enable backup link for communication. There are two ways to configure the coordination of IS-IS with BFD: associate BFD for all the interfaces that have enabled IS-IS protocol; specify the interface to associate BFD.

For BFD parameters, see the BFD configuration manual.

#### Configuration Condition

Before configuring the coordination of IS-IS with BFD, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

## Configure Coordination of IS-IS with BFD

Table 32 Configuring Coordination of IS-IS with BFD

Step	Command
Enter the global configuration mode.	<b>configure terminal</b>
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>
Enable the BFD link detection function on the interface	isis <b>bfd</b>
Return to the global configuration mode	<b>exit</b>
Enter the IS-IS configuration mode	<b>router</b> isis [ <i>area-tag</i> ]
Enable the BFD link detection function on the IS-IS interface	<b>bfd all-interfaces</b>

### 57.2.8 Configure IS-IS FRR

#### Configuration Condition

Before configuring IS-IS FRR, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

#### Configure IS-IS FRR

In the IS-IS network, as a result of link or device failure, the packets passing the point of failure will be discarded or loops will be produced. The traffic interruption caused thereby will continue until the protocol reconverges after several seconds. In order to reduce the time of traffic interruption, IS-IS FRR can be configured. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic passing through the failed link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 33 Configuring IS-IS FRR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv4 address family configuration mode	<b>address-family ipv4 unicast</b>	-
Configure ISIS to enable the FRR function	<b>fast-reroute route-map</b> <i>route-map-name</i>	Mandatory By default, the IS-IS FRR function is disabled.
Configure IS-IS to enable the dynamic FRR function	<b>fast-reroute loop-free-alternate</b> [route-map <i>route-map-name</i> ]	Mandatory By default, the IS-IS dynamic FRR function is disabled.
Configure IS-IS to enable the pic function	<b>pic</b>	Mandatory After the pic function is enabled, the auto FRR function is enabled. By default, the IS-IS pic function is disabled.

---

### Note

- The IS-IS FRR function has two types, i.e. static FRR and dynamic FRR.
  - Static FRR needs to associate route-map where the next hop interface and address of back-up route are set.
  - Currently, dynamic FRR supports point-to-point network only, i.e. all the output interfaces of the device have a network type of point-to-point. After dynamic FRR is configured, the device automatically calculates and sets back-up next hop interface and address. Dynamic FRR can also associate route-map to set back-up next hop interface and address for the route which matches the route-map only.
  - The methods of enabling rerouting are mutually exclusive;
- 

## 57.2.9 Configure IS-IS GR

GR (Graceful Restart) is used to keep the routing information in the forwarding layer of this device and neighbor device unchanged during the switch between host and standby devices to ensure the forwarding

process is not affected; after the device is switched for re-running, the two devices synchronize routing information and update forwarding layer in the protocol layer so that the data can keep forwarding during the process of device switch.

There are two types of roles in the GR process:

GR Restarter end: The device for graceful restart of protocol.

GR Helper end: The device which helps with the graceful restart of protocol.

The distributed device can act as GR Restarter and GR Helper, while the centralized device only serves as GR Helper to help the Restarter complete GR.

### Configuration Condition

Before configuring IS-IS GR, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.
- Enable IS-IS Protocol.

### Configure IS-IS GR Restarter

Table 34 Configuring IS-IS GR Restarter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ <i>area-tag</i> ]</b>	-
Enable IS-IS to enable the GR function	<b>nsf ietf</b>	Mandatory By default, the GR function is disabled.
Configure advertisement to enter the retransmission times of GR process message	<b>nsf interface-expire <i>resend-cnt</i></b>	Optional By default, the number of retransmission times is 3.
Configure the retransmission waiting time of GR process message	<b>nsf interface-timer <i>wait-time</i></b>	Optional By default, the waiting time is 10 seconds.

### Configure IS-IS GR Helper

GR Helper can help the Restarter end complete GR. By default, the device enables this function. Users can close this function via command.

Table 35 Configuring IS-IS GR Helper

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS GR Helper to disable the capability of Helper	<b>nsf ietf helper-disable</b>	Mandatory Configure IS-IS GR Helper to disable the capability of Helper

## 57.2.10IS-IS monitoring and maintaining

Table 36 IS-IS Monitoring and Maintaining

Command	Description
<b>clear isis</b> [ <i>instance -null   area-tag</i> ] <b>statistics</b> [ <i>interface_name</i> ]	Clear the statistical information of IS-IS protocol operation
<b>clear isis</b> [ <i>instance -null   area-tag</i> ] <b>process</b>	Restart IS-IS protocol process
<b>show isis</b> [ <i>instance -null   area-tag</i> ]	Show the information of IS-IS process
<b>show isis instance</b> { <i>-null   area-tag</i> } <b>ipv4 bfd-sessions</b>	Show the BFD session information of IS-IS process
<b>show isis</b> [ <i>instance -null   area-tag</i> ] <b>database</b> [ <i>lsp_id</i> ] [ <b>detail</b> ] [ <i>l1 / l2</i> ] [ <i>level-1 / level-2</i> ] [ <i>self</i> ] [ <i>verbose</i> ]	Show the IS-IS link status database information
<b>show isis interface</b> [ <i>interface-name</i> ] [ <b>detail</b> ]	Show the information of running IS-IS protocol interface
<b>show isis</b> [ <i>instance -null   area-tag</i> ] <b>ipv4 reach-info</b>	Show the IPV4 subnet reachable information of IS-IS

Command	Description
<b>show isis [ instance –null   area-tag ] ipv4 route</b>	Show the IPV4 routing information of IS-IS
<b>show isis [ instance –null   area-tag ] ipv4 topology</b>	Show the IPV4 topological information of IS-IS
<b>show isis [ instance – null   area-tag ] is-reach-info [ level-1   level-2 ]</b>	Show the information about neighboring nodes of IS-IS
<b>show isis [instance –null   area-tag] mesh-groups</b>	Show the mesh group of IS-IS
<b>show isis [ instance –null   area-tag ] neighbors [ interface-name ] [ detail ]</b>	Show the information of IS-IS neighbors
<b>show isis [ instance –null   area-tag ] statistics [ interface-name ]</b>	Show the statistical information of IS-IS protocol operation
<b>show isis router</b>	Show the host name information of IS-IS

## 57.3 Typical configuration example of IS-IS

### 57.3.1 Configure Basic Functions of IS-IS

#### Network Requirements

- Enable network interconnection between devices by configuring IS-IS protocol.
- Device1 is a Level-1 router; Device2 is a Level-1-2 router; Device1 and Device2 are in the same area; the area number is 10. Device3 is a Level-2 router, and the area number is 20. Device2 connects the two areas.

#### Network Topology

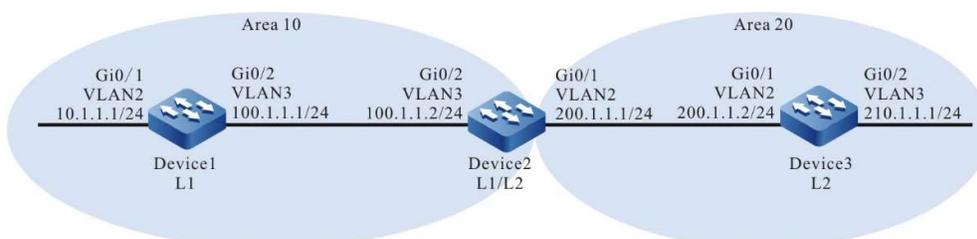

Figure 57 Network Topology for Basic Functions of IS-IS

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IS-IS and enable the this process on the interface.

#On Device1, configure IS-IS process 100, area number 10 and type Level-1, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-1
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip router isis 100
Device1(config-if-vlan3)#exit
```

#On Device2, configure IS-IS process 100, area number 10 and type Level-1-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip router isis 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip router isis 100
Device2(config-if-vlan3)#exit
```

#On Device3, configure IS-IS process 100, area number 20 and type Level-2, and enable this process on the interface.

```
Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 20.0000.0000.0003.00
Device3(config-isis)#is-type level-2
Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip router isis 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip router isis 100
Device3(config-if-vlan3)#exit
```

Step 3: Check the result.

#View the information of IS-IS neighbors on Device1.

```
Device1#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L1-LAN 0000.0000.0002 vlan3 Up 29 sec L1 capable 64 0000.0000.0001.01
```

#View the information of IS-IS neighbors on Device2.

```

Device2#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 2):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L2-LAN 0000.0000.0003 vlan2 Up 9 sec L2 capable 64 0000.0000.0003.01
L1-LAN 0000.0000.0001 vlan3 Up 8 sec L1 capable 64 0000.0000.0001.01

```

Device2 establishes IS-IS neighbors with Device1 and Device3.

#View the information of IS-IS neighbors on Device 3.

```

Device3#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L2-LAN 0000.0000.0002 vlan3 Up 22 sec L2 capable 64 0000.0000.0003.01

```

#View the routing information of Device1.

```

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

i 0.0.0.0/0 [115/10] via 100.1.1.2, 17:44:09, vlan3
C 10.1.1.0/24 is directly connected, 16:56:18, vlan2
C 100.1.1.0/24 is directly connected, 18:37:57, vlan3
C 127.0.0.0/8 is directly connected, 284:02:13, lo0
i 200.1.1.0/24 [115/20] via 100.1.1.2, 17:44:09, vlan3

```

```

Device1#show isis ipv4 route
IS-IS Instance 100, VRF Kernel, IPv4 routes table (Counter 4):
L1 0.0.0.0/0, flags none, metric 10, from learned, installed
   via 100.1.1.2, vlan3, neighbor 0000.0000.0002
L1 10.1.1.0/24, flags none, metric 10, from network connected
   via 0.0.0.0, vlan2
L1 100.1.1.0/24, flags none, metric 10, from network connected
   via 0.0.0.0, vlan3
L1 200.1.1.0/24, flags none, metric 20, from learned, installed
   via 100.1.1.2, vlan3, neighbor 0000.0000.0002

```

There is a default route in the routing table of Device1. The next hop is Device2.

#View the routing information of Device2.

```

Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route

   via 0.0.0.0, vlan2
L2 210.1.1.0/24, flags none, metric 20, from learned, installed
   via 200.1.1.2, vlan2, neighbor 0000.0000.0003
Device2 includes Level-1 and Level-2 routes.

```

#View the routing information of Device3.

```
Device3#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
i 10.1.1.0/24 [115/30] via 200.1.1.1, 16:59:29, vlan2
i 100.1.1.0/24 [115/20] via 200.1.1.1, 17:47:29, vlan2
C 127.0.0.0/8 is directly connected, 945:29:12, lo0
C 200.1.1.0/24 is directly connected, 18:40:27, vlan2
C 210.1.1.0/24 is directly connected, 16:59:04, vlan3
```

```
Device3#show isis ipv4 route
IS-IS Instance 100, VRF Kernel, IPv4 routes table (Counter 4):
L2 10.1.1.0/24, flags none, metric 30, from learned, installed
   via 200.1.1.1, vlan2, neighbor 0000.0000.0002
L2 100.1.1.0/24, flags none, metric 20, from learned, installed
   via 200.1.1.1, vlan2, neighbor 0000.0000.0002
L2 200.1.1.0/24, flags none, metric 10, from network connected
   via 0.0.0.0, vlan2
L2 210.1.1.0/24, flags none, metric 10, from network connected
   via 0.0.0.0, vlan3
```

Device3 learns Level-1 route. By default, Level-1 leaks to Level-2.

---

## Note

- The metric type is narrow metric by default. Wide metric is recommended.
  - The IS-IS entity attribute is Level-1-2 by default.
- 

## 57.3.2 Configure the DIS election of IS-IS

### Network Requirements

- Specify the device as DIS by modifying priority.
- Both Device1 and Device2 are Level-1-2 devices; Device3 is a Level-1 device; Device4 is a Level-2 device. Device1, Device2, Device3, and Device4 are in the same broadcast network and area, with the area number being 10.

### Network Topology

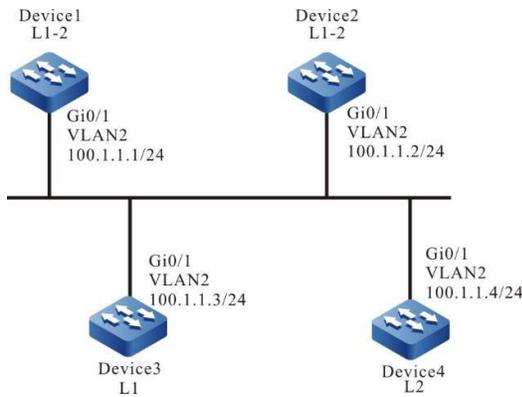

Figure 1 Network Topology for Configuring DIS Election of IS-IS

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IS-IS and enable the this process on the interface.

#On Device1, configure IS-IS process 100, area number 10 and type Level-1-2, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip router isis 100
Device1(config-if-vlan2)#exit
```

#On Device2, configure IS-IS process 100, area number 10 and type Level-1-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip router isis 100
Device2(config-if-vlan2)#exit
```

#On Device3, configure IS-IS process 100, area number 10 and type Level-1, and enable this process on the interface.

```
Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 10.0000.0000.0003.00
Device3(config-isis)#is-type level-1
Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip router isis 100
Device3(config-if-vlan2)#exit
```

#On Device4, configure IS-IS process 100, area number 20 and type Level-2, and enable this process on the interface.

```

Device4#configure terminal
Device4(config)#router isis 100
Device4(config-isis)#net 20.0000.0000.0004.00
Device4(config-isis)#is-type level-2
Device4(config-isis)#metric-style wide
Device4(config-isis)#exit
Device4(config)#interface vlan2
Device4(config-if-vlan2)#ip router isis 100
Device4(config-if-vlan2)#exit

```

#View the information of IS-IS neighbors on Device1.

```

Device1#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 4):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L1-LAN 0000.0000.0002 vlan2 Up 23 sec L1 capable 64 0000.0000.0003.01
L2-LAN 0000.0000.0002 vlan2 Up 23 sec L2 capable 64 0000.0000.0004.01
L1-LAN 0000.0000.0003 vlan2 Up 8 sec L1 capable 64 0000.0000.0003.01
L2-LAN 0000.0000.0004 vlan2 Up 8 sec L2 capable 64 0000.0000.0004.01

```

The pseudo node of Level-1 is 0000.0000.0003.01, and Device3 is the DIS of Level-1. The pseudo node of Level-2 is 0000.0000.0004.01, and Device4 is the DIS of Level-2.

#Use the command **show isis interface** to view the MAC address of the interface. In the default priority, DIS is selected according to the principle that the larger the MAC address of the physical interface, the higher the priority.

Step 3: Modify interface priority.

#Modify the priority of Device1 interface.

```

Device1(config)#interface vlan2
Device1(config-if-vlan2)#isis priority 100
Device1(config-if-vlan2)#exit

```

Step 4: Check the result.

#View the information of IS-IS neighbors on Device1.

```

Device1#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 4):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L1-LAN 0000.0000.0002 vlan2 Up 24 sec L1 capable 64 0000.0000.0001.01
L2-LAN 0000.0000.0002 vlan2 Up 23 sec L2 capable 64 0000.0000.0001.01
L1-LAN 0000.0000.0003 vlan2 Up 20 sec L1 capable 64 0000.0000.0001.01
L2-LAN 0000.0000.0004 vlan2 Up 24 sec L2 capable 64 0000.0000.0001.01

```

The pseudo node of Level-1-2 is 0000.0000.0001.01, and Device1 is the DIS of Level-1-2.

---

## Note

- The priority of IS-IS interface is 64 by default. The larger the number the higher the priority.
-

### 57.3.3 Configure IS-IS Inter-area Route Leak

#### Network Requirements

- Leak Level-2 route to Level-1 by configuring inter-layer leak on Level-1-2 device.
- Device1 is a Level-1 router; Device2 is a Level-1-2 router; Device1 and Device2 are in the same area; the area number is 10. Device3 is a Level-2 router, and the area number is 20. Device2 connects the two areas.

#### Network Topology

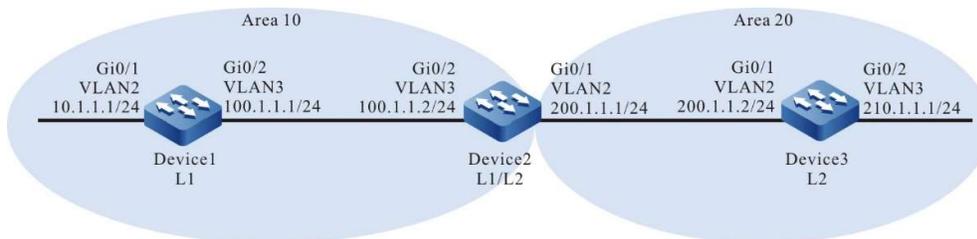

Figure 2 Network Topology for Inter-layer Leak of IS-IS

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IS-IS and enable the this process on the interface.

#On Device1, configure IS-IS process 100, area number 10 and type Level-1, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-1
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip router isis 100
Device1(config-if-vlan3)#exit
```

#On Device2, configure IS-IS process 100, area number 10 and type Level-1-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip router isis 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip router isis 100
```

```
Device2(config-if-vlan3)#exit
```

#On Device3, configure IS-IS process 100, area number 20 and type Level-2, and enable this process on the interface.

```
Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 20.0000.0000.0003.00
Device3(config-isis)#is-type level-2
Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip router isis 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip router isis 100
Device3(config-if-vlan3)#exit
```

#View the routing information of Device1.

```
Device1#show ip route

In addition to default route, Device1 learns the Level-2 route advertised by Device3.

### 57.3.4 IS-IS route redistribution

#### Network Requirements

- Configure redistribution to import external routes into IS-IS for network interconnection between devices.
- Both Device1 and Device2 are Level-2 routers. Configure IS-IS, with the area number being 10. Configure OSPF for Device2 and Device3. On Device2, redistribute OSPF route to IS-IS through configuration.

#### Network Topology

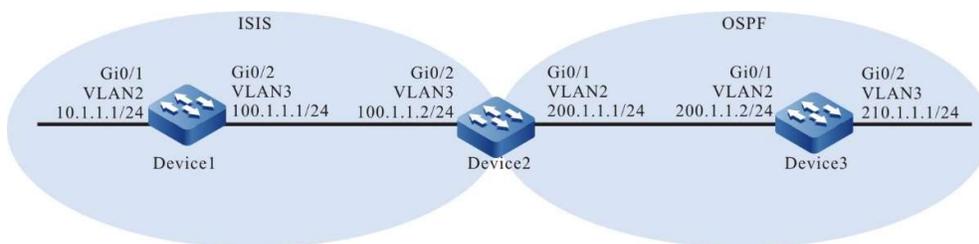

Figure 3 Network Topology for IS-IS Route Redistribution

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IS-IS and enable the this process on the interface.

#On Device1, configure IS-IS process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-2
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip router isis 100
Device1(config-if-vlan3)#exit
```

#On Device2, configure IS-IS process 100, area number 10 and type Level-1-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#is-type level-2
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip router isis 100
Device2(config-if-vlan3)#exit
```

Step 3: Configure OSPF.

#Configure Device2.

```
Device2(config)#router ospf 100
Device2(config-ospf)#network 200.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 210.1.1.0 0.0.0.255 area 0
Device3(config-ospf)#network 200.1.1.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#View the routing table of Device1. Device1 fails to learn the OSPF route redistributed by Device2.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

### 57.3.5 Configure IS-IS Neighbor Authentication

#### Network Requirements

- Enable authentication on the interface to establish neighbors between devices configured with the same password.
- Device1 is a Level-1 router; Device2 is a Level-1-2 router; Device1 and Device2 are in

the same area; the area number is 10. Device3 is a Level-2 router, and the area number is 20. Device2 connects the two areas.

### Network Topology

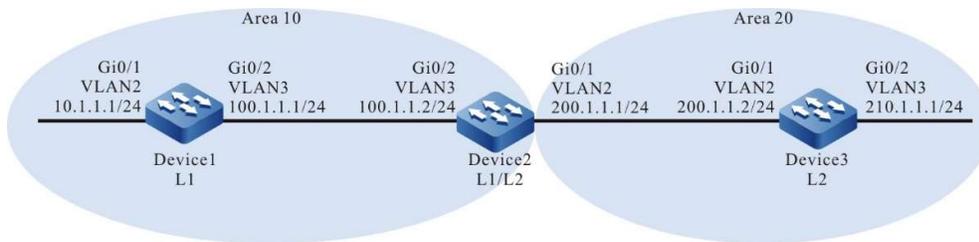

Figure 4 Network Topology for IS-IS Neighbor Authentication

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IS-IS and enable the this process on the interface.

#On Device1, configure IS-IS process 100, area number 10 and type Level-1, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-1
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip router isis 100
Device1(config-if-vlan3)#exit
```

#On Device2, configure IS-IS process 100, area number 10 and type Level-1-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip router isis 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip router isis 100
Device2(config-if-vlan3)#exit
```

#On Device3, configure IS-IS process 100, area number 20 and type Level-2, and enable this process on the interface.

```
Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 20.0000.0000.0003.00
Device3(config-isis)#is-type level-2
```

```

Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip router isis 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip router isis 100
Device3(config-if-vlan3)#exit

```

#View the information of IS-IS neighbors on Device1.

```

Device1#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L1-LAN 0000.0000.0002 vlan3 Up 29 sec L1 capable 64 0000.0000.0001.01

```

#View the information of IS-IS neighbors on Device2.

```

Device2#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 2):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L2-LAN 0000.0000.0003 vlan2 Up 9 sec L2 capable 64 0000.0000.0003.01
L1-LAN 0000.0000.0001 vlan3 Up 7 sec L1 capable 64 0000.0000.0001.01

```

#View the information of IS-IS neighbors on Device 3.

```

Device3#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L2-LAN 0000.0000.0002 vlan2 Up 24 sec L2 capable 64 0000.0000.0003.01

```

**Step 3: Configure authentication.**

#Configure MD5 authentication on the interface of Device2, with the password being admin.

```

Device2(config)#interface vlan2
Device2(config-if-vlan2)#isis authentication mode md5
Device2(config-if-vlan2)#isis authentication key 0 admin
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#isis authentication mode md5
Device2(config-if-vlan3)#isis authentication key 0 admin
Device2(config-if-vlan3)#exit

```

#View the IS-IS neighbors on Device2.

```

Device2#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 0):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID

```

At this moment, no authentication has been configured on Device1 and Device3, and there is no ISIS neighbor on Device2.

#Configure MD5 authentication on the vlan3 interface of Device1, with the password being admin.

```

Device1(config)#interface vlan3
Device1(config-if-vlan3)#isis authentication mode md5
Device1(config-if-vlan3)#isis authentication key 0 admin
Device1(config-if-vlan3)#exit

```

#Configure MD5 authentication on the vlan2 interface of Device3, with the password being admin.

```

Device3(config)#interface vlan2
Device3(config-if-vlan2)#isis authentication mode md5
Device3(config-if-vlan2)#isis authentication key 0 admin
Device3(config-if-vlan2)#exit

```

Step 4: Check the result.

#View the information of IS-IS neighbors on Device1.

```
Device1#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L1-LAN 0000.0000.0002 vlan3 Up 29 sec L1 capable 64 0000.0000.0001.01
```

According to the result, ISIS neighbor has been successfully established between Device1 and Device2. This means the authentication has succeeded.

#View the information of IS-IS neighbors on Device2.

```
Device2#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 2):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L2-LAN 0000.0000.0003 vlan2 Up 9 sec L2 capable 64 0000.0000.0003.01
L1-LAN 0000.0000.0001 vlan3 Up 7 sec L1 capable 64 0000.0000.0001.01
```

According to the result, ISIS neighbor has been successfully established between Device2 and Device1 & Device3. This means the authentication has succeeded.

#View the information of IS-IS neighbors on Device 3.

```
Device3#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L2-LAN 0000.0000.0002 vlan2 Up 24 sec L2 capable 64 0000.0000.0003.01
```

According to the result, ISIS neighbor has been successfully established between Device3 and Device2. This means the authentication has succeeded.

#View the routing information of Device2. It can normally receive the routes advertised by Device1 and Device3.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
i 10.1.1.0/24 [115/20] via 100.1.1.1, 16:58:26, vlan3
C 100.1.1.0/24 is directly connected, 18:39:58, vlan3
C 127.0.0.0/8 is directly connected, 20:16:34, lo0
C 200.1.1.0/24 is directly connected, 18:39:37, vlan2
i 210.1.1.0/24 [115/20] via 200.1.1.2, 16:57:56, vlan2
```

```
Device2#show isis ipv4 route
IS-IS Instance 100, VRF Kernel, IPv4 routes table (Counter 4):
L1 10.1.1.0/24, flags none, metric 20, from learned, installed
via 100.1.1.1, vlan3, neighbor 0000.0000.0001
L1 100.1.1.0/24, flags none, metric 10, from network connected
via 0.0.0.0, vlan3
L1 200.1.1.0/24, flags none, metric 10, from network connected
via 0.0.0.0, vlan2
L2 210.1.1.0/24, flags none, metric 20, from learned, installed
via 200.1.1.2, vlan2, neighbor 0000.0000.0003
```

## 57.3.6 Configure Coordination of IS-IS with BFD

### Network Requirements

- Configure BFD association between devices. When the main line fails, the service can quickly switch to the backup line.
- Device1, Device2, and Device3 are all Level-2 routers and in the same area, with the area number being 10. Configure BFD on Device1 and Device3 to establish a session. When the intermediate line between Device1 and Device3 is disconnected under abnormal conditions, Device1 can quickly switch and learn the 10.1.1.1/24 route from Device2.

### Network Topology

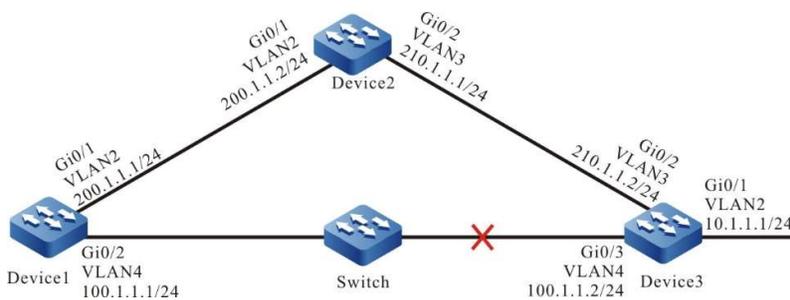

Figure 5 Network Topology for Coordination of IS-IS with BFD

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IS-IS and enable the this process on the interface.

#On Device1, configure IS-IS process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-2
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan4
Device1(config-if-vlan4)#ip router isis 100
Device1(config-if-vlan4)#exit
```

#On Device2, configure IS-IS process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#is-type level-2
```

```

Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip router isis 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip router isis 100
Device2(config-if-vlan3)#exit

```

#On Device3, configure IS-IS process 100, area number 10 and type Level-2, and enable this process on the interface.

```

Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 10.0000.0000.0003.00
Device3(config-isis)#is-type level-2
Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip router isis 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip router isis 100
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan4
Device3(config-if-vlan4)#ip router isis 100
Device3(config-if-vlan4)#exit

```

#View the routing information of Device1 which prefers the route 10.1.1.0/24 advertised by Device3.

```

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

i 10.1.1.0/24 [115/20] via 100.1.1.2, 00:00:15, vlan4
C 100.1.1.0/24 is directly connected, 00:09:15, vlan4
C 127.0.0.0/8 is directly connected, 253:58:17, lo0
C 200.1.1.0/24 is directly connected, 00:11:29, vlan2
i 210.1.1.0/24 [115/20] via 100.1.1.2, 00:00:15, vlan4
  [115/20] via 200.1.1.2, 00:00:15, vlan2
Device1#show isis ipv4 route
IS-IS Instance 100, VRF Kernel, IPv4 routes table (Counter 4):
L2 10.1.1.0/24, flags none, metric 20, from learned, installed
   via 100.1.1.2, vlan4, neighbor 0000.0000.0003
L2 100.1.1.0/24, flags none, metric 10, from network connected
   via 0.0.0.0, vlan4
L2 200.1.1.0/24, flags none, metric 10, from network connected
   via 0.0.0.0, vlan2
L2 210.1.1.0/24, flags none, metric 20, from learned, installed
   via 100.1.1.2, vlan4, neighbor 0000.0000.0003
   via 200.1.1.2, vlan2, neighbor 0000.0000.0002

```

### Step 3: Configure BFD.

#Enable BFD on the interface of Device1.

```

Device1(config)#bfd fast-detect
Device1(config)#interface vlan4
Device1(config-if-vlan4)#isis bfd
Device1(config-if-vlan4)#exit
#Enable BFD on the interface of Device3.
Device3(config)#bfd fast-detect
Device3(config)#interface vlan4
Device3(config-if-vlan4)#isis bfd
Device3(config-if-vlan4)#exit

```

#View the BFD information of Device1.

```
Device1#show bfd session
OurAddr      NeighAddr      LD/RD      State
100.1.1.2    100.1.1.1     1/1        UP
Holddown     interface
5000         vlan4
```

Step 4: Check the result.

#When the line between Device1 and Device3 fails, BFD will quickly identify the failure and notify ISIS which will switch route to Device2 for communication. View the routing table on Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
i 10.1.1.0/24 [115/30] via 200.1.1.2, 00:00:14, vlan2
C 127.0.0.0/8 is directly connected, 112:55:25, lo0
C 200.1.1.0/24 is directly connected, 101:20:08, vlan2
```

```
Device1#show isis ipv4 route
IS-IS Instance 100, VRF Kernel, IPv4 routes table (Counter 2):
L2 10.1.1.0/24, flags none, metric 30, from I earned, installed
   via 200.1.1.2, vlan2, neighbor 0000.0000.0003
L2 200.1.1.0/24, flags none, metric 20, from network connected
   via 0.0.0.0, vlan2
```

#According to the result, for the data flow from Device1 to the network segment 10.1.1.0/24, priority is given to Device2.

### 57.3.7 Configure ISIS FRR

#### Network Requirements

- All devices are configured with ISIS protocol.
- Device1 learns the ISIS route 192.168.1.1/32 from Device2 and Device3 at the same time, and first uses the lines between it and Device3 to forward packets. Likewise, Device3 learns the ISIS route 100.1.1.1/32 from Device1 and Device2, and prefers to use the lines between it and Device1 to forward packets.
- Enable ISIS FRR on Device1 and Device3. When the lines between Device1 and Device3 fail, the service can quickly switch to Device2 for communication.

#### Network Topology

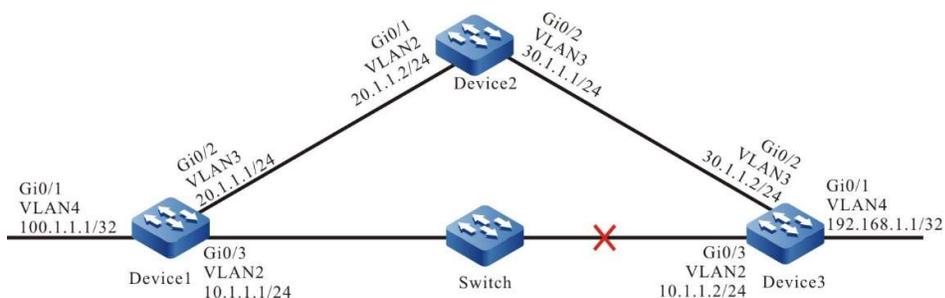

Figure 6 Network Topology for Configuring ISIS FRR

### Configuration Steps

Step 1: Configures IP addresses for the ports. (Omitted)

Step 2: Configure IS-IS and enable the this process on the interface.

#On Device1, configure IS-IS process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-2
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ip router isis 100
Device1(config-if-vlan3)#exit
Device1(config)#interface loopback 0
Device1(config-if-loopback0)#ip router isis 100
Device1(config-if-loopback0)#exit
```

#On Device2, configure IS-IS process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#is-type level-2
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ip router isis 100
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ip router isis 100
Device2(config-if-vlan3)#exit
```

#On Device3, configure IS-IS process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 10.0000.0000.0003.00
Device3(config-isis)#is-type level-2
Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ip router isis 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ip router isis 100
Device3(config-if-vlan3)#exit
Device3(config)#interface loopback 0
Device3(config-if-loopback0)#ip router isis 100
Device3(config-if-loopback0)#exit
```

Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 192.168.1.1/32 only, and filter other networks.

The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 20.1.1.2.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 192.168.1.1 0.0.0.0
Device1(config-std-nacl)#exit
Device1(config)#route-map ipfir_isis
Device1(config-route-map)#match ip address 1
Device1(config-route-map)#set fast-reroute backup-interface vlan3 backup-nexthop 20.1.1.2
Device1(config-route-map)#exit
```

#On Device3, configure route-map to invoke ACL to match 100.1.1.1/32 only, and filter other networks.

The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 30.1.1.1.

```
Device3(config)#ip access-list standard 1
Device3(config-std-nacl)#permit 100.1.1.1 0.0.0.0
Device3(config-std-nacl)#exit
Device3(config)#route-map ipfir_isis
Device3(config-route-map)#match ip address 1
Device3(config-route-map)#set fast-reroute backup-interface vlan3 backup-nexthop 30.1.1.1
Device3(config-route-map)#exit
```

#### Step 4: Configure FRR.

#On Device1, enable ISIS FRR.

```
Device1(config)#router isis 100
Device1(config-isis)#address-family ipv4 unicast
Device1(config-isis-af)#ipfir route-map ipfir_isis
Device1(config-isis-af)#exit-address-family
Device1(config-isis)#exit
```

#On Device3, enable ISIS FRR.

```
Device3(config)#router isis 100
Device3(config-isis)#address-family ipv4 unicast
Device3(config-isis-af)#ipfir route-map ipfir_isis
Device3(config-isis-af)#exit-address-family
Device3(config-isis)#exit
```

#### Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
C 10.1.1.0/24 is directly connected, 00:02:39, vlan2
L 10.1.1.1/32 is directly connected, 00:02:39, vlan2
C 20.1.1.0/24 is directly connected, 06:19:51, vlan3
L 20.1.1.1/32 is directly connected, 06:19:51, vlan3
i 30.1.1.0/24 [115/20] via 20.1.1.2, 00:00:03, vlan3
   [115/20] via 10.1.1.2, 00:00:03, vlan2
C 127.0.0.0/8 is directly connected, 30:54:34, lo0
L 127.0.0.1/32 is directly connected, 30:54:34, lo0
LC 100.1.1.1/32 is directly connected, 02:54:43, loopback0
i 192.168.1.1/32 [115/20] via 10.1.1.2, 00:01:13, vlan2
```

#The FRR table of Device1 shows the route of network 192.168.1.1/32. The next hop interface is vlan3.

```
Device1#show ip frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
i 192.168.1.1/32 [115/0] via 20.1.1.2, 00:00:03, vlan3
```

#According to the backup next hop information of Device1, the backup interface of FRR is vlan3.

```
Device1#show nexthop frr detail
Index          : 262

```

Total 1 entries.

#When the lines between Device1 and Device3 fail, it will quickly identify the failures and switch to Device2 for communication. It can be seen from the routing table and FRR table of Device1 that the output interface of the destination network 192.168.1.1/32 in the routing table has switched to the backup interface vlan3.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 10.1.1.0/24 is directly connected, 00:02:39, vlan2
L 10.1.1.1/32 is directly connected, 00:02:39, vlan2
C 20.1.1.0/24 is directly connected, 06:19:51, vlan3
L 20.1.1.1/32 is directly connected, 06:19:51, vlan3
i 30.1.1.0/24 [115/20] via 20.1.1.2, 00:00:03, vlan3
   [115/20] via 10.1.1.2, 00:00:03, vlan2
C 127.0.0.0/8 is directly connected, 30:54:34, lo0
L 127.0.0.1/32 is directly connected, 30:54:34, lo0
LC 100.1.1.1/32 is directly connected, 02:54:43, loopback0
i 192.168.1.1/32 [115/30] via 20.1.1.2, 00:01:13, vlan3
```

On Device3, it is processed in a manner which is similar to that on Device1.

# 58 IPv6 IS-IS

## 58.1 Overview

The IPv6 routing protocol has the same protocol behaviors as the IS-IS routing protocol except for the IP address structure in the packet. For details, see the overview of IS-IS route.

## 58.2 IPv6 IS-IS function configuration

Table 58 IPv6 IS-IS Function Configuration List

Configuration Task	
Configure Basic Functions of IPv6 IS-IS	Enable IPv6 IS-IS Protocol
	Configure IPv6 IS-IS VRF Attributes
Configure Attributes of IPv6 IS-IS Layer	Configure Attributes of IPv6 IS-IS Layer

## 58.2.1 Configure Basic Functions of IPv6 IS-IS

### Configuration Condition

Before using the IPv6 IS-IS protocol, ensure that:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.

### Enable IS-IS Protocol

Multiple IPv6 IS-IS processes can run in the system, and each of them is distinguished by process name.

Table 58 Enabling IPv6 IS-IS Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Create IS-IS process and enter IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	Mandatory By default, there is no IS-IS process running in the system, and <i>area-tag</i> is a process name.
Configure network entity title for IS-IS	<b>net</b> <i>entry-title</i>	Mandatory By default, IS-IS doesn't have network entity title.
Return to the global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Enable IPv6 IS-IS protocol on the interface	<b>ipv6 router isis</b> [ <i>area-tag</i> ]	Mandatory By default, IPv6 IS-IS protocol is disabled on the interface.

### Note

IS-IS cannot be run if there is no network entity title.

## Configure IS-IS VRF Attributes

Table 58 Configuring IS-IS VRF Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS VRF attributes	<b>vrf</b> <i>vrf-name</i>	Optional By default, the IS-IS process is within the global VRF.

## 58.2.2 Configure Attributes of IPv6 IS-IS Layer

### Configuration Condition

Before configuring attributes of IPv6 IS-IS layer, ensure that:

- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.
- Enable the IPv6 IS-IS protocol.

### Configure Attributes of IS-IS Layer

Attributes of IS-IS layer have two types, i.e. global layer attributes and interface layer attributes. Global layer attributes are the categories of IS-IS intermediate system. They are divided into the following three categories:

- Level-1 intermediate system: It has Level-1 link status database only, and can advertise and learn routes in Level-1 area only;
- Level-2 intermediate system: It has Level-2 link status database only, and can advertise and learn routes in Level-2 area only;
- Level-1-2 intermediate system: It has both Level-1 and Level-2 link status databases, and can advertise and learn both Level-1 and Level-2 routes. It is an interconnecting device in Level-1 and Level-2 area.

The IS-IS interface layer attributes also have three types:

- Level-1 interface: It can send and receive Level-1 packets of IS-IS protocol only, and can establish Level-1 neighbors only;
- Level-2 interface: It can send and receive Level-2 packets of IS-IS protocol only, and can establish Level-2 neighbors only;
- Level-1-2 interface: It can send and receive both Level-1 and Level-2 packets of IS-IS protocol, and can establish both Level-1 and Level-2 neighbors.

IS-IS interface layer attributes relay on IS-IS global layer attributes. Level-1 intermediate system can own Level-1 interface only, Level-2 intermediate system can own Level-2 interface only, and Level-1-2 intermediate system can own all interfaces at the same time.

Table 58 Configuring Attributes of IPv6 IS-IS Global Layer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-

Step	Command	Description
Configure IS-IS global layer attributes	<b>is-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> }	Optional By default, the IS-IS global layer attribute is Level-1-2.

Table 58 Configuring IS-IS Interface Layer Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure interface layer attributes	<b>isis circuit-type</b> [ <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> ]	Optional By default, when the interface layer attributes are not specified, they are consistent with global layer attributes.

### 58.2.3 Configure IPv6 IS-IS Route Generation

#### Configuration Condition

Before configuring IPv6 IS-IS route generation, ensure that:

- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.
- Enable the IPv6 IS-IS protocol.

#### Configure IPv6 IS-IS default route

The Level-2 area of IS-IS protocol cannot generate a default route during operation. You may add the default route information in the Level-2 LSP and send it. After this information is received by the areas of the same level of other intermediate systems, they will add a default route to the routing table.

Table 58 Configuring IS-IS Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-
Enter the IS-IS IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IS-IS to distribute default route	<b>default-information originate</b>	Mandatory By default, the default route is not advertised.

### Configure IPv6 IS-IS Route Redistribution

The routing information of other routing protocols can be imported into the IS-IS protocol through route redistribution so that the AS where IS-IS protocol is running is interconnected with the AS or routing domain where other routing protocol is running. When importing external route, you may specify the route importing policy and the layer attributes after the route is imported.

Table 58 Configuring IS-IS Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-
Enter the IS-IS IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IS-IS Route Redistribution	<b>redistribute protocol [ protocol-id ] [ level-1 / level-1-2 / level-2 / metric metric-value / metric-type { external   internal } / route-map route-map-name / match route-sub-type ]</b>	Mandatory By default, the information of other routing protocol is not redistributed.

## 58.2.4 Configure IPv6 IS-IS Route Control

### Configuration Condition

Before configuring IPv6 IS-IS routing features, ensure that:

- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.
- Enable the IPv6 IS-IS protocol.

### Configure IPv6 IS-IS metric type

The initial IS-IS only has a narrow metric. When narrow metric is used, the maximum metric value of the interface is 63. With the gradual expansion of the network size, narrow metric is far from meeting the demand. Therefore, the metric type is expanded later to include wide metric which can reach 16777214. Devices using different metric types cannot advertise and learn routing information from each other. In order to achieve the transition between the two metric types, a configuration method for transiting metric type is provided.

Wide metric is recommended.

Table 58 Configuring IS-IS Metric Type

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure the metric type of interface	<b>metric-style</b> { <b>narrow</b>   <b>narrow transition</b>   <b>transition</b>   <b>wide</b>   <b>wide transition</b> } [ <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> ]	Optional By default, narrow metric is used.

### Configure metric value of IPv6 IS-IS interface

After IS-IS protocol is enabled on the interface, the metric of IS-IS route is the global metric value, which can be separately specified for each interface through command.

Table 58 Configuring Metric Value of Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS global metric value	<b>metric</b> <i>metric-value</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the global metric value is 10.
Return to the global configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the metric value of interface	<b>isis ipv6 metric</b> { <i>metric-value</i> / <b>maximum</b> } [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the global metric value is used.

### Configure IPv6 IS-IS administrative distance

The system selects routes according to the administrative distance. The smaller the administrative distance, the higher the route priority.

Table 1 Configuring IS-IS Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the administrative distance of IS-IS route	<b>distance</b> <i>distance-value</i>	Optional By default, the administrative distance is 115.

### Configure IPv6 IS-IS route summarization

Route summarization can summarize multiple pieces of routing information into one piece of routing information. After IS-IS is configured with route summarization, it can effectively reduce the number of

subnet information reachable through advertisement, and reduce the size of the link status database and routing table, so as to effectively save memory and CPU resources. This configuration is generally used on Level-1-2 edge devices to reduce the routing information advertised between layers.

Table 2 Configuring IS-IS Route Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-
Enter the IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IS-IS Route Summarization	<b>summary-prefix prefix-value [ metric metric-value / route-type { internal   external } / metric-type { internal   external } / tag tag-value / not-advertise / level-1 / level-2 / level-1-2 ]</b>	Mandatory By default, route summarization is disabled.

### Configure the maximum number of IPv6 IS-IS load balancing entries

There may be multiple paths with the same cost that lead to the same destination address. These equal-cost paths can improve link utilization rate. Users can control the maximum number of IS-IS equal-cost routes.

Table 3 Configuring Maximum Number of IS-IS Load Balancing Entries

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-
Enter the IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-

Step	Command	Description
Configure the Maximum Number of IS-IS Load Balancing Entries	<b>maximum-paths</b> <i>max-number</i>	Optional By default, the maximum number of load balancing entries is 4.

### Configure IPv6 IS-IS inter-layer route leak

By default, IS-IS only leaks Level-1 routes to Level-2, and Level-1 areas cannot know the routes in Level-2 area. You can import Level-2 routes to Level-1 by configuring inter-layer route leak. When configuring inter-layer route leak, you can specify a routing policy to only leak the route which match the conditions.

Table 4 Configuring IS-IS Inter-layer Route Leak

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IS-IS Inter-area Route Leak	<b>propagate { level-1 into level-2   level-2 into level-1 } [ distribute-list <i>access-list-name</i>   route-map <i>route-map-name</i> ]</b>	Mandatory By default, Level-1 leaks routes to Level-2.

### Configure IPv6 IS-IS ATT bit

In Level-1-2 devices, ATT bit is used to advertise other nodes whether this node has connections with other areas. If yes, ATT bit will be set as 1 automatically, and other nodes will produce a default route towards this node. This will increase the business burden of this node. To change this situation, you can set ATT bit as 0.

Table 58-14 Configuring IS-IS ATT Bit

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IS-IS ATT Bit	<b>set-attached-bit</b> { <b>on</b>   <b>off</b> }	Mandatory By default, ATT bit is set based on whether a node has connected with other areas.

## 58.2.5 Configure IPv6 IS-IS Network Optimization

### Configuration Condition

Before configuring IPv6 IS-IS adjustment and optimization, ensure that:

- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.
- Enable the IPv6 IS-IS protocol.

### Configure IPv6 IS-IS interface priority

On the broadcast link, IS-IS needs to elect a node as DIS. DIS nodes send CSNP packets on a regular basis to synchronize the link status database across the network. The Level-1 and Level-2 DIS nodes are separately elected. Those with the highest interface priority are elected as DIS nodes. When the priority is the same, those with a large MAC address as DIS nodes.

Table 58 Configuring IS-IS Interface Priority

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure IS-IS Interface Priority	<b>isis priority</b> <i>priority-value</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the interface priority is 64.

### Configure passive IPv6 IS-IS interface

Passive interface means the interface where no IS-IS protocol packets will be sent or received, though its direct network routing information is distributed; configuring passive IS-IS interface can save both bandwidth and the processing time of CPU; on this basis, IS-IS can also be specified to distribute direct network routing information of passive interface rather than of non-passive interface.

Table 5 Configuring Passive IS-IS Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure Passive IS-IS Interface	<b>passive-interface</b> <i>interface-name</i>	Mandatory By default, there is no passive interface in IS-IS.
Configure IS-IS to distribute the routing information of passive interface only	<b>advertise-passive-only</b>	Optional By default, all the information of direct network routes that have enabled IS-IS protocol interface is distributed.

### Configure Hello packet parameters of IPv6 IS-IS

1. Configure Hello packet sending interval

After the IS-IS protocol interface is enabled, Hello packets will be periodically sent to maintain neighbor relations. The smaller the Hello packet sending interval, the larger the network convergence and the bandwidth occupied.

Table 6 Configuring Hello Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure Hello packet sending interval for the interface	<b>isis hello-interval</b> { <i>interval</i>   <b>minimal</b> } [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the Hello packet sending interval is 10 seconds.

### 2. Configure the number of invalid Hello packets

S-IS calculates the time of maintaining neighbor relations according to the number of invalid Hello packets, and advertise such time to neighbor devices. If the neighbor device fails to receive the Hello packets from this device during this time, it is believed the neighbor relation has become invalid, and routing calculation will be done anew.

Table 7 Configuring Number of Invalid Hello Packets

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the number of invalid Hello packets on the interface	<b>isis hello-multiplier</b> <i>multiplier</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the number of invalid Hello packets is 3.

### 3. Cancel Hello packet filling

If the MTU values of the interfaces at both ends of the link are inconsistent, large packets will not be able to pass through. To avoid this situation, IS-IS fills Hello packets to the MTU value of interface so that neighbor relation cannot be established. However, this method causes a waste of bandwidth. In actual applications, you can cancel Hello packet filling to send small Hello packets.

Table 8 Configuring Function of Cancelling Hello Packet Filling

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Cancel Hello packet filling	<b>no isis hello padding</b>	Mandatory

Step	Command	Description
		By default, the Hello packet filling function is enabled.

### Configure LSP packet parameters of IPv6 IS-IS

1. Configure the maximum Time-To-Live of LSP packets

Each LSP packet has a maximum Time-To-Live. After decreasing to zero, the Time-To-Live of LSP packets will be deleted from the link status database. The maximum Time-To-Live of LSP packets shall be greater than their refresh interval.

Table 9 Configuring Parameters of IS-IS LSP Packet

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ <i>area-tag</i> ]</b>	-
Configure the maximum Time-To-Live of LSP packets	<b>max-lsp-lifetime <i>life-time</i></b>	Optional By default, the maximum Time-To-Live of LSP packets is 1200 seconds.

2. Configure LSP packet refresh interval

The IS-IS protocol advertises and learns routes by interacting with their respective LSP packets. The node stores the LSP packets received in its own link state database. Each LSP packet has a maximum Time-To-Live, so all nodes need to update their LSP packets on a regular basis to prevent the maximum Time-To-Live of LSP packets from reducing to zero, and to keep the LSP packets in the entire area synchronized. Reducing the periodic LSP packet sending interval can accelerate network convergence, though it will occupy a larger bandwidth.

Table 10 Configuring LSP Packet Refresh Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ <i>area-tag</i> ]</b>	-

Step	Command	Description
Configure LSP packet refresh interval	<b>lsp-refresh-interval</b> <i>refresh-interval</i>	Optional By default, the period sending interval is 900 seconds.

### 3. Configure LSP packet generation interval

In addition to periodic update, change of interface and network status can trigger generation of new LSP packets. To avoid frequent generation of LSP packets to occupy a large amount of CPU resources, users can configure the minimum LSP packet generation interval.

Table 11 Configuring LSP Packet Generation Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure LSP packet generation interval	<b>lsp-gen-interval</b> [ <i>level-1</i>   <i>level-2</i> ] <i>max-interval</i> [ <i>initial-interval</i> [ <i>secondary-interval</i> ] ]	Optional By default, the LSP packet generation interval is 50 milliseconds.

### 4. Configure LSP packet sending interval

Whenever LSP packets are generated, they are sent on the interface. To avoid frequent generation of LSP packets to occupy massive interface bandwidth, you can configure the minimum LSP packet sending interval for each interface.

Table 12 Configuring LSP Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure LSP packet sending interval	<b>isis lsp-interval</b> <i>min-interval</i>	Optional

Step	Command	Description
		By default, the LSP packet sending interval is 33 milliseconds.

#### 5. Configure LSP packet retransmission time

On the point-to-point link, IS-IS needs to send a PSNP confirmation message from the peer port after sending LSP packet. If the confirmation message from the peer port fails to be received, the LSP packet will be resent. The time of waiting for confirmation, i.e. the LSP packet retransmission time, can be configured by users to prevent LSP packets from being retransmitted because the confirmation is not received when there is a long time delay.

Table 13 Configuring LSP Packet Retransmission Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure LSP packet retransmission time	<b>isis retransmit-interval</b> <i>interval [ level-1   level-2 ]</i>	Optional By default, the retransmission time is 5 seconds.

#### 6. Configure LSP MTU value

IS-IS protocol packets cannot be automatically fragmented. To ensure normal diffusion of LSP packets, the maximum length of LSP packets in a routing domain shall not exceed the minimum MTU value of the IS-IS interface of all devices; when the MTU values of the device interfaces in the routing domain are inconsistent, uniform setting of the maximum LSP packet length is recommended.

Table 14 Configuring LSP MTU Value

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-

Step	Command	Description
Configure MTU value of LSP packet	<b>lsp-mtu</b> <i>mtu-size</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the MTU value of LSP packet is 1492 bytes.

### Configure SNP packet parameters of IPv6 IS-IS

#### 1. Configure CSNP packet sending interval

The broadcast link election node needs to periodically send CSNP packets to synchronize the link status database of the entire network. The periodic sending interval of CSNP packets can be adjusted based on the actual situation.

Table 15 Configuring CSNP Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure CSNP packet sending interval	<b>isis csnp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the periodic CSNP packet sending interval is 10 seconds.

#### 2. Configure PSNP packet sending interval

On the broadcast link, PSNP packets are used to synchronize the link status database of the entire network; on the point-to-point link, PSNP packets are used to confirm the received LSP packets. In order to prevent a large number of PSNP packets from being sent on the interface, a minimum sending time interval is set for PSNP packets. Users can dynamically modify this interval. A very large PSNP packet sending interval is not recommended. For broadcast links, it will affect the synchronization of the link status database of the entire network. For point-to-point links, it will cause the retransmission of LSP packets due to late receipt of confirmation.

Table 16 Configuring PSNP Packet Sending Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure PSNP packet sending interval	<b>isis psnp-interval</b> <i>min-interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Optional By default, the PSNP packet sending interval is 2 seconds.

### Configure SPF calculation interval of IPv6 IS-IS

The change of IS-IS link status database will trigger SPF routing calculation. Frequent SPF calculation consumes a great many CUP resources. Users may configure the SPF calculation interval.

Table 17 Configuring IS-IS SPF Calculation Interval

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Enter the IS-IS IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IS-IS SPF calculation interval	<b>spf-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>maximum-interval</i> [ <i>min-initial-delay</i> [ <i>min-second-delay</i> ] ]	Optional By default, <i>maximum-interval</i> is 10s, <i>min-initial-delay</i> is 50ms, and <i>min-second-delay</i> is 200ms.

### Configure the maximum number of areas for IPv6 IS-IS

An IS-IS process can be configured with multiple area addresses that are mainly used for the smooth transition of merging multiple Level-1 areas into one Level-1 area, or dividing a Level-1 area into multiple Level-1 areas.

Table 18 Configuring Maximum Number of Areas for IS-IS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure the Maximum Number of IS-IS Areas	<b>max-area-addresses</b> <i>max-number</i>	Optional By default, the maximum number of area addresses is 3.

### Note

- This requires consistent configuration in the entire IS-IS Level-1 routing domain. Otherwise, Level-1 neighbors cannot be normally established. This is not the case for Level-2 neighbors.

### Configure IPv6 IS-IS host name mapping

IS-IS can uniquely identify an intermediate system through system ID. The fixed length of the system ID is 6 bytes. When viewing system information (e.g. neighbor relation, and link status database), users cannot link the system ID with host name; IS-IS supports the mapping of system ID and host name for intuitive and convenient viewing of system information by users. There are two ways to configure IS-IS host name mapping:

1. Configure IS-IS static host name mapping

IS-IS static host name mapping means the mapping that users manually establish system ID and host name for remote devices.

Table 19 Configuring IS-IS Static Host Name Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS static host name mapping	<b>hostname static</b> <i>system-id</i> <i>host-name</i>	Mandatory

2. Configure IS-IS dynamic host name mapping

Static host name mapping requires users to configure system ID and host name mapping of other devices for each device in the network, which is a heavy workload; for dynamic host name mapping, other devices in the network can learn the host name of the device after configuring host name for each device and enabling the host name advertisement function.

Table 20 Configuring IS-IS Dynamic Host Name Mapping

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS dynamic host name mapping	<b>hostname dynamic</b> { <i>host-name</i>   <i>area-tag</i>   <b>recv-only</b>   <b>system-name</b> }	Mandatory By default, only the host name advertised by other devices is learned.

#### Add IPv6 IS-IS interface into mesh group

Without being added into the Mesh group, the IS-IS interface will send the LSP packet received from an interface via all the other IS-IS interfaces. This causes a huge waste of bandwidth in the fully meshed network. You may add several IS-IS interfaces into the same Mesh group. After receiving the LSP packet, the interfaces only send this packet to the interfaces in other Mesh group.

Table 21 Adding IS-IS Interface into Mesh Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Add IS-IS Interface to Mesh Group	<b>isis mesh-group</b> { <i>group-number</i>   <b>blocked</b> }	Mandatory By default, it is not added into any Mesh group.

#### Note

- **isis mesh-group blocked** sets the interface as a blocking interface. The blocking interface

---

will not actively send LSP packets. It does so only when LSP request is received.

---

## 58.2.6 Configure IPv6 IS-IS Network Authentication

### Configuration Condition

Before configuring IPv6 IS-IS network authentication, ensure that:

- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.
- Enable the IPv6 IS-IS protocol.

### Configure IPv6 IS-IS neighbor authentication

After configuring IS-IS to enable neighbor relation authentication, an authentication message will be added into the Hello packet sent, and the Hello packet received will be authenticated. If the authentication fails, a neighbor relation cannot be formed. This will prevent the establishment of neighbor relation with the device which cannot be trusted.

Table 22 Configuring IS-IS Neighbor Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure Hello packet authentication mode	<b>isis authentication mode</b> { <b>md5</b>   <b>sm3</b>   <b>text</b> } [ <b>level-1</b>   <b>level-2</b> ]	Mandatory  By default, the authentication function is disabled.
Configure the authentication password of Hello packet	<b>isis authentication key</b> { <b>0</b>   <b>7</b> } <i>password</i> [ <b>level-1</b>   <b>level-2</b> ]	Either-or  By default, there is no authentication password; authentication password can be configured with a coding strand. For the configuration of coding strand, see the coding strand configuration section in the User Manual.
	<b>isis authentication key-chain</b> <i>key-chain-name</i> [ <b>level-1</b>   <b>level-2</b> ]	

### Configure IPv6 IS-IS route authentication

After configuring IS-IS routing information authentication, an authentication message will be added into the LSP and SNP packet, and the LSP and SNP packet received will be authenticated. If the authentication fails, the packet will be directly discarded. This will prevent the routing information which cannot be trusted from diffusing into the IS-IS network.

Table 23 Configuring IS-IS Route Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure the authentication mode of routing information packet	<b>authentication mode</b> { <b>md5</b>   <b>sm3</b>   <b>text</b> } [ <b>level-1</b>   <b>level-2</b> ]	Mandatory  By default, the authentication function is disabled.
Configure the authentication password of routing information packet	<b>authentication key</b> { <b>0</b>   <b>7</b> } <i>password</i> [ <b>level-1</b>   <b>level-2</b> ]	Either-or  By default, there is no authentication password; authentication password can be configured with a coding strand. For the configuration of coding strand, see the coding strand configuration section in the User Manual.
	<b>authentication key-chain</b> <i>key-chain-name</i> [ <b>level-1</b>   <b>level-2</b> ]	

### 58.2.7 Configure IPv6 IS-IS FRR

#### Configuration Condition

Before configuring IS-IS FRR, ensure that:

- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.
- Enable the IPv6 IS-IS protocol.

#### Configure IPv6 IS-IS FRR

In the IPv6 IS-IS network, as a result of link or device failure, the packets passing the point of failure will be discarded or loops will be produced. The traffic interruption caused thereby will continue until the protocol reconverges after several seconds. In order to reduce the time of traffic interruption, IS-IS FRR can be configured. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic passing through the failed link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 24 Configuring IPv6 IS-IS FRR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-
Enter the IS-IS IPv6 address family configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IPv6 IS-IS to enable the FRR function	<b>fast-reroute route-map</b> <i>route-map-name</i>	Mandatory By default, the IPv6 IS-IS FRR function is disabled.
Configure IPv6 IS-IS to enable the dynamic FRR function	<b>fast-reroute loop-free-alternate [route-map</b> <i>route-map-name]</i>	Mandatory By default, the IPv6 IS-IS dynamic FRR function is disabled.
Configure IPv6 IS-IS to enable the pic function	<b>pic</b>	Mandatory After the pic function is enabled, the auto FRR function is enabled.  By default, the IPv6 IS-IS pic function is disabled.

- 
- The IPv6 IS-IS FRR function has two types, i.e. static FRR and dynamic FRR.
  - Static FRR needs to associate route-map where the next hop interface and address of back-up route are set.
  - Currently, dynamic FRR supports point-to-point network only, i.e. all the output interfaces of the device have a network type of point-to-point. After dynamic FRR is configured, the device automatically calculates and sets back-up next hop interface and address. Dynamic FRR can also associate route-map to set back-up next hop interface and address for the route which matches the route-map only.
  - The methods of enabling rerouting are mutually exclusive;
- 

### 58.2.8 Configure IPv6 IS-IS GR

GR (Graceful Restart) is used to keep the routing information in the forwarding layer of this device and neighbor device unchanged during the switch between host and standby devices to ensure the forwarding process is not affected; after the device is switched for re-running, the two devices synchronize routing information and update forwarding layer in the protocol layer so that the data can keep forwarding during the process of device switch.

There are two types of roles in the GR process:

GR Restarter end: The device for graceful restart of protocol.

GR Helper end: The device which helps with the graceful restart of protocol.

The distributed device can act as GR Restarter and GR Helper, while the centralized device only serves as GR Helper to help the Restarter complete GR.

#### Configuration Condition

Before configuring IPv6 IS-IS GR, ensure that:

- Configure the IPv6 address of interface so that neighbor nodes are reachable at the network layer.
- Enable the IPv6 IS-IS protocol.

#### Configure IPv6 IS-IS GR Restarter

Table 25 Configuring IS-IS GR Restarter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis [ area-tag ]</b>	-

Step	Command	Description
Enable IS-IS to enable the GR function	<b>nsf ietf</b>	Mandatory By default, the GR function is disabled.
Configure advertisement to enter the retransmission times of GR process message	<b>nsf interface-expire</b> <i>resend-cnt</i>	Optional By default, the number of retransmission times is 3.
Configure the retransmission waiting time of GR process message	<b>nsf interface-timer</b> <i>wait-time</i>	Optional By default, the waiting time is 10 seconds.

### Configure IPv6 IS-IS GR Helper

GR Helper can help the Restarter end complete GR. By default, the device enables this function. Users can close this function via command.

Table 26 Configuring IS-IS GR Restarter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IS-IS configuration mode	<b>router isis</b> [ <i>area-tag</i> ]	-
Configure IS-IS GR Helper to disable the capability of Helper	<b>nsf ietf helper disable</b>	Mandatory Configure IS-IS GR Helper to disable the capability of Helper

### 58.2.9 IPv6 IS-IS monitoring and maintaining

Table 27 IPv6 IS-IS Monitoring and Maintaining

Command	Description
<b>clear isis</b> [ <b>instance -null</b>   <i>area-tag</i> ] <b>statistics</b> [ <i>interface_name</i> ]	Clear the statistical information of IPv6 IS-IS protocol operation

Command	Description
<b>clear isis [ instance -null   area-tag ] process</b>	Restart the IPv6 IS-IS protocol process
<b>show isis [ instance -null   area-tag ]</b>	Show the information of IPv6 IS-IS process
<b>show isis instance { -null   area-tag } ipv6 bfd-sessions</b>	Show the information about BFD session of IPv6 IS-IS process
<b>show isis [ instance -null   area-tag ] database [ lsp_id ] [ detail ] [ I1 / I2 ] [ level-1 / level-2 ] [ self ] [ verbose ]</b>	Show the IPv6 IS-IS link status database information
<b>show isis interface [ interface-name ] [ detail ]</b>	Show information of the interface running IPv6 IS-IS protocol
<b>show isis [ instance -null   area-tag ] ipv6 reach-info</b>	Show IPV6 subnet reachable information of IPv6 IS-IS
<b>show isis [ instance -null   area-tag ] ipv6 route</b>	Show the IPV6 routing information of IPv6 IS-IS
<b>show isis [instance -null   area-tag ] mesh-groups</b>	Show the mesh group of IPv6 IS-IS
<b>show isis [ instance -null   area-tag ] neighbors [ interface-name ] [ detail ]</b>	Show the information of IPv6 IS-IS neighbors
<b>show isis [ instance -null   area-tag ] statistics [ interface-name ]</b>	Show the statistical information of IPv6 IS-IS protocol operation
<b>show isis nsf message</b>	Show the information of IPv6 IS-IS GR
<b>show isis nsf status</b>	Show the IPv6 IS-IS GR status
<b>show isis router</b>	Show the host name information of IS-IS

## 58.3 Typical configuration example of IS-ISv6

### 58.3.1 Configure basic functions of IS-ISv6

#### Network Requirements

- Enable network interconnection between devices by configuring IS-ISv6 protocol.

- Device1 is a Level-1 router; Device2 is a Level-1-2 router; Device1 and Device2 are in the same area; the area number is 10. Device3 is a Level-2 router, and the area number is 20. Device2 connects the two areas.

## Network Topology

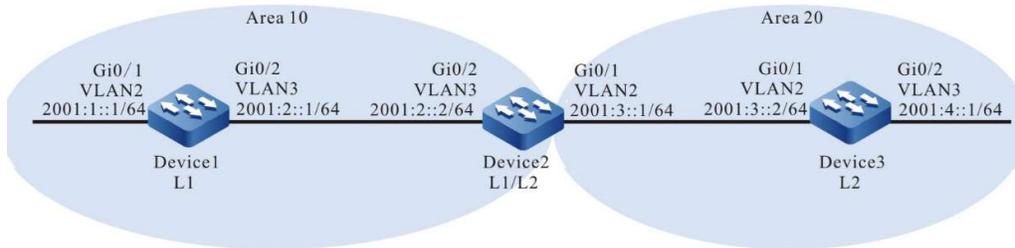

Figure 58 Network Topology for Configuring Basic Functions of IS-ISv6

## Configuration Steps

- Step 1: Configure IPv6 addresses for the ports. (Omitted)
- Step 2: Configure IS-ISv6 and enable the this process on the interface.

#On Device1, configure IS-ISv6 process 100, area number 10 and type Level-1, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-1
Device1(config-isis)#metric-style wide
Device1(config-isis)#address-family ipv6 unicast
Device1(config-isis-af)#multi-topology
Device1(config-isis-af)#exit-address-family
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router isis 100
Device1(config-if-vlan3)#exit
```

#On Device2, configure IS-ISv6 process 100, area number 10 and type Level-1-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#metric-style wide
Device2(config-isis)#address-family ipv6 unicast
Device2(config-isis-af)#multi-topology
Device2(config-isis-af)#exit-address-family
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router isis 100
Device2(config-if-vlan2)#exit
```

```

Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router isis 100
Device2(config-if-vlan3)#exit

```

#On Device3, configure IS-ISv6 process 100, area number 20 and type Level-2, and enable this process on the interface.

```

Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 20.0000.0000.0003.00
Device3(config-isis)#is-type level-2
Device3(config-isis)#metric-style wide
Device3(config-isis)#address-family ipv6 unicast
Device3(config-isis-af)#multi-topology
Device3(config-isis-af)#exit-address-family
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router isis 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router isis 100
Device3(config-if-vlan3)#exit

```

Step 3: Check the result.

#View the information of IS-ISv6 neighbors on Device1.

```

Device1#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L1-LAN 0000.0000.0002 vlan3 Up 25 sec L1 capable 64 0000.0000.0001.02

```

#View the information of IS-ISv6 neighbors on Device2.

```

Device2#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 2):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L1-LAN 0000.0000.0001 vlan2 Up 8 sec L1 capable 64 0000.0000.0001.02
L2-LAN 0000.0000.0003 vlan3 Up 7 sec L2 capable 64 0000.0000.0003.01

```

Device2 establishes IS-ISv6 neighbors with Device1 and Device3.

#View the information of IS-ISv6 neighbors on Device 3.

```

Device3#show isis neighbors
IS-IS Instance 100 Neighbors (Counter 1):
Type System ID Interface State Holdtime Level IETF-NSF Priority Circuit ID
L2-LAN 0000.0000.0002 vlan3 Up 23 sec L2 capable 64 0000.0000.0003.01

```

#View the routing information of Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

i ::0 [115/10]
via fe80::201:7aff:fe5e:6d45, 00:03:17, vlan3
L ::1/128 [0/0]
via ::, 16:03:18, lo0

```

```

C 2001:1::/64 [0/0]
  via ::, 00:20:11, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:20:10, lo0

L 2001:3::2/128 [0/0]
  via ::, 00:00:12, lo0
C 2001:4::/64 [0/0]
  via ::, 00:00:12, vlan3
L 2001:4::1/128 [0/0]
  via ::, 00:00:12, lo0
```

```
Device3#show isis ipv6 route
IS-IS Instance 100, VRF Kernel, IPv6 routes table (Counter 4):
L2 2001:1::/64, flags none, metric 30, from learned, installed
  via fe80::201:7aff:fe5e:6d46, vlan2, neighbor 0000.0000.0002
L2 2001:2::/64, flags none, metric 20, from learned, installed
  via fe80::201:7aff:fe5e:6d46, vlan2, neighbor 0000.0000.0002
L2 2001:3::/64, flags none, metric 10, from network connected
  via ::, vlan2
L2 2001:4::/64, flags none, metric 10, from network connected
  via ::, vlan3
```

Device3 learns Level-1 route. By default, Level-1 leaks to Level-2.

---

## Note

- The metric type is narrow metric by default. Wide metric is recommended.
  - The IS-ISv6 entity attribute is Level-1-2 by default.
-

## 58.3.2 Configure IPv6 IS-IS static FRR

### Network Requirements

- All devices are configured with IPv6 IS-IS protocol.
- Enable static FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

### Network Topology

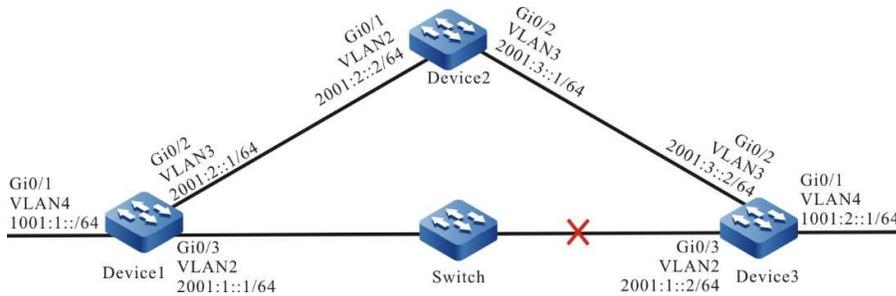

Figure 58 Network Topology for Configuring IPv6 IS-IS Static FRR

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface. (Omitted)

Step 2: Configure IS-ISv6 and enable the this process on the interface.

#On Device1, configure IS-ISv6 process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-2
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router isis 100
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router isis 100
Device1(config-if-vlan3)#exit
```

#On Device2, configure IS-ISv6 process 100, area number 10 and type Level-2, and enable this process on the interface.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#is-type level-2
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#ipv6 router isis 100
Device2(config-if-vlan2)#exit
```

```

Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router isis 100
Device2(config-if-vlan3)#exit

```

#On Device3, configure IS-ISv6 process 100, area number 10 and type Level-2, and enable this process on the interface.

```

Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 10.0000.0000.0003.00
Device3(config-isis)#is-type level-2
Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router isis 100
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router isis 100
Device3(config-if-vlan3)#exit
Device3(config-if-vlan4)#ipv6 router isis 100
Device3(config-if-vlan4)#exit

```

#### Step 4: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 1001:2::1/64 only, and filter other network segments. The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 2001:2::2.

```

Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 1001:2::1/64 any
Device1(config-v6-list)#exit
Device1(config)#route-map ipv6frr_isis
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#set ipv6 fast-reroute backup-interface vlan2 backup-next-hop 2001:2::2
Device1(config-route-map)#exit

```

#### Step 5: Configure static FRR.

```

Device1(config)#router isis 100
Device1(config-isis)#address-family ipv6 unicast
Device1(config-isis-af)#fast-reroute route-map ipv6frr_isis
Device1(config-isis-af)#exit-address-family
Device1(config-isis)#exit

```

#### Step 6: Check the results.

#View IPv6 IS-IS routing table on Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 06:22:27, lo0
C 1001:1::/64 [0/0]
  via ::, 06:17:34, vlan4
L 1001:1::1/128 [0/0]
  via ::, 06:17:34, vlan4
i 1001:2::/64 [115/20]
  via fe80::201:7aff:fe92:e6b6, 00:10:32, vlan2
C 2001:1::/64 [0/0]
  via ::, 01:24:08, vlan2
L 2001:1::1/128 [0/0]
  via ::, 01:24:08, vlan2

```

```

C 2001:2::/64 [0/0]
  via ::, 06:16:52, vlan3
L 2001:2::1/128 [0/0]
  via ::, 06:16:52, vlan3
i 2001:3::/64 [115/20]
  via fe80::201:7aff:fe92:e6b6, 00:29:05, vlan2
  via fe80::ced8:1fff:fe10:7aae, 00:35:19, vlan3

```

According to the routing table, the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View IPv6 FRR routing table on Device1.

```

Device1#show ipv6 frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
i 1001:2::/64 [115/4294967295]
  via 2001:2::2, 00:13:16, vlan3

```

According to the result, the next hop and output interface of the frr route 1001:2::/64 are 2001:2::2 and vlan3 respectively.

#View the BFD session information of Device1.

```

Device1#show bfd session ipv6 2001:1::1 detail
Total ipv6 session number: 1
OurAddr      NeighAddr      LD/RD      State  Holddown  Interface
2001:1::1    2001:1::1      1012/1012  UP     500       vlan2
Type:ipv6 direct Mode:echo
Local Discriminator:301 Remote Discriminator:301
Local State:UP Remote State:UP Up for: 0h:15m:38s Number of times UP:1
Send Interval:100ms Detection time:500ms(100ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
Registered modules:FIB_MGR

```

According to the result, FIB\_MGR has been successfully coordinated with BFD. The session is established normally in the mode of echo.

#When the lines between Device1 and Device3 fail, it can quickly identify the failures and switch to Device2 for communication. The routing table of Device1 shows that the output interface of the destination network 1001:2::/64 has switched to the backup interface vlan3.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 06:29:08, lo0
C 1001:1::/64 [0/0]
  via ::, 06:24:15, vlan4
L 1001:1::1/128 [0/0]
  via ::, 06:24:15, vlan4
i 1001:2::/64 [115/30]
  via fe80::ced8:1fff:fe10:7aae, 00:00:01, vlan3
i 2001:1::/64 [115/30]
  via fe80::ced8:1fff:fe10:7aae, 00:00:01, vlan3
C 2001:2::/64 [0/0]
  via ::, 06:23:33, vlan3
L 2001:2::1/128 [0/0]
  via ::, 06:23:33, vlan3
i 2001:3::/64 [115/20]
  via fe80::ced8:1fff:fe10:7aae, 00:42:00, vlan3

```

### 58.3.3 Configure IPv6 IS-IS dynamic FRR

#### Network Requirements

- All devices are configured with IPv6 IS-IS protocol.
- Enable dynamic FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

#### Network Topology

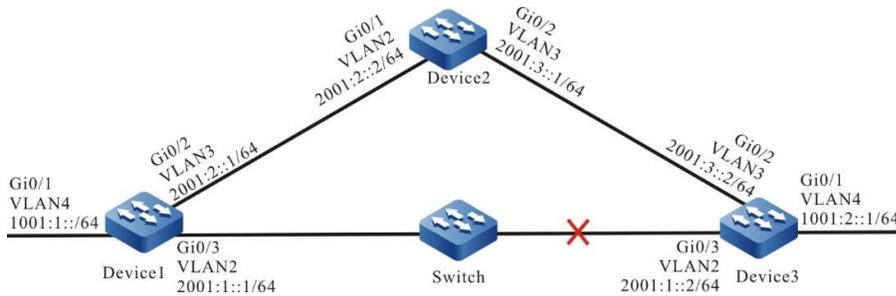

Figure 1 Network Topology for Configuring IPv6 IS-IS Dynamic FRR

#### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface. (Omitted)

Step 2: Configure IS-ISv6 and enable the this process on the interface.

#On Device1, configure IS-ISv6 process 100, area number 10 and type Level-2, and enable this process on the interface. Configure the network type of the interface as point-to-point.

```
Device1#configure terminal
Device1(config)#router isis 100
Device1(config-isis)#net 10.0000.0000.0001.00
Device1(config-isis)#is-type level-2
Device1(config-isis)#metric-style wide
Device1(config-isis)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ipv6 router isis 100
Device1(config-if-vlan2)# isis network point-to-point
Device1(config-if-vlan2)#exit
Device1(config)#interface vlan3
Device1(config-if-vlan3)#ipv6 router isis 100
Device1(config-if-vlan3)# isis network point-to-point
Device1(config-if-vlan3)#exit
```

#On Device2, configure IS-ISv6 process 100, area number 10 and type Level-2, and enable this process on the interface. Configure the network type of the interface as point-to-point.

```
Device2#configure terminal
Device2(config)#router isis 100
Device2(config-isis)#net 10.0000.0000.0002.00
Device2(config-isis)#is-type level-2
Device2(config-isis)#metric-style wide
Device2(config-isis)#exit
Device2(config)#interface vlan2
```

```

Device2(config-if-vlan2)#ipv6 router isis 100
Device2(config-if-vlan2)# isis network point-to-point
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan3
Device2(config-if-vlan3)#ipv6 router isis 100
Device2(config-if-vlan3)# isis network point-to-point
Device2(config-if-vlan3)#exit

```

#On Device3, configure IS-ISv6 process 100, area number 10 and type Level-2, and enable this process on the interface. Configure the network type of the interface as point-to-point.

```

Device3#configure terminal
Device3(config)#router isis 100
Device3(config-isis)#net 10.0000.0000.0003.00
Device3(config-isis)#is-type level-2
Device3(config-isis)#metric-style wide
Device3(config-isis)#exit
Device3(config)#interface vlan2
Device3(config-if-vlan2)#ipv6 router isis 100
Device3(config-if-vlan2)# isis network point-to-point
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan3
Device3(config-if-vlan3)#ipv6 router isis 100
Device3(config-if-vlan3)# isis network point-to-point
Device3(config-if-vlan3)#exit
Device3(config-if-vlan4)#ipv6 router isis 100
Device3(config-if-vlan4)# isis network point-to-point
Device3(config-if-vlan4)#exit

```

### Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 1001:2::1/64 only, and filter other network segments.

```

Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 1001:2::1/64 any
Device1(config-v6-list)#exit
Device1(config)#route-map ipv6frr_isis
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#exit

```

### Step 4: Configure static FRR.

```

Device1(config)#router isis 100
Device1(config-isis)#address-family ipv6 unicast
Device1(config-isis-af)# fast-reroute loop-free-alternate route-map ipv6frr_isis
Device1(config-isis-af)#exit-address-family
Device1(config-isis)#exit

```

### Step 5: Check the results.

#View IPv6 IS-IS routing table on Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 06:22:27, lo0
C 1001:1::/64 [0/0]
  via ::, 06:17:34, vlan4
L 1001:1::1/128 [0/0]
  via ::, 06:17:34, vlan4
i 1001:2::/64 [115/20]
  via fe80::201:7aff:fe92:e6b6, 00:10:32, vlan2

```

```

C 2001:1::/64 [0/0]
  via ::, 01:24:08, vlan2
L 2001:1::1/128 [0/0]
  via ::, 01:24:08, vlan2
C 2001:2::/64 [0/0]
  via ::, 06:16:52, vlan3
L 2001:2::1/128 [0/0]
  via ::, 06:16:52, vlan3
i 2001:3::/64 [115/20]
  via fe80::201:7aff:fe92:e6b6, 00:29:05, vlan2
  via fe80::ced8:1fff:fe10:7aae, 00:35:19, vlan3

```

According to the routing table, the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View IPv6 FRR routing table on Device1.

```

Device1#show ipv6 frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
i 1001:2::/64 [115/4294967295]
  via fe80::ced8:1fff:fe10:7aae, 00:07:18, vlan3

```

#View the BFD session information of Device1.

```

Device1#show bfd session ipv6 2001 :1 ::1 detail
Total ipv6 session number: 1
OurAddr      NeighAddr      LD/RD      State      Holddown  Interface
2001 :1 ::1  2001 :1 ::1    1012/1012  UP         500      vlan2
Type:ipv6 direct Mode:echo
Local Discriminator:301 Remote Discriminator:301
Local State:UP Remote State:UP Up for: 0h:15m:38s Number of times UP:1
Send Interval:100ms Detection time:500ms(100ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
Registered modules:FIB_MGR

```

According to the result, FIB\_MGR has been successfully coordinated with BFD. The session is established normally in the mode of echo.

#When the lines between Device1 and Device3 fail, it can quickly identify the failures and switch to Device2 for communication. The routing table of Device1 shows that the output interface of the destination network 1001:2::/64 has switched to the backup interface vlan3.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 06:29:08, lo0
C 1001:1::/64 [0/0]
  via ::, 06:24:15, vlan4
L 1001:1::1/128 [0/0]
  via ::, 06:24:15, vlan4
i 1001:2::/64 [115/30]
  via fe80::ced8:1fff:fe10:7aae, 00:00:01, vlan3
i 2001:1::/64 [115/30]

C 2001:2::/64 [0/0]
  via ::, 06:23:33, vlan3
L 2001:2::1/128 [0/0]
  via ::, 06:23:33, vlan3
i 2001:3::/64 [115/20]
  via fe80::ced8:1fff:fe10:7aae, 00:42:00, vlan3

```

# 59 IRMP

---

## 59.1 Overview

IRMP (Internal Routing Message Protocol), compatible with Cisco's EIGRP, is a dynamic routing protocol based on distance vector. IRMP uses the diffusing update algorithm for parallel computing between multiple devices to ensure zero loop and fast convergence. While overcoming the defect of slow convergence of distance vector routing protocol, it needs no link status routing protocol to run the Dijkstra algorithm, and can avoid the huge consumption of CPU and memory by relevant database.

IRMP is applicable to small and medium-sized networks. It supports multiple AS that are independent of each other.

## 59.2 IRMP function configuration

Table 59 IRMP Function Configuration List

Configuration Task	
Configure Basic Functions of IRMP	Enable IRMP Protocol
Configure IRMP Route Generation	Configure IRMP Route Redistribution
Configure IRMP Route Control	Configure IRMP Route Summarization
	Configure IRMP Administrative Distance
	Configure IRMP Load Balancing
	Configure IRMP Route Filtration

Configuration Task	
	Configure IRMP Metric Offset
	Configure Metric Value of IRMP Route
Configure IRMP Network Optimization	Configure Passive IRMP Interface
	Configure IRMP Stub
	Configure IRMP Intelligent Query
	Configure IRMP Split Horizon
	Configure IRMP Timer
	Configure IRMP Static Neighbors
Configure IRMP Network Authentication	Configure IRMP Authentication

### 59.2.1 Configure Basic Functions of IRMP

In the various configuration tasks of IRMP, you must first enable the IRMP protocol so that the configuration of the other function features can take effect.

#### Configuration Condition

Before configuring the basic functions of IRMP, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer.

#### Enable IRMP Protocol

To use IRMP, the following configurations are required:

- Create IRMP process;
- Configure the direct network segment covered by IRMP.

Table 59 Enabling IRMP Protocol

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create IRMP process and enter IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	Mandatory By default, IRMP process is disabled.
Configure the direct network segment covered by IRMP	<b>network</b> <i>ip-address</i> [ <i>wildcard-mask</i> ]	Mandatory By default, no direct network segment is covered.  When no inverse mask is carried, it is classful network address by default.

---

### Note

- When establishing IRMP neighbors, ensure the AS number is consistent. Otherwise, neighbor relation cannot be established.
- 

## 59.2.2 Configure IRMP Route Generation

In IRMP, cover the routes in direct network segment via the command **network**, and import external routes through redistribution.

### Configuration Condition

Before configuring IRMP route generation, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable IRMP protocol.

### Configure IRMP Route Redistribution

The routes generated by other protocols can be imported into IRMP by configuring route redistribution. The routes of other IRMP processes can also be imported.

Table 59 Configuring IRMP Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP Route Redistribution	<b>redistribute protocol</b> [ <i>process-id</i> ] [ <b>route-map route-map-name / metric bandwidth delay reliability loading mtu</b> ]	Mandatory By default, external routes are not redistributed.
Configure IRMP to redistribute the default metric value of external route	<b>default-metric bandwidth delay reliability loading mtu</b>	Optional

---

### Note

- When **default-metric** and **redistribute protocol** [ *process-id* ] **metric** are both configured, the latter has a higher priority.
- 

## 59.2.3 Configure IRMP Route Control

### Configuration Condition

Before configuring IRMP route control, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable IRMP protocol.

### Configure IRMP Route Summarization

Both the IRMP summarized route and the original detail route appear in the local routing table. In large and medium-sized networks, only advertising the summarized route to neighbor can significantly decrease the size of the neighbor's routing table, and reduce the consumption of network bandwidth by protocol packets.

IRMP supports automatic summarization and interface address summarization. The metric value of the summarized route uses the minimum metric value among all detail routes.

## 1. Automatic summarization

For automatic summarization, the route is summarized into corresponding classful network address under non- manual configuration by users. Automatic summarization is applicable to the routes in direct network segment only.

Table 59 Configuring IRMP Automatic Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP automatic summarization	<b>auto-summary</b>	Optional By default, the IRMP automatic summarization function is disabled.

## 2. Interface address summarization

For interface address summarization, a pair of destination address and mask combination needs to be configured. They will summarize the routes covered by this network segment.

Table 59 Configuring IRMP Interface Address Summarization

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure IRMP interface address summarization	<b>ip summary-address irmp</b> <i>autonomous-system-number ip-address mask</i>	Mandatory

---

### Note

- For automatic summarization, only the routes in the direct network segment are summarized, and it will result in the reestablishment of all neighbors in the process.
- Interface route summarization is applicable to all the IRMP routes from the specified

---

interface. It will result in the reestablishment of all neighbors on the specified interface.

- Interface route summarization precedes automatic summarization.
  - Interface route summarizations are independent of each other. That is to say, when interface summarizations of 10.1.0.0/16 and 10.0.0.0/8 are configured, IRMP will advertise the two summarized routes at the same time.
- 

### Configure IRMP Administrative Distance

Administrative distance is used to make routing decisions for the same network segment routes from different protocols, and routes with a small administrative distance take precedence. Routing decisions can be affected by modifying the administrative distance of IRMP routes.

Table 59 Configuring IRMP Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> autonomous-system-number	-
Configure IRMP Administrative Distance	<b>distance { irmp</b> <i>internal-routes-distance</i> <i>external-routes-distance</i>   <b>summary</b> <i>summary-routes-distance</i> }	Optional  By default, the administrative distance of internal routes of IRMP is 90, and that of external routes is 170. The summarized route has an administrative distance of 5.

---

### Note

- Configuring IRMP administrative distance will result in the reestablishment of all neighbors in the process.
- 

### Configure IRMP Load Balancing

IRMP supports equal-cost load balancing and unequal-cost load balancing. When there are multiple routes with the same metric leading to a certain destination network, equal-cost load balancing can be formed;

when there are multiple routes with different metrics leading to a certain destination network, the transformation factor can be modified through the command **variance** to form unequal-cost load balancing.

Variance defines a transformation factor to identify the action scope of unequal-cost load balancing routes. When the metric value of a non-optimal route is less than the metric value of the optimal route multiplied by the variance value, the route is selected as an unequal-cost load balancing route.

The **maximum-paths** command is used to control the maximum number of load balancing entries of IRMP. It supports 32 loads at most. When the *path-number* is configured as 1, the load function is cancelled. The IRMP load balancing entries include both equal-cost load and unequal-cost load. IRMP selects the paths that can be used as load balancing according to the transformation factor variance.

Table 59 Configuring IRMP Load Balancing

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP transformation factor to form unequal-cost load	<b>variance</b> <i>number</i>	Optional By default, the value of transformation factor is 1.
Configure the Maximum Number of IRMP Load Balancing Entries	<b>maximum-paths</b> <i>path-number</i>	Optional By default, IRMP supports up to 4 load balancing entries.

### Configure IRMP Route Filtration

Control the routes received or sent by configuring ACLs or prefix lists, and configure route filtration in the in and out directions on the interface at the same time.

Table 59 Configuring IRMP Route Filtration

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP Route Filtration	<b>distribute-list</b> { <i>access-list-name</i>   <b>gateway</b> <i>prefix-list-name1</i>   <b>prefix</b> <i>prefix-list-name2</i> [ <b>gateway</b> <i>prefix-list-name3</i> ] } { <b>in</b>   <b>out</b> } [ <i>interface-name</i> ]	Mandatory

## Note

- IRMP route filtration supports standard ACL only.
- Filtration can be configured on all the interfaces, or on some interfaces through the parameter *interface-name*. When it is configured simultaneously, they are permitted to pass only when both of the two filtering rules are permitted.

### Configure IRMP Metric Offset

By default, IRMP route applies the metric value advertised by the neighbor. To modify the metric value in some special application scenarios, users can configure the IRMP metric offset to correct the metric value of the specified route.

When the metric offset in the incoming direction is configured, the routing metric value is modified when receiving the IRMP route, saved in the routing table, and advertised to neighbors. When the metric offset in the outgoing direction is configured, only the metric value advertised to the neighbor route is modified, with the local one remaining unchanged.

Table 59 Configuring IRMP Metric Offset

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-

Step	Command	Description
Configure IRMP Metric Offset	<b>offset-list</b> <i>access-list-name</i> { <b>in</b>   <b>out</b> } <i>offset-value</i> [ <i>interface-name</i> ]	Mandatory

## Note

- IRMP metric offset supports standard ACL only.
- Configuring IRMP metric offset will result in the reestablishment of all neighbors in the process.

### Configure Metric Value of IRMP Route

IRMP calculates a composite metric value as the routing metric value based on the link characteristics, including bandwidth, time delay, load, and reliability. Calculation method: Routing metric =  $256 * ((k1 * (10^7 / \text{bandwidth}) + k2 * (10^7 / \text{bandwidth}) / (256 - \text{load}) + k3 * (\text{time delay} / 10)) * [k5 / (\text{reliability} + k4)])$ . Of which, the bandwidth unit is Kbit/s, the time delay unit is microsecond, and each k value denotes the weighted value of corresponding link characteristic. By default, IRMP selects link width and time delay as metric values.

Table 59 Configuring IRMP Routing Metric Value

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP Routing Metric Value	<b>metric weights</b> <i>tos k1 k2 k3 k4 k5</i>	Mandatory  tos means service type. Only 0-type service is supported.  By default, $k1=k3=1$ , $k2=k4=k5=0$ . When establishing neighbors, the k value must be consistent. Otherwise, neighbor

Step	Command	Description
		relation cannot be established.

## 59.2.4 Configure IRMP Network Optimization

### Configuration Condition

Before configuring IRMP network optimization, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable IRMP protocol.

### Configure Passive IRMP Interface

Dynamic routing protocol uses passive interface, which can effectively reduce the consumption of network bandwidth by routing protocol. In IRMP, configuring passive interface can suppress the sending and receiving of IRMP packets on the specified interface. For example, after vlan2 is configured as a passive interface, even if the network segment where this interface is located is covered through the command **network**, IRMP will not receive or send packets on this interface.

Table 1 Configuring Passive IRMP Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure Passive IRMP Interface	<b>passive interface</b> <i>interface-name</i>	Mandatory

### Configure IRMP Stub

IRMP Stub can effectively improve IRMP network stability and reduce occupation of resources. The Stub function is usually used in the hub and spoke network topology. To enable this function, users simply need to configure Stub on the spoke router. It's unnecessary to change configuration on the hub router. The spoke router specifies the type of route to be advertised through the **irmp stub** command, and the hub router will not send query packets to Stub neighbors.

Table 2 Configuring IRMP Stub

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP Stub	<b>irmp stub</b> { <b>receive-only</b> }   { <b>connected</b> / <b>summary</b> / <b>redistributed</b> }	Mandatory By default, the Stub mode is disabled.

### Note

- Modifying Stub configuration will result in the reestablishment of all neighbors in the process.

### Configure IRMP Intelligent Query

Configuring IRMP intelligent query to control the sending of query packets can effectively cut down packet interactions in the network so as to reduce resource occupation. When the intelligent query function is enabled, the device will not send query packets to the neighbors with routes cancelled to reduce the number of query and response packets in the network.

Table 3 Configuring IRMP Stub

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP intelligent query	<b>smart-query infinity-update</b>	Mandatory By default, intelligent query is disabled.

### Configure IRMP Split Horizon

IRMP split horizon means that the route learnt from an interface by IRMP will not be advertised from this interface to prevent loops from being produced.

Table 4 Configuring IRMP Split Horizon

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure IRMP split horizon	<b>ip split-horizon irmp</b> <i>autonomous-system-number</i>	Optional By default, the split horizon function is enabled.

### Configure IRMP Timer

#### 1. Configure Keepalive Timer of IRMP Neighbors

IRMP Hello packets are used to identify and keep alive neighbors. They are diffused through periodic unreliable multicast (multicast address 224.0.0.10) on the network. The default sending interval of Hello packets is determined by the network type of the sending interface: 5 seconds on broadcast and point-to-point interface, and 60 seconds on NBMA interface.

Hold time means the invalid time interval of IRMP neighbors. When a device receives a Hello packet from its neighbor, this packet will contain a hold time which tells this device the maximum valid time of the neighbor; if the Hello packet is not received from the neighbor within this time, it is deemed that the neighbor is unreachable and it will be deleted. By default, hold time is 3 times the Hello interval.

Table 5 Configuring Keepalive Timer of IRMP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure IRMP Hello interval	<b>ip hello-interval irmp</b> <i>autonomous-system hello-time</i>	Optional By default, Hello interval is 5 seconds or 60 seconds depending on the network type.

Step	Command	Description
Configure IRMP hold time	<b>ip hold-time irmp</b> <i>autonomous-system-number hold-time</i>	Optional By default, hold time is 3 times the Hello interval.

## 2. Configure Keepalive Timer of IRMP Routes

IRMP uses DUAL (Diffusing Update Algorithm) to learn routes. When the diffusion calculation begins, an Active-timer is started. If the response to all query packets is not received after time out, the neighbors that give no response will be deleted from the neighbor list, and the route that receives no response is set as Active and considered unreachable.

When IRMP receives a neighbor request, if the local route is also learnt from other neighbors, it will not give a response immediately. Instead, it will start a Hold Down timer and wait for a period of time. During this period of time, if no request packet is received from the neighbor, a response packet will be given to prevent loops from being produced.

Table 6 Configuring IRMP Route Timer

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure the timeout time of Active-timer	<b>timers active-time</b> <i>minutes</i>	Optional The default timeout time of Active-timer is 3 minutes.
Configure the timeout time of hold down	<b>timers holddown-time</b> <i>seconds</i>	Optional By default, the timeout time of hold down is 5 seconds.

### Note

- Configuring route timer will result in the reestablishment of all neighbors in the process.

## Configure IRMP Static Neighbors

Configure IRMP static neighbors to enable all IRMP packets between neighbors interact with each other in unicast manner.

To run the IRMP dynamic routing protocol on NBMA network which doesn't support broadcast (e.g. X.25, Frame), you can configure static neighbors. This should be done in pairs on both sides, otherwise neighbor relation cannot be established.

Table 7 Configuring IRMP Static Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the IRMP configuration mode	<b>router irmp</b> <i>autonomous-system-number</i>	-
Configure IRMP Static Neighbors	<b>neighbor</b> <i>neighbor-ip-address interface-name</i>	Mandatory

## 59.2.5 Configure IRMP Network Authentication

### Configuration Condition

Before configuring IRMP authentication, ensure that:

- Interface IP addresses have been configured so that neighbor nodes are reachable at the network layer;
- Enable IRMP protocol.

### Configure IRMP Authentication

Check and verify the effectiveness of IRMP packets by configuring IRMP authentication to improve network security. IRMP supports MD5 authentication only.

Table 8 Configuring IRMP Authentication

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-

Step	Command	Description
Configure IRMP authentication function	<b>ip message-digest-key irmp</b> <i>autonomous-system-number</i> <i>key-id md5 { 0   7 }</i> <i>password</i>	Mandatory

## Note

- To establish IRMP neighbor relation, you need to configure the same Key-id and password on the interface.

## 59.2.6 IRMP monitoring and maintaining

Table 9 IRMP Monitoring and Maintaining

Command	Description
<b>clear ip irmp error</b>	Clear statistics of IGMP error packets
<b>clear ip irmp</b> [ <i>autonomous-system-number</i> ] <b>neighbors</b> [ <i>interface-name</i> ]	Reset IRMP neighbors
<b>clear ip irmp traffic</b> [ <i>autonomous-system-number</i> ]	Clear statistics of sending and receiving IRMP packets
<b>show ip irmp error</b>	Show statistics of IGMP error packets
<b>show ip irmp interface</b> [ <i>autonomous-system-number</i> ]   [ <i>interface-name</i> ]	Show IRMP interface information
<b>show ip irmp neighbor</b> [ <i>autonomous-system-number</i>   <b>detail</b>   <i>interface-name</i> ]	Show IRMP neighbor information
<b>show ip irmp topology</b> [ <i>autonomous-system-number</i> ] [ <b>active</b>   <b>detail</b>   <b>summary</b>   <i>ip-address mask</i> ]	Show the routing information in the IRMP topology table
<b>show ip irmp traffic</b> [ <i>autonomous-system-number</i> ]	Show statistics of sending and receiving IRMP packets

## 59.3 Typical configuration example of IRMP

### 59.3.1 Configure Basic Functions of IRMP

#### Network Requirements

- Run IRMP between Device1 and Device2 for establishment of neighbors and route interaction.

#### Network Topology

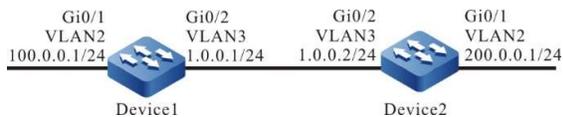

Figure 59 Network Topology for Basic Functions of IRMP

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IRMP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router irmp 100
Device1(config-irmp)#network 1.0.0.0 0.0.0.255
Device1(config-irmp)#network 100.0.0.0 0.0.0.255
Device1(config-irmp)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router irmp 100
Device2(config-irmp)#network 1.0.0.0 0.0.0.255
Device2(config-irmp)#network 200.0.0.0 0.0.0.255
Device2(config-irmp)#exit
```

Step 3: Check the result.

#### #View the information of IRMP neighbors on Device1.

```
Device1#show ip irmp neighbor
IP-IRMP neighbors for process 100 Total neighbor 1
Address      Interface      Hold(s)  Uptime    SeqNum  Srtt(ms)  Rto(s)
1.0.0.2      vlan3          11       00:01:19  1        16         2
```

#### #View the information of IRMP neighbors on Device2.

```
Device2#show ip irmp neighbor
IP-IRMP neighbors for process 100 Total neighbor 1
Address      Interface      Hold(s)  Uptime    SeqNum  Srtt(ms)  Rto(s)
1.0.0.1      vlan3          11       00:01:19  1        16         2
```

According to the result, IRMP neighbor has been successfully established between Device1 and Device2.

#View topology table and routing table on Device1.

```
Device1#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
> - FIB route, * - FIB successor

P >1.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan3
P >200.0.0.0/24, 1 successors, FD is 30720
   *via 1.0.0.2 (30720/28160), vlan3
P >100.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan2

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:27:02, vlan3
E 200.0.0.0/24 [90/30720] via 1.0.0.2, 00:15:07, vlan3
C 100.0.0.0/24 is directly connected, 00:27:14, vlan2
C 127.0.0.0/8 is directly connected, 137:46:13, lo0
```

Device1 learns the route 200.0.0.0/24 advertised by Device2.

#View the IRMP topology table and routing table of Device2.

```
Device2#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
> - FIB route, * - FIB successor

P >1.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan3
P >200.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan2
P >100.0.0.0/24, 1 successors, FD is 30720
   *via 1.0.0.1 (30720/28160), vlan3

Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:20:12, vlan3
C 200.0.0.0/24 is directly connected, 00:19:53, vlan2
E 100.0.0.0/24 [90/30720] via 1.0.0.1, 00:08:41, vlan3
C 127.0.0.0/8 is directly connected, 361:04:08, lo0
```

Device2 learns the route 100.0.0.0/24 advertised by Device1.

## 59.3.2 Configure IRMP Route Redistribution

### Network Requirements

- Device3 establishes OSPF neighbors with Device2, and advertises direct routes of the interface 200.0.0.0/24 and 210.0.0.0/24 to Device2.
- Device1 establishes IRMP neighbors with Device2. When Device2 redistributes OSPF route to IRMP, use routing policy to advertise the route 200.0.0.0/24 instead of the

route 210.0.0.0/24 to Device1.

## Network Topology

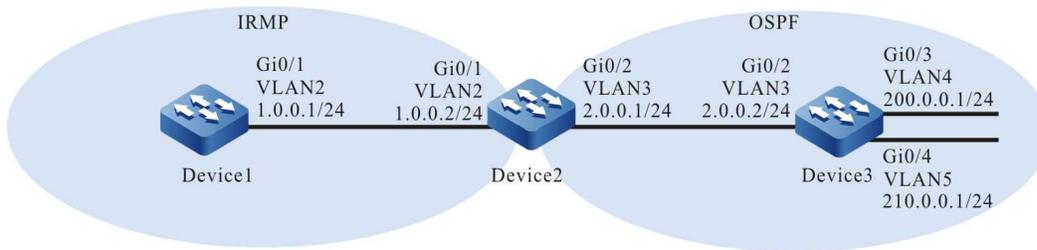

Figure 59 Network Topology for IRMP Route Redistribution

## Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure OSPF.

#Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 200.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 210.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#View the routing table of Device 2.

```
Device2#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 07:39:21, vlan2
C 2.0.0.0/24 is directly connected, 00:03:36, vlan3
C 127.0.0.8 is directly connected, 57:04:58, lo0
O 200.0.0.0/24 [110/2] via 2.0.0.2, 00:01:10, vlan3
O 210.0.0.0/24 [110/2] via 2.0.0.2, 00:01:10, vlan3
```

According to the routing table, Device2 learns the OSPF route 200.0.0.0/24 and 210.0.0.0/24 advertised by Device3.

Step 3: Configure IRMP.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router irmp 100
```

```
Device1(config-irmp)#network 1.0.0.0 0.0.0.255
Device1(config-irmp)#exit
```

#Configure Device2.

```
Device2(config)#router irmp 100
Device2(config-irmp)#network 1.0.0.0 0.0.0.255
Device2(config-irmp)#exit
```

#View the information of IRMP neighbors on Device1.

```
Device1#show ip irmp neighbor
IP-IRMP neighbors for process 100 Total neighbor 1
Address      Interface      Hold(s)  Uptime  SeqNum  Srtt(ms)  Rto(s)
1.0.0.2      vlan2          11       00:01:19  1       16        2
```

IRMP neighbor has been successfully established between Device1 and Device2.

Step 4: Configure IRMP to redistribute OSPF routes and associate routing policy.

#Configure routing policy on Device2 to match the ACL that permits the route 200.0.0.0/24 only, and associate this routing policy when IRMP redistributes OSPF routes.

```
Device2(config)#ip access-list standard 1
Device2(config-std-nacl)#permit 200.0.0.0 0.0.0.255
Device2(config-std-nacl)#exit
Device2(config)#route-map ospf_to_irmp
Device2(config-route-map)#match ip address 1
Device2(config-route-map)#exit
Device2(config)#router irmp 100
Device2(config-irmp)#redistribute ospf 100 route-map ospf_to_irmp
Device2(config-irmp)#exit
```

---

## Note

- When configuring a routing policy, both the prefix list and ACL can create matching rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 5: Check the result.

#View the RMP topology table on Device2.

```
Device2#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
> - FIB route, * - FIB successor

P >1.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan2
P 200.0.0.0/24, 1 successors, FD is 28160
   via RedisOSPF 100 (28160/0)
```

According to the result, Device2 has successfully redistributed OSPF route to IRMP.

#View topology table and routing table on Device1.

```
Device1#show ip irmp topology
```

```
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
       > - FIB route, * - FIB successor

P>1.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan2
P>200.0.0.0/24, 1 successors, FD is 30720
   *via 1.0.0.2 (30720/28160), vlan2

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 07:47:01, vlan2
C 127.0.0.0/8 is directly connected, 07:55:23, lo0
Ex 200.0.0.0/24 [170/30720] via 1.0.0.2, 00:00:06, vlan2
```

According to the result, Device1 learns the route 200.0.0.0/24.

---

## Caution

- In practical applications, if the autonomous system has 2 or more edge routers, directly redistributing routes between different routing protocols is not recommended. When configuration is necessary, routing control policies such as filtering and summarization are required on the edge routers of the autonomous system to avoid routing loops.
- 

### 59.3.3 Configure IRMP Metric Offset

#### Network Requirements

- Run IRMP protocol between Device1, Device2, Device3 and Device4 for interaction.
- Device1 learns the route 200.0.0.0/24 from both Device2 and Device3 at the same time.
- It is required to configure the routing metric offset in the receiving direction on Device1 to make Device1 first select the route advertised by Device2.

#### Network Topology

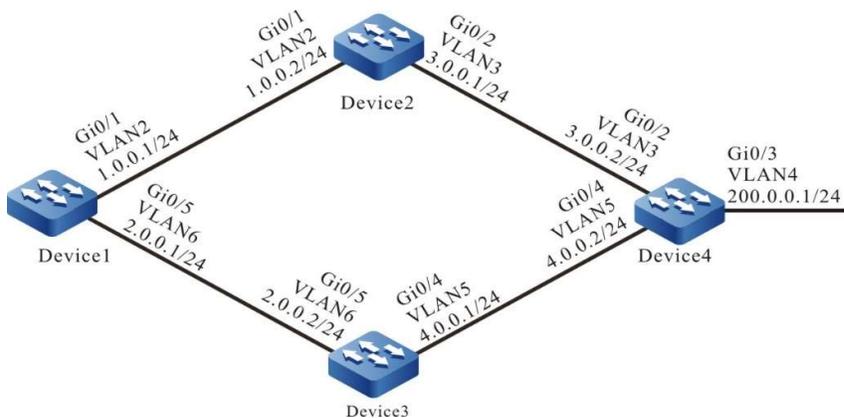

Figure 59 Network Topology for IRMP Metric Offset

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IRMP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router irmp 100
Device1(config-irmp)#network 1.0.0.0 0.0.0.255
Device1(config-irmp)#network 2.0.0.0 0.0.0.255
Device1(config-irmp)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router irmp 100
Device2(config-irmp)#network 1.0.0.0 0.0.0.255
Device2(config-irmp)#network 3.0.0.0 0.0.0.255
Device2(config-irmp)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router irmp 100
Device3(config-irmp)#network 2.0.0.0 0.0.0.255
Device3(config-irmp)#network 4.0.0.0 0.0.0.255
Device3(config-irmp)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router irmp 100
Device4(config-irmp)#network 3.0.0.0 0.0.0.255
Device4(config-irmp)#network 4.0.0.0 0.0.0.255
Device4(config-irmp)#network 200.0.0.0 0.0.0.255
Device4(config-irmp)#exit
```

#### #View the information of IRMP neighbors on Device1.

```
Device1#show ip irmp neighbor

   *via 1.0.0.2 (30720/28160), vlan2
P >4.0.0.0/24, 1 successors, FD is 30720
   *via 2.0.0.2 (30720/512), vlan6
P >200.0.0.0/24, 2 successors, FD is 33280
   *via 2.0.0.2 (33280/30720), vlan6
   *via 1.0.0.2 (33280/30720), vlan2

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 13:16:35, vlan2
C 2.0.0.0/24 is directly connected, 13:19:24, vlan6
E 3.0.0.0/24 [90/30720] via 1.0.0.2, 00:03:22, vlan2
E 4.0.0.0/24 [90/30720] via 2.0.0.2, 00:22:01, vlan6
C 127.0.0.0/8 is directly connected, 22:27:25, lo0
E 200.0.0.0/24 [90/33280] via 2.0.0.2, 00:21:22, vlan6
   [90/33280] via 1.0.0.2, 00:03:22, vlan2
```

There are two load balancing routes leading to the network segment 200.0.0.0/24 in the routing table of Device1. The forwarding paths to this network segment are as follows: Device1→Device2→Device4 and Device1→Device3→Device4.

Step 3: Configure IRMP metric offset.

#Configure an offset list on Device1, and add the metric value by 100 on the interface connected to Device3 for the specified route 200.0.0.0/24, so that the total metric value that passes through Device3 is greater than that passes through Device2.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 200.0.0.0 0.0.0.255
Device1(config-std-nacl)#exit
Device1(config)#router irmp 100
Device1(config-irmp)#offset-list 1 in 100 vlan 6
Device1(config-irmp)#exit
```

Step 4: Check the result.

#View topology table and routing table on Device1.

```
Device1#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
> - FIB route, * - FIB successor

P >1.0.0.0/24, 1 successors, FD is 28160
  *via Connected (28160/0), vlan2
P >2.0.0.0/24, 1 successors, FD is 28160
  *via Connected (28160/0), vlan6
P >3.0.0.0/24, 1 successors, FD is 30720
  *via 1.0.0.2 (30720/28160), vlan2
P >4.0.0.0/24, 1 successors, FD is 30720
  *via 2.0.0.2 (30720/512), vlan6
P >200.0.0.0/24, 2 successors, FD is 33280
  *via 1.0.0.2 (33280/30720), vlan2
  via 2.0.0.2 (33380/30820), vlan6

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 13:33:22, vlan2
C 2.0.0.0/24 is directly connected, 13:36:11, vlan6
E 3.0.0.0/24 [90/30720] via 1.0.0.2, 00:06:56, vlan2
E 4.0.0.0/24 [90/30720] via 2.0.0.2, 00:05:43, vlan6
C 127.0.0.0/8 is directly connected, 22:44:12, lo0
E 200.0.0.0/24 [90/33280] via 1.0.0.2, 00:06:56, vlan2
```

After configuring metric offset, Device1 selects the route 200.0.0.0/24 advertised by Device2.

---

### Note

- Configuring IRMP offset list will result in the reestablishment of neighbors.
- 

## 59.3.4 Configure IRMP Route Filtration

### Network Requirements

- Run IRMP between Device1 and Device2 for route interaction.
- The two routes 2.0.0.0/24 and 3.0.0.0/24 advertised by Device2 are learned on Device1. Yet only the routing information of 2.0.0.0/24 needs to be retained on Device1.

### Network Topology

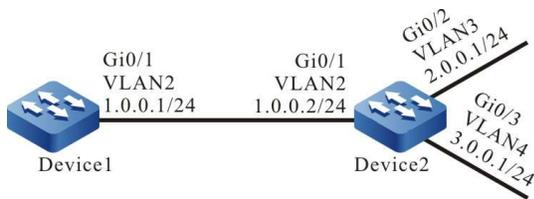

Figure 59 Network Topology for IRMP Route Filtration

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IRMP.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router irmp 100
Device1(config-irmp)#network 1.0.0.0 0.0.0.255
Device1(config-irmp)#exit
```

#Configure Device2.

```
Device2#configure terminal
Device2(config)#router irmp 100
Device2(config-irmp)#network 1.0.0.0 0.0.0.255
Device2(config-irmp)#network 2.0.0.0 0.0.0.255
Device2(config-irmp)#network 3.0.0.0 0.0.0.255
Device2(config-irmp)#exit
```

#View the information of IRMP neighbors on Device1.

```
Device1#show ip irmp neighbor
IP-IRMP neighbors for process 100 Total neighbor 1
Address      Interface      Hold(s)  Uptime    SeqNum  Srtt(ms)  Rto(s)
1.0.0.2     vlan2          11       00:05:00  3       0         2
```

According to the result, IRMP neighbor has been successfully established between Device1 and Device2.

#View the routing table of Device1.

```
Device1#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
> - FIB route, * - FIB successor

P >1.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan2
P >2.0.0.0/24, 1 successors, FD is 30720
   *via 1.0.0.2 (30720/28160), vlan2
P >3.0.0.0/24, 1 successors, FD is 30720
   *via 1.0.0.2 (30720/28160), vlan2

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:11:29, vlan2
E 2.0.0.0/24 [90/30720] via 1.0.0.2, 00:07:43, vlan2
E 3.0.0.0/24 [90/30720] via 1.0.0.2, 00:07:40, vlan2
C 127.0.0.0/8 is directly connected, 00:19:50, lo0
```

Device1 learns the routes 2.0.0.0/24 and 3.0.0.0/24.

Step 3: Configure route filtration.

#Configure ACL rules on Device1 to allow the route 2.0.0.0/24 only, and configure association of filter list with this ACL in the incoming direction in IRMP.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 2.0.0.0 0.0.0.255
Device1(config-std-nacl)#exit
Device1(config)#router irmp 100
Device1(config-irmp)#distribute-list 1 in
Device1(config-irmp)#exit
```

---

### Note

- When configuring route filtration, both the prefix list and ACL can create filtering rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 4: Check the result.

#View topology table and routing table on Device1.

```
Device1#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
> - FIB route, * - FIB successor

P >1.0.0.0/24, 1 successors, FD is 28160
   *via Connected (28160/0), vlan2
P >2.0.0.0/24, 1 successors, FD is 30720
   *via 1.0.0.2 (30720/28160), vlan2

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 00:22:33, vlan2
E 2.0.0.0/24 [90/30720] via 1.0.0.2, 00:04:18, vlan2
C 127.0.0.0/8 is directly connected, 00:30:55, lo0
```

Device1 learns the route 2.0.0.0/24 only. The route 3.0.0.0/24 has been successfully filtered.

---

### Note

- Configuring the command **distribute-list** will result in the reestablishment of IRMP neighbors.
-

## 59.3.5 Configure IRMP Route Summarization

### Network Requirements

- Run IRMP between Device1, Device2, Device3 and Device4 for route interaction.
- Device1 learns two routes, i.e. 100.1.0.0/24 and 100.2.0.0/24, from Device2. In order to reduce the size of the routing table of Device1, Device2 needs to distribute the summarized route 100.0.0.0/14 only to Device1.

### Network Topology

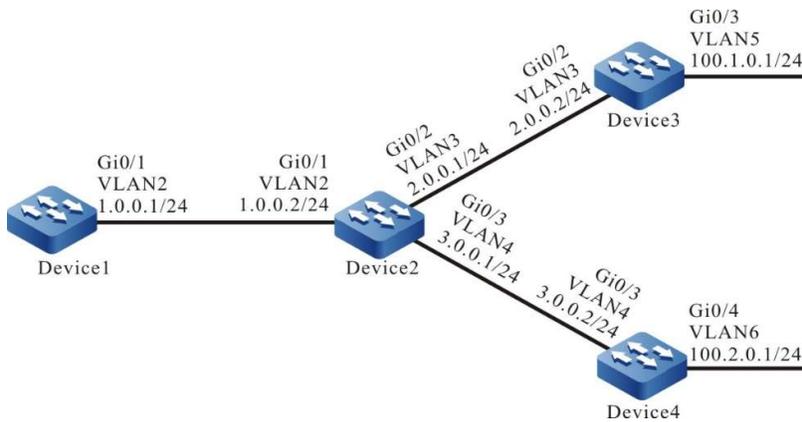

Figure 59 Network Topology for IRMP Route Summarization

### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IRMP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router irmp 100
Device1(config-irmp)#network 1.0.0.0 0.0.0.255
Device1(config-irmp)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router irmp 100
Device2(config-irmp)#network 1.0.0.0 0.0.0.255
Device2(config-irmp)#network 2.0.0.0 0.0.0.255
Device2(config-irmp)#network 3.0.0.0 0.0.0.255
Device2(config-irmp)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router irmp 100

    *via 1.0.0.2 (30720/28160), vlan2
P >100.0.0.0/14, 1 successors, FD is 33280
    *via 1.0.0.2 (33280/30720), vlan2

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
```

O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```
C 1.0.0.0/24 is directly connected, 08:18:49, vlan2
E 2.0.0.0/24 [90/30720] via 1.0.0.2, 00:04:54, vlan2
E 3.0.0.0/24 [90/30720] via 1.0.0.2, 00:04:54, vlan2
E 100.0.0.0/14 [90/33280] via 1.0.0.2, 00:04:54, vlan2
C 127.0.0.0/8 is directly connected, 08:27:10, lo0
```

According to the result, only the summarized route 100.0.0.0/14 is found in the routing table of Device1. There are no corresponding detail routes 100.1.0.0/24 and 100.2.0.0/24.

---

## Note

- Configuring IRMP route summarization in interface mode will result in the reestablishment of neighbors.
- 

### 59.3.6 Configure IRMP Load Balancing

#### Network Requirements

- Run IRMP between Device1, Device2, Device3 and Device4 for route interaction.
- Device1 learns the route 200.0.0.0/24 from Device2 and Device3 at the same time. Modify the bandwidth of Device1's interface vlan4 so that Device1 selects the route 200.0.0.0/24 learned from Device2.
- Device1 is required to forward data to the network segment 200.0.0.0/24 on the two lines Device1→Device2→Device4 and Device1→Device3→Device4.

#### Network Topology

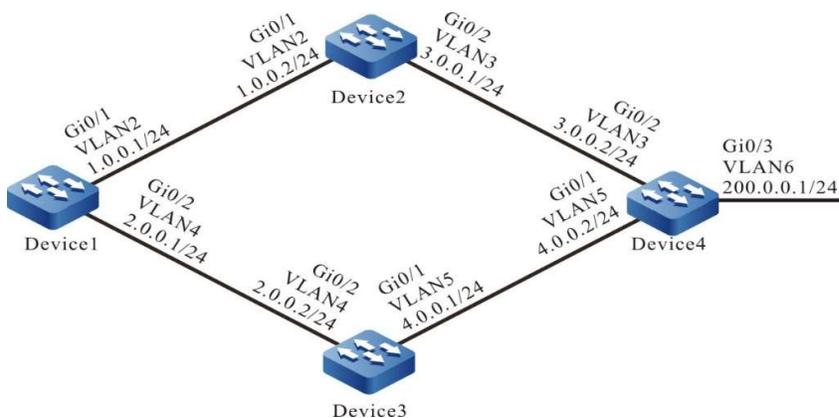

Figure 59 Network Topology for IRMP Unequal-cost Load Balancing

#### Configuration Steps

Step 1: Configure IP addresses for the ports. (Omitted)

Step 2: Configure IRMP.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router irmp 100
Device1(config-irmp)#network 1.0.0.0 0.0.0.255
Device1(config-irmp)#network 2.0.0.0 0.0.0.255
Device1(config-irmp)#exit
```

#Configure Device2.

```
Device2#configure terminal
Device2(config)#router irmp 100
Device2(config-irmp)#network 1.0.0.0 0.0.0.255
Device2(config-irmp)#network 3.0.0.0 0.0.0.255
Device2(config-irmp)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#router irmp 100
Device3(config-irmp)#network 2.0.0.0 0.0.0.255
Device3(config-irmp)#network 4.0.0.0 0.0.0.255
Device3(config-irmp)#exit
```

#Configure Device4.

```
Device4#configure terminal
Device4(config)#router irmp 100
Device4(config-irmp)#network 3.0.0.0 0.0.0.255
Device4(config-irmp)#network 4.0.0.0 0.0.0.255
Device4(config-irmp)#network 200.0.0.0 0.0.0.255
Device4(config-irmp)#exit
```

#View the information of IRMP neighbors on Device1.

```
Device1#show ip irmp neighbor

C 2.0.0.0/24 is directly connected, 13:19:24, vlan4
E 3.0.0.0/24 [90/30720] via 1.0.0.2, 00:03:22, vlan2
E 4.0.0.0/24 [90/30720] via 2.0.0.2, 00:22:01, vlan4
C 127.0.0.0/8 is directly connected, 22:27:25, lo0
E 200.0.0.0/24 [90/33280] via 2.0.0.2, 00:21:22, vlan4
  [90/33280] via 1.0.0.2, 00:03:22, vlan2

```

There are two routes leading to the network segment 200.0.0.0/24 in the routing table of Device1. The forwarding paths to this network segment are as follows: Device1→Device2→Device4 and Device1→Device3→Device4.

Step 3: Modify interface bandwidth.

#Modify the bandwidth of the interface connected to Device1 and Device3 as 10000Kbps.

```

Device1(config)#interface vlan 4
Device1(config-if-vlan4)#bandwidth 10000
Device1(config-if-vlan4)#exit

```

#View topology table and routing table on Device1.

```

Device1#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
       > - FIB route, * - FIB successor

P>1.0.0.0/24, 1 successors, FD is 28160
  *via Connected (28160/0), vlan2
P>2.0.0.0/24, 1 successors, FD is 258560
  *via Connected (258560/0), vlan4
P>3.0.0.0/24, 1 successors, FD is 30720
  *via 1.0.0.2 (30720/28160), vlan2
P>4.0.0.0/24, 1 successors, FD is 261120
  *via 2.0.0.2 (261120/28160), vlan4
P>200.0.0.0/24, 2 successors, FD is 33280
  *via 1.0.0.2 (33280/30720), vlan2
  via 2.0.0.2 (263680/30720), vlan4

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 28:44:11, vlan2
C 2.0.0.0/24 is directly connected, 00:14:05, vlan4
E 3.0.0.0/24 [90/30720] via 1.0.0.2, 00:10:11, vlan2
E 4.0.0.0/24 [90/284160] via 2.0.0.2, 00:07:57, vlan4
C 127.0.0.0/8 is directly connected, 22:26:51, lo0
E 200.0.0.0/24 [90/33280] via 1.0.0.2, 00:10:11, vlan2

```

After configuring metric offset, Device1 selects the route 200.0.0.0/24 advertised by Device2.

Step 4: Configure IRMP unequal-cost load balancing.

#On Device1, configure the transformation factor of load balancing as 100.

```
Device1(config)#router irmp 100
Device1(config-irmp)#variance 100
Device1(config-irmp)#exit
```

For detailed introduction to the transformation factor of load balancing, see the load balancing section of the IRMP function configuration part.

Step 5: Check the result.

#View topology table and routing table on Device1.

```
Device1#show ip irmp topology
IP-IRMP Topology Table for process 100
Codes: P - Passive, A - Active, H - Holddown, D - Hidden
> - FIB route, * - FIB successor

P >1.0.0.0/24, 1 successors, FD is 28160
  *via Connected (28160/0), vlan2
P >2.0.0.0/24, 1 successors, FD is 28160
  *via Connected (28160/0), vlan4
P >3.0.0.0/24, 1 successors, FD is 30720
  *via 1.0.0.2 (30720/28160), vlan2
P >4.0.0.0/24, 1 successors, FD is 284160
  *via 2.0.0.2 (284160/28160), vlan4
P >200.0.0.0/24, 2 successors, FD is 33280
  *via 1.0.0.2 (33280/30720), vlan2
  *via 2.0.0.2 (263680/30720), vlan4

Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 1.0.0.0/24 is directly connected, 28:47:15, vlan2
C 2.0.0.0/24 is directly connected, 00:17:08, vlan4
E 3.0.0.0/24 [90/30720] via 1.0.0.2, 00:13:15, vlan2
E 4.0.0.0/24 [90/284160] via 2.0.0.2, 00:11:00, vlan4
C 127.0.0.0/8 is directly connected, 220:29:54, lo0
E 200.0.0.0/24 [90/33280] via 1.0.0.2, 00:13:15, vlan2
  [90/263680] via 2.0.0.2, 00:00:12, vlan4
```

The route 200.0.0.0/24 on Device1 shows unequal-cost load balancing. The data will have load transmission on these two paths by the inverse ratio of metric value.

# 60 BGP

---

## 60.1 Overview

BGP (Border Gateway Protocol) is a routing protocol which can be used to exchange Network Layer Reachability Information (NLRI) between Autonomous Systems (AS). IGPs (Internal Gateway Protocols), e.g. RIP, OSPF and IS-IS, aim to look for exact paths, with network node (such as router, three-layer switch, and multi-NIC host) being the path finding unit. EGPs (External Gateway Protocols) focus on controlling routing direction, with AS network being the unit.

BGPs can be used for interconnection between AS networks to provide routing information exchange between AS. They are widely applied in large network aggregation and network core. This application level makes BGP have the following characteristics compared to IGP:

- BGP uses TCP protocol to transmit packets, and the service port number is 179. TCP guarantees the reliability of transmission. Therefore, a separate transmission control policy is not required to ensure the reliability of information;
- BGP updates routes through increment. That is to say, only when routing attributes change or routes are added or deleted, such routing change will be advertised to neighbors. This greatly reduces the network bandwidth occupied by BGP to propagate routes;
- BGP is an AS-based distance vector protocol. It deals with routing loops by carrying AS path attributes in routing packets;
- BGP route has various attributes. You can control route filtering and selection by applying routing policies to modify these attributes;
- BGP has two types of neighbor, i.e. IBGP and EBGP. They have different route advertising and selection policies.

## 60.2 BGP function configuration

Table 60 BGP Function Configuration List

Configuration Task	
Configure BGP Neighbor	Configure IBGP Neighbor
	Configure EBGP Neighbor

Configuration Task	
	Configure Passive BGP Neighbor
	Configure MP-BGP Neighbor
	Configure MD5 Authentication of BGP Neighbor
Configure BGP Route Generation	Configure BGP to Distribute Local Route
	Configure BGP Route Redistribution
	Configure BGP to Distribute Default Route
Configure BGP Route Control	Configure BGP to Distribute Aggregated Route
	Configure Administrative Distance of BGP Route
	Configure Routing Policy of BGP Neighbors in Outgoing Direction
	Configure Routing Policy of BGP Neighbors in Incoming Direction
	Configure the Maximum Number of Routing Entries Received by BGP Neighbors
	Configure the Maximum Number of BGP Load Balancing Entries
Configure BGP Route Attributes	Configure BGP Route Weight
	Configure MED Attributes of BGP Route
	Configure Local-Preference Attributes of BGP Route
	Configure AS_PATH Attributes of BGP Route
	Configure NEXT-HOP Attributes of BGP Route
	Configure Community Attributes of BGP Route
Configure BGP Network Optimization	Configure Keepalive Time of BGP Neighbor
	Configure BGP Route Detection Time

Configuration Task	
	Configure Fast Disconnection of EBGP Neighbor
	Configure BGP Route Dampening Function
	Configure BGP Neighbor Refresh Capability
	Configure Soft Resetting Capability of BGP Neighbor
	Configure ORF Capability of BGP Neighbor
Configure Large BGP Network	Configure BGP Peer Group
	Configure BGP Route Reflector
	Configure BGP Confederation
Configure BGP GR	Configure BGP GR Helper
Configure BGP to Coordinate with BFD	Configure EBGP to Coordinate with BFD
	Configure IBGP to Coordinate with BFD

## 60.2.1 Configure BGP Neighbor

### Configuration Condition

Before configuring BGP neighbors, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.

### Configure IBGP Neighbor

#### 1. Basic configuration

To configure IBGP neighbor, you are required to specify the same AS of neighbor as that of this device. Router ID can be configured for the device. It is used to uniquely mark a BGP device when establishing BGP session. When Router ID is not configured, the device will select one based interface address according to by following principles:

- Firstly, select the largest IP address from the Loopback interface as Router ID;

- If no Loopback interface is configured for IP address, select the largest IP addresses from other interfaces as Router ID;
- Only when the interface is UP can the interface address be selected as Router ID.

Table 60 Configuring IBGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	Mandatory By default, BGP is disabled.
Configure BGP device ID	<b>bgp router-id</b> <i>router-id</i>	Optional By default, the device makes selections according to interface address. In particular, Loopback interface and large IP address have a higher priority.
Configure IBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no IBGP neighbor is created.
Activate IBGP neighbor's capability of receiving and sending IPv4 unicast route	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Optional By default, IBGP neighbor's capability of receiving and sending IPv4 unicast route is automatically activated.
Description of configuring IBGP neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>description</b> <i>description-string</i>	Optional By default, there is no description of IBGP neighbor.

## 2. Configure source address of TCP session

BGP uses TCP as transmission protocol. Featured by reliable transmission, TCP can effectively ensure that BGP protocol packets are correctly transmitted to the neighbors.

Table 60 Configuring Source Address of TCP Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure IBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no IBGP neighbor is created.
Configure source address for TCP session of IBGP neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-name</i>   <i>ip-address</i> }	Mandatory By default, the TCP session automatically selects the address of the route's output interface as source address.

### Note

- When there is load balancing route, source address of TCP session is required to be configured between BGP neighbors. When the TCP source address is not configured, different output interfaces may be used as their source addresses because neighbors have different optimal routes. As a result, BGP session cannot be successfully established within a period of time.

## Configure EBGP Neighbor

### 1. Basic configuration

To configure EBGP neighbor, you are required to specify different AS of neighbor from that of this device.

Table 60 Configuring EBGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure EBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no EBGP neighbor is created.

## 2. Configure Indirect EBGP Neighbor

Located in different operation networks, EBGP neighbors are often connected via a direct physical link. Thus, the default TTL value of IP packets communicated between EBGP neighbors is 1. If they are in the indirect operation network, you can set the TTL value of IP packets via a configuration command to allow BGP connection.

Table 60 Configuring Indirect EBGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure EBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no EBGP neighbor is created.
Configure source address for TCP session of EBGP neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-name</i>   <i>ip-address</i> }	Optional By default, the TCP session automatically selects the address of the route's output interface as source address.
allow connection between indirect EBGP neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>ebgp-multihop</b> [ <i>ttl-value</i> ]	Mandatory By default, EBGP neighbor relation between indirect devices is not allowed.

## Configure Passive BGP Neighbor

The passive neighbor function is required in the special application environment. After passive neighbor is applied, BGP will not actively initiate a TCP connection request to establish BGP neighbor. The neighbor relation cannot be built until the neighbor actively issues a connection request. By default, the two neighbors will actively initiate connections to each other. When there is a conflict between the connections, a TCP connection will be selected to create a BGP session. Before configuring passive BGP neighbors, you need to configure BGP neighbors.

● Table 60 Configuring Passive BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Configure Passive BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>passive</b>	Mandatory By default, no passive neighbor is enabled.

## Configure MP-BGP Neighbor

By default, BGP neighbors are activated under the IPv4 unicast address family. They have the ability of sending and receiving IPv4 unicast routes. For other address families, such as multicast address family, VRF address family, and LS unicast address cluster, neighbors need to be activated through a configuration command so that they can send and receive corresponding routes. Before configuring MP-BGP neighbors, you need to configure BGP neighbors.

Table 60 Configuring MP-BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Enter the BGP IPv4 multicast configuration mode	<b>address-family ipv4 multicast</b>	Mandatory By default, unicast address family mode shows after entering the BGP configuration mode.
Activate neighbors under BGP IPv4 multicast address family	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Mandatory By default, global neighbors are not activated under multicast address family.
Exit the BGP IPv4 multicast configuration mode	<b>exit-address-family</b>	-
Enter the BGP IPv4 VRF configuration mode	<b>address-family ipv4 vrf</b> <i>vrf-name</i>	-
Configure neighbors under BGP IPv4 VRF address family	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Activate neighbors under IPv4 VRF address family	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Optional By default, the neighbors under BGP IPv4 VRF configuration mode have been activated.
Exit the BGP IPv4 VRF configuration mode	<b>exit-address-family</b>	-
Enter the BGP LS configuration mode	<b>address-family link-state unicast</b>	-

Step	Command	Description
Activate neighbors under BGP LS unicast address family	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Mandatory By default, global neighbors are not activated under VPN address family.
Exit the BGP LS configuration mode	<b>exit-address-family</b>	-

### Note

- Neighbors configured in BGP configuration mode and BGP IPv4 unicast configuration mode are global neighbors, and those configured in BGP IPv4 VRF configuration mode belong to the VRF address family only.

### Configure MD5 Authentication of BGP Neighbor

BGP supports the configuration of MD5 authentication so as to protect the information exchange between neighbors. MD5 authentication is completed by TCP transmission protocol. To establish TCP connection, both neighbors must be configured with the same MD5 authentication password. Otherwise, TCP connection cannot be established after the TCP transmission protocol fails in MD5 authentication. Before configuring MD5 authentication for BGP neighbors, you need to configure BGP neighbors.

Table 60 Configuring MD5 Authentication for BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Configure MD5 Authentication of BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>password</b> [ 0   7 ] <i>password-string</i>	Mandatory

Step	Command	Description
		By default, there is no MD5 authentication between BGP neighbors.

## 60.2.2 Configure BGP Route Generation

### Configuration Condition

Before configuring BGP route generation, ensure that:

- Enable BGP protocol;
- Configure BGP neighbor and successfully establish and connect a session.

### Configure BGP to Distribute Local Route

BGP can import route from IP routing table into BGP routing table through the **network** command. Only when there is an entry in the IP routing table that fully matches the **network** prefix and mask, will the route be imported into the BGP routing table and distributed.

When distributing locate routes, you can apply a routing map for the routes or specify such routes as backdoor routes. Backdoor route deems EBGP route as local BGP route and uses the administrative distance of local route. In this case, IGP route is allowed to precede EBGP route, and the backdoor route will not advertise it to EBGP neighbors.

Table 60 Configuring BGP to Distribute Local Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to Distribute Local Route	<b>network</b> <i>ip-address mask</i> [ <b>route-map</b> <i>rtmap-name</i> [ <b>backdoor</b> ]   <b>backdoor</b> ]	Mandatory By default, BGP doesn't distribute any local route.

### Note

- The Origin attribute of of the local route distributed by BGP is IGP.

- After using the **network backdoor** command on EBGp routes, the EBGp route administrative distance will become the local route administrative distance (by default, the EBGp route administrative distance is 20, and the local route administrative distance is 200), which is lower than the default IGP route administrative distance. In this case, the IGP route will be preferred, and a backdoor link will be created between EBGp neighbors.
- When BGP distributes local routes and applies the routing map, the match options supported include as-path, community, extcommunity, ip address, ip nexthop, and metric, and the set options supported include as-path, comm-list, community, extcommunity, ip next-hop, local-preference, metric, origin, and weight.

### Configure BGP Route Redistribution

BGP is not responsible for learning routes. Instead, it focuses on controlling routing direction by managing route attributes. Therefore, BGP generates BGP routes for advertisement to neighbors by redistributing IGP. BGP can apply the routing map while redistributing IGP routes.

Table 1 Configuring BGP Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to redistribute IGP routes	<b>redistribute</b> { <b>connected</b>   <b>irmp</b> <i>as-number</i>   <b>isis</b> [ <i>area-tag</i> ] [ <b>match</b> <i>isis-level</i> ]   <b>ospf</b> <i>as-number</i> [ <b>match</b> <i>route-sub-type</i> ]   <b>rip</b>   <b>static</b> } [ <b>route-map</b> <i>map-name</i> / <b>metric</b> <i>value</i> ]	Mandatory By default, BGP doesn't redistribute any other IGP routes.

### Note

- The Origin attribute of the IGP route distributed by BGP is INCOMPLETE.
- When BGP redistributes other protocols and applies the routing map, the match options supported include as-path, community, extcommunity, ip address, ip nexthop, and metric, and the set options supported include as-path, comm-list, community, extcommunity, ip next-hop, local-preference, metric, origin, and weight.

### Configure BGP to Distribute Default Route

Before distributing a default route to neighbors, BGP is required to import a default route. This can be done by the following two manners: generate the default route of BGP via the command **neighbor default-originate**; redistribute the default route of other protocols via the command **default-information originate**.

The default route generated by the **neighbor default-originate** command is a route of 0.0.0.0/0 automatically generated through BGP. The default route redistributed by the **default-information originate** command is a route of 0.0.0.0/0 generated when BGP imports the redistributed protocol.

Table 60 Configuring BGP to Distribute Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to generate default route	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>default-originate</b> [ <b>route-map</b> <i>rmap-name</i> ]	Mandatory By default, BGP doesn't generate default route.
Configure BGP to redistribute the default route of other protocols	<b>default-information originate</b>	Mandatory By default, BGP doesn't redistribute the default route of other protocols.

### Note

- When configuring BGP to redistribute the default route of other protocols, it is required to configure route redistribution.
- You can apply the routing map for the route when configuring BGP to generate a default route.
- When BGP generates default route and applies the routing map, the set options supported include as-path, comm-list, community, extcommunity, ip next-hop, local-preference, metric, origin, and weigh.

## 60.2.3 Configure BGP Route Control

### Configuration Condition

Before configuring BGP route control, ensure that:

- Enable BGP protocol;
- Configure BGP neighbor and successfully establish and connect a session.

### Configure BGP to Distribute Aggregated Route

In large BGP networks, in order to reduce the number of routes advertised to neighbors or effectively control the routing process of BGP, it is required to configure BGP aggregated route.

Table 60 Configuring BGP to Distribute Aggregated Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to Distribute Aggregated Route	<b>aggregate-address</b> <i>ip-address mask</i> [ <b>as-set</b> / <b>summary-only</b> / <b>route-map</b> <i>rtmap-name</i> ]	Mandatory By default, route aggregation is disabled for BGP.

---

### Note

- When BGP distributes aggregated routes, the scale of route advertisement can be reduced by specifying the **summary-only** command option to advertise aggregated routes only.
  - The aggregated route with AS\_PATH attribute can be generated by specifying the **as-set** command option.
  - More attributes can be set for the aggregated routes by applying routing map to them.
- 

### Configure Administrative Distance of BGP Route

Each protocol in the IP routing table has an administrative distance for routing control. The smaller the value, the higher the priority. BGP affects routing by configuring administrative distance for routes in the specified network segment. The administrative distances covered by the routes in the specified network segment will all be modified. At the same time, you may use ACL to effectively filter the network segment so that only the administrative distances in the network segment allowed by ACL can be modified.

The command **distance bgp** can be used to modify the administrative distance of BGP's external, internal and local routes, while the command **distance** is used to change that of the routes in the specified network

segment. The command **distance** precedes **distance bgp**. The network segment configured to be covered by **distance** uses the administrative distance specified by this command, and that uncovered adopts the administrative distance set via **distance bgp**.

Table 2 Configuring BGP Route Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to modify the default administrative distance	<b>distance bgp</b> <i>external-distance internal-distance local-distance</i>	Optional
Configure administrative distance of the specified network segment	<b>distance administrative-distance</b> <i>ip-address mask [ acl-name ]</i>	By default, the administrative distance of EBGp route is 20, that of IBGP 200, and that of local route 200.

### Configure Routing Policy of BGP Neighbors in Outgoing Direction

BGP route advertisement or routing relies on its powerful route attributes. When advertising routes to neighbors, you can modify route attributes or filter some routes by applying corresponding policies.

Currently, the policies that can be applied in the outgoing direction include:

- distribute-list: distribution list;
- filter-list: filter list with AS\_PATH attribute;
- Prefix-list: IP prefix list;
- route-map: routing map.

Table 3 Configuring Routing Policy of BGP Neighbors in Outgoing Direction

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Apply distribution list in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>distribute-list</b> <i>access-list-name</i> <b>out</b>	Multiple choice (distribution list and IP prefix list cannot be configured at the same time)
Apply the filter list with AS_PATH attribute in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>filter-list</b> <i>aspath-list-name</i> <b>out</b>	
Apply IP prefix list in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>prefix-list</b> <i>prefix-list-name</i> <b>out</b>	By default, the routing policy of BGP neighbors in the outgoing direction is not configured.
Apply routing map in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>out</b>	

## Note

- After configuring the routing policy of BGP neighbors in the outgoing direction, it is required to reset the neighbors to make it take effect.
- When applying routing map in the outgoing direction of route reflector, only NEXT-HOP attribute can be changed.
- For the configuration of filter list, see the policy tools-configure AS-PATH list section.
- When configuring policy for neighbors in the outgoing direction, you can configure multiple policies at the same time. For BGP, the following sequence applies: **distribute-list**, **filter-list**, **prefix-list**, and **route-map**. After the first policy is rejected, the following policy will not be implemented. Only after all the policies configured pass will the routing information be advertised.
- For the routing map applied in the outgoing direction of BGP, the match options supported include as-path, community, extcommunity, ip address, ip nexthop, and metric, and the set options supported include as-path, comm-list, community, extcommunity, ip next-hop, local-preference, metric, origin, and weight.

## Configure Routing Policy of BGP Neighbors in Incoming Direction

BGP can use policies to filter the routing information received or modify its attributes. Like the outgoing direction, four policies are supported in the incoming direction:

- distribute-list: distribution list;
- filter-list: filter list with AS\_PATH attribute;
- Prefix-list: IP prefix list;

- route-map: routing map.

Table 4 Configuring Application Policy of BGP Neighbors in Incoming Direction

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Apply distribution list in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>distribute-list</b> <i>access-list-name</i> <b>in</b>	Multiple choice (distribution list and IP prefix list cannot be configured at the same time)  By default, no policy is specified in the incoming direction.
Apply the filter list with AS_PATH attribute in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>filter-list</b> <i>aspath-list-name</i> <b>in</b>	
Apply IP prefix list in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>prefix-list</b> <i>prefix-list-name</i> <b>in</b>	
Apply routing map in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>	

## Note

- After configuring the routing policy of BGP neighbors in the incoming direction, it is required to reset the neighbors to make it take effect.
- When configuring policy for neighbors in the incoming direction, you can configure multiple policies at the same time. For BGP, the following sequence applies: **distribute-list**, **filter-list**, **prefix-list**, and **route-map**. After the first policy is rejected, the following policy will not be implemented. Only after all the policies configured pass will the route be added to the database.
- For the routing policies applied in the incoming direction of BGP, the match options supported include as-path, community, extcommunity, ip address, ip nexthop, and metric, and the set options supported include as-path, comm-list, community, extcommunity, ip next-hop, local-preference, metric, origin, and weight.

## Configure the Maximum Number of Routing Entries Received by BGP Neighbors

For BGP device, you can limit the number of routing entries received from the designated neighbor. It gives alarms or disconnects when the routes received from the designated neighbor reaches a certain threshold.

Table 5 Configuring Maximum Number of Routing Entries Received by BGP Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the maximum number of routing entries received by neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>maximum-prefix</b> <i>prefix-num</i> [ <i>threshold-value</i> ] [ <b>warning-only</b> ]	Mandatory By default, the number of prefix entries received from neighbors is not restricted.

### Note

- If the warning-only command option is not specified, the BGP session will be automatically disconnected when the number of routing entries received by BGP from the neighbor reaches the maximum.
- If the warning-only command option is specified, when the number of routing entries received by BGP from the neighbor reaches the maximum, only alarm message is given, and route learning continues.

### Configure the Maximum Number of BGP Load Balancing Entries

In the BGP networking environment, if there are several paths with the same cost to reach the same destination, you can achieve load balancing routing by configuring the number of BGP load entries.

Table 60 Configuring Maximum Number of Load Balancing Entries of BGP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Configure the maximum number of IBGP load entries	<b>maximum-paths ibgp</b> <i>number</i>	Mandatory By default, there is no load balancing routing for IBGP.
Configure the maximum number of EBGP load entries	<b>maximum-paths</b> <i>number</i>	Mandatory By default, there is no load balancing routing for EBGP.

---

### Note

- After configuring the maximum number of EBGP load balancing entries, load can be formed only when EBGP route is preferred.
  - The commands used to configure the maximum number of load balancing entries vary with BGP configuration modes. For details, see the description of **maximum-paths** in BGP technical manual.
- 

## 60.2.4 Configure BGP Route Attributes

### Configuration Condition

Before configuring BGP route attributes, ensure that:

- Enable BGP protocol;
- Configure BGP neighbor and successfully establish and connect a session.

### Configure BGP Route Weight

The first rule for BGP routing is to compare the value of route weight. The larger the value, the higher the priority. The value of route weight is a local attribute of the device. It will not be transmitted to other BGP neighbors. It ranges from 0 to 65535. By default, the weight value of route learned from neighbors is 0, and those of all the routes generated on local device are 32768.

Table 6 Configuring BGP Route Weight

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the route weight of neighbor or peer group	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>weight</b> <i>weight-num</i>	Mandatory By default, the route weight of neighbor is 0.

### Configure MED Attributes of BGP Route

MED attributes can be used to select the optimal route for the traffic entering AS. When other routing conditions are the same, if BGP learns the routes with the same destination address yet different next hops from different EBGP neighbors, it prefers that with the minimum MED value as the optimal entrance.

Sometimes MED is also called "external metric". It is marked as "metric" in the routing table of BGP. BGP will advertise the MED attributes of the routes learned from neighbors to IBGP neighbors rather than EBGP neighbors. Thus, MED is only applicable between neighboring AS.

#### 1. Configure BGP to allow comparison of MEDs from different AS neighboring routes

By default, BGP only performs MED routing for the routes learned from the same AS. You can use the **bgp always-compare-med** command to ignore the restriction on the same AS in MED routing.

Table 7 Configuring BGP to Allow Comparison of MEDs from Different AS Neighboring Routes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to allow comparison of MEDs from different AS neighboring routes	<b>bgp always-compare-med</b>	Mandatory By default, BGP only allows to compare MEDs of the routes from the same AS

#### 2. Configure BGP to prioritise MEDs according to the route AS\_PATH-based group

By default, BGP doesn't prioritise MEDs according to the route AS\_PATH-based group. You can enable this function using the command **bgp deterministic-med**. When selecting routes, all routes are arranged based on AS\_PATH. Within each AS\_PATH group, the routes are ranked according to the MED size. The route with the minimum MED value is selected as the best route of this group.

Table 8 Configuring BGP to Prioritise MEDs According to the Route AS\_PATH-based Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
BGP prioritises MEDs according to the route AS_PATH-based group	<b>bgp deterministic-med</b>	Mandatory By default, BGP doesn't prioritise MEDs according to the route AS_PATH-based group.

### 3. Configure to compare MEDs of local confederated routes

By default, EBGP routes from different AS don't compare MED attributes. This principle also applies to the confederated EBGP. The command **bgp bestpath med confed** is used to enable comparison of MED attribute values for local confederated routes.

Table 60 Configuring BGP to Compare MEDs of Local Confederated Routes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to compare MEDs of local confederated routes	<b>bgp bestpath med confed</b>	Mandatory By default, the MEDs of local confederated routes are not compared.

#### 4. Configure the routing map to modify MED attributes

For route sending and receiving, routing map can be used to modify the value of MED attributes.

Table 9 Configuring Routing Map to Modify MED Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the routing map to modify MED attributes	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

#### Note

- When configuring the routing map to modify MED attributes, you are required to modify MED with the **set metric** command, see the policy tool-**set metric**.
- After the **neighbor attribute-unchanged** command is configured, MED attributes of the neighbor cannot be changed through routing map.

#### Configure Local-Preference Attributes of BGP Route

Local-Preference attributes are transmitted among IBGP neighbors only. Local-Preference is used to select the optimal exit to leave AS. The route with the largest route will be preferred.

Its value ranges from 0 to 4294967295. The larger the value, the higher the priority. By default, all the routes advertised to IBGP neighbors have a Local-Preference attribute of 100, which can be modified through **bgp default local-preference** or routing map.

##### 1. Configure BGP to modify default Local-Preference attributes

Table 10 Configuring BGP to Modify Default Local-Preference Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the default Local-Preference value	<b>bgp default local-preference</b> <i>local-value</i>	Optional By default, the local preference is 100.

## 2. Configure the routing map to modify Local-Preference attributes

Table 11 Configuring Routing Map to Modify Local-Preference Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the routing map to modify Local-Preference attributes	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

### Note

- When configuring the routing map to modify Local-Preference attributes, you are required to modify Local-Preference attributes with the **set local-preference** command, see the policy tool-set **local-preference**.

## Configure AS\_PATH Attributes of BGP Route

### 1. Configure BGP to ignore comparison of AS\_PATH in routing

When other conditions are the same, BGP will prefer the route with the shortest AS\_PATH. You can cancel AS\_PATH routing via the command **bgp bestpath as-path ignore**.

Table 12 Configuring BGP to Ignore Comparison of AS\_PATH in Routing

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to ignore comparison of AS_PATH in routing	<b>bgp bestpath as-path ignore</b>	Mandatory By default, AS_PATH values are compared in routing.

## 2. Configure BGP for allowed Times of Repeated Local AS Number

In order to avoid routing loops, BGP will check the AS\_PATH attributes of the routes received from neighbors, and discard those containing local AS number. You may use the command **neighbor allowas-in** to allow the routes received by BGP to contain local AS number, and can configure the number of local AS numbers.

Table 13 Configuring BGP for allowed Times of Repeated Local AS Number

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure to allow repeated local AS number	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>allowas-in</b> [ <i>as-num</i> ]	Mandatory By default, the AS_PATH attributes of the routes received from neighbors are not allowed to contain local AS number.

## 3. Configure BGP to remove private AS number when advertising route to neighbors

In large BGP networks, the AS\_PATH of routing has the following attributes: confederation or community. By default, BGP carries these private AS attributes when advertising to neighbors. In order to shield private network information, you can use **neighbor remove-private-AS** to remove private AS number.

Table 14 Configuring BGP to Remove Private AS Number When Advertising Route to Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to remove private AS number when advertising route to neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remove-private-AS</b>	Mandatory By default, private AS number is carried when advertising to neighbors.

#### 4. Configure to detect legality of first AS number of EBGp route

When BGP advertises route to EBGp neighbors, the local AS number is pressed to the start position of AS\_PATH, and the first AS advertising this route will become the last one. Generally, the first AS number of the route received from EBGp should be the same as the AS number of neighbors. Otherwise, this route will be discarded.

Table 15 Configuring to Detect Legality of First AS Number of EBGp Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure to detect legality of the first AS number of EBGp route	<b>bgp enforce-first-as</b>	Mandatory By default, the first AS number check mechanism is disabled in BGP.

#### 5. Configure the routing map to modify AS\_PATH attributes

BGP supports the configuration of routing map to modify AS\_PATH attributes. You can add route attributes via **set as-path prepend** so as to affect the routing of neighbors. When using the function **set as-path**

**prepend**, local AS is first used to add AS\_PATH. When using other AS, enough attention must be paid to avoid being rejected in route advertisement to this AS.

Table 16 Configuring Routing Map to Modify AS\_PATH Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the routing map to modify AS_PATH attributes	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

### Note

- When configuring the routing map to modify AS\_PATH attributes, you are required to modify AS\_PATH attributes with the **set as-path prepend** command, see the policy tool-**set as-path**.

## Configure NEXT-HOP Attributes of BGP Route

When BGP advertises routes to IBGP neighbors, the route attributes (including next hop) are not changed. The next hop attribute is often used for BGP to advertise the routes learned by EBGP neighbors to IBGP neighbors. The **neighbor next-hop-self** command can be used to modify the next hop attribute of the routes advertised to BGP neighbors to use local IP address. For BGP, you can also use routing map to modify the next hop attribute.

### 1. Configure BGP to use local IP address as next hop of route

Table 17 Configuring BGP to Use Local IP Address as Next Hop of Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Configure to use local IP address as the next hop when advertising routes to neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>next-hop-self</b>	Mandatory  By default, the next hop attribute of the route advertised to EBGp neighbor is local IP address. The next hop attribute of the route advertised to IBGP will not be modified. Its original attribute value will be kept unchanged.

### Note

- When configuring BGP to use local IP address as the next hop of the route, if the source address of the TCP session is configured with the **neighbor update-source**, it will be used as the next hop address. Otherwise, the output interface IP of the advertising device will be selected as local IP address.

## 2. Configure the routing map to modify NEXT-HOP attributes

BGP supports the configuration of routing map to modify NEXT-HOP attributes through **set ip next-hop**.

Table 18 Configuring Routing Map to Modify NEXT-HOP Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the routing map to modify NEXT-HOP attributes	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory  By default, routing map is not applied to any neighbor.

---

## Note

- When configuring the routing map to modify NEXT-HOP attributes, you are required to modify NEXT-HOP attributes with the **set ip next-hop** command, see the policy tool-**set ip next-hop**.
- 

### Configure Community Attributes of BGP Route

When advertising routes to neighbors, BGP allows the configuration of sending community attributes. You can apply routing map to match community attributes for specified neighbors in both incoming and outgoing directions.

Community attributes are used to identify a group of routes so as to apply routing policy to them. Community attributes have two forms, i.e. standard and extended. Standard community attributes have 4 bytes. Their attributes include NO\_EXPORT, LOCAL\_AS, NO\_ADVERTISE, and INTERNET. Extcommunity attributes have 8 bytes. Their attributes include Route Target (RT) and Route Origin.

#### 1. Configure BGP to advertise community attributes of route to neighbors

**neighbor send-community** allows to advertise standard or extcommunity attributes or both to neighbors.

Table 19 Configuring BGP to Advertise Community Attributes of Route to Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure to advertise community attributes of route to neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>send-community</b> [ <b>both</b>   <b>extended</b>   <b>standard</b> ]	Mandatory By default, community attributes are not advertised to any neighbor.

---

## Note

- After the neighbor is activated under VPNv4 address family, the standard and extcommunity attributes will be automatically advertised to neighbors.
-

## 2. Configure the routing map to modify community attributes of route

BGP supports the configuration of routing map to modify community attributes through **set communtiy**.

Table 60 Configuring Routing Map to Modify Community Attributes of Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the routing map to modify community attributes of BGP route	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

---

### Note

- When configuring the routing map to modify community attributes of the route, you are required to modify community attributes with the **set communtiy** command, see the policy tool-**set communtiy**.
- 

## 60.2.5 Configure BGP Network Optimization

### Configuration Condition

Before configuring BGP network optimization, ensure that:

- Enable BGP protocol;
- Configure BGP neighbor and successfully establish and connect a session.

### Configure Keepalive Time of BGP Neighbor

After a BGP session is successfully established, neighbors will periodically send Keepalive messages to maintain the BGP session relationship. If the neighbor's Keepalive message or route update packet is not received within the holdtime, the BGP session will be disconnected for over time. The keepalive time of the session will not be more than one third of the holdtime.

Table 20 Configuring Keepalive Time of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure keepalive time and holdtime of global BGP	<b>timers bgp</b> <i>keepalive-interval holdtime-interval</i>	Optional
Configure the keepalive time and holdtime of BGP neighbor or peer group	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>timers</b> { <i>keepalive-interval holdtime-interval</i>   <b>connect</b> <i>connect-interval</i> }	By default, the interval of keepalive timer is 60 seconds; the interval of hold timer is 180 seconds; the interval of session reconnection timer is 120 seconds.

## Note

- The keepalive time and holdtime configured for specified neighbors precede those of global BGP.
- After neighbor negotiation, the minimum holdtime will be used as the holdtime of BGP session.
- When both keepalive time and holdtime are configured as zero, the neighbor keepalive/hold function is cancelled.
- When the keepalive time interval is more than one third of the holdtime, the BGP session sends keepalive packets within one third of the holdtime.

### Configure BGP Route Detection Time

BGP mainly completes the pathfinding process with AS as the unit, and IGP completes the pathfinding process within the AS. Therefore, BGP routing often relies on IGP routing. After the next hop or output interface of IGP route on which BGP relies changes, BGP updates BGP route by periodically detecting IGP route. Update of local BGP route and other matters are completed within the detection period.

Table 21 Configuring BGP Route Detection Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Route Detection Time	<b>bgp scan-time</b> <i>time</i>	Optional By default, the BGP route detection time is 60 seconds.

## Caution

- When a very short BGP route detection time is configured, BGP will frequently detect routes. This will affect the performance of the device.

### Configure Fast Disconnection of EBGP Neighbor

After a BGP session is successfully established, neighbors will periodically send Keepalive messages to each other to maintain the BGP session relationship. If the neighbor's Keepalive message or route update packet is not received within the holdtime, the BGP session will be disconnected for over time. You can configure a direct EBGP neighbor to disconnect BGP connection immediately when the connected interface is down, without waiting for the BGP keepalive timeout. When the fast disconnection of EBGP neighbors is cancelled, the EBGP session will not give a response to the down event on the interface. It will be disconnected after timeout.

Table 22 Configuring Fast Disconnection of EBGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure Fast Disconnection of EBGP Neighbor	<b>bgp fast-external-failover</b>	Optional By default, EBGP can give a fast response to the offline event on the direct interface.

### Configure BGP Route Dampening Function

Frequent route flapping in the network will make the network unstable. BGP suppresses such routes by configuring route dampening to reduce the impact of route flapping on the network.

For the routes subject to frequent flapping, their penalty value will increase. When the penalty value exceeds the dampening threshold, the route will not be advertised to neighbors. The penalty value shall not exceed the maximum dampening time. When no route flapping happens during the half-life, the penalty value will be halved. The route will not be re-advertised to neighbors until the value is less than the reuse limit.

- Half-life: The period when the penalty value of route is halved.
- Reuse limit: The limit that route returns to service.
- Suppress limit: The limit that the route is suppressed.
- Max suppress time: The maximum time that the route is suppressed.

Table 23 Configuring BGP Route Suppression Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP route dampening period	<b>bgp dampening</b> [ <i>reach-half-life</i> [ <i>reuse-value suppress-value max-suppress-time</i> [ <i>unreach-half-life</i> ] ] ]   <b>route-map</b> <i>rtmap-name</i> ]	Mandatory  By default, the route suppression function is disabled. After it is enabled, the default route suppression half-life is 15 minutes; the route reuse limit is 750; the route suppress limit is 2000; the max suppress time is 60 minutes; the unreachable half-life of route penalty is 15 minutes.

 **Note**

- Route flapping includes both addition or deletion of routes, and change of route attributes,

---

such as next hop and MED attributes.

---

### Configure BGP Neighbor Refresh Capability

When the routing policy or route selection policy applied by BGP neighbors changes, the routing table needs to be refreshed again by two manners. One is to reset by recovering BGP connection to restart the session. This method may cause BGP route flapping and affect business operation. The other one is more graceful. You need to configure the BGP device of local port to support the capability of route refresh. When its neighbor needs to reset the route, the Route-Refresh message is sent to local port which will re-send the route to this neighbor after receiving the message. In this case, the routing table is dynamically refreshed without disconnecting BPG sessions.

Table 24 Configuring Refreshing Capability of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enable BGP Neighbor Refresh Capability	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>capability route-refresh</b>	Optional By default, advertising neighbors to support route refresh capability is enabled.

### Configure Soft Resetting Capability of BGP Neighbor

When the routing policy or route selection policy applied by BGP neighbors changes, the routing table needs to be refreshed again by two manners. One is to reset by recovering BGP connection to restart the session. This method may cause BGP route flapping and affect business operation. Another more graceful method is to configure local BGP device to support route refresh capability. You can also enable the soft resetting capability of local BGP device. By default, the BGP device retains the routing information of all neighbors. After enabling its neighbors' soft reset capability, it refreshes the routes of local retained neighbors again. At this time, the BGP session will not be disconnected.

Table 25 Configuring Soft Resetting Capability of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enable soft resetting capability of BGP neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>soft-reconfiguration inbound</b>	Mandatory By default, the soft resetting function is disabled.

### Configure ORF Capability of BGP Neighbor

BGP accurately controls routes through various route attributes. To this end, it usually applies routing policy in both incoming and outgoing directions, a local behavior of BGP. BGP also supports ORF (Outbound Route Filtering) capability. It advertises local ingress policy through Route-refresh packet to its neighbor which applies this policy when advertising routes to it. This can largely reduce the interactions of route update packet between BGP neighbors.

To successfully negotiate ORF capability, the following conditions must be satisfied:

- Both neighbors need to enable ORF capability;
- ORF send and ORF receive must be paired, i.e., if one uses ORF send, the other must be ORF both or ORF receive; if one uses ORF receive, the other must be ORF send or ORF both;
- For the neighbor using ORF send, a prefix list needs to be applied in the incoming direction.

Table 26 Configuring ORF Capability of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Make the neighbor apply prefix list in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>prefix-list</b> <i>prefix-list-name</i> <b>in</b>	Mandatory By default, prefix list is not applied to any BGP neighbor.
Make the neighbor support ORF capability	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>capability orf prefix-list</b> { <b>both</b>   <b>receive</b>   <b>send</b> }	Mandatory By default, advertising neighbors to support ORF capability is disabled.

## 60.2.6 Configure Large BGP Network

### Configuration Condition

Before configuring large BGP network, ensure that:

- Enable BGP protocol;
- Configure BGP neighbor and successfully establish and connect a session.

### Configure BGP Peer Group

BGP peer group is a set of BGP neighbors with the same configuration policy. Any configuration of the peer group will influence all the members in the group. Configuring BGP peer group is beneficial for the centralized management and maintenance of neighbors.

Table 27 Configuring BGP Peer Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Create BGP peer group	<b>neighbor</b> <i>peer-group-name</i> <b>peer-group</b>	Mandatory By default, peer group is not configured, and neighbors are not added into any peer group.
Add neighbors into the peer group	<b>neighbor</b> <i>neighbor-address</i> <b>peer-group</b> <i>peer-group-name</i>	

---

 **Note**

- The configuration of peer group will influence all the group members.
  - After a neighbor is added into the peer group, the configuration of the original one which is the same as that of the peer group will be deleted.
  - After configuring the routing policy in outgoing and incoming directions for the peer group, if the routing policy changes, it is not effective for the neighbor already added into the peer group. The altered routing policy cannot apply to members of the peer group until the peer group is reset.
- 

### Configure BGP Route Reflector

In large BGP networking environments, IBGP neighbors are required to be connected across the whole network. That is to say, each BGP has to connect with all the other IBGP neighbors. Then, in the networking environment with N BGP neighbors, there are  $N*(N-1)/2$  BGP connections. The more the connections, the larger the amount of route advertisement. BGP route reflector can reduce the number of network connections. It includes several IBGPs into a group, and specifies a BGP as a reflector (RR), other BGPs as clients, and the BGPs not in the group as non-clients. The clients establish peering relationships with the PR only to reduce necessary IBGP connections. The number of connections can be decreased to N-1.

The principle of reflecting routes by BGP route reflector:

- The routes learned from non-client IBGP neighbors are reflected to clients only;
- The routes learned from clients will be reflected to all the clients and non-clients except the clients initiating these routes;
- The routes learned from EBGPs will be reflected to all the clients and non-clients.

Table 28 Configuring BGP Route Reflector

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure reflector cluster ID	<b>bgp cluster-id</b> { <i>cluster-id-in-ip</i>   <i>cluster-id-in-num</i> }	Mandatory By default, the route reflector cluster ID is the Router ID of the device.

Step	Command	Description
Configure neighbor as reflector client	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-reflector-client</b>	Mandatory By default, no neighbor is specified as reflector client.
Configure the route reflection function between BGP clients	<b>bgp client-to-client reflection</b>	Optional By default, the route reflection function between BGP route reflector clients is enabled.

### Note

- Reflector cluster ID is used to identify the same reflector area with many reflectors that have the same reflector cluster ID.

## Configure BGP Confederation

In large BGP networking environments, IBGP neighbors are required to be connected across the whole network. That is to say, each BGP has to connect with all the other IBGP neighbors. Then, in the networking environment with N BGP neighbors, there are  $N*(N-1)/2$  BGP connections. The more the connections, the larger the amount of route advertisement. BGP confederation can also reduce network connections. It uses the divide-and-conquer strategy to divide the AS into several sub-AS areas. Each of them forms a confederation which is fully connected through IBGP. The sub-AS areas of the confederation are connected via EBGp to effectively reduce BGP connections.

When configuring BGP confederation, it is required to assign a confederation ID to each confederation and specify members of such confederation. Unlike route reflector (only route reflector is required to support route reflection when necessary), confederation requires all members to support the confederation function.

Table 29 Configuring BGP Confederation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Create BGP confederation ID	<b>bgp confederation identifier</b> <i>as-number</i>	Mandatory By default, no confederation AS number is configured.
Configure BGP confederation members	<b>bgp confederation peers</b> <i>as-number-list</i>	Mandatory By default, the confederation's sub-AS number is not configured.

---

### Note

- The confederation ID is used to identify the confederation sub-AS which contains the confederation members.
- 

## 60.2.7 Configure BGP GR

GR (Graceful Restart) is used to keep the routing information in the forwarding layer of this device and neighbor device unchanged during the switch between host and standby devices to ensure the forwarding process is not affected; after the device is switched for re-running, the two devices synchronize routing information and update forwarding layer in the protocol layer so that the data can keep forwarding during the process of device switch.

Roles in GR process:

- GR Restarter: The device for graceful restart of protocol;
- GR Helper: The device which helps with the graceful restart of protocol;
- GR Time: The maximum time for GR-Restarter to restart. GR Helper maintains routing stability during this period of time only.

The dual-master device can act as GR Restarter and GR Helper, while the centralized device only serves as GR Helper to help the Restarter complete GR. When the GR Restarter is doing GR, GR Helper maintains its route until GR Time is time out and the GR is completed for routing information synchronization. During

this period of time, network routing and packet forwarding stays at the status prior to GR, which effectively ensures network stability.

BGP GR relationship is established through OPEN packet negotiation when neighbors establish connections. When the GR Restarter neighbor restarts, the BGP session will be disconnected, but the routes learned from the neighbor will not be deleted. They will continue to be forwarded normally in the IP routing table. Marked with Stale in the BGP routing table, they will be updated after GR is completed or time out.

GR Restarter needs to complete the connection with GR Helper within the maximum allowable time. Otherwise, GR Helper will eliminate the GR routes retained and cancel the GR process. After neighbor re-establishment is completed, the GR Helper needs to receive the update packets with End-Of-RIB tag from the GR Restarter to successfully complete the GR process. Otherwise, the GR route not updated will be deleted after the maximum hold time (**stalepath-time**), and the GR relationship will be cancelled.

### Configuration Condition

Before configuring BGP GR, ensure that:

- Enable BGP protocol;
- Configure BGP neighbor and successfully establish and connect a session.

### Configure BGP GR Restarter

Table 30 Configuring BGP GR Restarter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enable BGP GR capability	<b>bgp graceful-restart</b> [ <b>restart-time</b> <i>time</i>   <b>stalepath-time</b> <i>time</i> ]	Mandatory  By default, the GR capability is not enabled on the BGP device. After GR is enabled, the default maximum allowable time for neighbors to re-establish sessions is 120 seconds; the maximum hold time of GR routes is 360 seconds.

Step	Command	Description
Configure to advertise GR-Restarter capability to neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>capability graceful-restart</b>	Mandatory By default, GR-Restarter capability is not advertised to any neighbor.

### Configure BGP GR Helper

Table 31 Configuring BGP GR Helper

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enable BGP GR capability	<b>bgp graceful-restart</b> [ <b>restart-time</b> <i>time</i>   <b>stalepath-time</b> <i>time</i> ]	Mandatory By default, the GR capability is not enabled on the BGP device. After GR is enabled, the default maximum allowable time for neighbors to re-establish sessions is 120 seconds; the maximum hold time of GR routes is 360 seconds.

### 60.2.8 Configure BGP to Coordinate with BFD

Generally, there are other intermediate devices between BGP neighbors. When these devices fail, BGP sessions are normal within the hold time. They cannot give a response to the link failures of intermediate devices in a timely manner. BFD (Bidirectional Forwarding Detection) provides a method to quickly detect the status of lines between two devices. When BFD detection is enabled between BGP devices, if there is a line failure between the devices, BFD can quickly detect the failure and notify BGP to trigger BGP to rapidly disconnect the session and switch to the backup line. In this way, it can reach the purpose of fast route switch.

## Configuration Condition

Before configuring the coordination of BGP with BFD, ensure that:

- Enable BGP protocol;
- Configure BGP neighbor and successfully establish and connect a session.

## Configure EBGP to Coordinate with BFD

The coordination of EBGP with BFD is based on single-hop BFD sessions, and BFD session parameters are required to be configured in interface mode.

Table 60 Configuring Coordination of EBGP with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure EBGP to Coordinate with BFD	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>fall-over bfd</b>	Mandatory By default, the BFD function of neighbor is disabled.
Exit the BGP configuration mode	<b>exit</b>	-
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the minimum receiving time interval of BFD sessions	<b>bfd min-receive-interval</b> <i>milliseconds</i>	Optional By default, the minimum receiving time interval of BFD sessions is 1000 milliseconds.
Configure the minimum sending time interval of BFD sessions	<b>bfd min-transmit-interval</b> <i>milliseconds</i>	Optional By default, the minimum sending time interval of BFD sessions is 1000 milliseconds.

Step	Command	Description
Configure the BFD session detection timeout multiple	<b>bfd multiplier <i>number</i></b>	Optional The BFD session detection timeout multiple is 5.

## Note

- For the BFD-related configurations, please see the Reliability Technology - BFD-related section.

## 60.2.9 Configure BGP FRR

### Configuration Condition

Before configuring the coordination of BGP with BFD, ensure that:

- Enable BGP protocol.
- Configure BGP neighbor and successfully establish and connect a session.

### Configure BGP FRR

In the BGP network, as a result of link or device failure, the packets passing the point of failure will be discarded or loops will be produced. The traffic interruption caused thereby will continue until the protocol reconverges after several seconds. BGP FRR can reduce the time of traffic interruption. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic passing through the main link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 32 Configuring BGP FRR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp <i>autonomous-system</i></b>	-
Configure BGP FRR	<b>fast-reroute route-map <i>rtmap-name</i></b>	Optional By default, the FRR function is disabled.

Configure BGP auto FRR	<b>pic</b>	Mandatory By default, the BGP auto FRR function is disabled.
------------------------	------------	---

## Caution

- After BGP FRR is configured, BGP needs to be reset to complete initial route check and backup. Otherwise, it is only effective for the routes learned after the configuration.
- When set fast-reroute backup-nexthop auto is configured for the FRR based on route-map, the protocol enables automatic FRR;
- When pic method is used, the protocol enables automatic FRR;
- The methods of enabling FRR are mutually exclusive;
- After configuring BGP FRR and applying the routing map, use the command **set fast-reroute backup-nexthop *nexthop-address*** to set the BGP neighbor as the backup next hop in the routing map. If the non-BGP neighbor is configured as the backup next hop, the FRR function cannot take effect.

## 60.2.10 Configure BGP LS

### Configuration Condition

Before configuring BGP LS, ensure that:

- Enable OSPF protocol.
- Establish neighbors for OSPF and configure distribute link-state.

### Configure BGP LS

Configure BGP LS to collect the topological information of IGP protocol.

Table 60-33 Configuring BGP LS

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp <i>autonomous-system</i></b>	-

Configure BGP link-state address family	<b>address-family link-state unicast</b>	Optional By default, the link-state address family is disabled.
Activate the LS capability of BGP neighbor	<b>neighbor { neighbor-address   peer-group-name } activate</b>	Optional By default, the LS capability of BGP neighbor is not activated.

## 60.2.11 BGP monitoring and maintaining

Table 34 BGP Monitoring and Maintaining

Command	Description
<b>clear ip bgp</b> { *   <i>neighbor-address</i>   <i>as-number</i>   <b>peer-group</b> <i>peer-group-name</i>   <b>external</b> } [ <b>vrf</b> <i>vrf-name</i>   <b>ipv4 unicast</b>   <b>ipv4 multicast</b>   <b>vpn4 unicast</b>   <b>mvpn</b> ]	Reset BGP neighbors
<b>clear ip bgp</b> [ <b>ipv4 unicast</b>   <b>ipv4 multicast</b> ] <b>dampening</b> [ <i>ip-address</i>   <i>ip-address/mask-length</i> ]	Clear dampened routes
<b>clear ip bgp</b> [ <b>ipv4 unicast</b>   <b>ipv4 multicast</b> ] <b>flap-statistics</b> [ <i>ip-address</i>   <i>ip-address/mask-length</i> ]	Clear jitter statistics
<b>clear ip bgp</b> { *   <i>neighbor-address</i>   <i>as-number</i>   <b>peer-group</b> <i>peer-group-name</i>   <b>external</b> } [ <b>ipv4 unicast</b>   <b>ipv4 multicast</b>   <b>vpn4 unicast</b>   <b>vrf</b> <i>vrf-name</i>   <b>mvpn</b> ] { [ <b>soft</b> ] [ <b>in</b>   <b>out</b> ] }	Softly reset neighbors
<b>clear ip bgp</b> { *   <i>neighbor-address</i> } <b>in</b> { <b>ecomm</b>   <b>prefix-filter</b> }	Advertise ORF to neighbors
<b>show ip bgp</b> [ <b>vpn4</b> { <b>all</b>   <b>vrf</b> <i>vrf-name</i>   <b>rd</b> <i>route-distinguisher</i> } ] [ <i>ip-address</i>   <i>ip-address/mask-length</i> ]	Show the routing information under corresponding address family of BGP

Command	Description
<b>show ip bgp attribute-info</b>	Show the public route attributes of BGP
<b>show ip bgp cidr-only</b>	Show all classful network routes of BGP
<b>show ip bgp community</b> [ <i>community-number</i> / <i>aa:nn</i> / <b>exact-match</b> / <b>local-AS</b> / <b>no-advertise</b> / <b>no-export</b> ]	Show the routing information which matches specified community attributes
<b>show ip bgp community-info</b>	Show the community attributes of all BGPs
<b>show ip bgp community-list</b> <i>community-list-name</i>	Show the community attribute list applied to routing information
<b>show ip bgp</b> [ <b>vpn4</b> { <b>all</b>   <b>vrf</b> <i>vrf-name</i>   <b>rd</b> <i>route-distinguisher</i> } ] <b>dampening</b> { <b>dampened-paths</b>   <b>flap-statistics</b>   <b>parameters</b> }	Show detailed information of route dampening
<b>show ip bgp filter-list</b> <i>filter-list-name</i> [ <b>exact-match</b> ]	Show the routes matching AS_PATH access list
<b>show ip bgp inconsistent-a</b>	Show the routes in conflict with AS_PATH
<b>show ip bgp ipv4 vpn-target</b> [ <i>vpn-rt</i> ]	Show the VPN-TARGET routing table of BGP
<b>show ip bgp ipv4 vpn-target rt-filter</b> [ <b>neighbor</b> <i>ip-address</i> ]	Show the RT filter list of BGP neighbors
<b>show ip bgp mvpn</b> { <b>all</b>   <b>vrf</b> <i>vrf-name</i>   <b>rd</b> <i>route-distinguisher</i> } { <b>all-type</b>   <b>type</b> { <b>1</b> [ <i>ip-address</i> ]   <b>7</b> [ <i>as:source-ip-address:group-ip-address</i> ] } }	Show the routing information under MVPN address family of BGP
<b>show ip bgp mvpn</b> { <b>all</b>   <b>vrf</b> <i>vrf-name</i>   <b>rd</b> <i>route-distinguisher</i> } { <b>neighbors</b> <i>ip-address</i> } { <b>advertised-routes</b>   <b>received-routes</b>   <b>routes</b> } { <b>all-type</b>   <b>type</b> { <b>1</b> [ <i>ip-address</i> ]   <b>7</b> [ <i>as:source-ip-address:group-ip-address</i> ] } }	Show the routing information of specified neighbors under MVPN address family of BGP
<b>show ip bgp mvpn</b> { <b>all</b>   <b>vrf</b> <i>vrf-name</i>   <b>rd</b> <i>route-distinguisher</i> / <b>neighbors</b> <i>ip-address</i> } { <b>all-type</b>   <b>type</b> { <b>1</b>   <b>7</b> } } { <b>statistics</b> }	Show the statistical information of the routes under MVPN address family of BGP

Command	Description
<b>show ip bgp</b> [ <b>vpn4</b> { <b>all</b>   <b>vrf</b> <i>vrf_name</i>   <b>rd</b> <i>route-distinguisher</i> } ] <b>neighbors</b> [ <i>ip-address</i> ]	Show the detailed information BGP neighbors
<b>show ip bgp orf ecomm</b>	Show the ORF information of all BGP neighbors
<b>show ip bgp paths</b>	Configure the AS_PATH information of BGP routes
<b>show ip bgp prefix-list</b> <i>prefix-list-name</i>	Show the routes matching prefix list
<b>show ip bgp quote-regexp</b> <i>as-path-list-name</i>	Show the routes matching AS_PATH list
<b>show ip bgp regexp</b> <i>as-path-list-name</i>	Show the routes matching AS_PATH list
<b>show ip bgp route-map</b> <i>rtmap-name</i>	Show the route matching the routing map
<b>show ip bgp scan</b>	Show the scanning information of BGP
<b>show ip bgp</b> [ <b>vpn4</b> { <b>all</b>   <b>vrf</b> <i>vrf-name</i>   <b>rd</b> <i>route-distinguisher</i> }   <b>mvpn</b> ] <b>summary</b>	Show the neighbor summarization information of BGP

## 60.3 Typical configuration example of BGP

### 60.3.1 Configure basic functions of BGP

#### Network Requirements

- EBGP neighbors are established between Device1 and Device2, and IBGP neighbors are established between Device2 and Device3.
- Device1 learns the direct route 200.0.0.0/24 from the interface of Device3 which learns the direct route 100.0.0.0/24 from the interface of Device1.

#### Network Topology

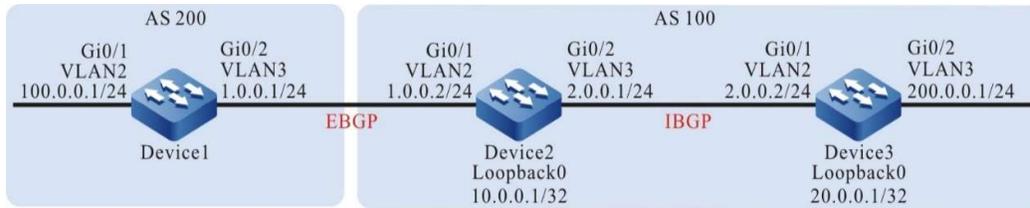

Figure 60 Network Topology for Configuring Basic Functions of BGP

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#### #View the routing table of Device 2.

```
Device2#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 20.0.0.1/32 [110/2] via 2.0.0.2, 00:27:09, vlan3
```

#### #Check the routing table of Device3.

```
Device3#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 10.0.0.1/32 [110/2] via 2.0.0.1, 00:28:13, vlan2
```

According to the result, both Device2 and Device3 have learned the route of peer loopback interface by running OSPF protocol. On this basis, Device2 and Device3 can establish IBGP neighbors through loopback interface.

- Step 4: Configure BGP.

### #Configure Device1.

Establish a direct EBGP peer with Device2, and import 100.0.0.0/24 into BGP through the network.

```
Device1#configure terminal
Device1(config)#router bgp 200
Device1(config-bgp)#neighbor 1.0.0.2 remote-as 100
Device1(config-bgp)#network 100.0.0.0 255.255.255.0
Device1(config-bgp)#exit
```

### #Configure Device2.

Build indirect IBGP peer relationship with Device3 through Loopback0, and set the next hop of the advertised route as itself to establish a direct EBGP peer with Device1.

```
Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 20.0.0.1 remote-as 100
Device2(config-bgp)#neighbor 20.0.0.1 update-source loopback0
Device2(config-bgp)#neighbor 1.0.0.1 remote-as 200
Device2(config-bgp)#neighbor 20.0.0.1 next-hop-self
Device2(config-bgp)#exit
```

### #Configure Device3.

Build indirect IBGP peer relationship with Device2 through Loopback0, and import 200.0.0.0/24 into BGP through the network.

```
Device3(config)#router bgp 100
Device3(config-bgp)#neighbor 10.0.0.1 remote-as 100
Device3(config-bgp)#neighbor 10.0.0.1 update-source loopback0
Device3(config-bgp)#network 200.0.0.0 255.255.255.0
Device3(config-bgp)#exit
```

---

## Note

- In order to avoid route flapping, IBGP neighbors are established through loopback interfaces. OSPF is required to synchronize the routing information of the loopback interfaces between IBGP neighbors.
- 

Step 5: Check the result.

#View the status of BGP neighbors on Device 2.

```
Device2#show ip bgp summary
BGP router identifier 10.0.0.1, local AS number 100
BGP table version is 2
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
1.0.0.1    4  200    3      3       1    0  0 00:00:29  1
20.0.0.1   4  100    5      4       2    0  0 00:02:13  1
```

From the case where the content of the State/PfxRcd column is displayed as a digit (from the number of routing prefixes received by the neighbor), you can see that Device 2 has successfully established BGP neighbors with Device1 and Device3.

#View the routing table of Device1.

```
Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 200.0.0.0/24 [20/0] via 1.0.0.2, 00:15:52, vlan3
```

#View the routing table of Device 2.

```
Device2#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 100.0.0.0/24 [20/0] via 1.0.0.1, 00:14:11, vlan2
B 200.0.0.0/24 [200/0] via 20.0.0.1, 00:17:12, vlan3
```

#Check the routing table of Device3.

```
Device3#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 100.0.0.0/24 [200/0] via 10.0.0.1, 00:14:50, vlan2
```

According to the result, Device1 learns the direct route 200.0.0.0/24 from the interface of Device3 which learns the direct route 100.0.0.0/24 from the interface of Device1.

## 60.3.2 Configure BGP Route Redistribution

### Network Requirements

- Device3 establishes OSPF neighbors with Device2, and advertises the direct route of the interface 200.0.0.0/24 to Device2.
- Establish EBGP neighbors between Device1 and Device2 so that Device2 will redistribute the OSPF route to BGP and advertise it to Device1.

### Network Topology

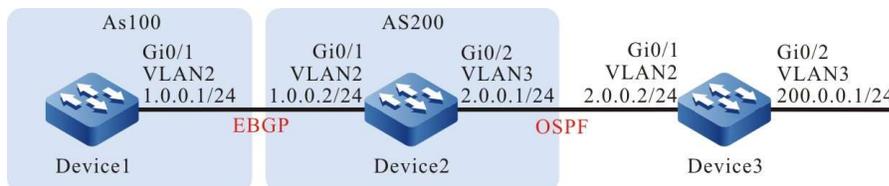

Figure 60 Network Topology for Configuring BGP Route Redistribution

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#exit
```

#Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 200.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

#View the routing table of Device 2.

```
Device2#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i - ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 200.0.0.0/24 [110/2] via 2.0.0.2, 00:01:45, vlan3
```

It can be seen from the routing table that Device2 learns the OSPF route 200.0.0.0/24 advertised by Device3.

Step 4: Configure BGP.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router bgp 200
Device1(config-bgp)#neighbor 1.0.0.2 remote-as 100
Device1(config-bgp)#exit
```

#Configure Device2.

```
Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 1.0.0.1 remote-as 200
Device2(config-bgp)#exit
```

#View the status of BGP neighbors on Device 2.

```
Device2#show ip bgp summary
BGP router identifier 2.0.0.1, local AS number 100
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
1.0.0.1    4  200    2     2     2    0  00:00:42    0
```

#It can be seen that BGP neighbors have been successfully established between Device 2 and Device1.

Step 5: Configure BGP to redistribute OSPF routes.

#Configure Device2.

```
Device2(config)#router bgp 100
Device2(config-bgp)#redistribute ospf 100
Device2(config-bgp)#exit
```

Step 6: Check the result.

#View the BGP routing table of Device2.

```
Device2#show ip bgp
BGP table version is 6, local router ID is 2.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[O]*> 2.0.0.0/24  0.0.0.0          1    32768 ?
[O]*> 200.0.0.0/24 2.0.0.2          2    32768 ?
```

According to the result, OSPF route has been successfully redistributed to BGP.

#View the routing table of Device1.

```
Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 2.0.0.0/24 [20/1] via 1.0.0.2, 00:06:14, vlan2
B 200.0.0.0/24 [20/2] via 1.0.0.2, 00:06:14, vlan2
```

According to the result, Device1 has successfully learnt the routes 2.0.0.0/24 and 200.0.0.0/24.

---

## Note

- In practical applications, if the autonomous system has 2 or more edge routers, directly redistributing routes between different routing protocols is not recommended. When configuration is necessary, routing control policies such as filtering and summarization are required on the edge routers of the autonomous system to avoid routing loops.
- 

### 60.3.3 Configure community attributes of BGP

#### Network Requirements

- EBMP neighbors are successfully established between Device1 and Device2.
- Device1 imports two direct routes 100.0.0.0/24 and 200.0.0.0/24 into BGP through the network, and sets different community attributes for the two routes when they are

advertised to Device2.

- When Device2 receives the route advertised by Device1, it filters the route 100.0.0.0/24 in the incoming direction of the neighbor by matching community attributes, and permits the route 200.0.0.0/24 to pass.

### Network Topology

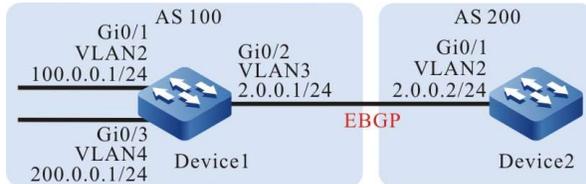

Figure 60 Network Topology for Configuring Community Attributes of BGP

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure BGP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 2.0.0.2 remote-as 200
Device1(config-bgp)#network 100.0.0.0 255.255.255.0
Device1(config-bgp)#network 200.0.0.0 255.255.255.0
Device1(config-bgp)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router bgp 200
Device2(config-bgp)#neighbor 2.0.0.1 remote-as 100
Device2(config-bgp)#exit
```

#### #View the status of BGP neighbors on Device 1.

```
Device1#show ip bgp summary
BGP router identifier 200.0.0.1, local AS number 100
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
2.0.0.2    4  200    2    3    1    0  00:00:04  0
```

#It can be seen that BGP neighbors have been successfully established between Device 1 and Device2.

#### #View the routing table on Device2.

```
Device2#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i - ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 100.0.0.0/24 [20/0] via 2.0.0.1, 00:07:47, vlan2
B 200.0.0.0/24 [20/0] via 2.0.0.1, 00:07:47, vlan2
```

According to the result, Device2 has successfully learnt the routes 100.0.0.0/24 and 200.0.0.0/24.

Step 4: Configure access list and routing policy, and set BGP community attributes.

#Configure Device1.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 100.0.0.0 0.0.0.255
Device1(config-std-nacl)#commit
Device1(config-std-nacl)#exit
Device1(config)#ip access-list standard 2
Device1(config-std-nacl)#permit 200.0.0.0 0.0.0.255
Device1(config-std-nacl)#commit
Device1(config-std-nacl)#exit
Device1(config)#route-map CommunitySet 10
Device1(config-route-map)#match ip address 1
Device1(config-route-map)#set community 100:1
Device1(config-route-map)#exit
Device1(config)#route-map CommunitySet 20
Device1(config-route-map)#match ip address 2
Device1(config-route-map)#set community 100:2
Device1(config-route-map)#exit
```

Set different community attributes for the routes 100.0.0.0/24 and 200.0.0.0/24 by configuring access list and routing policy.

Step 5: Configure BGP to associate with the routing policy.

#Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 2.0.0.2 route-map CommunitySet out
Device1(config-bgp)#neighbor 2.0.0.2 send-community
Device1(config-bgp)#exit
```

#View the BGP routing table of Device2.

```
Device2#show ip bgp 100.0.0.0
BGP routing table entry for 100.0.0.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
Not advertised to any peer
100
  2.0.0.1 (metric 10) from 2.0.0.1 (10.0.0.1)

Origin IGP, metric 0, localpref 100, valid, external, best
Community: 100:1
Last update: 00:01:06 ago

Device2#show ip bgp 200.0.0.0
BGP routing table entry for 200.0.0.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
Not advertised to any peer
100
  2.0.0.1 (metric 10) from 2.0.0.1 (10.0.0.1)

Origin IGP, metric 0, localpref 100, valid, external, best
Community: 100:2
Last update: 00:01:10 ago
```

It can be seen from the BGP routing table of Device2 that the community attribute of 100.0.0.0/24 has been set as 100:1, and that of 200.0.0.0/24 as 100:2.

Step 6: Configure BGP route filtration.

#Configure Device2.

```
Device2(config)#ip community-list 1 permit 100:2
Device2(config)#route-map communityfilter
Device2(config-route-map)#match community 1
Device2(config-route-map)#exit
Device2(config)#router bgp 200
Device2(config-bgp)#neighbor 2.0.0.1 route-map communityfilter in
Device2(config-bgp)#exit
```

Step 7: Check the result.

#View the routing table of Device 2.

```
Device2#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 200.0.0.0/24 [20/0] via 2.0.0.1, 00:00:53, vlan2
```

It can be seen from the BGP routing table of Device2 that 100.0.0.0/24 is filtered in the incoming direction, while 200.0.0.0/24 is allowed to pass.

---

### Note

- After configuring routing policy on the peer, it is required to reset the BGP process to make it take effect.
  - The command `send-community` is required to advertise the community attributes to the peer.
- 

## 60.3.4 Configure BGP Route Reflector

### Network Requirements

- Device3 establishes EBGP neighbors with Device4 which advertises the route of the 100.0.0.0/24 to Device3.
- Device2 establishes IBGP neighbors with Device3 and Device1 respectively. Route reflector is configured on Device2. Device1 and Device3 serve as clients so that Device1 can learn the route 100.0.0.0/24 advertised by Device4.

### Network Topology

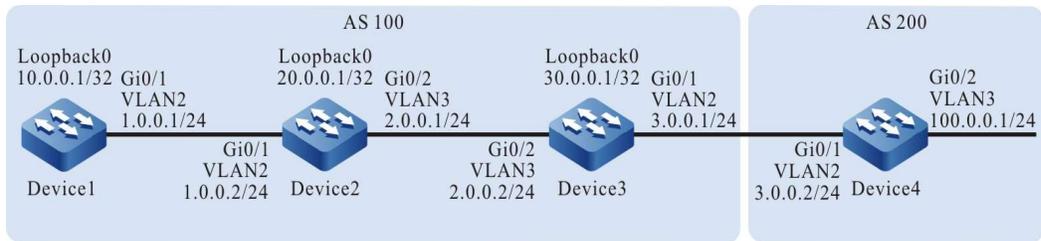

Figure 60 Network Topology for Configuring BGP Route Reflector

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Device1(config-ospf)#exit
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device2#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.1 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#### #View the routing table of Device1.

```
Device1#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 2.0.0.0/24 [110/2] via 1.0.0.2, 01:12:00, vlan2
O 20.0.0.1/32 [110/2] via 1.0.0.2, 01:11:47, vlan2
O 30.0.0.1/32 [110/3] via 1.0.0.2, 01:07:47, vlan2
```

#### #View the routing table of Device 2.

```
Device2#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

- 10.0.0.1/32 [110/2] via 1.0.0.1, 01:13:02, vlan2
- 30.0.0.1/32 [110/2] via 2.0.0.2, 01:08:58, vlan3

#### #Check the routing table of Device3.

```
Device3#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 1.0.0.0/24 [110/2] via 2.0.0.1, 01:10:04, vlan2
O 10.0.0.1/32 [110/3] via 2.0.0.1, 01:10:04, vlan2
O 20.0.0.1/32 [110/2] via 2.0.0.1, 01:10:04, vlan2
```

It can be seen that Device1, Device2 and Device3 can learn the routes of their loopback interface from each other.

#### Step 4: Configure BGP.

##### #Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 20.0.0.1 remote-as 100
Device1(config-bgp)#neighbor 20.0.0.1 update-source loopback0
Device1(config-bgp)#exit
```

##### #Configure Device2.

```
Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 30.0.0.1 remote-as 100
Device2(config-bgp)#neighbor 30.0.0.1 update-source loopback0
Device2(config-bgp)#neighbor 10.0.0.1 remote-as 100
Device2(config-bgp)#neighbor 10.0.0.1 update-source loopback0
Device2(config-bgp)#exit
```

##### #Configure Device3.

```
Device3(config)#router bgp 100
Device3(config-bgp)#neighbor 3.0.0.2 remote-as 200
Device3(config-bgp)#neighbor 20.0.0.1 remote-as 100
Device3(config-bgp)#neighbor 20.0.0.1 update-source loopback0
Device3(config-bgp)#neighbor 20.0.0.1 next-hop-self
Device3(config-bgp)#exit
```

##### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router bgp 200
Device4(config-bgp)#neighbor 3.0.0.1 remote-as 100
Device4(config-bgp)#network 100.0.0.0 255.255.255.0
Device4(config-bgp)#exit
```

##### #View the status of BGP neighbors on Device 2.

```
Device2#show ip bgp summary
BGP router identifier 20.0.0.1, local AS number 100
BGP table version is 1
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
10.0.0.1    4 100    8     8     1  0  0 00:03:01  0
30.0.0.1    4 100    9     9     1  0  0 00:02:41  1
```

##### #View the status of BGP neighbors on Device4.

```

Device4#show ip bgp summary
BGP router identifier 100.0.0.1, local AS number 200
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
3.0.0.1      4 100   19    19      1    0 00:05:40    0

```

It can be seen that BGP neighbors have been successfully established between devices.

#View the BGP routing table of Device3.

```

Device3#show ip bgp
BGP table version is 2, local router ID is 30.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network        Next Hop      Metric LocPrf Weight Path
[B]*> 100.0.0/24  3.0.0.2      0      0 200 i

```

#View the BGP routing table of Device2.

```

Device2#show ip bgp
BGP table version is 768, local router ID is 20.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network        Next Hop      Metric LocPrf Weight Path
[B]*>i100.0.0/24 30.0.0.1      0    100  0 200 i

```

#View the BGP routing table on Device1.

```

Device1#show ip bgp
BGP table version is 2, local router ID is 10.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network        Next Hop      Metric LocPrf Weight Path

```

It can be seen from above that both Device2 and Device3 have learned the route 100.0.0.0/24, though Device2 doesn't advertise it to Device1.

Step 5: Configure BGP route reflector.

#Configure Device2.

```

Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 10.0.0.1 route-reflector-client
Device2(config-bgp)#neighbor 30.0.0.1 route-reflector-client
Device2(config-bgp)#exit

```

On Device2, configure Device1 and Device3 as clients of route reflector.

Step 6: Check the result.

#View the routing table of Device1.

```

Device1#show ip bgp
BGP table version is 2, local router ID is 10.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

```

```

Network      Next Hop      Metric LocPrf Weight Path
[B]*>i100.0.0.0/24 30.0.0.1      0 100  0 200 i

```

```

Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

```

```

B 100.0.0.0/24 [200/0] via 30.0.0.1, 00:01:40, vlan2

```

Configure Device1 and Device3 as clients of route reflector in the BGP of Device2 which successfully reflects the route 100.0.0.0/24 to the client Device1.

---

## Note

- When a peer is configured as the client of route reflector, the neighbors of the device and this peer will be reset.
- 

### 60.3.5 Configure BGP route aggregation

#### Network Requirements

- Device1 establishes OSPF neighbors with Device3 which advertises the two routes 100.1.0.0/24 and 100.2.0.0/24 to Device1.
- EBMP neighbors are successfully established between Device1 and Device2.
- On Device1, the routes 100.1.0.0/24 and 100.2.0.0/24 are aggregated into 100.0.0.0/14 to advertise to Device2.

#### Network Topology

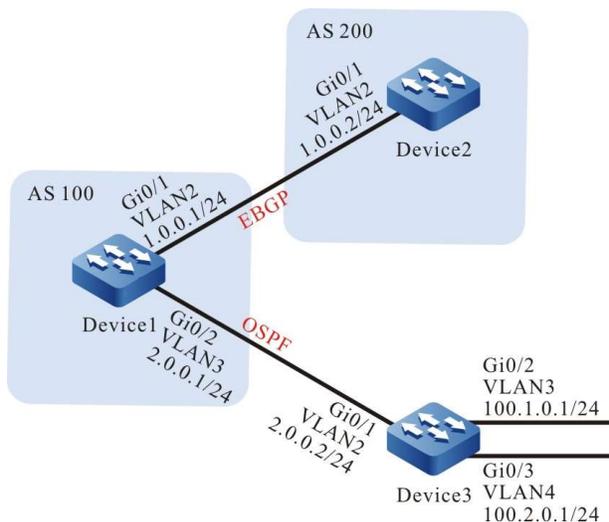

Figure 60 Network Topology for Configuring BGP Route Aggregation

## Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 100.1.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 100.2.0.0 0.0.0.255 area 0
Device3(config-ospf)#exit
```

### #View the routing table of Device1.

```
Device1#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 100.1.0.0/24 [110/2] via 2.0.0.2, 00:00:24, vlan3
O 100.2.0.0/24 [110/2] via 2.0.0.2, 00:00:24, vlan3
```

According to the result, Device1 learns the two routes 100.1.0.0/24 and 100.2.0.0/24 distributed by Device3.

Step 4: Configure BGP.

### #Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 1.0.0.2 remote-as 200
Device1(config-bgp)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router bgp 200
Device2(config-bgp)#neighbor 1.0.0.1 remote-as 100
Device2(config-bgp)#exit
```

### #View the status of BGP neighbors on Device 1.

```
Device1#show ip bgp summary
BGP router identifier 1.0.0.1, local AS number 100
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
```

```
1.0.0.2 4 200 2 2 2 0 0 00:00:42 0
```

BGP neighbor has been successfully established between Device1 and Device2.

Step 5: Configure BGP route aggregation.

To meet the network requirements, here are two schemes:

Scheme 1: Configure the aggregated static route pointing to null0 and import it into BGP.

#Configure Device1.

```
Device1(config)#ip route 100.0.0.0 255.252.0.0 null0
Device1(config)#router bgp 100
Device1(config-bgp)#network 100.0.0.0 255.252.0.0
Device1(config-bgp)#exit
```

Check the result.

#View the BGP routing table on Device1.

```
Device1#show ip bgp
BGP table version is 2, local router ID is 10.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]*> 100.0.0.0/14  0.0.0.0          32768 i
```

It can be seen that the aggregated route 100.0.0.0/14 has been generated in the BGP routing table of Device1.

#View the routing table of Device 2.

```
Device2#show ip bgp
BGP table version is 3, local router ID is 20.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]*> 100.0.0.0/14  1.0.0.1          0      0 100 i

Device2#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 100.0.0.0/14 [20/0] via 1.0.0.1, 01:39:30, vlan2
```

It can be seen that Device2 has successfully learned the aggregated route 100.0.0.0/14 advertised by Device1.

Scheme 2: First import the detail route into BGP and then complete route aggregation via the command **aggregate-address**.

#Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#redistribute ospf 100
Device1(config-bgp)#aggregate-address 100.0.0.0 255.252.0.0 summary-only
Device1(config-bgp)#exit
```

Check the result.

#View the BGP routing table on Device1.

```
Device1#show ip bgp
BGP table version is 2, local router ID is 10.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]*> 100.0.0.0/14  0.0.0.0          32768 i
[B]s> 100.1.0.0/24  2.0.0.2           2   32768 i
[B]s> 100.2.0.0/24  2.0.0.2           2   32768 i
```

It can be seen that the aggregated route 100.0.0.0/14 has been generated in the BGP routing table of Device1.

#View the routing table of Device 2.

```
Device2#show ip bgp
BGP table version is 3, local router ID is 20.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]*> 100.0.0.0/14  1.0.0.1           0     0 100 i

Device2#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 100.0.0.0/14 [20/0] via 1.0.0.1, 01:39:30, vlan2
```

It can be seen that Device2 has successfully learned the aggregated route 100.0.0.0/14 advertised by Device1.

---

## Note

- When the command `aggregate-address` is used for route aggregation, if the extension command `summary-only` is configured, the device will advertise aggregated route only; otherwise, it will advertise both detail route and aggregated route.
- 

## 60.3.6 Configure BGP route preference

### Network Requirements

- Device1 has established IBGP neighbors with Device2 and Device3, and Device4 has established EBGP neighbors with Device2 and Device3.
- Device1 advertises two routes to Device4, i.e. 55.0.0.0/24 and 65.0.0.0/24; Device4 advertises two routes to Device1, i.e. 75.0.0.0/24 and 85.0.0.0/24.
- By modifying the Local-preference of route on Device2 and Device3, you can make

Device1 prefer the route 75.0.0.0/24 advertised by Device2 and the route 85.0.0.0/24 advertised by Device3.

- By modifying the MED of route on Device2 and Device3, you can make Device4 prefer the route 55.0.0.0/24 advertised by Device2 and the route 65.0.0.0/24 advertised by Device3.

## Network Topology

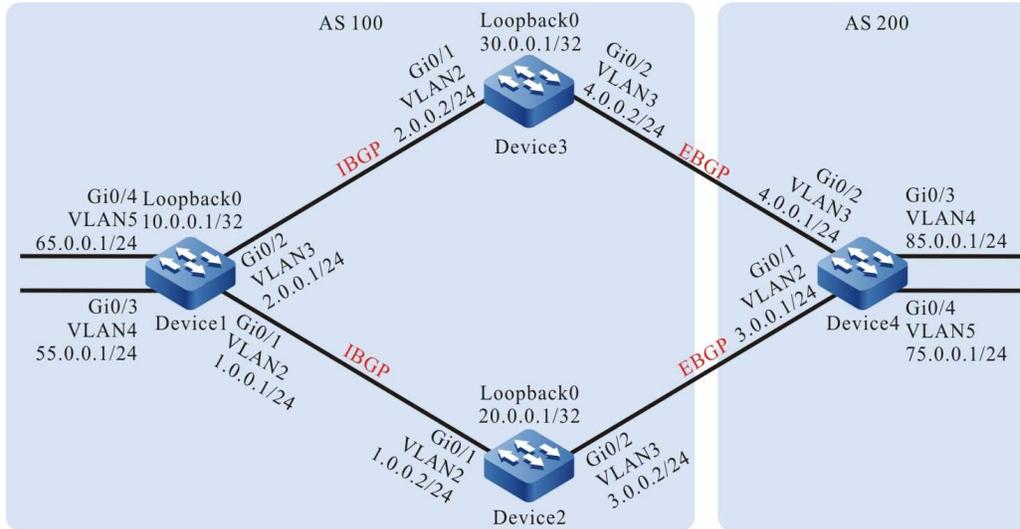

Figure 60 Network Topology for Configuring BGP Route Preference

## Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router ospf 100
Device1(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device1(config-ospf)#network 10.0.0.1 0.0.0.0 area 0
Device1(config-ospf)#exit
```

### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 1.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Device2(config-ospf)#exit
```

### #Configure Device3.

```
Device3#configure terminal
```

```
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.1 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#### #View the routing table of Device1.

```
Device1#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 20.0.0.1/32 [110/2] via 1.0.0.2, 00:03:15, vlan2
O 30.0.0.1/32 [110/2] via 2.0.0.2, 00:01:40, vlan3
```

#### #View the routing table of Device 2.

```
Device2#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 2.0.0.0/24 [110/2] via 1.0.0.1, 00:03:54, vlan2
O 10.0.0.1/32 [110/2] via 1.0.0.1, 00:03:54, vlan2
O 30.0.0.1/32 [110/3] via 1.0.0.1, 00:02:14, vlan2
```

#### #Check the routing table of Device3.

```
Device3#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 1.0.0.0/24 [110/2] via 2.0.0.1, 00:02:35, vlan2
O 10.0.0.1/32 [110/2] via 2.0.0.1, 00:02:35, vlan2
O 20.0.0.1/32 [110/3] via 2.0.0.1, 00:02:35, vlan2
```

It can be seen that Device1, Device2 and Device3 can learn the routes of their loopback interface from each other.

#### Step 4: Configure BGP.

##### #Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 20.0.0.1 remote-as 100
Device1(config-bgp)#neighbor 20.0.0.1 update-source loopback0
Device1(config-bgp)#neighbor 30.0.0.1 remote-as 100
Device1(config-bgp)#neighbor 30.0.0.1 update-source loopback0
Device1(config-bgp)#network 55.0.0.0 255.255.255.0
Device1(config-bgp)#network 65.0.0.0 255.255.255.0
Device1(config-bgp)#exit
```

##### #Configure Device2.

```
Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 10.0.0.1 remote-as 100
Device2(config-bgp)#neighbor 10.0.0.1 update-source loopback0
Device2(config-bgp)#neighbor 10.0.0.1 next-hop-self
Device2(config-bgp)#neighbor 3.0.0.1 remote-as 200
Device2(config-bgp)#exit
```

##### #Configure Device3.

```
Device3(config)#router bgp 100
Device3(config-bgp)#neighbor 10.0.0.1 remote-as 100
Device3(config-bgp)#neighbor 10.0.0.1 update-source loopback0
```

```
Device3(config-bgp)#neighbor 10.0.0.1 next-hop-self
Device3(config-bgp)#neighbor 4.0.0.1 remote-as 200
Device3(config-bgp)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router bgp 200
Device4(config-bgp)#neighbor 3.0.0.2 remote-as 100
Device4(config-bgp)#neighbor 4.0.0.2 remote-as 100
Device4(config-bgp)#network 75.0.0.0 255.255.255.0
Device4(config-bgp)#network 85.0.0.0 255.255.255.0
Device4(config-bgp)#exit
```

#### #View the status of BGP neighbors on Device 1.

```
Device1#show ip bgp summary
BGP router identifier 10.0.0.1, local AS number 100
BGP table version is 2
2 BGP AS-PATH entries
0 BGP community entries

[B]*>i          20.0.0.1      0 100  0 200 i
[B]* i85.0.0.0/24  30.0.0.1      0 100  0 200 i
[B]*>i          20.0.0.1      0 100  0 200 i

Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 75.0.0.0/24 [200/0] via 20.0.0.1, 01:13:17, vlan2
B 85.0.0.0/24 [200/0] via 20.0.0.1, 01:13:17, vlan2
```

It can be seen that both 75.0.0.0/24 and 85.0.0.0/24 on Device1 select Device2 as the optimal next hop device.

#### #View the routing table of Device 4.

```

Device4#show ip bgp
BGP table version is 2, local router ID is 85.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop      Metric LocPrf Weight Path
[B]* 55.0.0.0/24  3.0.0.2       0       0 100 i
[B]*> 55.0.0.0/24 4.0.0.2       0       0 100 i
[B]* 65.0.0.0/24  3.0.0.2       0       0 100 i
[B]*> 65.0.0.0/24 4.0.0.2       0       0 100 i
[B]*> 75.0.0.0/24  0.0.0.0       0      32768 i
[B]*> 85.0.0.0/24  0.0.0.0       0      32768 i

Device4#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 55.0.0.0/24 [20/0] via 4.0.0.2, 01:25:19, vlan3
B 65.0.0.0/24 [20/0] via 4.0.0.2, 01:25:19, vlan3

```

It can be seen that both 55.0.0.0/24 and 65.0.0.0/24 on Device4 select Device3 as the optimal next hop device.

Step 5: Configure access control list and routing policy, and set local-preference and metric.

#Configure Device2.

```

Device2(config)#ip access-list standard 1
Device2(config-std-nacl)#permit 75.0.0.0 0.0.0.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#ip access-list standard 2
Device2(config-std-nacl)#permit 65.0.0.0 0.0.0.255
Device2(config-std-nacl)#commit
Device2(config-std-nacl)#exit
Device2(config)#route-map SetPriority1 10
Device2(config-route-map)#match ip address 1
Device2(config-route-map)#set local-preference 110
Device2(config-route-map)#exit
Device2(config)#route-map SetPriority1 20
Device2(config-route-map)#exit
Device2(config)#route-map SetPriority2 10
Device2(config-route-map)#match ip address 2
Device2(config-route-map)#set metric 100
Device2(config-route-map)#exit
Device2(config)#route-map SetPriority2 20
Device2(config-route-map)#exit

```

Configure routing policy on Device2 to set the local-preference of 75.0.0.0/24 as 110 and the metric of 65.0.0.0/24 as 100.

#Configure Device3.

```

Device3(config)#ip access-list standard 1
Device3(config-std-nacl)#permit 85.0.0.0 0.0.0.255
Device3(config-std-nacl)#commit
Device3(config-std-nacl)#exit
Device3(config)#ip access-list standard 2
Device3(config-std-nacl)#permit 55.0.0.0 0.0.0.255
Device3(config-std-nacl)#commit
Device3(config-std-nacl)#exit
Device3(config)#route-map SetPriority1 10
Device3(config-route-map)#match ip address 1
Device3(config-route-map)#set local-preference 110
Device3(config-route-map)#exit
Device3(config)#route-map SetPriority1 20

```

```

Device3(config-route-map)#exit
Device3(config)#route-map SetPriority2 10
Device3(config-route-map)#match ip address 2
Device3(config-route-map)#set metric 100
Device3(config-route-map)#exit
Device3(config)#route-map SetPriority2 20
Device3(config-route-map)#exit

```

Configure routing policy on Device3 to set the local-preference of 85.0.0.0/24 as 110 and the metric of 55.0.0.0/24 as 100.

---

## Note

- When configuring a routing policy, both the prefix list and ACL can create filtering rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 6: Configure BGP to associate with the routing policy.

#Configure Device2.

```

Device2(config)#router bgp 100
Device2(config-bgp)#neighbor 10.0.0.1 route-map SetPriority1 out
Device2(config-bgp)#neighbor 3.0.0.1 route-map SetPriority2 out
Device2(config-bgp)#exit

```

On Device2, modify the local-preference of 75.0.0.0/24 in the outgoing direction of neighbor 10.0.0.1 and the metric of 65.0.0.0/24 in the outgoing direction of neighbor 3.0.0.1.

#Configure Device3.

```

Device3(config)#router bgp 100
Device3(config-bgp)#neighbor 10.0.0.1 route-map SetPriority1 out
Device3(config-bgp)#neighbor 4.0.0.1 route-map SetPriority2 out
Device3(config-bgp)#exit

```

On Device3, modify the local-preference of 85.0.0.0/24 in the outgoing direction of neighbor 10.0.0.1 and the metric of 55.0.0.0/24 in the outgoing direction of neighbor 4.0.0.1.

After configuring routing policy on the peer, it is required to reset the BGP process to make it take effect.

Step 7: Check the result.

#View the routing table of Device1.

```

Device1#show ip bgp
BGP table version is 5, local router ID is 10.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

```

Network	Next Hop	Metric	LocPrf	Weight	Path
[B]*> 55.0.0.0/24	0.0.0.0	0			32768 i
[B]*> 65.0.0.0/24	0.0.0.0	0			32768 i
[B]* i75.0.0.0/24	30.0.0.1	0	100	0	200 i
[B]*>i	20.0.0.1	0	110	0	200 i
[B]*>i85.0.0.0/24	30.0.0.1	0	110	0	200 i

```
[B]* i      20.0.0.1      0 100  0 200 i
```

```
Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 75.0.0.0/24 [200/0] via 20.0.0.1, 00:01:34, vlan2
B 85.0.0.0/24 [200/0] via 30.0.0.1, 00:00:51, vlan3
```

It can be seen that the local-preference values of 75.0.0.0/24 and 85.0.0.0/24 have been successfully modified, and Device1 prefers the route 75.0.0.0/24 advertised by Device2 and the route 85.0.0.0/24 advertised by Device3.

#View the routing table of Device 4.

```
Device4#show ip bgp
BGP table version is 4, local router ID is 85.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network        Next Hop        Metric LocPrf Weight Path
[B]* 55.0.0.0/24  4.0.0.2         100    0 100 i
[B]*> 3.0.0.2      3.0.0.2         0      0 100 i
[B]*> 65.0.0.0/24 4.0.0.2         0      0 100 i
[B]* 3.0.0.2        3.0.0.2        100    0 100 i
[B]*> 75.0.0.0/24  0.0.0.0         0     32768 i
[B]*> 85.0.0.0/24  0.0.0.0         0     32768 i
```

```
Device4#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
B 55.0.0.0/24 [20/0] via 3.0.0.2, 00:15:02, vlan2
B 65.0.0.0/24 [20/0] via 4.0.0.2, 00:14:55, vlan3
```

It can be seen that the metric values of 55.0.0.0/24 and 65.0.0.0/24 have been successfully modified, and Device4 prefers the route 55.0.0.0/24 advertised by Device2 and the route 65.0.0.0/24 advertised by Device3.

---

## Note

- Routing policy can be used either in the outgoing direction of route advertisement or in the incoming direction of route receiving.
- 

## 60.3.7 Configure BGP Confederation

### Network Requirements

- Device2, Device3, Device4 and Device5 are within the same BGP AS 200. In order to reduce IBGP full connections, you can incorporate them into two different AS within the same BGP confederation.

- Device1 establishes EBGP neighbors with Device2 and advertises the route 100.0.0.0/24 to AS 200.

### Network Topology

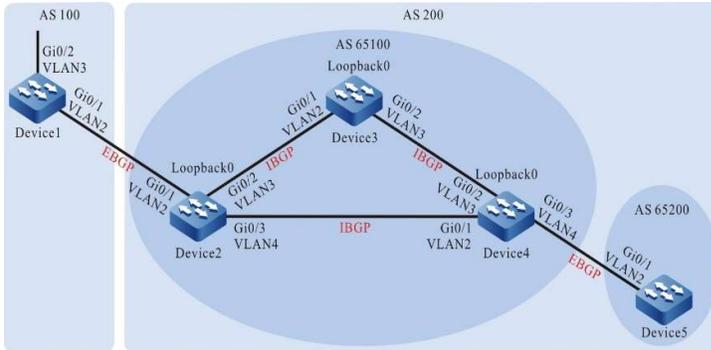

Figure 60 Network Topology for Configuring BGP Confederation

of equipment	Interface	VLAN	IP address
Device1	Gi0/1	2	1.0.0.1/24
	Gi0/2	3	100.0.0.1/24
Device2	Gi0/1	2	1.0.0.2/24
	Gi0/2	3	2.0.0.2/24
	Gi0/3	4	3.0.0.2/24
	Loopback0		20.0.0.1/32
Device3	Gi0/1	2	2.0.0.1/24
	Gi0/2	3	4.0.0.1/24
	Loopback0		30.0.0.1/32
Device4	Gi0/1	2	3.0.0.1/24
	Gi0/2	3	4.0.0.2/24
	Gi0/3	4	5.0.0.1/24
	Loopback0		40.0.0.1/32

of equipment	Interface	VLAN	IP address
Device5	Gi0/1	2	5.0.0.2/24

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configure IP addresses for the ports. (Omitted)

Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 2.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.1 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router ospf 100
Device4(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device4(config-ospf)#network 4.0.0.0 0.0.0.255 area 0
Device4(config-ospf)#network 5.0.0.0 0.0.0.255 area 0
Device4(config-ospf)#network 40.0.0.1 0.0.0.0 area 0
Device4(config-ospf)#exit
```

#### #Configure Device5.

```
Device5#configure terminal
Device5(config)#router ospf 100
Device5(config-ospf)#network 5.0.0.0 0.0.0.255 area 0
Device5(config-ospf)#exit
```

#### #View the routing table of Device 2.

```
Device2#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 4.0.0.0/24 [110/2] via 2.0.0.1, 00:02:42, vlan3
   [110/2] via 3.0.0.1, 00:02:11, vlan4
O 30.0.0.1/32 [110/2] via 2.0.0.1, 00:02:32, vlan3
O 40.0.0.1/32 [110/2] via 3.0.0.1, 00:02:05, vlan4
```

### #Check the routing table of Device3.

```
Device3#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 3.0.0.0/24 [110/2] via 2.0.0.2, 00:03:24, vlan2
   [110/2] via 4.0.0.2, 00:02:38, vlan3
O 20.0.0.1/32 [110/2] via 2.0.0.2, 00:03:24, vlan2
O 40.0.0.1/32 [110/2] via 4.0.0.2, 00:02:38, vlan3
```

### #View the routing table of Device 4.

```
Device4#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 2.0.0.0/24 [110/2] via 3.0.0.2, 00:03:42, vlan2
   [110/2] via 4.0.0.1, 00:03:42, vlan3
O 20.0.0.1/32 [110/2] via 3.0.0.2, 00:03:42, vlan2
O 30.0.0.1/32 [110/2] via 4.0.0.1, 00:03:42, vlan3
```

### #View the routing table of Device5.

```
Device5#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 2.0.0.0/24 [110/3] via 5.0.0.1, 00:00:03, vlan2
O 3.0.0.0/24 [110/2] via 5.0.0.1, 00:00:03, vlan2
O 4.0.0.0/24 [110/2] via 5.0.0.1, 00:00:03, vlan2
O 20.0.0.1/32 [110/3] via 5.0.0.1, 00:00:03, vlan2
O 30.0.0.1/32 [110/3] via 5.0.0.1, 00:00:03, vlan2
O 40.0.0.1/32 [110/2] via 5.0.0.1, 00:00:03, vlan2
```

It can be seen that Device2, Device3 and Device4 can learn the routes of their loopback interface from each other.

Step 4: Configure BGP connections within the confederation.

### #Configure IBGP connections within the confederation.

#### #Configure Device2.

```
Device2(config)#router bgp 65100
Device2(config-bgp)#neighbor 30.0.0.1 remote-as 65100
Device2(config-bgp)#neighbor 30.0.0.1 update-source loopback0
Device2(config-bgp)#neighbor 40.0.0.1 remote-as 65100
Device2(config-bgp)#neighbor 40.0.0.1 update-source loopback0
Device2(config-bgp)#neighbor 30.0.0.1 next-hop-self
Device2(config-bgp)#neighbor 40.0.0.1 next-hop-self
Device2(config-bgp)#exit
```

#### #Configure Device3.

```
Device3(config)#router bgp 65100
Device3(config-bgp)#neighbor 20.0.0.1 remote-as 65100
Device3(config-bgp)#neighbor 20.0.0.1 update-source loopback0
Device3(config-bgp)#neighbor 40.0.0.1 remote-as 65100
Device3(config-bgp)#neighbor 40.0.0.1 update-source loopback0
Device3(config-bgp)#exit
```

#### #Configure Device4.

```
Device4(config)#router bgp 65100
Device4(config-bgp)#neighbor 20.0.0.1 remote-as 65100
Device4(config-bgp)#neighbor 20.0.0.1 update-source loopback0
Device4(config-bgp)#neighbor 30.0.0.1 remote-as 65100
Device4(config-bgp)#neighbor 30.0.0.1 update-source loopback0
Device4(config-bgp)#exit
```

#Configure EBGP connections within the confederation

#Configure Device4.

```
Device4(config)#router bgp 65100
Device4(config-bgp)#neighbor 5.0.0.2 remote-as 65200
Device4(config-bgp)#exit
```

#Configure Device5.

```
Device5(config)#router bgp 65200
Device5(config-bgp)#neighbor 5.0.0.1 remote-as 65100
Device5(config-bgp)#exit
```

#View the status of BGP neighbors on Device4.

```
Device4#show ip bgp summary
BGP router identifier 40.0.0.1, local AS number 65100
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down State/PfxRcd
5.0.0.2    4 65200   15    15    2    0  00:09:40    0
20.0.0.1   4 65100    9     9    2    0  00:07:49    0
30.0.0.1   4 65100    7     7    2    0  00:05:39    0
```

Device4 has established IBGP neighbors with Device2 and Device3, and Device4 has established EBGP neighbors with Device5.

Step 5: Configure BGP confederation.

#Configure Device1.

Configure EBGP peer. The peer AS number is the confederation ID 200.

```
Device1#configure terminal
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 1.0.0.2 remote-as 200
Device1(config-bgp)#network 100.0.0.0 255.255.255.0
Device1(config-bgp)#exit
```

#Configure Device2.

Configure the BGP confederation ID as 200 and EBGP peer (AS number 100).

```
Device2(config)#router bgp 65100
Device2(config-bgp)#bgp confederation identifier 200
Device2(config-bgp)#neighbor 1.0.0.1 remote-as 100
Device2(config-bgp)#exit
```

#Configure Device3.

Configure the BGP confederation ID as 200.

```
Device3(config)#router bgp 65100
Device3(config-bgp)#bgp confederation identifier 200
Device3(config-bgp)#exit
```

#Configure Device4.

Configure the BGP confederation ID as 200, and make the confederation contain area 65100.

```
Device4#configure terminal
Device4(config)#router bgp 65100
Device4(config-bgp)#bgp confederation identifier 200
Device4(config-bgp)#bgp confederation peers 65200
Device4(config-bgp)#exit
```

#Configure Device5.

Configure the BGP confederation ID as 200, and make the confederation contain area 65200.

```
Device5(config)#router bgp 65200
Device5(config-bgp)#bgp confederation identifier 200
Device5(config-bgp)#bgp confederation peers 65100
Device5(config-bgp)#exit
```

Step 6: Check the result.

#View the status of BGP neighbors on Device 1.

```
Device1#show ip bgp summary
BGP router identifier 100.0.0.1, local AS number 100
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd
1.0.0.2    4  200    6    6    2    0  00:02:20    0
```

#It can be seen that EBGP neighbor relation has been successfully established between Device 1 and Device2.

#View the routing information on Device5.

```
Device5#show ip bgp
BGP table version is 49, local router ID is 5.0.0.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop        Metric LocPrf Weight Path
[B]*> 100.0.0.0/24  20.0.0.1          0  100   0 (65100) 100 i

Device5#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 100.0.0.0/24 [200/0] via 20.0.0.1, 00:00:38, vlan2
```

Device5 has successfully learned the route 100.0.0.0/24, and it can be seen that the next-hop attribute keeps unchanged when this route is transmitted in the confederation. Device2, Device3, Device4 and Device5 all belong to the same confederation. So full connections are not required. Device5 obtains external routing information through Device4.

## 60.3.8 Configure BGP to Coordinate with BFD

### Network Requirements

- Device1 establishes EBGP neighbors with Device2 and Device3, and IBGP neighbors are

established between Device2 and Device3.

- Device1 learns theEBGP route 3.0.0.0/24 from Device2 and Device3 at the same time, and prefers Device2 to forward data to the network segment 3.0.0.0/24.
- Configure EBGP to associate BFD on Device1 and Device2. When the line between Device1 and Device2 fails, BFD can quickly detect and notify BGP. Then, Device1 chooses Device3 to forward data to the network segment 3.0.0.0/24.

### Network Topology

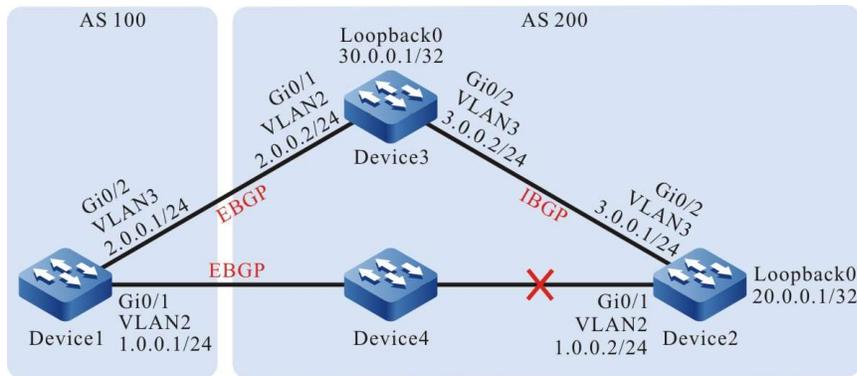

Figure 60 Network Topology for Configuring Coordination of BGP with BFD

### Configuration Steps

- Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)
- Step 2: Configure IP addresses for the ports. (Omitted)
- Step 3: Configure OSPF so that the routes of Loopback between devices are reachable from each other.

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 100
Device2(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.0.0.1 0.0.0.0 area 0
Device2(config-ospf)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#router ospf 100
Device3(config-ospf)#network 3.0.0.0 0.0.0.255 area 0
Device3(config-ospf)#network 30.0.0.1 0.0.0.0 area 0
Device3(config-ospf)#exit
```

#### #View the routing table of Device 2.

```
Device2#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external
```

```
O 30.0.0.1/32 [110/2] via 3.0.0.2, 00:02:26, vlan3
```

#Check the routing table of Device3.

```
Device3#show ip route ospf
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

O 20.0.0.1/32 [110/2] via 3.0.0.1, 00:03:38, vlan3
```

It can be seen that Device2 and Device3 can learn the routes of their loopback interface from each other.

Step 4: Configure access control list and routing policy, and set the routing metric.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 3.0.0.0 0.0.0.255
Device1(config-std-nacl)#commit
Device1(config-std-nacl)#exit
Device1(config)#route-map SetMetric
Device1(config-route-map)#match ip address 1
Device1(config-route-map)#set metric 50
Device1(config-route-map)#exit
```

On Device1, configure the routing policy and set the metric value of 3.0.0.0/24 as 50.

Step 5: Configure BGP and associate routing policy on Device1.

#Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 1.0.0.2 remote-as 200
Device1(config-bgp)#neighbor 2.0.0.2 remote-as 200
Device1(config-bgp)#neighbor 2.0.0.2 route-map SetMetric in
Device1(config-bgp)#exit
```

#Configure Device2.

```
Device2(config)#router bgp 200
Device2(config-bgp)#neighbor 1.0.0.1 remote-as 100
Device2(config-bgp)#neighbor 30.0.0.1 remote-as 200
Device2(config-bgp)#neighbor 30.0.0.1 update-source loopback0
Device2(config-bgp)#network 3.0.0.0 255.255.255.0
Device2(config-bgp)#exit
```

#Configure Device3.

```
Device3(config)#router bgp 200
Device3(config-bgp)#neighbor 2.0.0.1 remote-as 100
Device3(config-bgp)#neighbor 20.0.0.1 remote-as 200
Device3(config-bgp)#neighbor 20.0.0.1 update-source loopback0
Device3(config-bgp)#network 3.0.0.0 255.255.255.0
Device3(config-bgp)#exit
```

After configuring routing policy on the peer, it is required to reset the BGP process to make it take effect.

#View the status of BGP neighbors on Device 1.

```
Device1#show ip bgp summary
BGP router identifier 2.0.0.1, local AS number 100
BGP table version is 2
2 BGP AS-PATH entries
0 BGP community entries
```

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
1.0.0.2	4	200	2	2	2	0	0	00:01:32	1
2.0.0.2	4	200	2	2	2	0	0	00:01:43	1

#View the status of BGP neighbors on Device 2.

```
Device2#show ip bgp summary
BGP router identifier 20.0.0.1, local AS number 200
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ  OutQ Up/Down  State/PfxRcd
1.0.0.1      4 100    2     2     2     0  0 00:02:52    0
30.0.0.1     4 200    3     3     2     0  0 00:02:45    1
```

It can be seen that BGP neighbor has been successfully established between Device1, Device2 and Device3.

#View the routing table of Device1.

```
Device1#show ip bgp
BGP table version is 3, local router ID is 1.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]* 3.0.0.0/24    2.0.0.2         50      0 200 i
[B]*> 1.0.0.2      1.0.0.2         0        0 200 i

Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 3.0.0.0/24 [20/0] via 1.0.0.2, 00:07:19, vlan2
```

It can be seen that the route 3.0.0.0/24 on Device1 selects Device2 as the optimal next hop device.

Step 6: Configure coordination of BGP with BFD.

#Configure Device1.

```
Device1(config)#bfd fast-detect
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 1.0.0.2 fall-over bfd
Device1(config-bgp)#exit
Device1(config)#interface vlan2
Device1(config-if-vlan2)#bfd min-receive-interval 500
Device1(config-if-vlan2)#bfd min-transmit-interval 500
Device1(config-if-vlan2)#bfd multiplier 4
Device1(config-if-vlan2)#exit
```

#Configure Device2.

```
Device2(config)#bfd fast-detect
Device2(config)#router bgp 200
Device2(config-bgp)#neighbor 1.0.0.1 fall-over bfd
Device2(config-bgp)#exit
Device2(config)#interface vlan2
Device2(config-if-vlan2)#bfd min-receive-interval 500
Device2(config-if-vlan2)#bfd min-transmit-interval 500
Device2(config-if-vlan2)#bfd multiplier 4
Device2(config-if-vlan2)#exit
```

Enable BFD between EBGP neighbors Device1 and Device2, and modify BFD to control the minimum sending interval, minimum receiving interval and detection timeout multiples of packets.

Step 7: Check the result.

#View the BFD session status on Device1.

```
Device1#show bfd session
OurAddr      NeighAddr    LD/RD      State      Holddown    interface
1.0.0.1      1.0.0.2      2/2        UP         2000        vlan2
```

According to the result, BFD status on Device1 is correctly up, and the holddown time is negotiated as 2000ms.

#When the lines between Device1 and Device2 fail, the route can quickly switch to the backup line.

#View the routing table of Device1.

```
Device1#show ip bgp
BGP table version is 6, local router ID is 1.0.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric LocPrf Weight Path
[B]*> 3.0.0.0/24   2.0.0.2         50      0 200 i

Device1#show ip route bgp
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

B 3.0.0.0/24 [20/50] via 2.0.0.2, 00:00:05, vlan3
```

It can be seen that the next hop of 3.0.0.0/24 switches to Device3.

## 60.3.9 Configure BGP FRR

### Network Requirements

- All the devices are configured with BGP protocol.
- Device1 learns the BGP route 192.168.1.1/32 from Device2 and Device3 at the same time, and first uses the lines between it and Device3 to forward packets. Likewise, Device3 learns the BGP route 100.1.1.1/32 from Device1 and Device2, and prefers to use the lines between it and Device1 to forward packets.
- Enable BGP FRR on Device1 and Device3. When the lines between Device1 and Device3 fail, the service can quickly switch to Device2 for communication.

### Network Topology

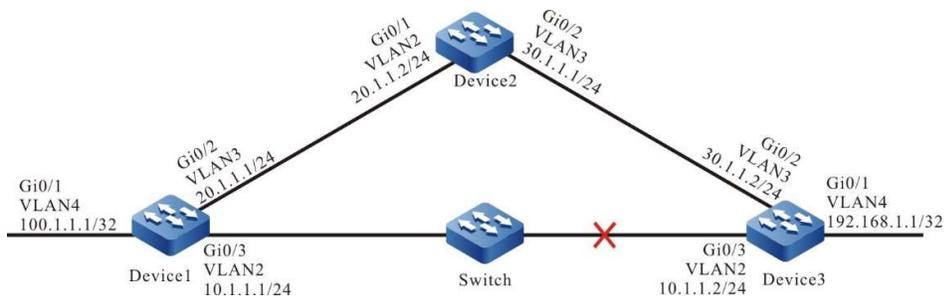

Figure 60 Network Topology for Configuring BGP FRR

### Configuration Steps

- Step 1: Configure VLAN, and add ports to the required VLAN; configure the IP address of each interface (Omitted).
- Step 2: Configure BGP.

Device1 establishes BGP neighbors with Device2 and Device3, and the route weight of neighbor with Device3 is 100.

```
Device1#configure terminal
Device1(config)#router bgp 100
Device1(config-bgp)#neighbor 10.1.1.2 remote-as 300
Device1(config-bgp)#neighbor 10.1.1.2 weight 100
Device1(config-bgp)#neighbor 20.1.1.2 remote-as 200
Device1(config-bgp)#network 100.1.1.1 255.255.255.255
Device1(config-bgp)#exit
```

#Device2 establishes BGP neighbors with Device1 and Device3.

```
Device2#configure terminal
Device2(config)#router bgp 200
Device2(config-bgp)#neighbor 20.1.1.1 remote-as 100
Device2(config-bgp)#neighbor 30.1.1.2 remote-as 300
Device2(config-bgp)#exit
```

#Device3 establishes BGP neighbors with Device1 and Device2, and the route weight of neighbor with Device1 is 100.

```
Device3#configure terminal
Device3(config)#router bgp 300
Device3(config-bgp)#neighbor 10.1.1.1 remote-as 100
Device3(config-bgp)#neighbor 10.1.1.1 weight 100
Device3(config-bgp)#neighbor 30.1.1.1 remote-as 200
Device3(config-bgp)#network 195.168.1.1 255.255.255.255
Device3(config-bgp)#exit
```

Step 3: Configure routing policy.

#On Device1, configure route-map to invoke ACL to match 192.168.1.1/32 only, and filter other networks.

The route matching the match rule applies the backup next hop address is 20.1.1.2.

```
Device1(config)#ip access-list standard 1
Device1(config-std-nacl)#permit 192.168.1.1 0.0.0.0
Device1(config-std-nacl)#exit
Device1(config)#route-map ipfir_bgp
Device1(config-route-map)#match ip address 1
Device1(config-route-map)#set fast-reroute backup-nextthop 20.1.1.2
Device1(config-route-map)#exit
```

#On Device3, configure route-map to invoke ACL to match 100.1.1.1/32 only, and filter other networks.

The route matching the match rule applies the backup next hop address is 30.1.1.1.

```
Device3(config)#ip access-list standard 1
Device3(config-std-nacl)#permit 100.1.1.1 0.0.0.0
Device3(config-std-nacl)#exit
Device3(config)#route-map ipfir_bgp
Device3(config-route-map)#match ip address 1
Device3(config-route-map)#set fast-reroute backup-nextthop 30.1.1.1
Device3(config-route-map)#exit
```

Step 4: Configure FRR.

#On Device1, enable BGP FRR.

```
Device1(config)#router bgp 100
Device1(config-bgp)#fast-reroute route-map ipfir_bgp
Device1(config-bgp)#exit
```

#On Device3, enable BGP FRR.

```
Device3(config)#router bgp 300
Device3(config-bgp)#fast-reroute route-map ipfir_bgp
Device3(config-bgp)#exit
```

Step 5: Check the result.

#View the routing table of Device1.

```
Device1#show ip route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management, E - IRMP, EX - IRMP external

C 20.1.1.0/24 is directly connected, 01:29:32, vlan3
L 20.1.1.1/32 is directly connected, 01:29:32, vlan3
C 127.0.0.0/8 is directly connected, 01:36:07, lo0
L 127.0.0.1/32 is directly connected, 01:36:07, lo0
LC 100.1.1.1/32 is directly connected, 01:35:18, vlan 4
B 192.168.1.1/32 [20/0] via 20.1.1.2, 00:00:40, vlan3

```

On Device3, it is processed in a manner which is similar to that on Device1.

## 60.3.10 Configure basic functions of BGP-LS

### Network Requirements

- Device1 establishes OSPF neighbors with Device2 and advertises the route of the loopback interface to Device2.
- Device3 establishes OSPF neighbors with Device2, and advertises the route of the loopback interface to Device2.
- Device2 establishes BGP-LS neighbors with Device4, and advertises BGP-LS route to Device4.

### Network Topology

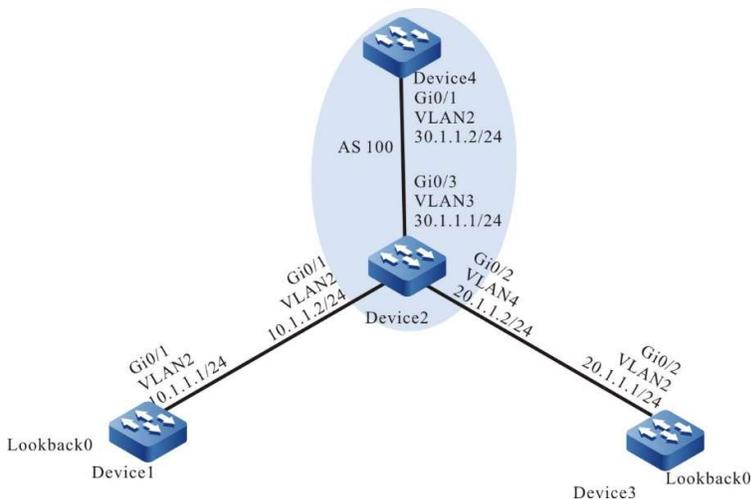

Figure 1 Network Topology for Configuring Basic Functions of BGP-LS

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IP address of each interface (Omitted).

Step 2: Configure OSPF.

#Device1 establishes OSPF neighbors with Device2 in backbone areas.

```
Device1#configure terminal
Device1(config)#router ospf 65535
Device1(config-ospf)#router-id 100.1.1.1
Device1(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device1(config-ospf)#network 1.1.1.1 0.0.0.0 area 0
Device1(config-ospf)#exit
```

#Configure Device2.

```
Device2#configure terminal
Device2(config)#router ospf 65535
Device2(config-ospf)#router-id 100.1.1.2
Device2(config-ospf)#network 10.1.1.0 0.0.0.255 area 0
Device2(config-ospf)#network 20.1.1.0 0.0.0.255 area 10
```

```
Device2(config-ospf)#exit
```

#Device3 establishes OSPF neighbors with Device2 in non-backbone areas.

```
Device3#configure terminal
Device3(config)#router ospf 65535
Device3(config-ospf)#router-id 100.1.1.3
Device2(config-ospf)#network 20.1.1.0 0.0.0.255 area 10
Device3(config-ospf)#network 3.3.3.3 0.0.0.0 area 10
Device3(config-ospf)#exit
```

Step 3: Configure BGP.

#Configure BGP on Device2 and activate the BGP-LS capability of the neighbors

```
Device2#configure terminal
Device2(config)#router bgp 65535
Device2(config-bgp)#bgp router-id 100.1.1.2
Device2(config-bgp)#neighbor 30.1.1.2 remote-as 65535
Device2(config-bgp)#address-family link-state unicast
Device2(config-bgp-af)#neighbor 30.1.1.2 activate
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit
```

#Configure BGP on Device4 and activate the BGP-LS capability of the neighbors

```
Device4#configure terminal
Device4(config)#router bgp 65535
Device2(config-bgp)#bgp router-id 100.1.1.4
Device4(config-bgp)#neighbor 30.1.1.1 remote-as 65535
Device4(config-bgp)#address-family link-state unicast
Device4(config-bgp-af)#neighbor 30.1.1.1 activate
Device4(config-bgp-af)#exit-address-family
Device4(config-bgp)#exit
```

Step 4: Configure OSPF to import IGP topological information.

#Import IGP topological information under the OSPF address family of Device2.

```
Device1(config)#router ospf 65535
Device2(config-ospf)#distribute link-state
Device1(config-ospf)#exit
```

Step 5: Check the result.

#View the topological information of the IGP node generated by Device1.

```
Device2#show ip ospf 65535 link-state node
OSPF process 65535:
OSPF-LS local link state route:
Codes: N - Node route, L - Link route, P - Prefix route

# 61 IPv6 BGP

---

## 61.1 Overview

IPv6 BGP (BGP4+) is an extension of BGP-4. BGP-4 can manage IPv4 routing information only. In order to support IPv6 protocol, IETF extends BGP-4 to form IPv6 BGP. Current IPv6 BGP standard is RFC 2858 (Multiprotocol Extensions for BGP-4).

IPv6 BGP needs to reflect the information of IPv6 network layer protocol in NLRI (Network Layer Reachability Information) and NEXT\_HOP attributes. The two NLRI attributes imported to IPv6 BGP are shown as follows:

- MP\_REACH\_NLRI: Multiprotocol Reachable NLRI. It can be used to distribute reachable route and next hop information.
- MP\_UNREACH\_NLRI: Multiprotocol Unreachable NLRI. It can be used to withdraw unreachable routes.

The NEXT\_HOP attribute in IPv6 BGP is represented by IPv6 address, either IPv6 global unicast address or link-local address.

IPv6 BGP utilizes the multi-protocol extension attribute of BGP for application in IPv6 networks. The original message mechanism and routing mechanism of BGP protocol have not changed.

## 61.2 IPv6 BGP function configuration

Table 61 BGP Function Configuration List

Configuration Task	
Configure IPv6 BGP Neighbor	Configure IBGP Neighbor
	Configure EBGP Neighbor
	Configure Passive BGP Neighbor
	Configure MP-BGP Neighbor
	Configure MD5 Authentication of BGP Neighbor
Configure BGP Route Generation	Configure BGP to Distribute Local Route
	Configure BGP Route Redistribution
	Configure BGP to Distribute Default Route
Configure BGP Route Control	Configure BGP to Distribute Aggregated Route
	Configure Administrative Distance of BGP Route
	Configure Routing Policy of BGP Neighbors in Outgoing Direction
	Configure Routing Policy of BGP Neighbors in Incoming Direction
	Configure the Maximum Number of Routing Entries Received by BGP Neighbors
	Configure the Maximum Number of BGP Load Balancing Entries
Configure BGP Route Attributes	Configure BGP Route Weight
	Configure MED Attributes of BGP Route
	Configure Local-Preference Attributes of BGP Route
	Configure AS_PATH Attributes of BGP Route

Configuration Task	
	Configure NEXT-HOP Attributes of BGP Route
	Configure Community Attributes of BGP Route
Configure BGP Network Optimization	Configure Keepalive Time of BGP Neighbor
	Configure BGP Route Detection Time
	Configure Fast Disconnection of EBGP Neighbor
	Configure BGP Route Dampening Function
	Configure BGP Neighbor Refresh Capability
	Configure Soft Resetting Capability of BGP Neighbor
	Configure ORF Capability of BGP Neighbor
Configure Large BGP Network	Configure BGP Peer Group
	Configure BGP Route Reflector
	Configure BGP Confederation
Configure BGP GR	Configure BGP GR Restarter
	Configure BGP GR Helper
Configure BGP to Coordinate with BFD	Configure EBGP to Coordinate with BFD
	Configure IBGP to Coordinate with BFD

### 61.2.1 Configure IPv6 BGP Neighbor

#### Configuration Condition

Before configuring BGP neighbors, do the following:

- The link layer protocol has been configured to ensure normal communication at the link layer.
- Configure address of interface at network layer so that neighbor network nodes are reachable at the network layer.

#### Configure IBGP Neighbor

## 1. Basic configuration

To configure IBGP neighbor, you are required to specify the same AS of neighbor as that of this device. Router ID can be configured for the device. It is used to uniquely mark a BGP device when establishing BGP session. When Router ID is not configured, the device will select one based interface address according to by following principles:

- Firstly, select the largest IP address from the Loopback interface as Router ID;
- If no Loopback interface is configured for IP address, select the largest IP addresses from other interfaces as Router ID;
- Only when the interface is UP can the interface address be selected as Router ID.

Table 61 Configuring IBGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	Mandatory By default, BGP is disabled.
Configure BGP device ID	<b>bgp router-id</b> <i>router-id</i>	Optional By default, the device makes selections according to interface address. In particular, Loopback interface and large IP address have a higher priority.
Configure IBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no IBGP neighbor is created.
Description of configuring IBGP neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>description</b> <i>description-string</i>	Optional By default, there is no description of IBGP neighbor.
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-

Step	Command	Description
Activate IBGP neighbor's capability of receiving and sending IPv6 unicast route	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Optional By default, IBGP neighbor's capability of receiving and sending IPv6 unicast route is disabled.

## 2. Configure source address of TCP session

BGP uses TCP as transmission protocol. Featured by reliable transmission, TCP can effectively ensure that BGP protocol packets are correctly transmitted to the neighbors.

Table 61 Configuring Source Address of TCP Session

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure IBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no IBGP neighbor is created.
Configure source address for TCP session of IBGP neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-name</i>   <i>ipv6-address</i> }	Mandatory By default, the TCP session automatically selects the address of the route's output interface as source address.

### Note

- When there is load balancing route, source address of TCP session is required to be configured between BGP neighbors. When the TCP source address is not configured, different output interfaces may be used as their source addresses because neighbors have different optimal routes. As a result, BGP session cannot be successfully established within a period of time.

## Configure EBGP Neighbor

### 1. Basic configuration

To configure EBGP neighbor, you are required to specify different AS of neighbor from that of this device.

Table 61 Configuring EBGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enable the BGP protocol and enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure EBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no EBGP neighbor is created.

### 2. Configure Indirect EBGP Neighbor

Located in different operation networks, EBGP neighbors are often connected via a direct physical link. Thus, the default TTL value of IP packets communicated between EBGP neighbors is 1. If they are in the indirect operation network, you can set the TTL value of IP packets via a configuration command to allow BGP connection.

Table 61 Configuring Indirect EBGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure EBGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no EBGP neighbor is created.
Configure source address for TCP session of EBGP neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-name</i>   <i>ipv6-address</i> }	Optional By default, the TCP session automatically selects the address of the route's output

Step	Command	Description
		interface as source address.
allow connection between indirect EBGP neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>ebgp-multihop</b> [ <i>tvl-value</i> ]	Mandatory By default, EBGP neighbor relation between indirect devices is not allowed.

### Configure Passive BGP Neighbor

The passive neighbor function is required in the special application environment. After passive neighbor is applied, BGP will not actively initiate a TCP connection request to establish BGP neighbor. The neighbor relation cannot be built until the neighbor actively issues a connection request. By default, the two neighbors will actively initiate connections to each other. When there is a conflict between the connections, a TCP connection will be selected to create a BGP session. Before configuring passive BGP neighbors, you need to configure BGP neighbors.

Table 61 Configuring Passive BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Configure Passive BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>passive</b>	Mandatory By default, no passive neighbor is enabled.

### Configure MP-BGP Neighbor

By default, BGP neighbors cannot receive and send corresponding routes until activated in the VRF and VPN address family. Before configuring MP-BGP neighbors, you need to configure BGP neighbors.

Table 61 Configuring MP-BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Enter the BGP IPv6 VRF configuration mode	<b>address-family ipv6 vrf</b> <i>vrf-name</i>	-
Configure neighbors under BGP IPv6 VRF address family	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Activate neighbors under IPv6 VRF address family	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b>	Optional By default, the neighbors under BGP IPv6 VRF configuration mode have been activated.
Exit the BGP IPv6 VRF configuration mode	<b>exit-address-family</b>	-

---

## Note

- Neighbors configured in BGP configuration mode and BGP IPv6 unicast configuration mode are global neighbors, and those configured in BGP IPv6 VRF configuration mode belong to the VRF address family only.
- 

### Configure MD5 Authentication of BGP Neighbor

BGP supports the configuration of MD5 authentication so as to protect the information exchange between neighbors. MD5 authentication is completed by TCP transmission protocol. To establish TCP connection, both neighbors must be configured with the same MD5 authentication password. Otherwise, TCP connection cannot be established after the TCP transmission protocol fails in MD5 authentication. Before configuring MD5 authentication for BGP neighbors, you need to configure BGP neighbors.

Table 61 Configuring MD5 Authentication for BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>	Mandatory By default, no BGP neighbor is created.
Configure MD5 Authentication of BGP Neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>password</b> [ 0   7 ] <i>password-string</i>	Mandatory By default, there is no MD5 authentication between BGP neighbors.

## 61.2.2 Configure IPv6 BGP route generation

### Configuration Condition

Before configuring BGP route generation, ensure that:

- Enable BGP protocol.
- Configure IPv6 BGP neighbor and successfully establish and connect a session.

### Configure BGP to Distribute Local Route

BGP can import route from IPv6 routing table into BGP routing table through the **network** command. Only when there is an entry in the IPv6 routing table that fully matches the **network** prefix and mask, will the route be imported into the BGP routing table and distributed.

When distributing locate routes, you can apply a routing map for the routes or specify such routes as backdoor routes. Backdoor route deems EBGp route as local BGP route and uses the administrative distance of local route. In this case, IGP route is allowed to precede EBGp route, and the backdoor route will not advertise it to EBGp neighbors.

Table 61 Configuring BGP to Distribute Local Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure BGP to Distribute Local Route	<b>network</b> <i>ipv6-prefix</i> [ <b>route-map</b> <i>rtmap-name</i> [ <b>backdoor</b> ]   <b>backdoor</b> ]	Mandatory By default, BGP doesn't distribute any local route.

## Note

- The Origin attribute of the local route distributed by BGP is IGP.
- After using the `network backdoor` command on EBGp routes, the EBGp route administrative distance will become the local route administrative distance (by default, the EBGp route administrative distance is 20, and the local route administrative distance is 200), which is lower than the default IGP route administrative distance. In this case, the IGP route will be preferred, and a backdoor link will be created between EBGp neighbors.
- When BGP distributes local routes and applies the routing map, the match options supported include `as-path`, `community`, `extcommunity`, `ipv6 address`, `ipv6 nexthop`, and `metric`, and the set options supported include `as-path`, `comm-list`, `community`, `extcommunity`, `ipv6 next-hop`, `local-preference`, `metric`, `origin`, and `weight`.

### Configure BGP Route Redistribution

BGP is not responsible for learning routes. Instead, it focuses on controlling routing direction by managing route attributes. Therefore, BGP generates BGP routes for advertisement to neighbors by redistributing IGP. BGP can apply the routing map while redistributing IGP routes.

Table 1 Configuring BGP Route Redistribution

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure BGP to redistribute IGP routes	<b>redistribute</b> { <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ] [ <b>match isis-level</b> ]   <b>ospf as-number</b> [ <b>match route-sub-type</b> ]   <b>rip process-id</b>   <b>static</b> } [ <b>route-map map-name</b> / <b>metric value</b> ]	Mandatory By default, BGP doesn't redistribute any other IGP routes.

## Note

- The Origin attribute of the IGP route distributed by BGP is INCOMPLETE.
- When BGP redistributes other protocols and applies the routing map, the match options supported include as-path, community, extcommunity, ipv6 address, ipv6 nexthop, and metric, and the set options supported include as-path, comm-list, community, extcommunity, ipv6 next-hop, local-preference, metric, origin, and weight.

### Configure BGP to Distribute Default Route

Before distributing a default route to neighbors, BGP is required to import a default route. This can be done by the following two manners: generate the default route of BGP via the command **neighbor default-originate**; redistribute the default route of other protocols via the command **default-information originate**.

The default route generated by the **neighbor default-originate** command is a route of 0::/0 automatically generated through BGP. The default route redistributed by the **default-information originate** command is a route of 0::/0 generated when BGP imports the redistributed protocol.

Table 61 Configuring BGP to Distribute Default Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-

Step	Command	Description
Configure BGP to generate default route	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>default-originate</b> [ <b>route-map</b> <i>rtmap-name</i> ]	Mandatory By default, BGP doesn't generate default route.
Configure BGP to redistribute the default route of other protocols	<b>default-information originate</b>	Mandatory By default, BGP doesn't redistribute the default route of other protocols.

### Note

- When configuring BGP to redistribute the default route of other protocols, it is required to configure route redistribution.
- You can apply the routing map for the route when configuring BGP to generate a default route.
- When BGP generates default route and applies the routing map, the set options supported include as-path, comm-list, community, extcommunity, ipv6 next-hop, local-preference, metric, origin, and weight.

## 61.2.3 Configure IPv6 BGP route control

### Configuration Condition

Before configuring BGP route control, ensure that:

- Enable BGP protocol.
- Configure IPv6 BGP neighbor and successfully establish and connect a session.

### Configure BGP to Distribute Aggregated Route

In large BGP networks, in order to reduce the number of routes advertised to neighbors or effectively control the routing process of BGP, it is required to configure BGP aggregated route.

Table 61 Configuring BGP to Distribute Aggregated Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure BGP to Distribute Aggregated Route	<b>aggregate-address</b> <i>ipv6-prefix</i> [ <b>as-set</b> / <b>summary-only</b> / <b>route-map</b> <i>rtmap-name</i> ]	Mandatory By default, route aggregation is disabled for BGP.

### Note

- When BGP distributes aggregated routes, the scale of route advertisement can be reduced by specifying the **summary-only** command option to advertise aggregated routes only.
- The aggregated route with AS\_PATH attribute can be generated by specifying the **as-set** command option.
- More attributes can be set for the aggregated routes by applying routing map to them.

### Configure Administrative Distance of BGP Route

Each protocol in the IP routing table has an administrative distance for routing control. The smaller the value, the higher the priority. BGP affects routing by configuring administrative distance for routes in the specified network segment. The administrative distances covered by the routes in the specified network segment will all be modified. At the same time, you may use ACL to effectively filter the network segment so that only the administrative distances in the network segment allowed by ACL can be modified.

The command **distance bgp** can be used to modify the administrative distance of BGP's external, internal and local routes, while the command **distance** is used to change that of the routes in the specified network segment. The command **distance** precedes **distance bgp**. The network segment configured to be covered by **distance** uses the administrative distance specified by this command, and that uncovered adopts the administrative distance set via **distance bgp**.

Table 2 Configuring BGP Route Administrative Distance

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure BGP to modify the default administrative distance	<b>distance bgp</b> <i>external-distance internal-distance local-distance</i>	Optional By default, the administrative distance of EBGp route is 20, that of IBGP 200, and that of local route 200.
Configure administrative distance of the specified network segment	<b>distance administrative-distance</b> <i>ipv6-prefix [ acl-num   acl-name ]</i>	

### Configure Routing Policy of BGP Neighbors in Outgoing Direction

BGP route advertisement or routing relies on its powerful route attributes. When advertising routes to neighbors, you can modify route attributes or filter some routes by applying corresponding policies. Currently, the policies that can be applied in the outgoing direction include:

- distribute-list: distribution list;
- filter-list: filter list with AS\_PATH attribute;
- Prefix-list: IP prefix list;
- route-map: routing map.

Table 3 Configuring Routing Policy of BGP Neighbors in Outgoing Direction

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Apply distribution list in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>distribute-list</b> { <i>access-list-num</i>   <i>access-list-name</i> } <b>out</b>	Multiple choice (distribution list and IP prefix list cannot be

Step	Command	Description
Apply the filter list with AS_PATH attribute in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>filter-list</b> <i>aspath-list-name</i> <b>out</b>	configured at the same time)  By default, the routing policy of BGP neighbors in the outgoing direction is not configured.
Apply IP prefix list in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>prefix-list</b> <i>prefix-list-name</i> <b>out</b>	
Apply routing map in the outgoing direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>out</b>	

## Note

- After configuring the routing policy of BGP neighbors in the outgoing direction, it is required to reset the neighbors to make it take effect.
- When applying routing map in the outgoing direction of route reflector, only NEXT-HOP attribute can be changed.
- For the configuration of filter list, see the policy tools-configure AS-PATH list section.
- When configuring policy for neighbors in the outgoing direction, you can configure multiple policies at the same time. For BGP, the following sequence applies: distribute-list, filter-list, prefix-list, and route-map. After the first policy is rejected, the following policy will not be implemented. Only after all the policies configured pass will the routing information be advertised.
- For the routing map of BGP applied in outgoing direction, the match options supported include as-path, community, extcommunity, ipv6 address, ipv6 nexthop, and metric, and the set options supported include as-path, comm-list, community, extcommunity, ipv6 next-hop, local-preference, metric, origin, and weight.

### Configure Routing Policy of BGP Neighbors in Incoming Direction

BGP can use policies to filter the routing information received or modify its attributes. Like the outgoing direction, four policies are supported in the incoming direction:

- distribute-list: distribution list;
- filter-list: filter list with AS\_PATH attribute;
- Prefix-list: Configuring IPV6 prefix list;
- route-map: routing map.

Table 4 Configuring Application Policy of BGP Neighbors in Incoming Direction

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Apply distribution list in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>distribute-list</b> { <i>access-list-num</i>   <i>access-list-name</i> } <b>in</b>	Multiple choice (distribution list and IP prefix list cannot be configured at the same time)
Apply the filter list with AS_PATH attribute in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>filter-list</b> <i>aspath-list-name</i> <b>in</b>	
Apply IP prefix list in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>prefix-list</b> <i>prefix-list-name</i> <b>in</b>	By default, no policy is specified in the incoming direction.
Apply routing map in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>	

## Note

- After configuring the routing policy of BGP neighbors in the incoming direction, it is required to reset the neighbors to make it take effect.
- When configuring policy for neighbors in the incoming direction, you can configure multiple policies at the same time. For BGP, the following sequence applies: distribute-list, filter-list, prefix-list, and route-map. After the first policy is rejected, the following policy will not be implemented. Only after all the policies configured pass will the route be added to the database.
- For the routing policy of BGP applied in incoming direction, the match options supported include as-path, community, extcommunity, ipv6 address, ipv6 nexthop, and metric, and the set options supported include as-path, comm-list, community, extcommunity, ipv6 next-hop, local-preference, metric, origin, and weight.

### Configure the Maximum Number of Routing Entries Received by BGP Neighbors

For BGP device, you can limit the number of routing entries received from the designated neighbor. It gives alarms or disconnects when the routes received from the designated neighbor reaches a certain threshold.

Table 5 Configuring Maximum Number of Routing Entries Received by BGP Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the maximum number of routing entries received by neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>maximum-prefix</b> <i>prefix-num</i> [ <i>threshold-value</i> ] [ <b>warning-only</b> ]	Mandatory By default, the number of prefix entries received from neighbors is not restricted.

### Note

- If the **warning-only** command option is not specified, the BGP session will be automatically disconnected when the number of routing entries received by BGP from the neighbor reaches the maximum.
- If the **warning-only** command option is specified, when the number of routing entries received by BGP from the neighbor reaches the maximum, only alarm message is given, and route learning continues.

### Configure the Maximum Number of BGP Load Balancing Entries

In the BGP networking environment, if there are several paths with the same cost to reach the same destination, you can achieve load balancing routing by configuring the number of BGP load entries.

Table 6 Configuring Maximum Number of Load Balancing Entries of BGP

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the maximum number of IBGP load entries	<b>maximum-paths ibgp number</b>	Mandatory By default, there is no load balancing routing for IBGP.
Configure the maximum number of EBGP load entries	<b>maximum-paths number</b>	Mandatory By default, there is no load balancing routing for EBGP.

---

### Note

- After configuring the maximum number of EBGP load balancing entries, load can be formed only when EBGP route is preferred.
  - The commands used to configure the maximum number of load balancing entries vary with BGP configuration modes. For details, see the description of **maximum-paths** in BGP technical commands.
- 

## 61.2.4 Configure IPv6 BGP route attributes

### Configuration Condition

Before configuring BGP route attributes, ensure that:

- Enable BGP protocol.
- Configure IPv6 BGP neighbor and successfully establish and connect a session.

### Configure BGP Route Weight

The first rule for BGP routing is to compare the value of route weight. The larger the value, the higher the priority. The value of route weight is a local attribute of the device. It will not be transmitted to other BGP neighbors. It ranges from 0 to 65535. By default, the weight value of route learned from neighbors is 0, and those of all the routes generated on local device are 32768.

Table 7 Configuring BGP Route Weight

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the route weight of neighbor or peer group	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>weight</b> <i>weight-num</i>	Mandatory By default, the route weight of neighbor is 0.

### Configure MED Attributes of BGP Route

MED attributes can be used to select the optimal route for the traffic entering AS. When other routing conditions are the same, if BGP learns the routes with the same destination address yet different next hops from different EBGP neighbors, it prefers that with the minimum MED value as the optimal entrance.

Sometimes MED is also called "external metric". It is marked as "metric" in the routing table of BGP. BGP will advertise the MED attributes of the routes learned from neighbors to IBGP neighbors rather than EBGP neighbors. Thus, MED is only applicable between neighboring AS.

#### 1. Configure BGP to allow comparison of MEDs from different AS neighboring routes

By default, BGP only performs MED routing for the routes learned from the same AS. You can use the **bgp always-compare-med** command to ignore the restriction on the same AS in MED routing.

Table 8 Configuring BGP to Allow Comparison of MEDs from Different AS Neighboring Routes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to allow comparison of MEDs from different AS neighboring routes	<b>bgp always-compare-med</b>	Mandatory By default, BGP only allows to compare MEDs of the routes from the same AS

#### 2. Configure BGP to prioritise MEDs according to the route AS\_PATH-based group

By default, BGP doesn't prioritise MEDs according to the route AS\_PATH-based group. You can enable this function using the command **bgp deterministic-med**. When selecting routes, all routes are arranged based on AS\_PATH. Within each AS\_PATH group, the routes are ranked according to the MED size. The route with the minimum MED value is selected as the best route of this group.

Table 9 Configuring BGP to Prioritise MEDs According to the Route AS\_PATH-based Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
BGP prioritises MEDs according to the route AS_PATH-based group	<b>bgp deterministic-med</b>	Mandatory By default, BGP doesn't prioritise MEDs according to the route AS_PATH-based group.

### 3. Configure to compare MEDs of local confederated routes

By default, EBGP routes from different AS don't compare MED attributes. This principle also applies to the confederated EBGP. The command **bgp bestpath med confed** is used to enable comparison of MED attribute values for local confederated routes.

Table 10 Configuring BGP to Compare MEDs of Local Confederated Routes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to compare MEDs of local confederated routes	<b>bgp bestpath med confed</b>	Mandatory By default, the MEDs of local confederated routes are not compared.

### 4. Configure the routing map to modify MED attributes

For route sending and receiving, routing map can be used to modify the value of MED attributes.

Table 11 Configuring Routing Map to Modify MED Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the routing map to modify MED attributes	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

### Note

- When configuring the routing map to modify MED attributes, you are required to modify MED with the set metric command, see the policy tool-set metric.
- After the neighbor attribute-unchanged command is configured, MED attributes of the neighbor cannot be changed through routing map.

### Configure Local-Preference Attributes of BGP Route

Local-Preference attributes are transmitted among IBGP neighbors only. Local-Preference is used to select the optimal exit to leave AS. The route with the largest route will be preferred.

Its value ranges from 0 to 4294967295. The larger the value, the higher the priority. By default, all the routes advertised to IBGP neighbors have a Local-Preference attribute of 100, which can be modified through **bgp default local-preference** or routing map.

#### 1. Configure BGP to modify default Local-Preference attributes

Table 12 Configuring BGP to Modify Default Local-Preference Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure the default Local-Preference value	<b>bgp default local-preference</b> <i>local-value</i>	Optional By default, the local preference is 100.

## 2. Configure the routing map to modify Local- Preference attributes

Table 13 Configuring Routing Map to Modify Local-Preference Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the routing map to modify Local-Preference attributes	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

### Note

- When configuring the routing map to modify Local-Preference attributes, you are required to modify Local-Preference attributes with the set local-preference command, see the policy tool-set local-preference.

## Configure AS\_PATH Attributes of BGP Route

### 1. Configure BGP to ignore comparison of AS\_PATH in routing

When other conditions are the same, BGP will prefer the route with the shortest AS\_PATH. You can cancel AS\_PATH routing via the command **bgp bestpath as-path ignore**.

Table 14 Configuring BGP to Ignore Comparison of AS\_PATH in Routing

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP to ignore comparison of AS_PATH in routing	<b>bgp bestpath as-path ignore</b>	Mandatory By default, AS_PATH values are compared in routing.

## 2. Configure BGP for allowed Times of Repeated Local AS Number

In order to avoid routing loops, BGP will check the AS\_PATH attributes of the routes received from neighbors, and discard those containing local AS number. You may use the command **neighbor allowas-in** to allow the routes received by BGP to contain local AS number, and can configure the number of local AS numbers.

Table 15 Configuring BGP for allowed Times of Repeated Local AS Number

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure to allow repeated local AS number	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>allowas-in</b> [ <i>as-num</i> ]	Mandatory By default, the AS_PATH attributes of the routes received from neighbors are not allowed to contain local AS number.

## 3. Configure BGP to remove private AS number when advertising route to neighbors

In large BGP networks, the AS\_PATH of routing has the following attributes: confederation or community. By default, BGP carries these private AS attributes when advertising to neighbors. In order to shield private network information, you can use **neighbor remove-private-AS** to remove private AS number.

Table 16 Configuring BGP to Remove Private AS Number When Advertising Route to Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure BGP to remove private AS number when advertising route to neighbors	<b>neighbor { neighbor-address   peer-group-name } remove-private-AS</b>	Mandatory By default, private AS number is carried when advertising to neighbors.

#### 4. Configure to detect legality of first AS number of EBG route

When BGP advertises route to EBG neighbors, the local AS number is pressed to the start position of AS\_PATH, and the first AS advertising this route will become the last one. Generally, the first AS number of the route received from EBG should be the same as the AS number of neighbors. Otherwise, this route will be discarded.

Table 17 Configuring to Detect Legality of First AS Number of EBG Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure to detect legality of the first AS number of EBG route	<b>bgp enforce-first-as</b>	Mandatory By default, the first AS number check mechanism is disabled in BGP.

## 5. Configure the routing map to modify AS\_PATH attributes

BGP supports the configuration of routing map to modify AS\_PATH attributes. You can add route attributes via **set as-path prepend** so as to affect the routing of neighbors. When using the function **set as-path prepend**, local AS is first used to add AS\_PATH. When using other AS, enough attention must be paid to avoid being rejected in route advertisement to this AS.

Table 18 Configuring Routing Map to Modify AS\_PATH Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the routing map to modify AS_PATH attributes	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

### Note

- When configuring the routing map to modify AS\_PATH attributes, you are required to modify AS\_PATH attributes with the **set as-path prepend** command, see the policy tool-set **as-path**.

## Configure NEXT-HOP Attributes of BGP Route

When BGP advertises routes to IBGP neighbors, the route attributes (including next hop) are not changed. The next hop attribute is often used for BGP to advertise the routes learned by EBGP neighbors to IBGP neighbors. The **neighbor next-hop-self** command can be used to modify the next hop attribute of the routes advertised to BGP neighbors to use local IPv6 address. For BGP, you can also use routing map to modify the next hop attribute.

### 1. Configure BGP to use local IP address as next hop of route

Table 19 Configuring BGP to Use Local IP Address as Next Hop of Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure to use local IP address as the next hop when advertising routes to neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>next-hop-self</b>	Mandatory  By default, the next hop attribute of the route advertised to EBGP neighbor is local IPv6 address. The next hop attribute of the route advertised to IBGP will not be modified. Its original attribute value will be kept unchanged.

## Note

- When configuring BGP to use local IPv6 address as the next hop of the route, if the source address of the TCP session is configured with the `neighbor update-source`, it will be used as the next hop address. Otherwise, the output interface address of the advertising device will be selected as local IPv6 address.

## 2. Configure the routing map to modify NEXT-HOP attributes

BGP supports the configuration of routing map to modify NEXT-HOP attributes through **set ipv6 next-hop**.

Table 20 Configuring Routing Map to Modify NEXT-HOP Attributes

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the routing map to modify NEXT-HOP attributes	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } route-map <i>rtmap-name</i> in   out</b>	Mandatory By default, routing map is not applied to any neighbor.

---

### Note

- When configuring the routing map to modify NEXT-HOP attributes, you are required to modify these attributes with the `set ipv6 next-hop` command, see the `policy tool-set ipv6 next-hop`.
- 

## Configure Community Attributes of BGP Route

When advertising routes to neighbors, BGP allows the configuration of sending community attributes. You can apply routing map to match community attributes for specified neighbors in both incoming and outgoing directions.

Community attributes are used to identify a group of routes so as to apply routing policy to them. Community attributes have two forms, i.e. standard and extended. Standard community attributes have 4 bytes. Their attributes include NO\_EXPORT, LOCAL\_AS, NO\_ADVERTISE, and INTERNET. Extcommunity attributes have 8 bytes. Their attributes include Route Target (RT) and Route Origin.

### 1. Configure BGP to advertise community attributes of route to neighbors

**neighbor send-community** allows to advertise standard or extcommunity attributes or both to neighbors.

Table 21 Configuring BGP to Advertise Community Attributes of Route to Neighbors

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp <i>autonomous-system</i></b>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-

Configure to advertise community attributes of route to neighbors	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>send-community</b> [ <b>both</b>   <b>extended</b>   <b>standard</b> ]	Mandatory By default, community attributes are not advertised to any neighbor.
---	--	---

## Note

- After the neighbor is activated under VPNv6 address family, the standard and extcommunity attributes will be automatically advertised to neighbors.

## 2. Configure the routing map to modify community attributes of route

BGP supports the configuration of routing map to modify community attributes through **set community**.

Table 22 Configuring Routing Map to Modify Community Attributes of Route

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the routing map to modify community attributes of BGP route	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>rtmap-name</i> <b>in</b>   <b>out</b>	Mandatory By default, routing map is not applied to any neighbor.

## Note

- When configuring the routing map to modify community attributes of the route, you are required to modify community attributes with the **set community** command, see the **policy tool-set community**.

## 61.2.5 Configure IPv6 BGP network optimization

### Configuration Condition

Before configuring BGP network optimization, ensure that:

- Enable BGP protocol.
- Configure IPv6 BGP neighbor and successfully establish and connect a session.

### Configure Keepalive Time of BGP Neighbor

After a BGP session is successfully established, neighbors will periodically send Keepalive messages to maintain the BGP session relationship. If the neighbor's Keepalive message or route update packet is not received within the holdtime, the BGP session will be disconnected for over time. The keepalive time of the session will not be more than one third of the holdtime.

Table 23 Configuring Keepalive Time of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure keepalive time and holdtime of global BGP	<b>timers bgp</b> <i>keepalive-interval holdtime-interval</i>	Optional
Configure the keepalive time and holdtime of BGP neighbor or peer group	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>timers</b> { <i>keepalive-interval holdtime-interval</i>   <b>connect</b> <i>connect-interval</i> }	By default, the interval of keepalive timer is 60 seconds; the interval of hold timer is 180 seconds; the interval of session reconnection timer is 120 seconds.

---

### Note

- The keepalive time and holdtime configured for specified neighbors precede those of global BGP.
  - After neighbor negotiation, the minimum holdtime will be used as the holdtime of BGP session.
  - When both keepalive time and holdtime are configured as zero, the neighbor keepalive/hold function is cancelled.
  - When the keepalive time interval is more than one third of the holdtime, the BGP session sends keepalive packets within one third of the holdtime.
-

## Configure BGP Route Detection Time

BGP mainly completes the pathfinding process with AS as the unit, and IGP completes the pathfinding process within the AS. Therefore, BGP routing often relies on IGP routing. After the next hop or output interface of IGP route on which BGP relies changes, BGP updates BGP route by periodically detecting IGP route. Update of local BGP route and other matters are completed within the detection period.

Table 24 Configuring BGP Route Detection Time

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure BGP Route Detection Time	<b>bgp scan-time</b> <i>time</i>	Optional By default, the BGP route detection time is 60 seconds.

---

### Caution

- When a very short BGP route detection time is configured, BGP will frequently detect routes. This will affect the performance of the device.
- 

## Configure Fast Disconnection of EBGP Neighbor

After a BGP session is successfully established, neighbors will periodically send Keepalive messages to each other to maintain the BGP session relationship. If the neighbor's Keepalive message or route update packet is not received within the holdtime, the BGP session will be disconnected for over time. You can configure a direct EBGP neighbor to disconnect BGP connection immediately when the connected interface is down, without waiting for the BGP keepalive timeout. When the fast disconnection of EBGP neighbors is cancelled, the EBGP session will not give a response to the down event on the interface. It will be disconnected after timeout.

Table 25 Configuring Fast Disconnection of EBGP Neighbor

Step	Command	Description
------	---------	-------------

Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure Fast Disconnection of EBGP Neighbor	<b>bgp fast-external-failover</b>	Optional By default, EBGP can give a fast response to the offline event on the direct interface.

### Configure BGP Route Dampening Function

Frequent route flapping in the network will make the network unstable. BGP suppresses such routes by configuring route dampening to reduce the impact of route flapping on the network.

For the routes subject to frequent flapping, their penalty value will increase. When the penalty value exceeds the dampening threshold, the route will not be advertised to neighbors. The penalty value shall not exceed the maximum dampening time. When no route flapping happens during the half-life, the penalty value will be halved. The route will not be re-advertised to neighbors until the value is less than the reuse limit.

- Half-life: The period when the penalty value of route is halved.
- Reuse limit: The limit that route returns to service.
- Suppress limit: The limit that the route is suppressed.
- Max suppress time: The maximum time that the route is suppressed.

Table 26 Configuring BGP Route Suppression Function

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure BGP route dampening period	<b>bgp dampening</b> [ <i>reach-half-life</i> [ <i>reuse-value suppress-value max-suppress-time</i>	Mandatory

	[ <i>unreach-half-life</i> ] ]   <b>route-map</b> <i>rtmap-name</i> ]	By default, the route suppression function is disabled. After it is enabled, the default route suppression half-life is 15 minutes; the route reuse limit is 750; the route suppress limit is 2000; the max suppress time is 60 minutes; the unreachable half-life of route penalty is 15 minutes.
--	---	--

## Note

- Route flapping includes both addition or deletion of routes, and change of route attributes, such as next hop and MED attributes.

### Configure BGP Neighbor Refresh Capability

When the routing policy or route selection policy applied by BGP neighbors changes, the routing table needs to be refreshed again by two manners. One is to reset by recovering BGP connection to restart the session. This method may cause BGP route flapping and affect business operation. The other one is more graceful. You need to configure the BGP device of local port to support the capability of route refresh. When its neighbor needs to reset the route, the Route-Refresh message is sent to local port which will re-send the route to this neighbor after receiving the message. In this case, the routing table is dynamically refreshed without disconnecting BPG sessions.

Table 27 Configuring Refreshing Capability of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enable BGP Neighbor Refresh Capability	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>capability route-refresh</b>	Optional By default, advertising neighbors to support

Step	Command	Description
		route refresh capability is enabled.

### Configure Soft Resetting Capability of BGP Neighbor

When the routing policy or route selection policy applied by BGP neighbors changes, the routing table needs to be refreshed again by two manners. One is to reset by recovering BGP connection to restart the session. This method may cause BGP route flapping and affect business operation. Another more graceful method is to configure local BGP device to support route refresh capability. You can also enable the soft resetting capability of local BGP device. By default, the BGP device retains the routing information of all neighbors. After enabling its neighbors' soft reset capability, it refreshes the routes of local retained neighbors again. At this time, the BGP session will not be disconnected.

Table 28 Configuring Soft Resetting Capability of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Enable soft resetting capability of BGP neighbor	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>soft-reconfiguration inbound</b>	Mandatory By default, the soft resetting function is disabled.

### Configure ORF Capability of BGP Neighbor

BGP accurately controls routes through various route attributes. To this end, it usually applies routing policy in both incoming and outgoing directions, a local behavior of BGP. BGP also supports ORF (Outbound Route Filtering) capability. It advertises local ingress policy through Route-refresh packet to its neighbor which applies this policy when advertising routes to it. This can largely reduce the interactions of route update packet between BGP neighbors.

To successfully negotiate ORF capability, the following conditions must be satisfied:

- Both neighbors need to enable ORF capability;
- ORF send and ORF receive must be paired, i.e., if one uses ORF send, the other must be ORF both or ORF receive; if one uses ORF receive, the other must be ORF send or ORF both;

- For the neighbor using ORF send, a prefix list needs to be applied in the incoming direction.

Table 29 Configuring ORF Capability of BGP Neighbor

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Make the neighbor apply prefix list in the incoming direction	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>prefix-list</b> <i>prefix-list-name</i> <b>in</b>	Mandatory By default, prefix list is not applied to any BGP neighbor.
Make the neighbor support ORF capability	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>capability orf prefix-list</b> { <b>both</b>   <b>receive</b>   <b>send</b> }	Mandatory By default, advertising neighbors to support ORF capability is disabled.

## 61.2.6 Configure large IPv6 BGP network

### Configuration Condition

Before configuring large BGP network, ensure that:

- Enable BGP protocol;
- Configure IPv6 BGP neighbor and successfully establish and connect a session.

### Configure BGP Peer Group

BGP peer group is a set of BGP neighbors with the same configuration policy. Any configuration of the peer group will influence all the members in the group. Configuring BGP peer group is beneficial for the centralized management and maintenance of neighbors.

Table 61 Configuring BGP Peer Group

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Create BGP peer group	<b>neighbor</b> <i>peer-group-name</i> <b>peer-group</b>	Mandatory
Add neighbors into the peer group	<b>neighbor</b> <i>neighbor-address</i> <b>peer-group</b> <i>peer-group-name</i>	By default, peer group is not configured, and neighbors are not added into any peer group.

---

### Note

- The configuration of peer group will influence all the group members.
  - After a neighbor is added into the peer group, the configuration of the original one which is the same as that of the peer group will be deleted.
  - After configuring the routing policy in outgoing and incoming directions for the peer group, if the routing policy changes, it is not effective for the neighbor already added into the peer group. The altered routing policy cannot apply to members of the peer group until the peer group is reset.
- 

### Configure BGP Route Reflector

In large BGP networking environments, IBGP neighbors are required to be connected across the whole network. That is to say, each BGP has to connect with all the other IBGP neighbors. Then, in the networking environment with N BGP neighbors, there are  $N*(N-1)/2$  BGP connections. The more the connections, the larger the amount of route advertisement. BGP route reflector can reduce the number of network connections. It includes several IBGPs into a group, and specifies a BGP as a reflector (RR), other BGPs as clients, and the BGPs not in the group as non-clients. The clients establish peering relationships with the RR only to reduce necessary IBGP connections. The number of connections can be decreased to N-1.

The principle of reflecting routes by BGP route reflector:

- The routes learned from non-client IBGP neighbors are reflected to clients only;
- The routes learned from clients will be reflected to all the clients and non-clients except the clients initiating these routes;
- The routes learned from EBGP clients will be reflected to all the clients and non-clients.

Table 30 Configuring BGP Route Reflector

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Configure reflector cluster ID	<b>bgp cluster-id</b> { <i>cluster-id-in-ip</i>   <i>cluster-id-in-num</i> }	Mandatory By default, the route reflector cluster ID is the Router ID of the device.
Configure neighbor as reflector client	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>route-reflector-client</b>	Mandatory By default, no neighbor is specified as reflector client.
Configure the route reflection function between BGP clients	<b>bgp client-to-client reflection</b>	Optional By default, the route reflection function between BGP route reflector clients is enabled.

---

 **Note**

- Reflector cluster ID is used to identify the same reflector area with many reflectors that have the same reflector cluster ID.
- 

### Configure BGP Confederation

In large BGP networking environments, IBGP neighbors are required to be connected across the whole network. That is to say, each BGP has to connect with all the other IBGP neighbors. Then, in the networking environment with N BGP neighbors, there are  $N*(N-1)/2$  BGP connections. The more the connections, the larger the amount of route advertisement. BGP confederation can also reduce network connections. It uses the divide-and-conquer strategy to divide the AS into several sub-AS areas. Each of them forms a confederation which is fully connected through IBGP. The sub-AS areas of the confederation are connected via EBGP to effectively reduce BGP connections.

When configuring BGP confederation, it is required to assign a confederation ID to each confederation and specify members of such confederation. Unlike route reflector (only route reflector is required to support route reflection when necessary), confederation requires all members to support the confederation function.

Table 31 Configuring BGP Confederation

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Create BGP confederation ID	<b>bgp confederation identifier</b> <i>as-number</i>	Mandatory By default, no confederation AS number is configured.
Configure BGP confederation members	<b>bgp confederation peers</b> <i>as-number-list</i>	Mandatory By default, the confederation's sub-AS number is not configured.

---

### Note

- The confederation ID is used to identify the confederation sub-AS which contains the confederation members.
- 

## 61.2.7 Configure IPv6 BGP GR

GR (Graceful Restart) is used to keep the routing information in the forwarding layer of this device and neighbor device unchanged during the switch between host and standby devices to ensure the forwarding process is not affected; after the device is switched for re-running, the two devices synchronize routing information and update forwarding layer in the protocol layer so that the data can keep forwarding during the process of device switch.

Roles in GR process:

- GR Restarter: The device for graceful restart of protocol.

- GR Helper: The device which helps with the graceful restart of protocol.
- GR Time: The maximum time for GR-Restarter to restart. GR Helper maintains routing stability during this period of time only.

The dual-master device can act as GR Restarter and GR Helper, while the centralized device only serves as GR Helper to help the Restarter complete GR. When the GR Restarter is doing GR, GR Helper maintains its route until GR Time is time out and the GR is completed for routing information synchronization. During this period of time, network routing and packet forwarding stays at the status prior to GR, which effectively ensures network stability.

BGP GR relationship is established through OPEN packet negotiation when neighbors establish connections. When the GR Restarter neighbor restarts, the BGP session will be disconnected, but the routes learned from the neighbor will not be deleted. They will continue to be forwarded normally in the IP routing table. Marked with Stale in the BGP routing table, they will be updated after GR is completed or time out.

GR Restarter needs to complete the connection with GR Helper within the maximum allowable time (**restart-time**). Otherwise, GR Helper will eliminate the GR routes retained and cancel the GR process. After neighbor re-establishment is completed, the GR Helper needs to receive the update packets with End-Of-RIB tag from the GR Restarter to successfully complete the GR process. Otherwise, the GR route not updated will be deleted after the maximum hold time (**stalepath-time**), and the GR relationship will be cancelled.

### Configuration Condition

Before configuring BGP GR, ensure that:

- Enable BGP protocol.
- Configure IPv6 BGP neighbor and successfully establish and connect a session.

Configure BGP GR Restarter

Table 32 Configuring BGP GR Restarter

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enable BGP GR capability	<b>bgp graceful-restart</b> [ <b>restart-time</b> <i>time</i>   <b>stalepath-time</b> <i>time</i> ]	Mandatory By default, the GR capability is not enabled on the BGP device. After GR is enabled, the default maximum

Step	Command	Description
		allowable time for neighbors to re-establish sessions is 120 seconds; the maximum hold time of GR routes is 360 seconds.
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure to advertise GR-Restarter capability to neighbors	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } capability graceful-restart</b>	Mandatory By default, GR-Restarter capability is not advertised to any neighbor.

### Configure BGP GR Helper

Table 33 Configuring BGP GR Helper

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp <i>autonomous-system</i></b>	-
Enable BGP GR capability	<b>bgp graceful-restart [ <i>restart-time time</i>   <i>stalepath-time time</i> ]</b>	Mandatory By default, the GR capability is not enabled on the BGP device. After GR is enabled, the default maximum allowable time for neighbors to re-establish sessions is 120 seconds; the maximum hold time of GR routes is 360 seconds.

## 61.2.8 Configure coordination of IPv6 BGP with BFD

Generally, there are other intermediate devices between BGP neighbors. When these devices fail, BGP sessions are normal within the hold time. They cannot give a response to the link failures of intermediate devices in a timely manner. BFD (Bidirectional Forwarding Detection) provides a method to quickly detect the status of lines between two devices. When BFD detection is enabled between BGP devices, if there is a line failure between the devices, BFD can quickly detect the failure and notify BGP to trigger BGP to rapidly disconnect the session and switch to the backup line. In this way, it can reach the purpose of fast route switch.

### Configuration Condition

Before configuring the coordination of BGP with BFD, ensure that:

- Enable BGP protocol.
- Configure IPv6 BGP neighbor and successfully establish and connect a session.

### Configure EBGP to Coordinate with BFD

The coordination of EBGP with BFD is based on single-hop BFD sessions, and BFD session parameters are required to be configured in interface mode.

Table 34 Configuring Coordination of EBGP with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure EBGP to Coordinate with BFD	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>fall-over bfd</b> [ <b>single-hop</b> ]	Mandatory By default, the BFD function of neighbor is disabled.
Exit the BGP IPv6 unicast configuration mode	<b>exit-address-family</b>	-
Exit the BGP configuration mode	<b>exit</b>	-

Step	Command	Description
Enter the interface configuration mode	<b>interface</b> <i>interface-name</i>	-
Configure the minimum receiving time interval of BFD sessions	<b>bfd min-receive-interval</b> <i>milliseconds</i>	Optional By default, the minimum receiving time interval of BFD sessions is 1000 seconds.
Configure the minimum sending time interval of BFD sessions	<b>bfd min-transmit-interval</b> <i>milliseconds</i>	Optional By default, the minimum sending time interval of BFD sessions is 1000 seconds.
Configure the BFD session detection timeout multiple	<b>bfd multiplier</b> <i>number</i>	Optional The BFD session detection timeout multiple is 5.

---

### Note

- For the BFD-related configurations, please see the Reliability Technology - BFD-related section.
- 

### Configure IBGP to Coordinate with BFD

The coordination of IBGP with BFD is based on multi-hop BFD sessions, and BFD session parameters are required to be configured in BGP mode.

Table 35 Configuring Coordination of IBGP with BFD

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-

Step	Command	Description
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure IBGP to Coordinate with BFD	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } fall-over bfd [single-hop]</b>	Mandatory By default, the BFD function of neighbor is disabled.
Configure the minimum receiving time interval of BFD sessions	<b>bfd min-receive-interval <i>milliseconds</i></b>	Optional By default, the minimum receiving time interval of BFD sessions is 1000 seconds.
Configure the minimum sending time interval of BFD sessions	<b>bfd min-transmit-interval <i>milliseconds</i></b>	Optional By default, the minimum sending time interval of BFD sessions is 1000 seconds.
Configure the BFD session detection timeout multiple	<b>bfd multiplier <i>number</i></b>	Optional The BFD session detection timeout multiple is 5.

## 61.2.9 Configure IPv6 BGP FRR

### Configuration Condition

Before configuring IPv6 BGP FRR, ensure that:

- When the FRR based on route-map is configured, the associated route-map has been configured.
- Enable IPv6BGP protocol.

### Configure BGP FRR

In the IPv6BGP network, as a result of link or device failure, the packets passing the point of failure will be discarded or loops will be produced. The traffic interruption caused thereby will continue until the protocol reconverges after several seconds. IPv6BGP FRR can reduce the time of traffic interruption. By applying the routing map, set a backup next hop for the successfully matched route. Once the main link fails, the traffic

passing through the main link will immediately switch to the backup link, achieving the purpose of fast switching.

Table 36 Configuring IPv6 BGP FRR

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the BGP configuration mode	<b>router bgp</b> <i>autonomous-system</i>	-
Enter the BGP IPv6 unicast configuration mode	<b>address-family ipv6 unicast</b>	-
Configure the route-map-based FRR of BGP	<b>fast-reroute route-map</b> <i>route-map-name</i>	Mandatory By default, the route-map FRR function is disabled.
Configure BGP auto FRR	<b>pic</b>	Mandatory By default, the BGP auto FRR function is disabled.

---

### Caution

- After BGP FRR is configured, BGP needs to be reset to complete initial route check and backup. Otherwise, it is only effective for the routes learned after the configuration.
  - When set fast-reroute backup-nexthop is configured for the FRR based on route-map, the protocol enables automatic FRR;
  - When pic method is used, the protocol enables automatic FRR;
  - The methods of enabling FRR are mutually exclusive;
  - After configuring BGP FRR and applying the routing map, use the command set backup-nexthop nexthop-address to set the BGP neighbor as the backup next hop in the routing map. If the non-BGP neighbor is configured as the backup next hop, the FRR function cannot take effect.
- 

## 61.2.10 IPv6 BGP monitoring and maintaining

Table 37 BGP Monitoring and Maintaining

Command	Description
<b>clear bgp ipv6</b> { *   <i>as-number</i>   <b>peer-group</b> <i>peer-group-name</i>   <b>external</b>   <i>neighbor-address</i> } [ <b>vrf</b> <i>vrf-name</i> ]	Reset BGP neighbors
<b>clear bgp</b> [ <b>ipv6 unicast</b> ] <b>dampening</b> [ <i>ipv6-address</i>   <i>ipv6-address/mask-length</i> ]	Clear dampened routes
<b>clear bgp</b> [ <b>ipv6 unicast</b> ] <b>flap-statistics</b> [ <i>ipv6-address</i>   <i>ipv6-address/mask-length</i> ]	Clear jitter statistics
<b>clear bgp</b> [ <b>ipv6</b> ] { *   <i>as-number</i>   <b>peer-group</b> <i>peer-group-name</i>   <b>external</b>   <i>neighbor-address</i> } [ <b>vrf</b> <i>vrf-name</i> ] { [ <b>soft</b> ] [ <b>in</b>   <b>out</b> ] }	Softly reset neighbors
<b>clear bgp</b> [ <b>ipv6</b> ] { *   <i>neighbor-address</i>   <i>as-number</i>   <b>peer-group</b> <i>peer-group-name</i>   <b>external</b> } [ <b>vrf</b> <i>vrf-name</i> ] <b>in prefix-filter</b>	Advertise ORF to neighbors
<b>show bgp</b> { <b>ipv6 unicast</b>   <b>vpnv6 unicast</b> <b>vrf</b> <i>vrf-name</i> } [ <i>ipv6-address</i>   <i>ipv6-address/mask-length</i> ]	Show the routing information under corresponding address family of BGP
<b>show ip bgp attribute-info</b>	Show the public route attributes of BGP
<b>show bgp ipv6 unicast community</b> [ <i>community-number</i> / <i>aa:nn</i> / <b>exact-match</b> / <b>local-AS</b> / <b>no-advertise</b> / <b>no-export</b> ]	Show the routing information which matches specified community attributes
<b>show bgp ipv6 unicast community-list</b> <i>community-list-name</i>	Show the community attribute list applied to routing information
<b>show bgp</b> { <b>ipv6 unicast</b>   <b>vpnv6 unicast</b> <b>vrf</b> <i>vrf-name</i> } <b>dampening</b> { <b>dampened-paths</b>   <b>flap-statistics</b>   <b>parameters</b> }	Show detailed information of route dampening
<b>show bgp ipv6 unicast filter-list</b> <i>filter-list-name</i> [ <b>exact-match</b> ]	Show the routes matching AS_PATH access list
<b>show bgp ipv6 unicast inconsistent-as</b>	Show the routes in conflict with AS_PATH

Command	Description
<b>show bgp { ipv6 unicast   vpv6 uicast vrf vrf-name } neighbors [ ipv6-address ]</b>	Show the detailed information BGP neighbors
<b>show bgp ipv6 unicast prefix-list prefix-list-name</b>	Show the routes matching prefix list
<b>show bgp ipv6 unicast quote-regexp as-path-list-name</b>	Show the routes matching AS_PATH list
<b>show bgp ipv6 unicast regexp as-path-list-name</b>	Show the routes matching AS_PATH list
<b>show bgp ipv6 unicast route-map rtmap-name</b>	Show the route matching the routing map
<b>show ip bgp scan</b>	Show the scanning information of BGP
<b>show bgp {ipv6 unicast   vpv6 vrf vrf-name } summary</b>	Show the neighbor summarization information of BGP

## 61.3 Typical configuration example of IPv6 BGP

### 61.3.1 Configure basic functions of IPv6 BGP

#### Network Requirements

- EBGP neighbors are established between Device1 and Device2, and IBGP neighbors are established between Device2 and Device3.
- Device1 learns the direct route 2001:4::/64 from the interface of Device3 which learns the direct route 2001:1::/64 from the interface of Device1.

#### Network Topology

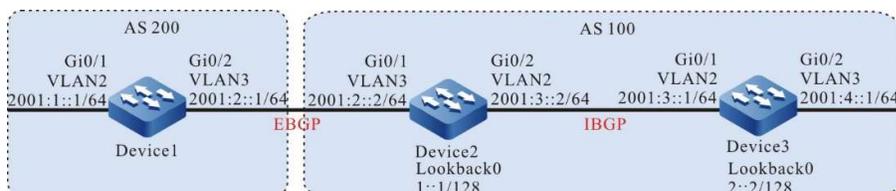

Figure 61 Network Topology for Configuring Basic Functions of IPv6 BGP

#### Configuration Steps

Step 1: Configure IPv6 global unicast address for interface. (Omitted)

Step 2: Configure OSPFv3 so that the routes of Loopback interfaces between devices are reachable from each other.

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 router ospf 100 area 0
Device2(config-if-vlan2)#exit
Device2(config)#interface loopback 0
Device2(config-if-loopback0)#ipv6 router ospf 100 area 0
Device2(config-if-loopback0)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan 2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
Device3(config-if-vlan2)#exit
Device3(config)#interface loopback 0
Device3(config-if-loopback0)#ipv6 router ospf 100 area 0
Device3(config-if-loopback0)#exit
```

#### #View the routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L  ::1/128 [0/0]
   via ::, 1w1d:23:51:37, lo0
LC 1::1/128 [0/0]
   via ::, 00:09:34, loopback0
O  2::2/128 [110/2]
   via fe80::201:7aff:fec0:525a, 00:05:29, vlan2
C  2001:2::/64 [0/0]
   via ::, 00:09:41, vlan3
L  2001:2::2/128 [0/0]
   via ::, 00:09:39, vlan3
C  2001:3::/64 [0/0]
   via ::, 00:08:55, vlan2
L  2001:3::2/128 [0/0]
   via ::, 00:08:53, vlan2
```

#### #Check the routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L  ::1/128 [0/0]
   via ::, 1w5d:18:34:53, lo0
O  1::1/128 [110/2]
   via fe80::201:7aff:fe5e:6d2e, 00:29:59, vlan2
```

```

LC 2::2/128 [0/0]
  via ::, 00:32:36, loopback0
C 2001:3::/64 [0/0]
  via ::, 00:32:59, vlan2
L 2001:3::1/128 [0/0]
  via ::, 00:32:58, vlan2
C 2001:4::/64 [0/0]
  via ::, 00:32:44, vlan3
L 2001:4::1/128 [0/0]
  via ::, 00:32:43, vlan3

```

According to the result, both Device2 and Device3 have learned the route of peer loopback interface by running OSPFv3 protocol. On this basis, Device2 and Device3 can establish IBGP neighbors through loopback interface.

Step 3: Configure basic functions of IPv6 BGP.

#Configure Device1.

Establish a direct EBGP peer with Device2, and import 2001:1::/64 into BGP through the network.

```

Device1#configure terminal
Device1(config)#router bgp 200
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:2::2 remote-as 100
Device1(config-bgp-af)#network 2001:1::/64
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit

```

#Configure Device2.

Establish a direct EBGP peer with Device1, build indirect IBGP peer relationship with Device3 through Loopback0, and set the next hop of the advertised route as itself.

```

Device2(config)#router bgp 100
Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 2001:2::1 remote-as 200
Device2(config-bgp-af)#neighbor 2::2 remote-as 100
Device2(config-bgp-af)#neighbor 2::2 next-hop-self
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#neighbor 2::2 update-source loopback 0
Device2(config-bgp)#exit

```

#Configure Device3.

Build indirect IBGP peer relationship with Device2 through Loopback0, and import 2001:4::/64 into BGP through the network.

```

Device3(config)#router bgp 100
Device3(config-bgp)#bgp router-id 3.3.3.3
Device3(config-bgp)#address-family ipv6
Device3(config-bgp-af)#neighbor 1::1 remote-as 100
Device3(config-bgp-af)#network 2001:4::/64
Device3(config-bgp-af)#exit-address-family
Device3(config-bgp)#neighbor 1::1 update-source loopback 0
Device3(config-bgp)#exit

```

---

 **Note**

- In order to avoid route flapping, IBGP neighbors are established through loopback interfaces. OSPFv3 is required to synchronize the routing information of the loopback interfaces between IBGP neighbors.
- 

Step 4: Check the result.

#View the status of IPv6 BGP neighbors on Device 2.

```
Device2#show bgp ipv6 unicast summary
BGP router identifier 2.2.2.2, local AS number 100
BGP table version is 4
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRcd
2::2       4 100    8    6    3    0  00:04:12    1
2001:2::1  4 200   15   15    3    0  00:11:17    1

Total number of neighbors 2
```

From the case where the content of the State/PfxRcd column is displayed as a digit (from the number of routing prefixes received by the neighbor), you can see that Device 2 has successfully established IPv6 BGP neighbors with Device1 and Device3.

#View the routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w2d:00:42:57, lo0
C 2001:1::/64 [0/0]
  via ::, 00:02:59, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:02:56, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:52:17, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:52:16, vlan3
B 2001:4::/64 [20/0]
  via 2001:2::2, 00:06:13, vlan3
```

#View the routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w2d:00:34:53, lo0
LC 1::1/128 [0/0]
  via ::, 00:52:49, loopback0
O 2::2/128 [110/2]
  via fe80::201:7aff:fec0:525a, 00:48:45, vlan2
```

```

B 2001:1::/64 [20/0]
  via 2001:2::1, 00:03:18, vlan3
C 2001:2::/64 [0/0]
  via ::, 00:52:57, vlan3
L 2001:2::2/128 [0/0]
  via ::, 00:52:55, vlan3
C 2001:3::/64 [0/0]
  via ::, 00:52:10, vlan2
L 2001:3::2/128 [0/0]
  via ::, 00:52:09, lo0
B 2001:4::/64 [200/0]
  via 2::2, 00:07:27, vlan2

```

#Check the routing table of Device3.

```

Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w5d:18:54:38, lo0
O 1::1/128 [110/2]
  via fe80::201:7aff:fe5e:6d2e, 00:49:44, vlan2
LC 2::2/128 [0/0]
  via ::, 00:52:21, loopback0
B 2001:1::/64 [200/0]
  via 1::1, 00:03:54, vlan2
C 2001:3::/64 [0/0]
  via ::, 00:52:44, vlan2
L 2001:3::1/128 [0/0]
  via ::, 00:52:43, vlan2
C 2001:4::/64 [0/0]
  via ::, 00:52:29, vlan3
L 2001:4::1/128 [0/0]
  via ::, 00:52:28, vlan3

```

According to the result, Device1 learns the direct route 2001:4::/64 from the interface of Device3 which learns the direct route 2001:1::/64 from the interface of Device1.

### 61.3.2 Configure IPv6 BGP route redistribution

#### Network Requirements

- Device3 establishes OSPFv3 neighbors with Device2, and advertises the direct route of the interface 2001:3::/64 to Device2.
- Establish EBGP neighbors between Device1 and Device2 so that Device2 will redistribute the OSPFv3 route to IPv6 BGP and advertise it to Device1.

#### Network Topology

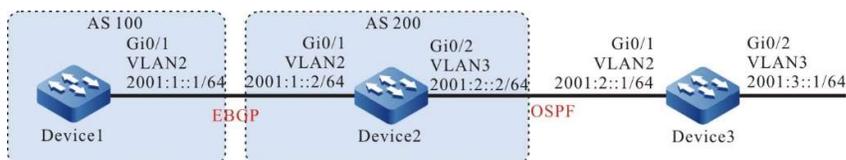

Figure 61 Network Topology for Configuring IPv6 BGP Route Redistribution

#### Configuration Steps

Step 1: Configure IPv6 global unicast address for interface. (Omitted)

Step 2: Configure OSPFv3 so that Device2 can learn the direct route 2001:3::/64 from Device3.

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 router ospf 100 area 0
Device2(config-if-vlan3)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan 2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan 3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)#exit
```

#### #View the routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w2d:01:10:38, lo0
C 2001:1::/64 [0/0]
  via ::, 00:06:25, vlan2
L 2001:1::2/128 [0/0]
  via ::, 00:06:24, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:05:46, vlan3
L 2001:2::2/128 [0/0]
  via ::, 00:05:43, vlan3
O 2001:3::/64 [110/2]
  via fe80::201:7aff:fec0:525a, 00:02:41, vlan3
```

It can be seen from the routing table that Device2 learns the OSPFv3 route 2001:3::/64 advertised by Device3.

Step 3: Configure basic functions of IPv6 BGP.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#router bgp 100
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:1::2 remote-as 200
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit
```

#### #Configure Device2.

```

Device2(config)#router bgp 200
Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 2001:1::1 remote-as 100
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit

```

#View the status of IPv6 BGP neighbors on Device 2.

```

Device2#show bgp ipv6 unicast summary
BGP router identifier 2.2.2.2, local AS number 200
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries

Neighbor      V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRcd
2001:1::1    4 100    2     2     1    0  00:00:50    0

Total number of neighbors 1

```

#According to the result, IPv6 BGP neighbors have been successfully established between Device 2 and Device1.

Step 4: Configure IPv6 BGP to redistribute OSPFv3 route.

#Configure Device2.

```

Device2(config)#router bgp 200
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#redistribute ospf 100
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit

```

Step 5: Check the result.

#View the IPv6 BGP routing table of Device2.

```

Device2#show bgp ipv6 unicast
BGP table version is 2, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric  LocPrf Weight Path
[O]*> 2001:2::/64  ::           1       32768 ?
[O]*> 2001:3::/64  ::           2       32768 ?

```

According to the result, OSPFv3 route has been successfully redistributed to IPv6 BGP.

#View the routing table of Device1.

```

Device1#show bgp ipv6 unicast
BGP table version is 3, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric  LocPrf Weight Path
[B]*> 2001:2::/64  2001:1::2     1         0 200 ?
[B]*> 2001:3::/64  2001:1::2     2         0 200 ?

```

According to the result, Device1 has successfully learnt the routes 2001:2::/64 and 2001:3::/64.

说明：

- In practical applications, if the autonomous system has 2 or more edge devices, directly redistributing routes between different routing protocols is not recommended. When configuration is necessary, routing control policies such as filtering and summarization are required on the edge devices of the autonomous system to avoid routing loops.

### 61.3.3 Configure IPv6 BGP community attributes

#### Network Requirements

- EBMP neighbors are successfully established between Device1 and Device2.
- Device1 imports two direct routes 2001:1::/64 and 2001:2::/64 into BGP through the network, and sets different community attributes for the two routes when they are advertised to Device2.
- When Device2 receives the route advertised by Device1, it filters the route 2001:1::/64 in the incoming direction of the neighbor by matching community attributes, and permits the route 2001:2::/64 to pass.

#### Network Topology

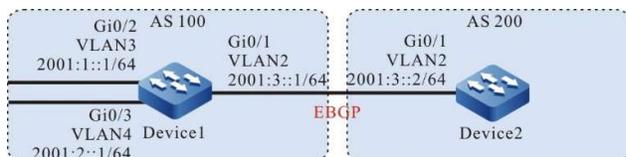

Figure 1 Network Topology for Configuring Community Attributes of IPv6 BGP

#### Configuration Steps

Step 1: Configure IPv6 global unicast address for interface. (Omitted)

Step 2: Configure basic functions of IPv6 BGP.

#Configure Device1.

```
Device1#configure terminal
Device1(config)#router bgp 100
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:3::2 remote-as 200
Device1(config-bgp-af)#network 2001:1::/64
Device1(config-bgp-af)#network 2001:2::/64
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit
```

#Configure Device2.

```
Device2#configure terminal
Device2(config)#router bgp 200
```

```

Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 2001:3::1 remote-as 100
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit

```

#View the status of IPv6 BGP neighbors on Device1.

```

Device1#show bgp ipv6 unicast summary
BGP router identifier 1.1.1.1, local AS number 100
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRcd
2001:3::2   4  200    3    4    1    0  00:01:02    0

Total number of neighbors 1

```

#It can be seen that IPv6 BGP neighbors have been successfully established between Device 1 and Device2.

#View the routing table on Device2.

```

Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w2d:05:45:34, lo0
B 2001:1::/64 [20/0]
  via 2001:3::1, 00:01:35, vlan2
B 2001:2::/64 [20/0]
  via 2001:3::1, 00:01:35, vlan2
C 2001:3::/64 [0/0]
  via ::, 00:04:09, vlan2
L 2001:3::2/128 [0/0]
  via ::, 00:04:08, vlan2

```

According to the result, Device2 has successfully learnt the routes 2001:1::/64 and 2001:2::/64.

Step 3: Configure access list and routing policy, and set IPv6 BGP community attributes.

#Configure Device1.

```

Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 2001:1::/64 any
Device1(config-v6-list)#commit
Device1(config-v6-list)#exit
Device1(config)#ipv6 access-list extended 7002
Device1(config-v6-list)#permit ipv6 2001:2::/64 any
Device1(config-v6-list)#commit
Device1(config-v6-list)#exit
Device1(config)#route-map CommunitySet 10
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#set community 100:1
Device1(config-route-map)#exit
Device1(config)#route-map CommunitySet 20
Device1(config-route-map)#match ipv6 address 7002
Device1(config-route-map)#set community 100:2
Device1(config-route-map)#exit

```

Set different community attributes for the routes 2001:1::/64 and 2001:2::/64 by configuring access list and routing policy.

Step 4: Configure IPv6 BGP to associate routing policy.

#Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:3::2 route-map CommunitySet out
Device1(config-bgp-af)#neighbor 2001:3::2 send-community
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit
```

#View the IPv6 BGP routing table of Device2.

```
Device2#show bgp ipv6 unicast 2001:1::/64
BGP routing table entry for 2001:1::/64
Paths: (1 available, best #1, table Default-IP-Routing-Table)
Not advertised to any peer
100
2001:3::1 (metric 10) from 2001:3::1 (1.1.1.1)

Origin IGP, metric 0, localpref 100, valid, external, best
Community: 100:1
Last update: 00:00:24 ago
Device2#show bgp ipv6 unicast 2001:2::/64
BGP routing table entry for 2001:2::/64
Paths: (1 available, best #1, table Default-IP-Routing-Table)
Not advertised to any peer
100
2001:3::1 (metric 10) from 2001:3::1 (1.1.1.1)

Origin IGP, metric 0, localpref 100, valid, external, best
Community: 100:2
Last update: 00:00:30 ago
```

It can be seen from the IPv6 BGP routing table of Device2 that the community attribute of 2001:1::/64 has been set as 100:1, and that of 2001:2::/64 as 100:2.

Step 5: Configure IPv6 BGP route filtration.

#Configure Device2.

```
Device2(config)#ip community-list 1 permit 100:2
Device2(config)#route-map CommunityFilter
Device2(config-route-map)#match community 1
Device2(config-route-map)#exit
Device2(config)#router bgp 200
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 2001:3::1 route-map CommunityFilter in
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit
```

Step 6: Check the result.

#View the routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
via ::, 1w2d:05:58:57, lo0
```

```

B 2001:2::/64 [20/0]
  via 2001:3::1, 00:00:05, vlan2
C 2001:3::/64 [0/0]
  via ::, 00:17:32, vlan2
L 2001:3::2/128 [0/0]
  via ::, 00:17:30, vlan2

```

It can be seen from the IPv6 BGP routing table of Device2 that 2001:1::/64 is filtered in the incoming direction, while 2001:2::/64 is allowed to pass.

## Note

- After configuring the routing policy on IPv6 BGP neighbors, it is required to reset the IPv6 BGP neighbors to make it take effect.
- The command **send-community** is required to advertise the community attributes to the peer.

### 61.3.4 Configure IPv6 BGP route reflector

#### Network Requirements

- Device3 establishes EBGP neighbors with Device4 which advertises the route of the 2001:4::/64 to Device3.
- Device2 establishes IBGP neighbors with Device3 and Device1 respectively. Route reflector is configured on Device2. Device1 and Device3 serve as clients so that Device1 can learn the route 2001:4::/64 advertised by Device4.

#### Network Topology

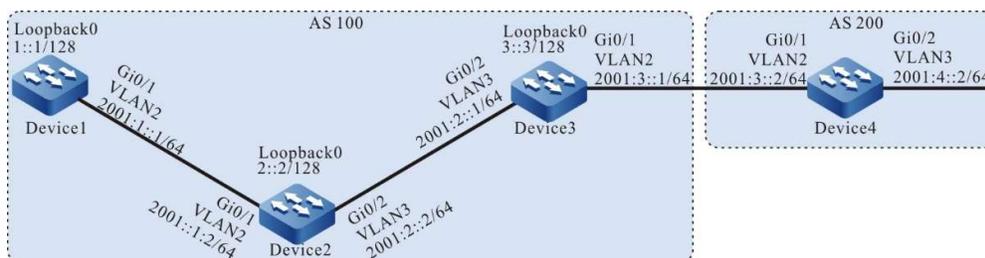

Figure 61 Network Topology for Configuring IPv6 BGP Route Reflector

#### Configuration Steps

- Step 1: Configure IPv6 global unicast address for interface. (Omitted)
- Step 2: Configure OSPFv3 so that the routes of Loopback interfaces between devices are reachable from each other.

#Configure Device1.

```

Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
Device1(config)#interface loopback 0
Device1(config-if-loopback0)#ipv6 router ospf 100 area 0
Device1(config-if-loopback0)#exit

```

### #Configure Device2.

```

Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#ipv6 router ospf 100 area 0
Device2(config-if-vlan2)#exit
Device2(config)#interface vlan 3
Device2(config-if-vlan3)#ipv6 router ospf 100 area 0
Device2(config-if-vlan3)#exit
Device2(config)#interface loopback 0
Device2(config-if-loopback0)#ipv6 router ospf 100 area 0
Device2(config-if-loopback0)#exit

```

### #Configure Device3.

```

Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan 3
Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)#exit
Device3(config)#interface loopback 0
Device3(config-if-loopback0)#ipv6 router ospf 100 area 0
Device3(config-if-loopback0)#exit

```

### #View the routing table of Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L  ::1/128 [0/0]
   via ::, 1w2d:06:26:16, lo0
LC 1::1/128 [0/0]
   via ::, 00:13:56, loopback0
O  2::2/128 [110/2]
   via fe80::201:7aff:fec0:525a, 00:09:06, vlan2
O  3::3/128 [110/3]
   via fe80::201:7aff:fec0:525a, 00:00:36, vlan2
C  2001:1::/64 [0/0]
   via ::, 00:14:03, vlan2
L  2001:1::1/128 [0/0]
   via ::, 00:14:02, vlan2
O  2001:2::/64 [110/2]
   via fe80::201:7aff:fec0:525a, 00:09:06, vlan2

```

### #View the routing table of Device 2.

```

Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

```

```

L ::1/128 [0/0]
  via ::, 1w6d:00:46:09, lo0
O 1::1/128 [110/2]
  via fe80::201:7aff:fe5e:6d2e, 00:10:05, vlan2
LC 2::2/128 [0/0]
  via ::, 00:14:23, loopback0
O 3::3/128 [110/2]
  via fe80::201:7aff:fe62:bb80, 00:01:44, vlan3
C 2001:1::/64 [0/0]
  via ::, 00:14:48, vlan2
L 2001:1::2/128 [0/0]
  via ::, 00:14:47, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:14:41, vlan3
L 2001:2::2/128 [0/0]
  via ::, 00:14:39, vlan3

```

### #Check the routing table of Device3.

```

Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

```

```

L ::1/128 [0/0]
  via ::, 1w2d:06:37:24, lo0
O 1::1/128 [110/3]
  via fe80::201:7aff:fec0:525b, 00:02:39, vlan3
O 2::2/128 [110/2]
  via fe80::201:7aff:fec0:525b, 00:02:39, vlan3
LC 3::3/128 [0/0]
  via ::, 00:14:45, loopback0
O 2001:1::/64 [110/2]
  via fe80::201:7aff:fec0:525b, 00:02:39, vlan3
C 2001:2::/64 [0/0]
  via ::, 00:15:03, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:15:02, vlan3
C 2001:3::/64 [0/0]
  via ::, 00:14:55, vlan2
L 2001:3::1/128 [0/0]
  via ::, 00:14:54, vlan2

```

It can be seen that Device1, Device2 and Device3 can learn the routes of their loopback interface from each other.

### Step 3: Configure basic functions of IPv6 BGP.

#### #Configure Device1.

```

Device1(config)#router bgp 100
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2::2 remote-as 100
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#neighbor 2::2 update-source loopback 0
Device1(config-bgp)#exit

```

#### #Configure Device2.

```

Device2(config)#router bgp 100
Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 1::1 remote-as 100
Device2(config-bgp-af)#neighbor 3::3 remote-as 100
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#neighbor 1::1 update-source loopback 0

```

```
Device2(config-bgp)#neighbor 3::3 update-source loopback 0
Device2(config-bgp)#exit
```

### #Configure Device3.

```
Device3(config)#router bgp 100
Device3(config-bgp)#bgp router-id 3.3.3.3
Device3(config-bgp)#address-family ipv6
Device3(config-bgp-af)#neighbor 2::2 remote-as 100
Device3(config-bgp-af)#neighbor 2::2 next-hop-self
Device3(config-bgp-af)#neighbor 2001:3::2 remote-as 200
Device3(config-bgp-af)#exit-address-family
Device3(config-bgp)#neighbor 2::2 update-source loopback 0
Device3(config-bgp)#exit
```

### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router bgp 200
Device4(config-bgp)#bgp router-id 4.4.4.4
Device4(config-bgp)#address-family ipv6
Device4(config-bgp-af)#neighbor 2001:3::1 remote-as 100
Device4(config-bgp-af)#network 2001:4::/64
Device4(config-bgp-af)#exit-address-family
Device4(config-bgp)#exit
```

### #View the status of IPv6 BGP neighbors on Device 2.

```
Device2#show bgp ipv6 unicast summary
BGP router identifier 2.2.2.2, local AS number 100
BGP table version is 2
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRcd
1::1        4  100   10   10     2  0  0 00:07:18    0
3::3        4  100   10    9     2  0  0 00:06:53    1

Total number of neighbors 2
```

### #View the status of IPv6 BGP neighbors on Device4.

```
Device4#show bgp ipv6 unicast summary
BGP router identifier 4.4.4.4, local AS number 200
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRcd
2001:3::1   4  100    3    4     2  0  0 00:01:45    0

Total number of neighbors 1
```

It can be seen that IPv6 BGP neighbors have been successfully established between devices.

### #View the IPv6 BGP routing table of Device3.

```
Device3#show bgp ipv6 unicast
BGP table version is 3, local router ID is 3.3.3.3
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric  LocPrf Weight Path
[B]*> 2001:4::/64  2001:3::2      0         0 200 i
```

### #View the IPv6 BGP routing table of Device2.

```
Device2#show bgp ipv6 unicast
BGP table version is 7, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
```

```

S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric  LocPrf Weight Path
[B]*>i2001:4::/64    3::3          0      100   0 200 i

```

#View the IPv6 BGP routing table of Device1.

```
Device1#show bgp ipv6 unicast
```

It can be seen from above that both Device2 and Device3 have learned the route 2001:4::/64, though Device2 doesn't advertise it to Device1.

Step 4: Configure IPv6 BGP route reflector.

#Configure Device2.

```

Device2(config)#router bgp 100
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 1::1 route-reflector-client
Device2(config-bgp-af)#neighbor 3::3 route-reflector-client
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit

```

On Device2, configure Device1 and Device3 as clients of route reflector.

Step 5: Check the result.

#View the routing table of Device1.

```

Device1#show bgp ipv6 unicast
BGP table version is 2, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric  LocPrf Weight Path
[B]*>i2001:4::/64    3::3          0      100   0 200 i
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management

```

```

L ::1/128 [0/0]
via ::, 1w2d:06:48:52, lo0
LC 1::1/128 [0/0]
via ::, 00:36:32, loopback0
O 2::2/128 [110/2]
via fe80::201:7aff:fec0:525a, 00:31:42, vlan2
O 3::3/128 [110/3]
via fe80::201:7aff:fec0:525a, 00:23:12, vlan2
C 2001:1::/64 [0/0]
via ::, 00:36:39, vlan2
L 2001:1::1/128 [0/0]
via ::, 00:36:38, vlan2
O 2001:2::/64 [110/2]
via fe80::201:7aff:fec0:525a, 00:31:42, vlan2
B 2001:4::/64 [200/0]
via 3::3, 00:01:16, vlan2

```

Configure Device1 and Device3 as clients of route reflector in the BGP of Device2 which successfully reflects the route 2001:4::/64 to the client Device1.

---

## Note

- When a IPv6 BGP neighbor is configured as the client of route reflector, this neighbor will be reset.
- 

### 61.3.5 Configure IPv6 BGP route aggregation

#### Network Requirements

- Device1 establishes OSPFv3 neighbors with Device3 which advertises the two routes 2002:1::/64 and 2002:2::/64 to Device1.
- EBMP neighbors are successfully established between Device1 and Device2.
- On Device1, the routes 2002:1::/64 and 2002:2::/64 are aggregated into 2002::/30 to advertise to Device2.

#### Network Topology

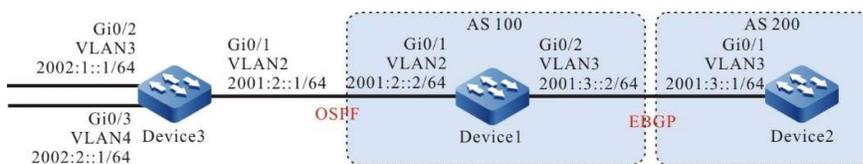

Figure 61 Network Topology for Configuring IPv6 BGP Route Aggregation

#### Configuration Steps

- Step 1: Configure IPv6 global unicast address for interface. (Omitted)
- Step 2: Configure OSPFv3 so that Device1 can learn the two routes 2002:1::/64 and 2002:2::/64 advertised by Device3.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
Device1(config-if-vlan2)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan 2
Device3(config-if-vlan2)#ipv6 router ospf 100 area 0
Device3(config-if-vlan2)#exit
Device3(config)#interface vlan 3
```

```

Device3(config-if-vlan3)#ipv6 router ospf 100 area 0
Device3(config-if-vlan3)#exit
Device3(config)#interface vlan 4
Device3(config-if-vlan4)#ipv6 router ospf 100 area 0
Device3(config-if-vlan4)#exit

```

### #View the routing table of Device1.

```

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w2d:07:35:38, lo0
C 2001:3::/64 [0/0]
  via ::, 00:01:11, vlan3
L 2001:3::2/128 [0/0]
  via ::, 00:01:10, vlan3
C 2001:2::/64 [0/0]
  via ::, 00:01:06, vlan2
L 2001:2::2/128 [0/0]
  via ::, 00:01:04, vlan2
O 2002:1::/64 [110/2]
  via fe80::201:7aff:fe62:bb7e, 00:01:54, vlan2
O 2002:2::/64 [110/2]
  via fe80::201:7aff:fe62:bb7e, 00:01:54, vlan2

```

It can be seen that Device1 learns the two routes 2002:1:1::/64 and 2002:1:2::/64 distributed by Device3.

### Step 3: Configure basic functions of IPv6 BGP.

#### #Configure Device1.

```

Device1(config)#router bgp 100
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:3::1 remote-as 200
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit

```

#### #Configure Device2.

##### Device2#configure terminal

```

Device2(config)#router bgp 200
Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 2001:3::2 remote-as 100
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit

```

#### #View the status of IPv6 BGP neighbors on Device1.

```

Device1#show bgp ipv6 unicast summary
BGP router identifier 1.1.1.1, local AS number 100
BGP table version is 1
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRcd
2001:3::1   4  200   3    3    1    0  00:01:16    0

```

IPv6 BGP neighbors have been successfully established between Device 1 and Device2.

Step 4: Configure IPv6 BGP route aggregation.

To meet the network requirements, here are two schemes:

Scheme 1: Configure IPv6 static route pointing to null0 and import it into BGP.

#Configure Device1.

```
Device1(config)#ipv6 route 2002::/30 null 0
Device1(config)#router bgp 100
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#network 2002::/30
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit
```

Check the result.

#View the IPv6 BGP routing table of Device1.

```
Device1#show bgp ipv6 unicast
BGP table version is 2, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric   LocPrf Weight Path
[B]*> 2002::/30   ::              0        32768 i
```

It can be seen that the aggregated route 2002::/30 has been generated in the IPv6 BGP routing table of Device1.

#View the routing table of Device 2.

```
Device2#show bgp ipv6 unicast
BGP table version is 2, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric   LocPrf Weight Path
[B]*> 2002::/30   2001:3::2       0         0 100 i
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w6d:03:14:01, lo0
C 2001:3::/64 [0/0]
  via ::, 01:20:21, vlan3
L 2001:3::1/128 [0/0]
  via ::, 01:20:20, vlan3
B 2002::/30 [20/0]
  via 2001:3::2, 00:00:44, vlan3
```

It can be seen that Device2 has successfully learned the aggregated route 2002::/30 advertised by Device1.

Scheme 2: First import the detail route into BGP and then complete route aggregation via the command aggregate-address.

#Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#redistribute ospf 100
```

```

Device1(config-bgp-af)#aggregate-address 2002::/30 summary-only
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit

```

Check the result.

#### #View the IPv6 BGP routing table of Device1.

```

Device1#show bgp ipv6 unicast
BGP table version is 4, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric    LocPrf Weight Path
[O]*> 2001:2::/64  ::              1         32768 ?
[B]*> 2002::/30   ::              32768 i
[O]s> 2002:1::/64 ::              2         32768 ?
[O]s> 2002:2::/64 ::              2         32768 ?

```

It can be seen that the aggregated route 2002::/30 has been generated in the IPv6 BGP routing table of Device1.

#### #View the routing table of Device 2.

```

Device2#show bgp ipv6 unicast
BGP table version is 4, local router ID is 2.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric    LocPrf Weight Path
[B]*> 2001:2::/64  2001:3::2       1         0 100 ?
[B]*> 2002::/30   2001:3::2       0         0 100 i
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

```

```

L ::1/128 [0/0]
  via ::, 1w6d:03:16:42, lo0
B 2001:2::/64 [20/0]
  via 2001:3::2, 00:00:50, vlan3
C 2001:3::/64 [0/0]
  via ::, 01:23:01, vlan3
L 2001:3::1/128 [0/0]
  via ::, 01:23:00, vlan3
B 2002::/30 [20/0]
  via 2001:3::2, 00:00:50, vlan3

```

It can be seen that Device2 has successfully learned the aggregated route 2002::/30 advertised by Device1.

---

### Note

- When the command `aggregate-address` is used for route aggregation, if the extension command `summary-only` is configured, the device will advertise aggregated route only; otherwise, it will advertise both detail route and aggregated route.
-

## 61.3.6 Configure IPv6 BGP route preference

### Network Requirements

- Device1 has established IBGP neighbors with Device2 and Device3, and Device4 has established EBGP neighbors with Device2 and Device3.
- Device1 advertises two routes to Device4, i.e. 2001:1::/64 and 2001:2::/64; Device4 advertises two routes to Device1, i.e. 2001:7::/64 and 2001:8::/64.
- By modifying the Local-preference of route on Device2 and Device3, you can make Device1 prefer the route 2001:7::/64 advertised by Device3 and the route 2001:8::/64 advertised by Device2.
- By modifying the MED of route on Device2 and Device3, you can make Device4 prefer the route 2001:1::/64 advertised by Device3 and the route 2001:2::/64 advertised by Device2.

### Network Topology

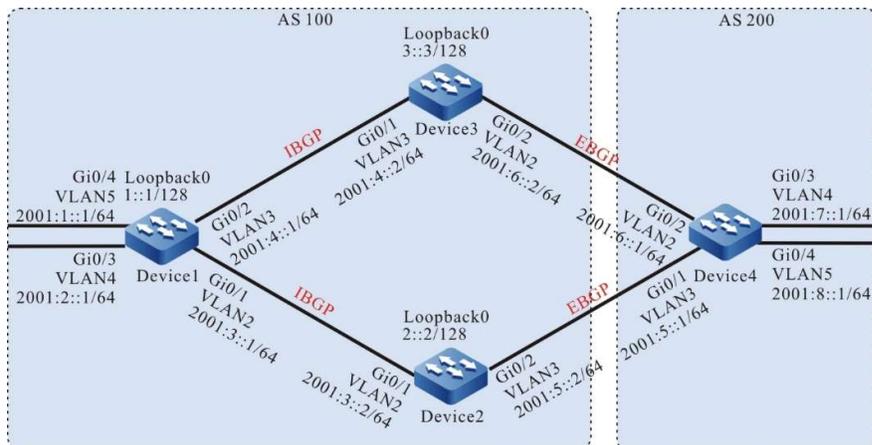

Figure 61 Network Topology for Configuring IPv6 BGP Route Preference

### Configuration Steps

- Step 1: Configure IPv6 global unicast address for interface. (Omitted)
- Step 2: Configure OSPFv3 so that the routes of Loopback interfaces between devices are reachable from each other.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ipv6 router ospf 100
Device1(config-ospf6)#router-id 1.1.1.1
Device1(config-ospf6)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#ipv6 router ospf 100 area 0
```

```

Device1(config-if-vlan2)#exit
Device1(config)#interface vlan 3

  via fe80::201:7aff:fe62:bb7f, 00:04:25, vlan2
C 2001:5::/64 [0/0]
  via ::, 00:09:39, vlan3
L 2001:5::2/128 [0/0]
  via ::, 00:09:38, vlan3
```

### #Check the routing table of Device3.

```
Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
U - Per-user Static route
O - OSPF, OE-OSPF External, M - Management
```

```
L ::1/128 [0/0]
  via ::, 2w1d:22:16:55, lo0
O 1::1/128 [110/2]
  via fe80::201:7aff:fe62:bb80, 00:04:27, vlan3
O 2::2/128 [110/3]
  via fe80::201:7aff:fe62:bb80, 00:04:27, vlan3
LC 3::3/128 [0/0]
  via ::, 00:10:48, loopback0
O 2001:3::/64 [110/2]
  via fe80::201:7aff:fe62:bb80, 00:04:27, vlan3
C 2001:4::/64 [0/0]
  via ::, 00:11:55, vlan3
L 2001:4::2/128 [0/0]
  via ::, 00:11:54, vlan3
C 2001:6::/64 [0/0]
  via ::, 00:11:48, vlan2
L 2001:6::2/128 [0/0]
  via ::, 00:11:47, vlan2
```

It can be seen that Device1, Device2 and Device3 can learn the routes of their loopback interface from each other.

### Step 3: Configure basic functions of IPv6 BGP.

#### #Configure Device1.

```
Device1(config)#router bgp 100
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2::2 remote-as 100
Device1(config-bgp-af)#neighbor 3::3 remote-as 100
Device1(config-bgp-af)#network 2001:1::/64
Device1(config-bgp-af)#network 2001:2::/64
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#neighbor 2::2 update-source loopback 0
Device1(config-bgp)#neighbor 3::3 update-source loopback 0
```

```
Device1(config-bgp)#exit
```

#### #Configure Device2.

```
Device2(config)#router bgp 100
Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 1::1 remote-as 100
Device2(config-bgp-af)#neighbor 1::1 next-hop-self
Device2(config-bgp-af)#neighbor 2001:5::1 remote-as 200
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#neighbor 1::1 update-source loopback 0
Device2(config-bgp)#exit
```

#### #Configure Device3.

```
Device3(config)#router bgp 100
Device3(config-bgp)#bgp router-id 3.3.3.3
Device3(config-bgp)#address-family ipv6
Device3(config-bgp-af)#neighbor 1::1 remote-as 100
Device3(config-bgp-af)#neighbor 1::1 next-hop-self
Device3(config-bgp-af)#neighbor 2001:6::1 remote-as 200
Device3(config-bgp-af)#exit-address-family
Device3(config-bgp)#neighbor 1::1 update-source loopback 0
Device3(config-bgp)#exit
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#router bgp 200
Device4(config-bgp)#bgp router-id 4.4.4.4
Device4(config-bgp)#address-family ipv6
Device4(config-bgp-af)#neighbor 2001:5::2 remote-as 100
Device4(config-bgp-af)#neighbor 2001:6::2 remote-as 100
Device4(config-bgp-af)#network 2001:7::/64
Device4(config-bgp-af)#network 2001:8::/64
Device4(config-bgp-af)#exit-address-family
Device4(config-bgp)#exit
```

#### #View the status of IPv6 BGP neighbors on Device1.

```
Device1#show bgp ipv6 unicast summary
BGP router identifier 1.1.1.1, local AS number 100
BGP table version is 4
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRed
2::2       4 100    9   10    4   0  00:06:18    2
3::3       4 100    7    8    4   0  00:04:29    2

Total number of neighbors 2
```

#### #View the status of IPv6 BGP neighbors on Device4.

```
Device4#show bgp ipv6 unicast summary
BGP router identifier 4.4.4.4, local AS number 200
BGP table version is 4
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRed
2001:5::2   4 100    6    5    4   0  00:02:43    2
2001:6::2   4 100    5    6    4   0  00:02:32    2

Total number of neighbors 2
```

According to the result, Device1 has successfully established IBGP neighbors with Device2 and Device3, and Device4 has successfully established EBGP neighbors with Device2 and Device3.

## #View the routing table of Device1.

```
Device1#show bgp ipv6 unicast
BGP table version is 4, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric   LocPrf Weight Path
[B]*> 2001:1::/64   ::              0        32768 i
[B]*> 2001:2::/64   ::              0        32768 i

[B]*>i             2::2            0        100   0 200 i
[B]*>i2001:8::/64  2::2            0        100   0 200 i
[B]* i             3::3            0        100   0 200 i

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
```

```
L ::1/128 [0/0]
   via ::, 1w5d:04:20:19, lo0
LC 1::1/128 [0/0]
   via ::, 00:25:47, loopback0
O 2::2/128 [110/2]
   via fe80::201:7aff:fe5e:87da, 00:19:12, vlan2
O 3::3/128 [110/2]
   via fe80::201:7aff:fec0:525b, 00:17:46, vlan3
C 2001:1::/64 [0/0]
   via ::, 00:26:20, vlan5
L 2001:1::1/128 [0/0]
   via ::, 00:26:19, vlan5
C 2001:2::/64 [0/0]
   via ::, 00:25:34, vlan4
L 2001:2::1/128 [0/0]
   via ::, 00:25:34, vlan4
C 2001:3::/64 [0/0]
   via ::, 00:26:09, vlan2
L 2001:3::1/128 [0/0]
   via ::, 00:26:08, vlan2
C 2001:4::/64 [0/0]
   via ::, 00:26:03, vlan3
L 2001:4::1/128 [0/0]
   via ::, 00:26:01, vlan3
B 2001:7::/64 [200/0]
   via 2::2, 00:03:21, vlan2
B 2001:8::/64 [200/0]
   via 2::2, 00:02:57, vlan2
```

It can be seen that both 2001:7::/64 and 2001:8::/64 on Device1 select Device2 as the optimal next hop device.

## #View the routing table of Device 4.

```
Device4#show bgp ipv6 unicast
BGP table version is 4, local router ID is 4.4.4.4
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop        Metric   LocPrf Weight Path
[B]* 2001:1::/64   2001:6::2       0         0 100 i
[B]*> 2001:5::2    2001:5::2       0         0 100 i
[B]* 2001:2::/64   2001:6::2       0         0 100 i
[B]*> 2001:5::2    2001:5::2       0         0 100 i
[B]*> 2001:7::/64   ::              0        32768 i
[B]*> 2001:8::/64   ::              0        32768 i

Device4#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
```

U - Per-user Static route  
O - OSPF, OE-OSPF External, M - Management

```
L ::1/128 [0/0]
  via ::, 1w5d:04:14:15, lo0
B 2001:1::/64 [20/0]
  via 2001:5::2, 00:06:52, vlan2
B 2001:2::/64 [20/0]
  via 2001:5::2, 00:06:52, vlan2
C 2001:5::/64 [0/0]
  via ::, 00:26:17, vlan3
L 2001:5::1/128 [0/0]
  via ::, 00:26:16, vlan3
C 2001:6::/64 [0/0]
  via ::, 00:26:24, vlan2
L 2001:6::1/128 [0/0]
  via ::, 00:26:23, vlan2
C 2001:7::/64 [0/0]
  via ::, 00:25:53, vlan4
L 2001:7::1/128 [0/0]
  via ::, 00:25:51, vlan4
C 2001:8::/64 [0/0]
  via ::, 00:25:40, vlan5
L 2001:8::1/128 [0/0]
  via ::, 00:25:40, vlan5
```

According to the result, both 2001:1::/64 and 2001:2::/64 on Device4 select Device3 as the optimal next hop device.

Step 4: Configure access control list and routing policy, and set local-preference and metric.

#Configure Device2.

```
Device2(config)#ipv6 access-list extended 7001
Device2(config-v6-list)#permit ipv6 2001:8::/64 any
Device2(config-v6-list)#commit
Device2(config-v6-list)#exit
Device2(config)#ipv6 access-list extended 7002
Device2(config-v6-list)#permit ipv6 2001:1::/64 any
Device2(config-v6-list)#commit
Device2(config-v6-list)#exit
Device2(config)#route-map SetPriority1 10
Device2(config-route-map)#match ipv6 address 7001
Device2(config-route-map)#set local-preference 110
Device2(config-route-map)#exit
Device2(config)#route-map SetPriority1 20
Device2(config-route-map)#set local-preference 20
Device2(config-route-map)#exit
Device2(config)#route-map SetPriority2 10
Device2(config-route-map)#match ipv6 address 7002
Device2(config-route-map)#set metric 100
Device2(config-route-map)#exit
Device2(config)#route-map SetPriority2 20
Device2(config-route-map)#set metric 20
Device2(config-route-map)#exit
```

Configure routing policy on Device2 to set the local-preference of 2001:8::/64 as 110 and the metric of 2001:1::/64 as 100.

#Configure Device3.

```
Device3(config)#ipv6 access-list extended 7001
Device3(config-v6-list)#permit ipv6 2001:7::/64 any
Device3(config-v6-list)#commit
Device3(config-v6-list)#exit
Device3(config)#ipv6 access-list extended 7002
```

```

Device3(config-v6-list)#permit ipv6 2001:2::/64 any
Device3(config-v6-list)#commit
Device3(config-v6-list)#exit
Device3(config)#route-map SetPriority1 10
Device3(config-route-map)#match ipv6 address 7001
Device3(config-route-map)#set local-preference 110
Device3(config-route-map)#exit
Device3(config)#route-map SetPriority1 20
Device3(config-route-map)#exit
Device3(config)#route-map SetPriority2 10
Device3(config-route-map)#match ipv6 address 7002
Device3(config-route-map)#set metric 100
Device3(config-route-map)#exit
Device3(config)#route-map SetPriority2 20
Device3(config-route-map)#exit

```

Configure routing policy on Device3 to set the local-preference of 2001:7::/64 as 110 and the metric of 2001:2::/64 as 100.

---

## Note

- When configuring a routing policy, both the prefix list and ACL can create filtering rules. The difference is that the prefix list can exactly match the routing mask.
- 

Step 5: Configure IPv6 BGP to associate routing policy.

#Configure Device2.

```

Device2(config)#router bgp 100
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 1::1 route-map SetPriority1 out
Device2(config-bgp-af)#neighbor 2001:5::1 route-map SetPriority2 out
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit

```

On Device2, modify the local-preference of 2001:8::/64 in the outgoing direction of neighbor 1::1 and the metric of 2001:1::/64 in the outgoing direction of neighbor 2001:5::1.

#Configure Device3.

```

Device3(config)#router bgp 100
Device3(config-bgp)#address-family ipv6
Device3(config-bgp-af)#neighbor 1::1 route-map SetPriority1 out
Device3(config-bgp-af)#neighbor 2001:6::1 route-map SetPriority2 out
Device3(config-bgp-af)# exit-address-family
Device2(config-bgp)#exit

```

On Device3, modify the local-preference of 2001:7::/64 in the outgoing direction of neighbor 10.0.0.1 and the metric of 2001:2::/64 in the outgoing direction of neighbor 2001:6::1.

After configuring routing policy on the neighbor, it is required to reset the neighbor to make it take effect.

Step 6: Check the result.

#View the routing table of Device1.

```

Device1#show bgp ipv6 unicast
BGP table version is 9, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network        Next Hop      Metric    LocPrf Weight Path
[B]*> 2001:1::/64  ::           0         32768 i
[B]*> 2001:2::/64  ::           0         32768 i
[B]* i2001:7::/64  2::2        0         100   0 200 i
[B]*>i             3::3        0         110   0 200 i
[B]*>i2001:8::/64  2::2        0         110   0 200 i
[B]* i             3::3        0         100   0 200 i

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

```

```

L ::1/128 [0/0]
  via ::, 1w5d:04:59:59, lo0
LC 1::1/128 [0/0]
  via ::, 01:05:27, loopback0
O 2::2/128 [110/2]
  via fe80::201:7aff:fe5e:87da, 00:58:52, vlan2
O 3::3/128 [110/2]
  via fe80::201:7aff:fec0:525b, 00:57:26, vlan3
C 2001:1::/64 [0/0]
  via ::, 01:06:00, vlan5
L 2001:1::1/128 [0/0]
  via ::, 01:05:59, vlan5
C 2001:2::/64 [0/0]
  via ::, 01:05:14, vlan4
L 2001:2::1/128 [0/0]
  via ::, 01:05:14, vlan4
C 2001:3::/64 [0/0]
  via ::, 01:05:49, vlan2
L 2001:3::1/128 [0/0]
  via ::, 01:05:48, vlan2
C 2001:4::/64 [0/0]
  via ::, 01:05:43, vlan3
L 2001:4::1/128 [0/0]
  via ::, 01:05:41, vlan3

  via 3::3, 00:09:05, vlan3
B 2001:8::/64 [200/0]
  via 2::2, 00:04:58, vlan2

```

It can be seen that the local-preference values of 2001:7::/64 and 2001:8::/64 have been successfully modified, and Device1 prefers the route 2001:8::/64 advertised by Device2 and the route 2001:7::/64 advertised by Device3.

#View the routing table of Device 4.

```

Device4#show bgp ipv6 unicast
BGP table version is 5, local router ID is 4.4.4.4
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale

[B]*> 2001:2::/64  2001:5::2    0         0 100 i
[B]*             2001:6::2    100       0 100 i
[B]*> 2001:7::/64  ::           0         32768 i
[B]*> 2001:8::/64  ::           0         32768 i

Device4#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS

```

U - Per-user Static route  
O - OSPF, OE-OSPF External, M - Management

```
L ::1/128 [0/0]
  via ::, 1w5d:04:53:45, lo0
B 2001:1::/64 [20/0]
  via 2001:6::2, 00:12:10, vlan3
B 2001:2::/64 [20/0]
  via 2001:5::2, 00:07:40, vlan2
C 2001:5::/64 [0/0]
  via ::, 01:05:47, vlan3
L 2001:5::1/128 [0/0]
  via ::, 01:05:46, vlan3
C 2001:6::/64 [0/0]
  via ::, 01:05:54, vlan2
L 2001:6::1/128 [0/0]
  via ::, 01:05:52, vlan2
C 2001:7::/64 [0/0]
  via ::, 01:05:22, vlan4
L 2001:7::1/128 [0/0]
  via ::, 01:05:21, vlan4
C 2001:8::/64 [0/0]
  via ::, 01:05:09, vlan5
L 2001:8::1/128 [0/0]
  via ::, 01:05:09, vlan5
```

It can be seen that the metric values of 2001:1::/64 and 2001:2::/64 have been successfully modified, and Device4 prefers the route 2001:2::/64 advertised by Device2 and the route 2001:1::/64 advertised by Device3.

---

### Note

- Routing policy can be used either in the outgoing direction of route advertisement or in the incoming direction of route receiving.
- 

## 61.3.7 Configure coordination of IPv6 BGP with BFD

### Network Requirements

- Device1 establishes EBGP neighbors with Device2 and Device3, and IBGP neighbors are established between Device2 and Device3.
- Device1 learns the EBGP route 2001:3::/64 from Device2 and Device3 at the same time, and prefers Device2 to forward data to the network segment 2001:3::/64.
- Configure EBGP to associate BFD on Device1 and Device2. When the line between Device1 and Device2 fails, BFD can quickly detect and notify BGP. Then, Device1 chooses Device3 to forward data to the network segment 2001:3::/64.

### Network Topology

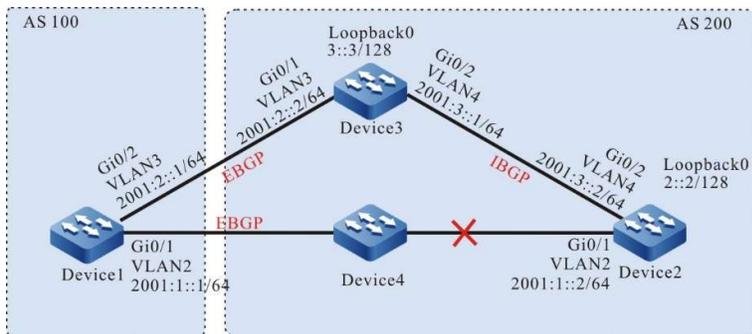

Figure 61 Network Topology for Configuring Coordination of IPv6 BGP with BFD

### Configuration Steps

- Step 1: Configure IPv6 global unicast address for interface. (Omitted)
- Step 2: Configure OSPFv3 so that the routes of Loopback interfaces between devices are reachable from each other.

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ipv6 router ospf 100
Device2(config-ospf6)#router-id 2.2.2.2
Device2(config-ospf6)#exit
Device2(config)# interface vlan 4
Device2(config-if-vlan4)#ipv6 router ospf 100 area 0
Device2(config-if-vlan4)#exit
Device2(config)#interface loopback 0
Device2(config-if-loopback0)#ipv6 router ospf 100 area 0
Device2(config-if-loopback0)#exit
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ipv6 router ospf 100
Device3(config-ospf6)#router-id 3.3.3.3
Device3(config-ospf6)#exit
Device3(config)#interface vlan 4
Device3(config-if-vlan4)#ipv6 router ospf 100 area 0
Device3(config-if-vlan4)#exit
Device3(config)# interface loopback 0
Device3(config-if-loopback0)#ipv6 router ospf 100 area 0
Device3(config-if-loopback0)#exit
```

#### #View the routing table of Device 2.

```
Device2#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w2d:09:31:22, lo0
LC 2::2/128 [0/0]
  via ::, 00:10:10, loopback0
O 3::3/128 [110/1]
  via fe80::201:7aff:fec0:525a, 00:00:12, vlan4
C 2001:1::/64 [0/0]
  via ::, 00:10:54, vlan2
```

```

L 2001:1::2/128 [0/0]
  via ::, 00:10:53, vlan2
C 2001:3::/64 [0/0]
  via ::, 00:10:17, vlan4
L 2001:3::2/128 [0/0]
  via ::, 00:10:16, vlan4

```

### #Check the routing table of Device3.

```

Device3#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

L ::1/128 [0/0]
  via ::, 1w6d:03:50:38, lo0
O 2::2/128 [110/2]
  via fe80::201:7aff:fe5e:6d2e, 00:02:40, vlan4
LC 3::3/128 [0/0]
  via ::, 00:00:49, loopback0
C 2001:2::/64 [0/0]
  via ::, 00:03:03, vlan3
L 2001:2::2/128 [0/0]
  via ::, 00:03:02, vlan3
C 2001:3::/64 [0/0]
  via ::, 00:03:18, vlan4
L 2001:3::1/128 [0/0]
  via ::, 00:03:17, vlan4

```

It can be seen that Device2 and Device3 can learn the routes of their loopback interface from each other.

Step 3: Configure access control list and routing policy, and set the routing metric.

### #Configure Device1.

```

Device1#configure terminal
Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 2001:3::/64 any
Device1(config-v6-list)#commit
Device1(config-v6-list)#exit
Device1(config)#route-map SetMetric
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#set metric 50
Device1(config-route-map)#exit

```

On Device1, configure the routing policy and set the metric value of 2001:3::/64 as 50.

Step 4: Configure basic functions of IPv6 BGP and associate routing policy on Device1.

### #Configure Device1.

```

Device1(config)#router bgp 100
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:1::2 remote-as 200
Device1(config-bgp-af)#neighbor 2001:2::2 remote-as 200
Device1(config-bgp-af)#neighbor 2001:2::2 route-map SetMetric in
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit

```

### #Configure Device2.

```

Device2(config)#router bgp 200
Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6

```

```

Device2(config-bgp-af)#neighbor 2001:1::1 remote-as 100
Device2(config-bgp-af)#neighbor 3::3 remote-as 200
Device2(config-bgp-af)#network 2001:3::/64
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#neighbor 3::3 update-source loopback 0
Device2(config-bgp)#exit

```

### #Configure Device3.

```

Device3(config)#router bgp 200
Device3(config-bgp)#bgp router-id 3.3.3.3
Device3(config-bgp)#address-family ipv6
Device3(config-bgp-af)#neighbor 2001:2::1 remote-as 100
Device3(config-bgp-af)#neighbor 2::2 remote-as 200
Device3(config-bgp-af)#network 2001:3::/64
Device3(config-bgp-af)#exit-address-family
Device3(config-bgp)#neighbor 2::2 update-source loopback 0
Device3(config-bgp)#exit

```

After configuring routing policy on the peer, it is required to reset the peer to make it take effect.

### #View the status of IPv6 BGP neighbors on Device1.

```

Device1#show bgp ipv6 unicast summary
BGP router identifier 1.1.1.1, local AS number 100
BGP table version is 2
2 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRed
2001:1::2   4 200    7    6    2    0 00:04:00    1
2001:2::2   4 200    5    5    2    0 00:02:03    1

Total number of neighbors 2

```

### #View the status of IPv6 BGP neighbors on Device 2.

```

Device2#show bgp ipv6 unicast summary
BGP router identifier 2.2.2.2, local AS number 200
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V  AS MsgRcvd MsgSent  TblVer  InQ OutQ Up/Down  State/PfxRed
3::3       4 200    5    5    2    0 00:02:10    1
2001:1::1   4 100    6    7    2    0 00:04:38    0

Total number of neighbors 2

```

According to the result, IPv6 BGP neighbor has been successfully established between Device1, Device2 and Device3.

### #View the routing table of Device1.

```

Device1#show bgp ipv6 unicast
BGP table version is 2, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
Network      Next Hop      Metric  LocPrf Weight Path
[B]* 2001:3::/64 2001:2::2      50      0 200 i
[B]*>         2001:1::2      0        0 200 i

Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management

```

```

L ::1/128 [0/0]
  via ::, 1w2d:09:53:27, lo0
C 2001:1::/64 [0/0]
  via ::, 00:24:05, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:24:02, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:25:21, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:25:20, vlan3
B 2001:3::/64 [20/0]
  via 2001:1::2, 00:05:06, vlan2

```

According to the result, the route 2001:3::/64 on Device1 selects Device2 as the optimal next hop device.

Step 5: Configure coordination of IPv6 BGP with BFD.

#Configure Device1.

```

Device1(config)#router bgp 100
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:1::2 fall-over bfd
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit
Device1(config)#interface vlan 2
Device1(config-if-vlan2)#bfd min-transmit-interval 500
Device1(config-if-vlan2)#bfd min-receive-interval 500
Device1(config-if-vlan2)#bfd multiplier 4
Device1(config-if-vlan2)#exit

```

#Configure Device2.

```

Device2(config)#router bgp 200
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 2001:1::1 fall-over bfd
Device2(config-bgp-af)#exit-address-family
Device2(config-bgp)#exit
Device2(config)#interface vlan 2
Device2(config-if-vlan2)#bfd min-transmit-interval 500
Device2(config-if-vlan2)#bfd min-receive-interval 500
Device2(config-if-vlan2)#bfd multiplier 4
Device2(config-if-vlan2)#exit

```

Enable BFD between Device1 and Device2, and modify BFD to control the minimum sending interval, minimum receiving interval and detection timeout multiples of packets.

Step 6: Check the result.

#View the BFD session status on Device1.

```

Device1#show bfd session ipv6
OurAddr          NeighAddr          State  Holddown  Interface
2001:1::1        2001:1::2          UP     2000      vlan2

```

According to the result, BFD status on Device1 is correctly up, and the holddown time is negotiated as 2000ms.

#When the lines between Device1 and Device2 fail, the route can quickly switch to the backup line.

#View the routing table of Device1.

```

Device1#show bgp ipv6 unicast
BGP table version is 3, local router ID is 1.1.1.1

```

Status codes: s suppressed, d damped, h history, \* valid, > best, i - internal,  
 S Stale  
 Origin codes: i - IGP, e - EGP, ? - incomplete  
 Network Next Hop Metric LocPrf Weight Path  
**[B]\*> 2001:3::/64 2001:2::2 50 0 200 i**  
 Device1#show ipv6 route  
 Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS  
 U - Per-user Static route  
 O - OSPF, OE-OSPF External, M - Management

```
L ::1/128 [0/0]
  via ::, 1w2d:10:06:30, lo0
C 2001:1::/64 [0/0]
  via ::, 00:37:08, vlan2
L 2001:1::1/128 [0/0]
  via ::, 00:37:04, vlan2
C 2001:2::/64 [0/0]
  via ::, 00:38:24, vlan3
L 2001:2::1/128 [0/0]
  via ::, 00:38:23, vlan3
B 2001:3::/64 [20/0]
  via 2001:2::2, 00:00:16, vlan3
```

It can be seen that the next hop of 2001 :3 ::/64 switches to Device3.

## 61.3.8 Configure IPv6 BGP static FRR

### Network Requirements

- All devices are configured with IPv6 BGP protocol.
- Enable static FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

### Network Topology

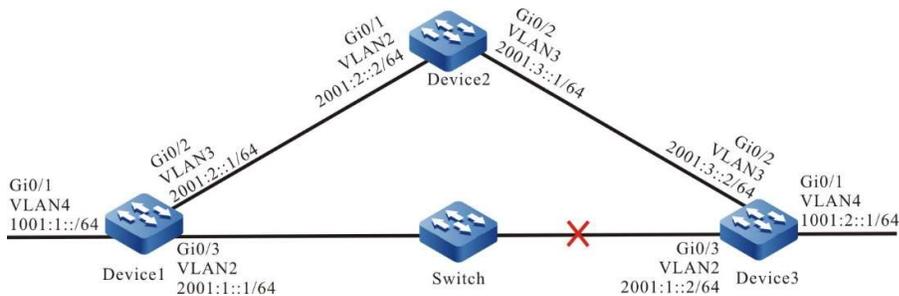

Figure 2 Network Topology for Configuring IPv6 BGP Static FRR

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface (Omitted).

```
S      Configure BGP.
t
e
p
2
:
```

#Device1 establishes BGP neighbors with Device2 and Device3.

```
Device1(config)#router bgp 100
Device1(config-bgp)#bgp router-id 1.1.1.1
Device1(config-bgp)#address-family ipv6
Device1(config-bgp-af)#neighbor 2001:1::2 remote-as 300
Device1(config-bgp-af)#neighbor 2001:2::2 remote-as 200
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit
```

#Device2 establishes BGP neighbors with Device1 and Device3.

```
Device2(config)#router bgp 200
Device2(config-bgp)#bgp router-id 2.2.2.2
Device2(config-bgp)#address-family ipv6
Device2(config-bgp-af)#neighbor 2001:2::1 remote-as 100
Device2(config-bgp-af)#neighbor 2001:3::2 remote-as 300
Device2(config-bgp-af)#exit-address-family
Device2 (config-bgp)#exit
```

#Device3 establishes BGP neighbors with Device1 and Device2.

```
Device3(config)#router bgp 300
Device3(config-bgp)#bgp router-id 3.3.3.3
Device3(config-bgp)#address-family ipv6 unicast
Device3(config-bgp-af)#neighbor 2001:3::1 remote-as 200
Device3(config-bgp-af)#neighbor 2001:1::1 remote-as 100
Device3(config-bgp-af)#network 1001:2::/64
Device3(config-bgp-af)#exit-address-family
Device3(config-bgp)#exit
```

```
S      Configure routing policy.
t
e
p
3
:
```

#On Device1, configure route-map to invoke ACL to match 1001:2::1/64 only, and filter other network segments. The route matching the match rule applies the backup next hop interface vlan3. The next hop address is 2001:2::2.

```
Device1(config)#ipv6 access-list extended 7001
Device1(config-v6-list)#permit ipv6 1001:2::1/64 any
Device1(config-v6-list)#exit
Device1(config)#route-map ipv6frr_bgp
Device1(config-route-map)#match ipv6 address 7001
Device1(config-route-map)#set ipv6 fast-reroute backup-interface vlan3 backup-next-hop 2001:2::2
Device1(config-route-map)#exit
```

```
S      Configure static FRR.
t
e
p
4
:
```

```
Device1(config)#router bgp 100
Device1(config-bgp)#address-family ipv6 unicast
Device1(config-bgp-af)#fast-reroute route-map ipv6frr_bgp
Device1(config-bgp-af)#exit-address-family
Device1(config-bgp)#exit
```

```
S      Check the results.
t
e
p
5
:
```

#View the IPv6 BGP routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 23:12:10, lo0
C 1001:1::/64 [0/0]
  via ::, 23:07:17, vlan4
```

```

L 1001:1::1/128 [0/0]
  via ::, 23:07:17, vlan4
B 1001:2::/64 [20/0]
  via 2001:1::2, 00:03:25, vlan2
C 2001:1::/64 [0/0]
  via ::, 13:47:06, vlan2
L 2001:1::1/128 [0/0]
  via ::, 13:47:06, vlan2
C 2001:2::/64 [0/0]
  via ::, 23:06:35, vlan3
L 2001:2::1/128 [0/0]
  via ::, 23:06:35, vlan3

```

According to the routing table, the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View IPv6 FRR routing table on Device1.

```

Device1#show ipv6 frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
B 1001:2::/64 [20/4294967295]
  via 2001:2::2, 00:05:16, vlan3

```

According to the result, the next hop and output interface of the frr route 1001:2::/64 are 2001:2::2 and vlan3 respectively.

#View the BFD session information of Device1.

```

Device1#show bfd session ipv6 2001:1::1 detail
Total ipv6 session number: 1
OurAddr      NeighAddr      LD/RD          State  Holddown  Interface
2001:1::1    2001:1::1      1016/1016     UP     500       vlan2
Type:ipv6 direct Mode:echo
Local Discriminator:73 Remote Discriminator:73
Local State:UP Remote State:UP Up for: 0h:8m:52s Number of times UP:1

  via ::, 23:13:12, vlan3

```

## 61.3.9 Configure IPv6 BGP dynamic FRR

### Network Requirements

- All devices are configured with IPv6 BGP protocol.
- Enable dynamic FRR between Device1 and Device3. When the lines fail, the service can quickly switch to Device2 for communication.

### Network Topology

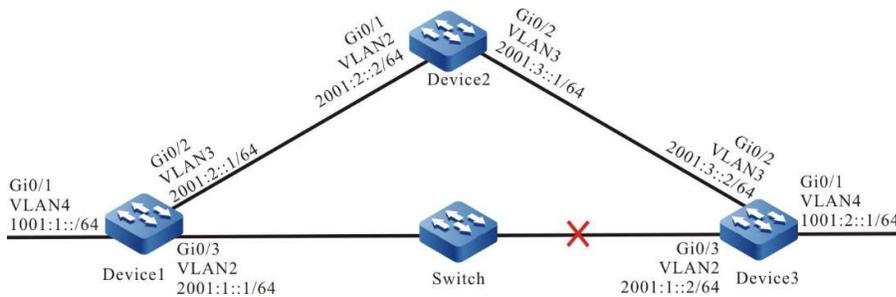

Figure 61 Network Topology for Configuring IPv6 BGP Dynamic FRR

### Configuration Steps

Step 1: Configure VLAN, and add ports to the required VLAN; configure the IPv6 address of each interface (Omitted).

```
S      Configure BGP.  
t  
e  
p  
2  
:
```

#Device1 establishes BGP neighbors with Device2 and Device3.

```
Device1(config)#router bgp 100  
Device1(config-bgp)#bgp router-id 1.1.1.1  
Device1(config-bgp)#address-family ipv6  
Device1(config-bgp-af)#neighbor 2001:1::2 remote-as 300  
Device1(config-bgp-af)#neighbor 2001:2::2 remote-as 200  
Device1(config-bgp-af)#exit-address-family  
Device1(config-bgp)#exit
```

#Device2 establishes BGP neighbors with Device1 and Device3.

```
Device2(config)#router bgp 200  
Device2(config-bgp)#bgp router-id 2.2.2.2  
Device2(config-bgp)#address-family ipv6  
Device2(config-bgp-af)#neighbor 2001:2::1 remote-as 100  
Device2(config-bgp-af)#neighbor 2001:3::2 remote-as 300  
Device2(config-bgp-af)#exit-address-family  
Device2 (config-bgp)#exit
```

#Device3 establishes BGP neighbors with Device1 and Device2.

```
Device3(config)#router bgp 300
Device3(config-bgp)#bgp router-id 3.3.3.3
Device3(config-bgp)#address-family ipv6 unicast
Device3(config-bgp-af)#neighbor 2001:3::1 remote-as 200
Device3(config-bgp-af)#neighbor 2001:1::1 remote-as 100

#View the IPv6 BGP routing table of Device1.

```
Device1#show ipv6 route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
L ::1/128 [0/0]
  via ::, 23:12:10, lo0
C 1001:1::/64 [0/0]
  via ::, 23:07:17, vlan4
L 1001:1::1/128 [0/0]
```

```

    via ::, 23:07:17, vlan4
B 1001:2::/64 [20/0]
  via 2001:1::2, 00:03:25, vlan2
C 2001:1::/64 [0/0]
  via ::, 13:47:06, vlan2
L 2001:1::1/128 [0/0]
  via ::, 13:47:06, vlan2
C 2001:2::/64 [0/0]
  via ::, 23:06:35, vlan3
L 2001:2::1/128 [0/0]
  via ::, 23:06:35, vlan3

```

According to the routing table, the route 1001:2::/64 prefers the lines between Device1 and Device3 for communication.

#View IPv6 FRR routing table on Device1.

```

Device1#show ipv6 frr route
Codes: C - Connected, L - Local, S - static, R - RIP, B - BGP, i-ISIS
       U - Per-user Static route
       O - OSPF, OE-OSPF External, M - Management
B 1001:2::/64 [20/4294967295]
  via 2001:2::2, 00:05:16, vlan3

```

According to the result, the next hop and output interface of the frr route 1001:2::/64 are 2001:2::2 and vlan3 respectively.

#View the BFD session information of Device1.

```

Device1#show bfd session ipv6 2001:1::1 detail
Total ipv6 session number: 1
OurAddr      NeighAddr      LD/RD          State  Holddown  Interface
2001:1::1    2001:1::1      1032/1032     UP     500       vlan2
Type:ipv6 direct Mode:echo
Local Discriminator:73 Remote Discriminator:73
Local State:UP Remote State:UP Up for: 0h:8m:52s Number of times UP:1
Send Interval:100ms Detection time:500ms(100ms*5)
Local Diag:0 Demand mode:0 Poll bit:0
Registered modules:FIB_MGR

```

According to the result, FIB\_MGR has been successfully coordinated with BFD. The session is established normally in the mode of echo.

#When the lines between Device1 and Device3 fail, it can quickly identify the failures and switch to Device2 for communication. The routing table of Device1 shows that the output interface of the destination network 1001:2::/64 has switched to the backup interface vlan3.

```

```

# 62 Policy Route

---

## 62.1 Overview

Policy route is a routing mechanism which conducts packet forwarding according to users' customized policies. When forwarding routes, the packet can be matched according to ACL rules. The content to be matched includes IP protocol number, source IP address, destination IP address, source TCP/UDP port number, destination TCP/UDP port number, packet priority, and TCP flag. For the packets that meet the match rules, corresponding operations shall be conducted according to the specified policy (set next hop of the packet) to complete their forwarding control.

The traditional routing method forwards packets according to destination address. By contrast, policy route is more flexible. It effectively complements and reinforces the traditional routing mechanism.

## 62.2 Function configuration of policy route

Table 62 Policy Route Configuration List

Configuration Task	
Configure Policy Route	Configure Next Hop IP Address for Packet Forwarding
	Configure Backup Next Hop IP Address for Packet Forwarding
	Configure Next Hop IPv6 Address for Packet Forwarding
	Configure Backup Next Hop IPv6 Address for Packet Forwarding
	Configure Binding of PBR Action Group to ACL

Configuration Task	
	Configure Binding of PBR Action Group to ACL Rules
Configuration Application of Policy Route	Configure Application of ACL with Policy Route to Layer-2/3 Ethernet Interface
	Configure Application of ACL with Policy Route to VLAN
	Configure Application of ACL with Policy Route to Interface VLAN
	Configure Application of ACL with Policy Route to vlan range
	Configure Application of ACL with Policy Route to interface vlan range
	Configure Application of ACL with Policy Route to global

### 62.2.1 Configure Policy Route

The implementation of policy route depends on the filtration of packets by ACL rules. The ACL rules first filter out the packets that meet the conditions, and then execute policy route forwarding to the next hop for the packets.

#### Configuration Condition

Before configuring the functions of policy route, ensure that:

- Configure ACL and ACL rules.

#### Configure Next Hop IP Address for Packet Forwarding

Configure the next hop IP address for packet forwarding to specify the destination address of policy route.

At most 6 next hop IP addresses for packet forwarding can be configured. If users configure multiple next hop IP addresses simultaneously and there are several reachable next hop IP addresses, the packet will be forwarded to the next hop IP address through load balancing.

Table 62 Configuring Next Hop IP Address for Packet Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter PBR action group configuration mode	<b>pbr-action-group</b> <i>pbr-action-group-name</i>	-
Configure next hop IP address for packet forwarding	<b>redirect ipv4-nexthop</b> <i>ip-address [ip-address] [ip-address] [ip-address] [ip-address] [vrf vrf-name]</i>	Mandatory  By default, the next hop IP address for packet forwarding is not configured.

### Note

- If all the next hop IP addresses configured for forwarding are not reachable, the function of policy route will not take effect.
- The next hop IP address shall not be configured as multicast address or broadcast address.
- The device doesn't support ECMP load balancing. The traffic always pass through the first effective next hop.

### Configure Backup Next Hop IP Address for Packet Forwarding

Configure the backup next hop IP address for packet forwarding to specify the destination address of policy route.

When the primary next hop is unreachable, if the backup next hop IP address is reachable, the packet is forwarded to the backup next hop IP address; if the primary next hop is reachable, the packet continues to be forwarded to such primary next hop IP address.

Table 1 Configuring Backup Next Hop IP Address for Packet Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter PBR action group configuration mode	<b>pbr-action-group</b> <i>pbr-action-group-name</i>	-

Step	Command	Description
Configure next hop IP address for packet forwarding	<b>redirect ipv4-nexthop backup</b> <i>ip-address</i> [ <i>vrf vrf-name</i> ]	Mandatory By default, the backup next hop IP address for packet forwarding is not configured.

### Note

- If the backup next hop IP address configured for forwarding is not reachable, the function of policy route will not take effect.
- The next hop IP address shall not be configured as multicast address or broadcast address.

### Configure Next Hop IPv6 Address for Packet Forwarding

Configure the next hop IPv6 address for packet forwarding to specify the destination address of policy route.

At most 6 next hop IPv6 addresses for packet forwarding can be configured. If users configure multiple next hop IPv6 addresses simultaneously and there are several reachable next hop IPv6 addresses, the packet will be forwarded to the next hop IPv6 address through load balancing.

Table 62 Configuring Next Hop IPv6 Address for Packet Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter PBR action group configuration mode	<b>pbr-action-group</b> <i>pb-action-group-name</i>	-
Configure next hop IPv6 address for packet forwarding	<b>redirect ipv6-nexthop</b> <i>ipv6-address</i> [ <i>ipv6-address</i> ] [ <i>ipv6-address</i> ] [ <i>ipv6-address</i> ] [ <i>ipv6-address</i> ] [ <i>vrf vrf-name</i> ]	Mandatory By default, the next hop IPv6 address for packet forwarding is not configured.

---

## Note

- If all the next hop IPv6 addresses configured for forwarding are not reachable, the function of policy route will not take effect.
  - The next hop IPv6 address shall not be configured as multicast address or broadcast address.
  - The device doesn't support ECMP load balancing. The traffic always pass through the first effective next hop.
- 

### Configure Backup Next Hop IPv6 Address for Packet Forwarding

Configure the backup next hop IPv6 address for packet forwarding to specify the destination address of policy route.

When the primary next hop is unreachable, if the backup next hop IPv6 address is reachable, the packet is forwarded to the backup next hop IPv6 address; if the primary next hop is reachable, the packet continues to be forwarded to such primary next hop IPv6 address.

Table 62 Configuring Backup Next Hop IPv6 Address for Packet Forwarding

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter PBR action group configuration mode	<b>pbr-action-group</b> <i>pbr-action-group-name</i>	-
Configure next hop IPv6 address for packet forwarding	<b>redirect ipv6-nexthop backup</b> <i>ipv6-address</i> [ <i>vrf vrf-name</i> ]	Mandatory By default, the backup next hop IPv6 address for packet forwarding is not configured.

---

## Note

- If the backup next hop IPv6 address configured for forwarding is not reachable, the function of policy route will not take effect.
  - The next hop IPv6 address shall not be configured as multicast address or broadcast address.
-

## Configure Binding of PBR Action Group to ACL

Configure the binding of PBR action group to ACL so that all ACL rules are associated with actions of policy route.

After the PBR action group is bound to ACL, all ACL rules will associate with actions of policy route. Only if the packets received by the port match the ACL rules, they will be forwarded to the next hop.

Table 62 Configuring Binding of PBR Action Group to ACL

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Binding of PBR Action Group to ACL	<b>ip pbr-action-group</b> <i>pbr-action-group-name</i> <b>access-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional By default, PBR action group is not bound to IP ACL.  PBR action group supports the binding of IP ACL which contains standard IP ACL and extended IP ACL.
	<b>ipv6 pbr-action-group</b> <i>pbr-action-group-name</i> <b>access-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional By default, PBR action group is not bound to IPv6 ACL.  PBR action group supports the binding of IPv6 ACL which contains standard IPv6 ACL and extended IPv6 ACL.

---

### Note

- Only when the next hop IP address configured is reachable will the policy route take effect.
  - The policy route only takes effect for the allowable rules in ACL.
- 

## Configure Binding of PBR Action Group to ACL Rules

Configure the binding of PBR action group to ACL rules so that ACL rules are associated with actions of policy route.

After the PBR action group is bound to ACL rules, ACL rules will associate with actions of policy route. If the packets received by the port match the ACL rules, they will be forwarded according to the next hop specified by the action group.

Table 62 Configuring Binding of PBR Action Group to ACL Rules

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure Binding of PBR Action Group to ACL Rules	Please see "Configure Standard IP ACL" Please see "Configure Extended IP ACL" Please see "Configure Standard IPv6 ACL" Please see "Configure Extended IPv6 ACL"	When configuring the allowable rules of standard IP ACL and extended ACL, you must specify a PBR action group to make the policy route take effect.  When configuring the allowable rules of standard IPv6 ACL and extended ACL, you must specify a PBR action group to make the policy route take effect.

 **Note**

- Only when the next hop IP address configured is reachable will the policy route take effect.
- The policy route only takes effect for the allowable rules in ACL.

### 62.2.2 Configuration Application of Policy Route

The application of policy route is actually that of the ACL with policy route which takes effect depending on ACL rules. ACL can be applied to layer-2/3 Ethernet interface, VLAN, interface VLAN, VLAN RANGE, interface VLAN RANGE, and global.

When the ACL with policy route is applied to global, VLAN, Interface VLAN, VLAN RANGE, Interface VLAN RANGE, and Layer-2/3 Ethernet interface, conflict may appear. In this case, the policy route with a high priority takes effect. The following has the priority from high to low: port, VLAN/ Interface VLAN, VLAN RANGE/Interface VLAN RANGE, global.

## Configuration Condition

None

## Configure Application of ACL with Policy Route to Layer-2/3 Ethernet Interface

After applying the ACL with policy route to layer-2/3 Ethernet interface, corresponding layer-2/3 Ethernet interface will have the function of policy route.

Table 62 Configuring Application of Policy Route to Layer-2/3 Ethernet Interface

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the L2/L3 Ethernet interface configuration mode.	<b>interface</b> <i>interface-name</i>	At least one option must be selected.  After you enter the layer-2/3 Ethernet interface configuration mode, the subsequent configuration takes effect only on the current port. After you enter the aggregation group configuration mode, the subsequent configuration takes effect only within the aggregation group.
Enter Aggregation Group Configuration Mode	<b>link-aggregation</b> <i>link-aggregation-id</i>	
Configuration application of policy route to the port	<b>ip policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional  By default, no IP ACL with policy route is applied to the port.
	<b>ipv6 policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional  By default, no IPv6 ACL with policy route is applied to the port.

## Configure Application of ACL with Policy Route to VLAN

After applying the ACL with policy route to VLAN, all ports within corresponding VLAN will have the function of policy route.

Table 62 Configuring Application of Policy Route to VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the VLAN configuration mode	<b>vlan</b> <i>vlan-id</i>	-
Configure application of policy route to VLAN	<b>ip policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional By default, no IP ACL with policy route is applied to VLAN.
	<b>ipv6 policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional By default, no IPv6 ACL with policy route is applied to VLAN.

### Configure Application of ACL with Policy Route to Interface VLAN

After applying the ACL with policy route to Interface VLAN, corresponding Interface VLAN will have the function of policy route.

Table 62 Configuring Application of Policy Route to Interface VLAN

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Enter the Interface VLAN configuration mode	<b>interface</b> <i>vlan</i> <i>vlan-id</i>	-
Configure application of policy route to Interface VLAN	<b>ip policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional By default, no IP ACL with policy route is applied to Interface VLAN.

Step	Command	Description
	<b>ipv6 policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Optional  By default, no IPv6 ACL with policy route is applied to Interface VLAN.

### Configure Application of ACL with Policy Route to VLAN RANGE

After applying the ACL with policy route to VLAN RANGE, corresponding VLAN RANGE will have the function of policy route.

Table 62 Configuring Application of Policy Route to VLAN RANGE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure application of policy route to VLAN RANGE	<b>ip policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> } <b>vlan range</b> <1-4094>	Optional  By default, no IP ACL with policy route is applied to VLAN RANGE.
	<b>ipv6 policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> } <b>vlan range</b> <1-4094>	Optional  By default, no IPv6 ACL with policy route is applied to VLAN RANGE.

### Configure Application of ACL with Policy Route to Interface VLAN RANGE

After applying the ACL with policy route to Interface VLAN RANGE, corresponding Interface VLAN RANGE will have the function of policy route.

Table 2 Configuring Application of Policy Route to Interface VLAN RANGE

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure application of policy route to VLAN RANGE	<b>ip policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> } <b>interface</b> <b>vlan range</b> <1-4094>	Optional By default, no IP ACL with policy route is applied to Interface VLAN RANGE.
	<b>ipv6 policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> } <b>interface</b> <b>vlan range</b> <1-4094>	Optional By default, no IPv6 ACL with policy route is applied to Interface VLAN RANGE.

### Configure Application of ACL with Policy Route to global

After applying the ACL with policy route to global, all ports of the device will have the function of policy route.

Table 3 Configuring Application of Policy Route to Global

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure application of policy route to global	<b>global ip policy-based-route</b> { <i>access-list-number</i>   <i>access-list-name</i> }	Mandatory By default, no ACL with policy route is applied to global.

### 62.2.3 Policy route monitoring and maintaining

Table 62 Policy Route Monitoring and Maintaining

Command	Description
<b>show pbr-action-group</b> [ <i>pbr-action-group-name</i> ]	Show the configuration information of policy route

Command	Description
<b>show policy-based-route object</b> [ global   interface [ vlan   switchport   vlan-range ]   vlan   vlan-range ]	Show policy route configuration and application information. If no parameter has been specified, then it means the application information of all PBRs.

## 62.3 Typical configuration example of policy route

### 62.3.1 Configure Policy Route

#### Network Requirements

- Device1 has default route. The gateway is Device2.
- By configuring policy route on Device1, the PC can access network 1.1.1.0/24 through Device3, and network 1.1.2.0/24 through Device2.

#### Network Topology

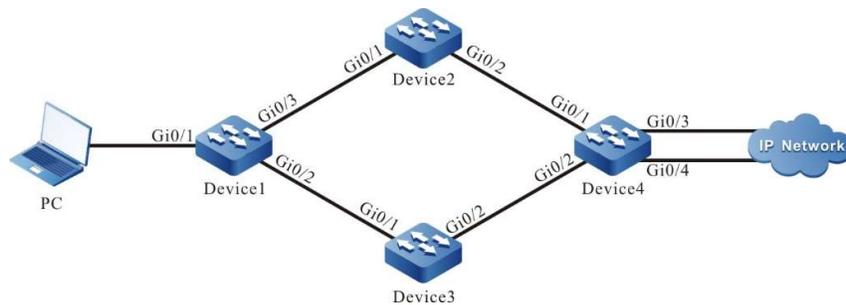

Figure 62 Network Topology for Configuring Policy Route

of equipment	port	VLAN	IP address
PC			10.1.1.1/24
Device1	Gi0/1	2	10.1.1.2/24
	Gi0/2	3	20.1.1.1/24
	Gi0/3	4	30.1.1.1/24
Device2	Gi0/1	2	30.1.1.2/24

of equipment	port	VLAN	IP address
	Gi0/2	3	50.1.1.1/24
Device3	Gi0/1	2	20.1.1.2/24
	Gi0/2	3	40.1.1.1/24
Device4	Gi0/1	2	50.1.1.2/24
	Gi0/2	3	40.1.1.2/24
	Gi0/3	4	1.1.1.1/24
	Gi0/4	5	1.1.2.1/24

### Configuration Steps

Step 1: Configure VLANs, and add ports to the required VLANs. (Omitted)

Step 2: Configures IP addresses for the ports. (Omitted)

Step 3: Configure static routes.

#### #Configure Device1.

```
Device1#configure terminal
Device1(config)#ip route 0.0.0.0 0.0.0.0 30.1.1.2
```

#### #Configure Device2.

```
Device2#configure terminal
Device2(config)#ip route 10.1.1.0 255.255.255.0 30.1.1.1
Device2(config)#ip route 1.1.0.0 255.255.0.0 50.1.1.2
```

#### #Configure Device3.

```
Device3#configure terminal
Device3(config)#ip route 10.1.1.0 255.255.255.0 20.1.1.1
Device3(config)#ip route 1.1.0.0 255.255.0.0 40.1.1.2
```

#### #Configure Device4.

```
Device4#configure terminal
Device4(config)#ip route 30.1.1.0 255.255.255.0 50.1.1.1
Device4(config)#ip route 20.1.1.0 255.255.255.0 40.1.1.1
Device4(config)#ip route 10.1.1.0 255.255.255.0 50.1.1.1
Device4(config)#ip route 10.1.1.0 255.255.255.0 40.1.1.1
```

#### #View the routing table of Device1.

```
Device1#show ip route
```

Codes: C - connected, S - static, R - RIP, O - OSPF, OE-OSPF External, M - Management  
D - Redirect, E - IRMP, Ex - IRMP external, o - SNSP, B - BGP, i-ISIS

Gateway of last resort is 30.1.1.2 to network 0.0.0.0

```
S 0.0.0.0/0 [1/100] via 30.1.1.2, 00:26:24, vlan4
C 10.1.1.0/24 is directly connected, 00:00:59, vlan2
C 20.1.1.0/24 is directly connected, 00:00:50, vlan3
C 30.1.1.0/24 is directly connected, 00:00:39, vlan4
C 127.0.0.0/8 is directly connected, 03:47:36, lo0
```

#### Step 4: Configure policy route on Device1.

#Configure PBR action group, and re-direct the packets to the next hop 20.1.1.2.

```
Device1(config)#pbr-action-group pbr
Device1(config-action-group)#redirect ipv4-nexthop 20.1.1.2
Device1(config-action-group)#exit
```

#View the information of PBR action group on Device1.

```
Device1#show pbr-action-group pbr
pbr-action-group pbr
redirect ipv4-nexthop 20.1.1.2(valid)
```

#Configure ACL, and bind the ACL rules matching the destination IP network segment 1.1.1.0/24 to the L3 PBR action group.

```
Device1(config)#ip access-list extended 1001
Device1(config-std-nacl)#permit ip any 1.1.1.0 0.0.0.255 pbr-action-group pbr
Device1(config-std-nacl)#permit ip any 1.1.2.0 0.0.0.255
Device1(config-std-nacl)#commit
Device1(config-std-nacl)#exit
```

#View the information of ACL on Device1.

```
Device1#show ip access-list 1001
ip access-list standard 1001
10 permit ip any 1.1.1.0 0.0.0.255 pbr-action-group pbr (active)
20 permit ip any 1.1.2.0 0.0.0.255
```

#### Step 6: Apply ACL.

#Apply ACL 1001 to the port vlan2 of Device1.

```
Device1(config)#interface vlan2
Device1(config-if-vlan2)#ip policy-based-route 1001
Device1(config-if-vlan2)#exit
```

#### Step 7: Check the result.

#On the PC, view through Traceroute the paths through which the destination network 1.1.1.0/24 can be reached.

```
C:\Documents and Settings\Administrator>tracert 1.1.1.1
```

Tracing route to 1.1.1.1 over a maximum of 30 hops

```
 1  1 ms  1 ms  1 ms 10.1.1.2
 2 <1 ms <1 ms <1 ms 20.1.1.2
 3 <1 ms <1 ms <1 ms 1.1.1.1
Trace complete.
```

It can be seen that PC reaches network 1.1.1.0/24 through Device1, Device3 and Device4.

#On the PC, view through Traceroute the paths through which the destination network 1.1.2.0/24 can be reached.

```
C:\Documents and Settings\Administrator>tracert 1.1.2.1
```

Tracing route to 1.1.2.1 over a maximum of 30 hops

```
 1  1 ms  1 ms  1 ms 10.1.1.2
 2 <1 ms <1 ms <1 ms 30.1.1.2
 3 <1 ms <1 ms <1 ms 1.1.2.1
Trace complete.
```

It can be seen that PC reaches network 1.1.2.0/24 through Device1, Device2 and Device4.

---

## Note

- The packets can be flexibly matched according to ACL rules referenced. The content to be matched includes packets' source IP address, destination IP address, source port, destination port, protocol, and TCP flag.
  - For ACL binding, except for binding to layer-2/3 Ethernet interface, it can be bound to VLAN, Interface VLAN and global.
-

# 63 Routing Policy Tool

---

## 63.1 Overview

Routing policy changes the paths through which routing information or data traffic passes by changing route attributes or route reachability. It is mainly applied in the following aspects:

- Set route attributes: Set corresponding attributes through the route matching the routing policy;
- Control route distribution: When distributing routes, the routing protocol distributes the routing information which satisfies the conditions only;
- Control route receiving: When receiving routes, the routing protocol receives the routing information which satisfies the conditions only so as to control the number of routing table entries and improve network security;
- Control route redistribution: When redistributing and importing external routes, the routing protocol imports routing information which satisfies the conditions, or uses routing policy tool to set certain attributes of importing external routes.

Key-chain is a password management tool. It provides authentication password when the routing protocol is authenticating protocol packets.

## 63.2 Function configuration of routing policy tool

Table 63 Routing Policy Tool Configuration List

### 63.2.1 Configure Prefix List

#### Configuration Condition

None

#### Configure Prefix List

Prefix list can be used to filter prefixes and particularly routes. ACL is designed to filter data packet at first and routes later. However, prefix list is designed to filter routes. Although they overlap in route filtration, prefix list is more flexible than ACL.

A prefix list is identified with a name of prefix list. Each prefix list can contain multiple entries, each of which can separately specify a match scope. Each entry corresponding to a number is used to indicate the sequence in which the prefix list conducts match check.

The relationship between entries of the prefix list is "or". During the matching process, the device checks according to corresponding sequence number of the entries from small to large. Once a specific entry is matched, the filtration of this prefix list has been passed, and it will not continue to check the next entry.

Table 63 Configuring Prefix List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure IPv4 prefix list	<b>ip prefix-list</b> <i>prefix-list-name</i> [ <b>seq</b> <i>seq-value</i> ] { <b>deny</b>   <b>permit</b> } <i>network / length</i> [ <b>ge</b> <i>ge-value</i> ] [ <b>le</b> <i>le-value</i> ]	Mandatory  By default, no IPv4 prefix list is configured.

---

### Note

- **ge** means greater than or equal to, and **le** means less than or equal to. The value range is  $0 \leq \text{length} < \text{ge-value} \leq \text{le-value} \leq 32$ . For example, if you configure **ip prefix-list test permit 192.168.0.0/16 ge 18 le 24**, it means that routing entries with an address of 192.168.0.0 and a mask length between 18 (inclusive) and 24 (inclusive) are permitted to pass.
  - When the network/length is configured as 0.0.0.0/0, it means the default route is matched; when it is configured as 0.0.0.0/0 **le 32**, it means all routes are matched.
  - At the end of the IPv4 prefix list, there is an entry which prohibits all: **deny 0.0.0.0/0 le 32**. When deny statement is configured to prohibit some routes, it is recommended to add **permit 0.0.0.0/0 le 32** statement at the end to permit other IPv4 routes to pass.
- 

## 63.2.2 Configure AS-PATH List

### Configuration Condition

None

### Configure AS-PATH List

AS-PATH list can be used to filter AS numbers and BGP routes. The AS path attributes of BGP route record all the AS through which this route passes. When advertising a route to the outside of this AS, BGP will add the AS number to the AS path attributes to record the information of the AS path through which this route passes.

An AS-PATH list may contain multiple entries, the relationship between which is "or". During the matching process, the device checks according to the sequential order. As long as the route passes a certain entry in this AS-PATH list, it is deemed that it passes this AS-PATH list.

Table 63 Configuring AS-PATH List

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure AS-PATH List	<b>ip as-path access-list</b> <i>path-list-number</i> { <b>permit</b>   <b>deny</b> } <i>regular-expression</i>	Mandatory By default, no AS-PATH list is configured.

Regular expressions are used in the AS-PATH list to specify the set of AS attributes that meets the requirements. Regular expression is composed of some general characters and some metacharacters. General characters include letters in upper and lower case and figures; metacharacters have special meanings, as shown in the table below.

Table 63 Meanings of Metacharacters in Regular Expression

SYMBOL	Meaning
.	Match any single character
*	Match the sequence which can follow 0 or more bits in the mode
+	Match the sequence which can follow 1 or more bits in the mode
?	Match the sequence which can follow 0 or 1 bit in the mode
^	Match the start of the input string
\$	Match the end of the input string
—	Match comma, bracket, start and end of character string, and space

SYMBOL	Meaning
[]	Match the single characters in a certain scope
-	Separate the end points in a scope

### 63.2.3 Configure List of Community Attributes

#### Configuration Condition

None

#### Configure List of Community Attributes

Community-list is used to filter the community attributes of route. Generally, a route has two parts, i.e. prefix and route attributes. In particular, route attributes are different among various routing protocols. Generally, there are simple attributes in the IGP protocol, such as metric. BGP has many complicated attributes, including community attributes. Community-list is used to filter these attributes. The community-list filtering result is obtained for the entire route where this community attribute is located. That is to say, if the filtering result is deny, the entire route rather than just this community attribute will be denied.

Community-list has two types, i.e. standard and extended. The standard community-list filters according to local-AS, internet, no-advertise, and no-export of BGP routes; the extcommunity-list uses regular expressions to filter the BGP routes with these community attributes.

For the use of community-list, routing protocols with community attributes can be used directly. Generally, they are often used indirectly by binding the community-list to the routing map and then applying the routing map to the routing protocol.

A community-list may contain multiple entries, the relationship between which is "or". During the matching process, the device checks according to the sequential order. As long as the route passes a certain entry in this community-list, it is deemed that it passes this community-list. When configuring the extcommunity-list, the use of regular expression can refer to the part of configuring AS-PATH list.

Table 63 Configuring Community-list

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-

Step	Command	Description
Configure standard community-list	<b>ip community-list</b> { <i>community-list-number</i>   <b>standard</b> <i>community-list-name</i> } { <b>permit</b>   <b>deny</b> } [ <i>community-number</i> / <i>aa: nn</i> / <b>local-AS</b> / <b>internet</b> / <b>no-advertise</b> / <b>no-export</b> ]	Mandatory  By default, no standard community-list is configured.
Configure extcommunity-list	<b>ip community-list</b> { <i>community-list-number</i>   <b>expanded</b> <i>community-list-name</i> } { <b>permit</b>   <b>deny</b> } <i>regular-expression</i>	Mandatory  By default, no extcommunity-list is configured.

## 63.2.4 Configure List of Extcommunity Attributes

### Configuration Condition

None

### Configure List of Extcommunity Attributes

Extcommunity-list can be used to filter extcommunity attributes and particularly routes. The nature and application method of extcommunity-list are almost the same as those of community-list. The difference is that the extcommunity attributes are mainly used in MPLS L3VPN. Therefore, extcommunity-list is also mainly used in MPLS L3VPN.

Extcommunity-list has two types, i.e. standard and extended. The standard community-list filters according to Router Target and Site of Origin; the extended extcommunity-list uses regular expressions to filter the BGP routes with these community attributes.

An extcommunity-list may contain multiple entries, the relationship between which is "or". During the matching process, the device checks according to the sequential order. As long as the route passes a certain entry in this extcommunity-list, it is deemed that it passes this extcommunity-list. When configuring the extended extcommunity-list, the use of regular expression can refer to the part of configuring AS-PATH list.

Table 63 Configuring Extcommunity-list

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Configure standard extcommunity-list	<b>ip extcommunity-list</b> { <i>extcommunity-list-number</i>   <b>standard</b> <i>extcommunity-list-name</i> } { <b>permit</b>   <b>deny</b> } [ <b>rt</b> <i>extcommunity-number</i> / <b>soo</b> <i>extcommunity-number</i> ]	Mandatory  By default, no standard extcommunity-list is configured.
Configure extended extcommunity-list	<b>ip extcommunity-list</b> { <i>extcommunity-list-number</i>   <b>expanded</b> <i>extcommunity-list-name</i> } { <b>permit</b>   <b>deny</b> } <i>regular-expression</i>	Mandatory  By default, no extended extcommunity-list is configured.

### 63.2.5 Configure Routing Map

Routing map is a tool used to match routes and set route attributes. A routing map is composed of several statements, each of which contains some match sub-statements and set sub-statements. The former define the match rules of this statement, while the latter define the actions after passing the match of match sub-statements. The relationship between match sub-statements is "and", i.e. all match sub-statements of this statement must be satisfied.

The relationship between statements of the routing map is "or". During the matching process, the device checks according to corresponding sequence number of the statements from small to large. Once the check of a specific statement is passed, it means this routing map has been matched, and it will not continue to check the next statement. If no statement check has been passed, this routing map is not matched.

#### Configuration Condition

Before configuring a routing map, ensure that:

- Configure the ACL, prefix list, AS-PATH, community-list or extcommunity list required for routing map.

#### Create Routing Map

When creating the routing map, the match mode of its statements can be specified, i.e. **permit** or **deny**:

**permit** specifies the match mode of the statement of the routing map created is permit. The routing entries are allowed to pass and execute the set sub-statements of this statement when they meet all the match sub-statements of this statement. If the routing entries cannot satisfy the match sub-statements of this statement, the next statement of this routing map will be checked;

The word **deny** specifies the match mode of the statements of the routing map created is deny. The routing entries will be denied and check of the next statement will not be conducted only when they meet all the match sub-statements of this statement. The set sub-statement is not performed in **deny** mode.

Table 63 Creating Routing Map

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
Create Routing Map	<b>route-map</b> <i>map-name</i> [ { <b>permit</b>   <b>deny</b> } [ <i>seq-number</i> ] ]	Mandatory By default, no routing map is created.

---

### Note

- Create a routing map through the command route-map. When only the name of routing map is configured, yet the match mode and statement number are ignored, a statement with the match mode of permit and number of 10 will be added automatically.
  - When the routing protocol applies a routing map which is not configured, all the objects will be matched ineffectively.
- 

### Configure match Sub-statement of Routing Map

The relationship between the match sub-statements of the routing map's statements is "and". All the match sub-statements must be satisfied to pass.

Table 63 Creating Match Sub-statements of Routing Map

Step	Command	Description
Enter the global configuration mode.	<b>configure terminal</b>	-
